&\quad + \frac{c_2 \left(1 + \frac{21x^2}{8} + \frac{35x^4}{16} + \frac{35x^6}{64} + \frac{7x^{10}}{1024} + O(x^{11})\right)}{x^7}
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x^3 \left(1 - \frac{x^2}{2} + \frac{15x^4}{56} - \frac{5x^6}{32} + \frac{25x^8}{256} - \frac{33x^{10}}{512} + O(x^{11})\right) \\
&\quad + \frac{c_2 \left(1 + \frac{21x^2}{8} + \frac{35x^4}{16} + \frac{35x^6}{64} + \frac{7x^{10}}{1024} + O(x^{11})\right)}{x^7}
\end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^3 \left(1 - \frac{x^2}{2} + \frac{15x^4}{56} - \frac{5x^6}{32} + \frac{25x^8}{256} - \frac{33x^{10}}{512} + O(x^{11})\right) + \frac{c_2 \left(1 + \frac{21x^2}{8} + \frac{35x^4}{16} + \frac{35x^6}{64} + \frac{7x^{10}}{1024} + O(x^{11})\right)}{x^7} \tag{1}$$

Verification of solutions

$$y = c_1 x^3 \left(1 - \frac{x^2}{2} + \frac{15x^4}{56} - \frac{5x^6}{32} + \frac{25x^8}{256} - \frac{33x^{10}}{512} + O(x^{11})\right) + \frac{c_2 \left(1 + \frac{21x^2}{8} + \frac{35x^4}{16} + \frac{35x^6}{64} + \frac{7x^{10}}{1024} + O(x^{11})\right)}{x^7}$$

Verified OK.

16.42.1 Maple step by step solution

Let's solve

$x^2(x^2+1)\, y'' + (2x^3+5x)\, y' - 21y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{21y}{x^2(x^2+1)} - \frac{(2x^2+5)y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(2x^2+5)y'}{x(x^2+1)} - \frac{21y}{x^2(x^2+1)} = 0$

□ Check to see if x_0 is a regular singular point

- ◦ Define functions

  $\left[P_2(x) = \frac{2x^2+5}{x(x^2+1)}, P_3(x) = -\frac{21}{x^2(x^2+1)}\right]$

- ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\Big|_{x=0} = 5$

- ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

$$\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = -21$$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2(x^2+1)\,y'' + x(2x^2+5)\,y' - 21y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

- Shift index using $k- >k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k- >k+2-m$

  $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(7+r)\,(-3+r)\, x^r + a_1(8+r)\,(-2+r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(k+r+7)\,(k+r-3) + a_{k-2}(k-2\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(7+r)\,(-3+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{-7, 3\}$

- Each term must be 0

  $a_1(8+r)\,(-2+r) = 0$

- Solve for the dependent coefficient(s)

  $a_1 = 0$

- Each term in the series must be 0, giving the recursion relation

  $a_k(k+r+7)(k+r-3) + a_{k-2}(k-2+r)(k+r-1) = 0$

- Shift index using $k- >k+2$

  $a_{k+2}(k+9+r)(k+r-1) + a_k(k+r)(k+r+1) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{a_k(k+r)(k+r+1)}{(k+9+r)(k+r-1)}$

- Recursion relation for $r = -7$; series terminates at $k = 6$

  $a_{k+2} = -\frac{a_k(k-7)(k-6)}{(k+2)(k-8)}$

- Solution for $r = -7$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-7}, a_{k+2} = -\frac{a_k(k-7)(k-6)}{(k+2)(k-8)}, a_1 = 0\right]$

- Recursion relation for $r = 3$

  $a_{k+2} = -\frac{a_k(k+3)(k+4)}{(k+12)(k+2)}$

- Solution for $r = 3$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+3}, a_{k+2} = -\frac{a_k(k+3)(k+4)}{(k+12)(k+2)}, a_1 = 0\right]$

- Combine solutions and rename parameters

  $\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-7}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+3}\right), a_{k+2} = -\frac{a_k(k-7)(k-6)}{(k+2)(k-8)}, a_1 = 0, b_{k+2} = -\frac{b_k(k+3)(4+k)}{(k+12)(k+2)}, b_1 = 0\right]$

Problem number: 39.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(1+2x^2)\,y''-x(x^2+3)\,y'-2yx=0}$$

With the expansion point for the power series method at $x=0$.

The ODE is

$$(2x^4+x^2)\,y''+(-x^3-3x)\,y'-2yx=0$$

Or

$$x(2y''x^3-y'x^2+y''x-3y'-2y)=0$$

For $x\neq 0$ the above simplifies to

$$(2x^3+x)\,y''-y'x^2-2y-3y'=0$$

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(2x^4+x^2)\,y''+(-x^3-3x)\,y'-2yx=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$
\begin{aligned}
p(x) &= -\frac{x^2+3}{x\left(1+2x^2\right)} \\
q(x) &= -\frac{2}{\left(1+2x^2\right)x}
\end{aligned}
$$

Table 856: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{x^2+3}{x(1+2x^2)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{2}}{2}$	"regular"
$x = \frac{i\sqrt{2}}{2}$	"regular"

$q(x) = -\frac{2}{(1+2x^2)x}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{2}}{2}$	"regular"
$x = \frac{i\sqrt{2}}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{i\sqrt{2}}{2}, \frac{i\sqrt{2}}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$
x^2\left(1+2x^2\right)y'' + \left(-x^3-3x\right)y' - 2yx = 0
$$

Let the solution be represented as Frobenius power series of the form

$$
y = \sum_{n=0}^{\infty} a_n x^{n+r}
$$

Then

$$
\begin{aligned}
y' &= \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1} \\
y'' &= \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}
\end{aligned}
$$

Substituting the above back into the ode gives

$$
\begin{aligned}
x^2(1+2x^2)\left(\sum_{n=0}^{\infty}(n+r)(n+r-1)a_n x^{n+r-2}\right) \\
+(-x^3-3x)\left(\sum_{n=0}^{\infty}(n+r)a_n x^{n+r-1}\right)-2\left(\sum_{n=0}^{\infty}a_n x^{n+r}\right)x=0
\end{aligned} \tag{1}
$$

Which simplifies to

$$
\begin{aligned}
\left(\sum_{n=0}^{\infty}2x^{n+r+2}a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)(n+r-1)\right) \\
+\sum_{n=0}^{\infty}\left(-x^{n+r+2}a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-3x^{n+r}a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-2x^{1+n+r}a_n\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty}2x^{n+r+2}a_n(n+r)(n+r-1)&=\sum_{n=2}^{\infty}2a_{n-2}(n+r-2)(n-3+r)x^{n+r} \\
\sum_{n=0}^{\infty}\left(-x^{n+r+2}a_n(n+r)\right)&=\sum_{n=2}^{\infty}\left(-a_{n-2}(n+r-2)x^{n+r}\right) \\
\sum_{n=0}^{\infty}\left(-2x^{1+n+r}a_n\right)&=\sum_{n=1}^{\infty}\left(-2a_{n-1}x^{n+r}\right)
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
\left(\sum_{n=2}^{\infty}2a_{n-2}(n+r-2)(n-3+r)x^{n+r}\right) \\
+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)(n+r-1)\right)+\sum_{n=2}^{\infty}\left(-a_{n-2}(n+r-2)x^{n+r}\right) \\
+\sum_{n=0}^{\infty}\left(-3x^{n+r}a_n(n+r)\right)+\sum_{n=1}^{\infty}\left(-2a_{n-1}x^{n+r}\right)=0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - 3x^{n+r} a_n (n+r) = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - 3x^r a_0 r = 0$$

Or

$$(x^r r(-1+r) - 3x^r r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^r r(-4+r) = 0$$

Since the above is true for all x then the indicial equation becomes

$$r(-4+r) = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 4$$
$$r_2 = 0$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^r r(-4+r) = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right)$$

Or

$$y_1(x) = x^4 \left(\sum_{n=0}^{\infty} a_n x^n \right)$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n \right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+4}$$

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = \frac{2}{r^2 - 2r - 3}$$

For $2 \leq n$ the recursive equation is

$$2a_{n-2}(n+r-2)(n-3+r) + a_n(n+r)(n+r-1) - a_{n-2}(n+r-2) - 3a_n(n+r) - 2a_{n-1} = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{2n^2 a_{n-2} + 4nr a_{n-2} + 2r^2 a_{n-2} - 11n a_{n-2} - 11r a_{n-2} + 14a_{n-2} - 2a_{n-1}}{n^2 + 2nr + r^2 - 4n - 4r} \tag{4}$$

Which for the root $r = 4$ becomes

$$a_n = \frac{-2n^2 a_{n-2} - 5n a_{n-2} - 2a_{n-2} + 2a_{n-1}}{n(n+4)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 4$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2}{r^2-2r-3}$	$\frac{2}{5}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-2r^4 + 7r^3 - 9r + 4}{(r^2 - 2r - 3)(r^2 - 4)}$$

Which for the root $r = 4$ becomes

$$a_2 = -\frac{8}{5}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2}{r^2-2r-3}$	$\frac{2}{5}$
a_2	$\frac{-2r^4+7r^3-9r+4}{(r^2-2r-3)(r^2-4)}$	$-\frac{8}{5}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-8r^4 + 12r^3 + 18r^2 - 10r}{r^6 - 14r^4 + 49r^2 - 36}$$

Which for the root $r = 4$ becomes

$$a_3 = -\frac{86}{105}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2}{r^2-2r-3}$	$\frac{2}{5}$
a_2	$\frac{-2r^4+7r^3-9r+4}{(r^2-2r-3)(r^2-4)}$	$-\frac{8}{5}$
a_3	$\frac{-8r^4+12r^3+18r^2-10r}{r^6-14r^4+49r^2-36}$	$-\frac{86}{105}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4r^7 - 51r^5 + 5r^4 + 117r^3 - 33r^2 - 54r + 24}{r^7 + 3r^6 - 17r^5 - 39r^4 + 88r^3 + 108r^2 - 144r}$$

Which for the root $r = 4$ becomes

$$a_4 = \frac{445}{168}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2}{r^2-2r-3}$	$\frac{2}{5}$
a_2	$\frac{-2r^4+7r^3-9r+4}{(r^2-2r-3)(r^2-4)}$	$-\frac{8}{5}$
a_3	$\frac{-8r^4+12r^3+18r^2-10r}{r^6-14r^4+49r^2-36}$	$-\frac{86}{105}$
a_4	$\frac{4r^7-51r^5+5r^4+117r^3-33r^2-54r+24}{r^7+3r^6-17r^5-39r^4+88r^3+108r^2-144r}$	$\frac{445}{168}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{24r^7 + 72r^6 - 126r^5 - 378r^4 - 72r^3 + 114r^2 - 42r + 24}{(r+5)(1+r)^2(-1+r)(r-2)(r-3)(r+4)(r+3)r}$$

Which for the root $r = 4$ becomes

$$a_5 = \frac{9571}{6300}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2}{r^2-2r-3}$	$\frac{2}{5}$
a_2	$\frac{-2r^4+7r^3-9r+4}{(r^2-2r-3)(r^2-4)}$	$-\frac{8}{5}$
a_3	$\frac{-8r^4+12r^3+18r^2-10r}{r^6-14r^4+49r^2-36}$	$-\frac{86}{105}$
a_4	$\frac{4r^7-51r^5+5r^4+117r^3-33r^2-54r+24}{r^7+3r^6-17r^5-39r^4+88r^3+108r^2-144r}$	$\frac{445}{168}$
a_5	$\frac{24r^7+72r^6-126r^5-378r^4-72r^3+114r^2-42r+24}{(r+5)(1+r)^2(-1+r)(r-2)(r-3)(r+4)(r+3)r}$	$\frac{9571}{6300}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= x^4\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\
&= x^4\left(1 + \frac{2x}{5} - \frac{8x^2}{5} - \frac{86x^3}{105} + \frac{445x^4}{168} + \frac{9571x^5}{6300} + O(x^6)\right)
\end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned}
a_N &= a_4 \\
&= \frac{4r^7 - 51r^5 + 5r^4 + 117r^3 - 33r^2 - 54r + 24}{r^7 + 3r^6 - 17r^5 - 39r^4 + 88r^3 + 108r^2 - 144r}
\end{aligned}$$

Therefore

$$
\begin{aligned}
\lim_{r\rightarrow r_2} \frac{4r^7-51r^5+5r^4+117r^3-33r^2-54r+24}{r^7+3r^6-17r^5-39r^4+88r^3+108r^2-144r} &= \lim_{r\rightarrow 0} \frac{4r^7-51r^5+5r^4+117r^3-33r^2-54r+24}{r^7+3r^6-17r^5-39r^4+88r^3+108r^2-144r} \\
&= \textit{undefined}
\end{aligned}
$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$
y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)
$$

Therefore

$$
\begin{aligned}
\frac{d}{dx} y_2(x) &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\
&= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) \\
\frac{d^2}{dx^2} y_2(x) &= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\
&= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right)
\end{aligned}
$$

Substituting these back into the given ode $x^2(1+2x^2)\, y'' + (-x^3-3x)\, y' - 2yx = 0$ gives

$$
\begin{aligned}
&x^2(1+2x^2)\left(C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2}\right. \\
&\left. + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) \\
&+ (-x^3-3x)\left(C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right) \\
&- 2\left(C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)\right) x = 0
\end{aligned}
$$

Which can be written as

$$
\begin{aligned}
&\Bigg(\left(x^{2}\left(1+2x^{2}\right) y_1''(x)+\left(-x^{3}-3x\right) y_1'(x)-2y_1(x)\, x\right) \ln\left(x\right) \\
&+x^{2}\left(1+2x^{2}\right) \left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^{2}}\right)+\frac{\left(-x^{3}-3x\right) y_1(x)}{x}\Bigg) C \\
&+x^{2}\left(1+2x^{2}\right) \left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2} \left(n+r_2\right)^{2}}{x^{2}}-\frac{b_n x^{n+r_2} \left(n+r_2\right)}{x^{2}}\right)\right) \\
&+\left(-x^{3}-3x\right) \left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2} \left(n+r_2\right)}{x}\right)-2\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right) x=0
\end{aligned}
\tag{7}
$$

But since $y_1(x)$ is a solution to the ode, then

$$
x^{2}\left(1+2x^{2}\right) y_1''(x)+\left(-x^{3}-3x\right) y_1'(x)-2y_1(x)\, x=0
$$

Eq (7) simplifes to

$$
\begin{aligned}
&\left(x^{2}\left(1+2x^{2}\right) \left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^{2}}\right)+\frac{\left(-x^{3}-3x\right) y_1(x)}{x}\right) C \\
&+x^{2}\left(1+2x^{2}\right) \left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2} \left(n+r_2\right)^{2}}{x^{2}}-\frac{b_n x^{n+r_2} \left(n+r_2\right)}{x^{2}}\right)\right) \\
&+\left(-x^{3}-3x\right) \left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2} \left(n+r_2\right)}{x}\right)-2\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right) x=0
\end{aligned}
\tag{8}
$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$
\begin{aligned}
&\left(2\left(2x^{3}+x\right) \left(\sum_{n=0}^{\infty}x^{-1+n+r_1} a_n \left(n+r_1\right)\right)+\left(-3x^{2}-4\right) \left(\sum_{n=0}^{\infty}a_n x^{n+r_1}\right)\right) C \\
&+\left(2x^{4}+x^{2}\right) \left(\sum_{n=0}^{\infty}x^{-2+n+r_2} b_n \left(n+r_2\right) \left(-1+n+r_2\right)\right) \\
&+\left(-x^{3}-3x\right) \left(\sum_{n=0}^{\infty}x^{-1+n+r_2} b_n \left(n+r_2\right)\right)-2\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right) x=0
\end{aligned}
\tag{9}
$$

Since $r_1 = 4$ and $r_2 = 0$ then the above becomes

$$\begin{aligned}
&\left(2(2x^3+x)\left(\sum_{n=0}^{\infty} x^{3+n} a_n (n+4)\right) + (-3x^2-4)\left(\sum_{n=0}^{\infty} a_n x^{n+4}\right)\right) C \\
&+ (2x^4+x^2)\left(\sum_{n=0}^{\infty} x^{n-2} b_n n(n-1)\right) \\
&+ (-x^3-3x)\left(\sum_{n=0}^{\infty} x^{n-1} b_n n\right) - 2\left(\sum_{n=0}^{\infty} b_n x^n\right) x = 0
\end{aligned} \tag{10}$$

Which simplifies to

$$\begin{aligned}
&\left(\sum_{n=0}^{\infty} 4C\, x^{n+6} a_n (n+4)\right) + \left(\sum_{n=0}^{\infty} 2C\, x^{n+4} a_n (n+4)\right) + \sum_{n=0}^{\infty} \left(-3C\, x^{n+6} a_n\right) \\
&+ \sum_{n=0}^{\infty} \left(-4C\, x^{n+4} a_n\right) + \left(\sum_{n=0}^{\infty} 2n\, x^{n+2} b_n (n-1)\right) + \left(\sum_{n=0}^{\infty} x^n b_n n(n-1)\right) \\
&+ \sum_{n=0}^{\infty} \left(-n\, x^{n+2} b_n\right) + \sum_{n=0}^{\infty} \left(-3x^n b_n n\right) + \sum_{n=0}^{\infty} \left(-2x^{1+n} b_n\right) = 0
\end{aligned} \tag{2A}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\begin{aligned}
\sum_{n=0}^{\infty} 4C\, x^{n+6} a_n (n+4) &= \sum_{n=6}^{\infty} 4C a_{n-6} (n-2)\, x^n \\
\sum_{n=0}^{\infty} 2C\, x^{n+4} a_n (n+4) &= \sum_{n=4}^{\infty} 2C a_{n-4} n\, x^n \\
\sum_{n=0}^{\infty} \left(-3C\, x^{n+6} a_n\right) &= \sum_{n=6}^{\infty} \left(-3C a_{n-6} x^n\right) \\
\sum_{n=0}^{\infty} \left(-4C\, x^{n+4} a_n\right) &= \sum_{n=4}^{\infty} \left(-4C a_{n-4} x^n\right) \\
\sum_{n=0}^{\infty} 2n\, x^{n+2} b_n (n-1) &= \sum_{n=2}^{\infty} 2(n-2)\, b_{n-2} (n-3)\, x^n
\end{aligned}$$

$$\sum_{n=0}^{\infty} \left(-n\, x^{n+2} b_n\right) = \sum_{n=2}^{\infty} \left(-(n-2)\, b_{n-2} x^n\right)$$

$$\sum_{n=0}^{\infty} \left(-2x^{1+n} b_n\right) = \sum_{n=1}^{\infty} \left(-2b_{n-1} x^n\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to n.

$$\begin{aligned}
&\left(\sum_{n=6}^{\infty} 4C a_{n-6}(n-2)\, x^n\right) + \left(\sum_{n=4}^{\infty} 2C a_{n-4} n\, x^n\right) + \sum_{n=6}^{\infty} \left(-3C a_{n-6} x^n\right) \\
&\quad + \sum_{n=4}^{\infty} \left(-4C a_{n-4} x^n\right) + \left(\sum_{n=2}^{\infty} 2(n-2)\, b_{n-2}(n-3)\, x^n\right) \\
&\quad + \left(\sum_{n=0}^{\infty} x^n b_n n(n-1)\right) + \sum_{n=2}^{\infty} \left(-(n-2)\, b_{n-2} x^n\right) \\
&\quad + \sum_{n=0}^{\infty} \left(-3x^n b_n n\right) + \sum_{n=1}^{\infty} \left(-2b_{n-1} x^n\right) = 0
\end{aligned} \tag{2B}$$

For $n = 0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n = 1$, Eq (2B) gives

$$-3b_1 - 2b_0 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_1 - 2 = 0$$

Solving the above for b_1 gives

$$b_1 = -\frac{2}{3}$$

For $n = 2$, Eq (2B) gives

$$-4b_2 - 2b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-4b_2 + \frac{4}{3} = 0$$

Solving the above for b_2 gives

$$b_2 = \frac{1}{3}$$

For $n = 3$, Eq (2B) gives

$$-3b_3 - b_1 - 2b_2 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 0$$

For $n = N$, where $N = 4$ which is the difference between the two roots, we are free to choose $b_4 = 0$. Hence for $n = 4$, Eq (2B) gives

$$4C + \frac{2}{3} = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{1}{6}$$

For $n = 5$, Eq (2B) gives

$$6Ca_1 + 9b_3 - 2b_4 + 5b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$5b_5 - \frac{2}{5} = 0$$

Solving the above for b_5 gives

$$b_5 = \frac{2}{25}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{1}{6}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{1}{6}\left(x^4\left(1 + \frac{2x}{5} - \frac{8x^2}{5} - \frac{86x^3}{105} + \frac{445x^4}{168} + \frac{9571x^5}{6300} + O(x^6)\right)\right) \ln(x) + 1 - \frac{2x}{3} + \frac{x^2}{3} + \frac{2x^5}{25} + O(x^6)$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^4 \left(1+\frac{2x}{5}-\frac{8x^2}{5}-\frac{86x^3}{105}+\frac{445x^4}{168}+\frac{9571x^5}{6300}+O(x^6)\right) \\
&\quad + c_2 \left(-\frac{1}{6}\left(x^4\left(1+\frac{2x}{5}-\frac{8x^2}{5}-\frac{86x^3}{105}+\frac{445x^4}{168}+\frac{9571x^5}{6300}+O(x^6)\right)\right)\ln(x)+1 \right. \\
&\quad \left. -\frac{2x}{3}+\frac{x^2}{3}+\frac{2x^5}{25}+O(x^6)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^4 \left(1+\frac{2x}{5}-\frac{8x^2}{5}-\frac{86x^3}{105}+\frac{445x^4}{168}+\frac{9571x^5}{6300}+O(x^6)\right) \\
&\quad + c_2 \left(-\frac{x^4\left(1+\frac{2x}{5}-\frac{8x^2}{5}-\frac{86x^3}{105}+\frac{445x^4}{168}+\frac{9571x^5}{6300}+O(x^6)\right)\ln(x)}{6}+1-\frac{2x}{3}+\frac{x^2}{3} \right. \\
&\quad \left. +\frac{2x^5}{25}+O(x^6)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^4 \left(1+\frac{2x}{5}-\frac{8x^2}{5}-\frac{86x^3}{105}+\frac{445x^4}{168}+\frac{9571x^5}{6300}+O(x^6)\right) \\
&\quad + c_2 \left(-\frac{x^4\left(1+\frac{2x}{5}-\frac{8x^2}{5}-\frac{86x^3}{105}+\frac{445x^4}{168}+\frac{9571x^5}{6300}+O(x^6)\right)\ln(x)}{6}+1-\frac{2x}{3} \right. \\
&\quad \left. +\frac{x^2}{3}+\frac{2x^5}{25}+O(x^6)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$y = c_1x^4\left(1+\frac{2x}{5}-\frac{8x^2}{5}-\frac{86x^3}{105}+\frac{445x^4}{168}+\frac{9571x^5}{6300}+O(x^6)\right) + c_2\left(-\frac{x^4\left(1+\frac{2x}{5}-\frac{8x^2}{5}-\frac{86x^3}{105}+\frac{445x^4}{168}+\frac{9571x^5}{6300}+O(x^6)\right)\ln(x)}{6}+1-\frac{2x}{3}+\frac{x^2}{3} + \frac{2x^5}{25}+O(x^6)\right)$$

Verified OK.

16.43.1 Maple step by step solution

Let's solve

$x^2(1+2x^2)\,y''+(-x^3-3x)\,y'-2yx=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{2y}{x(1+2x^2)}+\frac{(x^2+3)y'}{x(1+2x^2)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{(x^2+3)y'}{x(1+2x^2)}-\frac{2y}{x(1+2x^2)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=-\frac{x^2+3}{x(1+2x^2)}, P_3(x)=-\frac{2}{(1+2x^2)x}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left.(x\cdot P_2(x))\right|_{x=0}=-3$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left.(x^2\cdot P_3(x))\right|_{x=0}=0$

  ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

$x_0 = 0$

- Multiply by denominators

  $x(1+2x^2)\, y'' + (-x^2-3)\, y' - 2y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y'$ to series expansion for $m = 0..2$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$

  - Shift index using $k- >k+1-m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

  - Convert $x^m \cdot y''$ to series expansion for $m = 1..3$

    $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$

  - Shift index using $k- >k+2-m$

    $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0 r(-4+r)\, x^{-1+r} + (a_1(1+r)\,(-3+r) - 2a_0)\, x^r + \left(\sum_{k=1}^{\infty} (a_{k+1}(k+1+r)\,(k-3+r) - 2a_k +$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $r(-4+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{0, 4\}$

- Each term must be 0

  $a_1(1+r)\,(-3+r) - 2a_0 = 0$

- Each term in the series must be 0, giving the recursion relation

  $2\left(k+r-\frac{5}{2}\right)(k+r-1)\, a_{k-1} + a_{k+1}(k+1+r)\,(k-3+r) - 2a_k = 0$

- Shift index using $k- >k+1$

  $2\left(k-\frac{3}{2}+r\right)(k+r)\, a_k + a_{k+2}(k+2+r)\,(k-2+r) - 2a_{k+1} = 0$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{2k^2 a_k + 4kr a_k + 2r^2 a_k - 3k a_k - 3r a_k - 2a_{k+1}}{(k+2+r)(k-2+r)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{2k^2 a_k - 3k a_k - 2a_{k+1}}{(k+2)(k-2)}$$

- Series not valid for $r = 0$, division by 0 in the recursion relation at $k = 2$

$$a_{k+2} = -\frac{2k^2 a_k - 3k a_k - 2a_{k+1}}{(k+2)(k-2)}$$

- Recursion relation for $r = 4$

$$a_{k+2} = -\frac{2k^2 a_k + 13k a_k + 20a_k - 2a_{k+1}}{(k+6)(k+2)}$$

- Solution for $r = 4$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+4}, a_{k+2} = -\frac{2k^2 a_k + 13k a_k + 20a_k - 2a_{k+1}}{(k+6)(k+2)}, 5a_1 - 2a_0 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 40.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2(x^2+1)\,y''+4x(x^2+2)\,y'-(x^2+15)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(4x^4+4x^2)\,y''+(4x^3+8x)\,y'+(-x^2-15)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{x^2+2}{x(x^2+1)}$$
$$q(x)=-\frac{x^2+15}{4x^2(x^2+1)}$$

Table 858: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x^2+2}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = -\frac{x^2+15}{4x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2(x^2+1)\, y'' + (4x^3+8x)\, y' + (-x^2-15)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2(x^2+1) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (4x^3+8x) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (-x^2-15) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n(n+r)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-15 a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4x^{n+r+2} a_n(n+r)(n+r-1) = \sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 4x^{n+r+2} a_n(n+r) = \sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-x^{n+r+2} a_n\right) = \sum_{n=2}^{\infty} \left(-a_{n-2} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n(n+r)\right) + \sum_{n=2}^{\infty} \left(-a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-15 a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n(n+r)(n+r-1) + 8x^{n+r} a_n(n+r) - 15 a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) + 8x^r a_0 r - 15a_0 x^r = 0$$

Or

$$\left(4x^r r(-1+r) + 8x^r r - 15x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 + 4r - 15\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 + 4r - 15 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{3}{2}$$
$$r_2 = -\frac{5}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 + 4r - 15\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^{\frac{3}{2}} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^{\frac{5}{2}}}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{3}{2}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{5}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} 4a_{n-2}(n+r-2)(n-3+r) + 4a_n(n+r)(n+r-1) \\ + 4a_{n-2}(n+r-2) + 8a_n(n+r) - a_{n-2} - 15a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(2n+2r-5)\, a_{n-2}}{2n+2r+5} \tag{4}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_n = -\frac{(n-1)\, a_{n-2}}{n+4} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{3}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1-2r}{9+2r}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_2 = -\frac{1}{6}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-2r}{9+2r}$	$-\frac{1}{6}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-2r}{9+2r}$	$-\frac{1}{6}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4r^2 + 4r - 3}{4r^2 + 44r + 117}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_4 = \frac{1}{16}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-2r}{9+2r}$	$-\frac{1}{6}$
a_3	0	0
a_4	$\frac{4r^2+4r-3}{4r^2+44r+117}$	$\frac{1}{16}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-2r}{9+2r}$	$-\frac{1}{6}$
a_3	0	0
a_4	$\frac{4r^2+4r-3}{4r^2+44r+117}$	$\frac{1}{16}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}y_1(x) &= x^{\frac{3}{2}}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= x^{\frac{3}{2}}\left(1 - \frac{x^2}{6} + \frac{x^4}{16} + O(x^6)\right)\end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned}a_N &= a_4 \\ &= \frac{4r^2 + 4r - 3}{4r^2 + 44r + 117}\end{aligned}$$

Therefore

$$\begin{aligned}\lim_{r\to r_2} \frac{4r^2 + 4r - 3}{4r^2 + 44r + 117} &= \lim_{r\to -\frac{5}{2}} \frac{4r^2 + 4r - 3}{4r^2 + 44r + 117} \\ &= \frac{3}{8}\end{aligned}$$

The limit is $\frac{3}{8}$. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned}y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^{n-\frac{5}{2}}\end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq(3) gives

$$b_1 = 0$$

For $2 \le n$ the recursive equation is

$$4b_{n-2}(n+r-2)(n-3+r) + 4b_n(n+r)(n+r-1) \\ + 4b_{n-2}(n+r-2) + 8b_n(n+r) - b_{n-2} - 15b_n = 0 \tag{4}$$

Which for for the root $r = -\frac{5}{2}$ becomes

$$4b_{n-2}\left(n-\frac{9}{2}\right)\left(n-\frac{11}{2}\right) + 4b_n\left(n-\frac{5}{2}\right)\left(n-\frac{7}{2}\right) \\ + 4b_{n-2}\left(n-\frac{9}{2}\right) + 8b_n\left(n-\frac{5}{2}\right) - b_{n-2} - 15b_n = 0 \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{(2n+2r-5)\, b_{n-2}}{2n+2r+5} \tag{5}$$

Which for the root $r = -\frac{5}{2}$ becomes

$$b_n = -\frac{(2n-10)\, b_{n-2}}{2n} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{5}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -\frac{2r-1}{9+2r}$$

Which for the root $r = -\frac{5}{2}$ becomes

$$b_2 = \frac{3}{2}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1-2r}{9+2r}$	$\frac{3}{2}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1-2r}{9+2r}$	$\frac{3}{2}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{4r^2 + 4r - 3}{(9 + 2r)(13 + 2r)}$$

Which for the root $r = -\frac{5}{2}$ becomes

$$b_4 = \frac{3}{8}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1-2r}{9+2r}$	$\frac{3}{2}$
b_3	0	0
b_4	$\frac{4r^2+4r-3}{4r^2+44r+117}$	$\frac{3}{8}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1-2r}{9+2r}$	$\frac{3}{2}$
b_3	0	0
b_4	$\frac{4r^2+4r-3}{4r^2+44r+117}$	$\frac{3}{8}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{3}{2}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 + \frac{3x^2}{2} + \frac{3x^4}{8} + O(x^6)}{x^{\frac{5}{2}}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{3}{2}}\left(1 - \frac{x^2}{6} + \frac{x^4}{16} + O(x^6)\right) + \frac{c_2\left(1 + \frac{3x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)}{x^{\frac{5}{2}}} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{3}{2}}\left(1 - \frac{x^2}{6} + \frac{x^4}{16} + O(x^6)\right) + \frac{c_2\left(1 + \frac{3x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)}{x^{\frac{5}{2}}} \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{3}{2}}\left(1 - \frac{x^2}{6} + \frac{x^4}{16} + O(x^6)\right) + \frac{c_2\left(1 + \frac{3x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)}{x^{\frac{5}{2}}} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{3}{2}} \left(1 - \frac{x^2}{6} + \frac{x^4}{16} + O(x^6)\right) + \frac{c_2 \left(1 + \frac{3x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)}{x^{\frac{5}{2}}}$$

Verified OK.

16.44.1 Maple step by step solution

Let's solve

$4x^2(x^2+1)\,y'' + (4x^3+8x)\,y' + (-x^2-15)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(x^2+2)y'}{x(x^2+1)} + \frac{(x^2+15)y}{4x^2(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x^2+2)y'}{x(x^2+1)} - \frac{(x^2+15)y}{4x^2(x^2+1)} = 0$

☐ Check to see if x_0 is a regular singular point

- ○ Define functions

  $\left[P_2(x) = \frac{x^2+2}{x(x^2+1)}, P_3(x) = -\frac{x^2+15}{4x^2(x^2+1)}\right]$

- ○ $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\bigg|_{x=0} = 2$

- ○ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\bigg|_{x=0} = -\frac{15}{4}$

- ○ $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $4x^2(x^2+1)\,y'' + 4x(x^2+2)\,y' + (-x^2-15)\,y = 0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k->k-m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$$

- Shift index using $k->k+1-m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k->k+2-m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(5+2r)\,(-3+2r)\, x^r + a_1(7+2r)\,(-1+2r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(2k+2r+5)\,(2k+2r-3) + a_{k-}\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(5+2r)\,(-3+2r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \left\{-\frac{5}{2}, \frac{3}{2}\right\}$

- Each term must be 0

  $a_1(7+2r)\,(-1+2r) = 0$

- Solve for the dependent coefficient(s)

  $a_1 = 0$

- Each term in the series must be 0, giving the recursion relation

$$4\left(k+r-\frac{3}{2}\right)\left(\left(k+r-\frac{5}{2}\right)a_{k-2}+a_k\left(k+r+\frac{5}{2}\right)\right)=0$$

- Shift index using $k->k+2$

$$4\left(k+\frac{1}{2}+r\right)\left(\left(k-\frac{1}{2}+r\right)a_k+a_{k+2}\left(k+\frac{9}{2}+r\right)\right)=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{(2k+2r-1)a_k}{2k+9+2r}$$

- Recursion relation for $r=-\frac{5}{2}$

$$a_{k+2}=-\frac{(2k-6)a_k}{2k+4}$$

- Solution for $r=-\frac{5}{2}$

$$\left[y=\sum_{k=0}^{\infty}a_k x^{k-\frac{5}{2}}, a_{k+2}=-\frac{(2k-6)a_k}{2k+4}, a_1=0\right]$$

- Recursion relation for $r=\frac{3}{2}$

$$a_{k+2}=-\frac{(2k+2)a_k}{2k+12}$$

- Solution for $r=\frac{3}{2}$

$$\left[y=\sum_{k=0}^{\infty}a_k x^{k+\frac{3}{2}}, a_{k+2}=-\frac{(2k+2)a_k}{2k+12}, a_1=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty}a_k x^{k-\frac{5}{2}}\right)+\left(\sum_{k=0}^{\infty}b_k x^{k+\frac{3}{2}}\right), a_{k+2}=-\frac{(2k-6)a_k}{2k+4}, a_1=0, b_{k+2}=-\frac{(2k+2)b_k}{2k+12}, b_1=0\right]$$

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_3rd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x^3y''' - x^2y'' - 2y'x + 6y = 0}$$

With initial conditions

$$[y(-1) = -4, y'(-1) = -14, y''(-1) = -20]$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned}
y' &= \lambda\, x^{\lambda-1} \\
y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\
y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3}
\end{aligned}$$

Substituting these back into

$$x^3y''' - x^2y'' - 2y'x + 6y = 0$$

gives

$$-2x\lambda\, x^{\lambda-1} - x^2\lambda(\lambda-1)\, x^{\lambda-2} + x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} + 6x^\lambda = 0$$

Which simplifies to

$$-2\lambda\, x^\lambda - \lambda(\lambda-1)\, x^\lambda + \lambda(\lambda-1)\,(\lambda-2)\, x^\lambda + 6x^\lambda = 0$$

And since $x^\lambda \neq 0$ then dividing through by x^λ, the above becomes

$$-2\lambda - \lambda(\lambda - 1) + \lambda(\lambda - 1)(\lambda - 2) + 6 = 0$$

Simplifying gives the characteristic equation as

$$\lambda^3 - 4\lambda^2 + \lambda + 6 = 0$$

Solving the above gives the following roots

$$\lambda_1 = 2$$
$$\lambda_2 = 3$$
$$\lambda_3 = -1$$

This table summarises the result

root	multiplicity	type of root
-1	1	real root
2	1	real root
3	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a $c_1 x^\lambda$ basis solution. Each real root of multiplicty two, generates $c_1 x^\lambda$ and $c_2 x^\lambda \ln(x)$ basis solutions. Each real root of multiplicty three, generates $c_1 x^\lambda$ and $c_2 x^\lambda \ln(x)$ and $c_3 x^\lambda \ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^\alpha (c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x) x^\alpha (c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2 x^\alpha (c_1 \cos(\beta \ln(x)) + c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = \frac{c_1}{x} + c_2 x^2 + c_3 x^3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \frac{1}{x}$$
$$y_2 = x^2$$
$$y_3 = x^3$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$y = \frac{c_1}{x} + c_2 x^2 + c_3 x^3 \tag{1}$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = -4$ and $x = -1$ in the above gives

$$-4 = -c_1 + c_2 - c_3 \tag{1A}$$

Taking derivative of the solution gives

$$y' = -\frac{c_1}{x^2} + 2c_2 x + 3c_3 x^2$$

substituting $y' = -14$ and $x = -1$ in the above gives

$$-14 = -c_1 - 2c_2 + 3c_3 \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = \frac{2c_1}{x^3} + 2c_2 + 6c_3 x$$

substituting $y'' = -20$ and $x = -1$ in the above gives

$$-20 = -2c_1 + 2c_2 - 6c_3 \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$\begin{aligned} c_1 &= \frac{25}{3} \\ c_2 &= \frac{22}{3} \\ c_3 &= 3 \end{aligned}$$

Substituting these values back in above solution results in

$$y = \frac{9x^4 + 22x^3 + 25}{3x}$$

<u>Summary</u>
The solution(s) found are the following

$$y = \frac{9x^4 + 22x^3 + 25}{3x} \tag{1}$$

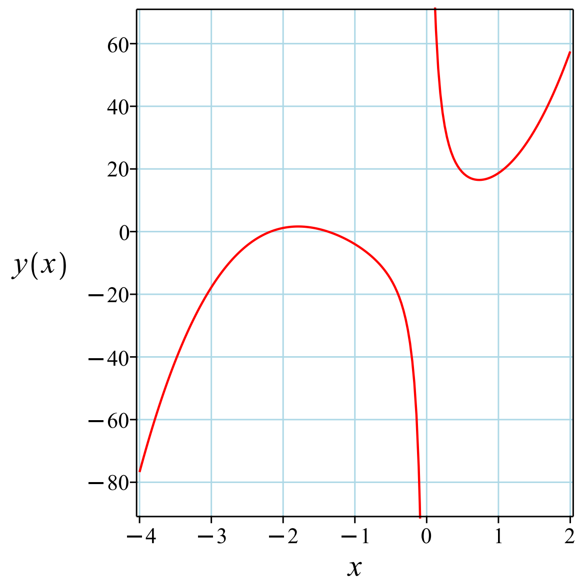

Figure 537: Solution plot

Verification of solutions

$$y = \frac{9x^4 + 22x^3 + 25}{3x}$$

Verified OK.

17.1.1 Maple step by step solution

Let's solve

$$\left[x^3 y''' - x^2 y'' - 2y'x + 6y = 0, y(-1) = -4, y'\Big|_{\{x=-1\}} = -14, y''\Big|_{\{x=-1\}} = -20\right]$$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = -\frac{6y}{x^3} + \frac{y''x + 2y'}{x^2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - \frac{y''}{x} - \frac{2y'}{x^2} + \frac{6y}{x^3} = 0$

- Multiply by denominators of the ODE

  $x^3 y''' - x^2 y'' - 2y'x + 6y = 0$

- Make a change of variables

  $t = \ln(x)$

☐ Substitute the change of variables back into the ODE

  - Calculate the 1st derivative of y with respect to x , using the chain rule

    $y' = \left(\frac{d}{dt}y(t)\right) t'(x)$

  - Compute derivative

    $y' = \frac{\frac{d}{dt}y(t)}{x}$

  - Calculate the 2nd derivative of y with respect to x , using the chain rule

    $y'' = \left(\frac{d^2}{dt^2}y(t)\right) t'(x)^2 + t''(x)\left(\frac{d}{dt}y(t)\right)$

  - Compute derivative

    $y'' = \frac{\frac{d^2}{dt^2}y(t)}{x^2} - \frac{\frac{d}{dt}y(t)}{x^2}$

  - Calculate the 3rd derivative of y with respect to x , using the chain rule

    $y''' = \left(\frac{d^3}{dt^3}y(t)\right) t'(x)^3 + 3t'(x)\, t''(x)\left(\frac{d^2}{dt^2}y(t)\right) + t'''(x)\left(\frac{d}{dt}y(t)\right)$

  - Compute derivative

    $y''' = \frac{\frac{d^3}{dt^3}y(t)}{x^3} - \frac{3\left(\frac{d^2}{dt^2}y(t)\right)}{x^3} + \frac{2\left(\frac{d}{dt}y(t)\right)}{x^3}$

    Substitute the change of variables back into the ODE

    $x^3\left(\frac{\frac{d^3}{dt^3}y(t)}{x^3} - \frac{3\left(\frac{d^2}{dt^2}y(t)\right)}{x^3} + \frac{2\left(\frac{d}{dt}y(t)\right)}{x^3}\right) - x^2\left(\frac{\frac{d^2}{dt^2}y(t)}{x^2} - \frac{\frac{d}{dt}y(t)}{x^2}\right) - 2\frac{d}{dt}y(t) + 6y(t) = 0$

- Simplify

  $\frac{d^3}{dt^3}y(t) - 4\frac{d^2}{dt^2}y(t) + \frac{d}{dt}y(t) + 6y(t) = 0$

☐ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(t)$

    $y_1(t) = y(t)$

  - Define new variable $y_2(t)$

    $y_2(t) = \frac{d}{dt}y(t)$

  - Define new variable $y_3(t)$

    $y_3(t) = \frac{d^2}{dt^2}y(t)$

  - Isolate for $\frac{d}{dt}y_3(t)$ using original ODE

$\frac{d}{dt}y_3(t) = 4y_3(t) - y_2(t) - 6y_1(t)$

Convert linear ODE into a system of first order ODEs

$\left[y_2(t) = \frac{d}{dt}y_1(t), y_3(t) = \frac{d}{dt}y_2(t), \frac{d}{dt}y_3(t) = 4y_3(t) - y_2(t) - 6y_1(t)\right]$

- Define vector

$$\vec{y}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- System to solve

$$\frac{d}{dt}\vec{y}(t) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & -1 & 4 \end{bmatrix} \cdot \vec{y}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & -1 & 4 \end{bmatrix}$$

- Rewrite the system as

$\frac{d}{dt}\vec{y}(t) = A \cdot \vec{y}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = e^{-t} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = e^{2t} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = e^{3t} \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\vec{y} = c_1 \vec{y}_1 + c_2 \vec{y}_2 + c_3 \vec{y}_3$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{-t} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} + c_2 e^{2t} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} + c_3 e^{3t} \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y(t) = c_1 e^{-t} + \frac{c_2 e^{2t}}{4} + \frac{c_3 e^{3t}}{9}$$

- Change variables back using $t=\ln(x)$

  $y=\frac{c_1}{x}+\frac{c_2x^2}{4}+\frac{c_3x^3}{9}$

- Use the initial condition $y(-1)=-4$

  $-4=-c_1+\frac{c_2}{4}-\frac{c_3}{9}$

- Calculate the 1st derivative of the solution

  $y'=-\frac{c_1}{x^2}+\frac{c_2x}{2}+\frac{c_3x^2}{3}$

- Use the initial condition $y'\Big|_{\{x=-1\}}=-14$

  $-14=-c_1-\frac{c_2}{2}+\frac{c_3}{3}$

- Calculate the 2nd derivative of the solution

  $y''=\frac{2c_1}{x^3}+\frac{c_2}{2}+\frac{2c_3x}{3}$

- Use the initial condition $y''\Big|_{\{x=-1\}}=-20$

  $-20=-2c_1+\frac{c_2}{2}-\frac{2c_3}{3}$

- Solve for the unknown coefficients

  $\left\{c_1=\frac{25}{3},c_2=\frac{88}{3},c_3=27,x=x\right\}$

- Solution to the IVP

  $y=\frac{25}{3x}+\frac{22x^2}{3}+3x^3$

Problem number: section 9.1, problem 3.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

`[[_high_order, _missing_x]]`

$$\boxed{y'''' + y''' - 7y'' - y' + 6y = 0}$$

With initial conditions

$$[y(0) = 5, y'(0) = -6, y''(0) = 10, y'''(0) = -36]$$

The characteristic equation is

$$\lambda^4 + \lambda^3 - 7\lambda^2 - \lambda + 6 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 2$$
$$\lambda_3 = -3$$
$$\lambda_4 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{x} + e^{-3x} c_3 + e^{2x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{-x} \\
y_2 &= \mathrm{e}^{x} \\
y_3 &= \mathrm{e}^{-3x} \\
y_4 &= \mathrm{e}^{2x}
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + \mathrm{e}^{-3x} c_3 + \mathrm{e}^{2x} c_4 \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 5$ and $x = 0$ in the above gives

$$
5 = c_1 + c_2 + c_3 + c_4 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = -c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} - 3\,\mathrm{e}^{-3x} c_3 + 2\,\mathrm{e}^{2x} c_4
$$

substituting $y' = -6$ and $x = 0$ in the above gives

$$
-6 = -c_1 + c_2 - 3c_3 + 2c_4 \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + 9\,\mathrm{e}^{-3x} c_3 + 4\,\mathrm{e}^{2x} c_4
$$

substituting $y'' = 10$ and $x = 0$ in the above gives

$$
10 = c_1 + c_2 + 9c_3 + 4c_4 \tag{3A}
$$

Taking three derivatives of the solution gives

$$
y''' = -c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} - 27\,\mathrm{e}^{-3x} c_3 + 8\,\mathrm{e}^{2x} c_4
$$

substituting $y''' = -36$ and $x = 0$ in the above gives

$$
-36 = -c_1 + c_2 - 27c_3 + 8c_4 \tag{4A}
$$

Equations {1A,2A,3A,4A} are now solved for $\{c_1, c_2, c_3, c_4\}$. Solving for the constants gives

$$c_1 = 3$$
$$c_2 = 2$$
$$c_3 = 1$$
$$c_4 = -1$$

Substituting these values back in above solution results in

$$y = 3\,e^{-x} + 2\,e^{x} + e^{-3x} - e^{2x}$$

Summary

The solution(s) found are the following

$$y = 3\,e^{-x} + 2\,e^{x} + e^{-3x} - e^{2x} \tag{1}$$

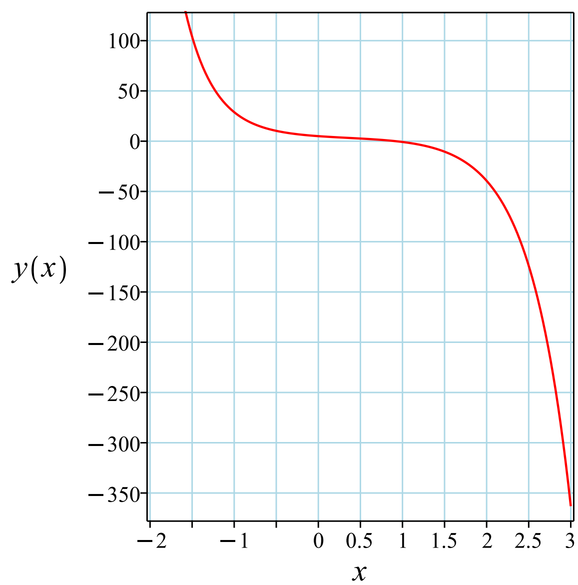

Figure 538: Solution plot

Verification of solutions

$$y = 3\,e^{-x} + 2\,e^{x} + e^{-3x} - e^{2x}$$

Verified OK.

17.2.1 Maple step by step solution

Let's solve

$$\left[y'''' + y''' - 7y'' - y' + 6y = 0, y(0) = 5, y'\Big|_{\{x=0\}} = -6, y''\Big|_{\{x=0\}} = 10, y'''\Big|_{\{x=0\}} = -36\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.1. Page 471
Problem number: section 9.1, problem 5(b) 1.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

`[[_3rd_order, _exact, _linear, _homogeneous]]`

$$\boxed{x^3y''' - x^2y'' - 2y'x + 6y = 0}$$

With initial conditions

$$[y(1) = 1, y'(1) = 0, y''(1) = 0]$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned} y' &= \lambda\, x^{\lambda-1} \\ y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\ y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \end{aligned}$$

Substituting these back into

$$x^3y''' - x^2y'' - 2y'x + 6y = 0$$

gives

$$-2x\lambda\, x^{\lambda-1} - x^2\lambda(\lambda-1)\, x^{\lambda-2} + x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} + 6x^\lambda = 0$$

Which simplifies to

$$-2\lambda\, x^\lambda - \lambda(\lambda-1)\, x^\lambda + \lambda(\lambda-1)\,(\lambda-2)\, x^\lambda + 6x^\lambda = 0$$

And since $x^{\lambda} \neq 0$ then dividing through by x^{λ}, the above becomes

$$-2\lambda - \lambda(\lambda - 1) + \lambda(\lambda - 1)(\lambda - 2) + 6 = 0$$

Simplifying gives the characteristic equation as

$$\lambda^3 - 4\lambda^2 + \lambda + 6 = 0$$

Solving the above gives the following roots

$$\lambda_1 = 2$$
$$\lambda_2 = 3$$
$$\lambda_3 = -1$$

This table summarises the result

root	multiplicity	type of root
-1	1	real root
2	1	real root
3	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^{λ} basis solution. Each real root of multiplicty two, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ and $c_3x^{\lambda}\ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^{\alpha}(c_1\cos(\beta\ln(x)) + c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x)\, x^{\alpha}(c_1\cos(\beta\ln(x)) + c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2\, x^{\alpha}(c_1\cos(\beta\ln(x)) + c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = \frac{c_1}{x} + c_2x^2 + c_3x^3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \frac{1}{x}$$
$$y_2 = x^2$$
$$y_3 = x^3$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$y = \frac{c_1}{x} + c_2 x^2 + c_3 x^3 \tag{1}$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 1$ and $x = 1$ in the above gives

$$1 = c_1 + c_2 + c_3 \tag{1A}$$

Taking derivative of the solution gives

$$y' = -\frac{c_1}{x^2} + 2c_2 x + 3c_3 x^2$$

substituting $y' = 0$ and $x = 1$ in the above gives

$$0 = -c_1 + 2c_2 + 3c_3 \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = \frac{2c_1}{x^3} + 2c_2 + 6c_3 x$$

substituting $y'' = 0$ and $x = 1$ in the above gives

$$0 = 2c_1 + 2c_2 + 6c_3 \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$c_1 = \frac{1}{2}$$
$$c_2 = 1$$
$$c_3 = -\frac{1}{2}$$

Substituting these values back in above solution results in

$$y = -\frac{x^4 - 2x^3 - 1}{2x}$$

Summary

The solution(s) found are the following

$$y = -\frac{x^4 - 2x^3 - 1}{2x} \tag{1}$$

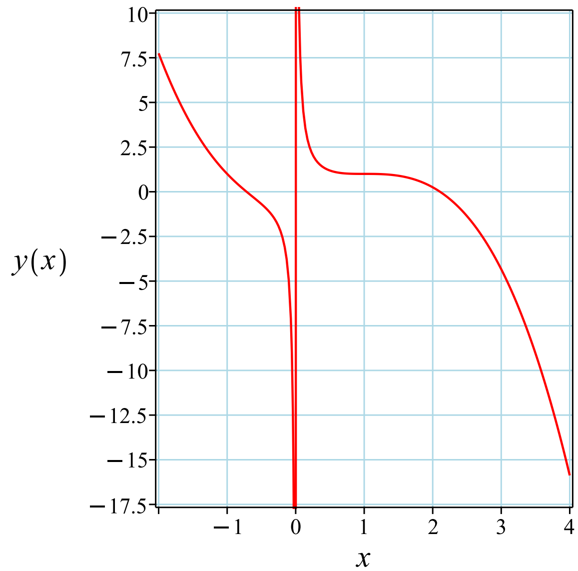

Figure 539: Solution plot

Verification of solutions

$$y = -\frac{x^4 - 2x^3 - 1}{2x}$$

Verified OK.

