1 Introduction **31**

1.1 Listing of CAS systems tested . . . 31
1.2 Results . . . 32
1.3 Performance . . . 36
1.4 list of integrals that has no closed form antiderivative . . . 37
1.5 list of integrals solved by CAS but has no known antiderivative . . . 38
1.6 list of integrals solved by CAS but failed verification . . . 38
1.7 Timing . . . 39
1.8 Verification . . . 39
1.9 Important notes about some of the results . . . 39
1.9.1 Important note about Maxima results . . . 39
1.9.2 Important note about FriCAS and Giac/XCAS results . . . 40
1.9.3 Important note about finding leaf size of antiderivative . . . 41
1.9.4 Important note about Mupad results . . . 41
1.10 Design of the test system . . . 42

2 detailed summary tables of results **43**

2.1 List of integrals sorted by grade for each CAS . . . 43
2.1.1 Rubi . . . 43
2.1.2 Mathematica . . . 44
2.1.3 Maple . . . 45
2.1.4 Maxima . . . 46

2.1.5 FriCAS . . . 47
2.1.6 Sympy . . . 48
2.1.7 Giac . . . 49
2.1.8 Mupad . . . 50
2.2 Detailed conclusion table per each integral for all CAS systems . . . 52
2.3 Detailed conclusion table specific for Rubi results . . . 219

3 Listing of integrals **253**
3.1 $\int \sin^3(e+fx)(a+a\sin(e+fx))^2\,dx$ . . . 253
3.2 $\int \sin^3(e+fx)(a+a\sin(e+fx))^3\,dx$ . . . 258
3.3 $\int \frac{\sin^4(x)}{a+a\sin(x)}\,dx$ . . . 262
3.4 $\int \frac{\sin^3(x)}{a+a\sin(x)}\,dx$ . . . 267
3.5 $\int \frac{\sin^2(x)}{a+a\sin(x)}\,dx$ . . . 271
3.6 $\int \frac{\sin(x)}{a+a\sin(x)}\,dx$ . . . 275
3.7 $\int \frac{1}{a+a\sin(x)}\,dx$ . . . 278
3.8 $\int \frac{\csc(x)}{a+a\sin(x)}\,dx$ . . . 281
3.9 $\int \frac{\csc^2(x)}{a+a\sin(x)}\,dx$ . . . 284
3.10 $\int \frac{\csc^3(x)}{a+a\sin(x)}\,dx$ . . . 288
3.11 $\int \frac{\csc^4(x)}{a+a\sin(x)}\,dx$ . . . 292
3.12 $\int \frac{\sin^4(x)}{(a+a\sin(x))^2}\,dx$ . . . 296
3.13 $\int \frac{\sin^3(x)}{(a+a\sin(x))^2}\,dx$ . . . 301
3.14 $\int \frac{\sin^2(x)}{(a+a\sin(x))^2}\,dx$ . . . 306
3.15 $\int \frac{\sin(x)}{(a+a\sin(x))^2}\,dx$ . . . 310
3.16 $\int \frac{1}{(a+a\sin(x))^2}\,dx$ . . . 313

Chapter 1

Introduction

This report gives the result of running the computer algebra independent integration problems. The listing of the problems are maintained by and can be downloaded from `https://rulebasedintegration.org`

The number of integrals in this report is [837]. This is test number [73].

1.1 Listing of CAS systems tested

The following systems were tested at this time.

1. Mathematica 12.3 (64 bit) on windows 10.
2. Rubi 4.16.1 in Mathematica 12.1 on windows 10.
3. Maple 2021.1 (64 bit) on windows 10.
4. Maxima 5.44 on Linux. (via sagemath 9.3)
5. Fricas 1.3.7 on Linux (via sagemath 9.3)
6. Giac/Xcas 1.7 on Linux. (via sagemath 9.3)
7. Sympy 1.8 under Python 3.8.8 using Anaconda distribution on Ubuntu.
8. Mupad using Matlab 2021a with Symbolic Math Toolbox Version 8.7 under windows 10 (64 bit)

Maxima, Fricas and Giac/Xcas were called from inside SageMath. This was done using SageMath integrate command by changing the name of the algorithm to use the different CAS systems.

Sympy was called directly using Python.

1.2 Results

Important note: A number of problems in this test suite have no antiderivative in closed form. This means the antiderivative of these integrals can not be expressed in terms of elementary, special functions or `Hypergeometric2F1` functions. `RootSum` and `RootOf` are not allowed.

