

Computer Algebra Independent Integration Tests

Nasser M. Abbasi

December 16, 2018

Compiled on December 16, 2018 at 10:27am

[public]

These reports and the web pages themselves were written in \LaTeX using TeXLive distribution and compiled to HTML using TeX4ht.

FULL CAS integration tests

These reports show the result of using full CAS test suite on different CAS's at same time. This compares how one CAS performs against another.

The test suite used is the full Rubi CAS intergation tests.

1. Completed August 2, 2018 Started June 6, 2018. This build is now complete.
CAS systems used are : Rubi 4.15.2, Mathematica 11.3, Maple 2018, Maxima 5.41, Fricas 1.3.3, Sympy 1.1.1 and Giac/XCAS 1.4.9.
Number of integrals [69,522].
2. In progress. Updated December 16, 2018 Number of tests completed [28,425]
This report which includes the same CAS systems as above, but with the addition of Rubi in Sympy implemetation. This is a port of Rubi to Sympy.
Sympy 1.3 was used in this test for both Sympy itself and for Rubi in Sympy.

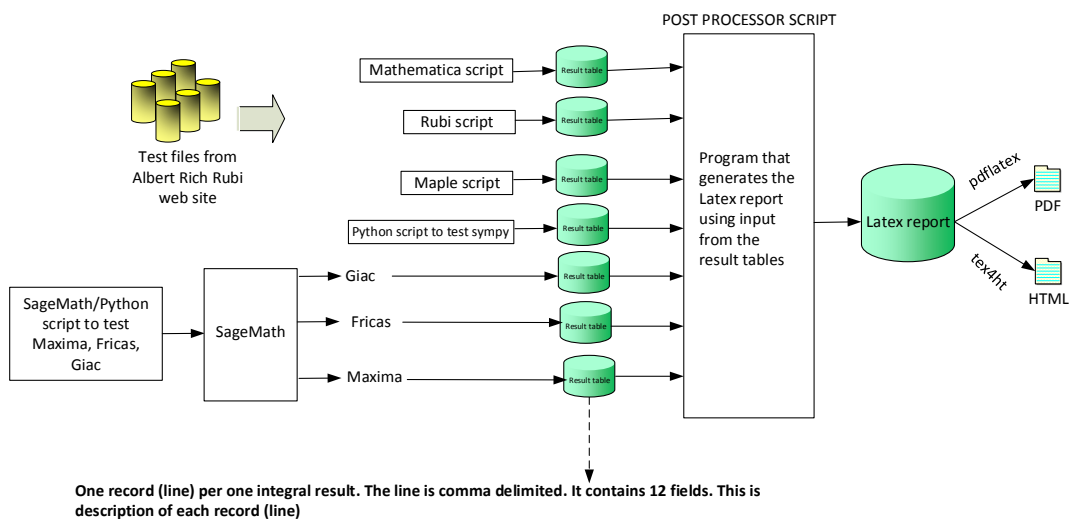

LITE CAS integration tests

These reports show the result of using same test suite on different versions of same CAS. Only Maple, Mathematica and Rubi are used. This is for regression testing to find how different version of the same CAS improved over the years. The test suite used is the lite version of the full CAS intergation tests. It contains smaller number of integrals compared to the full test suite used above.

1. Mathematica This zip file contains the raw input tests used which was obtained from Rubi web site.
2. Rubi Uses same zip file as above for input.
3. Maple This zip file contains the raw input tests used which was obtained from Rubi web site.

Note on build system

The following diagram gives a high level view of the current test build system.

One record (line) per one integral result. The line is comma delimited. It contains 12 fields. This is description of each record (line)

1. integer, the problem number.
2. integer. 0 or 1 for failed or passed. (this is not the grade field)
3. integer. Leaf size of result.
4. integer. Leaf size of the optimal antiderivative.
5. number. CPU time used to solve this integral. 0 if failed.
6. string. The integral in Latex format
7. string. The input used in CAS own syntx.
8. string. The result (antiderivative) produced by CAS in Latex format
9. string. The optimal antiderivative in Latex format.
10. integer. 0 or 1. Indicates if problem has known antiderivative or not
11. String. The result (antiderivative) in CAS own syntax.
12. String. The grade of the antiderivative. Can be "A", "B", "C", or "F"

High level overview of the CAS independent integration test build system

Nasser M. Abbasi
June 22, 2018

My PC during running the tests

I really need a faster PC with much more RAM !