17.3.1 Maple step by step solution

Let's solve

$$\left[x^3 y''' - x^2 y'' - 2y'x + 6y = 0, y(1) = 1, y'\Big|_{\{x=1\}} = 0, y''\Big|_{\{x=1\}} = 0\right]$$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = -\frac{6y}{x^3} + \frac{y''x + 2y'}{x^2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - \frac{y''}{x} - \frac{2y'}{x^2} + \frac{6y}{x^3} = 0$

- Multiply by denominators of the ODE

  $x^3 y''' - x^2 y'' - 2y'x + 6y = 0$

- Make a change of variables

$t = \ln(x)$

□ Substitute the change of variables back into the ODE

- Calculate the 1st derivative of y with respect to x , using the chain rule

  $y' = \left(\frac{d}{dt}y(t)\right) t'(x)$

- Compute derivative

  $y' = \frac{\frac{d}{dt}y(t)}{x}$

- Calculate the 2nd derivative of y with respect to x , using the chain rule

  $y'' = \left(\frac{d^2}{dt^2}y(t)\right) t'(x)^2 + t''(x) \left(\frac{d}{dt}y(t)\right)$

- Compute derivative

  $y'' = \frac{\frac{d^2}{dt^2}y(t)}{x^2} - \frac{\frac{d}{dt}y(t)}{x^2}$

- Calculate the 3rd derivative of y with respect to x , using the chain rule

  $y''' = \left(\frac{d^3}{dt^3}y(t)\right) t'(x)^3 + 3t'(x)\, t''(x) \left(\frac{d^2}{dt^2}y(t)\right) + t'''(x) \left(\frac{d}{dt}y(t)\right)$

- Compute derivative

  $y''' = \frac{\frac{d^3}{dt^3}y(t)}{x^3} - \frac{3\left(\frac{d^2}{dt^2}y(t)\right)}{x^3} + \frac{2\left(\frac{d}{dt}y(t)\right)}{x^3}$

  Substitute the change of variables back into the ODE

  $x^3\left(\frac{\frac{d^3}{dt^3}y(t)}{x^3} - \frac{3\left(\frac{d^2}{dt^2}y(t)\right)}{x^3} + \frac{2\left(\frac{d}{dt}y(t)\right)}{x^3}\right) - x^2\left(\frac{\frac{d^2}{dt^2}y(t)}{x^2} - \frac{\frac{d}{dt}y(t)}{x^2}\right) - 2\frac{d}{dt}y(t) + 6y(t) = 0$

- Simplify

  $\frac{d^3}{dt^3}y(t) - 4\frac{d^2}{dt^2}y(t) + \frac{d}{dt}y(t) + 6y(t) = 0$

□ Convert linear ODE into a system of first order ODEs

- Define new variable $y_1(t)$

  $y_1(t) = y(t)$

- Define new variable $y_2(t)$

  $y_2(t) = \frac{d}{dt}y(t)$

- Define new variable $y_3(t)$

  $y_3(t) = \frac{d^2}{dt^2}y(t)$

- Isolate for $\frac{d}{dt}y_3(t)$ using original ODE

  $\frac{d}{dt}y_3(t) = 4y_3(t) - y_2(t) - 6y_1(t)$

Convert linear ODE into a system of first order ODEs

$$\left[y_2(t) = \frac{d}{dt}y_1(t), y_3(t) = \frac{d}{dt}y_2(t), \frac{d}{dt}y_3(t) = 4y_3(t) - y_2(t) - 6y_1(t)\right]$$

- Define vector

$$\vec{y}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- System to solve

$$\frac{d}{dt}\vec{y}(t) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & -1 & 4 \end{bmatrix} \cdot \vec{y}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & -1 & 4 \end{bmatrix}$$

- Rewrite the system as

$$\frac{d}{dt}\vec{y}(t) = A \cdot \vec{y}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-t} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_2 = \mathrm{e}^{2t} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_3 = \mathrm{e}^{3t} \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\overrightarrow{y} = c_1 \overrightarrow{y}_1 + c_2 \overrightarrow{y}_2 + c_3 \overrightarrow{y}_3$$

- Substitute solutions into the general solution

$$\overrightarrow{y} = c_1 \mathrm{e}^{-t} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} + c_2 \mathrm{e}^{2t} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} + c_3 \mathrm{e}^{3t} \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y(t) = c_1 \mathrm{e}^{-t} + \frac{c_2 \mathrm{e}^{2t}}{4} + \frac{c_3 \mathrm{e}^{3t}}{9}$$

- Change variables back using $t = \ln(x)$

  $y = \frac{c_1}{x} + \frac{c_2 x^2}{4} + \frac{c_3 x^3}{9}$
- Use the initial condition $y(1) = 1$

  $1 = c_1 + \frac{c_2}{4} + \frac{c_3}{9}$
- Calculate the 1st derivative of the solution

  $y' = -\frac{c_1}{x^2} + \frac{c_2 x}{2} + \frac{c_3 x^2}{3}$
- Use the initial condition $y'\Big|_{\{x=1\}} = 0$

  $0 = -c_1 + \frac{c_2}{2} + \frac{c_3}{3}$
- Calculate the 2nd derivative of the solution

  $y'' = \frac{2c_1}{x^3} + \frac{c_2}{2} + \frac{2c_3 x}{3}$
- Use the initial condition $y''\Big|_{\{x=1\}} = 0$

  $0 = 2c_1 + \frac{c_2}{2} + \frac{2c_3}{3}$
- Solve for the unknown coefficients

  $\left\{c_1 = \frac{1}{2}, c_2 = 4, c_3 = -\frac{9}{2}, x = x\right\}$
- Solution to the IVP

  $y = \frac{1}{2x} + x^2 - \frac{x^3}{2}$

ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

`[[_3rd_order, _exact, _linear, _homogeneous]]`

$$\boxed{x^3y''' - x^2y'' - 2y'x + 6y = 0}$$

With initial conditions

$$[y(1) = 0, y'(1) = 1, y''(1) = 0]$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned} y' &= \lambda\, x^{\lambda-1} \\ y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\ y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \end{aligned}$$

Substituting these back into

$$x^3y''' - x^2y'' - 2y'x + 6y = 0$$

gives

$$-2x\lambda\, x^{\lambda-1} - x^2\lambda(\lambda-1)\, x^{\lambda-2} + x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} + 6x^\lambda = 0$$

Which simplifies to

$$-2\lambda\, x^\lambda - \lambda(\lambda-1)\, x^\lambda + \lambda(\lambda-1)\,(\lambda-2)\, x^\lambda + 6x^\lambda = 0$$

And since $x^{\lambda} \neq 0$ then dividing through by x^{λ}, the above becomes

$$-2\lambda - \lambda(\lambda - 1) + \lambda(\lambda - 1)(\lambda - 2) + 6 = 0$$

Simplifying gives the characteristic equation as

$$\lambda^3 - 4\lambda^2 + \lambda + 6 = 0$$

Solving the above gives the following roots

$$\begin{aligned}\lambda_1 &= 2\\ \lambda_2 &= 3\\ \lambda_3 &= -1\end{aligned}$$

This table summarises the result

root	multiplicity	type of root
-1	1	real root
2	1	real root
3	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a $c_1 x^{\lambda}$ basis solution. Each real root of multiplicty two, generates $c_1 x^{\lambda}$ and $c_2 x^{\lambda} \ln(x)$ basis solutions. Each real root of multiplicty three, generates $c_1 x^{\lambda}$ and $c_2 x^{\lambda} \ln(x)$ and $c_3 x^{\lambda} \ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^{\alpha}(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x)\, x^{\alpha}(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2\, x^{\alpha}(c_1 \cos(\beta \ln(x)) + c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = \frac{c_1}{x} + c_2 x^2 + c_3 x^3$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned}y_1 &= \frac{1}{x}\\ y_2 &= x^2\\ y_3 &= x^3\end{aligned}$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$y = \frac{c_1}{x} + c_2 x^2 + c_3 x^3 \tag{1}$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 0$ and $x = 1$ in the above gives

$$0 = c_1 + c_2 + c_3 \tag{1A}$$

Taking derivative of the solution gives

$$y' = -\frac{c_1}{x^2} + 2c_2 x + 3c_3 x^2$$

substituting $y' = 1$ and $x = 1$ in the above gives

$$1 = -c_1 + 2c_2 + 3c_3 \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = \frac{2c_1}{x^3} + 2c_2 + 6c_3 x$$

substituting $y'' = 0$ and $x = 1$ in the above gives

$$0 = 2c_1 + 2c_2 + 6c_3 \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$\begin{aligned} c_1 &= -\frac{1}{3} \\ c_2 &= \frac{1}{3} \\ c_3 &= 0 \end{aligned}$$

Substituting these values back in above solution results in

$$y = \frac{x^3 - 1}{3x}$$

Summary

The solution(s) found are the following

$$y = \frac{x^3 - 1}{3x} \tag{1}$$

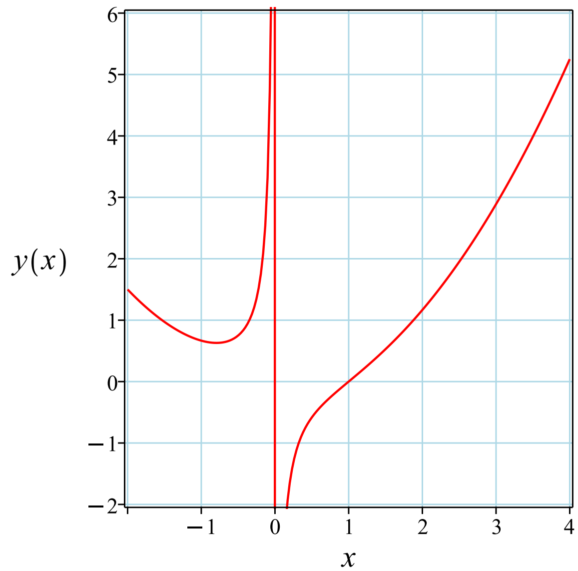

Figure 540: Solution plot

Verification of solutions

$$y = \frac{x^3 - 1}{3x}$$

Verified OK.

17.4.1 Maple step by step solution

Let's solve

$$\left[x^3 y''' - x^2 y'' - 2y'x + 6y = 0, y(1) = 0, y'\Big|_{\{x=1\}} = 1, y''\Big|_{\{x=1\}} = 0\right]$$

- Highest derivative means the order of the ODE is 3

  y'''
- Isolate 3rd derivative

  $y''' = -\frac{6y}{x^3} + \frac{y''x + 2y'}{x^2}$
- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - \frac{y''}{x} - \frac{2y'}{x^2} + \frac{6y}{x^3} = 0$
- Multiply by denominators of the ODE

  $x^3 y''' - x^2 y'' - 2y'x + 6y = 0$
- Make a change of variables

$t = \ln(x)$

☐ Substitute the change of variables back into the ODE

- Calculate the 1st derivative of y with respect to x , using the chain rule

  $y' = \left(\frac{d}{dt}y(t)\right) t'(x)$

- Compute derivative

  $y' = \frac{\frac{d}{dt}y(t)}{x}$

- Calculate the 2nd derivative of y with respect to x , using the chain rule

  $y'' = \left(\frac{d^2}{dt^2}y(t)\right) t'(x)^2 + t''(x) \left(\frac{d}{dt}y(t)\right)$

- Compute derivative

  $y'' = \frac{\frac{d^2}{dt^2}y(t)}{x^2} - \frac{\frac{d}{dt}y(t)}{x^2}$

- Calculate the 3rd derivative of y with respect to x , using the chain rule

  $y''' = \left(\frac{d^3}{dt^3}y(t)\right) t'(x)^3 + 3t'(x)\,t''(x) \left(\frac{d^2}{dt^2}y(t)\right) + t'''(x) \left(\frac{d}{dt}y(t)\right)$

- Compute derivative

  $y''' = \frac{\frac{d^3}{dt^3}y(t)}{x^3} - \frac{3\left(\frac{d^2}{dt^2}y(t)\right)}{x^3} + \frac{2\left(\frac{d}{dt}y(t)\right)}{x^3}$

  Substitute the change of variables back into the ODE

  $x^3\left(\frac{\frac{d^3}{dt^3}y(t)}{x^3} - \frac{3\left(\frac{d^2}{dt^2}y(t)\right)}{x^3} + \frac{2\left(\frac{d}{dt}y(t)\right)}{x^3}\right) - x^2\left(\frac{\frac{d^2}{dt^2}y(t)}{x^2} - \frac{\frac{d}{dt}y(t)}{x^2}\right) - 2\frac{d}{dt}y(t) + 6y(t) = 0$

- Simplify

  $\frac{d^3}{dt^3}y(t) - 4\frac{d^2}{dt^2}y(t) + \frac{d}{dt}y(t) + 6y(t) = 0$

☐ Convert linear ODE into a system of first order ODEs

- Define new variable $y_1(t)$

  $y_1(t) = y(t)$

- Define new variable $y_2(t)$

  $y_2(t) = \frac{d}{dt}y(t)$

- Define new variable $y_3(t)$

  $y_3(t) = \frac{d^2}{dt^2}y(t)$

- Isolate for $\frac{d}{dt}y_3(t)$ using original ODE

  $\frac{d}{dt}y_3(t) = 4y_3(t) - y_2(t) - 6y_1(t)$

Convert linear ODE into a system of first order ODEs

$$\left[y_2(t) = \frac{d}{dt}y_1(t), y_3(t) = \frac{d}{dt}y_2(t), \frac{d}{dt}y_3(t) = 4y_3(t) - y_2(t) - 6y_1(t)\right]$$

- Define vector

$$\vec{y}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- System to solve

$$\frac{d}{dt}\vec{y}(t) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & -1 & 4 \end{bmatrix} \cdot \vec{y}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & -1 & 4 \end{bmatrix}$$

- Rewrite the system as

$$\frac{d}{dt}\vec{y}(t) = A \cdot \vec{y}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-t} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\begin{bmatrix} 2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} \end{bmatrix}$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{2t} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\begin{bmatrix} 3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix} \end{bmatrix}$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = \mathrm{e}^{3t} \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$\vec{y} = c_1 \vec{y}_1 + c_2 \vec{y}_2 + c_3 \vec{y}_3$

- Substitute solutions into the general solution

$$\vec{y} = c_1 \mathrm{e}^{-t} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} + c_2 \mathrm{e}^{2t} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} + c_3 \mathrm{e}^{3t} \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$y(t) = c_1 \mathrm{e}^{-t} + \frac{c_2 \mathrm{e}^{2t}}{4} + \frac{c_3 \mathrm{e}^{3t}}{9}$

- Change variables back using $t = \ln(x)$

  $y = \frac{c_1}{x} + \frac{c_2 x^2}{4} + \frac{c_3 x^3}{9}$
- Use the initial condition $y(1) = 0$

  $0 = c_1 + \frac{c_2}{4} + \frac{c_3}{9}$
- Calculate the 1st derivative of the solution

  $y' = -\frac{c_1}{x^2} + \frac{c_2 x}{2} + \frac{c_3 x^2}{3}$
- Use the initial condition $y'\Big|_{\{x=1\}} = 1$

  $1 = -c_1 + \frac{c_2}{2} + \frac{c_3}{3}$
- Calculate the 2nd derivative of the solution

  $y'' = \frac{2c_1}{x^3} + \frac{c_2}{2} + \frac{2c_3 x}{3}$
- Use the initial condition $y''\Big|_{\{x=1\}} = 0$

  $0 = 2c_1 + \frac{c_2}{2} + \frac{2c_3}{3}$
- Solve for the unknown coefficients

  $\left\{c_1 = -\frac{1}{3}, c_2 = \frac{4}{3}, c_3 = 0, x = x\right\}$
- Solution to the IVP

  $y = \frac{x^3 - 1}{3x}$

ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

`[[_3rd_order, _exact, _linear, _homogeneous]]`

$$\boxed{x^3y''' - x^2y'' - 2y'x + 6y = 0}$$

With initial conditions

$$[y(1) = 0, y'(1) = 0, y''(1) = 1]$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned} y' &= \lambda\, x^{\lambda-1} \\ y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\ y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \end{aligned}$$

Substituting these back into

$$x^3y''' - x^2y'' - 2y'x + 6y = 0$$

gives

$$-2x\lambda\, x^{\lambda-1} - x^2\lambda(\lambda-1)\, x^{\lambda-2} + x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} + 6x^\lambda = 0$$

Which simplifies to

$$-2\lambda\, x^\lambda - \lambda(\lambda-1)\, x^\lambda + \lambda(\lambda-1)\,(\lambda-2)\, x^\lambda + 6x^\lambda = 0$$

And since $x^{\lambda} \neq 0$ then dividing through by x^{λ}, the above becomes

$$-2\lambda - \lambda(\lambda - 1) + \lambda(\lambda - 1)(\lambda - 2) + 6 = 0$$

Simplifying gives the characteristic equation as

$$\lambda^3 - 4\lambda^2 + \lambda + 6 = 0$$

Solving the above gives the following roots

$$\lambda_1 = 2$$
$$\lambda_2 = 3$$
$$\lambda_3 = -1$$

This table summarises the result

root	multiplicity	type of root
-1	1	real root
2	1	real root
3	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a $c_1 x^{\lambda}$ basis solution. Each real root of multiplicty two, generates $c_1 x^{\lambda}$ and $c_2 x^{\lambda} \ln(x)$ basis solutions. Each real root of multiplicty three, generates $c_1 x^{\lambda}$ and $c_2 x^{\lambda} \ln(x)$ and $c_3 x^{\lambda} \ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^{\alpha}(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x) x^{\alpha}(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2 x^{\alpha}(c_1 \cos(\beta \ln(x)) + c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = \frac{c_1}{x} + c_2 x^2 + c_3 x^3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \frac{1}{x}$$
$$y_2 = x^2$$
$$y_3 = x^3$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$y = \frac{c_1}{x} + c_2 x^2 + c_3 x^3 \tag{1}$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 0$ and $x = 1$ in the above gives

$$0 = c_1 + c_2 + c_3 \tag{1A}$$

Taking derivative of the solution gives

$$y' = -\frac{c_1}{x^2} + 2c_2 x + 3c_3 x^2$$

substituting $y' = 0$ and $x = 1$ in the above gives

$$0 = -c_1 + 2c_2 + 3c_3 \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = \frac{2c_1}{x^3} + 2c_2 + 6c_3 x$$

substituting $y'' = 1$ and $x = 1$ in the above gives

$$1 = 2c_1 + 2c_2 + 6c_3 \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$\begin{aligned} c_1 &= \frac{1}{12} \\ c_2 &= -\frac{1}{3} \\ c_3 &= \frac{1}{4} \end{aligned}$$

Substituting these values back in above solution results in

$$y = \frac{3x^4 - 4x^3 + 1}{12x}$$

Summary

The solution(s) found are the following

$$y = \frac{3x^4 - 4x^3 + 1}{12x} \tag{1}$$

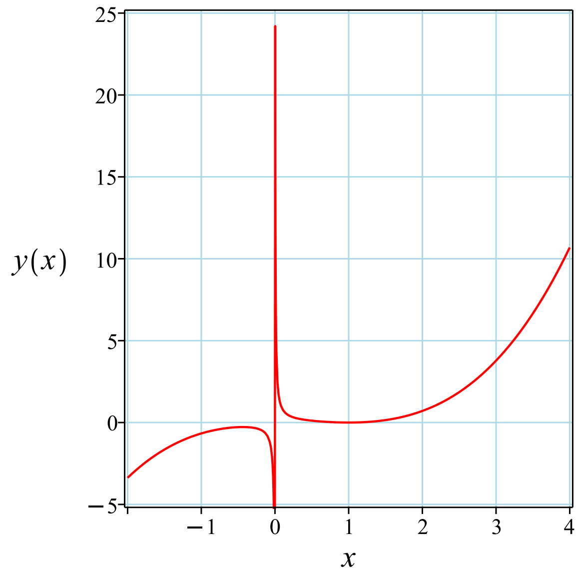

Figure 541: Solution plot

Verification of solutions

$$y = \frac{3x^4 - 4x^3 + 1}{12x}$$

Verified OK.

17.5.1 Maple step by step solution

Let's solve

$$\left[x^3 y''' - x^2 y'' - 2y'x + 6y = 0, y(1) = 0, y'\Big|_{\{x=1\}} = 0, y''\Big|_{\{x=1\}} = 1\right]$$

- Highest derivative means the order of the ODE is 3

  y'''
- Isolate 3rd derivative

  $y''' = -\frac{6y}{x^3} + \frac{y''x+2y'}{x^2}$
- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - \frac{y''}{x} - \frac{2y'}{x^2} + \frac{6y}{x^3} = 0$
- Multiply by denominators of the ODE

  $x^3 y''' - x^2 y'' - 2y'x + 6y = 0$
- Make a change of variables

$t = \ln(x)$

☐ Substitute the change of variables back into the ODE

- Calculate the 1st derivative of y with respect to x , using the chain rule

  $y' = \left(\frac{d}{dt}y(t)\right) t'(x)$

- Compute derivative

  $y' = \frac{\frac{d}{dt}y(t)}{x}$

- Calculate the 2nd derivative of y with respect to x , using the chain rule

  $y'' = \left(\frac{d^2}{dt^2}y(t)\right) t'(x)^2 + t''(x)\left(\frac{d}{dt}y(t)\right)$

- Compute derivative

  $y'' = \frac{\frac{d^2}{dt^2}y(t)}{x^2} - \frac{\frac{d}{dt}y(t)}{x^2}$

- Calculate the 3rd derivative of y with respect to x , using the chain rule

  $y''' = \left(\frac{d^3}{dt^3}y(t)\right) t'(x)^3 + 3t'(x)\, t''(x)\left(\frac{d^2}{dt^2}y(t)\right) + t'''(x)\left(\frac{d}{dt}y(t)\right)$

- Compute derivative

  $y''' = \frac{\frac{d^3}{dt^3}y(t)}{x^3} - \frac{3\left(\frac{d^2}{dt^2}y(t)\right)}{x^3} + \frac{2\left(\frac{d}{dt}y(t)\right)}{x^3}$

  Substitute the change of variables back into the ODE

  $x^3\left(\frac{\frac{d^3}{dt^3}y(t)}{x^3} - \frac{3\left(\frac{d^2}{dt^2}y(t)\right)}{x^3} + \frac{2\left(\frac{d}{dt}y(t)\right)}{x^3}\right) - x^2\left(\frac{\frac{d^2}{dt^2}y(t)}{x^2} - \frac{\frac{d}{dt}y(t)}{x^2}\right) - 2\frac{d}{dt}y(t) + 6y(t) = 0$

- Simplify

  $\frac{d^3}{dt^3}y(t) - 4\frac{d^2}{dt^2}y(t) + \frac{d}{dt}y(t) + 6y(t) = 0$

☐ Convert linear ODE into a system of first order ODEs

- Define new variable $y_1(t)$

  $y_1(t) = y(t)$

- Define new variable $y_2(t)$

  $y_2(t) = \frac{d}{dt}y(t)$

- Define new variable $y_3(t)$

  $y_3(t) = \frac{d^2}{dt^2}y(t)$

- Isolate for $\frac{d}{dt}y_3(t)$ using original ODE

  $\frac{d}{dt}y_3(t) = 4y_3(t) - y_2(t) - 6y_1(t)$

Convert linear ODE into a system of first order ODEs

$\left[y_2(t) = \frac{d}{dt}y_1(t), y_3(t) = \frac{d}{dt}y_2(t), \frac{d}{dt}y_3(t) = 4y_3(t) - y_2(t) - 6y_1(t)\right]$

- Define vector

$$\vec{y}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- System to solve

$$\frac{d}{dt}\vec{y}(t) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & -1 & 4 \end{bmatrix} \cdot \vec{y}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & -1 & 4 \end{bmatrix}$$

- Rewrite the system as

$\frac{d}{dt}\vec{y}(t) = A \cdot \vec{y}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = e^{-t} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\begin{bmatrix} 2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} \end{bmatrix}$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = e^{2t} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\begin{bmatrix} 3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix} \end{bmatrix}$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = e^{3t} \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$\vec{y} = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{-t} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} + c_2 e^{2t} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} + c_3 e^{3t} \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$y(t) = c_1 e^{-t} + \frac{c_2 e^{2t}}{4} + \frac{c_3 e^{3t}}{9}$

- Change variables back using $t = \ln(x)$

  $y = \frac{c_1}{x} + \frac{c_2 x^2}{4} + \frac{c_3 x^3}{9}$
- Use the initial condition $y(1) = 0$

  $0 = c_1 + \frac{c_2}{4} + \frac{c_3}{9}$
- Calculate the 1st derivative of the solution

  $y' = -\frac{c_1}{x^2} + \frac{c_2 x}{2} + \frac{c_3 x^2}{3}$
- Use the initial condition $y'\Big|_{\{x=1\}} = 0$

  $0 = -c_1 + \frac{c_2}{2} + \frac{c_3}{3}$
- Calculate the 2nd derivative of the solution

  $y'' = \frac{2c_1}{x^3} + \frac{c_2}{2} + \frac{2c_3 x}{3}$
- Use the initial condition $y''\Big|_{\{x=1\}} = 1$

  $1 = 2c_1 + \frac{c_2}{2} + \frac{2c_3}{3}$
- Solve for the unknown coefficients

  $\left\{c_1 = \frac{1}{12}, c_2 = -\frac{4}{3}, c_3 = \frac{9}{4}, x = x\right\}$
- Solution to the IVP

  $y = \frac{3x^4 - 4x^3 + 1}{12x}$

ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

`[[_3rd_order, _exact, _linear, _homogeneous]]`

$$\boxed{x^3y''' - x^2y'' - 2y'x + 6y = 0}$$

With initial conditions

$$[y(1) = k_0, y'(1) = k_1, y''(1) = k_2]$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned} y' &= \lambda\, x^{\lambda-1} \\ y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\ y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \end{aligned}$$

Substituting these back into

$$x^3y''' - x^2y'' - 2y'x + 6y = 0$$

gives

$$-2x\lambda\, x^{\lambda-1} - x^2\lambda(\lambda-1)\, x^{\lambda-2} + x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} + 6x^\lambda = 0$$

Which simplifies to

$$-2\lambda\, x^\lambda - \lambda(\lambda-1)\, x^\lambda + \lambda(\lambda-1)\,(\lambda-2)\, x^\lambda + 6x^\lambda = 0$$

And since $x^\lambda \neq 0$ then dividing through by x^λ, the above becomes

$$-2\lambda - \lambda(\lambda - 1) + \lambda(\lambda - 1)(\lambda - 2) + 6 = 0$$

Simplifying gives the characteristic equation as

$$\lambda^3 - 4\lambda^2 + \lambda + 6 = 0$$

Solving the above gives the following roots

$$\lambda_1 = 2$$
$$\lambda_2 = 3$$
$$\lambda_3 = -1$$

This table summarises the result

root	multiplicity	type of root
-1	1	real root
2	1	real root
3	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a $c_1 x^\lambda$ basis solution. Each real root of multiplicty two, generates $c_1 x^\lambda$ and $c_2 x^\lambda \ln(x)$ basis solutions. Each real root of multiplicty three, generates $c_1 x^\lambda$ and $c_2 x^\lambda \ln(x)$ and $c_3 x^\lambda \ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^\alpha(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x)\, x^\alpha(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2 x^\alpha(c_1 \cos(\beta \ln(x)) + c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = \frac{c_1}{x} + c_2 x^2 + c_3 x^3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \frac{1}{x}$$
$$y_2 = x^2$$
$$y_3 = x^3$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$y = \frac{c_1}{x} + c_2 x^2 + c_3 x^3 \tag{1}$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = k_0$ and $x = 1$ in the above gives

$$k_0 = c_1 + c_2 + c_3 \tag{1A}$$

Taking derivative of the solution gives

$$y' = -\frac{c_1}{x^2} + 2c_2 x + 3c_3 x^2$$

substituting $y' = k_1$ and $x = 1$ in the above gives

$$k_1 = -c_1 + 2c_2 + 3c_3 \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = \frac{2c_1}{x^3} + 2c_2 + 6c_3 x$$

substituting $y'' = k_2$ and $x = 1$ in the above gives

$$k_2 = 2c_1 + 2c_2 + 6c_3 \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$\begin{aligned} c_1 &= \frac{k_0}{2} - \frac{k_1}{3} + \frac{k_2}{12} \\ c_2 &= \frac{k_1}{3} + k_0 - \frac{k_2}{3} \\ c_3 &= \frac{k_2}{4} - \frac{k_0}{2} \end{aligned}$$

Substituting these values back in above solution results in

$$y = -\frac{6x^4 k_0 - 3x^4 k_2 - 12x^3 k_0 - 4x^3 k_1 + 4x^3 k_2 - 6k_0 + 4k_1 - k_2}{12x}$$

Which simplifies to

$$y = \frac{3(k_2 - 2k_0)\, x^4 + 4(k_1 + 3k_0 - k_2)\, x^3 + 6k_0 - 4k_1 + k_2}{12x}$$

Summary
The solution(s) found are the following

$$y = \frac{3(k_2 - 2k_0)\, x^4 + 4(k_1 + 3k_0 - k_2)\, x^3 + 6k_0 - 4k_1 + k_2}{12x} \tag{1}$$

Verification of solutions

$$y = \frac{3(k_2 - 2k_0)\, x^4 + 4(k_1 + 3k_0 - k_2)\, x^3 + 6k_0 - 4k_1 + k_2}{12x}$$

Verified OK.

17.6.1 Maple step by step solution

Let's solve

$$\left[x^3 y''' - x^2 y'' - 2y'x + 6y = 0, y(1) = k_0, y'\Big|_{\{x=1\}} = k_1, y''\Big|_{\{x=1\}} = k_2\right]$$

- Highest derivative means the order of the ODE is 3
  y'''
- Isolate 3rd derivative
  $y''' = -\frac{6y}{x^3} + \frac{y''x + 2y'}{x^2}$
- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear
  $y''' - \frac{y''}{x} - \frac{2y'}{x^2} + \frac{6y}{x^3} = 0$
- Multiply by denominators of the ODE
  $x^3 y''' - x^2 y'' - 2y'x + 6y = 0$
- Make a change of variables
  $t = \ln(x)$

□ Substitute the change of variables back into the ODE
  - Calculate the 1st derivative of y with respect to x , using the chain rule
    $y' = \left(\frac{d}{dt} y(t)\right) t'(x)$
  - Compute derivative
    $y' = \frac{\frac{d}{dt} y(t)}{x}$
  - Calculate the 2nd derivative of y with respect to x , using the chain rule
    $y'' = \left(\frac{d^2}{dt^2} y(t)\right) t'(x)^2 + t''(x) \left(\frac{d}{dt} y(t)\right)$

- Compute derivative

  $y'' = \frac{\frac{d^2}{dt^2}y(t)}{x^2} - \frac{\frac{d}{dt}y(t)}{x^2}$

- Calculate the 3rd derivative of y with respect to x , using the chain rule

  $y''' = \left(\frac{d^3}{dt^3}y(t)\right) t'(x)^3 + 3t'(x)\, t''(x) \left(\frac{d^2}{dt^2}y(t)\right) + t'''(x) \left(\frac{d}{dt}y(t)\right)$

- Compute derivative

  $y''' = \frac{\frac{d^3}{dt^3}y(t)}{x^3} - \frac{3\left(\frac{d^2}{dt^2}y(t)\right)}{x^3} + \frac{2\left(\frac{d}{dt}y(t)\right)}{x^3}$

  Substitute the change of variables back into the ODE

  $x^3\left(\frac{\frac{d^3}{dt^3}y(t)}{x^3} - \frac{3\left(\frac{d^2}{dt^2}y(t)\right)}{x^3} + \frac{2\left(\frac{d}{dt}y(t)\right)}{x^3}\right) - x^2\left(\frac{\frac{d^2}{dt^2}y(t)}{x^2} - \frac{\frac{d}{dt}y(t)}{x^2}\right) - 2\frac{d}{dt}y(t) + 6y(t) = 0$

- Simplify

  $\frac{d^3}{dt^3}y(t) - 4\frac{d^2}{dt^2}y(t) + \frac{d}{dt}y(t) + 6y(t) = 0$

☐ Convert linear ODE into a system of first order ODEs

- Define new variable $y_1(t)$

  $y_1(t) = y(t)$

- Define new variable $y_2(t)$

  $y_2(t) = \frac{d}{dt}y(t)$

- Define new variable $y_3(t)$

  $y_3(t) = \frac{d^2}{dt^2}y(t)$

- Isolate for $\frac{d}{dt}y_3(t)$ using original ODE

  $\frac{d}{dt}y_3(t) = 4y_3(t) - y_2(t) - 6y_1(t)$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(t) = \frac{d}{dt}y_1(t), y_3(t) = \frac{d}{dt}y_2(t), \frac{d}{dt}y_3(t) = 4y_3(t) - y_2(t) - 6y_1(t)\right]$

- Define vector

  $\vec{y}(t) = \left[\begin{array}{c} y_1(t) \\ y_2(t) \\ y_3(t) \end{array}\right]$

- System to solve

$$\frac{d}{dt}\vec{y}(t) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & -1 & 4 \end{bmatrix} \cdot \vec{y}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & -1 & 4 \end{bmatrix}$$

- Rewrite the system as

$$\frac{d}{dt}\vec{y}(t) = A \cdot \vec{y}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-t} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_2 = e^{2t} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_3 = e^{3t} \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\overrightarrow{y} = c_1 \overrightarrow{y}_1 + c_2 \overrightarrow{y}_2 + c_3 \overrightarrow{y}_3$$

- Substitute solutions into the general solution

$$\overrightarrow{y} = c_1 e^{-t} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} + c_2 e^{2t} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} + c_3 e^{3t} \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y(t) = c_1 e^{-t} + \frac{c_2 e^{2t}}{4} + \frac{c_3 e^{3t}}{9}$$

- Change variables back using $t = \ln(x)$

$$y = \frac{c_1}{x} + \frac{c_2 x^2}{4} + \frac{c_3 x^3}{9}$$

- Use the initial condition $y(1) = k_0$

$$k_0 = c_1 + \frac{c_2}{4} + \frac{c_3}{9}$$

- Calculate the 1st derivative of the solution

$$y' = -\frac{c_1}{x^2} + \frac{c_2 x}{2} + \frac{c_3 x^2}{3}$$

- Use the initial condition $y'\Big|_{\{x=1\}} = k_1$

$$k_1 = -c_1 + \frac{c_2}{2} + \frac{c_3}{3}$$

- Calculate the 2nd derivative of the solution

  $y'' = \frac{2c_1}{x^3} + \frac{c_2}{2} + \frac{2c_3 x}{3}$

- Use the initial condition $y''\Big|_{\{x=1\}} = k_2$

  $k_2 = 2c_1 + \frac{c_2}{2} + \frac{2c_3}{3}$

- Solve for the unknown coefficients

  $\left\{c_1 = \frac{k_0}{2} - \frac{k_1}{3} + \frac{k_2}{12}, c_2 = -\frac{4k_2}{3} + 4k_0 + \frac{4k_1}{3}, c_3 = -\frac{9k_0}{2} + \frac{9k_2}{4}, x = x\right\}$

- Solution to the IVP

  $y = \frac{3(k_2-2k_0)x^4+4(k_1+3k_0-k_2)x^3+6k_0-4k_1+k_2}{12x}$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.1. Page 471
Problem number: section 9.1, problem 6(a).
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_x]]
```

$$\boxed{y''' + y'' - y' - y = 0}$$

The characteristic equation is

$$\lambda^3 + \lambda^2 - \lambda - 1 = 0$$

The roots of the above equation are

$$\begin{aligned}\lambda_1 &= 1\\ \lambda_2 &= -1\\ \lambda_3 &= -1\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-x} + x\,\mathrm{e}^{-x} c_2 + c_3 \mathrm{e}^{x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned}y_1 &= \mathrm{e}^{-x}\\ y_2 &= x\,\mathrm{e}^{-x}\\ y_3 &= \mathrm{e}^{x}\end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1 e^{-x} + x\, e^{-x} c_2 + c_3 e^{x} \tag{1}$$

Verification of solutions

$$y = c_1 e^{-x} + x\, e^{-x} c_2 + c_3 e^{x}$$

Verified OK.

17.7.1 Maple step by step solution

Let's solve

$y''' + y'' - y' - y = 0$

- Highest derivative means the order of the ODE is 3

  y'''

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = -y_3(x) + y_2(x) + y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = -y_3(x) + y_2(x) + y_1(x)]$

- Define vector

  $\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$

- System to solve

$$\overrightarrow{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 1 & -1 \end{bmatrix} \cdot \overrightarrow{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 1 & -1 \end{bmatrix}$$

- Rewrite the system as

$$\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue -1

$$\overrightarrow{y}_1(x) = e^{-x} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = -1$ is the eigenvalue, a

$$\overrightarrow{y}_2(x) = e^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_2(x)$ into the homogeneous system

$$\lambda e^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + e^{\lambda x}\overrightarrow{v} = \left(e^{\lambda x} A\right) \cdot \left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda\, \mathrm{e}^{\lambda x}\left(x\overrightarrow{v}+\overrightarrow{p}\right)+\mathrm{e}^{\lambda x}\overrightarrow{v}=\mathrm{e}^{\lambda x}\left(\lambda x\overrightarrow{v}+A\cdot \overrightarrow{p}\right)$$

- Simplify equation

$$\lambda\overrightarrow{p}+\overrightarrow{v}=A\cdot \overrightarrow{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I)\cdot \overrightarrow{p}+\overrightarrow{v}=A\cdot \overrightarrow{p}$$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_2(x)$ to be a solution to the homogeneous system

$$(A-\lambda \cdot I)\cdot \overrightarrow{p}=\overrightarrow{v}$$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue -1

$$\left(\left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 1 & -1 \end{array}\right]-(-1)\cdot \left[\begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{array}\right]\right)\cdot \overrightarrow{p}=\left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p}=\left[\begin{array}{c} 1 \\ 0 \\ 0 \end{array}\right]$$

- Second solution from eigenvalue -1

$$\overrightarrow{y}_2(x)=\mathrm{e}^{-x}\cdot \left(x\cdot \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]+\left[\begin{array}{c} 1 \\ 0 \\ 0 \end{array}\right]\right)$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_3=\mathrm{e}^{x}\cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_1 \vec{y}_1(x) + c_2 \vec{y}_2(x) + c_3 \vec{y}_3$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 \mathrm{e}^{-x} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} + c_2 \mathrm{e}^{-x} \cdot \left(x \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} + \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right) + c_3 \mathrm{e}^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = ((x+1) c_2 + c_1) \mathrm{e}^{-x} + c_3 \mathrm{e}^{x}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_x]]
```

$$\boxed{y''' - 3y'' + 7y' - 5y = 0}$$

The characteristic equation is

$$\lambda^3 - 3\lambda^2 + 7\lambda - 5 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 1 - 2i$$
$$\lambda_3 = 1 + 2i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + e^{(1+2i)x} c_2 + e^{(1-2i)x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^x$$
$$y_2 = e^{(1+2i)x}$$
$$y_3 = e^{(1-2i)x}$$

Summary
The solution(s) found are the following

$$y = c_1 e^x + e^{(1+2i)x} c_2 + e^{(1-2i)x} c_3 \tag{1}$$

Verification of solutions

$$y = c_1 e^x + e^{(1+2i)x} c_2 + e^{(1-2i)x} c_3$$

Verified OK.

17.8.1 Maple step by step solution

Let's solve

$y''' - 3y'' + 7y' - 5y = 0$

- Highest derivative means the order of the ODE is 3

  y'''

- □ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$
  - Define new variable $y_2(x)$

    $y_2(x) = y'$
  - Define new variable $y_3(x)$

    $y_3(x) = y''$
  - Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = 3y_3(x) - 7y_2(x) + 5y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 3y_3(x) - 7y_2(x) + 5y_1(x)]$

- Define vector

  $$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\overrightarrow{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 5 & -7 & 3 \end{bmatrix} \cdot \overrightarrow{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 5 & -7 & 3 \end{bmatrix}$$

- Rewrite the system as

$$\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[1-2\,\mathrm{I}, \begin{bmatrix} -\frac{3}{25}+\frac{4\,\mathrm{I}}{25} \\ \frac{1}{5}+\frac{2\,\mathrm{I}}{5} \\ 1 \end{bmatrix}\right], \left[1+2\,\mathrm{I}, \begin{bmatrix} -\frac{3}{25}-\frac{4\,\mathrm{I}}{25} \\ \frac{1}{5}-\frac{2\,\mathrm{I}}{5} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[1-2\,\mathrm{I}, \begin{bmatrix} -\frac{3}{25}+\frac{4\,\mathrm{I}}{25} \\ \frac{1}{5}+\frac{2\,\mathrm{I}}{5} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$e^{(1-2I)x} \cdot \begin{bmatrix} -\frac{3}{25}+\frac{4I}{25} \\ \frac{1}{5}+\frac{2I}{5} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of sin and cos

$$e^{x} \cdot (\cos(2x) - I\sin(2x)) \cdot \begin{bmatrix} -\frac{3}{25}+\frac{4I}{25} \\ \frac{1}{5}+\frac{2I}{5} \\ 1 \end{bmatrix}$$

- Simplify expression

$$e^{x} \cdot \begin{bmatrix} \left(-\frac{3}{25}+\frac{4I}{25}\right)(\cos(2x) - I\sin(2x)) \\ \left(\frac{1}{5}+\frac{2I}{5}\right)(\cos(2x) - I\sin(2x)) \\ \cos(2x) - I\sin(2x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_2(x) = e^{x} \cdot \begin{bmatrix} -\frac{3\cos(2x)}{25}+\frac{4\sin(2x)}{25} \\ \frac{\cos(2x)}{5}+\frac{2\sin(2x)}{5} \\ \cos(2x) \end{bmatrix}, \vec{y}_3(x) = e^{x} \cdot \begin{bmatrix} \frac{3\sin(2x)}{25}+\frac{4\cos(2x)}{25} \\ -\frac{\sin(2x)}{5}+\frac{2\cos(2x)}{5} \\ -\sin(2x) \end{bmatrix}\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x)$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} + c_2 e^{x} \cdot \begin{bmatrix} -\frac{3\cos(2x)}{25}+\frac{4\sin(2x)}{25} \\ \frac{\cos(2x)}{5}+\frac{2\sin(2x)}{5} \\ \cos(2x) \end{bmatrix} + c_3 e^{x} \cdot \begin{bmatrix} \frac{3\sin(2x)}{25}+\frac{4\cos(2x)}{25} \\ -\frac{\sin(2x)}{5}+\frac{2\cos(2x)}{5} \\ -\sin(2x) \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = -\frac{e^{x}(3c_2\cos(2x) - 4c_3\cos(2x) - 4c_2\sin(2x) - 3c_3\sin(2x) - 25c_1)}{25}$$

18.2.1 Maple step by step solution

Let's solve

$y'''' + 8y'' - 9y = 0$

- Highest derivative means the order of the ODE is 4

  y''''

□ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

  - Define new variable $y_3(x)$

    $y_3(x) = y''$

  - Define new variable $y_4(x)$

    $y_4(x) = y'''$

  - Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = -8y_3(x) + 9y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -8y_3(x) + 9y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 9 & 0 & -8 & 0 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 9 & 0 & -8 & 0 \end{bmatrix}$$

- Rewrite the system as

$\vec{y}'(x) = A \cdot \vec{y}(x)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[-3\,\mathrm{I}, \begin{bmatrix} -\frac{\mathrm{I}}{27} \\ -\frac{1}{9} \\ \frac{\mathrm{I}}{3} \\ 1 \end{bmatrix}\right], \left[3\,\mathrm{I}, \begin{bmatrix} \frac{\mathrm{I}}{27} \\ -\frac{1}{9} \\ -\frac{\mathrm{I}}{3} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = e^{-x} \cdot \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\begin{bmatrix} 1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} \end{bmatrix}$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\begin{bmatrix} -3\,\mathrm{I}, \begin{bmatrix} -\frac{\mathrm{I}}{27} \\ -\frac{1}{9} \\ \frac{\mathrm{I}}{3} \\ 1 \end{bmatrix} \end{bmatrix}$$

- Solution from eigenpair

$$e^{-3\,\mathrm{I}x} \cdot \begin{bmatrix} -\frac{\mathrm{I}}{27} \\ -\frac{1}{9} \\ \frac{\mathrm{I}}{3} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of sin and cos

$$(\cos(3x) - \mathrm{I}\sin(3x)) \cdot \begin{bmatrix} -\frac{\mathrm{I}}{27} \\ -\frac{1}{9} \\ \frac{\mathrm{I}}{3} \\ 1 \end{bmatrix}$$

- Simplify expression

$$\begin{bmatrix} -\frac{\mathrm{I}}{27}(\cos(3x) - \mathrm{I}\sin(3x)) \\ -\frac{\cos(3x)}{9} + \frac{\mathrm{I}\sin(3x)}{9} \\ \frac{\mathrm{I}}{3}(\cos(3x) - \mathrm{I}\sin(3x)) \\ \cos(3x) - \mathrm{I}\sin(3x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = \begin{bmatrix} -\frac{\sin(3x)}{27} \\ -\frac{\cos(3x)}{9} \\ \frac{\sin(3x)}{3} \\ \cos(3x) \end{bmatrix}, \vec{y}_4(x) = \begin{bmatrix} -\frac{\cos(3x)}{27} \\ \frac{\sin(3x)}{9} \\ \frac{\cos(3x)}{3} \\ -\sin(3x) \end{bmatrix}\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x)$$

- Substitute solutions into the general solution

$$\vec{y} = c_1\mathrm{e}^{-x} \cdot \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix} + c_2\mathrm{e}^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} + \begin{bmatrix} -\frac{c_3\sin(3x)}{27} - \frac{c_4\cos(3x)}{27} \\ -\frac{c_3\cos(3x)}{9} + \frac{c_4\sin(3x)}{9} \\ \frac{c_3\sin(3x)}{3} + \frac{c_4\cos(3x)}{3} \\ c_3\cos(3x) - c_4\sin(3x) \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = -c_1\mathrm{e}^{-x} + c_2\mathrm{e}^{x} - \frac{c_4\cos(3x)}{27} - \frac{c_3\sin(3x)}{27}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 3.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_x]]
```

$$\boxed{y''' - y'' + 16y' - 16y = 0}$$

The characteristic equation is

$$\lambda^3 - \lambda^2 + 16\lambda - 16 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 4i$$
$$\lambda_3 = -4i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + e^{-4ix} c_2 + e^{4ix} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^x$$
$$y_2 = e^{-4ix}$$
$$y_3 = e^{4ix}$$

Summary
The solution(s) found are the following

$$y = c_1 e^x + e^{-4ix} c_2 + e^{4ix} c_3 \tag{1}$$

Verification of solutions

$$y = c_1 e^x + e^{-4ix} c_2 + e^{4ix} c_3$$

Verified OK.

18.3.1 Maple step by step solution

Let's solve

$y''' - y'' + 16y' - 16y = 0$

- Highest derivative means the order of the ODE is 3

  y'''

□ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

  - Define new variable $y_3(x)$

    $y_3(x) = y''$

  - Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = y_3(x) - 16y_2(x) + 16y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = y_3(x) - 16y_2(x) + 16y_1(x)]$

- Define vector

  $\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 16 & -16 & 1 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 16 & -16 & 1 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[-4\,\mathrm{I}, \begin{bmatrix} -\frac{1}{16} \\ \frac{\mathrm{I}}{4} \\ 1 \end{bmatrix}\right], \left[4\,\mathrm{I}, \begin{bmatrix} -\frac{1}{16} \\ -\frac{\mathrm{I}}{4} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-4\,\mathrm{I}, \begin{bmatrix} -\frac{1}{16} \\ \frac{\mathrm{I}}{4} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$e^{-4 I x} \cdot \begin{bmatrix} -\frac{1}{16} \\ \frac{I}{4} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$(\cos(4x) - I\sin(4x)) \cdot \begin{bmatrix} -\frac{1}{16} \\ \frac{I}{4} \\ 1 \end{bmatrix}$$

- Simplify expression

$$\begin{bmatrix} -\frac{\cos(4x)}{16} + \frac{I\sin(4x)}{16} \\ \frac{I}{4}(\cos(4x) - I\sin(4x)) \\ \cos(4x) - I\sin(4x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_2(x) = \begin{bmatrix} -\frac{\cos(4x)}{16} \\ \frac{\sin(4x)}{4} \\ \cos(4x) \end{bmatrix}, \vec{y}_3(x) = \begin{bmatrix} \frac{\sin(4x)}{16} \\ \frac{\cos(4x)}{4} \\ -\sin(4x) \end{bmatrix}\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x)$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^x \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} + \begin{bmatrix} -\frac{c_2\cos(4x)}{16} + \frac{c_3\sin(4x)}{16} \\ \frac{c_2\sin(4x)}{4} + \frac{c_3\cos(4x)}{4} \\ c_2\cos(4x) - c_3\sin(4x) \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = c_1 e^x + \frac{c_3\sin(4x)}{16} - \frac{c_2\cos(4x)}{16}$$

Maple trace

Summary

The solution(s) found are the following

$$y = c_1 e^{-x} + c_2 e^{x} + e^{-\frac{3x}{2}} c_3 \tag{1}$$

Verification of solutions

$$y = c_1 e^{-x} + c_2 e^{x} + e^{-\frac{3x}{2}} c_3$$

Verified OK.

18.4.1 Maple step by step solution

Let's solve

$2y''' + 3y'' - 2y' - 3y = 0$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = -\frac{3y''}{2} + y' + \frac{3y}{2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' + \frac{3y''}{2} - y' - \frac{3y}{2} = 0$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = -\frac{3y_3(x)}{2} + y_2(x) + \frac{3y_1(x)}{2}$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = -\frac{3y_3(x)}{2} + y_2(x) + \frac{3y_1(x)}{2}\right]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{3}{2} & 1 & -\frac{3}{2} \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{3}{2} & 1 & -\frac{3}{2} \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-\frac{3}{2}, \begin{bmatrix} \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-\frac{3}{2}, \begin{bmatrix} \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-\frac{3x}{2}} \cdot \begin{bmatrix} \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = e^{-x} \cdot \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = e^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_1 \vec{y}_1 + c_2 \vec{y}_2 + c_3 \vec{y}_3$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{-\frac{3x}{2}} \cdot \left[\begin{array}{c} \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{array}\right] + c_2 e^{-x} \cdot \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right] + c_3 e^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y = \frac{\left(9c_3 e^{\frac{5x}{2}} + 9c_2 e^{\frac{x}{2}} + 4c_1\right) e^{-\frac{3x}{2}}}{9}$$

18.6.1 Maple step by step solution

Let's solve

$4y''' - 8y'' + 5y' - y = 0$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = 2y'' - \frac{5y'}{4} + \frac{y}{4}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - 2y'' + \frac{5y'}{4} - \frac{y}{4} = 0$

- □ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

  - Define new variable $y_3(x)$

    $y_3(x) = y''$

  - Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = 2y_3(x) - \frac{5y_2(x)}{4} + \frac{y_1(x)}{4}$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 2y_3(x) - \frac{5y_2(x)}{4} + \frac{y_1(x)}{4}\right]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{1}{4} & -\frac{5}{4} & 2 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{1}{4} & -\frac{5}{4} & 2 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[\frac{1}{2}, \begin{bmatrix} 4 \\ 2 \\ 1 \end{bmatrix}\right], \left[\frac{1}{2}, \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[\frac{1}{2}, \begin{bmatrix} 4 \\ 2 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue $\frac{1}{2}$

$$\vec{y}_1(x) = e^{\frac{x}{2}} \cdot \begin{bmatrix} 4 \\ 2 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = \frac{1}{2}$ is the eigenvalue, an

$\overrightarrow{y}_2(x) = \mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_2(x)$ into the homogeneous system

$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \left(\mathrm{e}^{\lambda x} A\right) \cdot \left(x\overrightarrow{v} + \overrightarrow{p}\right)$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \mathrm{e}^{\lambda x}\left(\lambda x\overrightarrow{v} + A \cdot \overrightarrow{p}\right)$

- Simplify equation

$\lambda\overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$

- Make use of the identity matrix I

$(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_2(x)$ to be a solution to the homogeneous system

$(A - \lambda \cdot I) \cdot \overrightarrow{p} = \overrightarrow{v}$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue $\frac{1}{2}$

$$\left(\left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{1}{4} & -\frac{5}{4} & 2 \end{array}\right] - \frac{1}{2} \cdot \left[\begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{array}\right]\right) \cdot \overrightarrow{p} = \left[\begin{array}{c} 4 \\ 2 \\ 1 \end{array}\right]$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p} = \left[\begin{array}{c} -8 \\ 0 \\ 0 \end{array}\right]$$

- Second solution from eigenvalue $\frac{1}{2}$

$$\overrightarrow{y}_2(x) = \mathrm{e}^{\frac{x}{2}} \cdot \left(x \cdot \left[\begin{array}{c} 4 \\ 2 \\ 1 \end{array}\right] + \left[\begin{array}{c} -8 \\ 0 \\ 0 \end{array}\right]\right)$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = e^x \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\vec{y} = c_1 \vec{y}_1(x) + c_2 \vec{y}_2(x) + c_3 \vec{y}_3$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{\frac{x}{2}} \cdot \begin{bmatrix} 4 \\ 2 \\ 1 \end{bmatrix} + c_2 e^{\frac{x}{2}} \cdot \left(x \cdot \begin{bmatrix} 4 \\ 2 \\ 1 \end{bmatrix} + \begin{bmatrix} -8 \\ 0 \\ 0 \end{bmatrix}\right) + c_3 e^x \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = ((4x - 8) c_2 + 4c_1) e^{\frac{x}{2}} + c_3 e^x$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 7.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_x]]
```

$$\boxed{27y''' + 27y'' + 9y' + y = 0}$$

The characteristic equation is

$$27\lambda^3 + 27\lambda^2 + 9\lambda + 1 = 0$$

The roots of the above equation are

$$\lambda_1 = -\frac{1}{3}$$
$$\lambda_2 = -\frac{1}{3}$$
$$\lambda_3 = -\frac{1}{3}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-\frac{x}{3}} + c_2 x\,\mathrm{e}^{-\frac{x}{3}} + x^2 \mathrm{e}^{-\frac{x}{3}} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \mathrm{e}^{-\frac{x}{3}}$$
$$y_2 = x\,\mathrm{e}^{-\frac{x}{3}}$$
$$y_3 = x^2 \mathrm{e}^{-\frac{x}{3}}$$

Summary

The solution(s) found are the following

$$y = c_1 \mathrm{e}^{-\frac{x}{3}} + c_2 x \,\mathrm{e}^{-\frac{x}{3}} + x^2 \mathrm{e}^{-\frac{x}{3}} c_3 \tag{1}$$

Verification of solutions

$$y = c_1 \mathrm{e}^{-\frac{x}{3}} + c_2 x \,\mathrm{e}^{-\frac{x}{3}} + x^2 \mathrm{e}^{-\frac{x}{3}} c_3$$

Verified OK.