If a CAS returns the above integral unevaluated within the time limit, then the result is counted as passed and assigned an A grade.

However, if CAS times out, then it is assigned an F grade even if the integral is not integrable, as this implies CAS could not determine that the integral is not integrable in the time limit.

If a CAS returns an antiderivative to such an integral, it is assigned an A grade automatically and this special result is listed in the introduction section of each individual test report to make it easy to identify as this can be important result to investigate.

The results given in in the table below reflects the above.

System	solved	Failed
Rubi	% 100.00 (837)	% 0.00 (0)
Mathematica	% 97.97 (820)	% 2.03 (17)
Maple	% 75.87 (635)	% 24.13 (202)
Maxima	% 25.93 (217)	% 74.07 (620)
Fricas	% 61.41 (514)	% 38.59 (323)
Sympy	% 18.28 (153)	% 81.72 (684)
Giac	% 36.08 (302)	% 63.92 (535)
Mupad	% 41.10 (344)	% 58.90 (493)

Table 1.1: Percentage solved for each CAS

The table below gives additional break down of the grading of quality of the antiderivatives generated by each CAS. The grading is given using the letters A,B,C and F with A being the best quality. The grading is accomplished by comparing the antiderivative generated with the optimal antiderivatives included in the test suite. The following table describes the meaning of these grades.

grade	description
A	Integral was solved and antiderivative is optimal in quality and leaf size.
B	Integral was solved and antiderivative is optimal in quality but leaf size is larger than twice the optimal antiderivatives leaf size.
C	Integral was solved and antiderivative is non-optimal in quality. This can be due to one or more of the following reasons 1. antiderivative contains a hypergeometric function and the optimal antiderivative does not. 2. antiderivative contains a special function and the optimal antiderivative does not. 3. antiderivative contains the imaginary unit and the optimal antiderivative does not.
F	Integral was not solved. Either the integral was returned unevaluated within the time limit, or it timed out, or CAS hanged or crashed or an exception was raised.

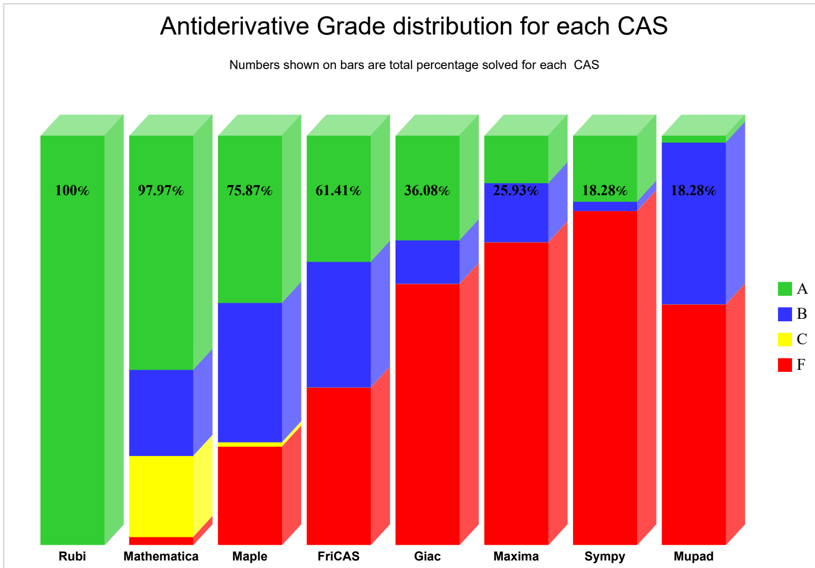
Table 1.2: Description of grading applied to integration result

Grading is implemented for all CAS systems. Based on the above, the following table summarizes the grading for this test suite.