This below shows example of CAS suddenly consuming all RAM in PC, and I had to terminate the process, since it did not time out as instructed, and just hanged.

my cheat sheet notes

Fricas

To use Fricas online, go to <http://axiom-wiki.newsynthesis.org/FriCASIntegration>
Go to bottom of page, type

```
\begin{axiom}
setSimplifyDenomsFlag(true)
integrate(sin(x),x)
\end{axiom}
```

Then click the preview button

to send email to supprt group use fricas-devel@googlegroups.com

To download go to <https://sourceforge.net/projects/fricas>

To install, see <http://fricas.sourceforge.net/doc/INSTALL.txt>

To build

```
#install sbcl
#sudo apt-get install sbcl #do not use this. bug
sudo apt-get install clisp #This lisp works
sudo apt-get install dvipng
sudo apt-get install auctex
bzip2 -dk fricas-1.3.2-full.tar.bz2
tar -xf fricas-1.3.2-full.tar
```

Now build it

```
make clean
fricas-1.3.2>./configure --with-lisp=/usr/bin/clisp

extracting list of SPAD type definitions
Type 'make' (without quotes) to build FriCAS

```

And

make

Add these to .bashrc

```

export PATH=/home/me/data/fricas/fricas-1.3.2/target/x86_64-linux-gnu/bin:$PATH
export AXIOM=/home/me/data/fricas/fricas-1.3.2/target/x86_64-linux-gnu
export DAASE=/home/me/data/fricas/fricas-1.3.2/target/x86_64-linux-gnu

```

Example of integral which fails in Fricas

```

ii:=integrate(log(1+x)/x/(1+(1+x)^(1/2))^(1/2),x)

>> Error detected within library code:
integrate: implementation incomplete (constant residues)

```

For Fricas, use these commands to get 1D plain text output

```

setSimplifyDenomsFlag(true)
)set output algebra on
ii:=integrate(1/(x*(3*x^2 - 6*x + 4)^(1/3)),x);
unparse(ii::InputForm)

```

Otherwise the output will go to console in 2D. To get Latex output do

```

setSimplifyDenomsFlag(true)
)set message prompt plain
)set output algebra off
)set output tex on
s:=asin(sqrt(1-x^2))/sqrt(1-x^2);
ii:=integrate(s,x)

```

And this will give

$$(19) \quad \frac{\arcsin\left(\sqrt{-x^2 + 1}\right)^2}{2}$$

To record console session to file, use (from <https://github.com/daly/axiom/blob/master/faq>)

```

)spool filename
    starts sending output to the file called filename
)spool )off
stops sending output to the file

```

Like this

```
)spool /home/me/data/output.txt
)set message prompt plain
)set output algebra off
)set output tex on
ii:=integrate(sin(x), x)
)set output tex off
)set output algebra on
unparse(ii::InputForm)
)spool )off
```

To send Latex output to file do

```
)set output tex on
)set output tex filename
```

To turn off, just do `)set output tex off`. Make sure to `tex on` first. To send back to console, do `)set output tex console`

To read commands from file do

To read an input file into Axiom, use the `)read` system command. `read` For example, you can read a file in a particular directory by issuing

```
)read /spad/src/input/matrix.input
```

To make record

```
)clear prop r
r: Record(a: String,b:Integer)
r:=["hello",10]
```

Some hints below thanks to Waldek Hebisch <http://mathforum.org/kb/message.jspa?messageID=9791385>

copied here so easy for me to get to:

1. How to measure CPU time used from the `int` call?

```
(3) -> )set messages time on
(3) -> integrate(x^(3/2)/sqrt(1 + x^5), x)
```

```
Type: Union(Expression(Integer),...)
Time: 0.06 (EV) + 0.00 (OT) = 0.06 sec
```

That is command `)set messages time on` tell FriCAS to print time needed to execute following command. The (EV) part means actual computation (OT) printing and at the end there is total