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{y'''' + y'' = 0}$$

The characteristic equation is

$$\lambda^4 + \lambda^2 = 0$$

The roots of the above equation are

$$\lambda_1 = 0$$
$$\lambda_2 = 0$$
$$\lambda_3 = i$$
$$\lambda_4 = -i$$

Therefore the homogeneous solution is

$$y_h(x) = c_2 x + c_1 + \mathrm{e}^{-ix} c_3 + \mathrm{e}^{ix} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = 1$$
$$y_2 = x$$
$$y_3 = \mathrm{e}^{-ix}$$
$$y_4 = \mathrm{e}^{ix}$$

Summary
The solution(s) found are the following

$$y = c_2 x + c_1 + \mathrm{e}^{-ix} c_3 + \mathrm{e}^{ix} c_4 \tag{1}$$

Verification of solutions

$$y = c_2 x + c_1 + \mathrm{e}^{-ix} c_3 + \mathrm{e}^{ix} c_4$$

Verified OK.

18.8.1 Maple step by step solution

Let's solve

$y'''' + y'' = 0$

- Highest derivative means the order of the ODE is 4

  y''''

□ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

  - Define new variable $y_3(x)$

    $y_3(x) = y''$

  - Define new variable $y_4(x)$

    $y_4(x) = y'''$

  - Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = -y_3(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -y_3(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & -1 & 0 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & -1 & 0 \end{bmatrix}$$

- Rewrite the system as

$\vec{y}'(x) = A \cdot \vec{y}(x)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[0, \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}\right], \left[0, \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}\right], \left[-\mathrm{I}, \begin{bmatrix} -\mathrm{I} \\ -1 \\ \mathrm{I} \\ 1 \end{bmatrix}\right], \left[\mathrm{I}, \begin{bmatrix} \mathrm{I} \\ -1 \\ -\mathrm{I} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[0, \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

- Consider eigenpair

$$\left[0, \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-\mathrm{I}, \begin{bmatrix} -\mathrm{I} \\ -1 \\ \mathrm{I} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$\mathrm{e}^{-\mathrm{I}x} \cdot \begin{bmatrix} -\mathrm{I} \\ -1 \\ \mathrm{I} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$(\cos(x) - \mathrm{I}\sin(x)) \cdot \begin{bmatrix} -\mathrm{I} \\ -1 \\ \mathrm{I} \\ 1 \end{bmatrix}$$

- Simplify expression

$$\begin{bmatrix} -\mathrm{I}(\cos(x) - \mathrm{I}\sin(x)) \\ -\cos(x) + \mathrm{I}\sin(x) \\ \mathrm{I}(\cos(x) - \mathrm{I}\sin(x)) \\ \cos(x) - \mathrm{I}\sin(x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = \begin{bmatrix} -\sin(x) \\ -\cos(x) \\ \sin(x) \\ \cos(x) \end{bmatrix}, \vec{y}_4(x) = \begin{bmatrix} -\cos(x) \\ \sin(x) \\ \cos(x) \\ -\sin(x) \end{bmatrix}\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x)$$

- Substitute solutions into the general solution

$$\vec{y} = \begin{bmatrix} -c_4\cos(x) - c_3\sin(x) + c_1 \\ c_4\sin(x) - c_3\cos(x) \\ c_4\cos(x) + c_3\sin(x) \\ -c_4\sin(x) + c_3\cos(x) \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = -c_4\cos(x) - c_3\sin(x) + c_1$$

Maple trace

Verified OK.

18.9.1 Maple step by step solution

Let's solve

$y'''' - 16y = 0$

- Highest derivative means the order of the ODE is 4

  y''''

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Define new variable $y_4(x)$

    $y_4(x) = y'''$

  ◦ Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = 16y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = 16y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 16 & 0 & 0 & 0 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 16 & 0 & 0 & 0 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[-2\,\mathrm{I}, \begin{bmatrix} -\frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[2\,\mathrm{I}, \begin{bmatrix} \frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ -\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = e^{-2x} \cdot \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = e^{2x} \cdot \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-2\,\mathrm{I}, \begin{bmatrix} -\frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$e^{-2\,\mathrm{I}x} \cdot \begin{bmatrix} -\frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$(\cos(2x) - \mathrm{I}\sin(2x)) \cdot \begin{bmatrix} -\frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}$$

- Simplify expression

$$\begin{bmatrix} -\frac{\mathrm{I}}{8}(\cos(2x) - \mathrm{I}\sin(2x)) \\ -\frac{\cos(2x)}{4} + \frac{\mathrm{I}\sin(2x)}{4} \\ \frac{\mathrm{I}}{2}(\cos(2x) - \mathrm{I}\sin(2x)) \\ \cos(2x) - \mathrm{I}\sin(2x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = \begin{bmatrix} -\frac{\sin(2x)}{8} \\ -\frac{\cos(2x)}{4} \\ \frac{\sin(2x)}{2} \\ \cos(2x) \end{bmatrix}, \vec{y}_4(x) = \begin{bmatrix} -\frac{\cos(2x)}{8} \\ \frac{\sin(2x)}{4} \\ \frac{\cos(2x)}{2} \\ -\sin(2x) \end{bmatrix}\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x)$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 \mathrm{e}^{-2x} \cdot \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix} + c_2 \mathrm{e}^{2x} \cdot \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} + \begin{bmatrix} -\frac{c_3 \sin(2x)}{8} - \frac{c_4 \cos(2x)}{8} \\ -\frac{c_3 \cos(2x)}{4} + \frac{c_4 \sin(2x)}{4} \\ \frac{c_3 \sin(2x)}{2} + \frac{c_4 \cos(2x)}{2} \\ c_3 \cos(2x) - c_4 \sin(2x) \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = -\frac{c_1 \mathrm{e}^{-2x}}{8} + \frac{c_2 \mathrm{e}^{2x}}{8} - \frac{c_4 \cos(2x)}{8} - \frac{c_3 \sin(2x)}{8}$$

Problem number: section 9.2, problem 10.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{y'''' + 12y'' + 36y = 0}$$

The characteristic equation is

$$\lambda^4 + 12\lambda^2 + 36 = 0$$

The roots of the above equation are

$$\lambda_1 = i\sqrt{6}$$
$$\lambda_2 = -i\sqrt{6}$$
$$\lambda_3 = i\sqrt{6}$$
$$\lambda_4 = -i\sqrt{6}$$

Therefore the homogeneous solution is

$$y_h(x) = \mathrm{e}^{-i\sqrt{6}\,x} c_1 + x\,\mathrm{e}^{-i\sqrt{6}\,x} c_2 + \mathrm{e}^{i\sqrt{6}\,x} c_3 + x\,\mathrm{e}^{i\sqrt{6}\,x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \mathrm{e}^{-i\sqrt{6}\,x}$$
$$y_2 = x\,\mathrm{e}^{-i\sqrt{6}\,x}$$
$$y_3 = \mathrm{e}^{i\sqrt{6}\,x}$$
$$y_4 = x\,\mathrm{e}^{i\sqrt{6}\,x}$$

Summary

The solution(s) found are the following

$$y = e^{-i\sqrt{6}\, x} c_1 + x\, e^{-i\sqrt{6}\, x} c_2 + e^{i\sqrt{6}\, x} c_3 + x\, e^{i\sqrt{6}\, x} c_4 \tag{1}$$

Verification of solutions

$$y = e^{-i\sqrt{6}\, x} c_1 + x\, e^{-i\sqrt{6}\, x} c_2 + e^{i\sqrt{6}\, x} c_3 + x\, e^{i\sqrt{6}\, x} c_4$$

Verified OK.

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 11.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{16y'''' - 72y'' + 81y = 0}$$

The characteristic equation is

$$16\lambda^4 - 72\lambda^2 + 81 = 0$$

The roots of the above equation are

$$\lambda_1 = \frac{3}{2}$$
$$\lambda_2 = \frac{3}{2}$$
$$\lambda_3 = -\frac{3}{2}$$
$$\lambda_4 = -\frac{3}{2}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-\frac{3x}{2}} + c_2 x\, e^{-\frac{3x}{2}} + e^{\frac{3x}{2}} c_3 + x\, e^{\frac{3x}{2}} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{-\frac{3x}{2}} \\
y_2 &= x\,\mathrm{e}^{-\frac{3x}{2}} \\
y_3 &= \mathrm{e}^{\frac{3x}{2}} \\
y_4 &= x\,\mathrm{e}^{\frac{3x}{2}}
\end{aligned}
$$

Summary
The solution(s) found are the following

$$
y = c_1 \mathrm{e}^{-\frac{3x}{2}} + c_2 x\,\mathrm{e}^{-\frac{3x}{2}} + \mathrm{e}^{\frac{3x}{2}} c_3 + x\,\mathrm{e}^{\frac{3x}{2}} c_4 \tag{1}
$$

Verification of solutions

$$
y = c_1 \mathrm{e}^{-\frac{3x}{2}} + c_2 x\,\mathrm{e}^{-\frac{3x}{2}} + \mathrm{e}^{\frac{3x}{2}} c_3 + x\,\mathrm{e}^{\frac{3x}{2}} c_4
$$

Verified OK.

18.11.1 Maple step by step solution

Let's solve

$16y'''' - 72y'' + 81y = 0$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = \frac{9y''}{2} - \frac{81y}{16}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'''' - \frac{9y''}{2} + \frac{81y}{16} = 0$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Define new variable $y_4(x)$

$y_4(x) = y'''$

- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = \frac{9y_3(x)}{2} - \frac{81y_1(x)}{16}$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = \frac{9y_3(x)}{2} - \frac{81y_1(x)}{16}\right]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -\frac{81}{16} & 0 & \frac{9}{2} & 0 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -\frac{81}{16} & 0 & \frac{9}{2} & 0 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-\frac{3}{2}, \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}\right], \left[-\frac{3}{2}, \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}\right], \left[\frac{3}{2}, \begin{bmatrix} \frac{8}{27} \\ \frac{4}{9} \\ \frac{2}{3} \\ 1 \end{bmatrix}\right], \left[\frac{3}{2}, \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[-\frac{3}{2}, \left[\begin{array}{c} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue $-\frac{3}{2}$

$$\overrightarrow{y}_{1}(x) = \mathrm{e}^{-\frac{3x}{2}} \cdot \left[\begin{array}{c} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = -\frac{3}{2}$ is the eigenvalue, a

$$\overrightarrow{y}_{2}(x) = \mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_{2}(x)$ into the homogeneous system

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \left(\mathrm{e}^{\lambda x} A\right) \cdot \left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \mathrm{e}^{\lambda x}\left(\lambda x\overrightarrow{v} + A \cdot \overrightarrow{p}\right)$$

- Simplify equation

$$\lambda\overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_{2}(x)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \overrightarrow{p} = \overrightarrow{v}$$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue $-\frac{3}{2}$

$$\left(\begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -\frac{81}{16} & 0 & \frac{9}{2} & 0 \end{bmatrix} - -\frac{3}{2} \cdot \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}\right) \cdot \overrightarrow{p} = \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p} = \begin{bmatrix} -\frac{16}{81} \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue $-\frac{3}{2}$

$$\overrightarrow{y}_2(x) = \mathrm{e}^{-\frac{3x}{2}} \cdot \left(x \cdot \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix} + \begin{bmatrix} -\frac{16}{81} \\ 0 \\ 0 \\ 0 \end{bmatrix}\right)$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[\frac{3}{2}, \begin{bmatrix} \frac{8}{27} \\ \frac{4}{9} \\ \frac{2}{3} \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue $\frac{3}{2}$

$$\overrightarrow{y}_3(x) = \mathrm{e}^{\frac{3x}{2}} \cdot \begin{bmatrix} \frac{8}{27} \\ \frac{4}{9} \\ \frac{2}{3} \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = \frac{3}{2}$ is the eigenvalue, an

$$\overrightarrow{y}_4(x) = \mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt

- Substitute $\overrightarrow{y}_4(x)$ into the homogeneous system

  $\lambda \mathrm{e}^{\lambda x}\left(x\overrightarrow{v}+\overrightarrow{p}\right)+\mathrm{e}^{\lambda x}\overrightarrow{v}=\left(\mathrm{e}^{\lambda x}A\right)\cdot\left(x\overrightarrow{v}+\overrightarrow{p}\right)$
- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

  $\lambda \mathrm{e}^{\lambda x}\left(x\overrightarrow{v}+\overrightarrow{p}\right)+\mathrm{e}^{\lambda x}\overrightarrow{v}=\mathrm{e}^{\lambda x}\left(\lambda x\overrightarrow{v}+A\cdot\overrightarrow{p}\right)$
- Simplify equation

  $\lambda\overrightarrow{p}+\overrightarrow{v}=A\cdot\overrightarrow{p}$
- Make use of the identity matrix I

  $(\lambda\cdot I)\cdot\overrightarrow{p}+\overrightarrow{v}=A\cdot\overrightarrow{p}$
- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_4(x)$ to be a solution to the homogeneous system

  $(A-\lambda\cdot I)\cdot\overrightarrow{p}=\overrightarrow{v}$
- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue $\frac{3}{2}$

  $$\left(\left[\begin{array}{cccc}0 & 1 & 0 & 0\\ 0 & 0 & 1 & 0\\ 0 & 0 & 0 & 1\\ -\frac{81}{16} & 0 & \frac{9}{2} & 0\end{array}\right]-\frac{3}{2}\cdot\left[\begin{array}{cccc}1 & 0 & 0 & 0\\ 0 & 1 & 0 & 0\\ 0 & 0 & 1 & 0\\ 0 & 0 & 0 & 1\end{array}\right]\right)\cdot\overrightarrow{p}=\left[\begin{array}{c}\frac{8}{27}\\ \frac{4}{9}\\ \frac{2}{3}\\ 1\end{array}\right]$$
- Choice of $\overrightarrow{p}$

  $$\overrightarrow{p}=\left[\begin{array}{c}-\frac{16}{81}\\ 0\\ 0\\ 0\end{array}\right]$$
- Second solution from eigenvalue $\frac{3}{2}$

  $$\overrightarrow{y}_4(x)=\mathrm{e}^{\frac{3x}{2}}\cdot\left(x\cdot\left[\begin{array}{c}\frac{8}{27}\\ \frac{4}{9}\\ \frac{2}{3}\\ 1\end{array}\right]+\left[\begin{array}{c}-\frac{16}{81}\\ 0\\ 0\\ 0\end{array}\right]\right)$$
- General solution to the system of ODEs

  $\overrightarrow{y}=c_1\overrightarrow{y}_1(x)+c_2\overrightarrow{y}_2(x)+c_3\overrightarrow{y}_3(x)+c_4\overrightarrow{y}_4(x)$
- Substitute solutions into the general solution

$$\vec{y} = c_1 \mathrm{e}^{-\frac{3x}{2}} \cdot \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix} + c_2 \mathrm{e}^{-\frac{3x}{2}} \cdot \left(x \cdot \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix} + \begin{bmatrix} -\frac{16}{81} \\ 0 \\ 0 \\ 0 \end{bmatrix} \right) + \mathrm{e}^{\frac{3x}{2}} c_3 \cdot \begin{bmatrix} \frac{8}{27} \\ \frac{4}{9} \\ \frac{2}{3} \\ 1 \end{bmatrix} + \mathrm{e}^{\frac{3x}{2}} c_4 \cdot \left(x \cdot \right.$$

- First component of the vector is the solution to the ODE

$$y = \frac{8((-3x-2)c_2-3c_1)\mathrm{e}^{-\frac{3x}{2}}}{81} + \frac{8\left(\left(x-\frac{2}{3}\right)c_4+c_3\right)\mathrm{e}^{\frac{3x}{2}}}{27}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{6y'''' + 5y''' + 7y'' + 5y' + y = 0}$$

The characteristic equation is

$$6\lambda^4 + 5\lambda^3 + 7\lambda^2 + 5\lambda + 1 = 0$$

The roots of the above equation are

$$\lambda_1 = -\frac{1}{2}$$
$$\lambda_2 = -\frac{1}{3}$$
$$\lambda_3 = i$$
$$\lambda_4 = -i$$

Therefore the homogeneous solution is

$$y_h(x) = \mathrm{e}^{-ix}c_1 + \mathrm{e}^{ix}c_2 + \mathrm{e}^{-\frac{x}{2}}c_3 + \mathrm{e}^{-\frac{x}{3}}c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-ix}$$
$$y_2 = e^{ix}$$
$$y_3 = e^{-\frac{x}{2}}$$
$$y_4 = e^{-\frac{x}{3}}$$

Summary
The solution(s) found are the following

$$y = e^{-ix}c_1 + e^{ix}c_2 + e^{-\frac{x}{2}}c_3 + e^{-\frac{x}{3}}c_4 \tag{1}$$

Verification of solutions

$$y = e^{-ix}c_1 + e^{ix}c_2 + e^{-\frac{x}{2}}c_3 + e^{-\frac{x}{3}}c_4$$

Verified OK.

18.12.1 Maple step by step solution

Let's solve

$6y'''' + 5y''' + 7y'' + 5y' + y = 0$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = -\frac{5y'''}{6} - \frac{7y''}{6} - \frac{5y'}{6} - \frac{y}{6}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'''' + \frac{5y'''}{6} + \frac{7y''}{6} + \frac{5y'}{6} + \frac{y}{6} = 0$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Define new variable $y_4(x)$

$y_4(x) = y'''$

- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = -\frac{5y_4(x)}{6} - \frac{7y_3(x)}{6} - \frac{5y_2(x)}{6} - \frac{y_1(x)}{6}$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -\frac{5y_4(x)}{6} - \frac{7y_3(x)}{6} - \frac{5y_2(x)}{6} - \frac{y_1(x)}{6}\right]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -\frac{1}{6} & -\frac{5}{6} & -\frac{7}{6} & -\frac{5}{6} \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -\frac{1}{6} & -\frac{5}{6} & -\frac{7}{6} & -\frac{5}{6} \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-\frac{1}{2}, \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix}\right], \left[-\frac{1}{3}, \begin{bmatrix} -27 \\ 9 \\ -3 \\ 1 \end{bmatrix}\right], \left[-I, \begin{bmatrix} -I \\ -1 \\ I \\ 1 \end{bmatrix}\right], \left[I, \begin{bmatrix} I \\ -1 \\ -I \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-\frac{1}{2}, \left[\begin{array}{c} -8 \\ 4 \\ -2 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-\frac{x}{2}} \cdot \left[\begin{array}{c} -8 \\ 4 \\ -2 \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[-\frac{1}{3}, \left[\begin{array}{c} -27 \\ 9 \\ -3 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{-\frac{x}{3}} \cdot \left[\begin{array}{c} -27 \\ 9 \\ -3 \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-\mathrm{I}, \left[\begin{array}{c} -\mathrm{I} \\ -1 \\ \mathrm{I} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$e^{-Ix} \cdot \begin{bmatrix} -I \\ -1 \\ I \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of sin and cos

$$\left(\cos\left(x\right) - I\sin\left(x\right)\right) \cdot \begin{bmatrix} -I \\ -1 \\ I \\ 1 \end{bmatrix}$$

- Simplify expression

$$\begin{bmatrix} -I(\cos\left(x\right) - I\sin\left(x\right)) \\ -\cos\left(x\right) + I\sin\left(x\right) \\ I(\cos\left(x\right) - I\sin\left(x\right)) \\ \cos\left(x\right) - I\sin\left(x\right) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = \begin{bmatrix} -\sin\left(x\right) \\ -\cos\left(x\right) \\ \sin\left(x\right) \\ \cos\left(x\right) \end{bmatrix}, \vec{y}_4(x) = \begin{bmatrix} -\cos\left(x\right) \\ \sin\left(x\right) \\ \cos\left(x\right) \\ -\sin\left(x\right) \end{bmatrix}\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x)$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{-\frac{x}{2}} \cdot \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix} + c_2 e^{-\frac{x}{3}} \cdot \begin{bmatrix} -27 \\ 9 \\ -3 \\ 1 \end{bmatrix} + \begin{bmatrix} -c_3\sin\left(x\right) - c_4\cos\left(x\right) \\ c_4\sin\left(x\right) - c_3\cos\left(x\right) \\ c_4\cos\left(x\right) + c_3\sin\left(x\right) \\ -c_4\sin\left(x\right) + c_3\cos\left(x\right) \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = -8c_1 e^{-\frac{x}{2}} - 27c_2 e^{-\frac{x}{3}} - c_4\cos\left(x\right) - c_3\sin\left(x\right)$$

$y_4(x) = y'''$

- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = -3y_4(x) - \frac{3y_3(x)}{4} + \frac{13y_2(x)}{4} + \frac{3y_1(x)}{2}$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -3y_4(x) - \frac{3y_3(x)}{4} + \frac{13y_2(x)}{4} + \frac{3y_1(x)}{2}\right]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ \frac{3}{2} & \frac{13}{4} & -\frac{3}{4} & -3 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ \frac{3}{2} & \frac{13}{4} & -\frac{3}{4} & -3 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right], \left[-\frac{3}{2}, \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}\right], \left[-\frac{1}{2}, \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = e^{-2x} \cdot \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-\frac{3}{2}, \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = e^{-\frac{3x}{2}} \cdot \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-\frac{1}{2}, \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = e^{-\frac{x}{2}} \cdot \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\begin{bmatrix} 1, & \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} \end{bmatrix}$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_4 = e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\vec{y} = c_1 \vec{y}_1 + c_2 \vec{y}_2 + c_3 \vec{y}_3 + c_4 \vec{y}_4$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{-2x} \cdot \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix} + c_2 e^{-\frac{3x}{2}} \cdot \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix} + e^{-\frac{x}{2}} c_3 \cdot \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix} + e^{x} c_4 \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = -\frac{\left(\frac{64 c_2 e^{\frac{x}{2}}}{27} + 64 e^{\frac{3x}{2}} c_3 - 8 e^{3x} c_4 + c_1\right) e^{-2x}}{8}$$

Problem number: section 9.2, problem 14.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{y'''' - 4y''' + 7y'' - 6y' + 2y = 0}$$

The characteristic equation is

$$\lambda^4 - 4\lambda^3 + 7\lambda^2 - 6\lambda + 2 = 0$$

The roots of the above equation are

$$\begin{aligned} \lambda_1 &= 1 - i \\ \lambda_2 &= 1 + i \\ \lambda_3 &= 1 \\ \lambda_4 &= 1 \end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^x + c_2 x \,\mathrm{e}^x + \mathrm{e}^{(1-i)x} c_3 + \mathrm{e}^{(1+i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{x} \\
y_2 &= x\,\mathrm{e}^{x} \\
y_3 &= \mathrm{e}^{(1-i)x} \\
y_4 &= \mathrm{e}^{(1+i)x}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
y = c_1 \mathrm{e}^{x} + c_2 x\,\mathrm{e}^{x} + \mathrm{e}^{(1-i)x} c_3 + \mathrm{e}^{(1+i)x} c_4 \tag{1}
$$

Verification of solutions

$$
y = c_1 \mathrm{e}^{x} + c_2 x\,\mathrm{e}^{x} + \mathrm{e}^{(1-i)x} c_3 + \mathrm{e}^{(1+i)x} c_4
$$

Verified OK.

18.14.1 Maple step by step solution

Let's solve

$y'''' - 4y''' + 7y'' - 6y' + 2y = 0$

- Highest derivative means the order of the ODE is 4

  y''''

- □ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$
  - Define new variable $y_2(x)$

    $y_2(x) = y'$
  - Define new variable $y_3(x)$

    $y_3(x) = y''$
  - Define new variable $y_4(x)$

    $y_4(x) = y'''$
  - Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = 4y_4(x) - 7y_3(x) + 6y_2(x) - 2y_1(x)$

  Convert linear ODE into a system of first order ODEs

$$[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = 4y_4(x) - 7y_3(x) + 6y_2(x) - 2y_1(x)]$$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -2 & 6 & -7 & 4 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -2 & 6 & -7 & 4 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}\right], \left[1 - \mathrm{I}, \begin{bmatrix} -\frac{1}{4} + \frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2} + \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[1 + \mathrm{I}, \begin{bmatrix} -\frac{1}{4} - \frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ \frac{1}{2} - \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\begin{bmatrix} 1, & \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} \end{bmatrix}$$

- First solution from eigenvalue 1

$$\vec{y}_1(x) = e^x \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = 1$ is the eigenvalue, an

$$\vec{y}_2(x) = e^{\lambda x}\left(x\vec{v} + \vec{p}\right)$$

- Note that the x multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\vec{y}_2(x)$ into the homogeneous system

$$\lambda e^{\lambda x}\left(x\vec{v} + \vec{p}\right) + e^{\lambda x}\vec{v} = \left(e^{\lambda x} A\right) \cdot \left(x\vec{v} + \vec{p}\right)$$

- Use the fact that $\vec{v}$ is an eigenvector of A

$$\lambda e^{\lambda x}\left(x\vec{v} + \vec{p}\right) + e^{\lambda x}\vec{v} = e^{\lambda x}\left(\lambda x\vec{v} + A \cdot \vec{p}\right)$$

- Simplify equation

$$\lambda\vec{p} + \vec{v} = A \cdot \vec{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$$

- Condition $\vec{p}$ must meet for $\vec{y}_2(x)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue 1

$$\left(\begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -2 & 6 & -7 & 4 \end{bmatrix} - 1 \cdot \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}\right) \cdot \vec{p} = \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Choice of $\vec{p}$

$$\vec{p} = \left[\begin{array}{c} -1 \\ 0 \\ 0 \\ 0 \end{array}\right]$$

- Second solution from eigenvalue 1

$$\vec{y}_2(x) = e^x \cdot \left(x \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \\ 1 \end{array}\right] + \left[\begin{array}{c} -1 \\ 0 \\ 0 \\ 0 \end{array}\right]\right)$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[1 - I, \left[\begin{array}{c} -\frac{1}{4} + \frac{I}{4} \\ \frac{I}{2} \\ \frac{1}{2} + \frac{I}{2} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$e^{(1-I)x} \cdot \left[\begin{array}{c} -\frac{1}{4} + \frac{I}{4} \\ \frac{I}{2} \\ \frac{1}{2} + \frac{I}{2} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^x \cdot (\cos(x) - I\sin(x)) \cdot \left[\begin{array}{c} -\frac{1}{4} + \frac{I}{4} \\ \frac{I}{2} \\ \frac{1}{2} + \frac{I}{2} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{x}\cdot\left[\begin{array}{c}\left(-\frac{1}{4}+\frac{I}{4}\right)\left(\cos\left(x\right)-I\sin\left(x\right)\right)\\ \frac{I}{2}\left(\cos\left(x\right)-I\sin\left(x\right)\right)\\ \left(\frac{1}{2}+\frac{I}{2}\right)\left(\cos\left(x\right)-I\sin\left(x\right)\right)\\ \cos\left(x\right)-I\sin\left(x\right)\end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_{3}(x)=e^{x}\cdot\left[\begin{array}{c}-\frac{\cos(x)}{4}+\frac{\sin(x)}{4}\\ \frac{\sin(x)}{2}\\ \frac{\cos(x)}{2}+\frac{\sin(x)}{2}\\ \cos\left(x\right)\end{array}\right],\vec{y}_{4}(x)=e^{x}\cdot\left[\begin{array}{c}\frac{\sin(x)}{4}+\frac{\cos(x)}{4}\\ \frac{\cos(x)}{2}\\ \frac{\cos(x)}{2}-\frac{\sin(x)}{2}\\ -\sin\left(x\right)\end{array}\right]\right]$$

- General solution to the system of ODEs

$$\vec{y}=c_{1}\vec{y}_{1}(x)+c_{2}\vec{y}_{2}(x)+c_{3}\vec{y}_{3}(x)+c_{4}\vec{y}_{4}(x)$$

- Substitute solutions into the general solution

$$\vec{y}=c_{1}e^{x}\cdot\left[\begin{array}{c}1\\ 1\\ 1\\ 1\end{array}\right]+c_{2}e^{x}\cdot\left(x\cdot\left[\begin{array}{c}1\\ 1\\ 1\\ 1\end{array}\right]+\left[\begin{array}{c}-1\\ 0\\ 0\\ 0\end{array}\right]\right)+c_{3}e^{x}\cdot\left[\begin{array}{c}-\frac{\cos(x)}{4}+\frac{\sin(x)}{4}\\ \frac{\sin(x)}{2}\\ \frac{\cos(x)}{2}+\frac{\sin(x)}{2}\\ \cos\left(x\right)\end{array}\right]+e^{x}c_{4}\cdot\left[\begin{array}{c}\frac{\sin(x)}{4}+\frac{\cos(x)}{4}\\ \frac{\cos(x)}{2}\\ \frac{\cos(x)}{2}-\frac{\sin(x)}{2}\\ -\sin\left(x\right)\end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y=\left(\frac{(-c_{3}+c_{4})\cos(x)}{4}+\frac{(c_{3}+c_{4})\sin(x)}{4}+\left(x-1\right)c_{2}+c_{1}\right)e^{x}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 15.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_x]]
```

$$\boxed{y''' - 2y'' + 4y' - 8y = 0}$$

With initial conditions

$$[y(0) = 2, y'(0) = -2, y''(0) = 2]$$

The characteristic equation is

$$\lambda^3 - 2\lambda^2 + 4\lambda - 8 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = 2i$$
$$\lambda_3 = -2i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{2x} + \mathrm{e}^{2ix} c_2 + \mathrm{e}^{-2ix} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= e^{2x} \\
y_2 &= e^{2ix} \\
y_3 &= e^{-2ix}
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$y = c_1 e^{2x} + e^{2ix} c_2 + e^{-2ix} c_3 \tag{1}$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 2$ and $x = 0$ in the above gives

$$2 = c_1 + c_2 + c_3 \tag{1A}$$

Taking derivative of the solution gives

$$y' = 2c_1 e^{2x} + 2i e^{2ix} c_2 - 2i e^{-2ix} c_3$$

substituting $y' = -2$ and $x = 0$ in the above gives

$$-2 = 2c_2 i - 2c_3 i + 2c_1 \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = 4c_1 e^{2x} - 4\,e^{2ix} c_2 - 4\,e^{-2ix} c_3$$

substituting $y'' = 2$ and $x = 0$ in the above gives

$$2 = 4c_1 - 4c_2 - 4c_3 \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$
\begin{aligned}
c_1 &= \frac{5}{4} \\
c_2 &= \frac{3}{8} + \frac{9i}{8} \\
c_3 &= \frac{3}{8} - \frac{9i}{8}
\end{aligned}
$$

Substituting these values back in above solution results in

$$y = \frac{5\,e^{2x}}{4} + \frac{3\cos(2x)}{4} - \frac{9\sin(2x)}{4}$$

Summary
The solution(s) found are the following

$$y = \frac{5\,e^{2x}}{4} + \frac{3\cos(2x)}{4} - \frac{9\sin(2x)}{4} \tag{1}$$

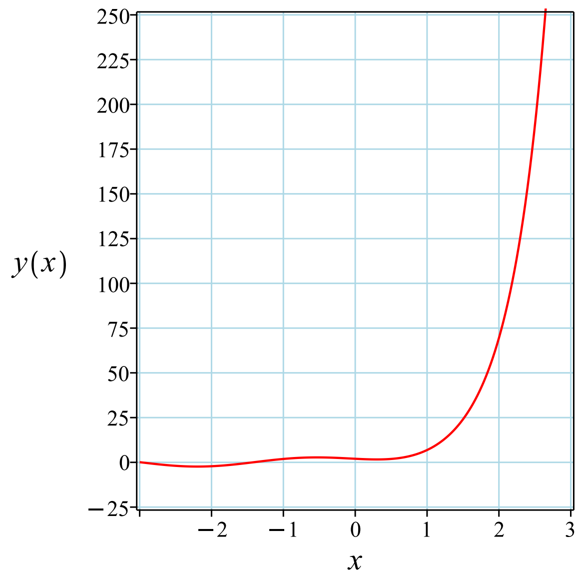

Figure 542: Solution plot

Verification of solutions

$$y = \frac{5\,e^{2x}}{4} + \frac{3\cos(2x)}{4} - \frac{9\sin(2x)}{4}$$

Verified OK.

18.15.1 Maple step by step solution

Let's solve

$$\left[y''' - 2y'' + 4y' - 8y = 0, y(0) = 2, y'\Big|_{\{x=0\}} = -2, y''\Big|_{\{x=0\}} = 2\right]$$

- Highest derivative means the order of the ODE is 3

  y'''

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

  $y_1(x) = y$

- Define new variable $y_2(x)$

  $y_2(x) = y'$
- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = 2y_3(x) - 4y_2(x) + 8y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 2y_3(x) - 4y_2(x) + 8y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 8 & -4 & 2 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 8 & -4 & 2 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x)$
- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[-2\,\mathrm{I}, \begin{bmatrix} -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[2\,\mathrm{I}, \begin{bmatrix} -\frac{1}{4} \\ -\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[2, \left[\begin{array}{c} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_{1} = \mathrm{e}^{2x} \cdot \left[\begin{array}{c} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-2\,\mathrm{I}, \left[\begin{array}{c} -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{-2\,\mathrm{I}x} \cdot \left[\begin{array}{c} -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\left(\cos \left(2x\right)-\mathrm{I} \sin \left(2x\right)\right) \cdot \left[\begin{array}{c} -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Simplify expression

$$\left[\begin{array}{c} -\frac{\cos(2x)}{4}+\frac{\mathrm{I} \sin(2x)}{4} \\ \frac{\mathrm{I}}{2}\left(\cos \left(2x\right)-\mathrm{I} \sin \left(2x\right)\right) \\ \cos \left(2x\right)-\mathrm{I} \sin \left(2x\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\overrightarrow{y}_{2}\left(x\right) = \left[\begin{array}{c} -\frac{\cos(2x)}{4} \\ \frac{\sin(2x)}{2} \\ \cos \left(2x\right) \end{array}\right], \overrightarrow{y}_{3}\left(x\right) = \left[\begin{array}{c} \frac{\sin(2x)}{4} \\ \frac{\cos(2x)}{2} \\ -\sin \left(2x\right) \end{array}\right]\right]$$

- General solution to the system of ODEs

$\overrightarrow{y} = c_1 \overrightarrow{y}_1 + c_2 \overrightarrow{y}_2(x) + c_3 \overrightarrow{y}_3(x)$

- Substitute solutions into the general solution

$$\overrightarrow{y} = c_1 e^{2x} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} + \begin{bmatrix} -\frac{c_2 \cos(2x)}{4} + \frac{c_3 \sin(2x)}{4} \\ \frac{c_2 \sin(2x)}{2} + \frac{c_3 \cos(2x)}{2} \\ c_2 \cos(2x) - c_3 \sin(2x) \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$y = \frac{c_1 e^{2x}}{4} + \frac{c_3 \sin(2x)}{4} - \frac{c_2 \cos(2x)}{4}$

- Use the initial condition $y(0) = 2$

$2 = \frac{c_1}{4} - \frac{c_2}{4}$

- Calculate the 1st derivative of the solution

$y' = \frac{c_1 e^{2x}}{2} + \frac{c_3 \cos(2x)}{2} + \frac{c_2 \sin(2x)}{2}$

- Use the initial condition $y'\Big|_{\{x=0\}} = -2$

$-2 = \frac{c_1}{2} + \frac{c_3}{2}$

- Calculate the 2nd derivative of the solution

$y'' = c_1 e^{2x} - c_3 \sin(2x) + c_2 \cos(2x)$

- Use the initial condition $y''\Big|_{\{x=0\}} = 2$

$2 = c_1 + c_2$

- Solve for the unknown coefficients

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 16.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_x]]
```

$$\boxed{y''' + 3y'' - y' - 3y = 0}$$

With initial conditions

$$[y(0) = 0, y'(0) = 14, y''(0) = -40]$$

The characteristic equation is

$$\lambda^3 + 3\lambda^2 - \lambda - 3 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = -3$$
$$\lambda_3 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{x} + e^{-3x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{-x} \\
y_2 &= \mathrm{e}^{x} \\
y_3 &= \mathrm{e}^{-3x}
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + \mathrm{e}^{-3x} c_3 \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 0$ and $x = 0$ in the above gives

$$
0 = c_1 + c_2 + c_3 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = -c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} - 3\,\mathrm{e}^{-3x} c_3
$$

substituting $y' = 14$ and $x = 0$ in the above gives

$$
14 = -c_1 + c_2 - 3c_3 \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + 9\,\mathrm{e}^{-3x} c_3
$$

substituting $y'' = -40$ and $x = 0$ in the above gives

$$
-40 = c_1 + c_2 + 9c_3 \tag{3A}
$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$
\begin{aligned}
c_1 &= 3 \\
c_2 &= 2 \\
c_3 &= -5
\end{aligned}
$$

Substituting these values back in above solution results in

$$
y = 3\,\mathrm{e}^{-x} + 2\,\mathrm{e}^{x} - 5\,\mathrm{e}^{-3x}
$$

Summary

The solution(s) found are the following

$$y = 3\,e^{-x} + 2\,e^{x} - 5\,e^{-3x} \tag{1}$$

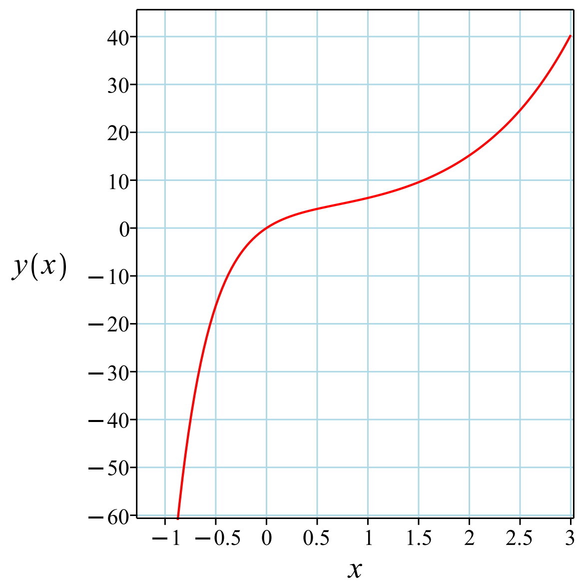

Figure 543: Solution plot

Verification of solutions

$$y = 3\,e^{-x} + 2\,e^{x} - 5\,e^{-3x}$$

Verified OK.

18.16.1 Maple step by step solution

Let's solve

$$\left[y''' + 3y'' - y' - 3y = 0, y(0) = 0, y'\Big|_{\{x=0\}} = 14, y''\Big|_{\{x=0\}} = -40\right]$$

- Highest derivative means the order of the ODE is 3

  y'''

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

$y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$

- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = -3y_3(x) + y_2(x) + 3y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = -3y_3(x) + y_2(x) + 3y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 3 & 1 & -3 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 3 & 1 & -3 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-3, \begin{bmatrix} \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-3, \left[\begin{array}{c} \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_{1} = \mathrm{e}^{-3x} \cdot \left[\begin{array}{c} \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_{2} = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_{3} = \mathrm{e}^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- General solution to the system of ODEs

$$\overrightarrow{y} = c_{1}\overrightarrow{y}_{1} + c_{2}\overrightarrow{y}_{2} + c_{3}\overrightarrow{y}_{3}$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{-3x} \cdot \begin{bmatrix} \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{bmatrix} + c_2 e^{-x} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} + c_3 e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- First component of the vector is the solution to the ODE

  $y = \frac{(9\,e^{4x}c_3 + 9c_2 e^{2x} + c_1)\,e^{-3x}}{9}$
- Use the initial condition $y(0) = 0$

  $0 = c_3 + c_2 + \frac{c_1}{9}$
- Calculate the 1st derivative of the solution

  $y' = \frac{(36\,e^{4x}c_3 + 18c_2 e^{2x})\,e^{-3x}}{9} - \frac{(9\,e^{4x}c_3 + 9c_2 e^{2x} + c_1)\,e^{-3x}}{3}$
- Use the initial condition $y'\Big|_{\{x=0\}} = 14$

  $14 = c_3 - c_2 - \frac{c_1}{3}$
- Calculate the 2nd derivative of the solution

  $y'' = \frac{(144\,e^{4x}c_3 + 36c_2 e^{2x})\,e^{-3x}}{9} - \frac{2(36\,e^{4x}c_3 + 18c_2 e^{2x})\,e^{-3x}}{3} + (9\,e^{4x}c_3 + 9c_2 e^{2x} + c_1)\,e^{-3x}$
- Use the initial condition $y''\Big|_{\{x=0\}} = -40$

  $-40 = c_1 + c_2 + c_3$
- Solve for the unknown coefficients

  $\{c_1 = -45, c_2 = 3, c_3 = 2\}$
- Solution to the IVP

  $y = (2\,e^{4x} + 3\,e^{2x} - 5)\,e^{-3x}$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_x]]
```

$$\boxed{y''' - y'' - y' + y = 0}$$

With initial conditions

$$[y(0) = -2, y'(0) = 9, y''(0) = 4]$$

The characteristic equation is

$$\lambda^3 - \lambda^2 - \lambda + 1 = 0$$

The roots of the above equation are

$$\lambda_1 = -1$$
$$\lambda_2 = 1$$
$$\lambda_3 = 1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + x\,\mathrm{e}^{x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{-x} \\
y_2 &= \mathrm{e}^{x} \\
y_3 &= x\,\mathrm{e}^{x}
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + x\,\mathrm{e}^{x} c_3 \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = -2$ and $x = 0$ in the above gives

$$
-2 = c_1 + c_2 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = -c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + c_3 \mathrm{e}^{x} + x\,\mathrm{e}^{x} c_3
$$

substituting $y' = 9$ and $x = 0$ in the above gives

$$
9 = -c_1 + c_2 + c_3 \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + 2c_3 \mathrm{e}^{x} + x\,\mathrm{e}^{x} c_3
$$

substituting $y'' = 4$ and $x = 0$ in the above gives

$$
4 = c_1 + c_2 + 2c_3 \tag{3A}
$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$
\begin{aligned}
c_1 &= -4 \\
c_2 &= 2 \\
c_3 &= 3
\end{aligned}
$$

Substituting these values back in above solution results in

$$
y = 3x\,\mathrm{e}^{x} - 4\,\mathrm{e}^{-x} + 2\,\mathrm{e}^{x}
$$

Which simplifies to

$$y = -4\,e^{-x} + e^{x}(3x+2)$$

Summary

The solution(s) found are the following

$$y = -4\,e^{-x} + e^{x}(3x+2) \tag{1}$$

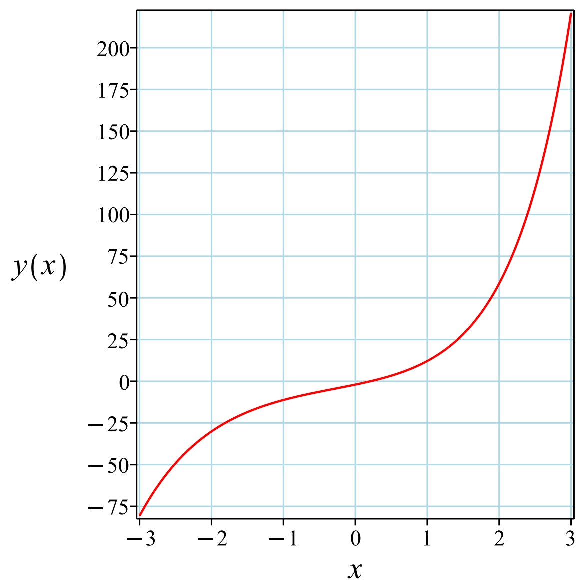

Figure 544: Solution plot

Verification of solutions

$$y = -4\,e^{-x} + e^{x}(3x+2)$$

Verified OK.

18.17.1 Maple step by step solution

Let's solve

$$\left[y''' - y'' - y' + y = 0, y(0) = -2, y'\Big|_{\{x=0\}} = 9, y''\Big|_{\{x=0\}} = 4\right]$$

- Highest derivative means the order of the ODE is 3

  y'''

- □ Convert linear ODE into a system of first order ODEs

- Define new variable $y_1(x)$

  $y_1(x) = y$

- Define new variable $y_2(x)$

  $y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$

- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = y_3(x) + y_2(x) - y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = y_3(x) + y_2(x) - y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & 1 & 1 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & 1 & 1 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_{1} = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue 1

$$\overrightarrow{y}_{2}(x) = \mathrm{e}^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 1$ is the eigenvalue, an

$$\overrightarrow{y}_{3}(x) = \mathrm{e}^{\lambda x} \left(x \overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_{3}(x)$ into the homogeneous system

$$\lambda\, \mathrm{e}^{\lambda x} \left(x \overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x} \overrightarrow{v} = \left(\mathrm{e}^{\lambda x} A\right) \cdot \left(x \overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda\, \mathrm{e}^{\lambda x} \left(x \overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x} \overrightarrow{v} = \mathrm{e}^{\lambda x} \left(\lambda x \overrightarrow{v} + A \cdot \overrightarrow{p}\right)$$

- Simplify equation

$$\lambda \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_{3}(x)$ to be a solution to the homogeneous system

$$(A-\lambda\cdot I)\cdot\vec{p}=\vec{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue 1

$$\left(\left[\begin{array}{ccc}0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & 1 & 1\end{array}\right]-1\cdot\left[\begin{array}{ccc}1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1\end{array}\right]\right)\cdot\vec{p}=\left[\begin{array}{c}1 \\ 1 \\ 1\end{array}\right]$$

- Choice of $\vec{p}$

$$\vec{p}=\left[\begin{array}{c}-1 \\ 0 \\ 0\end{array}\right]$$

- Second solution from eigenvalue 1

$$\vec{y}_3(x)=\mathrm{e}^x\cdot\left(x\cdot\left[\begin{array}{c}1 \\ 1 \\ 1\end{array}\right]+\left[\begin{array}{c}-1 \\ 0 \\ 0\end{array}\right]\right)$$

- General solution to the system of ODEs

$$\vec{y}=c_1\vec{y}_1+c_2\vec{y}_2(x)+c_3\vec{y}_3(x)$$

- Substitute solutions into the general solution

$$\vec{y}=c_1\mathrm{e}^{-x}\cdot\left[\begin{array}{c}1 \\ -1 \\ 1\end{array}\right]+c_2\mathrm{e}^x\cdot\left[\begin{array}{c}1 \\ 1 \\ 1\end{array}\right]+c_3\mathrm{e}^x\cdot\left(x\cdot\left[\begin{array}{c}1 \\ 1 \\ 1\end{array}\right]+\left[\begin{array}{c}-1 \\ 0 \\ 0\end{array}\right]\right)$$

- First component of the vector is the solution to the ODE

$$y=c_1\mathrm{e}^{-x}+\left((x-1)\,c_3+c_2\right)\mathrm{e}^x$$

- Use the initial condition $y(0)=-2$

$$-2=c_1+c_2-c_3$$

- Calculate the 1st derivative of the solution

$$y'=-c_1\mathrm{e}^{-x}+c_3\mathrm{e}^x+\left((x-1)\,c_3+c_2\right)\mathrm{e}^x$$

- Use the initial condition $y'\Big|_{\{x=0\}}=9$

$$9=-c_1+c_2$$

- Calculate the 2nd derivative of the solution

$$y'' = c_1 \mathrm{e}^{-x} + 2c_3 \mathrm{e}^{x} + ((x-1)\, c_3 + c_2)\, \mathrm{e}^{x}$$

- Use the initial condition $y''\Big|_{\{x=0\}} = 4$

$$4 = c_1 + c_2 + c_3$$

- Solve for the unknown coefficients

$$\{c_1 = -4, c_2 = 5, c_3 = 3\}$$

- Solution to the IVP

$$y = -4\,\mathrm{e}^{-x} + \mathrm{e}^{x}(3x+2)$$

Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 18.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_x]]
```

$$\boxed{y''' - 2y' - 4y = 0}$$

With initial conditions

$$[y(0) = 6, y'(0) = 3, y''(0) = 22]$$

The characteristic equation is

$$\lambda^3 - 2\lambda - 4 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = -1 - i$$
$$\lambda_3 = -1 + i$$

Therefore the homogeneous solution is

$$y_h(x) = e^{(-1-i)x}c_1 + c_2e^{2x} + e^{(-1+i)x}c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= e^{(-1-i)x} \\
y_2 &= e^{2x} \\
y_3 &= e^{(-1+i)x}
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = e^{(-1-i)x}c_1 + c_2 e^{2x} + e^{(-1+i)x}c_3 \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 6$ and $x = 0$ in the above gives

$$
6 = c_1 + c_2 + c_3 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = (-1-i)\,e^{(-1-i)x}c_1 + 2c_2 e^{2x} + (-1+i)\,e^{(-1+i)x}c_3
$$

substituting $y' = 3$ and $x = 0$ in the above gives

$$
3 = (-1-i)\,c_1 + 2c_2 + (-1+i)\,c_3 \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = 2ie^{(-1-i)x}c_1 + 4c_2 e^{2x} - 2ie^{(-1+i)x}c_3
$$

substituting $y'' = 22$ and $x = 0$ in the above gives

$$
22 = 2c_1 i - 2c_3 i + 4c_2 \tag{3A}
$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$
\begin{aligned}
c_1 &= 1 - \frac{3i}{2} \\
c_2 &= 4 \\
c_3 &= 1 + \frac{3i}{2}
\end{aligned}
$$

Substituting these values back in above solution results in

$$
y = e^{(-1-i)x} - \frac{3ie^{(-1-i)x}}{2} + 4\,e^{2x} + e^{(-1+i)x} + \frac{3ie^{(-1+i)x}}{2}
$$

Summary

The solution(s) found are the following

$$y = \left(1-\frac{3i}{2}\right) \mathrm{e}^{(-1-i)x}+\left(1+\frac{3i}{2}\right) \mathrm{e}^{(-1+i)x}+4\,\mathrm{e}^{2x} \tag{1}$$

Verification of solutions

$$y = \left(1-\frac{3i}{2}\right) \mathrm{e}^{(-1-i)x}+\left(1+\frac{3i}{2}\right) \mathrm{e}^{(-1+i)x}+4\,\mathrm{e}^{2x}$$

Verified OK.