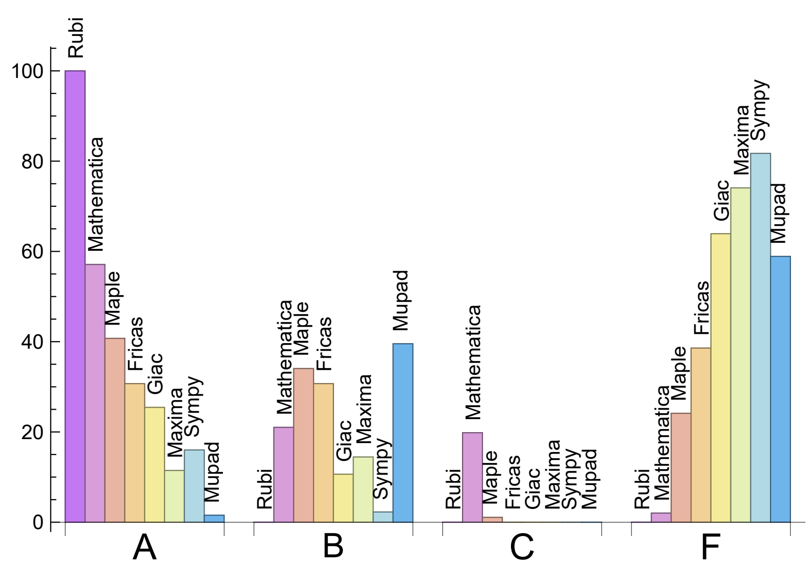
System	% A grade	% B grade	% C grade	% F grade
Rubi	100.00	0.00	0.00	0.00
Mathematica	57.11	21.03	19.83	2.03
Maple	40.74	34.05	1.08	24.13
Maxima	11.47	14.46	0.00	74.07
Fricas	30.70	30.70	0.00	38.59
Sympy	16.01	2.27	0.00	81.72
Giac	25.45	10.63	0.00	63.92
Mupad	1.55	39.55	0.00	58.90

Table 1.3: Antiderivative Grade distribution of each CAS

The following is a Bar chart illustration of the data in the above table.



The figure below compares the CAS systems for each grade level.



The following table shows the distribution of the different types of failure for each CAS. There are 3 types of reasons why it can fail. The first is when CAS returns back the input within the time limit, which means it could not solve it. This the typical normal failure **F** .

The second is due to time out. CAS could not solve the integral within the 3 minutes time limit which is assigned **F(-1)**.

The third is due to an exception generated. Assigned **F(-2)**. This most likely indicates an interface problem between sagemath and the CAS (applicable only to FriCAS, Maxima and Giac) or it could be an indication of an internal error in CAS. This type of error requires more investigations to determine the cause.

System	Number failed	Percentage normal failure	Percentage timeout failure	Percentage exception failure
Rubi	0	0.00 %	0.00 %	0.00 %
Mathematica	17	88.24 %	11.76 %	0.00 %
Maple	202	92.08 %	0.99 %	6.93 %
Maxima	620	81.61 %	4.03 %	14.35 %
Fricas	323	87.31 %	12.38 %	0.31 %
Sympy	684	49.85 %	49.71 %	0.44 %
Giac	535	63.55 %	13.64 %	22.80 %
Mupad	493	99.19 %	0.81 %	0.00 %

1.6 list of integrals solved by CAS but failed verification

The following are integrals solved by CAS but the verification phase failed to verify the anti-derivative produced is correct. This does not mean necessarily that the anti-derivative is wrong, as additional methods of verification might be needed, or more time is needed (3 minutes time limit was used). These integrals are listed here to make it easier to do further investigation to determine why it was not possible to verify the result produced.

1.7 Timing

The command `AboluteTiming[]` was used in Mathematica to obtain the elapsed time for each integrate call. In Maple, the command `Usage` was used as in the following example

```
cpu_time := Usage(assign ('result_of _int',int(expr,x)),output='realtime'
```

For all other CAS systems, the elapsed time to complete each integral was found by taking the difference between the time after the call has completed from the time before the call was made. This was done using Python's `time.time()` call.

All elapsed times shown are in seconds. A time limit of 3 minutes was used for each integral. If the integrate command did not complete within this time limit, the integral was aborted and considered to have failed and assigned an F grade. The time used by failed integrals due to time out is not counted in the final statistics.

1.8 Verification

A verification phase was applied on the result of integration for Rubi and Mathematica. Future version of this report will implement verification for the other CAS systems. For the integrals whose result was not run through a verification phase, it is assumed that the antiderivative produced was correct.

Verification phase has 3 minutes time out. An integral whose result was not verified could still be correct. Further investigation is needed on those integrals which failed verifications. Such integrals are marked in the summary table below and also in each integral separate section so they are easy to identify and locate.

1.9 Important notes about some of the results

1.9.1 Important note about Maxima results

Since these integrals are run in a batch mode, using an automated script, and by using sagemath (SageMath uses Maxima), then any integral where Maxima needs an interactive response from the user to answer a question during evaluation of the integral in order to complete the integration, will fail and is counted as failed.