2. How to measure leaf count/size of result? (Maple and Mathematica have build in function to do this)

That is a bit tricky. FriCAS (like Axiom) has quite different representation of expressions than Maple or Mathematica. In FriCAS expression is a quotient of two polynomials, with variables being kernels:

```
(13) -> f := exp(x^3 + 1/x) + 1
(14) -> numer(f)
```

```
4
x + 1
-----
x
```

```
(15) -> denom(f)
```

```
(16) -> variables(numer(f))
```

```
4
x + 1
-----
x
(16) [%e ]
Type: List(Kernel(Expression(Integer)))
Time: 0.00 (OT) = 0.00 sec
```

From FriCAS point of view natural measure of size is number of monomials in numerator and denominator:

```
(17) -> numberOfMonomials(numer(f))
```

```
(17) 2
```

```
(18) -> numberOfMonomials(denom(f))
```

```
(18) 1
```

but this may underestimate size because kernels may be big. Also internally given kernel is stored only once, but in printed output it may appear several times.

It is possible to traverse expression in somewhat tree like manner, so it is possible to give better approximation to say Maple result, but that would require investigating what Maple is doing. I personally never used Maple node count so I do not know if this is simple or if there are some traps.

3. How to check if int passed or failed? Aborted? nil result? etc..

integrate may produce an error (in particular it will do so if it can not decide if integral is elementary). Or may produce unevaluated integral. Or normal result. At programistic level it is possible to catch errors, but a bit tricky, If you look at printed output, than errors are reasonably easy to match via a regex:

```
(22) -> integrate(1/sqrt(exp(x) - x + 1), x)
integrate: implementation incomplete (constant residues)
```

the '>> Error' part indicates error. Unevaluated integrals always have integral sign at top level. FriCAS never returns partial results, so text match is relatively easy. Or you may use code like:

```
test_int(f) ==
res : Union(Expression Integer, LE)
res := integrate(f, 'x)
res0 : List Expression Integer :=
res case Expression Integer =>
[res::(Expression Integer)]@(List Expression Integer)
res case List Expression Integer =>
res::(List Expression Integer)
error "test_int: impossible 1"
for ri in res0 repeat
#(kernels ri) > 0 and is?(operator first kernels ri, 'integral) =>
```

```
print("Unevaluated integral"::OutputForm)
```

Note1: this is part extracted from bigger test script, I did not test it alone.

Note2: FriCAS may either return list of results or a single result. Middle part converts this to have always a list (typically of length 1). The last part is a loop so that all solutions can be examined. If you only want to know if result is evaluated, then loop is not needed: more than one result means that integral is evaluated.

Note3: In FriCAS testsuite I use a bit different test for evaluated integrals. Namely, FriCAS can do useful computations on unevaluated integrals and in particular unevaluated integrals may appear in the argument to integrate. Such unevaluated integrals of course may propagate from input to the output. The test above may misclassify such integral as unevaluated, while better test checks that unevaluated integral came from the input.

4. And most importantly, how to export the result (if it passed) to a plain text file in `_Latex_` format?

```
(24) -> )set output tex on
(24) -> integrate(exp(x)*exp(1/(exp(x)+1)-x), x)
```

Here one has to decide what to do with errors. Without error trapping error will abort currently executing function and propagate to top level (up to command line).

After doing:

```
)set break resume
```

after error FriCAS will continue executing file from next command (but still abort current command). If you need real loop then I can provide error catcher, but it is a bit more complicated than snippets above.