    $y_3(x)=y''$
  - Isolate for $y_3'(x)$ using original ODE

    $y_3'(x)=2y_2(x)+4y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x)=y_1'(x), y_3(x)=y_2'(x), y_3'(x)=2y_2(x)+4y_1(x)]$

- Define vector

  $\vec{y}(x)=\begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$

- System to solve

$$\overrightarrow{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 4 & 2 & 0 \end{bmatrix} \cdot \overrightarrow{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 4 & 2 & 0 \end{bmatrix}$$

- Rewrite the system as

$$\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[-1-\mathrm{I}, \begin{bmatrix} -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[-1+\mathrm{I}, \begin{bmatrix} \frac{\mathrm{I}}{2} \\ -\frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{2x} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-1-\mathrm{I}, \begin{bmatrix} -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$e^{(-1-I)x} \cdot \left[\begin{array}{c} -\frac{I}{2} \\ -\frac{1}{2}+\frac{I}{2} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of sin and cos

$$e^{-x} \cdot (\cos(x) - I\sin(x)) \cdot \left[\begin{array}{c} -\frac{I}{2} \\ -\frac{1}{2}+\frac{I}{2} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{-x} \cdot \left[\begin{array}{c} -\frac{I}{2}(\cos(x) - I\sin(x)) \\ \left(-\frac{1}{2}+\frac{I}{2}\right)(\cos(x) - I\sin(x)) \\ \cos(x) - I\sin(x) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_2(x) = e^{-x} \cdot \left[\begin{array}{c} -\frac{\sin(x)}{2} \\ -\frac{\cos(x)}{2}+\frac{\sin(x)}{2} \\ \cos(x) \end{array}\right], \vec{y}_3(x) = e^{-x} \cdot \left[\begin{array}{c} -\frac{\cos(x)}{2} \\ \frac{\cos(x)}{2}+\frac{\sin(x)}{2} \\ -\sin(x) \end{array}\right]\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x)$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{2x} \cdot \left[\begin{array}{c} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right] + c_2 e^{-x} \cdot \left[\begin{array}{c} -\frac{\sin(x)}{2} \\ -\frac{\cos(x)}{2}+\frac{\sin(x)}{2} \\ \cos(x) \end{array}\right] + c_3 e^{-x} \cdot \left[\begin{array}{c} -\frac{\cos(x)}{2} \\ \frac{\cos(x)}{2}+\frac{\sin(x)}{2} \\ -\sin(x) \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y = \frac{(-2c_2\sin(x) - 2c_3\cos(x))e^{-x}}{4} + \frac{c_1 e^{2x}}{4}$$

- Use the initial condition $y(0) = 6$

$$6 = -\frac{c_3}{2} + \frac{c_1}{4}$$

- Calculate the 1st derivative of the solution

$$y' = \frac{(-2c_2\cos(x)+2c_3\sin(x))\,\mathrm{e}^{-x}}{4} - \frac{(-2c_2\sin(x)-2c_3\cos(x))\,\mathrm{e}^{-x}}{4} + \frac{c_1\mathrm{e}^{2x}}{2}$$

- Use the initial condition $y'\Big|_{\{x=0\}} = 3$

$$3 = -\frac{c_2}{2} + \frac{c_3}{2} + \frac{c_1}{2}$$

- Calculate the 2nd derivative of the solution

$$y'' = \frac{(2c_2\sin(x)+2c_3\cos(x))\,\mathrm{e}^{-x}}{4} - \frac{(-2c_2\cos(x)+2c_3\sin(x))\,\mathrm{e}^{-x}}{2} + \frac{(-2c_2\sin(x)-2c_3\cos(x))\,\mathrm{e}^{-x}}{4} + c_1\mathrm{e}^{2x}$$

- Use the initial condition $y''\Big|_{\{x=0\}} = 22$

$$22 = c_1 + c_2$$

- Solve for the unknown coefficients

$$\{c_1 = 16, c_2 = 6, c_3 = -4\}$$

- Solution to the IVP

$$y = (-3\sin(x) + 2\cos(x))\,\mathrm{e}^{-x} + 4\,\mathrm{e}^{2x}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 19.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_x]]
```

$$\boxed{3y''' - y'' - 7y' + 5y = 0}$$

With initial conditions

$$\left[y(0) = \frac{14}{5}, y'(0) = 0, y''(0) = 10\right]$$

The characteristic equation is

$$3\lambda^3 - \lambda^2 - 7\lambda + 5 = 0$$

The roots of the above equation are

$$\lambda_1 = -\frac{5}{3}$$
$$\lambda_2 = 1$$
$$\lambda_3 = 1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + c_2 x e^x + e^{-\frac{5x}{3}} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{x} \\
y_2 &= x\,\mathrm{e}^{x} \\
y_3 &= \mathrm{e}^{-\frac{5x}{3}}
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = c_1 \mathrm{e}^{x} + c_2 x\,\mathrm{e}^{x} + \mathrm{e}^{-\frac{5x}{3}} c_3 \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = \frac{14}{5}$ and $x = 0$ in the above gives

$$
\frac{14}{5} = c_1 + c_3 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = c_1 \mathrm{e}^{x} + c_2 \mathrm{e}^{x} + c_2 x\,\mathrm{e}^{x} - \frac{5\,\mathrm{e}^{-\frac{5x}{3}} c_3}{3}
$$

substituting $y' = 0$ and $x = 0$ in the above gives

$$
0 = c_1 + c_2 - \frac{5c_3}{3} \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = c_1 \mathrm{e}^{x} + 2c_2 \mathrm{e}^{x} + c_2 x\,\mathrm{e}^{x} + \frac{25\,\mathrm{e}^{-\frac{5x}{3}} c_3}{9}
$$

substituting $y'' = 10$ and $x = 0$ in the above gives

$$
10 = c_1 + 2c_2 + \frac{25c_3}{9} \tag{3A}
$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$
\begin{aligned}
c_1 &= 1 \\
c_2 &= 2 \\
c_3 &= \frac{9}{5}
\end{aligned}
$$

Substituting these values back in above solution results in

$$y = 2x\,e^{x} + \frac{9\,e^{-\frac{5x}{3}}}{5} + e^{x}$$

Summary
The solution(s) found are the following

$$y = 2x\,e^{x} + \frac{9\,e^{-\frac{5x}{3}}}{5} + e^{x} \tag{1}$$

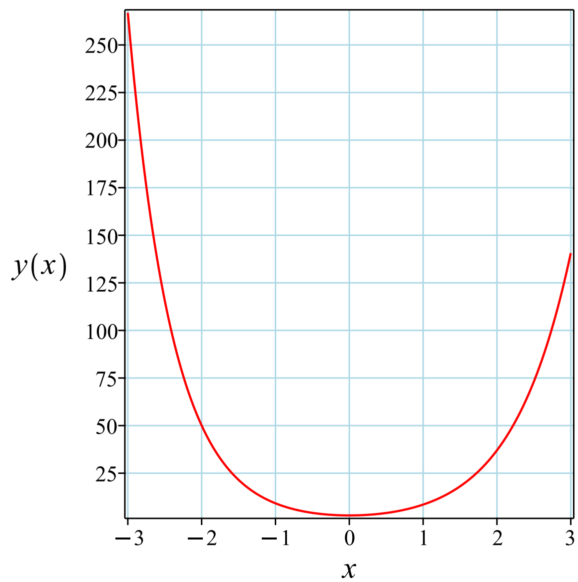

Figure 545: Solution plot

Verification of solutions

$$y = 2x\,e^{x} + \frac{9\,e^{-\frac{5x}{3}}}{5} + e^{x}$$

Verified OK.

18.19.1 Maple step by step solution

Let's solve

$$\left[3y''' - y'' - 7y' + 5y = 0, y(0) = \frac{14}{5}, y'\Big|_{\{x=0\}} = 0, y''\Big|_{\{x=0\}} = 10\right]$$

- Highest derivative means the order of the ODE is 3

y'''

- Isolate 3rd derivative

$y''' = \frac{y''}{3} + \frac{7y'}{3} - \frac{5y}{3}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''' - \frac{y''}{3} - \frac{7y'}{3} + \frac{5y}{3} = 0$

☐ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

  - Define new variable $y_3(x)$

    $y_3(x) = y''$

  - Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = \frac{y_3(x)}{3} + \frac{7y_2(x)}{3} - \frac{5y_1(x)}{3}$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = \frac{y_3(x)}{3} + \frac{7y_2(x)}{3} - \frac{5y_1(x)}{3}\right]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -\frac{5}{3} & \frac{7}{3} & \frac{1}{3} \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -\frac{5}{3} & \frac{7}{3} & \frac{1}{3} \end{bmatrix}$$

- Rewrite the system as

  $\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x)$
- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

  $$\left[\left[-\frac{5}{3}, \left[\begin{array}{c} \frac{9}{25} \\ -\frac{3}{5} \\ 1 \end{array}\right]\right], \left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right], \left[1, \left[\begin{array}{c} 0 \\ 0 \\ 0 \end{array}\right]\right]\right]$$
- Consider eigenpair

  $$\left[-\frac{5}{3}, \left[\begin{array}{c} \frac{9}{25} \\ -\frac{3}{5} \\ 1 \end{array}\right]\right]$$
- Solution to homogeneous system from eigenpair

  $$\overrightarrow{y}_1 = \mathrm{e}^{-\frac{5x}{3}} \cdot \left[\begin{array}{c} \frac{9}{25} \\ -\frac{3}{5} \\ 1 \end{array}\right]$$
- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

  $$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$
- First solution from eigenvalue 1

  $$\overrightarrow{y}_2(x) = \mathrm{e}^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$
- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 1$ is the eigenvalue, an

  $\overrightarrow{y}_3(x) = \mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$
- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_3(x)$ into the homogeneous system

$$\lambda \mathrm{e}^{\lambda x}\left(x\vec{v}+\vec{p}\right)+\mathrm{e}^{\lambda x}\vec{v}=\left(\mathrm{e}^{\lambda x}A\right)\cdot\left(x\vec{v}+\vec{p}\right)$$

- Use the fact that $\vec{v}$ is an eigenvector of A

$$\lambda \mathrm{e}^{\lambda x}\left(x\vec{v}+\vec{p}\right)+\mathrm{e}^{\lambda x}\vec{v}=\mathrm{e}^{\lambda x}\left(\lambda x\vec{v}+A\cdot\vec{p}\right)$$

- Simplify equation

$$\lambda\vec{p}+\vec{v}=A\cdot\vec{p}$$

- Make use of the identity matrix I

$$(\lambda\cdot I)\cdot\vec{p}+\vec{v}=A\cdot\vec{p}$$

- Condition $\vec{p}$ must meet for $\vec{y}_3(x)$ to be a solution to the homogeneous system

$$(A-\lambda\cdot I)\cdot\vec{p}=\vec{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue 1

$$\left(\begin{bmatrix}0 & 1 & 0\\ 0 & 0 & 1\\ -\frac{5}{3} & \frac{7}{3} & \frac{1}{3}\end{bmatrix}-1\cdot\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{bmatrix}\right)\cdot\vec{p}=\begin{bmatrix}1\\ 1\\ 1\end{bmatrix}$$

- Choice of $\vec{p}$

$$\vec{p}=\begin{bmatrix}-1\\ 0\\ 0\end{bmatrix}$$

- Second solution from eigenvalue 1

$$\vec{y}_3(x)=\mathrm{e}^{x}\cdot\left(x\cdot\begin{bmatrix}1\\ 1\\ 1\end{bmatrix}+\begin{bmatrix}-1\\ 0\\ 0\end{bmatrix}\right)$$

- General solution to the system of ODEs

$$\vec{y}=c_1\vec{y}_1+c_2\vec{y}_2(x)+c_3\vec{y}_3(x)$$

- Substitute solutions into the general solution

$$\vec{y}=c_1\mathrm{e}^{-\frac{5x}{3}}\cdot\begin{bmatrix}\frac{9}{25}\\ -\frac{3}{5}\\ 1\end{bmatrix}+c_2\mathrm{e}^{x}\cdot\begin{bmatrix}1\\ 1\\ 1\end{bmatrix}+c_3\mathrm{e}^{x}\cdot\left(x\cdot\begin{bmatrix}1\\ 1\\ 1\end{bmatrix}+\begin{bmatrix}-1\\ 0\\ 0\end{bmatrix}\right)$$

- First component of the vector is the solution to the ODE

$$y = \left(\left(\left(x-1\right) c_3+c_2\right) {\mathrm e}^{\frac{8 x}{3}}+\frac{9 c_1}{25}\right) {\mathrm e}^{-\frac{5 x}{3}}$$

- Use the initial condition $y \left(0\right)=\frac{14}{5}$

$$\frac{14}{5}=c_2-c_3+\frac{9 c_1}{25}$$

- Calculate the 1st derivative of the solution

$$y^{\prime}=\left(c_3 {\mathrm e}^{\frac{8 x}{3}}+\frac{8 \left(\left(x-1\right) c_3+c_2\right) {\mathrm e}^{\frac{8 x}{3}}}{3}\right) {\mathrm e}^{-\frac{5 x}{3}}-\frac{5 \left(\left(\left(x-1\right) c_3+c_2\right) {\mathrm e}^{\frac{8 x}{3}}+\frac{9 c_1}{25}\right) {\mathrm e}^{-\frac{5 x}{3}}}{3}$$

- Use the initial condition $y^{\prime}{\Big|}_{\left\{x =0\right\}}=0$

$$0=c_2-\frac{3 c_1}{5}$$

- Calculate the 2nd derivative of the solution

$$y^{\prime \prime}=\left(\frac{16 c_3 {\mathrm e}^{\frac{8 x}{3}}}{3}+\frac{64 \left(\left(x-1\right) c_3+c_2\right) {\mathrm e}^{\frac{8 x}{3}}}{9}\right) {\mathrm e}^{-\frac{5 x}{3}}-\frac{10 \left(c_3 {\mathrm e}^{\frac{8 x}{3}}+\frac{8 \left(\left(x-1\right) c_3+c_2\right) {\mathrm e}^{\frac{8 x}{3}}}{3}\right) {\mathrm e}^{-\frac{5 x}{3}}}{3}+\frac{25 \left(\left(\left(x-1\right) c_3+c_2\right) {\mathrm e}^{\frac{8 x}{3}}+\frac{9 c_1}{25}\right) {\mathrm e}^{-\frac{5 x}{3}}}{9}$$

- Use the initial condition $y^{\prime \prime}{\Big|}_{\left\{x =0\right\}}=10$

$$10=c_1+c_2+c_3$$

- Solve for the unknown coefficients

$$\left\{c_1 =5, c_2 =3, c_3 =2\right\}$$

- Solution to the IVP

$$y = {\mathrm e}^{-\frac{5 x}{3}} \left(\frac{9}{5}+\left(1+2 x \right) {\mathrm e}^{\frac{8 x}{3}}\right)$$

Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 20.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_x]]
```

$$\boxed{y''' - 6y'' + 12y' - 8y = 0}$$

With initial conditions

$$[y(0) = 1, y'(0) = -1, y''(0) = -4]$$

The characteristic equation is

$$\lambda^3 - 6\lambda^2 + 12\lambda - 8 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = 2$$
$$\lambda_3 = 2$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{2x} + c_2 x\, e^{2x} + x^2 e^{2x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{2x} \\
y_2 &= x\,\mathrm{e}^{2x} \\
y_3 &= x^2\mathrm{e}^{2x}
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = c_1\mathrm{e}^{2x} + c_2 x\,\mathrm{e}^{2x} + x^2\mathrm{e}^{2x} c_3 \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 1$ and $x = 0$ in the above gives

$$
1 = c_1 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = 2c_1\mathrm{e}^{2x} + c_2\mathrm{e}^{2x} + 2c_2 x\,\mathrm{e}^{2x} + 2x\,\mathrm{e}^{2x} c_3 + 2x^2\mathrm{e}^{2x} c_3
$$

substituting $y' = -1$ and $x = 0$ in the above gives

$$
-1 = 2c_1 + c_2 \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = 4c_1\mathrm{e}^{2x} + 4c_2\mathrm{e}^{2x} + 4c_2 x\,\mathrm{e}^{2x} + 2c_3\mathrm{e}^{2x} + 8x\,\mathrm{e}^{2x} c_3 + 4x^2\mathrm{e}^{2x} c_3
$$

substituting $y'' = -4$ and $x = 0$ in the above gives

$$
-4 = 4c_1 + 4c_2 + 2c_3 \tag{3A}
$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$
\begin{aligned}
c_1 &= 1 \\
c_2 &= -3 \\
c_3 &= 2
\end{aligned}
$$

Substituting these values back in above solution results in

$$
y = 2x^2\mathrm{e}^{2x} - 3x\,\mathrm{e}^{2x} + \mathrm{e}^{2x}
$$

Which simplifies to

$$y = e^{2x}(2x^2 - 3x + 1)$$

Summary

The solution(s) found are the following

$$y = e^{2x}(2x^2 - 3x + 1) \tag{1}$$

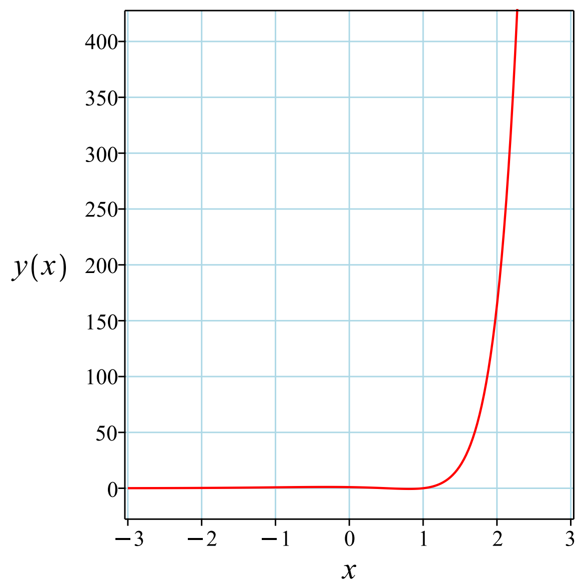

Figure 546: Solution plot

Verification of solutions

$$y = e^{2x}(2x^2 - 3x + 1)$$

Verified OK.

y = c_1 \mathrm{e}^{3x} + c_2 x\,\mathrm{e}^{3x} + \mathrm{e}^{-\frac{x}{2}} c_3 \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 6$ and $x = 0$ in the above gives

$$
6 = c_1 + c_3 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = 3c_1 \mathrm{e}^{3x} + c_2 \mathrm{e}^{3x} + 3c_2 x\,\mathrm{e}^{3x} - \frac{\mathrm{e}^{-\frac{x}{2}} c_3}{2}
$$

substituting $y' = 3$ and $x = 0$ in the above gives

$$
3 = 3c_1 + c_2 - \frac{c_3}{2} \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = 9c_1 \mathrm{e}^{3x} + 6c_2 \mathrm{e}^{3x} + 9c_2 x\,\mathrm{e}^{3x} + \frac{\mathrm{e}^{-\frac{x}{2}} c_3}{4}
$$

substituting $y'' = 13$ and $x = 0$ in the above gives

$$
13 = 9c_1 + 6c_2 + \frac{c_3}{4} \tag{3A}
$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$
\begin{aligned}
c_1 &= 2 \\
c_2 &= -1 \\
c_3 &= 4
\end{aligned}
$$

Substituting these values back in above solution results in

$$
y = -x\,\mathrm{e}^{3x} + 2\,\mathrm{e}^{3x} + 4\,\mathrm{e}^{-\frac{x}{2}}
$$

Which simplifies to

$$y = 4\,e^{-\frac{x}{2}} + (2-x)\,e^{3x}$$

Summary

The solution(s) found are the following

$$y = 4\,e^{-\frac{x}{2}} + (2-x)\,e^{3x} \tag{1}$$

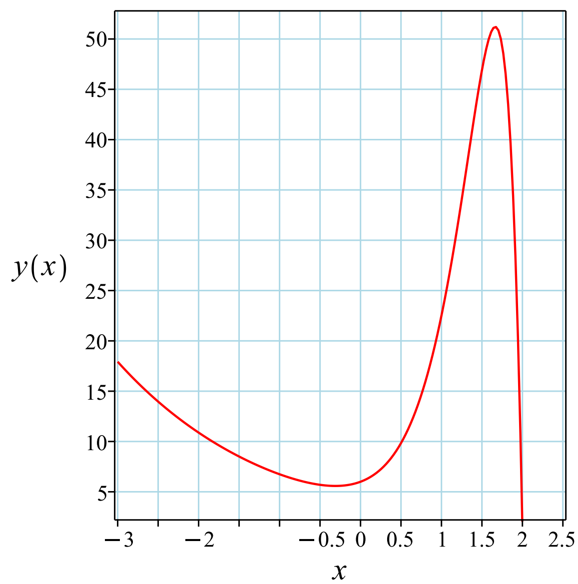

Figure 547: Solution plot

Verification of solutions

$$y = 4\,e^{-\frac{x}{2}} + (2-x)\,e^{3x}$$

Verified OK.

18.21.1 Maple step by step solution

Let's solve

$$\left[2y''' - 11y'' + 12y' + 9y = 0, y(0) = 6, y'\Big|_{\{x=0\}} = 3, y''\Big|_{\{x=0\}} = 13\right]$$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

$y''' = \frac{11y''}{2} - 6y' - \frac{9y}{2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - \frac{11y''}{2} + 6y' + \frac{9y}{2} = 0$

□ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

  - Define new variable $y_3(x)$

    $y_3(x) = y''$

  - Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = \frac{11y_3(x)}{2} - 6y_2(x) - \frac{9y_1(x)}{2}$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = \frac{11y_3(x)}{2} - 6y_2(x) - \frac{9y_1(x)}{2}\right]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -\frac{9}{2} & -6 & \frac{11}{2} \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -\frac{9}{2} & -6 & \frac{11}{2} \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-\frac{1}{2}, \left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]\right], \left[3, \left[\begin{array}{c} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{array}\right]\right], \left[3, \left[\begin{array}{c} 0 \\ 0 \\ 0 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-\frac{1}{2}, \left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-\frac{x}{2}} \cdot \left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[3, \left[\begin{array}{c} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue 3

$$\overrightarrow{y}_2(x) = \mathrm{e}^{3x} \cdot \left[\begin{array}{c} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 3$ is the eigenvalue, an

$$\overrightarrow{y}_3(x) = \mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_3(x)$ into the homogeneous system

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \left(\mathrm{e}^{\lambda x} A\right) \cdot \left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda \mathrm{e}^{\lambda x}\left(x\vec{v}+\vec{p}\right)+\mathrm{e}^{\lambda x}\vec{v}=\mathrm{e}^{\lambda x}\left(\lambda x\vec{v}+A\cdot\vec{p}\right)$$

- Simplify equation

$$\lambda\vec{p}+\vec{v}=A\cdot\vec{p}$$

- Make use of the identity matrix I

$$(\lambda\cdot I)\cdot\vec{p}+\vec{v}=A\cdot\vec{p}$$

- Condition $\vec{p}$ must meet for $\vec{y}_3(x)$ to be a solution to the homogeneous system

$$(A-\lambda\cdot I)\cdot\vec{p}=\vec{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue 3

$$\left(\left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -\frac{9}{2} & -6 & \frac{11}{2} \end{array}\right]-3\cdot\left[\begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{array}\right]\right)\cdot\vec{p}=\left[\begin{array}{c} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{array}\right]$$

- Choice of $\vec{p}$

$$\vec{p}=\left[\begin{array}{c} -\frac{1}{27} \\ 0 \\ 0 \end{array}\right]$$

- Second solution from eigenvalue 3

$$\vec{y}_3(x)=\mathrm{e}^{3x}\cdot\left(x\cdot\left[\begin{array}{c} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{array}\right]+\left[\begin{array}{c} -\frac{1}{27} \\ 0 \\ 0 \end{array}\right]\right)$$

- General solution to the system of ODEs

$$\vec{y}=c_1\vec{y}_1+c_2\vec{y}_2(x)+c_3\vec{y}_3(x)$$

- Substitute solutions into the general solution

$$\vec{y}=c_1\mathrm{e}^{-\frac{x}{2}}\cdot\left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]+c_2\mathrm{e}^{3x}\cdot\left[\begin{array}{c} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{array}\right]+c_3\mathrm{e}^{3x}\cdot\left(x\cdot\left[\begin{array}{c} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{array}\right]+\left[\begin{array}{c} -\frac{1}{27} \\ 0 \\ 0 \end{array}\right]\right)$$

- First component of the vector is the solution to the ODE

$$y=4c_1\mathrm{e}^{-\frac{x}{2}}+\frac{\left(\left(x-\frac{1}{3}\right)c_3+c_2\right)\mathrm{e}^{3x}}{9}$$

- Use the initial condition $y(0)=6$

$6 = 4c_1 - \frac{c_3}{27} + \frac{c_2}{9}$

- Calculate the 1st derivative of the solution

  $y' = -2c_1 e^{-\frac{x}{2}} + \frac{c_3 e^{3x}}{9} + \frac{\left(\left(x-\frac{1}{3}\right)c_3+c_2\right)e^{3x}}{3}$

- Use the initial condition $y'\Big|_{\{x=0\}} = 3$

  $3 = -2c_1 + \frac{c_2}{3}$

- Calculate the 2nd derivative of the solution

  $y'' = c_1 e^{-\frac{x}{2}} + \frac{2c_3 e^{3x}}{3} + \left(\left(x-\frac{1}{3}\right)c_3 + c_2\right)e^{3x}$