The exception raised is `ValueError`. Therefore Maxima result below is lower than what could result if Maxima was run directly and each question Maxima asks was answered correctly.

The percentage of such failures were not counted for each test file, but for an example, for the Timofeev test file, there were about 14 such integrals out of total 705, or about 2 percent. This pecrentage can be higher or lower depending on the specific input test file.

Such integrals can be indentified by looking at the output of the integration in each section for Maxima. The exception message will indicate of the error is due to the interactive question being asked or not.

Maxima integrate was run using SageMath with the following settings set by default

```
'besselexpand : true'
'display2d : false'
'domain : complex'
'keepfloat : true'
'load(to_poly_solve)'

```

SageMath loading of Maxima `abs_integrate` was found to cause some problem. So the following code was added to disable this effect.

```
from sage.interfaces.maxima_lib import maxima_lib
maxima_lib.set('extra_definite_integration_methods', '[]')
maxima_lib.set('extra_integration_methods', '[]')
```

See `https://ask.sagemath.org/question/43088/integrate-results-that-are-different-from-using-maxima/` for reference.

1.9.2 Important note about FriCAS and Giac/XCAS results

There are Few integrals which failed due to SageMath not able to translate the result back to SageMath syntax and not because these CAS system were not able to do the integrations.

These will fail With error `Exception raised: NotImplementedError`

The number of such cases seems to be very small. About 1 or 2 percent of all integrals.

Hopefully the next version of SageMath will have complete translation of FriCAS and XCAS syntax and I will re-run all the tests again when this happens.

1.9.3 Important note about finding leaf size of antiderivative

For Mathematica, Rubi and Maple, the buildin system function `LeafSize` is used to find the leaf size of each antiderivative.

The other CAS systems (SageMath and Sympy) do not have special buildin function for this purpose at this time. Therefore the leaf size for Fricas and Sympy and Giac antiderivatives is determined using the following function, thanks to user `slelievre` at https://ask.sagemath.org/question/57123/could-we-have-a-leaf_count-function-in-base-sagemath/

```
def tree_size(expr):
    r"""
    Return the tree size of this expression.
    """
    if expr not in SR:
        # deal with lists, tuples, vectors
        return 1 + sum(tree_size(a) for a in expr)
    expr = SR(expr)
    x, aa = expr.operator(), expr.operands()
    if x is None:
        return 1
    else:
        return 1 + sum(tree_size(a) for a in aa)
```

For Sympy, which is called directly from Python, the following code is used to obtain the leafsize of its result

```
try:
  # 1.7 is a fudge factor since it is low side from actual leaf count
  leafCount = round(1.7*count_ops(anti))

  except Exception as ee:
         leafCount =1
```

1.9.4 Important note about Mupad results

Matlab's symbolic toolbox does not have a leaf count function to measure the size of the antiderivative, Maple was used to determine the leaf size of Mupad output by post processing.

Currently no grading of the antiderivative for Mupad is implemented. If it can integrate the problem, it was assigned a B grade automatically as a placeholder. In the future, when grading function is implemented for Mupad, the tests will be rerun again.

The following is an example of using Matlab's symbolic toolbox (Mupad) to solve an integral

```
integrand = evalin(symengine,'cos(x)*sin(x)')
the_variable = evalin(symengine,'x')
anti = int(integrand,the_variable)
```

Which gives `sin(x)^2/2`

2.2 Detailed conclusion table per each integral for all CAS systems

Detailed conclusion table per each integral is given by table below. The elapsed time is in seconds. For failed result it is given as F(-1) if the failure was due to timeout. It is given as F(-2) if the failure was due to an exception being raised, which could indicate a bug in the system. If the failure was due to integral not being evaluated within the time limit, then it is given just an F.

In this table,the column **normalized size** is defined as $\frac{\text{antiderivative leaf size}}{\text{optimal antiderivative leaf size}}$

2.3 Detailed conclusion table specific for Rubi results

The following table is specific to Rubi. It gives additional statistics for each integral. the column **steps** is the number of steps used by Rubi to obtain the antiderivative. The **rules** column is the number of unique rules used. The **integrand size** column is the leaf size of the integrand. Finally the ratio $\frac{\text{number of rules}}{\text{integrand size}}$ is given. The larger this ratio is, the harder the integral was to solve. In this test, problem number [198] had the largest ratio of [.7500]