Waldek Hebisch

To get type of value in fricas do `typeOf(r)`

To clear everything do

```
)clear all
```

```
)clear completely
```

sympy

<http://docs.sympy.org/0.7.1/modules/integrals.html>

<http://docs.sympy.org/dev/tutorial/index.html>

To install python package do `conda install package-name` to update do `conda update package` for example `conda update spyder`

To integrate the command is

```
from sympy import *
```

or

```
import sympy #but now have to add sympy. to each call
```

```
import os
os.getcwd()
os.chdir('X:\\data\\public_html\\my_notes\\CAS_integration_tests\\reports\\rubi_4_11\\code')
os.getcwd()
import math
init_printing()
init_printing(use_unicode=False, wrap_line=False, no_global=True)
x = symbols('x', real=True)
r=integrate(x,x)
r0=latex(r)
text_file = open("python.txt", "w")
text_file.write("\n%s\n" % r0)
text_file.close()
```

To check if integral fails?

```
r=integrate(f*g, (x, L/2, L))
type(r) is integrals.Integral
```

Out[41]: True

or

```
isinstance(r, integrals.Integral)
Out[48]: True
```

```
r=integrate(x,x)
type(r) is integrals.Integral
Out[43]: False
```

```
if isinstance(r, integrals.Integral):
    result = 0
else:
    result=1
```

To get cwd

```
os.getcwd()
```

To get list of folder in cwd do

```
os.listdir(os.getcwd())
```

or

```
ls
```

```
Out[85]:
['1_Algebraic_functions',
 '2_Exponentials',
 '3_Logarithms',
 '4_Trig_functions',
 '5_Inverse_trig_functions',
 '6_Hyperbolic_functions',
 '7_Inverse_hyperbolic_functions',
 '8_Special_functions',
 'Independent_test_suites']
```

```
f = open('Hebisch_Problems.txt','r')
f.readline()
f.close()
```

how to do timeout? simple timeouts using `signal.alarm` module check <http://stackoverflow.com/questions/492519/timeout-on-a-function-call> for some code. There is also talk about it here <https://groups.google.com/forum/#!topic/sympy/qsPImy6WqcI> code from above is

```
def _timeout(self, function, timeout):
    def callback(x, y):
        signal.alarm(0)
        raise Skipped("Timeout")
    signal.signal(signal.SIGALRM, callback)
    signal.alarm(timeout) # Set an alarm with a given timeout
    function()
    signal.alarm(0) # Disable the alarm
```

elementary functions <http://docs.sympy.org/latest/modules/functions/elementary.html> and <http://docs.sympy.org/dev/modules/functions/special.html>

and <http://docs.sympy.org/latest/modules/functions/index.html>

Need to change

```
AppellF1 --> #hypergeometric function of two variables
Ellipticpi-->
arctanh --> atanh
arctan --> atan
arccosh->acosh
Pi --> pi.
arcsin -> asin
arccos -> acos
hypergeom -> hyper,
arccoth -> acoth
GAMMA -> uppergamma()
arccsc -> acsc
arcsec -> asec
arccot -> acot,
EllipticF -> elliptic_f
EllipticE -> elliptic_e
Li -> Li
Si -> Si
Ci -> Ci
Ei -> Ei
FresnelS -> fresnels
FresnelC -> fresnelc
```

I also removed 4th field that contains `integrate(...)` in it as it hangs the reading of the input file.

To run python tests do

```
cd /media/data/public_html/my_notes/CAS_integration_tests/reports/rubi_4_11
python sympy_main.py
```

To add new test, or run more tests, edit `sympy_main.py` and change the line

```
for n in range(0,1): #change the last number to the number of tests to do
```

To update conda and python do

```
conda update conda
conda update python
```

To update sympy do

```
pip list | grep sympy
pip install --upgrade sympy
```

To find version, from inside python, type

```
import sympy
sympy.__version__
```

from github <https://github.com/sympy/sympy/wiki/SymPy-vs.-Sage>

To obtain a Rational in SymPy, one of these methods must be used:

```
>>> from sympy import Rational
>>> Rational(2, 7)
2/7
```

In python/sympy, to loop using index 1, can use this:

```
>>> for num,val in enumerate(sol,start=1):
...   print("root number {} is {}".format(num,val))
```

For timeout in recent python, on windows, this seems to work

```
from subprocess import STDOUT, check_output
output = check_output('dir', shell=True, stderr=STDOUT, timeout=5)
print(output)
```

To download development sympy

```
sudo git clone git://github.com/sympy/sympy.git
sudo git clone https://github.com/HPAC/matchpy.git
```