- Use the initial condition $y''\Big|_{\{x=0\}} = 13$

  $13 = c_1 + \frac{c_3}{3} + c_2$

- Solve for the unknown coefficients

  $\{c_1 = 1, c_2 = 15, c_3 = -9\}$

- Solution to the IVP

  $y = 4\,e^{-\frac{x}{2}} + (2-x)\,e^{3x}$

Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 22.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_x]]
```

$$\boxed{8y''' - 4y'' - 2y' + y = 0}$$

With initial conditions

$$[y(0) = 4, y'(0) = -3, y''(0) = -1]$$

The characteristic equation is

$$8\lambda^3 - 4\lambda^2 - 2\lambda + 1 = 0$$

The roots of the above equation are

$$\lambda_1 = -\frac{1}{2}$$
$$\lambda_2 = \frac{1}{2}$$
$$\lambda_3 = \frac{1}{2}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-\frac{x}{2}} + c_2 \mathrm{e}^{\frac{x}{2}} + x\,\mathrm{e}^{\frac{x}{2}} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{-\frac{x}{2}} \\
y_2 &= \mathrm{e}^{\frac{x}{2}} \\
y_3 &= \mathrm{e}^{\frac{x}{2}} x
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = c_1 \mathrm{e}^{-\frac{x}{2}} + c_2 \mathrm{e}^{\frac{x}{2}} + x\,\mathrm{e}^{\frac{x}{2}} c_3 \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 4$ and $x = 0$ in the above gives

$$
4 = c_1 + c_2 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = -\frac{c_1 \mathrm{e}^{-\frac{x}{2}}}{2} + \frac{c_2 \mathrm{e}^{\frac{x}{2}}}{2} + c_3 \mathrm{e}^{\frac{x}{2}} + \frac{x\,\mathrm{e}^{\frac{x}{2}} c_3}{2}
$$

substituting $y' = -3$ and $x = 0$ in the above gives

$$
-3 = -\frac{c_1}{2} + \frac{c_2}{2} + c_3 \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = \frac{c_1 \mathrm{e}^{-\frac{x}{2}}}{4} + \frac{c_2 \mathrm{e}^{\frac{x}{2}}}{4} + c_3 \mathrm{e}^{\frac{x}{2}} + \frac{x\,\mathrm{e}^{\frac{x}{2}} c_3}{4}
$$

substituting $y'' = -1$ and $x = 0$ in the above gives

$$
-1 = \frac{c_1}{4} + \frac{c_2}{4} + c_3 \tag{3A}
$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$
\begin{aligned}
c_1 &= 3 \\
c_2 &= 1 \\
c_3 &= -2
\end{aligned}
$$

Substituting these values back in above solution results in

$$
y = -2\,\mathrm{e}^{\frac{x}{2}} x + 3\,\mathrm{e}^{-\frac{x}{2}} + \mathrm{e}^{\frac{x}{2}}
$$

Summary

The solution(s) found are the following

$$y = -2\,e^{\frac{x}{2}}x + 3\,e^{-\frac{x}{2}} + e^{\frac{x}{2}} \tag{1}$$

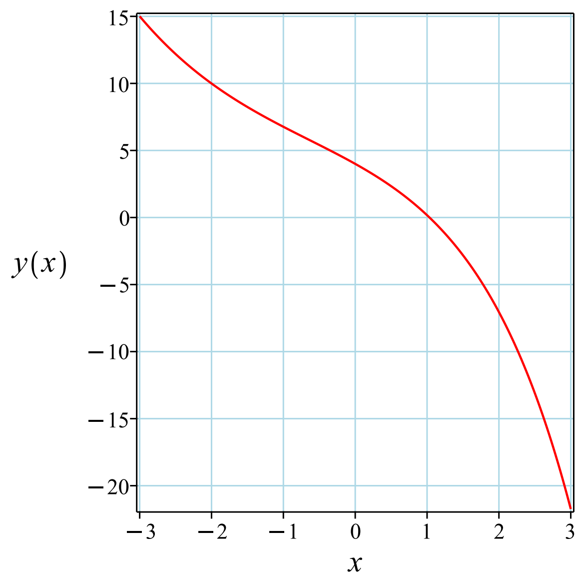

Figure 548: Solution plot

Verification of solutions

$$y = -2\,e^{\frac{x}{2}}x + 3\,e^{-\frac{x}{2}} + e^{\frac{x}{2}}$$

Verified OK.

18.22.1 Maple step by step solution

Let's solve

$\left[8y''' - 4y'' - 2y' + y = 0, y(0) = 4, y'\Big|_{\{x=0\}} = -3, y''\Big|_{\{x=0\}} = -1\right]$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = \frac{y''}{2} + \frac{y'}{4} - \frac{y}{8}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - \frac{y''}{2} - \frac{y'}{4} + \frac{y}{8} = 0$

- ☐ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$
  - Define new variable $y_2(x)$

    $y_2(x) = y'$
  - Define new variable $y_3(x)$

    $y_3(x) = y''$
  - Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = \frac{y_3(x)}{2} + \frac{y_2(x)}{4} - \frac{y_1(x)}{8}$

    Convert linear ODE into a system of first order ODEs

    $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = \frac{y_3(x)}{2} + \frac{y_2(x)}{4} - \frac{y_1(x)}{8}\right]$
- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -\frac{1}{8} & \frac{1}{4} & \frac{1}{2} \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -\frac{1}{8} & \frac{1}{4} & \frac{1}{2} \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x)$
- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-\frac{1}{2}, \left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]\right], \left[\frac{1}{2}, \left[\begin{array}{c} 4 \\ 2 \\ 1 \end{array}\right]\right], \left[\frac{1}{2}, \left[\begin{array}{c} 0 \\ 0 \\ 0 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-\frac{1}{2}, \left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-\frac{x}{2}} \cdot \left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[\frac{1}{2}, \left[\begin{array}{c} 4 \\ 2 \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue $\frac{1}{2}$

$$\overrightarrow{y}_2(x) = \mathrm{e}^{\frac{x}{2}} \cdot \left[\begin{array}{c} 4 \\ 2 \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = \frac{1}{2}$ is the eigenvalue, an

$$\overrightarrow{y}_3(x) = \mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_3(x)$ into the homogeneous system

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \left(\mathrm{e}^{\lambda x} A\right) \cdot \left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \mathrm{e}^{\lambda x}\left(\lambda x\overrightarrow{v} + A \cdot \overrightarrow{p}\right)$$

- Simplify equation

$$\lambda\vec{p}+\vec{v}=A\cdot\vec{p}$$

- Make use of the identity matrix I

$$(\lambda\cdot I)\cdot\vec{p}+\vec{v}=A\cdot\vec{p}$$

- Condition $\vec{p}$ must meet for $\vec{y}_3(x)$ to be a solution to the homogeneous system

$$(A-\lambda\cdot I)\cdot\vec{p}=\vec{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue $\frac{1}{2}$

$$\left(\left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -\frac{1}{8} & \frac{1}{4} & \frac{1}{2} \end{array}\right]-\frac{1}{2}\cdot\left[\begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{array}\right]\right)\cdot\vec{p}=\left[\begin{array}{c} 4 \\ 2 \\ 1 \end{array}\right]$$

- Choice of $\vec{p}$

$$\vec{p}=\left[\begin{array}{c} -8 \\ 0 \\ 0 \end{array}\right]$$

- Second solution from eigenvalue $\frac{1}{2}$

$$\vec{y}_3(x)=\mathrm{e}^{\frac{x}{2}}\cdot\left(x\cdot\left[\begin{array}{c} 4 \\ 2 \\ 1 \end{array}\right]+\left[\begin{array}{c} -8 \\ 0 \\ 0 \end{array}\right]\right)$$

- General solution to the system of ODEs

$$\vec{y}=c_1\vec{y}_1+c_2\vec{y}_2(x)+c_3\vec{y}_3(x)$$

- Substitute solutions into the general solution

$$\vec{y}=c_1\mathrm{e}^{-\frac{x}{2}}\cdot\left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]+c_2\mathrm{e}^{\frac{x}{2}}\cdot\left[\begin{array}{c} 4 \\ 2 \\ 1 \end{array}\right]+c_3\mathrm{e}^{\frac{x}{2}}\cdot\left(x\cdot\left[\begin{array}{c} 4 \\ 2 \\ 1 \end{array}\right]+\left[\begin{array}{c} -8 \\ 0 \\ 0 \end{array}\right]\right)$$

- First component of the vector is the solution to the ODE

$$y=\left(\left(4x-8\right)c_3+4c_2\right)\mathrm{e}^{\frac{x}{2}}+4c_1\mathrm{e}^{-\frac{x}{2}}$$

- Use the initial condition $y(0)=4$

$$4=-8c_3+4c_2+4c_1$$

- Calculate the 1st derivative of the solution

$$y' = 4c_3 e^{\frac{x}{2}} + \frac{((4x-8)c_3 + 4c_2) e^{\frac{x}{2}}}{2} - 2c_1 e^{-\frac{x}{2}}$$

- Use the initial condition $y'\Big|_{\{x=0\}} = -3$

$$-3 = 2c_2 - 2c_1$$

- Calculate the 2nd derivative of the solution

$$y'' = 4c_3 e^{\frac{x}{2}} + \frac{((4x-8)c_3 + 4c_2) e^{\frac{x}{2}}}{4} + c_1 e^{-\frac{x}{2}}$$

- Use the initial condition $y''\Big|_{\{x=0\}} = -1$

$$-1 = c_1 + c_2 + 2c_3$$

- Solve for the unknown coefficients

$$\left\{c_1 = \frac{3}{4}, c_2 = -\frac{3}{4}, c_3 = -\frac{1}{2}\right\}$$

- Solution to the IVP

$$y = -2\,e^{\frac{x}{2}} x + 3\,e^{-\frac{x}{2}} + e^{\frac{x}{2}}$$

Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 23.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{y'''' - 16y = 0}$$

With initial conditions

$$[y(0) = 2, y'(0) = 2, y''(0) = -2, y'''(0) = 0]$$

The characteristic equation is

$$\lambda^4 - 16 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = -2$$
$$\lambda_3 = 2i$$
$$\lambda_4 = -2i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-2x} + c_2 \mathrm{e}^{2x} + \mathrm{e}^{2ix} c_3 + \mathrm{e}^{-2ix} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{-2x} \\
y_2 &= \mathrm{e}^{2x} \\
y_3 &= \mathrm{e}^{2ix} \\
y_4 &= \mathrm{e}^{-2ix}
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = c_1 \mathrm{e}^{-2x} + c_2 \mathrm{e}^{2x} + \mathrm{e}^{2ix} c_3 + \mathrm{e}^{-2ix} c_4 \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 2$ and $x = 0$ in the above gives

$$
2 = c_1 + c_2 + c_3 + c_4 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = -2c_1 \mathrm{e}^{-2x} + 2c_2 \mathrm{e}^{2x} + 2i \mathrm{e}^{2ix} c_3 - 2i \mathrm{e}^{-2ix} c_4
$$

substituting $y' = 2$ and $x = 0$ in the above gives

$$
2 = 2c_3 i - 2c_4 i - 2c_1 + 2c_2 \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = 4c_1 \mathrm{e}^{-2x} + 4c_2 \mathrm{e}^{2x} - 4\,\mathrm{e}^{2ix} c_3 - 4\,\mathrm{e}^{-2ix} c_4
$$

substituting $y'' = -2$ and $x = 0$ in the above gives

$$
-2 = 4c_1 + 4c_2 - 4c_3 - 4c_4 \tag{3A}
$$

Taking three derivatives of the solution gives

$$
y''' = -8c_1 \mathrm{e}^{-2x} + 8c_2 \mathrm{e}^{2x} - 8i \mathrm{e}^{2ix} c_3 + 8i \mathrm{e}^{-2ix} c_4
$$

substituting $y''' = 0$ and $x = 0$ in the above gives

$$
0 = -8c_3 i + 8c_4 i - 8c_1 + 8c_2 \tag{4A}
$$

Equations {1A,2A,3A,4A} are now solved for $\{c_1, c_2, c_3, c_4\}$. Solving for the constants gives

$$c_1 = \frac{1}{8}$$
$$c_2 = \frac{5}{8}$$
$$c_3 = \frac{5}{8} - \frac{i}{4}$$
$$c_4 = \frac{5}{8} + \frac{i}{4}$$

Substituting these values back in above solution results in

$$y = \frac{e^{-2x}}{8} + \frac{5\,e^{2x}}{8} + \frac{5\cos(2x)}{4} + \frac{\sin(2x)}{2}$$

Summary

The solution(s) found are the following

$$y = \frac{e^{-2x}}{8} + \frac{5\,e^{2x}}{8} + \frac{5\cos(2x)}{4} + \frac{\sin(2x)}{2} \tag{1}$$

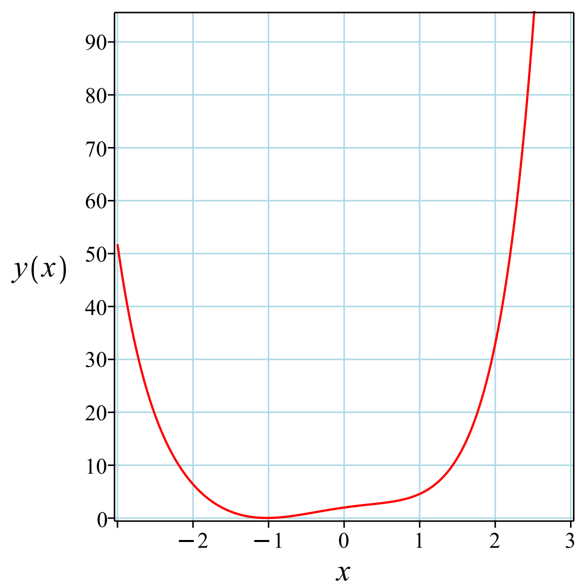

Figure 549: Solution plot

Verification of solutions

$$y = \frac{e^{-2x}}{8} + \frac{5\,e^{2x}}{8} + \frac{5\cos(2x)}{4} + \frac{\sin(2x)}{2}$$

Verified OK.

18.23.1 Maple step by step solution

Let's solve

$$\left[y'''' - 16y = 0, y(0) = 2, y'\Big|_{\{x=0\}} = 2, y''\Big|_{\{x=0\}} = -2, y'''\Big|_{\{x=0\}} = 0\right]$$

- Highest derivative means the order of the ODE is 4

  y''''

- □ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$
  - Define new variable $y_2(x)$

    $y_2(x) = y'$
  - Define new variable $y_3(x)$

    $y_3(x) = y''$
  - Define new variable $y_4(x)$

    $y_4(x) = y'''$
  - Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = 16y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = 16y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 16 & 0 & 0 & 0 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 16 & 0 & 0 & 0 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[-2\,\mathrm{I}, \begin{bmatrix} -\frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[2\,\mathrm{I}, \begin{bmatrix} \frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ -\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-2x} \cdot \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_2 = e^{2x} \cdot \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-2\,\mathrm{I}, \begin{bmatrix} -\frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$e^{-2\,\mathrm{I}x} \cdot \begin{bmatrix} -\frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of sin and cos

$$(\cos(2x) - \mathrm{I}\sin(2x)) \cdot \begin{bmatrix} -\frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}$$

- Simplify expression

$$\begin{bmatrix} -\frac{\mathrm{I}}{8}(\cos(2x) - \mathrm{I}\sin(2x)) \\ -\frac{\cos(2x)}{4} + \frac{\mathrm{I}\sin(2x)}{4} \\ \frac{\mathrm{I}}{2}(\cos(2x) - \mathrm{I}\sin(2x)) \\ \cos(2x) - \mathrm{I}\sin(2x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = \begin{bmatrix} -\frac{\sin(2x)}{8} \\ -\frac{\cos(2x)}{4} \\ \frac{\sin(2x)}{2} \\ \cos(2x) \end{bmatrix}, \vec{y}_4(x) = \begin{bmatrix} -\frac{\cos(2x)}{8} \\ \frac{\sin(2x)}{4} \\ \frac{\cos(2x)}{2} \\ -\sin(2x) \end{bmatrix}\right]$$

- General solution to the system of ODEs

$\vec{y} = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x)$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{-2x} \cdot \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix} + c_2 e^{2x} \cdot \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} + \begin{bmatrix} -\frac{c_3\sin(2x)}{8} - \frac{c_4\cos(2x)}{8} \\ -\frac{c_3\cos(2x)}{4} + \frac{c_4\sin(2x)}{4} \\ \frac{c_3\sin(2x)}{2} + \frac{c_4\cos(2x)}{2} \\ c_3\cos(2x) - c_4\sin(2x) \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$y = -\frac{c_1 e^{-2x}}{8} + \frac{c_2 e^{2x}}{8} - \frac{c_4\cos(2x)}{8} - \frac{c_3\sin(2x)}{8}$

- Use the initial condition $y(0) = 2$

$2 = -\frac{c_1}{8} + \frac{c_2}{8} - \frac{c_4}{8}$

- Calculate the 1st derivative of the solution

$y' = \frac{c_1 e^{-2x}}{4} + \frac{c_2 e^{2x}}{4} + \frac{c_4\sin(2x)}{4} - \frac{c_3\cos(2x)}{4}$

- Use the initial condition $y'\Big|_{\{x=0\}} = 2$

$2 = \frac{c_1}{4} + \frac{c_2}{4} - \frac{c_3}{4}$

- Calculate the 2nd derivative of the solution

$y'' = -\frac{c_1 e^{-2x}}{2} + \frac{c_2 e^{2x}}{2} + \frac{c_4\cos(2x)}{2} + \frac{c_3\sin(2x)}{2}$

- Use the initial condition $y''\Big|_{\{x=0\}} = -2$

$-2 = -\frac{c_1}{2} + \frac{c_2}{2} + \frac{c_4}{2}$

- Calculate the 3rd derivative of the solution

$y''' = c_1 e^{-2x} + c_2 e^{2x} - c_4\sin(2x) + c_3\cos(2x)$

- Use the initial condition $y'''\Big|_{\{x=0\}} = 0$

$0 = c_1 + c_2 + c_3$

- Solve for the unknown coefficients

  $$\{c_1 = -1, c_2 = 5, c_3 = -4, c_4 = -10\}$$

- Solution to the IVP

  $$y = \frac{e^{-2x}}{8} + \frac{5 e^{2x}}{8} + \frac{5\cos(2x)}{4} + \frac{\sin(2x)}{2}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 24.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{y'''' - 6y''' + 7y'' + 6y' - 8y = 0}$$

With initial conditions

$$[y(0) = -2, y'(0) = -8, y''(0) = -14, y'''(0) = -62]$$

The characteristic equation is

$$\lambda^4 - 6\lambda^3 + 7\lambda^2 + 6\lambda - 8 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 2$$
$$\lambda_3 = 4$$
$$\lambda_4 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{x} + c_3 e^{2x} + c_4 e^{4x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{-x} \\
y_2 &= \mathrm{e}^{x} \\
y_3 &= \mathrm{e}^{2x} \\
y_4 &= \mathrm{e}^{4x}
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + c_3 \mathrm{e}^{2x} + c_4 \mathrm{e}^{4x} \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = -2$ and $x = 0$ in the above gives

$$
-2 = c_1 + c_2 + c_3 + c_4 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = -c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + 2c_3 \mathrm{e}^{2x} + 4c_4 \mathrm{e}^{4x}
$$

substituting $y' = -8$ and $x = 0$ in the above gives

$$
-8 = -c_1 + c_2 + 2c_3 + 4c_4 \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + 4c_3 \mathrm{e}^{2x} + 16c_4 \mathrm{e}^{4x}
$$

substituting $y'' = -14$ and $x = 0$ in the above gives

$$
-14 = c_1 + c_2 + 4c_3 + 16c_4 \tag{3A}
$$

Taking three derivatives of the solution gives

$$
y''' = -c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + 8c_3 \mathrm{e}^{2x} + 64c_4 \mathrm{e}^{4x}
$$

substituting $y''' = -62$ and $x = 0$ in the above gives

$$
-62 = -c_1 + c_2 + 8c_3 + 64c_4 \tag{4A}
$$

Equations {1A,2A,3A,4A} are now solved for $\{c_1, c_2, c_3, c_4\}$. Solving for the constants gives

$$
\begin{aligned}
c_1 &= 2 \\
c_2 &= -4 \\
c_3 &= 1 \\
c_4 &= -1
\end{aligned}
$$

Substituting these values back in above solution results in

$$
y = 2\,\mathrm{e}^{-x} - 4\,\mathrm{e}^{x} + \mathrm{e}^{2x} - \mathrm{e}^{4x}
$$

Summary

The solution(s) found are the following

$$
y = 2\,\mathrm{e}^{-x} - 4\,\mathrm{e}^{x} + \mathrm{e}^{2x} - \mathrm{e}^{4x} \tag{1}
$$

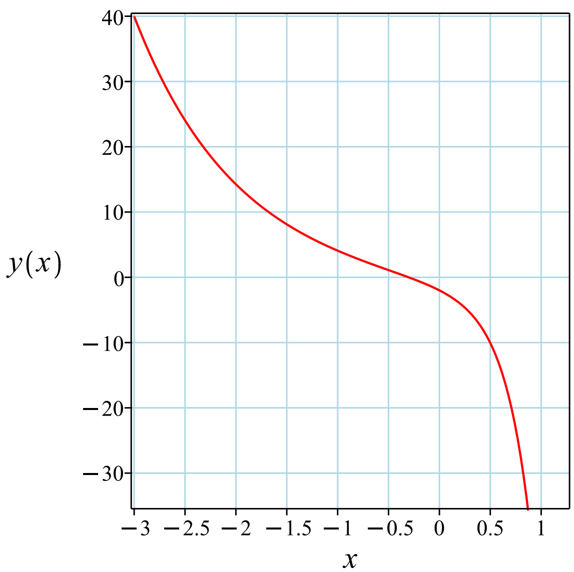

Figure 550: Solution plot

Verification of solutions

$$
y = 2\,\mathrm{e}^{-x} - 4\,\mathrm{e}^{x} + \mathrm{e}^{2x} - \mathrm{e}^{4x}
$$

Verified OK.

18.24.1 Maple step by step solution

Let's solve

$$\left[y'''' - 6y''' + 7y'' + 6y' - 8y = 0, y(0) = -2, y'\Big|_{\{x=0\}} = -8, y''\Big|_{\{x=0\}} = -14, y'''\Big|_{\{x=0\}} = -62\right]$$

Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 25.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{4y'''' - 13y'' + 9y = 0}$$

With initial conditions

$$[y(0) = 1, y'(0) = 3, y''(0) = 1, y'''(0) = 3]$$

The characteristic equation is

$$4\lambda^4 - 13\lambda^2 + 9 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = -1$$
$$\lambda_3 = -\frac{3}{2}$$
$$\lambda_4 = \frac{3}{2}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + \mathrm{e}^{-\frac{3x}{2}} c_3 + \mathrm{e}^{\frac{3x}{2}} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= e^{-x} \\
y_2 &= e^{x} \\
y_3 &= e^{-\frac{3x}{2}} \\
y_4 &= e^{\frac{3x}{2}}
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = c_1 e^{-x} + c_2 e^{x} + e^{-\frac{3x}{2}} c_3 + e^{\frac{3x}{2}} c_4 \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 1$ and $x = 0$ in the above gives

$$
1 = c_1 + c_2 + c_3 + c_4 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = -c_1 e^{-x} + c_2 e^{x} - \frac{3\,e^{-\frac{3x}{2}} c_3}{2} + \frac{3\,e^{\frac{3x}{2}} c_4}{2}
$$

substituting $y' = 3$ and $x = 0$ in the above gives

$$
3 = -c_1 + c_2 - \frac{3c_3}{2} + \frac{3c_4}{2} \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = c_1 e^{-x} + c_2 e^{x} + \frac{9\,e^{-\frac{3x}{2}} c_3}{4} + \frac{9\,e^{\frac{3x}{2}} c_4}{4}
$$

substituting $y'' = 1$ and $x = 0$ in the above gives

$$
1 = c_1 + c_2 + \frac{9c_3}{4} + \frac{9c_4}{4} \tag{3A}
$$

Taking three derivatives of the solution gives

$$
y''' = -c_1 e^{-x} + c_2 e^{x} - \frac{27\,e^{-\frac{3x}{2}} c_3}{8} + \frac{27\,e^{\frac{3x}{2}} c_4}{8}
$$

substituting $y''' = 3$ and $x = 0$ in the above gives

$$
3 = -c_1 + c_2 - \frac{27c_3}{8} + \frac{27c_4}{8} \tag{4A}
$$

Equations {1A,2A,3A,4A} are now solved for $\{c_1, c_2, c_3, c_4\}$. Solving for the constants gives

$$
\begin{aligned}
c_1 &= -1 \\
c_2 &= 2 \\
c_3 &= 0 \\
c_4 &= 0
\end{aligned}
$$

Substituting these values back in above solution results in

$$y = -\mathrm{e}^{-x} + 2\,\mathrm{e}^{x}$$

Summary

The solution(s) found are the following

$$y = -\mathrm{e}^{-x} + 2\,\mathrm{e}^{x} \tag{1}$$

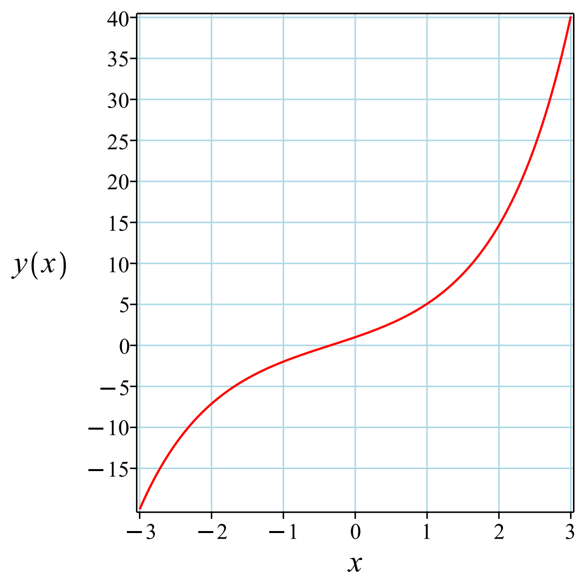

Figure 551: Solution plot

Verification of solutions

$$y = -\mathrm{e}^{-x} + 2\,\mathrm{e}^{x}$$

Verified OK.

18.25.1 Maple step by step solution

Let's solve

$$\left[4y'''' - 13y'' + 9y = 0, y(0) = 1, y'\Big|_{\{x=0\}} = 3, y''\Big|_{\{x=0\}} = 1, y'''\Big|_{\{x=0\}} = 3\right]$$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = \frac{13y''}{4} - \frac{9y}{4}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'''' - \frac{13y''}{4} + \frac{9y}{4} = 0$

□ Convert linear ODE into a system of first order ODEs

  ○ Define new variable $y_1(x)$

    $y_1(x) = y$

  ○ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ○ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ○ Define new variable $y_4(x)$

    $y_4(x) = y'''$

  ○ Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = \frac{13y_3(x)}{4} - \frac{9y_1(x)}{4}$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = \frac{13y_3(x)}{4} - \frac{9y_1(x)}{4}\right]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\overrightarrow{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -\frac{9}{4} & 0 & \frac{13}{4} & 0 \end{bmatrix} \cdot \overrightarrow{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -\frac{9}{4} & 0 & \frac{13}{4} & 0 \end{bmatrix}$$

- Rewrite the system as

$$\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-\frac{3}{2}, \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[\frac{3}{2}, \begin{bmatrix} \frac{8}{27} \\ \frac{4}{9} \\ \frac{2}{3} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-\frac{3}{2}, \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-\frac{3x}{2}} \cdot \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_{2} = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_{3} = \mathrm{e}^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[\frac{3}{2}, \left[\begin{array}{c} \frac{8}{27} \\ \frac{4}{9} \\ \frac{2}{3} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_4 = e^{\frac{3x}{2}} \cdot \begin{bmatrix} \frac{8}{27} \\ \frac{4}{9} \\ \frac{2}{3} \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\vec{y} = c_1 \vec{y}_1 + c_2 \vec{y}_2 + c_3 \vec{y}_3 + c_4 \vec{y}_4$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{-\frac{3x}{2}} \cdot \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix} + c_2 e^{-x} \cdot \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix} + c_3 e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} + e^{\frac{3x}{2}} c_4 \cdot \begin{bmatrix} \frac{8}{27} \\ \frac{4}{9} \\ \frac{2}{3} \\ 1 \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = -\frac{\left(-8\,e^{3x} c_4 - 27 c_3 e^{\frac{5x}{2}} + 27 c_2 e^{\frac{x}{2}} + 8 c_1\right) e^{-\frac{3x}{2}}}{27}$$

- Use the initial condition $y(0) = 1$

$$1 = \frac{8c_4}{27} + c_3 - c_2 - \frac{8c_1}{27}$$

- Calculate the 1st derivative of the solution

$$y' = -\frac{\left(-24\,e^{3x} c_4 - \frac{135 c_3 e^{\frac{5x}{2}}}{2} + \frac{27 c_2 e^{\frac{x}{2}}}{2}\right) e^{-\frac{3x}{2}}}{27} + \frac{\left(-8\,e^{3x} c_4 - 27 c_3 e^{\frac{5x}{2}} + 27 c_2 e^{\frac{x}{2}} + 8 c_1\right) e^{-\frac{3x}{2}}}{18}$$

- Use the initial condition $y'\Big|_{\{x=0\}} = 3$

$$3 = \frac{4c_4}{9} + c_3 + c_2 + \frac{4c_1}{9}$$

- Calculate the 2nd derivative of the solution

$$y'' = -\frac{\left(-72\,e^{3x} c_4 - \frac{675 c_3 e^{\frac{5x}{2}}}{4} + \frac{27 c_2 e^{\frac{x}{2}}}{4}\right) e^{-\frac{3x}{2}}}{27} + \frac{\left(-24\,e^{3x} c_4 - \frac{135 c_3 e^{\frac{5x}{2}}}{2} + \frac{27 c_2 e^{\frac{x}{2}}}{2}\right) e^{-\frac{3x}{2}}}{9} - \frac{\left(-8\,e^{3x} c_4 - 27 c_3 e^{\frac{5x}{2}} + 27 c_2 e^{\frac{x}{2}} + 8\right.}{12}$$

- Use the initial condition $y''\Big|_{\{x=0\}} = 1$

$$1 = \frac{2c_4}{3} + c_3 - c_2 - \frac{2c_1}{3}$$

- Calculate the 3rd derivative of the solution

$$y''' = -\frac{\left(-216\,e^{3x} c_4 - \frac{3375 c_3 e^{\frac{5x}{2}}}{8} + \frac{27 c_2 e^{\frac{x}{2}}}{8}\right) e^{-\frac{3x}{2}}}{27} + \frac{\left(-72\,e^{3x} c_4 - \frac{675 c_3 e^{\frac{5x}{2}}}{4} + \frac{27 c_2 e^{\frac{x}{2}}}{4}\right) e^{-\frac{3x}{2}}}{6} - \frac{\left(-24\,e^{3x} c_4 - \frac{135 c_3 e^{\frac{5x}{2}}}{2} + \frac{27 c_2}{2}\right.}{4}$$

- Use the initial condition $y'''\Big|_{\{x=0\}} = 3$

  $3 = c_1 + c_2 + c_3 + c_4$

- Solve for the unknown coefficients

  $\{c_1 = 0, c_2 = 1, c_3 = 2, c_4 = 0\}$

- Solution to the IVP

  $y = -\mathrm{e}^{-x} + 2\,\mathrm{e}^{x}$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{y'''' + 2y''' - 2y'' - 8y' - 8y = 0}$$

With initial conditions

$$[y(0) = 5, y'(0) = -2, y''(0) = 6, y'''(0) = 8]$$

The characteristic equation is

$$\lambda^4 + 2\lambda^3 - 2\lambda^2 - 8\lambda - 8 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = -2$$
$$\lambda_3 = -1 - i$$
$$\lambda_4 = -1 + i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-2x} + \mathrm{e}^{(-1-i)x} c_2 + c_3 \mathrm{e}^{2x} + \mathrm{e}^{(-1+i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{-2x} \\
y_2 &= \mathrm{e}^{(-1-i)x} \\
y_3 &= \mathrm{e}^{2x} \\
y_4 &= \mathrm{e}^{(-1+i)x}
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = c_1 \mathrm{e}^{-2x} + \mathrm{e}^{(-1-i)x} c_2 + c_3 \mathrm{e}^{2x} + \mathrm{e}^{(-1+i)x} c_4 \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 5$ and $x = 0$ in the above gives

$$
5 = c_1 + c_2 + c_3 + c_4 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = -2c_1 \mathrm{e}^{-2x} + (-1-i)\,\mathrm{e}^{(-1-i)x} c_2 + 2c_3 \mathrm{e}^{2x} + (-1+i)\,\mathrm{e}^{(-1+i)x} c_4
$$

substituting $y' = -2$ and $x = 0$ in the above gives

$$
-2 = -2c_1 + (-1-i)\,c_2 + 2c_3 + (-1+i)\,c_4 \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = 4c_1 \mathrm{e}^{-2x} + 2i\mathrm{e}^{(-1-i)x} c_2 + 4c_3 \mathrm{e}^{2x} - 2i\mathrm{e}^{(-1+i)x} c_4
$$

substituting $y'' = 6$ and $x = 0$ in the above gives

$$
6 = 2c_2 i - 2c_4 i + 4c_1 + 4c_3 \tag{3A}
$$

Taking three derivatives of the solution gives

$$
y''' = -8c_1 \mathrm{e}^{-2x} + (2-2i)\,\mathrm{e}^{(-1-i)x} c_2 + 8c_3 \mathrm{e}^{2x} + (2+2i)\,\mathrm{e}^{(-1+i)x} c_4
$$

substituting $y''' = 8$ and $x = 0$ in the above gives

$$
8 = -8c_1 + (2-2i)\,c_2 + 8c_3 + (2+2i)\,c_4 \tag{4A}
$$

Equations {1A,2A,3A,4A} are now solved for $\{c_1, c_2, c_3, c_4\}$. Solving for the constants gives

$$
\begin{aligned}
c_1 &= 1 \\
c_2 &= \frac{3}{2} + \frac{i}{2} \\
c_3 &= 1 \\
c_4 &= \frac{3}{2} - \frac{i}{2}
\end{aligned}
$$

Substituting these values back in above solution results in

$$
y = \mathrm{e}^{-2x} + \frac{3\,\mathrm{e}^{(-1-i)x}}{2} + \frac{i\mathrm{e}^{(-1-i)x}}{2} + \mathrm{e}^{2x} + \frac{3\,\mathrm{e}^{(-1+i)x}}{2} - \frac{i\mathrm{e}^{(-1+i)x}}{2}
$$

Summary

The solution(s) found are the following

$$
y = \left(\frac{3}{2} + \frac{i}{2}\right)\mathrm{e}^{(-1-i)x} + \left(\frac{3}{2} - \frac{i}{2}\right)\mathrm{e}^{(-1+i)x} + \mathrm{e}^{-2x} + \mathrm{e}^{2x} \tag{1}
$$

Verification of solutions

$$
y = \left(\frac{3}{2} + \frac{i}{2}\right)\mathrm{e}^{(-1-i)x} + \left(\frac{3}{2} - \frac{i}{2}\right)\mathrm{e}^{(-1+i)x} + \mathrm{e}^{-2x} + \mathrm{e}^{2x}
$$

Verified OK.

18.26.1 Maple step by step solution

Let's solve

$$
\left[y'''' + 2y''' - 2y'' - 8y' - 8y = 0, y(0) = 5, y'\Big|_{\{x=0\}} = -2, y''\Big|_{\{x=0\}} = 6, y'''\Big|_{\{x=0\}} = 8\right]
$$

- Highest derivative means the order of the ODE is 4

  y''''

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Define new variable $y_4(x)$

  $y_4(x) = y'''$
- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = -2y_4(x) + 2y_3(x) + 8y_2(x) + 8y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -2y_4(x) + 2y_3(x) + 8y_2(x) + 8y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 8 & 8 & 2 & -2 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 8 & 8 & 2 & -2 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x)$
- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \left[\begin{array}{c} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right], \left[2, \left[\begin{array}{c} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]\right], \left[-1-\mathrm{I}, \left[\begin{array}{c} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right], \left[-1+\mathrm{I}, \left[\begin{array}{c} \frac{1}{4}-\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ -\frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-2, \left[\begin{array}{c} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-2x} \cdot \left[\begin{array}{c} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[2, \left[\begin{array}{c} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{2x} \cdot \left[\begin{array}{c} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-1-\mathrm{I}, \left[\begin{array}{c} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(-1-\mathrm{I})x} \cdot \left[\begin{array}{c} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{-x} \cdot (\cos(x) - \mathrm{I}\sin(x)) \cdot \left[\begin{array}{c} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Simplify expression

$$\mathrm{e}^{-x} \cdot \left[\begin{array}{c} \left(\frac{1}{4}+\frac{\mathrm{I}}{4}\right)(\cos(x) - \mathrm{I}\sin(x)) \\ -\frac{\mathrm{I}}{2}(\cos(x) - \mathrm{I}\sin(x)) \\ \left(-\frac{1}{2}+\frac{\mathrm{I}}{2}\right)(\cos(x) - \mathrm{I}\sin(x)) \\ \cos(x) - \mathrm{I}\sin(x) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} \frac{\sin(x)}{4}+\frac{\cos(x)}{4} \\ -\frac{\sin(x)}{2} \\ -\frac{\cos(x)}{2}+\frac{\sin(x)}{2} \\ \cos(x) \end{array}\right], \vec{y}_4(x) = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} \frac{\cos(x)}{4}-\frac{\sin(x)}{4} \\ -\frac{\cos(x)}{2} \\ \frac{\cos(x)}{2}+\frac{\sin(x)}{2} \\ -\sin(x) \end{array}\right]\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x)$$

- Substitute solutions into the general solution

$$\overrightarrow{y} = c_1 e^{-2x} \cdot \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix} + c_2 e^{2x} \cdot \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} + c_3 e^{-x} \cdot \begin{bmatrix} \frac{\sin(x)}{4} + \frac{\cos(x)}{4} \\ -\frac{\sin(x)}{2} \\ -\frac{\cos(x)}{2} + \frac{\sin(x)}{2} \\ \cos(x) \end{bmatrix} + c_4 e^{-x} \cdot \begin{bmatrix} \frac{\cos(x)}{4} - \frac{\sin(x)}{4} \\ -\frac{\cos(x)}{2} \\ \frac{\cos(x)}{2} + \frac{\sin(x)}{2} \\ -\sin(x) \end{bmatrix}$$

- First component of the vector is the solution to the ODE

  $y = \frac{(c_2 e^{4x} + ((2c_3+2c_4)\cos(x) + 2(c_3-c_4)\sin(x))e^x - c_1)e^{-2x}}{8}$

- Use the initial condition $y(0) = 5$

  $5 = \frac{c_2}{8} + \frac{c_3}{4} + \frac{c_4}{4} - \frac{c_1}{8}$

- Calculate the 1st derivative of the solution

  $y' = \frac{(4c_2 e^{4x} + (-(2c_3+2c_4)\sin(x) + 2(c_3-c_4)\cos(x))e^x + ((2c_3+2c_4)\cos(x) + 2(c_3-c_4)\sin(x))e^x)e^{-2x}}{8} - \frac{(c_2 e^{4x} + ((2c_3+2c_4)\cos(x}{}$

- Use the initial condition $y'\Big|_{\{x=0\}} = -2$

  $-2 = \frac{c_2}{4} - \frac{c_4}{2} + \frac{c_1}{4}$

- Calculate the 2nd derivative of the solution

  $y'' = \frac{(16c_2 e^{4x} + (-(2c_3+2c_4)\cos(x) - 2(c_3-c_4)\sin(x))e^x + 2(-(2c_3+2c_4)\sin(x) + 2(c_3-c_4)\cos(x))e^x + ((2c_3+2c_4)\cos(x) + 2(c_3-c_4)}{8}$

- Use the initial condition $y''\Big|_{\{x=0\}} = 6$

  $6 = \frac{c_2}{2} - \frac{c_3}{2} + \frac{c_4}{2} - \frac{c_1}{2}$

- Calculate the 3rd derivative of the solution

  $y''' = \frac{(64c_2 e^{4x} + ((2c_3+2c_4)\sin(x) - 2(c_3-c_4)\cos(x))e^x + 3(-(2c_3+2c_4)\cos(x) - 2(c_3-c_4)\sin(x))e^x + 3(-(2c_3+2c_4)\sin(x) + 2(c_3-c_4}{8}$

- Use the initial condition $y'''\Big|_{\{x=0\}} = 8$

  $8 = c_1 + c_2 + c_3$

- Solve for the unknown coefficients

  $\{c_1 = -8, c_2 = 8, c_3 = 8, c_4 = 4\}$

- Solution to the IVP

  $y = (e^{4x} + (3\cos(x) + \sin(x))e^x + 1)e^{-2x}$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 27.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{4y'''' + 8y''' + 19y'' + 32y' + 12y = 0}$$

With initial conditions

$$\left[y(0) = 3, y'(0) = -3, y''(0) = -\frac{7}{2}, y'''(0) = \frac{31}{4}\right]$$

The characteristic equation is

$$4\lambda^4 + 8\lambda^3 + 19\lambda^2 + 32\lambda + 12 = 0$$

The roots of the above equation are

$$\lambda_1 = -\frac{3}{2}$$
$$\lambda_2 = -\frac{1}{2}$$
$$\lambda_3 = 2i$$
$$\lambda_4 = -2i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-\frac{x}{2}} + \mathrm{e}^{2ix} c_2 + \mathrm{e}^{-2ix} c_3 + \mathrm{e}^{-\frac{3x}{2}} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= e^{-\frac{x}{2}} \\
y_2 &= e^{2ix} \\
y_3 &= e^{-2ix} \\
y_4 &= e^{-\frac{3x}{2}}
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = c_1 e^{-\frac{x}{2}} + e^{2ix} c_2 + e^{-2ix} c_3 + e^{-\frac{3x}{2}} c_4 \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 3$ and $x = 0$ in the above gives

$$
3 = c_1 + c_2 + c_3 + c_4 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = -\frac{c_1 e^{-\frac{x}{2}}}{2} + 2i e^{2ix} c_2 - 2i e^{-2ix} c_3 - \frac{3\,e^{-\frac{3x}{2}} c_4}{2}
$$

substituting $y' = -3$ and $x = 0$ in the above gives

$$
-3 = -\frac{1}{2} c_1 + 2ic_2 - 2ic_3 - \frac{3}{2} c_4 \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = \frac{c_1 e^{-\frac{x}{2}}}{4} - 4\,e^{2ix} c_2 - 4\,e^{-2ix} c_3 + \frac{9\,e^{-\frac{3x}{2}} c_4}{4}
$$

substituting $y'' = -\frac{7}{2}$ and $x = 0$ in the above gives

$$
-\frac{7}{2} = \frac{c_1}{4} - 4c_2 - 4c_3 + \frac{9c_4}{4} \tag{3A}
$$

Taking three derivatives of the solution gives

$$
y''' = -\frac{c_1 e^{-\frac{x}{2}}}{8} - 8i e^{2ix} c_2 + 8i e^{-2ix} c_3 - \frac{27\,e^{-\frac{3x}{2}} c_4}{8}
$$

substituting $y''' = \frac{31}{4}$ and $x = 0$ in the above gives

$$
\frac{31}{4} = -\frac{1}{8} c_1 - 8ic_2 + 8ic_3 - \frac{27}{8} c_4 \tag{4A}
$$

Equations {1A,2A,3A,4A} are now solved for $\{c_1, c_2, c_3, c_4\}$. Solving for the constants gives

$$
\begin{aligned}
c_1 &= 2 \\
c_2 &= \frac{1}{2} + \frac{i}{2} \\
c_3 &= \frac{1}{2} - \frac{i}{2} \\
c_4 &= 0
\end{aligned}
$$

Substituting these values back in above solution results in

$$y = 2\,\mathrm{e}^{-\frac{x}{2}} + \cos(2x) - \sin(2x)$$

Summary

The solution(s) found are the following

$$y = 2\,\mathrm{e}^{-\frac{x}{2}} + \cos(2x) - \sin(2x) \tag{1}$$

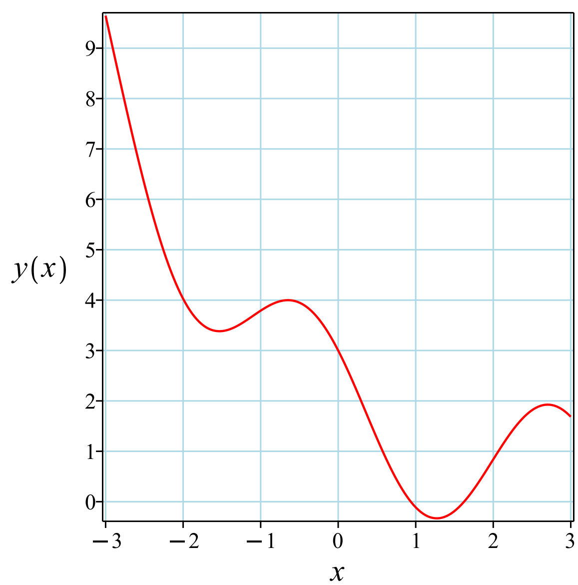

Figure 552: Solution plot

Verification of solutions

$$y = 2\,\mathrm{e}^{-\frac{x}{2}} + \cos(2x) - \sin(2x)$$

Verified OK.

18.27.1 Maple step by step solution

Let's solve

$$\left[4y'''' + 8y''' + 19y'' + 32y' + 12y = 0, y(0) = 3, y'\Big|_{\{x=0\}} = -3, y''\Big|_{\{x=0\}} = -\frac{7}{2}, y'''\Big|_{\{x=0\}} = \frac{31}{4}\right]$$

- Highest derivative means the order of the ODE is 4

y''''

- Isolate 4th derivative

$y'''' = -2y''' - \frac{19y''}{4} - 8y' - 3y$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y'''' + 2y''' + \frac{19y''}{4} + 8y' + 3y = 0$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

  $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

  $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

  $y_3(x) = y''$

  ◦ Define new variable $y_4(x)$

  $y_4(x) = y'''$

  ◦ Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = -2y_4(x) - \frac{19y_3(x)}{4} - 8y_2(x) - 3y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -2y_4(x) - \frac{19y_3(x)}{4} - 8y_2(x) - 3y_1(x)\right]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -3 & -8 & -\frac{19}{4} & -2 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -3 & -8 & -\frac{19}{4} & -2 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-\frac{3}{2}, \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}\right], \left[-\frac{1}{2}, \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix}\right], \left[-2\,\mathrm{I}, \begin{bmatrix} -\frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[2\,\mathrm{I}, \begin{bmatrix} \frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ -\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-\frac{3}{2}, \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-\frac{3x}{2}} \cdot \begin{bmatrix} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-\frac{1}{2}, \left[\begin{array}{c}-8 \\ 4 \\ -2 \\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_2 = e^{-\frac{x}{2}} \cdot \left[\begin{array}{c}-8 \\ 4 \\ -2 \\ 1\end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-2\,\mathrm{I}, \left[\begin{array}{c}-\frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1\end{array}\right]\right]$$

- Solution from eigenpair

$$e^{-2\,\mathrm{I}x} \cdot \left[\begin{array}{c}-\frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1\end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$(\cos (2x) - \mathrm{I} \sin (2x)) \cdot \left[\begin{array}{c}-\frac{\mathrm{I}}{8} \\ -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1\end{array}\right]$$

- Simplify expression

$$\left[\begin{array}{c} -\frac{I}{8}(\cos(2x)-I\sin(2x)) \\ -\frac{\cos(2x)}{4}+\frac{I\sin(2x)}{4} \\ \frac{I}{2}(\cos(2x)-I\sin(2x)) \\ \cos(2x)-I\sin(2x) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x)=\left[\begin{array}{c} -\frac{\sin(2x)}{8} \\ -\frac{\cos(2x)}{4} \\ \frac{\sin(2x)}{2} \\ \cos(2x) \end{array}\right], \vec{y}_4(x)=\left[\begin{array}{c} -\frac{\cos(2x)}{8} \\ \frac{\sin(2x)}{4} \\ \frac{\cos(2x)}{2} \\ -\sin(2x) \end{array}\right]\right]$$

- General solution to the system of ODEs

$\vec{y}=c_1\vec{y}_1+c_2\vec{y}_2+c_3\vec{y}_3(x)+c_4\vec{y}_4(x)$

- Substitute solutions into the general solution

$$\vec{y}=c_1 e^{-\frac{3x}{2}}\cdot\left[\begin{array}{c} -\frac{8}{27} \\ \frac{4}{9} \\ -\frac{2}{3} \\ 1 \end{array}\right]+c_2 e^{-\frac{x}{2}}\cdot\left[\begin{array}{c} -8 \\ 4 \\ -2 \\ 1 \end{array}\right]+\left[\begin{array}{c} -\frac{c_3\sin(2x)}{8}-\frac{c_4\cos(2x)}{8} \\ -\frac{c_3\cos(2x)}{4}+\frac{c_4\sin(2x)}{4} \\ \frac{c_3\sin(2x)}{2}+\frac{c_4\cos(2x)}{2} \\ c_3\cos(2x)-c_4\sin(2x) \end{array}\right]$$

- First component of the vector is the solution to the ODE

$y=-\frac{8c_1 e^{-\frac{3x}{2}}}{27}-8c_2 e^{-\frac{x}{2}}-\frac{c_4\cos(2x)}{8}-\frac{c_3\sin(2x)}{8}$

- Use the initial condition $y(0)=3$

$3=-\frac{8c_1}{27}-8c_2-\frac{c_4}{8}$

- Calculate the 1st derivative of the solution

$y'=\frac{4c_1 e^{-\frac{3x}{2}}}{9}+4c_2 e^{-\frac{x}{2}}+\frac{c_4\sin(2x)}{4}-\frac{c_3\cos(2x)}{4}$

- Use the initial condition $y'\Big|_{\{x=0\}}=-3$

$-3=\frac{4c_1}{9}+4c_2-\frac{c_3}{4}$

- Calculate the 2nd derivative of the solution

$y''=-\frac{2c_1 e^{-\frac{3x}{2}}}{3}-2c_2 e^{-\frac{x}{2}}+\frac{c_4\cos(2x)}{2}+\frac{c_3\sin(2x)}{2}$

- Use the initial condition $y''\Big|_{\{x=0\}} = -\frac{7}{2}$

  $-\frac{7}{2} = -\frac{2c_1}{3} - 2c_2 + \frac{c_4}{2}$
- Calculate the 3rd derivative of the solution

  $y''' = c_1 \mathrm{e}^{-\frac{3x}{2}} + c_2 \mathrm{e}^{-\frac{x}{2}} - c_4 \sin(2x) + c_3 \cos(2x)$
- Use the initial condition $y'''\Big|_{\{x=0\}} = \frac{31}{4}$

  $\frac{31}{4} = c_1 + c_2 + c_3$
- Solve for the unknown coefficients

  $\left\{c_1 = 0, c_2 = -\frac{1}{4}, c_3 = 8, c_4 = -8\right\}$
- Solution to the IVP

  $y = 2\,\mathrm{e}^{-\frac{x}{2}} + \cos(2x) - \sin(2x)$

18.28.1 Maple step by step solution

Let's solve

$y'''' - y = 0$

- Highest derivative means the order of the ODE is 4

  y''''

□ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

  - Define new variable $y_3(x)$

    $y_3(x) = y''$

  - Define new variable $y_4(x)$

    $y_4(x) = y'''$

  - Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[-\mathrm{I}, \begin{bmatrix} -\mathrm{I} \\ -1 \\ \mathrm{I} \\ 1 \end{bmatrix}\right], \left[\mathrm{I}, \begin{bmatrix} \mathrm{I} \\ -1 \\ -\mathrm{I} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = e^{-x} \cdot \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-\mathrm{I}, \begin{bmatrix} -\mathrm{I} \\ -1 \\ \mathrm{I} \\ 1 \end{bmatrix}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 43(b).
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{y'''' + y = 0}$$

The characteristic equation is

$$\lambda^4 + 1 = 0$$

The roots of the above equation are

$$\begin{aligned}
\lambda_1 &= \frac{\sqrt{2}}{2} + \frac{i\sqrt{2}}{2} \\
\lambda_2 &= -\frac{\sqrt{2}}{2} + \frac{i\sqrt{2}}{2} \\
\lambda_3 &= -\frac{\sqrt{2}}{2} - \frac{i\sqrt{2}}{2} \\
\lambda_4 &= \frac{\sqrt{2}}{2} - \frac{i\sqrt{2}}{2}
\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = e^{\left(\frac{\sqrt{2}}{2} - \frac{i\sqrt{2}}{2}\right)x} c_1 + e^{\left(\frac{\sqrt{2}}{2} + \frac{i\sqrt{2}}{2}\right)x} c_2 + e^{\left(-\frac{\sqrt{2}}{2} - \frac{i\sqrt{2}}{2}\right)x} c_3 + e^{\left(-\frac{\sqrt{2}}{2} + \frac{i\sqrt{2}}{2}\right)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{\left(\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}\right)x} \\
y_2 &= \mathrm{e}^{\left(\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}\right)x} \\
y_3 &= \mathrm{e}^{\left(-\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}\right)x} \\
y_4 &= \mathrm{e}^{\left(-\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}\right)x}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
y = \mathrm{e}^{\left(\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}\right)x} c_1 + \mathrm{e}^{\left(\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}\right)x} c_2 + \mathrm{e}^{\left(-\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}\right)x} c_3 + \mathrm{e}^{\left(-\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}\right)x} c_4 \tag{1}
$$

Verification of solutions

$$
y = \mathrm{e}^{\left(\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}\right)x} c_1 + \mathrm{e}^{\left(\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}\right)x} c_2 + \mathrm{e}^{\left(-\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}\right)x} c_3 + \mathrm{e}^{\left(-\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}\right)x} c_4
$$

Verified OK.

18.29.1 Maple step by step solution

Let's solve

$y'''' + y = 0$

- Highest derivative means the order of the ODE is 4

  y''''

- □ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -1 & 0 & 0 & 0 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -1 & 0 & 0 & 0 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-\frac{\sqrt{2}}{2} - \frac{I\sqrt{2}}{2}, \begin{bmatrix} \frac{1}{\left(-\frac{\sqrt{2}}{2} - \frac{I\sqrt{2}}{2}\right)^3} \\ \frac{1}{\left(-\frac{\sqrt{2}}{2} - \frac{I\sqrt{2}}{2}\right)^2} \\ \frac{1}{-\frac{\sqrt{2}}{2} - \frac{I\sqrt{2}}{2}} \\ 1 \end{bmatrix}\right], \left[-\frac{\sqrt{2}}{2} + \frac{I\sqrt{2}}{2}, \begin{bmatrix} \frac{1}{\left(-\frac{\sqrt{2}}{2} + \frac{I\sqrt{2}}{2}\right)^3} \\ \frac{1}{\left(-\frac{\sqrt{2}}{2} + \frac{I\sqrt{2}}{2}\right)^2} \\ \frac{1}{-\frac{\sqrt{2}}{2} + \frac{I\sqrt{2}}{2}} \\ 1 \end{bmatrix}\right], \left[\frac{\sqrt{2}}{2} - \frac{I\sqrt{2}}{2}, \begin{bmatrix} \frac{1}{\left(\frac{\sqrt{2}}{2} - \frac{I\sqrt{2}}{2}\right)^3} \\ \frac{1}{\left(\frac{\sqrt{2}}{2} - \frac{I\sqrt{2}}{2}\right)^2} \\ \frac{1}{\frac{\sqrt{2}}{2} - \frac{I\sqrt{2}}{2}} \\ 1 \end{bmatrix}\right]\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}, \left[\begin{array}{c}\frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}\right)^{3}}\\ \frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}\right)^{2}}\\ \frac{1}{-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}}\\ 1\end{array}\right]\right]$$

- Solution from eigenpair

$$e^{\left(-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}\right)x}\cdot\left[\begin{array}{c}\frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}\right)^{3}}\\ \frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}\right)^{2}}\\ \frac{1}{-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}}\\ 1\end{array}\right]$$

- Use Euler identity to write solution in terms of sin and cos

$$e^{-\frac{\sqrt{2}\,x}{2}}\cdot\left(\cos\left(\frac{\sqrt{2}\,x}{2}\right)-I\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right)\cdot\left[\begin{array}{c}\frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}\right)^{3}}\\ \frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}\right)^{2}}\\ \frac{1}{-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}}\\ 1\end{array}\right]$$

- Simplify expression

$$e^{-\frac{\sqrt{2}\,x}{2}}\cdot\left[\begin{array}{c}\frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)-I\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\left(-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}\right)^{3}}\\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)-I\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\left(-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}\right)^{2}}\\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)-I\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{-\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}}\\ \cos\left(\frac{\sqrt{2}\,x}{2}\right)-I\sin\left(\frac{\sqrt{2}\,x}{2}\right)\end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_1(x) = \mathrm{e}^{-\frac{\sqrt{2}\,x}{2}} \cdot \left[\begin{array}{c} \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} + \frac{\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} \\ -\sin\left(\frac{\sqrt{2}\,x}{2}\right) \\ -\frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} + \frac{\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} \\ \cos\left(\frac{\sqrt{2}\,x}{2}\right) \end{array}\right], \vec{y}_2(x) = \mathrm{e}^{-\frac{\sqrt{2}\,x}{2}} \cdot \left[\begin{array}{c} \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} - \frac{\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} \\ -\cos\left(\frac{\sqrt{2}\,x}{2}\right) \\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} + \frac{\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} \\ -\sin\left(\frac{\sqrt{2}\,x}{2}\right) \end{array}\right]\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[\frac{\sqrt{2}}{2} - \frac{\mathrm{I}\sqrt{2}}{2}, \left[\begin{array}{c} \frac{1}{\left(\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}\right)^3} \\ \frac{1}{\left(\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}\right)^2} \\ \frac{1}{\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{\left(\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}\right)x} \cdot \left[\begin{array}{c} \frac{1}{\left(\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}\right)^3} \\ \frac{1}{\left(\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}\right)^2} \\ \frac{1}{\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of sin and cos

$$\mathrm{e}^{\frac{\sqrt{2}\,x}{2}} \cdot \left(\cos\left(\frac{\sqrt{2}\,x}{2}\right) - \mathrm{I}\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right) \cdot \left[\begin{array}{c} \frac{1}{\left(\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}\right)^3} \\ \frac{1}{\left(\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}\right)^2} \\ \frac{1}{\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{\frac{\sqrt{2}\,x}{2}} \cdot \left[\begin{array}{c} \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)-I\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\left(\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}\right)^{3}} \\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)-I\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\left(\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}\right)^{2}} \\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)-I\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}} \\ \cos\left(\frac{\sqrt{2}\,x}{2}\right)-I\sin\left(\frac{\sqrt{2}\,x}{2}\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_{3}(x) = e^{\frac{\sqrt{2}\,x}{2}} \cdot \left[\begin{array}{c} -\frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2}+\frac{\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} \\ \sin\left(\frac{\sqrt{2}\,x}{2}\right) \\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2}+\frac{\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} \\ \cos\left(\frac{\sqrt{2}\,x}{2}\right) \end{array}\right], \vec{y}_{4}(x) = e^{\frac{\sqrt{2}\,x}{2}} \cdot \left[\begin{array}{c} \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2}+\frac{\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} \\ \cos\left(\frac{\sqrt{2}\,x}{2}\right) \\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2}-\frac{\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} \\ -\sin\left(\frac{\sqrt{2}\,x}{2}\right) \end{array}\right]\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_1\vec{y}_1(x) + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + c_4\vec{y}_4(x)$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{-\frac{\sqrt{2}\,x}{2}} \cdot \left[\begin{array}{c} \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2}+\frac{\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} \\ -\sin\left(\frac{\sqrt{2}\,x}{2}\right) \\ -\frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2}+\frac{\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} \\ \cos\left(\frac{\sqrt{2}\,x}{2}\right) \end{array}\right] + c_2 e^{-\frac{\sqrt{2}\,x}{2}} \cdot \left[\begin{array}{c} \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2}-\frac{\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} \\ -\cos\left(\frac{\sqrt{2}\,x}{2}\right) \\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2}+\frac{\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}}{2} \\ -\sin\left(\frac{\sqrt{2}\,x}{2}\right) \end{array}\right] + c_3 e^{\frac{\sqrt{2}\,x}{2}}$$

- First component of the vector is the solution to the ODE

$$y = \frac{\left(\left((c_1+c_2)e^{-\frac{\sqrt{2}\,x}{2}} - e^{\frac{\sqrt{2}\,x}{2}}(c_3-c_4)\right)\cos\left(\frac{\sqrt{2}\,x}{2}\right) + \sin\left(\frac{\sqrt{2}\,x}{2}\right)\left((c_1-c_2)e^{-\frac{\sqrt{2}\,x}{2}} + e^{\frac{\sqrt{2}\,x}{2}}(c_3+c_4)\right)\right)\sqrt{2}}{2}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 43(c).
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{y'''' + 64y = 0}$$

The characteristic equation is

$$\lambda^4 + 64 = 0$$

The roots of the above equation are

$$\begin{aligned}
\lambda_1 &= 2 - 2i \\
\lambda_2 &= 2 + 2i \\
\lambda_3 &= -2 - 2i \\
\lambda_4 &= -2 + 2i
\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = \mathrm{e}^{(2-2i)x}c_1 + \mathrm{e}^{(-2+2i)x}c_2 + \mathrm{e}^{(-2-2i)x}c_3 + \mathrm{e}^{(2+2i)x}c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned}
y_1 &= \mathrm{e}^{(2-2i)x} \\
y_2 &= \mathrm{e}^{(-2+2i)x} \\
y_3 &= \mathrm{e}^{(-2-2i)x} \\
y_4 &= \mathrm{e}^{(2+2i)x}
\end{aligned}$$

Summary

The solution(s) found are the following

$$y = e^{(2-2i)x} c_1 + e^{(-2+2i)x} c_2 + e^{(-2-2i)x} c_3 + e^{(2+2i)x} c_4 \tag{1}$$

Verification of solutions

$$y = e^{(2-2i)x} c_1 + e^{(-2+2i)x} c_2 + e^{(-2-2i)x} c_3 + e^{(2+2i)x} c_4$$

Verified OK.

18.30.1 Maple step by step solution

Let's solve

$y'''' + 64y = 0$

- Highest derivative means the order of the ODE is 4

  y''''

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Define new variable $y_4(x)$

    $y_4(x) = y'''$

  ◦ Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = -64y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -64y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -64 & 0 & 0 & 0 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -64 & 0 & 0 & 0 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2-2\mathrm{I}, \begin{bmatrix} \frac{1}{32}+\frac{\mathrm{I}}{32} \\ -\frac{\mathrm{I}}{8} \\ -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ 1 \end{bmatrix}\right], \left[-2+2\mathrm{I}, \begin{bmatrix} \frac{1}{32}-\frac{\mathrm{I}}{32} \\ \frac{\mathrm{I}}{8} \\ -\frac{1}{4}-\frac{\mathrm{I}}{4} \\ 1 \end{bmatrix}\right], \left[2-2\mathrm{I}, \begin{bmatrix} -\frac{1}{32}+\frac{\mathrm{I}}{32} \\ \frac{\mathrm{I}}{8} \\ \frac{1}{4}+\frac{\mathrm{I}}{4} \\ 1 \end{bmatrix}\right], \left[2+2\mathrm{I}, \begin{bmatrix} -\frac{1}{3\ldots} \\ \\ \frac{1}{4} \\ \end{bmatrix}\right.\right.$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-2-2\mathrm{I}, \begin{bmatrix} \frac{1}{32}+\frac{\mathrm{I}}{32} \\ -\frac{\mathrm{I}}{8} \\ -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$e^{(-2-2\,I)x} \cdot \begin{bmatrix} \frac{1}{32}+\frac{I}{32} \\ -\frac{I}{8} \\ -\frac{1}{4}+\frac{I}{4} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of sin and cos

$$e^{-2x} \cdot (\cos(2x) - I\sin(2x)) \cdot \begin{bmatrix} \frac{1}{32}+\frac{I}{32} \\ -\frac{I}{8} \\ -\frac{1}{4}+\frac{I}{4} \\ 1 \end{bmatrix}$$

- Simplify expression

$$e^{-2x} \cdot \begin{bmatrix} \left(\frac{1}{32}+\frac{I}{32}\right)(\cos(2x) - I\sin(2x)) \\ -\frac{I}{8}(\cos(2x) - I\sin(2x)) \\ \left(-\frac{1}{4}+\frac{I}{4}\right)(\cos(2x) - I\sin(2x)) \\ \cos(2x) - I\sin(2x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_1(x) = e^{-2x} \cdot \begin{bmatrix} \frac{\cos(2x)}{32}+\frac{\sin(2x)}{32} \\ -\frac{\sin(2x)}{8} \\ -\frac{\cos(2x)}{4}+\frac{\sin(2x)}{4} \\ \cos(2x) \end{bmatrix}, \vec{y}_2(x) = e^{-2x} \cdot \begin{bmatrix} \frac{\cos(2x)}{32}-\frac{\sin(2x)}{32} \\ -\frac{\cos(2x)}{8} \\ \frac{\sin(2x)}{4}+\frac{\cos(2x)}{4} \\ -\sin(2x) \end{bmatrix}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[2-2\,I, \begin{bmatrix} -\frac{1}{32}+\frac{I}{32} \\ \frac{I}{8} \\ \frac{1}{4}+\frac{I}{4} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$e^{(2-2I)x} \cdot \begin{bmatrix} -\frac{1}{32}+\frac{I}{32} \\ \frac{I}{8} \\ \frac{1}{4}+\frac{I}{4} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of sin and cos

$$e^{2x} \cdot (\cos(2x) - I\sin(2x)) \cdot \begin{bmatrix} -\frac{1}{32}+\frac{I}{32} \\ \frac{I}{8} \\ \frac{1}{4}+\frac{I}{4} \\ 1 \end{bmatrix}$$

- Simplify expression

$$e^{2x} \cdot \begin{bmatrix} \left(-\frac{1}{32}+\frac{I}{32}\right)(\cos(2x) - I\sin(2x)) \\ \frac{I}{8}(\cos(2x) - I\sin(2x)) \\ \left(\frac{1}{4}+\frac{I}{4}\right)(\cos(2x) - I\sin(2x)) \\ \cos(2x) - I\sin(2x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = e^{2x} \cdot \begin{bmatrix} -\frac{\cos(2x)}{32}+\frac{\sin(2x)}{32} \\ \frac{\sin(2x)}{8} \\ \frac{\sin(2x)}{4}+\frac{\cos(2x)}{4} \\ \cos(2x) \end{bmatrix}, \vec{y}_4(x) = e^{2x} \cdot \begin{bmatrix} \frac{\cos(2x)}{32}+\frac{\sin(2x)}{32} \\ \frac{\cos(2x)}{8} \\ \frac{\cos(2x)}{4}-\frac{\sin(2x)}{4} \\ -\sin(2x) \end{bmatrix}\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_1\vec{y}_1(x) + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + c_4\vec{y}_4(x)$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{-2x} \cdot \begin{bmatrix} \frac{\cos(2x)}{32}+\frac{\sin(2x)}{32} \\ -\frac{\sin(2x)}{8} \\ -\frac{\cos(2x)}{4}+\frac{\sin(2x)}{4} \\ \cos(2x) \end{bmatrix} + c_2 e^{-2x} \cdot \begin{bmatrix} \frac{\cos(2x)}{32}-\frac{\sin(2x)}{32} \\ -\frac{\cos(2x)}{8} \\ \frac{\sin(2x)}{4}+\frac{\cos(2x)}{4} \\ -\sin(2x) \end{bmatrix} + c_3 e^{2x} \cdot \begin{bmatrix} -\frac{\cos(2x)}{32}+\frac{\sin(2x)}{32} \\ \frac{\sin(2x)}{8} \\ \frac{\sin(2x)}{4}+\frac{\cos(2x)}{4} \\ \cos(2x) \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = \frac{((c_1+c_2)e^{-2x}-(c_3-c_4)e^{2x})\cos(2x)}{32} + \frac{((c_1-c_2)e^{-2x}+(c_3+c_4)e^{2x})\sin(2x)}{32}$$

18.31 problem section 9.2, problem 43(d)

Internal problem ID [1495]
Internal file name [`OUTPUT/1496_Sunday_June_05_2022_02_19_40_AM_23184824/index.tex`]

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 43(d).
ODE order: 6.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{y^{(6)} - y = 0}$$

The characteristic equation is

$$\lambda^6 - 1 = 0$$

The roots of the above equation are

$$\begin{aligned}
\lambda_1 &= 1 \\
\lambda_2 &= -1 \\
\lambda_3 &= \frac{\sqrt{-2i\sqrt{3}-2}}{2} \\
\lambda_4 &= -\frac{\sqrt{-2i\sqrt{3}-2}}{2} \\
\lambda_5 &= \frac{\sqrt{2i\sqrt{3}-2}}{2} \\
\lambda_6 &= -\frac{\sqrt{2i\sqrt{3}-2}}{2}
\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + \mathrm{e}^{\frac{\sqrt{2i\sqrt{3}-2}\,x}{2}} c_3 + \mathrm{e}^{\frac{\sqrt{-2i\sqrt{3}-2}\,x}{2}} c_4 + \mathrm{e}^{-\frac{\sqrt{2i\sqrt{3}-2}\,x}{2}} c_5 + \mathrm{e}^{-\frac{\sqrt{-2i\sqrt{3}-2}\,x}{2}} c_6$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned}
y_1 &= \mathrm{e}^{-x} \\
y_2 &= \mathrm{e}^{x} \\
y_3 &= \mathrm{e}^{\frac{\sqrt{2i\sqrt{3}-2}\,x}{2}} \\
y_4 &= \mathrm{e}^{\frac{\sqrt{-2i\sqrt{3}-2}\,x}{2}} \\
y_5 &= \mathrm{e}^{-\frac{\sqrt{2i\sqrt{3}-2}\,x}{2}} \\
y_6 &= \mathrm{e}^{-\frac{\sqrt{-2i\sqrt{3}-2}\,x}{2}}
\end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + \mathrm{e}^{\frac{\sqrt{2i\sqrt{3}-2}\,x}{2}} c_3 + \mathrm{e}^{\frac{\sqrt{-2i\sqrt{3}-2}\,x}{2}} c_4 + \mathrm{e}^{-\frac{\sqrt{2i\sqrt{3}-2}\,x}{2}} c_5 + \mathrm{e}^{-\frac{\sqrt{-2i\sqrt{3}-2}\,x}{2}} c_6 \quad (1)$$

Verification of solutions

$$y = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x} + \mathrm{e}^{\frac{\sqrt{2i\sqrt{3}-2}\,x}{2}} c_3 + \mathrm{e}^{\frac{\sqrt{-2i\sqrt{3}-2}\,x}{2}} c_4 + \mathrm{e}^{-\frac{\sqrt{2i\sqrt{3}-2}\,x}{2}} c_5 + \mathrm{e}^{-\frac{\sqrt{-2i\sqrt{3}-2}\,x}{2}} c_6$$

Verified OK.

18.31.1 Maple step by step solution

Let's solve

$y^{(6)} - y = 0$

- Highest derivative means the order of the ODE is 6

  $y^{(6)}$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

$y_3(x) = y''$

- Define new variable $y_4(x)$

  $y_4(x) = y'''$

- Define new variable $y_5(x)$

  $y_5(x) = y''''$

- Define new variable $y_6(x)$

  $y_6(x) = y^{(5)}$

- Isolate for $y_6'(x)$ using original ODE

  $y_6'(x) = y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_5(x) = y_4'(x), y_6(x) = y_5'(x), y_6'(x) = y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \\ y_5(x) \\ y_6(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 & 0 & 0 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

- Rewrite the system as

  $\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[-\frac{1}{2} - \frac{\mathrm{I}\sqrt{3}}{2}, \begin{bmatrix} \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^5} \\ \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^4} \\ \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^3} \\ \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^2} \\ \frac{1}{-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}} \\ 1 \end{bmatrix}\right], \left[-\frac{1}{2} + \frac{\mathrm{I}\sqrt{3}}{2}, \begin{bmatrix} \frac{1}{\left(-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}\right)^5} \\ \frac{1}{\left(-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}\right)^4} \\ \frac{1}{\left(-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}\right)^3} \\ \frac{1}{\left(-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}\right)^2} \\ \frac{1}{-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}} \\ 1 \end{bmatrix}\right], \left[\frac{1}{2}\right.\right.$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-x} \cdot \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\begin{bmatrix} 1, & \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} \end{bmatrix}$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-\frac{1}{2}-\frac{I\sqrt{3}}{2}, \left[\begin{array}{c} \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{5}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{4}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{-\frac{1}{2}-\frac{I\sqrt{3}}{2}} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$e^{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)x} \cdot \left[\begin{array}{c} \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{5}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{4}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{-\frac{1}{2}-\frac{I\sqrt{3}}{2}} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^{-\frac{x}{2}} \cdot \left(\cos\left(\frac{\sqrt{3}\,x}{2}\right) - I\sin\left(\frac{\sqrt{3}\,x}{2}\right)\right) \cdot \left[\begin{array}{c} \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{5}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{4}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{-\frac{1}{2}-\frac{I\sqrt{3}}{2}} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{-\frac{x}{2}} \cdot \left[\begin{array}{c} \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{5}} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{4}} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{3}} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{2}} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}} \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_{3}(x) = e^{-\frac{x}{2}} \cdot \left[\begin{array}{c} \Re\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{5}}\right) \\ \Re\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{4}}\right) \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right) \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2}-\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right) \end{array}\right], \vec{y}_{4}(x) = e^{-\frac{x}{2}} \cdot \left[\begin{array}{c} \Im\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{5}}\right) \\ \Im\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{4}}\right) \\ -\sin\left(\frac{\sqrt{3}\,x}{2}\right) \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2} \\ -\sin\left(\frac{\sqrt{3}\,x}{2}\right) \end{array}\right]\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[\frac{1}{2}-\frac{I\sqrt{3}}{2}, \left[\begin{array}{c} \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{5}} \\ \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{4}} \\ \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{\frac{1}{2}-\frac{I\sqrt{3}}{2}} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$e^{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)x} \cdot \left[\begin{array}{c} \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{5}} \\ \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{4}} \\ \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{\frac{1}{2}-\frac{I\sqrt{3}}{2}} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of sin and cos

$$e^{\frac{x}{2}} \cdot \left(\cos\left(\frac{\sqrt{3}\,x}{2}\right) - I\sin\left(\frac{\sqrt{3}\,x}{2}\right)\right) \cdot \left[\begin{array}{c} \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{5}} \\ \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{4}} \\ \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{\frac{1}{2}-\frac{I\sqrt{3}}{2}} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{\frac{x}{2}} \cdot \left[\begin{array}{c} \frac{\cos\left(\frac{\sqrt{3}\, x}{2}\right)-\mathrm{I} \sin\left(\frac{\sqrt{3}\, x}{2}\right)}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{5}} \\ \frac{\cos\left(\frac{\sqrt{3}\, x}{2}\right)-\mathrm{I} \sin\left(\frac{\sqrt{3}\, x}{2}\right)}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{4}} \\ \frac{\cos\left(\frac{\sqrt{3}\, x}{2}\right)-\mathrm{I} \sin\left(\frac{\sqrt{3}\, x}{2}\right)}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{3}} \\ \frac{\cos\left(\frac{\sqrt{3}\, x}{2}\right)-\mathrm{I} \sin\left(\frac{\sqrt{3}\, x}{2}\right)}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{2}} \\ \frac{\cos\left(\frac{\sqrt{3}\, x}{2}\right)-\mathrm{I} \sin\left(\frac{\sqrt{3}\, x}{2}\right)}{\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}} \\ \cos\left(\frac{\sqrt{3}\, x}{2}\right)-\mathrm{I} \sin\left(\frac{\sqrt{3}\, x}{2}\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_{5}(x) = e^{\frac{x}{2}} \cdot \left[\begin{array}{c} \Re\left(\frac{\cos\left(\frac{\sqrt{3}\, x}{2}\right)-\mathrm{I} \sin\left(\frac{\sqrt{3}\, x}{2}\right)}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{5}}\right) \\ \Re\left(\frac{\cos\left(\frac{\sqrt{3}\, x}{2}\right)-\mathrm{I} \sin\left(\frac{\sqrt{3}\, x}{2}\right)}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{4}}\right) \\ -\cos\left(\frac{\sqrt{3}\, x}{2}\right) \\ -\frac{\cos\left(\frac{\sqrt{3}\, x}{2}\right)}{2}+\frac{\sin\left(\frac{\sqrt{3}\, x}{2}\right)\sqrt{3}}{2} \\ \frac{\cos\left(\frac{\sqrt{3}\, x}{2}\right)}{2}+\frac{\sin\left(\frac{\sqrt{3}\, x}{2}\right)\sqrt{3}}{2} \\ \cos\left(\frac{\sqrt{3}\, x}{2}\right) \end{array}\right], \vec{y}_{6}(x) = e^{\frac{x}{2}} \cdot \left[\begin{array}{c} \Im\left(\frac{\cos\left(\frac{\sqrt{3}\, x}{2}\right)-\mathrm{I} \sin\left(\frac{\sqrt{3}\, x}{2}\right)}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{5}}\right) \\ \Im\left(\frac{\cos\left(\frac{\sqrt{3}\, x}{2}\right)-\mathrm{I} \sin\left(\frac{\sqrt{3}\, x}{2}\right)}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{4}}\right) \\ \sin\left(\frac{\sqrt{3}\, x}{2}\right) \\ \frac{\cos\left(\frac{\sqrt{3}\, x}{2}\right)\sqrt{3}}{2}+\frac{\sin\left(\frac{\sqrt{3}\, x}{2}\right)}{2} \\ \frac{\cos\left(\frac{\sqrt{3}\, x}{2}\right)\sqrt{3}}{2}-\frac{\sin\left(\frac{\sqrt{3}\, x}{2}\right)}{2} \\ -\sin\left(\frac{\sqrt{3}\, x}{2}\right) \end{array}\right]\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_{1}\vec{y}_{1}+c_{2}\vec{y}_{2}+c_{3}\vec{y}_{3}(x)+c_{4}\vec{y}_{4}(x)+c_{5}\vec{y}_{5}(x)+c_{6}\vec{y}_{6}(x)$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{-x} \cdot \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \\ -1 \\ 1 \end{bmatrix} + c_2 e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} + e^{-\frac{x}{2}} c_3 \cdot \begin{bmatrix} \Re\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right) - I\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^5}\right) \\ \Re\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right) - I\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^4}\right) \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right) \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2} - \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2} + \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right) \end{bmatrix} + c_4 e^{-\frac{x}{2}} \cdot \begin{bmatrix} \Im\left(\frac{\cos\left(\frac{\sqrt{3}}{2}\right.}{(}\right. \\ \Im\left(\frac{\cos\left(\frac{\sqrt{3}}{2}\right.}{(}\right. \\ -\mathrm{s} \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right.}{2} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2} \\ -\mathrm{s} \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = \left(c_2 e^{2x} + 32 c_5 e^{\frac{3x}{2}} \Re\left(\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right) + I\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(\sqrt{3}+I\right)^5}\right) + 32 c_6 e^{\frac{3x}{2}} \Im\left(\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right) + I\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(\sqrt{3}+I\right)^5}\right) + 32 c_3 \Re\left(\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right.}{(}\right.\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 43(e).
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{y'''' + 64y = 0}$$

The characteristic equation is

$$\lambda^4 + 64 = 0$$

The roots of the above equation are

$$\lambda_1 = 2 - 2i$$
$$\lambda_2 = 2 + 2i$$
$$\lambda_3 = -2 - 2i$$
$$\lambda_4 = -2 + 2i$$

Therefore the homogeneous solution is

$$y_h(x) = e^{(2-2i)x}c_1 + e^{(-2+2i)x}c_2 + e^{(-2-2i)x}c_3 + e^{(2+2i)x}c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{(2-2i)x}$$
$$y_2 = e^{(-2+2i)x}$$
$$y_3 = e^{(-2-2i)x}$$
$$y_4 = e^{(2+2i)x}$$

Summary
The solution(s) found are the following

$$y = e^{(2-2i)x}c_1 + e^{(-2+2i)x}c_2 + e^{(-2-2i)x}c_3 + e^{(2+2i)x}c_4 \tag{1}$$

Verification of solutions

$$y = e^{(2-2i)x}c_1 + e^{(-2+2i)x}c_2 + e^{(-2-2i)x}c_3 + e^{(2+2i)x}c_4$$

Verified OK.

18.32.1 Maple step by step solution

Let's solve

$y'''' + 64y = 0$

- Highest derivative means the order of the ODE is 4

  y''''

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Define new variable $y_4(x)$

    $y_4(x) = y'''$

  ◦ Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = -64y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -64y_1(x)]$

- Define vector

$$\vec{y}(x) = \left[\begin{array}{c} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{array}\right]$$

- System to solve

$$\vec{y}'(x) = \left[\begin{array}{cccc} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -64 & 0 & 0 & 0 \end{array}\right] \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \left[\begin{array}{cccc} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -64 & 0 & 0 & 0 \end{array}\right]$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2-2\mathrm{I}, \left[\begin{array}{c} \frac{1}{32}+\frac{\mathrm{I}}{32} \\ -\frac{\mathrm{I}}{8} \\ -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ 1 \end{array}\right]\right], \left[-2+2\mathrm{I}, \left[\begin{array}{c} \frac{1}{32}-\frac{\mathrm{I}}{32} \\ \frac{\mathrm{I}}{8} \\ -\frac{1}{4}-\frac{\mathrm{I}}{4} \\ 1 \end{array}\right]\right], \left[2-2\mathrm{I}, \left[\begin{array}{c} -\frac{1}{32}+\frac{\mathrm{I}}{32} \\ \frac{\mathrm{I}}{8} \\ \frac{1}{4}+\frac{\mathrm{I}}{4} \\ 1 \end{array}\right]\right], \left[2+2\mathrm{I}, \left[\begin{array}{c} -\frac{1}{3} \\ \\ \frac{1}{4} \\ \end{array}\right.\right.\right.$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-2-2\mathrm{I}, \left[\begin{array}{c} \frac{1}{32}+\frac{\mathrm{I}}{32} \\ -\frac{\mathrm{I}}{8} \\ -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$e^{(-2-2 I)x} \cdot \left[\begin{array}{c} \frac{1}{32}+\frac{I}{32} \\ -\frac{I}{8} \\ -\frac{1}{4}+\frac{I}{4} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of sin and cos

$$e^{-2x} \cdot \left(\cos \left(2x\right)-I \sin \left(2x\right)\right) \cdot \left[\begin{array}{c} \frac{1}{32}+\frac{I}{32} \\ -\frac{I}{8} \\ -\frac{1}{4}+\frac{I}{4} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{-2x} \cdot \left[\begin{array}{c} \left(\frac{1}{32}+\frac{I}{32}\right) \left(\cos \left(2x\right)-I \sin \left(2x\right)\right) \\ -\frac{I}{8}\left(\cos \left(2x\right)-I \sin \left(2x\right)\right) \\ \left(-\frac{1}{4}+\frac{I}{4}\right) \left(\cos \left(2x\right)-I \sin \left(2x\right)\right) \\ \cos \left(2x\right)-I \sin \left(2x\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_{1}\left(x\right)=e^{-2x} \cdot \left[\begin{array}{c} \frac{\cos \left(2x\right)}{32}+\frac{\sin \left(2x\right)}{32} \\ -\frac{\sin \left(2x\right)}{8} \\ -\frac{\cos \left(2x\right)}{4}+\frac{\sin \left(2x\right)}{4} \\ \cos \left(2x\right) \end{array}\right], \vec{y}_{2}\left(x\right)=e^{-2x} \cdot \left[\begin{array}{c} \frac{\cos \left(2x\right)}{32}-\frac{\sin \left(2x\right)}{32} \\ -\frac{\cos \left(2x\right)}{8} \\ \frac{\sin \left(2x\right)}{4}+\frac{\cos \left(2x\right)}{4} \\ -\sin \left(2x\right) \end{array}\right]\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[2-2 I, \left[\begin{array}{c} -\frac{1}{32}+\frac{I}{32} \\ \frac{I}{8} \\ \frac{1}{4}+\frac{I}{4} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$e^{(2-2\,\mathrm{I})x}\cdot\begin{bmatrix}-\frac{1}{32}+\frac{\mathrm{I}}{32}\\ \frac{\mathrm{I}}{8}\\ \frac{1}{4}+\frac{\mathrm{I}}{4}\\ 1\end{bmatrix}$$

- Use Euler identity to write solution in terms of sin and cos

$$e^{2x}\cdot(\cos(2x)-\mathrm{I}\sin(2x))\cdot\begin{bmatrix}-\frac{1}{32}+\frac{\mathrm{I}}{32}\\ \frac{\mathrm{I}}{8}\\ \frac{1}{4}+\frac{\mathrm{I}}{4}\\ 1\end{bmatrix}$$

- Simplify expression

$$e^{2x}\cdot\begin{bmatrix}\left(-\frac{1}{32}+\frac{\mathrm{I}}{32}\right)(\cos(2x)-\mathrm{I}\sin(2x))\\ \frac{\mathrm{I}}{8}(\cos(2x)-\mathrm{I}\sin(2x))\\ \left(\frac{1}{4}+\frac{\mathrm{I}}{4}\right)(\cos(2x)-\mathrm{I}\sin(2x))\\ \cos(2x)-\mathrm{I}\sin(2x)\end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x)=e^{2x}\cdot\begin{bmatrix}-\frac{\cos(2x)}{32}+\frac{\sin(2x)}{32}\\ \frac{\sin(2x)}{8}\\ \frac{\sin(2x)}{4}+\frac{\cos(2x)}{4}\\ \cos(2x)\end{bmatrix},\vec{y}_4(x)=e^{2x}\cdot\begin{bmatrix}\frac{\cos(2x)}{32}+\frac{\sin(2x)}{32}\\ \frac{\cos(2x)}{8}\\ \frac{\cos(2x)}{4}-\frac{\sin(2x)}{4}\\ -\sin(2x)\end{bmatrix}\right]$$

- General solution to the system of ODEs

$$\vec{y}=c_1\vec{y}_1(x)+c_2\vec{y}_2(x)+c_3\vec{y}_3(x)+c_4\vec{y}_4(x)$$

- Substitute solutions into the general solution

$$\vec{y}=c_1e^{-2x}\cdot\begin{bmatrix}\frac{\cos(2x)}{32}+\frac{\sin(2x)}{32}\\ -\frac{\sin(2x)}{8}\\ -\frac{\cos(2x)}{4}+\frac{\sin(2x)}{4}\\ \cos(2x)\end{bmatrix}+c_2e^{-2x}\cdot\begin{bmatrix}\frac{\cos(2x)}{32}-\frac{\sin(2x)}{32}\\ -\frac{\cos(2x)}{8}\\ \frac{\sin(2x)}{4}+\frac{\cos(2x)}{4}\\ -\sin(2x)\end{bmatrix}+c_3e^{2x}\cdot\begin{bmatrix}-\frac{\cos(2x)}{32}+\frac{\sin(2x)}{32}\\ \frac{\sin(2x)}{8}\\ \frac{\sin(2x)}{4}+\frac{\cos(2x)}{4}\\ \cos(2x)\end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = \frac{((c_1+c_2)\mathrm{e}^{-2x} - (c_3-c_4)\mathrm{e}^{2x})\cos(2x)}{32} + \frac{((c_1-c_2)\mathrm{e}^{-2x} + (c_3+c_4)\mathrm{e}^{2x})\sin(2x)}{32}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.2. constant coefficient. Page 483
Problem number: section 9.2, problem 43(g).
ODE order: 5.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_x]]
```

$$\boxed{y^{(5)}+y''''+y'''+y''+y'+y=0}$$

The characteristic equation is

$$\lambda^5+\lambda^4+\lambda^3+\lambda^2+\lambda+1=0$$

The roots of the above equation are

$$\begin{aligned}\lambda_1&=-1\\ \lambda_2&=-\frac{1}{2}-\frac{i\sqrt{3}}{2}\\ \lambda_3&=-\frac{1}{2}+\frac{i\sqrt{3}}{2}\\ \lambda_4&=\frac{1}{2}-\frac{i\sqrt{3}}{2}\\ \lambda_5&=\frac{1}{2}+\frac{i\sqrt{3}}{2}\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x)=c_1\mathrm{e}^{-x}+\mathrm{e}^{\left(-\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x}c_2+\mathrm{e}^{\left(\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x}c_3+\mathrm{e}^{\left(\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x}c_4+\mathrm{e}^{\left(-\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x}c_5$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{-x} \\
y_2 &= \mathrm{e}^{\left(-\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x} \\
y_3 &= \mathrm{e}^{\left(\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x} \\
y_4 &= \mathrm{e}^{\left(\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x} \\
y_5 &= \mathrm{e}^{\left(-\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
y = c_1\mathrm{e}^{-x} + \mathrm{e}^{\left(-\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x}c_2 + \mathrm{e}^{\left(\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x}c_3 + \mathrm{e}^{\left(\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x}c_4 + \mathrm{e}^{\left(-\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x}c_5 \tag{1}
$$

Verification of solutions

$$
y = c_1\mathrm{e}^{-x} + \mathrm{e}^{\left(-\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x}c_2 + \mathrm{e}^{\left(\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x}c_3 + \mathrm{e}^{\left(\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x}c_4 + \mathrm{e}^{\left(-\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x}c_5
$$

Verified OK.

18.33.1 Maple step by step solution

Let's solve

$y^{(5)} + y'''' + y''' + y'' + y' + y = 0$

- Highest derivative means the order of the ODE is 5

  $y^{(5)}$

□ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

  - Define new variable $y_3(x)$

    $y_3(x) = y''$

  - Define new variable $y_4(x)$

    $y_4(x) = y'''$

  - Define new variable $y_5(x)$

$y_5(x) = y''''$

- Isolate for $y_5'(x)$ using original ODE

  $y_5'(x) = -y_5(x) - y_4(x) - y_3(x) - y_2(x) - y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_5(x) = y_4'(x), y_5'(x) = -y_5(x) - y_4(x) - y_3(x) -$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \\ y_5(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \\ -1 & -1 & -1 & -1 & -1 \end{bmatrix} \cdot \vec{y}(x)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 \\ -1 & -1 & -1 & -1 & -1 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \left[\begin{array}{c}1\\ -1\\ 1\\ -1\\ 1\end{array}\right]\right], \left[-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}, \left[\begin{array}{c}\frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{4}}\\ \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{3}}\\ \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{2}}\\ \frac{1}{-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}}\\ 1\end{array}\right]\right], \left[-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}, \left[\begin{array}{c}\frac{1}{\left(-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}\right)^{4}}\\ \frac{1}{\left(-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}\right)^{3}}\\ \frac{1}{\left(-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}\right)^{2}}\\ \frac{1}{-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}}\\ 1\end{array}\right]\right], \left[\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}, \left[\begin{array}{c}\frac{1}{\left(\frac{1}{2}-\right.}\\ \frac{1}{\left(\frac{1}{2}-\right.}\\ \frac{1}{\left(\frac{1}{2}-\right.}\\ \frac{1}{\frac{1}{2}-}\end{array}\right.\right.\right.$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c}1\\ -1\\ 1\\ -1\\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_{1} = \mathrm{e}^{-x} \cdot \left[\begin{array}{c}1\\ -1\\ 1\\ -1\\ 1\end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}, \left[\begin{array}{c}\frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{4}}\\ \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{3}}\\ \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{2}}\\ \frac{1}{-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}}\\ 1\end{array}\right]\right]$$

- Solution from eigenpair

$$e^{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)x} \cdot \left[\begin{array}{c} \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{4}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{-\frac{1}{2}-\frac{I\sqrt{3}}{2}} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of sin and cos

$$e^{-\frac{x}{2}} \cdot \left(\cos\left(\frac{\sqrt{3}\,x}{2}\right) - I\sin\left(\frac{\sqrt{3}\,x}{2}\right)\right) \cdot \left[\begin{array}{c} \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{4}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{-\frac{1}{2}-\frac{I\sqrt{3}}{2}} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{-\frac{x}{2}} \cdot \left[\begin{array}{c} \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-I\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{4}} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-I\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{3}} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-I\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^{2}} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-I\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{-\frac{1}{2}-\frac{I\sqrt{3}}{2}} \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right) - I\sin\left(\frac{\sqrt{3}\,x}{2}\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_2(x) = e^{-\frac{x}{2}} \cdot \begin{bmatrix} \Re\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-I\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^4}\right) \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right) \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2}-\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right) \end{bmatrix}, \vec{y}_3(x) = e^{-\frac{x}{2}} \cdot \begin{bmatrix} \Im\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-I\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^4}\right) \\ -\sin\left(\frac{\sqrt{3}\,x}{2}\right) \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2} \\ -\sin\left(\frac{\sqrt{3}\,x}{2}\right) \end{bmatrix}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[\frac{1}{2}-\frac{I\sqrt{3}}{2}, \begin{bmatrix} \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^4} \\ \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^3} \\ \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^2} \\ \frac{1}{\frac{1}{2}-\frac{I\sqrt{3}}{2}} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$e^{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)x} \cdot \begin{bmatrix} \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^4} \\ \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^3} \\ \frac{1}{\left(\frac{1}{2}-\frac{I\sqrt{3}}{2}\right)^2} \\ \frac{1}{\frac{1}{2}-\frac{I\sqrt{3}}{2}} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^{\frac{x}{2}} \cdot \left(\cos\left(\frac{\sqrt{3}\,x}{2}\right) - \mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)\right) \cdot \left[\begin{array}{c} \frac{1}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{4}} \\ \frac{1}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{\frac{x}{2}} \cdot \left[\begin{array}{c} \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{4}} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{3}} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{2}} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}} \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right) - \mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_4(x) = e^{\frac{x}{2}} \cdot \left[\begin{array}{c} \Re\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{4}}\right) \\ -\cos\left(\frac{\sqrt{3}\,x}{2}\right) \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2} + \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2} + \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right) \end{array}\right], \vec{y}_5(x) = e^{\frac{x}{2}} \cdot \left[\begin{array}{c} \Im\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{4}}\right) \\ \sin\left(\frac{\sqrt{3}\,x}{2}\right) \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} + \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} - \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2} \\ -\sin\left(\frac{\sqrt{3}\,x}{2}\right) \end{array}\right]\right]$$

- General solution to the system of ODEs

$$\vec{y} = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + c_5\vec{y}_5(x)$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{-x} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \\ -1 \\ 1 \end{bmatrix} + c_2 e^{-\frac{x}{2}} \cdot \begin{bmatrix} \Re\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right) - \mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^4}\right) \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right) \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2} - \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2} + \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right) \end{bmatrix} + e^{-\frac{x}{2}} c_3 \cdot \begin{bmatrix} \Im\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right) - \mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^4}\right) \\ -\sin\left(\frac{\sqrt{3}\,x}{2}\right) \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} + \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} + \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2} \\ -\sin\left(\frac{\sqrt{3}\,x}{2}\right) \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = 16\,e^{-x}\left(c_4 e^{\frac{3x}{2}} \Im\left(\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right) + \mathrm{I}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(\sqrt{3}+\mathrm{I}\right)^4}\right) - c_5 e^{\frac{3x}{2}} \Re\left(\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right) + \mathrm{I}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(\sqrt{3}+\mathrm{I}\right)^4}\right) + c_2 \Im\left(\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right) + \mathrm{I}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\mathrm{I}+\sqrt{3}\right)^4}\right)\right.$$

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - 6y'' + 11y' - 6y = -e^{x}\left(-24x^{2} + 76x + 4\right)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - 6y'' + 11y' - 6y = 0$$

The characteristic equation is

$$\lambda^3 - 6\lambda^2 + 11\lambda - 6 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 2$$
$$\lambda_3 = 3$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + c_2 e^{2x} + c_3 e^{3x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^x$$
$$y_2 = e^{2x}$$
$$y_3 = e^{3x}$$

Now the particular solution to the given ODE is found

$$y''' - 6y'' + 11y' - 6y = -e^x(-24x^2 + 76x + 4)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-e^x(-24x^2 + 76x + 4)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x e^x, x^2 e^x, e^x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^x, e^{2x}, e^{3x}\}$$

Since e^x is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x e^x, x^2 e^x, e^x x^3\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x e^x + A_2 x^2 e^x + A_3 e^x x^3$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$6A_3 e^x x^2 - 18A_3 e^x x + 4A_2 x e^x + 6A_3 e^x - 6A_2 e^x + 2A_1 e^x = -e^x(-24x^2 + 76x + 4)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = -17, A_2 = -1, A_3 = 4]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -17x\,e^x - x^2e^x + 4\,e^x x^3$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1e^x + c_2e^{2x} + c_3e^{3x}\right) + \left(-17x\,e^x - x^2e^x + 4\,e^x x^3\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1e^x + c_2e^{2x} + c_3e^{3x} - 17x\,e^x - x^2e^x + 4\,e^x x^3 \tag{1}$$

Verification of solutions

$$y = c_1e^x + c_2e^{2x} + c_3e^{3x} - 17x\,e^x - x^2e^x + 4\,e^x x^3$$

Verified OK.

19.1.1 Maple step by step solution

Let's solve

$y''' - 6y'' + 11y' - 6y = -e^x(-24x^2 + 76x + 4)$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = 6y + 24x^2e^x - 76x\,e^x - 4\,e^x + 6y'' - 11y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - 6y'' + 11y' - 6y = 4\,e^x(6x^2 - 19x - 1)$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

  $y_1(x) = y$

◦ Define new variable $y_2(x)$

$y_2(x) = y'$

◦ Define new variable $y_3(x)$

$y_3(x) = y''$

◦ Isolate for $y_3'(x)$ using original ODE

$y_3'(x) = 24x^2 e^x - 76x\, e^x + 6y_3(x) - 11y_2(x) + 6y_1(x) - 4\, e^x$

Convert linear ODE into a system of first order ODEs

$[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 24x^2 e^x - 76x\, e^x + 6y_3(x) - 11y_2(x) + 6y_1(x) - 4\, e^x]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 6 & -11 & 6 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 24x^2 e^x - 76x\, e^x - 4\, e^x \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 24x^2 e^x - 76x\, e^x - 4\, e^x \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 6 & -11 & 6 \end{bmatrix}$$

- Rewrite the system as

$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \left[\begin{array}{c}1 \\ 1 \\ 1\end{array}\right]\right], \left[2, \left[\begin{array}{c}\frac{1}{4} \\ \frac{1}{2} \\ 1\end{array}\right]\right], \left[3, \left[\begin{array}{c}\frac{1}{9} \\ \frac{1}{3} \\ 1\end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c}1 \\ 1 \\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{x} \cdot \left[\begin{array}{c}1 \\ 1 \\ 1\end{array}\right]$$

- Consider eigenpair

$$\left[2, \left[\begin{array}{c}\frac{1}{4} \\ \frac{1}{2} \\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_2 = \mathrm{e}^{2x} \cdot \left[\begin{array}{c}\frac{1}{4} \\ \frac{1}{2} \\ 1\end{array}\right]$$

- Consider eigenpair

$$\left[3, \left[\begin{array}{c}\frac{1}{9} \\ \frac{1}{3} \\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_3 = \mathrm{e}^{3x} \cdot \left[\begin{array}{c}\frac{1}{9} \\ \frac{1}{3} \\ 1\end{array}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

$\overrightarrow{y}(x) = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2 + c_3\overrightarrow{y}_3 + \overrightarrow{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} e^{x} & \frac{e^{2x}}{4} & \frac{e^{3x}}{9} \\ e^{x} & \frac{e^{2x}}{2} & \frac{e^{3x}}{3} \\ e^{x} & e^{2x} & e^{3x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} e^{x} & \frac{e^{2x}}{4} & \frac{e^{3x}}{9} \\ e^{x} & \frac{e^{2x}}{2} & \frac{e^{3x}}{3} \\ e^{x} & e^{2x} & e^{3x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & \frac{1}{4} & \frac{1}{9} \\ 1 & \frac{1}{2} & \frac{1}{3} \\ 1 & 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} 3e^{x} - 3e^{2x} + e^{3x} & -\frac{5e^{x}}{2} + 4e^{2x} - \frac{3e^{3x}}{2} & \frac{e^{x}}{2} - e^{2x} + \frac{e^{3x}}{2} \\ 3e^{x} - 6e^{2x} + 3e^{3x} & -\frac{5e^{x}}{2} + 8e^{2x} - \frac{9e^{3x}}{2} & \frac{e^{x}}{2} - 2e^{2x} + \frac{3e^{3x}}{2} \\ 3e^{x} - 12e^{2x} + 9e^{3x} & -\frac{5e^{x}}{2} + 16e^{2x} - \frac{27e^{3x}}{2} & \frac{e^{x}}{2} - 4e^{2x} + \frac{9e^{3x}}{2} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

$\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$

- Take the derivative of the particular solution

$\overrightarrow{y}_p'(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

$A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot\overrightarrow{v}'(x)=\overrightarrow{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\overrightarrow{v}'(x)=\frac{1}{\Phi(x)}\cdot\overrightarrow{f}(x)$

- Integrate to solve for $\overrightarrow{v}(x)$

  $\overrightarrow{v}(x)=\int_0^x \frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds$

- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

  $\overrightarrow{y}_p(x)=\Phi(x)\cdot\left(\int_0^x \frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

  $$\overrightarrow{y}_p(x)=\left[\begin{array}{c} 32\,\mathrm{e}^{2x}-\frac{15\,\mathrm{e}^{3x}}{2}+\frac{(8x^3-2x^2-34x-49)\mathrm{e}^{x}}{2} \\ 64\,\mathrm{e}^{2x}-\frac{45\,\mathrm{e}^{3x}}{2}+\frac{(8x^3+22x^2-38x-83)\mathrm{e}^{x}}{2} \\ 128\,\mathrm{e}^{2x}-\frac{135\,\mathrm{e}^{3x}}{2}+\frac{(8x^3+46x^2+6x-121)\mathrm{e}^{x}}{2} \end{array}\right]$$

- Plug particular solution back into general solution

  $$\overrightarrow{y}(x)=c_1\overrightarrow{y}_1+c_2\overrightarrow{y}_2+c_3\overrightarrow{y}_3+\left[\begin{array}{c} 32\,\mathrm{e}^{2x}-\frac{15\,\mathrm{e}^{3x}}{2}+\frac{(8x^3-2x^2-34x-49)\mathrm{e}^{x}}{2} \\ 64\,\mathrm{e}^{2x}-\frac{45\,\mathrm{e}^{3x}}{2}+\frac{(8x^3+22x^2-38x-83)\mathrm{e}^{x}}{2} \\ 128\,\mathrm{e}^{2x}-\frac{135\,\mathrm{e}^{3x}}{2}+\frac{(8x^3+46x^2+6x-121)\mathrm{e}^{x}}{2} \end{array}\right]$$

- First component of the vector is the solution to the ODE

  $y=\frac{(128+c_2)\mathrm{e}^{2x}}{4}+\frac{(-135+2c_3)\mathrm{e}^{3x}}{18}+4\left(x^3-\frac{1}{4}x^2-\frac{17}{4}x+\frac{1}{4}c_1-\frac{49}{8}\right)\mathrm{e}^{x}$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - 2y'' - 5y' + 6y = \mathrm{e}^{-3x}\left(6x^2 - 23x + 32\right)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - 2y'' - 5y' + 6y = 0$$

The characteristic equation is

$$\lambda^3 - 2\lambda^2 - 5\lambda + 6 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 3$$
$$\lambda_3 = -2$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-2x} + c_2 e^{x} + c_3 e^{3x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^{-2x} \\ y_2 &= e^{x} \\ y_3 &= e^{3x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y''' - 2y'' - 5y' + 6y = e^{-3x}(6x^2 - 23x + 32)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{-3x}(6x^2 - 23x + 32)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,e^{-3x}, x^2 e^{-3x}, e^{-3x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^{x}, e^{-2x}, e^{3x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 x\,e^{-3x} + A_2 x^2 e^{-3x} + A_3 e^{-3x}$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$34A_1 e^{-3x} - 24A_1 x\,e^{-3x} - 22A_2 e^{-3x} + 68A_2 x\,e^{-3x} - 24A_2 x^2 e^{-3x} - 24A_3 e^{-3x} \\ = e^{-3x}(6x^2 - 23x + 32)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{1}{4}, A_2 = -\frac{1}{4}, A_3 = -\frac{3}{4}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{x\,\mathrm{e}^{-3x}}{4} - \frac{x^2\mathrm{e}^{-3x}}{4} - \frac{3\,\mathrm{e}^{-3x}}{4}$$

Therefore the general solution is

$$\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1\mathrm{e}^{-2x} + c_2\mathrm{e}^{x} + c_3\mathrm{e}^{3x}\right) + \left(\frac{x\,\mathrm{e}^{-3x}}{4} - \frac{x^2\mathrm{e}^{-3x}}{4} - \frac{3\,\mathrm{e}^{-3x}}{4}\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1\mathrm{e}^{-2x} + c_2\mathrm{e}^{x} + c_3\mathrm{e}^{3x} + \frac{x\,\mathrm{e}^{-3x}}{4} - \frac{x^2\mathrm{e}^{-3x}}{4} - \frac{3\,\mathrm{e}^{-3x}}{4} \tag{1}$$

Verification of solutions

$$y = c_1\mathrm{e}^{-2x} + c_2\mathrm{e}^{x} + c_3\mathrm{e}^{3x} + \frac{x\,\mathrm{e}^{-3x}}{4} - \frac{x^2\mathrm{e}^{-3x}}{4} - \frac{3\,\mathrm{e}^{-3x}}{4}$$

Verified OK.

19.2.1 Maple step by step solution

Let's solve

$y''' - 2y'' - 5y' + 6y = \mathrm{e}^{-3x}(6x^2 - 23x + 32)$

- Highest derivative means the order of the ODE is 3

  y'''

□ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$

- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = 6x^2 e^{-3x} - 23x\, e^{-3x} + 2y_3(x) + 5y_2(x) - 6y_1(x) + 32\, e^{-3x}$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 6x^2 e^{-3x} - 23x\, e^{-3x} + 2y_3(x) + 5y_2(x) - 6y_1(x) + 32\, e^{-3x}]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & 5 & 2 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 6x^2 e^{-3x} - 23x\, e^{-3x} + 32\, e^{-3x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 6x^2 e^{-3x} - 23x\, e^{-3x} + 32\, e^{-3x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & 5 & 2 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right], \left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right], \left[3, \left[\begin{array}{c} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-2, \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-2x} \cdot \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_2 = \mathrm{e}^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[3, \left[\begin{array}{c} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_3 = \mathrm{e}^{3x} \cdot \left[\begin{array}{c} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{array}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

  $\overrightarrow{y}(x) = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2 + c_3\overrightarrow{y}_3 + \overrightarrow{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

  $$\phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & e^{x} & \frac{e^{3x}}{9} \\ -\frac{e^{-2x}}{2} & e^{x} & \frac{e^{3x}}{3} \\ e^{-2x} & e^{x} & e^{3x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

  $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

  $$\Phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & e^{x} & \frac{e^{3x}}{9} \\ -\frac{e^{-2x}}{2} & e^{x} & \frac{e^{3x}}{3} \\ e^{-2x} & e^{x} & e^{3x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} \frac{1}{4} & 1 & \frac{1}{9} \\ -\frac{1}{2} & 1 & \frac{1}{3} \\ 1 & 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

  $$\Phi(x) = \begin{bmatrix} -\frac{(e^{5x}-5e^{3x}-1)e^{-2x}}{5} & \frac{(3e^{5x}+5e^{3x}-8)e^{-2x}}{30} & \frac{(3e^{5x}-5e^{3x}+2)e^{-2x}}{30} \\ -\frac{(3e^{5x}-5e^{3x}+2)e^{-2x}}{5} & \frac{(9e^{5x}+5e^{3x}+16)e^{-2x}}{30} & \frac{(9e^{5x}-5e^{3x}-4)e^{-2x}}{30} \\ -\frac{(9e^{5x}-5e^{3x}-4)e^{-2x}}{5} & \frac{(27e^{5x}+5e^{3x}-32)e^{-2x}}{30} & \frac{(27e^{5x}-5e^{3x}+8)e^{-2x}}{30} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

  $\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$

- Take the derivative of the particular solution

  $\overrightarrow{y}_p'(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot\vec{v}'(x)=\vec{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x)=\frac{1}{\Phi(x)}\cdot\vec{f}(x)$
- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x)=\int_0^x \frac{1}{\Phi(s)}\cdot\vec{f}(s)\,ds$
- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x)=\Phi(x)\cdot\left(\int_0^x \frac{1}{\Phi(s)}\cdot\vec{f}(s)\,ds\right)$
- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x)=\left[\begin{array}{c}\frac{\left(19\,\mathrm{e}^{6x}-45\,\mathrm{e}^{4x}-10x^2+56\,\mathrm{e}^{x}+10x-30\right)\mathrm{e}^{-3x}}{40}\\ -\frac{\left(-57\,\mathrm{e}^{6x}+45\,\mathrm{e}^{4x}-30x^2+112\,\mathrm{e}^{x}+50x-100\right)\mathrm{e}^{-3x}}{40}\\ \frac{\left(171\,\mathrm{e}^{6x}-45\,\mathrm{e}^{4x}-90x^2+224\,\mathrm{e}^{x}+210x-350\right)\mathrm{e}^{-3x}}{40}\end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x)=c_1\vec{y}_1+c_2\vec{y}_2+c_3\vec{y}_3+\left[\begin{array}{c}\frac{\left(19\,\mathrm{e}^{6x}-45\,\mathrm{e}^{4x}-10x^2+56\,\mathrm{e}^{x}+10x-30\right)\mathrm{e}^{-3x}}{40}\\ -\frac{\left(-57\,\mathrm{e}^{6x}+45\,\mathrm{e}^{4x}-30x^2+112\,\mathrm{e}^{x}+50x-100\right)\mathrm{e}^{-3x}}{40}\\ \frac{\left(171\,\mathrm{e}^{6x}-45\,\mathrm{e}^{4x}-90x^2+224\,\mathrm{e}^{x}+210x-350\right)\mathrm{e}^{-3x}}{40}\end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y=\left(c_2-\frac{9}{8}\right)\mathrm{e}^{-3x}\mathrm{e}^{4x}-\frac{\left(90x^2-90c_1\mathrm{e}^{x}-40c_3\mathrm{e}^{6x}-90x-504\,\mathrm{e}^{x}-171\,\mathrm{e}^{6x}+270\right)\mathrm{e}^{-3x}}{360}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{4y''' + 8y'' - y' - 2y = -e^{x}(6x^2 + 45x + 4)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$4y''' + 8y'' - y' - 2y = 0$$

The characteristic equation is

$$4\lambda^3 + 8\lambda^2 - \lambda - 2 = 0$$

The roots of the above equation are

$$\lambda_1 = -\frac{1}{2}$$
$$\lambda_2 = \frac{1}{2}$$
$$\lambda_3 = -2$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-2x} + c_2 e^{-\frac{x}{2}} + c_3 e^{\frac{x}{2}}$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-2x}$$
$$y_2 = e^{-\frac{x}{2}}$$
$$y_3 = e^{\frac{x}{2}}$$

Now the particular solution to the given ODE is found

$$4y''' + 8y'' - y' - 2y = -e^x (6x^2 + 45x + 4)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-e^x (6x^2 + 45x + 4)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x e^x, x^2 e^x, e^x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\left\{e^{-2x}, e^{-\frac{x}{2}}, e^{\frac{x}{2}}\right\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 x e^x + A_2 x^2 e^x + A_3 e^x$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$27A_1 e^x + 9A_1 x e^x + 40A_2 e^x + 54A_2 x e^x + 9A_2 x^2 e^x + 9A_3 e^x = -e^x (6x^2 + 45x + 4)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = -1, A_2 = -\frac{2}{3}, A_3 = \frac{149}{27}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -x\,\mathrm{e}^x - \frac{2x^2\mathrm{e}^x}{3} + \frac{149\,\mathrm{e}^x}{27}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1\mathrm{e}^{-2x} + c_2\mathrm{e}^{-\frac{x}{2}} + c_3\mathrm{e}^{\frac{x}{2}}\right) + \left(-x\,\mathrm{e}^x - \frac{2x^2\mathrm{e}^x}{3} + \frac{149\,\mathrm{e}^x}{27}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1\mathrm{e}^{-2x} + c_2\mathrm{e}^{-\frac{x}{2}} + c_3\mathrm{e}^{\frac{x}{2}} - x\,\mathrm{e}^x - \frac{2x^2\mathrm{e}^x}{3} + \frac{149\,\mathrm{e}^x}{27} \tag{1}$$

Verification of solutions

$$y = c_1\mathrm{e}^{-2x} + c_2\mathrm{e}^{-\frac{x}{2}} + c_3\mathrm{e}^{\frac{x}{2}} - x\,\mathrm{e}^x - \frac{2x^2\mathrm{e}^x}{3} + \frac{149\,\mathrm{e}^x}{27}$$

Verified OK.

19.3.1 Maple step by step solution

Let's solve

$4y''' + 8y'' - y' - 2y = -\mathrm{e}^x(6x^2 + 45x + 4)$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = \frac{y}{2} - 2y'' + \frac{y'}{4} - \frac{3x^2\mathrm{e}^x}{2} - \frac{45x\,\mathrm{e}^x}{4} - \mathrm{e}^x$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' + 2y'' - \frac{y'}{4} - \frac{y}{2} = -\frac{\mathrm{e}^x(6x^2+45x+4)}{4}$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

$y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$

- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = -\frac{3x^2 e^x}{2} - \frac{45x\,e^x}{4} - e^x - 2y_3(x) + \frac{y_2(x)}{4} + \frac{y_1(x)}{2}$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = -\frac{3x^2 e^x}{2} - \frac{45x\,e^x}{4} - e^x - 2y_3(x) + \frac{y_2(x)}{4} + \frac{y_1(x)}{2}\right]$

- Define vector

$$\vec{y}(x) = \left[\begin{array}{c} y_1(x) \\ y_2(x) \\ y_3(x) \end{array}\right]$$

- System to solve

$$\vec{y}'(x) = \left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{1}{2} & \frac{1}{4} & -2 \end{array}\right] \cdot \vec{y}(x) + \left[\begin{array}{c} 0 \\ 0 \\ -\frac{3x^2 e^x}{2} - \frac{45x\,e^x}{4} - e^x \end{array}\right]$$

- Define the forcing function

$$\vec{f}(x) = \left[\begin{array}{c} 0 \\ 0 \\ -\frac{3x^2 e^x}{2} - \frac{45x\,e^x}{4} - e^x \end{array}\right]$$

- Define the coefficient matrix

$$A = \left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{1}{2} & \frac{1}{4} & -2 \end{array}\right]$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right], \left[-\frac{1}{2}, \begin{bmatrix} 4 \\ -2 \\ 1 \end{bmatrix}\right], \left[\frac{1}{2}, \begin{bmatrix} 4 \\ 2 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-2x} \cdot \begin{bmatrix} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-\frac{1}{2}, \begin{bmatrix} 4 \\ -2 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{-\frac{x}{2}} \cdot \begin{bmatrix} 4 \\ -2 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[\frac{1}{2}, \begin{bmatrix} 4 \\ 2 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = \mathrm{e}^{\frac{x}{2}} \cdot \begin{bmatrix} 4 \\ 2 \\ 1 \end{bmatrix}$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

$\overrightarrow{y}(x) = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2 + c_3\overrightarrow{y}_3 + \overrightarrow{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & 4\,e^{-\frac{x}{2}} & 4\,e^{\frac{x}{2}} \\ -\frac{e^{-2x}}{2} & -2\,e^{-\frac{x}{2}} & 2\,e^{\frac{x}{2}} \\ e^{-2x} & e^{-\frac{x}{2}} & e^{\frac{x}{2}} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & 4\,e^{-\frac{x}{2}} & 4\,e^{\frac{x}{2}} \\ -\frac{e^{-2x}}{2} & -2\,e^{-\frac{x}{2}} & 2\,e^{\frac{x}{2}} \\ e^{-2x} & e^{-\frac{x}{2}} & e^{\frac{x}{2}} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} \frac{1}{4} & 4 & 4 \\ -\frac{1}{2} & -2 & 2 \\ 1 & 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{\left(6\,e^{\frac{5x}{2}}+10\,e^{\frac{3x}{2}}-1\right)e^{-2x}}{15} & -e^{-\frac{x}{2}} + e^{\frac{x}{2}} & \frac{2\left(3\,e^{\frac{5x}{2}}-5\,e^{\frac{3x}{2}}+2\right)e^{-2x}}{15} \\ \frac{\left(3\,e^{\frac{5x}{2}}-5\,e^{\frac{3x}{2}}+2\right)e^{-2x}}{15} & \frac{e^{-\frac{x}{2}}}{2} + \frac{e^{\frac{x}{2}}}{2} & \frac{\left(3\,e^{\frac{5x}{2}}+5\,e^{\frac{3x}{2}}-8\right)e^{-2x}}{15} \\ \frac{\left(3\,e^{\frac{5x}{2}}+5\,e^{\frac{3x}{2}}-8\right)e^{-2x}}{30} & -\frac{e^{-\frac{x}{2}}}{4} + \frac{e^{\frac{x}{2}}}{4} & \frac{\left(3\,e^{\frac{5x}{2}}-5\,e^{\frac{3x}{2}}+32\right)e^{-2x}}{30} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

$\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$

- Take the derivative of the particular solution

$\overrightarrow{y}_p'(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

$$A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$$

- Cancel like terms

$$\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$$

- Multiply by the inverse of the fundamental matrix

$$\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$$

- Integrate to solve for $\vec{v}(x)$

$$\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$$

- Plug $\vec{v}(x)$ into the equation for the particular solution

$$\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \left[\begin{array}{c} -\frac{\left(90x^2 e^{3x}+135x\, e^{3x}-745\, e^{3x}+1026\, e^{\frac{5x}{2}}-310\, e^{\frac{3x}{2}}+29\right) e^{-2x}}{135} \\ -\frac{\left(90x^2 e^{3x}+315x\, e^{3x}-610\, e^{3x}+513\, e^{\frac{5x}{2}}+155\, e^{\frac{3x}{2}}-58\right) e^{-2x}}{135} \\ -\frac{\left(180x^2 e^{3x}+990x\, e^{3x}-590\, e^{3x}+513\, e^{\frac{5x}{2}}-155\, e^{\frac{3x}{2}}+232\right) e^{-2x}}{270} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1 \vec{y}_1 + c_2 \vec{y}_2 + c_3 \vec{y}_3 + \left[\begin{array}{c} -\frac{\left(90x^2 e^{3x}+135x\, e^{3x}-745\, e^{3x}+1026\, e^{\frac{5x}{2}}-310\, e^{\frac{3x}{2}}+29\right) e^{-2x}}{135} \\ -\frac{\left(90x^2 e^{3x}+315x\, e^{3x}-610\, e^{3x}+513\, e^{\frac{5x}{2}}+155\, e^{\frac{3x}{2}}-58\right) e^{-2x}}{135} \\ -\frac{\left(180x^2 e^{3x}+990x\, e^{3x}-590\, e^{3x}+513\, e^{\frac{5x}{2}}-155\, e^{\frac{3x}{2}}+232\right) e^{-2x}}{270} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y = -\frac{2\left(\left(-6c_2-\frac{31}{9}\right) e^{\frac{3x}{2}}+\left(-6c_3+\frac{57}{5}\right) e^{\frac{5x}{2}}+\left(x^2+\frac{3}{2}x-\frac{149}{18}\right) e^{3x}-\frac{3c_1}{8}+\frac{29}{90}\right) e^{-2x}}{3}$$

ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' + 3y'' - y' - 3y = \mathrm{e}^{-2x}(3x^2 - 17x + 2)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' + 3y'' - y' - 3y = 0$$

The characteristic equation is

$$\lambda^3 + 3\lambda^2 - \lambda - 3 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = -3$$
$$\lambda_3 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{x} + e^{-3x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = e^{x}$$
$$y_3 = e^{-3x}$$

Now the particular solution to the given ODE is found

$$y''' + 3y'' - y' - 3y = e^{-2x}(3x^2 - 17x + 2)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{-2x}(3x^2 - 17x + 2)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x^2 e^{-2x}, e^{-2x} x, e^{-2x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^{x}, e^{-3x}, e^{-x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 x^2 e^{-2x} + A_2 e^{-2x} x + A_3 e^{-2x}$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$-6A_1 e^{-2x} - 2A_1 x e^{-2x} + 3A_1 x^2 e^{-2x} + 3A_2 e^{-2x} x - A_2 e^{-2x} + 3A_3 e^{-2x} = e^{-2x}(3x^2 - 17x + 2)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 1, A_2 = -5, A_3 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = x^2 e^{-2x} - 5 e^{-2x} x + e^{-2x}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-x} + c_2 e^{x} + e^{-3x} c_3\right) + \left(x^2 e^{-2x} - 5 e^{-2x} x + e^{-2x}\right) \end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1 e^{-x} + c_2 e^{x} + e^{-3x} c_3 + x^2 e^{-2x} - 5 e^{-2x} x + e^{-2x} \tag{1}$$

Verification of solutions

$$y = c_1 e^{-x} + c_2 e^{x} + e^{-3x} c_3 + x^2 e^{-2x} - 5 e^{-2x} x + e^{-2x}$$

Verified OK.

19.4.1 Maple step by step solution

Let's solve

$y''' + 3y'' - y' - 3y = e^{-2x}(3x^2 - 17x + 2)$

- Highest derivative means the order of the ODE is 3

  y'''

☐ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = 3x^2 e^{-2x} - 17\,e^{-2x}x + 2\,e^{-2x} - 3y_3(x) + y_2(x) + 3y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 3x^2 e^{-2x} - 17\,e^{-2x}x + 2\,e^{-2x} - 3y_3(x) + y_2(x) + 3y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 3 & 1 & -3 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 3x^2 e^{-2x} - 17\,e^{-2x}x + 2\,e^{-2x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 3x^2 e^{-2x} - 17\,e^{-2x}x + 2\,e^{-2x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 3 & 1 & -3 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-3, \begin{bmatrix} \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-3, \left[\begin{array}{c} \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-3x} \cdot \left[\begin{array}{c} \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_2 = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_3 = \mathrm{e}^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

$$\overrightarrow{y}(x) = c_1 \overrightarrow{y}_1 + c_2 \overrightarrow{y}_2 + c_3 \overrightarrow{y}_3 + \overrightarrow{y}_p(x)$$

□ Fundamental matrix

  - Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} \frac{e^{-3x}}{9} & e^{-x} & e^{x} \\ -\frac{e^{-3x}}{3} & -e^{-x} & e^{x} \\ e^{-3x} & e^{-x} & e^{x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

  $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} \frac{e^{-3x}}{9} & e^{-x} & e^{x} \\ -\frac{e^{-3x}}{3} & -e^{-x} & e^{x} \\ e^{-3x} & e^{-x} & e^{x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} \frac{1}{9} & 1 & 1 \\ -\frac{1}{3} & -1 & 1 \\ 1 & 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{(3\,e^{4x}+6\,e^{2x}-1)e^{-3x}}{8} & -\frac{e^{-x}}{2} + \frac{e^{x}}{2} & \frac{(e^{4x}-2\,e^{2x}+1)e^{-3x}}{8} \\ \frac{3(e^{4x}-2\,e^{2x}+1)e^{-3x}}{8} & \frac{e^{x}}{2} + \frac{e^{-x}}{2} & \frac{(e^{4x}+2\,e^{2x}-3)e^{-3x}}{8} \\ \frac{3(e^{4x}+2\,e^{2x}-3)e^{-3x}}{8} & -\frac{e^{-x}}{2} + \frac{e^{x}}{2} & \frac{(e^{4x}-2\,e^{2x}+9)e^{-3x}}{8} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

$$\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$$

- Integrate to solve for $\vec{v}(x)$

$$\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$$

- Plug $\vec{v}(x)$ into the equation for the particular solution

$$\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \left[\begin{array}{c} \frac{\left(-25+18\,e^{2x}-e^{4x}+8\left(x^{2}-5x+1\right)e^{x}\right)e^{-3x}}{8} \\ \frac{\left(-18\,e^{2x}-e^{4x}+75+\left(-16x^{2}+96x-56\right)e^{x}\right)e^{-3x}}{8} \\ \frac{\left(18\,e^{2x}-e^{4x}-225+\left(32x^{2}-224x+208\right)e^{x}\right)e^{-3x}}{8} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3 + \left[\begin{array}{c} \frac{\left(-25+18\,e^{2x}-e^{4x}+8\left(x^{2}-5x+1\right)e^{x}\right)e^{-3x}}{8} \\ \frac{\left(-18\,e^{2x}-e^{4x}+75+\left(-16x^{2}+96x-56\right)e^{x}\right)e^{-3x}}{8} \\ \frac{\left(18\,e^{2x}-e^{4x}-225+\left(32x^{2}-224x+208\right)e^{x}\right)e^{-3x}}{8} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y = \frac{\left(72\,e^{4x}c_3-9\,e^{4x}+72c_2e^{2x}+72x^{2}e^{x}+162\,e^{2x}-360x\,e^{x}+72\,e^{x}+8c_1-225\right)e^{-3x}}{72}$$

ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' + 3y'' - y' - 3y = e^{x}(16x^{3} + 24x^{2} + 2x - 1)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' + 3y'' - y' - 3y = 0$$

The characteristic equation is

$$\lambda^3 + 3\lambda^2 - \lambda - 3 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = -3$$
$$\lambda_3 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^x + e^{-3x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^{-x} \\ y_2 &= e^x \\ y_3 &= e^{-3x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y''' + 3y'' - y' - 3y = e^x(16x^3 + 24x^2 + 2x - 1)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^x(16x^3 + 24x^2 + 2x - 1)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\, e^x, x^2 e^x, e^x x^3, e^x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^x, e^{-3x}, e^{-x}\}$$

Since e^x is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\, e^x, x^2 e^x, e^x x^3, e^x x^4\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x\, e^x + A_2 x^2 e^x + A_3 e^x x^3 + A_4 e^x x^4$$

The unknowns $\{A_1, A_2, A_3, A_4\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$\begin{aligned} &24A_3 e^x x^2 + 32A_4 e^x x^3 + 36A_3 e^x x + 72A_4 e^x x^2 + 24A_4 e^x x + 16A_2 x\, e^x \\ &+ 12A_2 e^x + 8A_1 e^x + 6A_3 e^x = e^x(16x^3 + 24x^2 + 2x - 1) \end{aligned}$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = -\frac{1}{2}, A_2 = \frac{1}{2}, A_3 = -\frac{1}{2}, A_4 = \frac{1}{2}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -\frac{x\,e^x}{2} + \frac{x^2 e^x}{2} - \frac{e^x x^3}{2} + \frac{e^x x^4}{2}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-x} + c_2 e^x + e^{-3x} c_3\right) + \left(-\frac{x\,e^x}{2} + \frac{x^2 e^x}{2} - \frac{e^x x^3}{2} + \frac{e^x x^4}{2}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 e^{-x} + c_2 e^x + e^{-3x} c_3 - \frac{x\,e^x}{2} + \frac{x^2 e^x}{2} - \frac{e^x x^3}{2} + \frac{e^x x^4}{2} \tag{1}$$

Verification of solutions

$$y = c_1 e^{-x} + c_2 e^x + e^{-3x} c_3 - \frac{x\,e^x}{2} + \frac{x^2 e^x}{2} - \frac{e^x x^3}{2} + \frac{e^x x^4}{2}$$

Verified OK.