To install using conda `sudo conda install multiset`

packages are here `/home/me/anaconda3/lib/python3.6/site-packages`

To install pymatch

```
>sudo conda install -c conda-forge matchpy
[sudo] password for me:
Solving environment: done
```

```
## Package Plan ##
```

```
environment location: /opt/anaconda
```

```
added / updated specs:
- matchpy
```

To update sympy in conda do `sudo conda update sympy` I do not know now if I should always use sudo for this, but it works. To check conda version do

```
>conda list anaconda$
```

```
# packages in environment at /opt/anaconda:
```

```
#
```

```
# Name                Version             Build Channel
anaconda               5.2.0              py36_3
```

```
>sudo conda update conda
```

```
[sudo] password for me:
```

```
Solving environment: done
```

```
# All requested packages already installed.
```

```
>conda update anaconda
```

```
Solving environment: done
```

```
# All requested packages already installed.
```

Can also do `conda update --all` to update other conda stuff.

To get all info about conda do

```
>conda info
```

```
active environment : None
```

see also https://conda.io/docs/_downloads/conda-cheatsheet.pdf

This will list all versions of specific package `conda search sympy`

sagemath hints

see <http://doc.sagemath.org/html/en/tutorial/programming.html>

To check if integral evaluated or not, do

```
var('x')
sage: anti=integrate(sqrt(1+x^3),x)

sage: anti
integrate(sqrt(x^3 + 1), x)

sage: isinstance(anti.operator(), sage.symbolic.integration.integral.IndefiniteIntegral)

True
```

To simplify, use `expr.full_simplify()`

to find what methods are there for some expressions to apply to, type `expr.<TAB>` i.e. hit TAB key after the dot.

see help on <http://doc.sagemath.org/html/en/genindex.html>

To find versions of installed package do `ver = installed_packages()`

0.1 Trying rubi in sympy

First install 1.2 sympy then install this

```
>sudo conda install -c conda-forge matchpy
Solving environment: done
```

```
## Package Plan ##
```

```

```
certifi:      2018.8.13-py36_0      --> 2018.8.24-py36_1      conda-forge
conda:       4.5.10-py36_0            --> 4.5.11-py36_0        conda-forge
```

The following packages will be DOWNGRADED:

```
openssl:     1.0.2p-h14c3975_0            --> 1.0.2o-h470a237_1      conda-forge
```

Proceed ([y]/n)? y

Downloading and Extracting Packages

```
ca-certificates-2018 | 136 KB | #####
certifi-2018.8.24    | 139 KB | #####
openssl-1.0.2o      | 3.5 MB | #####
conda-4.5.11        | 625 KB | #####
hopcroftkarp-1.2.4  | 20 KB  | #####
multiset-2.1.1      | 11 KB  | #####
matchpy-0.4.4       | 49 KB  | #####
```

```
Preparing transaction: done
Verifying transaction: done
Executing transaction: done
```

Now try it for few commands

```
>python
Python 3.6.5 |Anaconda, Inc.| (default, Apr 29 2018, 16:14:56)
[GCC 7.2.0] on linux
Type "help", "copyright", "credits" or "license" for more information.
>>> from sympy import *
>>> from sympy.integrals.rubi.rubi import rubi_integrate
>>> x = symbols('x')
>>> rubi_integrate(exp(1-exp(x**2)*x+2*x**2)*(2*x**3+x)/(1-exp(x**2)*x)**2, x)
Integral((2*x**3 + x)*exp(2*x**2 - x*exp(x**2) + 1)/(-x*exp(x**2) + 1)**2, x)

>>> x,a,b = symbols('x a b')
>>> rubi_integrate(1/(a**2-b**2*x), x)
-log(a**2 - b**2*x)/b**2

>>> rubi_integrate(1/(a**2-b**2*x**2), x)
x*hyper((1, 1/2), (3/2,), b**2*x**2/a**2)/a**2

%the above seems to be wrong

>>> rubi_integrate(sec(2*a*x), x)
Integral(sec(2*a*x), x)

>>> rubi_integrate(1/(1+cos(x)), x)
Integral(1/(cos(x) + 1), x)

%why it can't do the above?

>>> integrate(1/(1+cos(x)), x)
tan(x/2)

%it looks like not all rules are there
```