19.5.1 Maple step by step solution

Let's solve

$y''' + 3y'' - y' - 3y = e^x(16x^3 + 24x^2 + 2x - 1)$

- Highest derivative means the order of the ODE is 3

  y'''

- ☐ Convert linear ODE into a system of first order ODEs
  - ○ Define new variable $y_1(x)$

    $y_1(x) = y$
  - ○ Define new variable $y_2(x)$

    $y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = 16\,\mathrm{e}^x x^3 + 24x^2\mathrm{e}^x + 2x\,\mathrm{e}^x - \mathrm{e}^x - 3y_3(x) + y_2(x) + 3y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x)\,, y_3(x) = y_2'(x)\,, y_3'(x) = 16\,\mathrm{e}^x x^3 + 24x^2\mathrm{e}^x + 2x\,\mathrm{e}^x - \mathrm{e}^x - 3y_3(x) + y_2(x) + 3y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 3 & 1 & -3 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 16\,\mathrm{e}^x x^3 + 24x^2\mathrm{e}^x + 2x\,\mathrm{e}^x - \mathrm{e}^x \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 16\,\mathrm{e}^x x^3 + 24x^2\mathrm{e}^x + 2x\,\mathrm{e}^x - \mathrm{e}^x \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 3 & 1 & -3 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-3, \left[\begin{array}{c}\frac{1}{9} \\ -\frac{1}{3} \\ 1\end{array}\right]\right], \left[-1, \left[\begin{array}{c}1 \\ -1 \\ 1\end{array}\right]\right], \left[1, \left[\begin{array}{c}1 \\ 1 \\ 1\end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-3, \left[\begin{array}{c}\frac{1}{9} \\ -\frac{1}{3} \\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-3x} \cdot \left[\begin{array}{c}\frac{1}{9} \\ -\frac{1}{3} \\ 1\end{array}\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c}1 \\ -1 \\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{-x} \cdot \left[\begin{array}{c}1 \\ -1 \\ 1\end{array}\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c}1 \\ 1 \\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = \mathrm{e}^{x} \cdot \left[\begin{array}{c}1 \\ 1 \\ 1\end{array}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

$\overrightarrow{y}(x) = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2 + c_3\overrightarrow{y}_3 + \overrightarrow{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} \frac{e^{-3x}}{9} & e^{-x} & e^{x} \\ -\frac{e^{-3x}}{3} & -e^{-x} & e^{x} \\ e^{-3x} & e^{-x} & e^{x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} \frac{e^{-3x}}{9} & e^{-x} & e^{x} \\ -\frac{e^{-3x}}{3} & -e^{-x} & e^{x} \\ e^{-3x} & e^{-x} & e^{x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} \frac{1}{9} & 1 & 1 \\ -\frac{1}{3} & -1 & 1 \\ 1 & 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{(3e^{4x}+6e^{2x}-1)e^{-3x}}{8} & -\frac{e^{-x}}{2}+\frac{e^{x}}{2} & \frac{(e^{4x}-2e^{2x}+1)e^{-3x}}{8} \\ \frac{3(e^{4x}-2e^{2x}+1)e^{-3x}}{8} & \frac{e^{x}}{2}+\frac{e^{-x}}{2} & \frac{(e^{4x}+2e^{2x}-3)e^{-3x}}{8} \\ \frac{3(e^{4x}+2e^{2x}-3)e^{-3x}}{8} & -\frac{e^{-x}}{2}+\frac{e^{x}}{2} & \frac{(e^{4x}-2e^{2x}+9)e^{-3x}}{8} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

$\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$

- Take the derivative of the particular solution

$\overrightarrow{y}'_p(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

$A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$
- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$
- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$
- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \left[\begin{array}{c} -\frac{e^{-x}}{4} + \frac{(2x^4-2x^3+2x^2-2x+1)e^x}{4} \\ \frac{e^{-x}}{4} + \frac{(2x^4+6x^3-4x^2+2x-1)e^x}{4} \\ -\frac{e^{-x}}{4} + \frac{(2x^4+14x^3+14x^2-6x+1)e^x}{4} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1 \vec{y}_1 + c_2 \vec{y}_2 + c_3 \vec{y}_3 + \left[\begin{array}{c} -\frac{e^{-x}}{4} + \frac{(2x^4-2x^3+2x^2-2x+1)e^x}{4} \\ \frac{e^{-x}}{4} + \frac{(2x^4+6x^3-4x^2+2x-1)e^x}{4} \\ -\frac{e^{-x}}{4} + \frac{(2x^4+14x^3+14x^2-6x+1)e^x}{4} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y = \frac{\left(\left(x^4-x^3+x^2-x+2c_3+\frac{1}{2}\right)e^{4x}+\left(2c_2-\frac{1}{2}\right)e^{2x}+\frac{2c_1}{9}\right)e^{-3x}}{2}$$

ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' + y'' - 2y = e^{x}(15x^{2} + 34x + 14)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' + y'' - 2y = 0$$

The characteristic equation is

$$\lambda^3 + \lambda^2 - 2 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = -1 - i$$
$$\lambda_3 = -1 + i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + e^{(-1-i)x} c_2 + e^{(-1+i)x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^x$$
$$y_2 = e^{(-1-i)x}$$
$$y_3 = e^{(-1+i)x}$$

Now the particular solution to the given ODE is found

$$y''' + y'' - 2y = e^x (15x^2 + 34x + 14)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^x (15x^2 + 34x + 14)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x e^x, x^2 e^x, e^x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^x, e^{(-1-i)x}, e^{(-1+i)x}\}$$

Since e^x is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x e^x, x^2 e^x, e^x x^3\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x e^x + A_2 x^2 e^x + A_3 e^x x^3$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$5A_1 e^x + 8A_2 e^x + 10A_2 x e^x + 15A_3 e^x x^2 + 24A_3 e^x x + 6A_3 e^x = e^x (15x^2 + 34x + 14)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 0, A_2 = 1, A_3 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = x^2 e^x + e^x x^3$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^x + e^{(-1-i)x} c_2 + e^{(-1+i)x} c_3\right) + \left(x^2 e^x + e^x x^3\right) \end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1 e^x + e^{(-1-i)x} c_2 + e^{(-1+i)x} c_3 + x^2 e^x + e^x x^3 \tag{1}$$

Verification of solutions

$$y = c_1 e^x + e^{(-1-i)x} c_2 + e^{(-1+i)x} c_3 + x^2 e^x + e^x x^3$$

Verified OK.

19.6.1 Maple step by step solution

Let's solve

$y''' + y'' - 2y = e^x(15x^2 + 34x + 14)$

- Highest derivative means the order of the ODE is 3

  y'''

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = 15x^2 e^x + 34x\, e^x - y_3(x) + 2y_1(x) + 14\, e^x$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 15x^2 e^x + 34x\, e^x - y_3(x) + 2y_1(x) + 14\, e^x]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & 0 & -1 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 15x^2 e^x + 34x\, e^x + 14\, e^x \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 15x^2 e^x + 34x\, e^x + 14\, e^x \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & 0 & -1 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[-1 - \mathrm{I}, \begin{bmatrix} -\frac{\mathrm{I}}{2} \\ -\frac{1}{2} + \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[-1 + \mathrm{I}, \begin{bmatrix} \frac{\mathrm{I}}{2} \\ -\frac{1}{2} - \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-1-\mathrm{I}, \left[\begin{array}{c} -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(-1-\mathrm{I})x} \cdot \left[\begin{array}{c} -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{-x} \cdot \left(\cos \left(x\right)-\mathrm{I} \sin \left(x\right)\right) \cdot \left[\begin{array}{c} -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Simplify expression

$$\mathrm{e}^{-x} \cdot \left[\begin{array}{c} -\frac{\mathrm{I}}{2}\left(\cos \left(x\right)-\mathrm{I} \sin \left(x\right)\right) \\ \left(-\frac{1}{2}+\frac{\mathrm{I}}{2}\right) \left(\cos \left(x\right)-\mathrm{I} \sin \left(x\right)\right) \\ \cos \left(x\right)-\mathrm{I} \sin \left(x\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\overrightarrow{y}_2\left(x\right) = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} -\frac{\sin \left(x\right)}{2} \\ -\frac{\cos \left(x\right)}{2}+\frac{\sin \left(x\right)}{2} \\ \cos \left(x\right) \end{array}\right], \overrightarrow{y}_3\left(x\right) = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} -\frac{\cos \left(x\right)}{2} \\ \frac{\cos \left(x\right)}{2}+\frac{\sin \left(x\right)}{2} \\ -\sin \left(x\right) \end{array}\right]\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

$\overrightarrow{y}(x) = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2(x) + c_3\overrightarrow{y}_3(x) + \overrightarrow{y}_p(x)$

☐ Fundamental matrix

  - Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} e^x & -\frac{\sin(x)e^{-x}}{2} & -\frac{\cos(x)e^{-x}}{2} \\ e^x & e^{-x}\left(-\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) & e^{-x}\left(\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) \\ e^x & \cos(x)e^{-x} & -\sin(x)e^{-x} \end{bmatrix}$$

  - The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

  - Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} e^x & -\frac{\sin(x)e^{-x}}{2} & -\frac{\cos(x)e^{-x}}{2} \\ e^x & e^{-x}\left(-\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) & e^{-x}\left(\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) \\ e^x & \cos(x)e^{-x} & -\sin(x)e^{-x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & 0 & -\frac{1}{2} \\ 1 & -\frac{1}{2} & \frac{1}{2} \\ 1 & 1 & 0 \end{bmatrix}}$$

  - Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{(3\cos(x)+\sin(x))e^{-x}}{5} + \frac{2e^x}{5} & \frac{(-2\cos(x)+\sin(x))e^{-x}}{5} + \frac{2e^x}{5} & \frac{(-2\sin(x)-\cos(x))e^{-x}}{5} + \frac{e^x}{5} \\ \frac{(-4\sin(x)-2\cos(x))e^{-x}}{5} + \frac{2e^x}{5} & \frac{(3\cos(x)+\sin(x))e^{-x}}{5} + \frac{2e^x}{5} & \frac{(-\cos(x)+3\sin(x))e^{-x}}{5} + \frac{e^x}{5} \\ \frac{(-2\cos(x)+6\sin(x))e^{-x}}{5} + \frac{2e^x}{5} & \frac{(-4\sin(x)-2\cos(x))e^{-x}}{5} + \frac{2e^x}{5} & \frac{(4\cos(x)-2\sin(x))e^{-x}}{5} + \frac{e^x}{5} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

  - Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

$\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$

  - Take the derivative of the particular solution

$\overrightarrow{y}_p'(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$

  - Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

  - The fundamental matrix has columns that are solutions to the homogeneous system so its der

$$A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$$

- Cancel like terms

$$\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$$

- Multiply by the inverse of the fundamental matrix

$$\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$$

- Integrate to solve for $\vec{v}(x)$

$$\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$$

- Plug $\vec{v}(x)$ into the equation for the particular solution

$$\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \begin{bmatrix} \frac{(4\sin(x)+2\cos(x))\mathrm{e}^{-x}}{5} + \frac{\mathrm{e}^x(5x^3+5x^2-2)}{5} \\ \frac{(2\cos(x)-6\sin(x))\mathrm{e}^{-x}}{5} + \left(x^3+4x^2+2x-\frac{2}{5}\right)\mathrm{e}^x \\ \frac{(-8\cos(x)+4\sin(x))\mathrm{e}^{-x}}{5} + \left(10x+7x^2+\frac{8}{5}+x^3\right)\mathrm{e}^x \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \begin{bmatrix} \frac{(4\sin(x)+2\cos(x))\mathrm{e}^{-x}}{5} + \frac{\mathrm{e}^x(5x^3+5x^2-2)}{5} \\ \frac{(2\cos(x)-6\sin(x))\mathrm{e}^{-x}}{5} + \left(x^3+4x^2+2x-\frac{2}{5}\right)\mathrm{e}^x \\ \frac{(-8\cos(x)+4\sin(x))\mathrm{e}^{-x}}{5} + \left(10x+7x^2+\frac{8}{5}+x^3\right)\mathrm{e}^x \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = \frac{((-5c_3+4)\cos(x)+(-5c_2+8)\sin(x))\mathrm{e}^{-x}}{10} + \left(c_1+x^3+x^2-\frac{2}{5}\right)\mathrm{e}^x$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{4y''' + 8y'' - y' - 2y = -\mathrm{e}^{-2x}(1 - 15x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$4y''' + 8y'' - y' - 2y = 0$$

The characteristic equation is

$$4\lambda^3 + 8\lambda^2 - \lambda - 2 = 0$$

The roots of the above equation are

$$\lambda_1 = -\frac{1}{2}$$
$$\lambda_2 = \frac{1}{2}$$
$$\lambda_3 = -2$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-2x} + c_2 \mathrm{e}^{-\frac{x}{2}} + c_3 \mathrm{e}^{\frac{x}{2}}$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \mathrm{e}^{-2x}$$
$$y_2 = \mathrm{e}^{-\frac{x}{2}}$$
$$y_3 = \mathrm{e}^{\frac{x}{2}}$$

Now the particular solution to the given ODE is found

$$4y''' + 8y'' - y' - 2y = -\mathrm{e}^{-2x}(1 - 15x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-\mathrm{e}^{-2x}(1 - 15x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{\mathrm{e}^{-2x} x, \mathrm{e}^{-2x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\left\{\mathrm{e}^{-2x}, \mathrm{e}^{-\frac{x}{2}}, \mathrm{e}^{\frac{x}{2}}\right\}$$

Since e^{-2x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 \mathrm{e}^{-2x}, \mathrm{e}^{-2x} x\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^2 \mathrm{e}^{-2x} + A_2 \mathrm{e}^{-2x} x$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$-32A_1 \mathrm{e}^{-2x} + 30A_1 x \,\mathrm{e}^{-2x} + 15A_2 \mathrm{e}^{-2x} = -\mathrm{e}^{-2x}(1 - 15x)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{1}{2}, A_2 = 1\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{x^2 e^{-2x}}{2} + e^{-2x} x$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-2x} + c_2 e^{-\frac{x}{2}} + c_3 e^{\frac{x}{2}}\right) + \left(\frac{x^2 e^{-2x}}{2} + e^{-2x} x\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 e^{-2x} + c_2 e^{-\frac{x}{2}} + c_3 e^{\frac{x}{2}} + \frac{x^2 e^{-2x}}{2} + e^{-2x} x \tag{1}$$

Verification of solutions

$$y = c_1 e^{-2x} + c_2 e^{-\frac{x}{2}} + c_3 e^{\frac{x}{2}} + \frac{x^2 e^{-2x}}{2} + e^{-2x} x$$

Verified OK.

19.7.1 Maple step by step solution

Let's solve

$4y''' + 8y'' - y' - 2y = -e^{-2x}(1 - 15x)$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = \frac{y}{2} - 2y'' + \frac{y'}{4} + \frac{15 e^{-2x} x}{4} - \frac{e^{-2x}}{4}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' + 2y'' - \frac{y'}{4} - \frac{y}{2} = \frac{e^{-2x}(15x-1)}{4}$

□ Convert linear ODE into a system of first order ODEs

- Define new variable $y_1(x)$

  $y_1(x) = y$
- Define new variable $y_2(x)$

  $y_2(x) = y'$
- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = \frac{15\,\mathrm{e}^{-2x}x}{4} - \frac{\mathrm{e}^{-2x}}{4} - 2y_3(x) + \frac{y_2(x)}{4} + \frac{y_1(x)}{2}$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = \frac{15\,\mathrm{e}^{-2x}x}{4} - \frac{\mathrm{e}^{-2x}}{4} - 2y_3(x) + \frac{y_2(x)}{4} + \frac{y_1(x)}{2}\right]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{1}{2} & \frac{1}{4} & -2 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ \frac{15\,\mathrm{e}^{-2x}x}{4} - \frac{\mathrm{e}^{-2x}}{4} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ \frac{15\,\mathrm{e}^{-2x}x}{4} - \frac{\mathrm{e}^{-2x}}{4} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{1}{2} & \frac{1}{4} & -2 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right], \left[-\frac{1}{2}, \left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]\right], \left[\frac{1}{2}, \left[\begin{array}{c} 4 \\ 2 \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-2, \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-2x} \cdot \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[-\frac{1}{2}, \left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{-\frac{x}{2}} \cdot \left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[\frac{1}{2}, \left[\begin{array}{c} 4 \\ 2 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = e^{\frac{x}{2}} \cdot \begin{bmatrix} 4 \\ 2 \\ 1 \end{bmatrix}$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

  $\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3 + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & 4\,e^{-\frac{x}{2}} & 4\,e^{\frac{x}{2}} \\ -\frac{e^{-2x}}{2} & -2\,e^{-\frac{x}{2}} & 2\,e^{\frac{x}{2}} \\ e^{-2x} & e^{-\frac{x}{2}} & e^{\frac{x}{2}} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

  $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & 4\,e^{-\frac{x}{2}} & 4\,e^{\frac{x}{2}} \\ -\frac{e^{-2x}}{2} & -2\,e^{-\frac{x}{2}} & 2\,e^{\frac{x}{2}} \\ e^{-2x} & e^{-\frac{x}{2}} & e^{\frac{x}{2}} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} \frac{1}{4} & 4 & 4 \\ -\frac{1}{2} & -2 & 2 \\ 1 & 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{\left(6\,e^{\frac{5x}{2}}+10\,e^{\frac{3x}{2}}-1\right)e^{-2x}}{15} & -e^{-\frac{x}{2}}+e^{\frac{x}{2}} & \frac{2\left(3\,e^{\frac{5x}{2}}-5\,e^{\frac{3x}{2}}+2\right)e^{-2x}}{15} \\ \frac{\left(3\,e^{\frac{5x}{2}}-5\,e^{\frac{3x}{2}}+2\right)e^{-2x}}{15} & \frac{e^{-\frac{x}{2}}}{2}+\frac{e^{\frac{x}{2}}}{2} & \frac{\left(3\,e^{\frac{5x}{2}}+5\,e^{\frac{3x}{2}}-8\right)e^{-2x}}{15} \\ \frac{\left(3\,e^{\frac{5x}{2}}+5\,e^{\frac{3x}{2}}-8\right)e^{-2x}}{30} & -\frac{e^{-\frac{x}{2}}}{4}+\frac{e^{\frac{x}{2}}}{4} & \frac{\left(3\,e^{\frac{5x}{2}}-5\,e^{\frac{3x}{2}}+32\right)e^{-2x}}{30} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)=A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\overrightarrow{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)=A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\overrightarrow{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot\overrightarrow{v}'(x)=\overrightarrow{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\overrightarrow{v}'(x)=\frac{1}{\Phi(x)}\cdot\overrightarrow{f}(x)$

- Integrate to solve for $\overrightarrow{v}(x)$

  $\overrightarrow{v}(x)=\int_0^x \frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds$

- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

  $\overrightarrow{y}_p(x)=\Phi(x)\cdot\left(\int_0^x \frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\overrightarrow{y}_p(x)=\left[\begin{array}{c}\frac{\left(2\,\mathrm{e}^{\frac{5x}{2}}-10\,\mathrm{e}^{\frac{3x}{2}}+5x^2+10x+8\right)\mathrm{e}^{-2x}}{10}\\ \frac{\left(\mathrm{e}^{\frac{5x}{2}}+5\,\mathrm{e}^{\frac{3x}{2}}-10x^2-10x-6\right)\mathrm{e}^{-2x}}{10}\\ \frac{\left(\mathrm{e}^{\frac{5x}{2}}-5\,\mathrm{e}^{\frac{3x}{2}}+40x^2+4\right)\mathrm{e}^{-2x}}{20}\end{array}\right]$$

- Plug particular solution back into general solution

$$\overrightarrow{y}(x)=c_1\overrightarrow{y}_1+c_2\overrightarrow{y}_2+c_3\overrightarrow{y}_3+\left[\begin{array}{c}\frac{\left(2\,\mathrm{e}^{\frac{5x}{2}}-10\,\mathrm{e}^{\frac{3x}{2}}+5x^2+10x+8\right)\mathrm{e}^{-2x}}{10}\\ \frac{\left(\mathrm{e}^{\frac{5x}{2}}+5\,\mathrm{e}^{\frac{3x}{2}}-10x^2-10x-6\right)\mathrm{e}^{-2x}}{10}\\ \frac{\left(\mathrm{e}^{\frac{5x}{2}}-5\,\mathrm{e}^{\frac{3x}{2}}+40x^2+4\right)\mathrm{e}^{-2x}}{20}\end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y=\frac{\left(80c_3\mathrm{e}^{\frac{5x}{2}}+4\,\mathrm{e}^{\frac{5x}{2}}+80c_2\mathrm{e}^{\frac{3x}{2}}-20\,\mathrm{e}^{\frac{3x}{2}}+10x^2+5c_1+20x+16\right)\mathrm{e}^{-2x}}{20}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - y'' - y' + y = -e^{x}(7 + 6x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - y'' - y' + y = 0$$

The characteristic equation is

$$\lambda^3 - \lambda^2 - \lambda + 1 = 0$$

The roots of the above equation are

$$\lambda_1 = -1$$
$$\lambda_2 = 1$$
$$\lambda_3 = 1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{x} + x e^{x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = e^{x}$$
$$y_3 = x e^{x}$$

Now the particular solution to the given ODE is found

$$y''' - y'' - y' + y = -e^{x}(7 + 6x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-e^{x}(7 + 6x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x e^{x}, e^{x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x e^{x}, e^{x}, e^{-x}\}$$

Since e^{x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x e^{x}, x^2 e^{x}\}]$$

Since $x e^{x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 e^{x}, e^{x} x^3\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^2 e^{x} + A_2 e^{x} x^3$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$4A_1 e^{x} + 12A_2 e^{x} x + 6A_2 e^{x} = -e^{x}(7 + 6x)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = -1, A_2 = -\frac{1}{2}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -x^2 \mathrm{e}^x - \frac{\mathrm{e}^x x^3}{2}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^x + x\,\mathrm{e}^x c_3\right) + \left(-x^2 \mathrm{e}^x - \frac{\mathrm{e}^x x^3}{2}\right) \end{aligned}$$

Which simplifies to

$$y = c_1 \mathrm{e}^{-x} + \mathrm{e}^x (c_3 x + c_2) - x^2 \mathrm{e}^x - \frac{\mathrm{e}^x x^3}{2}$$

Summary

The solution(s) found are the following

$$y = c_1 \mathrm{e}^{-x} + \mathrm{e}^x (c_3 x + c_2) - x^2 \mathrm{e}^x - \frac{\mathrm{e}^x x^3}{2} \tag{1}$$

Verification of solutions

$$y = c_1 \mathrm{e}^{-x} + \mathrm{e}^x (c_3 x + c_2) - x^2 \mathrm{e}^x - \frac{\mathrm{e}^x x^3}{2}$$

Verified OK.

19.8.1 Maple step by step solution

Let's solve

$y''' - y'' - y' + y = -\mathrm{e}^x (7 + 6x)$

- Highest derivative means the order of the ODE is 3

  y'''

- □ Convert linear ODE into a system of first order ODEs

- Define new variable $y_1(x)$

  $y_1(x) = y$
- Define new variable $y_2(x)$

  $y_2(x) = y'$
- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = -6x\,\mathrm{e}^{x} + y_3(x) + y_2(x) - y_1(x) - 7\,\mathrm{e}^{x}$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = -6x\,\mathrm{e}^{x} + y_3(x) + y_2(x) - y_1(x) - 7\,\mathrm{e}^{x}]$

- Define vector

$$\vec{y}(x) = \left[\begin{array}{c} y_1(x) \\ y_2(x) \\ y_3(x) \end{array}\right]$$

- System to solve

$$\vec{y}'(x) = \left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & 1 & 1 \end{array}\right] \cdot \vec{y}(x) + \left[\begin{array}{c} 0 \\ 0 \\ -6x\,\mathrm{e}^{x} - 7\,\mathrm{e}^{x} \end{array}\right]$$

- Define the forcing function

$$\vec{f}(x) = \left[\begin{array}{c} 0 \\ 0 \\ -6x\,\mathrm{e}^{x} - 7\,\mathrm{e}^{x} \end{array}\right]$$

- Define the coefficient matrix

$$A = \left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & 1 & 1 \end{array}\right]$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right], \left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right], \left[1, \left[\begin{array}{c} 0 \\ 0 \\ 0 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue 1

$$\overrightarrow{y}_2(x) = \mathrm{e}^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 1$ is the eigenvalue, an

$$\overrightarrow{y}_3(x) = \mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_3(x)$ into the homogeneous system

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \left(\mathrm{e}^{\lambda x} A\right) \cdot \left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v}+\overrightarrow{p}\right)+\mathrm{e}^{\lambda x}\overrightarrow{v}=\mathrm{e}^{\lambda x}\left(\lambda x\overrightarrow{v}+A\cdot\overrightarrow{p}\right)$$

- Simplify equation

$$\lambda\overrightarrow{p}+\overrightarrow{v}=A\cdot\overrightarrow{p}$$

- Make use of the identity matrix I

$$(\lambda\cdot I)\cdot\overrightarrow{p}+\overrightarrow{v}=A\cdot\overrightarrow{p}$$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_3(x)$ to be a solution to the homogeneous system

$$(A-\lambda\cdot I)\cdot\overrightarrow{p}=\overrightarrow{v}$$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue 1

$$\left(\left[\begin{array}{ccc}0 & 1 & 0\\ 0 & 0 & 1\\ -1 & 1 & 1\end{array}\right]-1\cdot\left[\begin{array}{ccc}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{array}\right]\right)\cdot\overrightarrow{p}=\left[\begin{array}{c}1\\ 1\\ 1\end{array}\right]$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p}=\left[\begin{array}{c}-1\\ 0\\ 0\end{array}\right]$$

- Second solution from eigenvalue 1

$$\overrightarrow{y}_3(x)=\mathrm{e}^{x}\cdot\left(x\cdot\left[\begin{array}{c}1\\ 1\\ 1\end{array}\right]+\left[\begin{array}{c}-1\\ 0\\ 0\end{array}\right]\right)$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

$$\overrightarrow{y}(x)=c_1\overrightarrow{y}_1+c_2\overrightarrow{y}_2(x)+c_3\overrightarrow{y}_3(x)+\overrightarrow{y}_p(x)$$

□ Fundamental matrix

- ○ Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x)=\left[\begin{array}{ccc}\mathrm{e}^{-x} & \mathrm{e}^{x} & (x-1)\,\mathrm{e}^{x}\\ -\mathrm{e}^{-x} & \mathrm{e}^{x} & x\,\mathrm{e}^{x}\\ \mathrm{e}^{-x} & \mathrm{e}^{x} & x\,\mathrm{e}^{x}\end{array}\right]$$

- ○ The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t

$$\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} e^{-x} & e^{x} & (x-1)\,e^{x} \\ -e^{-x} & e^{x} & x\,e^{x} \\ e^{-x} & e^{x} & x\,e^{x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & 1 & -1 \\ -1 & 1 & 0 \\ 1 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} -(x-1)\,e^{x} & -\frac{e^{-x}}{2}+\frac{e^{x}}{2} & \frac{e^{-x}}{2}-\frac{e^{x}}{2}+x\,e^{x} \\ -x\,e^{x} & \frac{e^{x}}{2}+\frac{e^{-x}}{2} & -\frac{e^{-x}}{2}+\frac{e^{x}}{2}+x\,e^{x} \\ -x\,e^{x} & -\frac{e^{-x}}{2}+\frac{e^{x}}{2} & \frac{e^{-x}}{2}+\frac{e^{x}}{2}+x\,e^{x} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$
- Take the derivative of the particular solution

  $\vec{y}'_p(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$
- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$
- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\,ds$
- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\,ds\right)$
- Plug in the fundamental matrix and the forcing function and compute

$$
\vec{y}_p(x) = \begin{bmatrix} e^{-x} + (-x^3 - 2x^2 + 2x - 1)\,e^{x} \\ -e^{-x} + (-x^3 - 5x^2 - 2x + 1)\,e^{x} \\ e^{-x} + (-x^3 - 5x^2 - 5x - 1)\,e^{x} \end{bmatrix}
$$

- Plug particular solution back into general solution

$$
\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \begin{bmatrix} e^{-x} + (-x^3 - 2x^2 + 2x - 1)\,e^{x} \\ -e^{-x} + (-x^3 - 5x^2 - 2x + 1)\,e^{x} \\ e^{-x} + (-x^3 - 5x^2 - 5x - 1)\,e^{x} \end{bmatrix}
$$

- First component of the vector is the solution to the ODE

$$
y = (1 + c_1)\,e^{-x} - e^{x}(x^3 + 2x^2 + (-c_3 - 2)\,x - c_2 + c_3 + 1)
$$

Problem number: section 9.3, problem 9.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{2y''' - 7y'' + 4y' + 4y = e^{2x}(17 + 30x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$2y''' - 7y'' + 4y' + 4y = 0$$

The characteristic equation is

$$2\lambda^3 - 7\lambda^2 + 4\lambda + 4 = 0$$

The roots of the above equation are

$$\lambda_1 = -\frac{1}{2}$$
$$\lambda_2 = 2$$
$$\lambda_3 = 2$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{2x} + c_2 x\, e^{2x} + e^{-\frac{x}{2}} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{2x}$$
$$y_2 = x\, e^{2x}$$
$$y_3 = e^{-\frac{x}{2}}$$

Now the particular solution to the given ODE is found

$$2y''' - 7y'' + 4y' + 4y = e^{2x}(17 + 30x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{2x}(17 + 30x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\, e^{2x}, e^{2x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\left\{x\, e^{2x}, e^{2x}, e^{-\frac{x}{2}}\right\}$$

Since e^{2x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\, e^{2x}, x^2 e^{2x}\}]$$

Since $x\, e^{2x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 e^{2x}, e^{2x} x^3\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^2 e^{2x} + A_2 e^{2x} x^3$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$10A_1\mathrm{e}^{2x} + 30A_2\mathrm{e}^{2x}x + 12A_2\mathrm{e}^{2x} = \mathrm{e}^{2x}(17 + 30x)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{1}{2}, A_2 = 1\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{x^2\mathrm{e}^{2x}}{2} + \mathrm{e}^{2x}x^3$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1\mathrm{e}^{2x} + c_2 x\,\mathrm{e}^{2x} + \mathrm{e}^{-\frac{x}{2}}c_3\right) + \left(\frac{x^2\mathrm{e}^{2x}}{2} + \mathrm{e}^{2x}x^3\right) \end{aligned}$$

Which simplifies to

$$y = \mathrm{e}^{-\frac{x}{2}}c_3 + \mathrm{e}^{2x}(c_2x + c_1) + \frac{x^2\mathrm{e}^{2x}}{2} + \mathrm{e}^{2x}x^3$$

Summary
The solution(s) found are the following

$$y = \mathrm{e}^{-\frac{x}{2}}c_3 + \mathrm{e}^{2x}(c_2x + c_1) + \frac{x^2\mathrm{e}^{2x}}{2} + \mathrm{e}^{2x}x^3 \tag{1}$$

Verification of solutions

$$y = \mathrm{e}^{-\frac{x}{2}}c_3 + \mathrm{e}^{2x}(c_2x + c_1) + \frac{x^2\mathrm{e}^{2x}}{2} + \mathrm{e}^{2x}x^3$$

Verified OK.

19.9.1 Maple step by step solution

Let's solve

$2y''' - 7y'' + 4y' + 4y = e^{2x}(17 + 30x)$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = -2y + \frac{7y''}{2} - 2y' + 15x\,e^{2x} + \frac{17\,e^{2x}}{2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - \frac{7y''}{2} + 2y' + 2y = \frac{e^{2x}(17+30x)}{2}$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = 15x\,e^{2x} + \frac{17\,e^{2x}}{2} + \frac{7y_3(x)}{2} - 2y_2(x) - 2y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 15x\,e^{2x} + \frac{17\,e^{2x}}{2} + \frac{7y_3(x)}{2} - 2y_2(x) - 2y_1(x)\right]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -2 & -2 & \frac{7}{2} \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 15x\,e^{2x} + \frac{17\,e^{2x}}{2} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 15x\,\mathrm{e}^{2x} + \frac{17\,\mathrm{e}^{2x}}{2} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -2 & -2 & \frac{7}{2} \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-\frac{1}{2}, \begin{bmatrix} 4 \\ -2 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-\frac{1}{2}, \begin{bmatrix} 4 \\ -2 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-\frac{x}{2}} \cdot \begin{bmatrix} 4 \\ -2 \\ 1 \end{bmatrix}$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue 2

  $\overrightarrow{y}_2(x) = \mathrm{e}^{2x} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 2$ is the eigenvalue, an

  $\overrightarrow{y}_3(x) = \mathrm{e}^{\lambda x} \left(x \overrightarrow{v} + \overrightarrow{p}\right)$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_3(x)$ into the homogeneous system

  $\lambda \mathrm{e}^{\lambda x} \left(x \overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x} \overrightarrow{v} = \left(\mathrm{e}^{\lambda x} A\right) \cdot \left(x \overrightarrow{v} + \overrightarrow{p}\right)$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

  $\lambda \mathrm{e}^{\lambda x} \left(x \overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x} \overrightarrow{v} = \mathrm{e}^{\lambda x} \left(\lambda x \overrightarrow{v} + A \cdot \overrightarrow{p}\right)$

- Simplify equation

  $\lambda \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$

- Make use of the identity matrix I

  $(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_3(x)$ to be a solution to the homogeneous system

  $(A - \lambda \cdot I) \cdot \overrightarrow{p} = \overrightarrow{v}$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue 2

  $\left(\begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -2 & -2 & \frac{7}{2} \end{bmatrix} - 2 \cdot \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \cdot \overrightarrow{p} = \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$

- Choice of $\overrightarrow{p}$

  $\overrightarrow{p} = \begin{bmatrix} -\frac{1}{8} \\ 0 \\ 0 \end{bmatrix}$

- Second solution from eigenvalue 2

$$\vec{y}_3(x) = e^{2x} \cdot \left(x \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} + \begin{bmatrix} -\frac{1}{8} \\ 0 \\ 0 \end{bmatrix} \right)$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} 4\,e^{-\frac{x}{2}} & \frac{e^{2x}}{4} & e^{2x}\left(\frac{x}{4} - \frac{1}{8}\right) \\ -2\,e^{-\frac{x}{2}} & \frac{e^{2x}}{2} & \frac{x\,e^{2x}}{2} \\ e^{-\frac{x}{2}} & e^{2x} & x\,e^{2x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} 4\,e^{-\frac{x}{2}} & \frac{e^{2x}}{4} & e^{2x}\left(\frac{x}{4} - \frac{1}{8}\right) \\ -2\,e^{-\frac{x}{2}} & \frac{e^{2x}}{2} & \frac{x\,e^{2x}}{2} \\ e^{-\frac{x}{2}} & e^{2x} & x\,e^{2x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 4 & \frac{1}{4} & -\frac{1}{8} \\ -2 & \frac{1}{2} & 0 \\ 1 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} (1-2x)\,e^{2x} & -\frac{8\,e^{-\frac{x}{2}}}{5} + \frac{8\,e^{2x}}{5} - 3x\,e^{2x} & \frac{4\,e^{-\frac{x}{2}}}{5} - \frac{4\,e^{2x}}{5} + 2x\,e^{2x} \\ -4x\,e^{2x} & \frac{4\,e^{-\frac{x}{2}}}{5} + \frac{e^{2x}}{5} - 6x\,e^{2x} & -\frac{2\,e^{-\frac{x}{2}}}{5} + \frac{2\,e^{2x}}{5} + 4x\,e^{2x} \\ -8x\,e^{2x} & -\frac{2\,e^{-\frac{x}{2}}}{5} + \frac{2\,e^{2x}}{5} - 12x\,e^{2x} & \frac{e^{-\frac{x}{2}}}{5} + \frac{4\,e^{2x}}{5} + 8x\,e^{2x} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

$\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

$\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x)\cdot \vec{v}(x)+\Phi(x)\cdot \vec{v}'(x)=A\cdot \Phi(x)\cdot \vec{v}(x)+\vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A\cdot \Phi(x)\cdot \vec{v}(x)+\Phi(x)\cdot \vec{v}'(x)=A\cdot \Phi(x)\cdot \vec{v}(x)+\vec{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot \vec{v}'(x)=\vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x)=\frac{1}{\Phi(x)}\cdot \vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x)=\int_0^x \frac{1}{\Phi(s)}\cdot \vec{f}(s)\, ds$

- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x)=\Phi(x)\cdot \left(\int_0^x \frac{1}{\Phi(s)}\cdot \vec{f}(s)\, ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

  $$\vec{y}_p(x)=\left[\begin{array}{c} -\frac{4\,\mathrm{e}^{-\frac{x}{2}}}{5}+\frac{\left(50x^3+25x^2-20x+8\right)\mathrm{e}^{2x}}{10} \\ \frac{2\,\mathrm{e}^{-\frac{x}{2}}}{5}+\frac{\left(50x^3+100x^2+5x-2\right)\mathrm{e}^{2x}}{5} \\ -\frac{\mathrm{e}^{-\frac{x}{2}}}{5}+\frac{\left(100x^3+200x^2+40x+1\right)\mathrm{e}^{2x}}{5} \end{array}\right]$$

- Plug particular solution back into general solution

  $$\vec{y}(x)=c_1\vec{y}_1+c_2\vec{y}_2(x)+c_3\vec{y}_3(x)+\left[\begin{array}{c} -\frac{4\,\mathrm{e}^{-\frac{x}{2}}}{5}+\frac{\left(50x^3+25x^2-20x+8\right)\mathrm{e}^{2x}}{10} \\ \frac{2\,\mathrm{e}^{-\frac{x}{2}}}{5}+\frac{\left(50x^3+100x^2+5x-2\right)\mathrm{e}^{2x}}{5} \\ -\frac{\mathrm{e}^{-\frac{x}{2}}}{5}+\frac{\left(100x^3+200x^2+40x+1\right)\mathrm{e}^{2x}}{5} \end{array}\right]$$

- First component of the vector is the solution to the ODE

  $$y=\frac{\left(160c_1-32\right)\mathrm{e}^{-\frac{x}{2}}}{40}+5\left(x^3+\frac{x^2}{2}+\left(\frac{c_3}{20}-\frac{2}{5}\right)x+\frac{c_2}{20}-\frac{c_3}{40}+\frac{4}{25}\right)\mathrm{e}^{2x}$$

ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - 5y'' + 3y' + 9y = 2\,\mathrm{e}^{3x}(11 - 24x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - 5y'' + 3y' + 9y = 0$$

The characteristic equation is

$$\lambda^3 - 5\lambda^2 + 3\lambda + 9 = 0$$

The roots of the above equation are

$$\lambda_1 = -1$$
$$\lambda_2 = 3$$
$$\lambda_3 = 3$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{3x} + c_3 e^{3x} x$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = e^{3x}$$
$$y_3 = x e^{3x}$$

Now the particular solution to the given ODE is found

$$y''' - 5y'' + 3y' + 9y = 2 e^{3x}(11 - 24x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$2 e^{3x}(11 - 24x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x e^{3x}, e^{3x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x e^{3x}, e^{-x}, e^{3x}\}$$

Since e^{3x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x e^{3x}, x^2 e^{3x}\}]$$

Since $x e^{3x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 e^{3x}, x^3 e^{3x}\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^2 e^{3x} + A_2 x^3 e^{3x}$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$8A_1 e^{3x} + 6A_2 e^{3x} + 24A_2 x\, e^{3x} = 2\, e^{3x}(11 - 24x)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{17}{4}, A_2 = -2\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{17x^2 e^{3x}}{4} - 2x^3 e^{3x}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-x} + c_2 e^{3x} + c_3 e^{3x} x\right) + \left(\frac{17x^2 e^{3x}}{4} - 2x^3 e^{3x}\right) \end{aligned}$$

Which simplifies to

$$y = (c_3 x + c_2)\, e^{3x} + c_1 e^{-x} + \frac{17x^2 e^{3x}}{4} - 2x^3 e^{3x}$$

Summary

The solution(s) found are the following

$$y = (c_3 x + c_2)\, e^{3x} + c_1 e^{-x} + \frac{17x^2 e^{3x}}{4} - 2x^3 e^{3x} \tag{1}$$

Verification of solutions

$$y = (c_3 x + c_2)\, e^{3x} + c_1 e^{-x} + \frac{17x^2 e^{3x}}{4} - 2x^3 e^{3x}$$

Verified OK.

19.10.1 Maple step by step solution

Let's solve

$y''' - 5y'' + 3y' + 9y = 2\,e^{3x}(11 - 24x)$

- Highest derivative means the order of the ODE is 3

y'''

- Isolate 3rd derivative

$y''' = -9y - 48x\,e^{3x} + 5y'' - 3y' + 22\,e^{3x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''' - 5y'' + 3y' + 9y = -2\,e^{3x}(-11 + 24x)$

☐ Convert linear ODE into a system of first order ODEs

- ○ Define new variable $y_1(x)$

$y_1(x) = y$

- ○ Define new variable $y_2(x)$

$y_2(x) = y'$

- ○ Define new variable $y_3(x)$

$y_3(x) = y''$

- ○ Isolate for $y_3'(x)$ using original ODE

$y_3'(x) = -48x\,e^{3x} + 22\,e^{3x} + 5y_3(x) - 3y_2(x) - 9y_1(x)$

Convert linear ODE into a system of first order ODEs

$[y_2(x) = y_1'(x)\,, y_3(x) = y_2'(x)\,, y_3'(x) = -48x\,e^{3x} + 22\,e^{3x} + 5y_3(x) - 3y_2(x) - 9y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -9 & -3 & 5 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ -48x\,e^{3x} + 22\,e^{3x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ -48x\,\mathrm{e}^{3x} + 22\,\mathrm{e}^{3x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -9 & -3 & 5 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}\right], \left[3, \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-x} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue 3

$$\vec{y}_2(x) = e^{3x} \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = 3$ is the eigenvalue, and

$$\vec{y}_3(x) = e^{\lambda x}\left(x\vec{v} + \vec{p}\right)$$

- Note that the x multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\vec{y}_3(x)$ into the homogeneous system

$$\lambda e^{\lambda x}\left(x\vec{v} + \vec{p}\right) + e^{\lambda x}\vec{v} = \left(e^{\lambda x}A\right) \cdot \left(x\vec{v} + \vec{p}\right)$$

- Use the fact that $\vec{v}$ is an eigenvector of A

$$\lambda e^{\lambda x}\left(x\vec{v} + \vec{p}\right) + e^{\lambda x}\vec{v} = e^{\lambda x}\left(\lambda x\vec{v} + A \cdot \vec{p}\right)$$

- Simplify equation

$$\lambda\vec{p} + \vec{v} = A \cdot \vec{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$$

- Condition $\vec{p}$ must meet for $\vec{y}_3(x)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue 3

$$\left(\begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -9 & -3 & 5 \end{bmatrix} - 3 \cdot \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \cdot \vec{p} = \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- Choice of $\vec{p}$

$$\vec{p} = \begin{bmatrix} -\frac{1}{27} \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue 3

$$\vec{y}_3(x) = e^{3x} \cdot \left(x \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix} + \begin{bmatrix} -\frac{1}{27} \\ 0 \\ 0 \end{bmatrix} \right)$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

  $\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} e^{-x} & \frac{e^{3x}}{9} & e^{3x}\left(\frac{x}{9} - \frac{1}{27}\right) \\ -e^{-x} & \frac{e^{3x}}{3} & \frac{x\,e^{3x}}{3} \\ e^{-x} & e^{3x} & x\,e^{3x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

  $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} e^{-x} & \frac{e^{3x}}{9} & e^{3x}\left(\frac{x}{9} - \frac{1}{27}\right) \\ -e^{-x} & \frac{e^{3x}}{3} & \frac{x\,e^{3x}}{3} \\ e^{-x} & e^{3x} & x\,e^{3x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & \frac{1}{9} & -\frac{1}{27} \\ -1 & \frac{1}{3} & 0 \\ 1 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} (-3x+1)\,e^{3x} & -\frac{3\,e^{-x}}{4} + \frac{3\,e^{3x}}{4} - 2x\,e^{3x} & \frac{e^{-x}}{4} - \frac{e^{3x}}{4} + x\,e^{3x} \\ -9x\,e^{3x} & \frac{3\,e^{-x}}{4} + \frac{e^{3x}}{4} - 6x\,e^{3x} & -\frac{e^{-x}}{4} + \frac{e^{3x}}{4} + 3x\,e^{3x} \\ -27x\,e^{3x} & -\frac{3\,e^{-x}}{4} + \frac{3\,e^{3x}}{4} - 18x\,e^{3x} & \frac{e^{-x}}{4} + \frac{3\,e^{3x}}{4} + 9x\,e^{3x} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}'_p(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$

- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \begin{bmatrix} \frac{(-64x^3+136x^2-68x+17)\mathrm{e}^{3x}}{8} - \frac{17\,\mathrm{e}^{-x}}{8} \\ \frac{(-192x^3+216x^2+68x-17)\mathrm{e}^{3x}}{8} + \frac{17\,\mathrm{e}^{-x}}{8} \\ \frac{(-576x^3+648x^2+108x+17)\mathrm{e}^{3x}}{8} - \frac{17\,\mathrm{e}^{-x}}{8} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \begin{bmatrix} \frac{(-64x^3+136x^2-68x+17)\mathrm{e}^{3x}}{8} - \frac{17\,\mathrm{e}^{-x}}{8} \\ \frac{(-192x^3+216x^2+68x-17)\mathrm{e}^{3x}}{8} + \frac{17\,\mathrm{e}^{-x}}{8} \\ \frac{(-576x^3+648x^2+108x+17)\mathrm{e}^{3x}}{8} - \frac{17\,\mathrm{e}^{-x}}{8} \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = \frac{(-1728x^3+3672x^2+(24c_3-1836)x+24c_2-8c_3+459)\mathrm{e}^{3x}}{216} + \frac{(216c_1-459)\mathrm{e}^{-x}}{216}$$

[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - 7y'' + 8y' + 16y = 2\,\mathrm{e}^{4x}(13 + 15x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - 7y'' + 8y' + 16y = 0$$

The characteristic equation is

$$\lambda^3 - 7\lambda^2 + 8\lambda + 16 = 0$$

The roots of the above equation are

$$\lambda_1 = -1$$
$$\lambda_2 = 4$$
$$\lambda_3 = 4$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{4x} + x\, e^{4x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = e^{4x}$$
$$y_3 = x\, e^{4x}$$

Now the particular solution to the given ODE is found

$$y''' - 7y'' + 8y' + 16y = 2\, e^{4x}(13 + 15x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$2\, e^{4x}(13 + 15x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\, e^{4x}, e^{4x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\, e^{4x}, e^{-x}, e^{4x}\}$$

Since e^{4x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\, e^{4x}, x^2 e^{4x}\}]$$

Since $x\, e^{4x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 e^{4x}, e^{4x} x^3\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^2 e^{4x} + A_2 e^{4x} x^3$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$10A_1 e^{4x} + 30A_2 e^{4x} x + 6A_2 e^{4x} = 2\,e^{4x}(13 + 15x)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 2, A_2 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = 2x^2 e^{4x} + e^{4x} x^3$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-x} + c_2 e^{4x} + x\,e^{4x} c_3\right) + \left(2x^2 e^{4x} + e^{4x} x^3\right) \end{aligned}$$

Which simplifies to

$$y = (c_3 x + c_2)\,e^{4x} + c_1 e^{-x} + 2x^2 e^{4x} + e^{4x} x^3$$

Summary
The solution(s) found are the following

$$y = (c_3 x + c_2)\,e^{4x} + c_1 e^{-x} + 2x^2 e^{4x} + e^{4x} x^3 \tag{1}$$

Verification of solutions

$$y = (c_3 x + c_2)\,e^{4x} + c_1 e^{-x} + 2x^2 e^{4x} + e^{4x} x^3$$

Verified OK.

19.11.1 Maple step by step solution

Let's solve

$y''' - 7y'' + 8y' + 16y = 2\,e^{4x}(13 + 15x)$

- Highest derivative means the order of the ODE is 3

y'''

- ☐ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$
  - Define new variable $y_2(x)$

    $y_2(x) = y'$
  - Define new variable $y_3(x)$

    $y_3(x) = y''$
  - Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = 30x\,e^{4x} + 26\,e^{4x} + 7y_3(x) - 8y_2(x) - 16y_1(x)$

    Convert linear ODE into a system of first order ODEs

    $[y_2(x) = y_1'(x)\,, y_3(x) = y_2'(x)\,, y_3'(x) = 30x\,e^{4x} + 26\,e^{4x} + 7y_3(x) - 8y_2(x) - 16y_1(x)]$
- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -16 & -8 & 7 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 30x\,e^{4x} + 26\,e^{4x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 30x\,e^{4x} + 26\,e^{4x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -16 & -8 & 7 \end{bmatrix}$$

- Rewrite the system as

$$\overrightarrow{y}'(x) = A\cdot \overrightarrow{y}(x) + \overrightarrow{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right], \left[4, \left[\begin{array}{c} \frac{1}{16} \\ \frac{1}{4} \\ 1 \end{array}\right]\right], \left[4, \left[\begin{array}{c} 0 \\ 0 \\ 0 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-x}\cdot \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[4, \left[\begin{array}{c} \frac{1}{16} \\ \frac{1}{4} \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue 4

$$\overrightarrow{y}_2(x) = \mathrm{e}^{4x}\cdot \left[\begin{array}{c} \frac{1}{16} \\ \frac{1}{4} \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 4$ is the eigenvalue, an

$$\overrightarrow{y}_3(x) = \mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_3(x)$ into the homogeneous system

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \left(\mathrm{e}^{\lambda x}A\right)\cdot\left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

  $\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v}+\overrightarrow{p}\right)+\mathrm{e}^{\lambda x}\overrightarrow{v}=\mathrm{e}^{\lambda x}\left(\lambda x\overrightarrow{v}+A\cdot\overrightarrow{p}\right)$

- Simplify equation

  $\lambda\overrightarrow{p}+\overrightarrow{v}=A\cdot\overrightarrow{p}$

- Make use of the identity matrix I

  $(\lambda\cdot I)\cdot\overrightarrow{p}+\overrightarrow{v}=A\cdot\overrightarrow{p}$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_3(x)$ to be a solution to the homogeneous system

  $(A-\lambda\cdot I)\cdot\overrightarrow{p}=\overrightarrow{v}$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue 4

  $$\left(\left[\begin{array}{ccc}0 & 1 & 0\\ 0 & 0 & 1\\ -16 & -8 & 7\end{array}\right]-4\cdot\left[\begin{array}{ccc}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{array}\right]\right)\cdot\overrightarrow{p}=\left[\begin{array}{c}\frac{1}{16}\\ \frac{1}{4}\\ 1\end{array}\right]$$

- Choice of $\overrightarrow{p}$

  $$\overrightarrow{p}=\left[\begin{array}{c}-\frac{1}{64}\\ 0\\ 0\end{array}\right]$$

- Second solution from eigenvalue 4

  $$\overrightarrow{y}_3(x)=\mathrm{e}^{4x}\cdot\left(x\cdot\left[\begin{array}{c}\frac{1}{16}\\ \frac{1}{4}\\ 1\end{array}\right]+\left[\begin{array}{c}-\frac{1}{64}\\ 0\\ 0\end{array}\right]\right)$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

  $\overrightarrow{y}(x)=c_1\overrightarrow{y}_1+c_2\overrightarrow{y}_2(x)+c_3\overrightarrow{y}_3(x)+\overrightarrow{y}_p(x)$

☐ Fundamental matrix

  ◦ Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

  $$\phi(x)=\left[\begin{array}{ccc}\mathrm{e}^{-x} & \frac{\mathrm{e}^{4x}}{16} & \mathrm{e}^{4x}\left(\frac{x}{16}-\frac{1}{64}\right)\\ -\mathrm{e}^{-x} & \frac{\mathrm{e}^{4x}}{4} & \frac{x\,\mathrm{e}^{4x}}{4}\\ \mathrm{e}^{-x} & \mathrm{e}^{4x} & x\,\mathrm{e}^{4x}\end{array}\right]$$

  ◦ The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t

$\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x)=\begin{bmatrix} \mathrm{e}^{-x} & \frac{\mathrm{e}^{4x}}{16} & \mathrm{e}^{4x}\left(\frac{x}{16}-\frac{1}{64}\right) \\ -\mathrm{e}^{-x} & \frac{\mathrm{e}^{4x}}{4} & \frac{x\,\mathrm{e}^{4x}}{4} \\ \mathrm{e}^{-x} & \mathrm{e}^{4x} & x\,\mathrm{e}^{4x} \end{bmatrix}\cdot\frac{1}{\begin{bmatrix} 1 & \frac{1}{16} & -\frac{1}{64} \\ -1 & \frac{1}{4} & 0 \\ 1 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x)=\begin{bmatrix} (-4x+1)\,\mathrm{e}^{4x} & -\frac{4\,\mathrm{e}^{-x}}{5}+\frac{4\,\mathrm{e}^{4x}}{5}-3x\,\mathrm{e}^{4x} & \frac{\mathrm{e}^{-x}}{5}-\frac{\mathrm{e}^{4x}}{5}+x\,\mathrm{e}^{4x} \\ -16x\,\mathrm{e}^{4x} & \frac{4\,\mathrm{e}^{-x}}{5}+\frac{\mathrm{e}^{4x}}{5}-12x\,\mathrm{e}^{4x} & -\frac{\mathrm{e}^{-x}}{5}+\frac{\mathrm{e}^{4x}}{5}+4x\,\mathrm{e}^{4x} \\ -64x\,\mathrm{e}^{4x} & -\frac{4\,\mathrm{e}^{-x}}{5}+\frac{4\,\mathrm{e}^{4x}}{5}-48x\,\mathrm{e}^{4x} & \frac{\mathrm{e}^{-x}}{5}+\frac{4\,\mathrm{e}^{4x}}{5}+16x\,\mathrm{e}^{4x} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x)=\Phi(x)\cdot\vec{v}(x)$
- Take the derivative of the particular solution

  $\vec{y}_p'(x)=\Phi'(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)$
- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)=A\cdot\Phi(x)\cdot\vec{v}(x)+\vec{f}(x)$
- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A\cdot\Phi(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)=A\cdot\Phi(x)\cdot\vec{v}(x)+\vec{f}(x)$
- Cancel like terms

  $\Phi(x)\cdot\vec{v}'(x)=\vec{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x)=\frac{1}{\Phi(x)}\cdot\vec{f}(x)$
- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x)=\int_0^x\frac{1}{\Phi(s)}\cdot\vec{f}(s)\,ds$
- Plug $\vec{v}(x)$ into the equation for the particular solution

$$\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \left[\begin{array}{c} \frac{(25x^3+50x^2-20x+4)\,e^{4x}}{5} - \frac{4\,e^{-x}}{5} \\ \frac{(100x^3+275x^2+20x-4)\,e^{4x}}{5} + \frac{4\,e^{-x}}{5} \\ \frac{2(200x^3+550x^2+55x+2)\,e^{4x}}{5} - \frac{4\,e^{-x}}{5} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \left[\begin{array}{c} \frac{(25x^3+50x^2-20x+4)\,e^{4x}}{5} - \frac{4\,e^{-x}}{5} \\ \frac{(100x^3+275x^2+20x-4)\,e^{4x}}{5} + \frac{4\,e^{-x}}{5} \\ \frac{2(200x^3+550x^2+55x+2)\,e^{4x}}{5} - \frac{4\,e^{-x}}{5} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y = \frac{(256+1600x^3+3200x^2+20(-64+c_3)x+20c_2-5c_3)\,e^{4x}}{320} + \frac{e^{-x}(5c_1-4)}{5}$$

ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{8y''' - 12y'' + 6y' - y = e^{\frac{x}{2}}(4x + 1)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$8y''' - 12y'' + 6y' - y = 0$$

The characteristic equation is

$$8\lambda^3 - 12\lambda^2 + 6\lambda - 1 = 0$$

The roots of the above equation are

$$\lambda_1 = \frac{1}{2}$$
$$\lambda_2 = \frac{1}{2}$$
$$\lambda_3 = \frac{1}{2}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{\frac{x}{2}} + c_2 e^{\frac{x}{2}} x + x^2 e^{\frac{x}{2}} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{\frac{x}{2}}$$
$$y_2 = e^{\frac{x}{2}} x$$
$$y_3 = x^2 e^{\frac{x}{2}}$$

Now the particular solution to the given ODE is found

$$8y''' - 12y'' + 6y' - y = e^{\frac{x}{2}} (4x + 1)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{\frac{x}{2}} (4x + 1)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$\left[\left\{e^{\frac{x}{2}} x, e^{\frac{x}{2}}\right\}\right]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\left\{x^2 e^{\frac{x}{2}}, e^{\frac{x}{2}} x, e^{\frac{x}{2}}\right\}$$

Since $e^{\frac{x}{2}}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$\left[\left\{x^2 e^{\frac{x}{2}}, e^{\frac{x}{2}} x\right\}\right]$$

Since $e^{\frac{x}{2}} x$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$\left[\left\{x^2 e^{\frac{x}{2}}, x^3 e^{\frac{x}{2}}\right\}\right]$$

Since $x^2 e^{\frac{x}{2}}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$\left[\left\{x^3 e^{\frac{x}{2}}, x^4 e^{\frac{x}{2}}\right\}\right]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^3 e^{\frac{x}{2}} + A_2 x^4 e^{\frac{x}{2}}$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$48A_1 e^{\frac{x}{2}} + 192A_2 x\, e^{\frac{x}{2}} = e^{\frac{x}{2}}(4x+1)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{1}{48}, A_2 = \frac{1}{48}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{x^3 e^{\frac{x}{2}}}{48} + \frac{x^4 e^{\frac{x}{2}}}{48}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{\frac{x}{2}} + c_2 e^{\frac{x}{2}} x + x^2 e^{\frac{x}{2}} c_3\right) + \left(\frac{x^3 e^{\frac{x}{2}}}{48} + \frac{x^4 e^{\frac{x}{2}}}{48}\right) \end{aligned}$$

Which simplifies to

$$y = e^{\frac{x}{2}}\left(c_3 x^2 + c_2 x + c_1\right) + \frac{x^3 e^{\frac{x}{2}}}{48} + \frac{x^4 e^{\frac{x}{2}}}{48}$$

Summary

The solution(s) found are the following

$$y = e^{\frac{x}{2}}\left(c_3 x^2 + c_2 x + c_1\right) + \frac{x^3 e^{\frac{x}{2}}}{48} + \frac{x^4 e^{\frac{x}{2}}}{48} \tag{1}$$

Verification of solutions

$$y = e^{\frac{x}{2}}\left(c_3 x^2 + c_2 x + c_1\right) + \frac{x^3 e^{\frac{x}{2}}}{48} + \frac{x^4 e^{\frac{x}{2}}}{48}$$

Verified OK.

Problem number: section 9.3, problem 13.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' + 3y''' - 3y'' - 7y' + 6y = -3\,\mathrm{e}^{-x}\left(-8x^2 + 8x + 12\right)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + 3y''' - 3y'' - 7y' + 6y = 0$$

The characteristic equation is

$$\lambda^4 + 3\lambda^3 - 3\lambda^2 - 7\lambda + 6 = 0$$

The roots of the above equation are

$$\lambda_1 = -3$$
$$\lambda_2 = -2$$
$$\lambda_3 = 1$$
$$\lambda_4 = 1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-2x} + c_2 \mathrm{e}^{x} + x\,\mathrm{e}^{x} c_3 + \mathrm{e}^{-3x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= \mathrm{e}^{-2x} \\ y_2 &= \mathrm{e}^{x} \\ y_3 &= x\,\mathrm{e}^{x} \\ y_4 &= \mathrm{e}^{-3x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' + 3y''' - 3y'' - 7y' + 6y = -3\,\mathrm{e}^{-x}\left(-8x^2 + 8x + 12\right)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-3\,\mathrm{e}^{-x}\left(-8x^2 + 8x + 12\right)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,\mathrm{e}^{-x}, x^2 \mathrm{e}^{-x}, \mathrm{e}^{-x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\,\mathrm{e}^{x}, \mathrm{e}^{x}, \mathrm{e}^{-3x}, \mathrm{e}^{-2x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 x\,\mathrm{e}^{-x} + A_2 x^2 \mathrm{e}^{-x} + A_3 \mathrm{e}^{-x}$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$\begin{aligned} &8A_2 x\,\mathrm{e}^{-x} + 8A_1 x\,\mathrm{e}^{-x} + 8A_2 x^2 \mathrm{e}^{-x} + 8A_3 \mathrm{e}^{-x} - 12A_2 \mathrm{e}^{-x} + 4A_1 \mathrm{e}^{-x} \\ &= -3\,\mathrm{e}^{-x}\left(-8x^2 + 8x + 12\right) \end{aligned}$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = -6, A_2 = 3, A_3 = 3]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -6x\,e^{-x} + 3x^2e^{-x} + 3\,e^{-x}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1e^{-2x} + c_2e^{x} + x\,e^{x}c_3 + e^{-3x}c_4\right) + \left(-6x\,e^{-x} + 3x^2e^{-x} + 3\,e^{-x}\right) \end{aligned}$$

Which simplifies to

$$y = \left((c_3x + c_2)\,e^{4x} + c_1e^{x} + c_4\right)e^{-3x} - 6x\,e^{-x} + 3x^2e^{-x} + 3\,e^{-x}$$

Summary

The solution(s) found are the following

$$y = \left((c_3x + c_2)\,e^{4x} + c_1e^{x} + c_4\right)e^{-3x} - 6x\,e^{-x} + 3x^2e^{-x} + 3\,e^{-x} \tag{1}$$

Verification of solutions

$$y = \left((c_3x + c_2)\,e^{4x} + c_1e^{x} + c_4\right)e^{-3x} - 6x\,e^{-x} + 3x^2e^{-x} + 3\,e^{-x}$$

Verified OK.

19.13.1 Maple step by step solution

Let's solve

$y'''' + 3y''' - 3y'' - 7y' + 6y = -3\,e^{-x}(-8x^2 + 8x + 12)$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = -6y + 24x^2e^{-x} - 24x\,e^{-x} - 36\,e^{-x} - 3y''' + 3y'' + 7y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'''' + 3y''' - 3y'' - 7y' + 6y = 12\,e^{-x}(2x^2 - 2x - 3)$

- ☐ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$
  - Define new variable $y_2(x)$

    $y_2(x) = y'$
  - Define new variable $y_3(x)$

    $y_3(x) = y''$
  - Define new variable $y_4(x)$

    $y_4(x) = y'''$
  - Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = 24x^2 e^{-x} - 24x\, e^{-x} - 36\, e^{-x} - 3y_4(x) + 3y_3(x) + 7y_2(x) - 6y_1(x)$

    Convert linear ODE into a system of first order ODEs

    $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = 24x^2 e^{-x} - 24x\, e^{-x} - 36\, e^{-x} - 3y_4(x) + 3y$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -6 & 7 & 3 & -3 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ 24x^2 e^{-x} - 24x\, e^{-x} - 36\, e^{-x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 24x^2 e^{-x} - 24x\, e^{-x} - 36\, e^{-x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -6 & 7 & 3 & -3 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-3, \begin{bmatrix} -\frac{1}{27} \\ \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{bmatrix}\right], \left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-3, \begin{bmatrix} -\frac{1}{27} \\ \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = e^{-3x} \cdot \begin{bmatrix} -\frac{1}{27} \\ \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_2 = e^{-2x} \cdot \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue 1

$$\overrightarrow{y}_3(x) = e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 1$ is the eigenvalue, an

$$\overrightarrow{y}_4(x) = e^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_4(x)$ into the homogeneous system

$$\lambda e^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + e^{\lambda x}\overrightarrow{v} = \left(e^{\lambda x}A\right) \cdot \left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda e^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + e^{\lambda x}\overrightarrow{v} = e^{\lambda x}\left(\lambda x\overrightarrow{v} + A \cdot \overrightarrow{p}\right)$$

- Simplify equation

$$\lambda\overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_4(x)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \overrightarrow{p} = \overrightarrow{v}$$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue 1

$$\left(\begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -6 & 7 & 3 & -3 \end{bmatrix} - 1 \cdot \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}\right) \cdot \overrightarrow{p} = \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p} = \begin{bmatrix} -1 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue 1

$$\overrightarrow{y}_4(x) = \mathrm{e}^x \cdot \left(x \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} + \begin{bmatrix} -1 \\ 0 \\ 0 \\ 0 \end{bmatrix}\right)$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

$\overrightarrow{y}(x) = c_1 \overrightarrow{y}_1 + c_2 \overrightarrow{y}_2 + c_3 \overrightarrow{y}_3(x) + c_4 \overrightarrow{y}_4(x) + \overrightarrow{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} -\frac{\mathrm{e}^{-3x}}{27} & -\frac{\mathrm{e}^{-2x}}{8} & \mathrm{e}^x & (x-1)\,\mathrm{e}^x \\ \frac{\mathrm{e}^{-3x}}{9} & \frac{\mathrm{e}^{-2x}}{4} & \mathrm{e}^x & x\,\mathrm{e}^x \\ -\frac{\mathrm{e}^{-3x}}{3} & -\frac{\mathrm{e}^{-2x}}{2} & \mathrm{e}^x & x\,\mathrm{e}^x \\ \mathrm{e}^{-3x} & \mathrm{e}^{-2x} & \mathrm{e}^x & x\,\mathrm{e}^x \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \left[\begin{array}{cccc} -\frac{e^{-3x}}{27} & -\frac{e^{-2x}}{8} & e^{x} & (x-1)\,e^{x} \\ \frac{e^{-3x}}{9} & \frac{e^{-2x}}{4} & e^{x} & x\,e^{x} \\ -\frac{e^{-3x}}{3} & -\frac{e^{-2x}}{2} & e^{x} & x\,e^{x} \\ e^{-3x} & e^{-2x} & e^{x} & x\,e^{x} \end{array}\right] \cdot \frac{1}{\left[\begin{array}{cccc} -\frac{1}{27} & -\frac{1}{8} & 1 & -1 \\ \frac{1}{9} & \frac{1}{4} & 1 & 0 \\ -\frac{1}{3} & -\frac{1}{2} & 1 & 0 \\ 1 & 1 & 1 & 0 \end{array}\right]}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \left[\begin{array}{cccc} -(x-1)\,e^{x} & \frac{((2+x)e^{4x}-3\,e^{x}+1)e^{-3x}}{6} & \frac{(8x\,e^{4x}-3\,e^{4x}+4\,e^{x}-1)e^{-3x}}{12} & \frac{(2x\,e^{4x}-e^{4x}+2\,e^{x}-1)e^{-3x}}{12} \\ -x\,e^{x} & \frac{((x+3)e^{4x}+6\,e^{x}-3)e^{-3x}}{6} & -\frac{(-8x\,e^{4x}-5\,e^{4x}+8\,e^{x}-3)e^{-3x}}{12} & \frac{(2x\,e^{4x}+e^{4x}-4\,e^{x}+3)e^{-3x}}{12} \\ -x\,e^{x} & \frac{((x+3)e^{4x}-12\,e^{x}+9)e^{-3x}}{6} & \frac{(8x\,e^{4x}+5\,e^{4x}+16\,e^{x}-9)e^{-3x}}{12} & \frac{(2x\,e^{4x}+e^{4x}+8\,e^{x}-9)e^{-3x}}{12} \\ -x\,e^{x} & \frac{((x+3)e^{4x}+24\,e^{x}-27)e^{-3x}}{6} & -\frac{(-8x\,e^{4x}-5\,e^{4x}+32\,e^{x}-27)e^{-3x}}{12} & \frac{(2x\,e^{4x}+e^{4x}-16\,e^{x}+27)e^{-3x}}{12} \end{array}\right]$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

  $\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$
- Take the derivative of the particular solution

  $\overrightarrow{y}_p'(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$
- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
- Cancel like terms

  $\Phi(x) \cdot \overrightarrow{v}'(x) = \overrightarrow{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\overrightarrow{v}'(x) = \frac{1}{\Phi(x)} \cdot \overrightarrow{f}(x)$
- Integrate to solve for $\overrightarrow{v}(x)$

  $\overrightarrow{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds$
- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

$$\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \begin{bmatrix} e^{-3x}\left((5x^2-9x+4)\,e^{2x} - 3x\,e^{4x} - 6\,e^{x} + \frac{5\,e^{4x}}{2} - \frac{1}{2}\right) \\ e^{-3x}\left((-5x^2+19x-13)\,e^{2x} - 3x\,e^{4x} + 12\,e^{x} - \frac{e^{4x}}{2} + \frac{3}{2}\right) \\ e^{-3x}\left((7x^2-29x+29)\,e^{2x} - 3x\,e^{4x} - 24\,e^{x} - \frac{e^{4x}}{2} - \frac{9}{2}\right) \\ e^{-3x}\left((-5x^2+43x-61)\,e^{2x} - 3x\,e^{4x} + 48\,e^{x} - \frac{e^{4x}}{2} + \frac{27}{2}\right) \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \begin{bmatrix} e^{-3x}\left((5x^2-9x+4)\,e^{2x} - 3x\,e^{4x} - 6\,e^{x} + \frac{5\,e^{4x}}{2} \right. \\ e^{-3x}\left((-5x^2+19x-13)\,e^{2x} - 3x\,e^{4x} + 12\,e^{x} - \frac{e^{4x}}{2} \right. \\ e^{-3x}\left((7x^2-29x+29)\,e^{2x} - 3x\,e^{4x} - 24\,e^{x} - \frac{e^{4x}}{2} \right. \\ e^{-3x}\left((-5x^2+43x-61)\,e^{2x} - 3x\,e^{4x} + 48\,e^{x} - \frac{e^{4x}}{2} \right. \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = 5\left(-\frac{1}{10} + \left(\frac{1}{2} + \frac{(c_4-3)x}{5} + \frac{c_3}{5} - \frac{c_4}{5}\right)e^{4x} + \left(x^2 - \frac{9}{5}x + \frac{4}{5}\right)e^{2x} + \frac{\left(-6-\frac{c_2}{8}\right)e^{x}}{5} - \frac{c_1}{135}\right)e^{-3x}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' + 3y''' + y'' - 3y' - 2y = -3\,\mathrm{e}^{2x}(11 + 12x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + 3y''' + y'' - 3y' - 2y = 0$$

The characteristic equation is

$$\lambda^4 + 3\lambda^3 + \lambda^2 - 3\lambda - 2 = 0$$

The roots of the above equation are

$$\begin{aligned}\lambda_1 &= -2\\ \lambda_2 &= 1\\ \lambda_3 &= -1\\ \lambda_4 &= -1\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + x\,e^{-x} c_2 + e^{-2x} c_3 + e^{x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^{-x} \\ y_2 &= x\,e^{-x} \\ y_3 &= e^{-2x} \\ y_4 &= e^{x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' + 3y''' + y'' - 3y' - 2y = -3\,e^{2x}(11 + 12x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-3\,e^{2x}(11 + 12x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,e^{2x}, e^{2x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\,e^{-x}, e^{x}, e^{-2x}, e^{-x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 x\,e^{2x} + A_2 e^{2x}$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$69A_1 e^{2x} + 36A_1 x\,e^{2x} + 36A_2 e^{2x} = -3\,e^{2x}(11 + 12x)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = -1, A_2 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -x\,\mathrm{e}^{2x} + \mathrm{e}^{2x}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 \mathrm{e}^{-x} + x\,\mathrm{e}^{-x} c_2 + \mathrm{e}^{-2x} c_3 + \mathrm{e}^{x} c_4\right) + \left(-x\,\mathrm{e}^{2x} + \mathrm{e}^{2x}\right) \end{aligned}$$

Which simplifies to

$$y = \left(\mathrm{e}^{3x} c_4 + \mathrm{e}^{x}(c_2 x + c_1) + c_3\right) \mathrm{e}^{-2x} - x\,\mathrm{e}^{2x} + \mathrm{e}^{2x}$$

Summary

The solution(s) found are the following

$$y = \left(\mathrm{e}^{3x} c_4 + \mathrm{e}^{x}(c_2 x + c_1) + c_3\right) \mathrm{e}^{-2x} - x\,\mathrm{e}^{2x} + \mathrm{e}^{2x} \tag{1}$$

Verification of solutions

$$y = \left(\mathrm{e}^{3x} c_4 + \mathrm{e}^{x}(c_2 x + c_1) + c_3\right) \mathrm{e}^{-2x} - x\,\mathrm{e}^{2x} + \mathrm{e}^{2x}$$

Verified OK.

19.14.1 Maple step by step solution

Let's solve

$y'''' + 3y''' + y'' - 3y' - 2y = -3\,\mathrm{e}^{2x}(11 + 12x)$

- Highest derivative means the order of the ODE is 4

  y''''

- □ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$
  - Define new variable $y_2(x)$

$y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Define new variable $y_4(x)$

  $y_4(x) = y'''$
- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = -36x\,\mathrm{e}^{2x} - 33\,\mathrm{e}^{2x} - 3y_4(x) - y_3(x) + 3y_2(x) + 2y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x)\,, y_3(x) = y_2'(x)\,, y_4(x) = y_3'(x)\,, y_4'(x) = -36x\,\mathrm{e}^{2x} - 33\,\mathrm{e}^{2x} - 3y_4(x) - y_3(x) + 3y_2($

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 2 & 3 & -1 & -3 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ -36x\,\mathrm{e}^{2x} - 33\,\mathrm{e}^{2x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ -36x\,\mathrm{e}^{2x} - 33\,\mathrm{e}^{2x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 2 & 3 & -1 & -3 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \left[\begin{array}{c} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right], \left[-1, \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]\right], \left[-1, \left[\begin{array}{c} 0 \\ 0 \\ 0 \\ 0 \end{array}\right]\right], \left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-2, \left[\begin{array}{c} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-2x} \cdot \left[\begin{array}{c} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[-1, \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue -1

$$\vec{y}_2(x) = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = -1$ is the eigenvalue, a

$\overrightarrow{y}_3(x) = \mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_3(x)$ into the homogeneous system

$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \left(\mathrm{e}^{\lambda x}A\right)\cdot\left(x\overrightarrow{v} + \overrightarrow{p}\right)$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \mathrm{e}^{\lambda x}\left(\lambda x\overrightarrow{v} + A\cdot\overrightarrow{p}\right)$

- Simplify equation

$\lambda\overrightarrow{p} + \overrightarrow{v} = A\cdot\overrightarrow{p}$

- Make use of the identity matrix I

$(\lambda\cdot I)\cdot\overrightarrow{p} + \overrightarrow{v} = A\cdot\overrightarrow{p}$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_3(x)$ to be a solution to the homogeneous system

$(A - \lambda\cdot I)\cdot\overrightarrow{p} = \overrightarrow{v}$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue -1

$$\left(\left[\begin{array}{cccc} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 2 & 3 & -1 & -3 \end{array}\right] - (-1)\cdot\left[\begin{array}{cccc} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{array}\right]\right)\cdot\overrightarrow{p} = \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p} = \left[\begin{array}{c} -1 \\ 0 \\ 0 \\ 0 \end{array}\right]$$

- Second solution from eigenvalue -1

$$\overrightarrow{y}_3(x) = \mathrm{e}^{-x}\cdot\left(x\cdot\left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right] + \left[\begin{array}{c} -1 \\ 0 \\ 0 \\ 0 \end{array}\right]\right)$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_4 = e^x \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1 \vec{y}_1 + c_2 \vec{y}_2(x) + c_3 \vec{y}_3(x) + c_4 \vec{y}_4 + \vec{y}_p(x)$

☐ Fundamental matrix

  ○ Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} -\frac{e^{-2x}}{8} & -e^{-x} & e^{-x}(-x-1) & e^x \\ \frac{e^{-2x}}{4} & e^{-x} & x\,e^{-x} & e^x \\ -\frac{e^{-2x}}{2} & -e^{-x} & -x\,e^{-x} & e^x \\ e^{-2x} & e^{-x} & x\,e^{-x} & e^x \end{bmatrix}$$

  ○ The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

  ○ Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} -\frac{e^{-2x}}{8} & -e^{-x} & e^{-x}(-x-1) & e^x \\ \frac{e^{-2x}}{4} & e^{-x} & x\,e^{-x} & e^x \\ -\frac{e^{-2x}}{2} & -e^{-x} & -x\,e^{-x} & e^x \\ e^{-2x} & e^{-x} & x\,e^{-x} & e^x \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} -\frac{1}{8} & -1 & -1 & 1 \\ \frac{1}{4} & 1 & 0 & 1 \\ -\frac{1}{2} & -1 & 0 & 1 \\ 1 & 1 & 0 & 1 \end{bmatrix}}$$

  ○ Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} (x+1)\,e^{-x} & \frac{(2\,e^{3x}+1+(3x-3)e^{x})e^{-2x}}{6} & -\frac{e^{-x}}{2} - x\,e^{-x} + \frac{e^{x}}{2} & \frac{(e^{3x}-3x\,e^{x}-1)e^{-2x}}{6} \\ -x\,e^{-x} & \frac{(2\,e^{3x}-2+(6-3x)e^{x})e^{-2x}}{6} & -\frac{e^{-x}}{2} + x\,e^{-x} + \frac{e^{x}}{2} & \frac{(e^{3x}+2+(3x-3)e^{x})e^{-2x}}{6} \\ x\,e^{-x} & \frac{(2\,e^{3x}+4+(3x-6)e^{x})e^{-2x}}{6} & \frac{e^{-x}}{2} - x\,e^{-x} + \frac{e^{x}}{2} & \frac{(e^{3x}-4+(-3x+3)e^{x})e^{-2x}}{6} \\ -x\,e^{-x} & \frac{(2\,e^{3x}-8+(6-3x)e^{x})e^{-2x}}{6} & -\frac{e^{-x}}{2} + x\,e^{-x} + \frac{e^{x}}{2} & \frac{(e^{3x}+8+(3x-3)e^{x})e^{-2x}}{6} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$
- Take the derivative of the particular solution

  $\vec{y}'_p(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$
- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$
- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\,ds$
- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\,ds\right)$
- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \begin{bmatrix} -\frac{(5x\,e^{4x}-4\,e^{4x}+e^{3x}+7x\,e^{x}+e^{x}+2)e^{-2x}}{2} \\ -\frac{(10x\,e^{4x}-3\,e^{4x}+e^{3x}-7x\,e^{x}+6\,e^{x}-4)e^{-2x}}{2} \\ -\frac{(8x\,e^{4x}-3\,e^{4x}+e^{3x}+7x\,e^{x}-6\,e^{x}+8)e^{-2x}}{2} \\ -\frac{(28x\,e^{4x}+9\,e^{4x}+e^{3x}-7x\,e^{x}+6\,e^{x}-16)e^{-2x}}{2} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x)=c_1\vec{y}_1+c_2\vec{y}_2(x)+c_3\vec{y}_3(x)+c_4\vec{y}_4+\left[\begin{array}{c} -\frac{\left(5x\,\mathrm{e}^{4x}-4\,\mathrm{e}^{4x}+\mathrm{e}^{3x}+7x\,\mathrm{e}^{x}+\mathrm{e}^{x}+2\right)\mathrm{e}^{-2x}}{2} \\ -\frac{\left(10x\,\mathrm{e}^{4x}-3\,\mathrm{e}^{4x}+\mathrm{e}^{3x}-7x\,\mathrm{e}^{x}+6\,\mathrm{e}^{x}-4\right)\mathrm{e}^{-2x}}{2} \\ -\frac{\left(8x\,\mathrm{e}^{4x}-3\,\mathrm{e}^{4x}+\mathrm{e}^{3x}+7x\,\mathrm{e}^{x}-6\,\mathrm{e}^{x}+8\right)\mathrm{e}^{-2x}}{2} \\ -\frac{\left(28x\,\mathrm{e}^{4x}+9\,\mathrm{e}^{4x}+\mathrm{e}^{3x}-7x\,\mathrm{e}^{x}+6\,\mathrm{e}^{x}-16\right)\mathrm{e}^{-2x}}{2} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y=-\left(\left(-c_4+\frac{1}{2}\right)\mathrm{e}^{3x}+\left(\frac{5x}{2}-2\right)\mathrm{e}^{4x}+\left(\left(c_3+\frac{7}{2}\right)x+c_2+c_3+\frac{1}{2}\right)\mathrm{e}^{x}+\frac{c_1}{8}+1\right)\mathrm{e}^{-2x}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_y]]
```

$$\boxed{y'''' + 8y''' + 24y'' + 32y' = -16\,\mathrm{e}^{-2x}\left(-x^3 + x^2 + x + 1\right)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + 8y''' + 24y'' + 32y' = 0$$

The characteristic equation is

$$\lambda^4 + 8\lambda^3 + 24\lambda^2 + 32\lambda = 0$$

The roots of the above equation are

$$\lambda_1 = 0$$
$$\lambda_2 = -4$$
$$\lambda_3 = -2 - 2i$$
$$\lambda_4 = -2 + 2i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 + c_2 e^{-4x} + e^{(-2+2i)x} c_3 + e^{(-2-2i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= 1 \\ y_2 &= e^{-4x} \\ y_3 &= e^{(-2+2i)x} \\ y_4 &= e^{(-2-2i)x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' + 8y''' + 24y'' + 32y' = -16\, e^{-2x} \left(-x^3 + x^2 + x + 1\right)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-16\, e^{-2x} \left(-x^3 + x^2 + x + 1\right)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x^2 e^{-2x}, x^3 e^{-2x}, e^{-2x} x, e^{-2x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{1, e^{(-2-2i)x}, e^{(-2+2i)x}, e^{-4x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 x^2 e^{-2x} + A_2 x^3 e^{-2x} + A_3 e^{-2x} x + A_4 e^{-2x}$$

The unknowns $\{A_1, A_2, A_3, A_4\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$-16A_4 e^{-2x} - 16A_1 x^2 e^{-2x} - 16A_2 x^3 e^{-2x} - 16A_3 e^{-2x} x = -16\, e^{-2x} \left(-x^3 + x^2 + x + 1\right)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 1, A_2 = -1, A_3 = 1, A_4 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = x^2 \mathrm{e}^{-2x} - x^3 \mathrm{e}^{-2x} + \mathrm{e}^{-2x} x + \mathrm{e}^{-2x}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 + c_2 \mathrm{e}^{-4x} + \mathrm{e}^{(-2+2i)x} c_3 + \mathrm{e}^{(-2-2i)x} c_4\right) + \left(x^2 \mathrm{e}^{-2x} - x^3 \mathrm{e}^{-2x} + \mathrm{e}^{-2x} x + \mathrm{e}^{-2x}\right) \end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1 + c_2 \mathrm{e}^{-4x} + \mathrm{e}^{(-2+2i)x} c_3 + \mathrm{e}^{(-2-2i)x} c_4 + x^2 \mathrm{e}^{-2x} - x^3 \mathrm{e}^{-2x} + \mathrm{e}^{-2x} x + \mathrm{e}^{-2x} \tag{1}$$

Verification of solutions

$$y = c_1 + c_2 \mathrm{e}^{-4x} + \mathrm{e}^{(-2+2i)x} c_3 + \mathrm{e}^{(-2-2i)x} c_4 + x^2 \mathrm{e}^{-2x} - x^3 \mathrm{e}^{-2x} + \mathrm{e}^{-2x} x + \mathrm{e}^{-2x}$$

Verified OK.

19.15.1 Maple step by step solution

Let's solve

$y'''' + 8y''' + 24y'' + 32y' = -16\,\mathrm{e}^{-2x}(-x^3 + x^2 + x + 1)$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = 16x^3 \mathrm{e}^{-2x} - 16x^2 \mathrm{e}^{-2x} - 16\,\mathrm{e}^{-2x} x - 16\,\mathrm{e}^{-2x} - 8y''' - 24y'' - 32y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'''' + 8y''' + 24y'' + 32y' = 16\,\mathrm{e}^{-2x}(x^3 - x^2 - x - 1)$

☐ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

- Define new variable $y_2(x)$

  $y_2(x) = y'$
- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Define new variable $y_4(x)$

  $y_4(x) = y'''$
- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = 16x^3 e^{-2x} - 16x^2 e^{-2x} - 16\, e^{-2x} x - 16\, e^{-2x} - 8y_4(x) - 24y_3(x) - 32y_2(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = 16x^3 e^{-2x} - 16x^2 e^{-2x} - 16\, e^{-2x} x - 16\, e^{-2x}$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & -32 & -24 & -8 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ 16x^3 e^{-2x} - 16x^2 e^{-2x} - 16\, e^{-2x} x - 16\, e^{-2x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 16x^3 e^{-2x} - 16x^2 e^{-2x} - 16\, e^{-2x} x - 16\, e^{-2x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \left[\begin{array}{cccc} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & -32 & -24 & -8 \end{array}\right]$$

- Rewrite the system as

$$\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x) + \overrightarrow{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-4, \left[\begin{array}{c} -\frac{1}{64} \\ \frac{1}{16} \\ -\frac{1}{4} \\ 1 \end{array}\right]\right], \left[0, \left[\begin{array}{c} 1 \\ 0 \\ 0 \\ 0 \end{array}\right]\right], \left[-2-2\,\mathrm{I}, \left[\begin{array}{c} \frac{1}{32}+\frac{\mathrm{I}}{32} \\ -\frac{\mathrm{I}}{8} \\ -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ 1 \end{array}\right]\right], \left[-2+2\,\mathrm{I}, \left[\begin{array}{c} \frac{1}{32}-\frac{\mathrm{I}}{32} \\ \frac{\mathrm{I}}{8} \\ -\frac{1}{4}-\frac{\mathrm{I}}{4} \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-4, \left[\begin{array}{c} -\frac{1}{64} \\ \frac{1}{16} \\ -\frac{1}{4} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-4x} \cdot \left[\begin{array}{c} -\frac{1}{64} \\ \frac{1}{16} \\ -\frac{1}{4} \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[0, \left[\begin{array}{c} 1 \\ 0 \\ 0 \\ 0 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-2-2\,\mathrm{I}, \begin{bmatrix} \frac{1}{32}+\frac{\mathrm{I}}{32} \\ -\frac{\mathrm{I}}{8} \\ -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(-2-2\,\mathrm{I})x} \cdot \begin{bmatrix} \frac{1}{32}+\frac{\mathrm{I}}{32} \\ -\frac{\mathrm{I}}{8} \\ -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{-2x} \cdot (\cos(2x) - \mathrm{I}\sin(2x)) \cdot \begin{bmatrix} \frac{1}{32}+\frac{\mathrm{I}}{32} \\ -\frac{\mathrm{I}}{8} \\ -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ 1 \end{bmatrix}$$

- Simplify expression

$$\mathrm{e}^{-2x} \cdot \begin{bmatrix} \left(\frac{1}{32}+\frac{\mathrm{I}}{32}\right)(\cos(2x) - \mathrm{I}\sin(2x)) \\ -\frac{\mathrm{I}}{8}(\cos(2x) - \mathrm{I}\sin(2x)) \\ \left(-\frac{1}{4}+\frac{\mathrm{I}}{4}\right)(\cos(2x) - \mathrm{I}\sin(2x)) \\ \cos(2x) - \mathrm{I}\sin(2x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = \mathrm{e}^{-2x} \cdot \begin{bmatrix} \frac{\cos(2x)}{32} + \frac{\sin(2x)}{32} \\ -\frac{\sin(2x)}{8} \\ -\frac{\cos(2x)}{4} + \frac{\sin(2x)}{4} \\ \cos(2x) \end{bmatrix}, \vec{y}_4(x) = \mathrm{e}^{-2x} \cdot \begin{bmatrix} \frac{\cos(2x)}{32} - \frac{\sin(2x)}{32} \\ -\frac{\cos(2x)}{8} \\ \frac{\sin(2x)}{4} + \frac{\cos(2x)}{4} \\ -\sin(2x) \end{bmatrix}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} -\frac{\mathrm{e}^{-4x}}{64} & 1 & \mathrm{e}^{-2x}\left(\frac{\cos(2x)}{32} + \frac{\sin(2x)}{32}\right) & \mathrm{e}^{-2x}\left(\frac{\cos(2x)}{32} - \frac{\sin(2x)}{32}\right) \\ \frac{\mathrm{e}^{-4x}}{16} & 0 & -\frac{\mathrm{e}^{-2x}\sin(2x)}{8} & -\frac{\mathrm{e}^{-2x}\cos(2x)}{8} \\ -\frac{\mathrm{e}^{-4x}}{4} & 0 & \mathrm{e}^{-2x}\left(-\frac{\cos(2x)}{4} + \frac{\sin(2x)}{4}\right) & \mathrm{e}^{-2x}\left(\frac{\sin(2x)}{4} + \frac{\cos(2x)}{4}\right) \\ \mathrm{e}^{-4x} & 0 & \mathrm{e}^{-2x}\cos(2x) & -\mathrm{e}^{-2x}\sin(2x) \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} -\frac{\mathrm{e}^{-4x}}{64} & 1 & \mathrm{e}^{-2x}\left(\frac{\cos(2x)}{32} + \frac{\sin(2x)}{32}\right) & \mathrm{e}^{-2x}\left(\frac{\cos(2x)}{32} - \frac{\sin(2x)}{32}\right) \\ \frac{\mathrm{e}^{-4x}}{16} & 0 & -\frac{\mathrm{e}^{-2x}\sin(2x)}{8} & -\frac{\mathrm{e}^{-2x}\cos(2x)}{8} \\ -\frac{\mathrm{e}^{-4x}}{4} & 0 & \mathrm{e}^{-2x}\left(-\frac{\cos(2x)}{4} + \frac{\sin(2x)}{4}\right) & \mathrm{e}^{-2x}\left(\frac{\sin(2x)}{4} + \frac{\cos(2x)}{4}\right) \\ \mathrm{e}^{-4x} & 0 & \mathrm{e}^{-2x}\cos(2x) & -\mathrm{e}^{-2x}\sin(2x) \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} -\frac{1}{64} & 1 & \frac{1}{32} & \frac{1}{32} \\ \frac{1}{16} & 0 & 0 & -\frac{1}{8} \\ -\frac{1}{4} & 0 & -\frac{1}{4} & \frac{1}{4} \\ 1 & 0 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} 1 & \frac{(-2\cos(2x)-2\sin(2x))\mathrm{e}^{-2x}}{4} - \frac{\mathrm{e}^{-4x}}{4} + \frac{3}{4} & \frac{(-\cos(2x)-3\sin(2x))\mathrm{e}^{-2x}}{8} - \frac{\mathrm{e}^{-4x}}{8} + \frac{1}{4} \\ 0 & \mathrm{e}^{-4x} + 2\,\mathrm{e}^{-2x}\sin(2x) & \frac{(-\cos(2x)+2\sin(2x))\mathrm{e}^{-2x}}{2} + \frac{\mathrm{e}^{-4x}}{2} \\ 0 & -4\,\mathrm{e}^{-4x} + (4\cos(2x) - 4\sin(2x))\,\mathrm{e}^{-2x} & (3\cos(2x) - \sin(2x))\,\mathrm{e}^{-2x} - 2\,\mathrm{e}^{-4x} \\ 0 & 16\,\mathrm{e}^{-4x} - 16\,\mathrm{e}^{-2x}\cos(2x) & (-8\cos(2x) - 4\sin(2x))\,\mathrm{e}^{-2x} + 8\,\mathrm{e}^{-4x} \quad (\end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$
  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$
- Take the derivative of the particular solution
  $\vec{y}'_p(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$
- Substitute particular solution and its derivative into the system of ODEs
  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
- The fundamental matrix has columns that are solutions to the homogeneous system so its der
  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
- Cancel like terms
  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$
- Multiply by the inverse of the fundamental matrix
  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$
- Integrate to solve for $\vec{v}(x)$
  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$
- Plug $\vec{v}(x)$ into the equation for the particular solution
  $\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$
- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \left[\begin{array}{c} -\frac{5}{16} + \frac{\left(-8x^3+8x^2+8x-2\cos(2x)-5\sin(2x)+8\right)\mathrm{e}^{-2x}}{8} - \frac{7\,\mathrm{e}^{-4x}}{16} \\ \frac{\left(8x^3-20x^2-3\cos(2x)+7\sin(2x)-4\right)\mathrm{e}^{-2x}}{4} + \frac{7\,\mathrm{e}^{-4x}}{4} \\ \left(-4x^3+16x^2-10x+5\cos\left(2x\right)-2\sin\left(2x\right)+2\right)\mathrm{e}^{-2x} - 7\,\mathrm{e}^{-4x} \\ \left(8x^3-44x^2+52x-14\cos\left(2x\right)-6\sin\left(2x\right)-14\right)\mathrm{e}^{-2x} + 28\,\mathrm{e}^{-4x} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \left[\begin{array}{c} -\frac{5}{16} + \frac{\left(-8x^3+8x^2+8x-2\cos(2x)-5\sin(2x)+8\right)\mathrm{e}^{-2x}}{8} \\ \frac{\left(8x^3-20x^2-3\cos(2x)+7\sin(2x)-4\right)\mathrm{e}^{-2x}}{4} + \frac{7\,\mathrm{e}^{-}}{4} \\ \left(-4x^3+16x^2-10x+5\cos\left(2x\right)-2\sin\left(2x\right)+2 \right. \\ \left(8x^3-44x^2+52x-14\cos\left(2x\right)-6\sin\left(2x\right)-14 \right. \end{array}\right.$$

- First component of the vector is the solution to the ODE

$$y = -\frac{5}{16} + \frac{(32+(-8+c_3+c_4)\cos(2x)+(-20+c_3-c_4)\sin(2x)-32x^3+32x^2+32x)\,\mathrm{e}^{-2x}}{32} + \frac{(-c_1-28)\,\mathrm{e}^{-4x}}{64} + c_2$$

ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{4y'''' - 11y'' - 9y' - 2y = -e^{x}(1 - 6x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$4y'''' - 11y'' - 9y' - 2y = 0$$

The characteristic equation is

$$4\lambda^4 - 11\lambda^2 - 9\lambda - 2 = 0$$

The roots of the above equation are

$$\lambda_1 = -1$$
$$\lambda_2 = 2$$
$$\lambda_3 = -\frac{1}{2}$$
$$\lambda_4 = -\frac{1}{2}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{2x} + e^{-\frac{x}{2}} c_3 + x\, e^{-\frac{x}{2}} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = e^{2x}$$
$$y_3 = e^{-\frac{x}{2}}$$
$$y_4 = x\, e^{-\frac{x}{2}}$$

Now the particular solution to the given ODE is found

$$4y'''' - 11y'' - 9y' - 2y = -e^{x}(1 - 6x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-e^{x}(1 - 6x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\, e^{x}, e^{x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\left\{x\, e^{-\frac{x}{2}}, e^{-x}, e^{2x}, e^{-\frac{x}{2}}\right\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 x\, e^{x} + A_2 e^{x}$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$-15A_1 e^{x} - 18A_1 x\, e^{x} - 18A_2 e^{x} = -e^{x}(1 - 6x)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = -\frac{1}{3}, A_2 = \frac{1}{3}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -\frac{x\,e^x}{3} + \frac{e^x}{3}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-x} + c_2 e^{2x} + e^{-\frac{x}{2}} c_3 + x\,e^{-\frac{x}{2}} c_4\right) + \left(-\frac{x\,e^x}{3} + \frac{e^x}{3}\right) \end{aligned}$$

Which simplifies to

$$y = \left(\left(c_4 x + c_3\right) e^{\frac{x}{2}} + c_2 e^{3x} + c_1\right) e^{-x} - \frac{x\,e^x}{3} + \frac{e^x}{3}$$

Summary
The solution(s) found are the following

$$y = \left(\left(c_4 x + c_3\right) e^{\frac{x}{2}} + c_2 e^{3x} + c_1\right) e^{-x} - \frac{x\,e^x}{3} + \frac{e^x}{3} \tag{1}$$

Verification of solutions

$$y = \left(\left(c_4 x + c_3\right) e^{\frac{x}{2}} + c_2 e^{3x} + c_1\right) e^{-x} - \frac{x\,e^x}{3} + \frac{e^x}{3}$$

Verified OK.

19.16.1 Maple step by step solution

Let's solve

$4y'''' - 11y'' - 9y' - 2y = -e^x(1 - 6x)$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = \frac{y}{2} + \frac{11y''}{4} + \frac{9y'}{4} + \frac{3x\,e^x}{2} - \frac{e^x}{4}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'''' - \frac{11y''}{4} - \frac{9y'}{4} - \frac{y}{2} = \frac{e^x(-1+6x)}{4}$

☐ Convert linear ODE into a system of first order ODEs

- Define new variable $y_1(x)$

  $y_1(x) = y$

- Define new variable $y_2(x)$

  $y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$

- Define new variable $y_4(x)$

  $y_4(x) = y'''$

- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = \frac{3x\,e^x}{2} - \frac{e^x}{4} + \frac{11y_3(x)}{4} + \frac{9y_2(x)}{4} + \frac{y_1(x)}{2}$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = \frac{3x\,e^x}{2} - \frac{e^x}{4} + \frac{11y_3(x)}{4} + \frac{9y_2(x)}{4} + \frac{y_1(x)}{2}\right]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ \frac{1}{2} & \frac{9}{4} & \frac{11}{4} & 0 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ \frac{3x\,e^x}{2} - \frac{e^x}{4} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ \frac{3x\,e^x}{2} - \frac{e^x}{4} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ \frac{1}{2} & \frac{9}{4} & \frac{11}{4} & 0 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[-\frac{1}{2}, \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix}\right], \left[-\frac{1}{2}, \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = e^{-x} \cdot \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[-\frac{1}{2}, \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue $-\frac{1}{2}$

$$\vec{y}_2(x) = e^{-\frac{x}{2}} \cdot \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = -\frac{1}{2}$ is the eigenvalue, a

$$\vec{y}_3(x) = e^{\lambda x}\left(x\vec{v} + \vec{p}\right)$$

- Note that the x multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\vec{y}_3(x)$ into the homogeneous system

$$\lambda\, e^{\lambda x}\left(x\vec{v} + \vec{p}\right) + e^{\lambda x}\vec{v} = \left(e^{\lambda x} A\right) \cdot \left(x\vec{v} + \vec{p}\right)$$

- Use the fact that $\vec{v}$ is an eigenvector of A

$$\lambda\, e^{\lambda x}\left(x\vec{v} + \vec{p}\right) + e^{\lambda x}\vec{v} = e^{\lambda x}\left(\lambda x\vec{v} + A \cdot \vec{p}\right)$$

- Simplify equation

$$\lambda\vec{p} + \vec{v} = A \cdot \vec{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$$

- Condition $\vec{p}$ must meet for $\vec{y}_3(x)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue $-\frac{1}{2}$

$$\left(\begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ \frac{1}{2} & \frac{9}{4} & \frac{11}{4} & 0 \end{bmatrix} - -\frac{1}{2} \cdot \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}\right) \cdot \vec{p} = \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix}$$

- Choice of $\vec{p}$

$$\vec{p} = \begin{bmatrix} -16 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue $-\frac{1}{2}$

$$\vec{y}_3(x) = \mathrm{e}^{-\frac{x}{2}} \cdot \left(x \cdot \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix} + \begin{bmatrix} -16 \\ 0 \\ 0 \\ 0 \end{bmatrix} \right)$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} \right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_4 = \mathrm{e}^{2x} \cdot \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1 \vec{y}_1 + c_2 \vec{y}_2(x) + c_3 \vec{y}_3(x) + c_4 \vec{y}_4 + \vec{y}_p(x)$

☐ Fundamental matrix

- ○ Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} -\mathrm{e}^{-x} & -8\,\mathrm{e}^{-\frac{x}{2}} & \mathrm{e}^{-\frac{x}{2}}(-8x-16) & \frac{\mathrm{e}^{2x}}{8} \\ \mathrm{e}^{-x} & 4\,\mathrm{e}^{-\frac{x}{2}} & 4x\,\mathrm{e}^{-\frac{x}{2}} & \frac{\mathrm{e}^{2x}}{4} \\ -\mathrm{e}^{-x} & -2\,\mathrm{e}^{-\frac{x}{2}} & -2x\,\mathrm{e}^{-\frac{x}{2}} & \frac{\mathrm{e}^{2x}}{2} \\ \mathrm{e}^{-x} & \mathrm{e}^{-\frac{x}{2}} & x\,\mathrm{e}^{-\frac{x}{2}} & \mathrm{e}^{2x} \end{bmatrix}$$

- ○ The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- ○ Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} -\mathrm{e}^{-x} & -8\,\mathrm{e}^{-\frac{x}{2}} & \mathrm{e}^{-\frac{x}{2}}(-8x-16) & \frac{\mathrm{e}^{2x}}{8} \\ \mathrm{e}^{-x} & 4\,\mathrm{e}^{-\frac{x}{2}} & 4x\,\mathrm{e}^{-\frac{x}{2}} & \frac{\mathrm{e}^{2x}}{4} \\ -\mathrm{e}^{-x} & -2\,\mathrm{e}^{-\frac{x}{2}} & -2x\,\mathrm{e}^{-\frac{x}{2}} & \frac{\mathrm{e}^{2x}}{2} \\ \mathrm{e}^{-x} & \mathrm{e}^{-\frac{x}{2}} & x\,\mathrm{e}^{-\frac{x}{2}} & \mathrm{e}^{2x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} -1 & -8 & -16 & \frac{1}{8} \\ 1 & 4 & 0 & \frac{1}{4} \\ -1 & -2 & 0 & \frac{1}{2} \\ 1 & 1 & 0 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{\mathrm{e}^{-\frac{x}{2}}(2+x)}{2} & \frac{\left(2\,\mathrm{e}^{3x}+75\,\mathrm{e}^{\frac{x}{2}}x-42\,\mathrm{e}^{\frac{x}{2}}+40\right)\mathrm{e}^{-x}}{60} & \frac{\left(2\,\mathrm{e}^{3x}+5\,\mathrm{e}^{\frac{x}{2}}x-22\,\mathrm{e}^{\frac{x}{2}}+20\right)\mathrm{e}^{-x}}{20} & \frac{\left(2\,\mathrm{e}^{3x}-15\,\mathrm{e}^{\frac{x}{2}}x+18\,\mathrm{e}^{\frac{x}{2}}-\cdots\right.}{30} \\ -\frac{x\,\mathrm{e}^{-\frac{x}{2}}}{4} & \frac{\left(8\,\mathrm{e}^{3x}-75\,\mathrm{e}^{\frac{x}{2}}x+192\,\mathrm{e}^{\frac{x}{2}}-80\right)\mathrm{e}^{-x}}{120} & \frac{\left(8\,\mathrm{e}^{3x}-5\,\mathrm{e}^{\frac{x}{2}}x+32\,\mathrm{e}^{\frac{x}{2}}-40\right)\mathrm{e}^{-x}}{40} & \frac{\left(8\,\mathrm{e}^{3x}+15\,\mathrm{e}^{\frac{x}{2}}x-48\,\mathrm{e}^{\frac{x}{2}}+\cdots\right.}{60} \\ \frac{x\,\mathrm{e}^{-\frac{x}{2}}}{8} & \frac{\left(32\,\mathrm{e}^{3x}+75\,\mathrm{e}^{\frac{x}{2}}x-192\,\mathrm{e}^{\frac{x}{2}}+160\right)\mathrm{e}^{-x}}{240} & \frac{\left(32\,\mathrm{e}^{3x}+5\,\mathrm{e}^{\frac{x}{2}}x-32\,\mathrm{e}^{\frac{x}{2}}+80\right)\mathrm{e}^{-x}}{80} & \frac{\left(32\,\mathrm{e}^{3x}-15\,\mathrm{e}^{\frac{x}{2}}x+48\,\mathrm{e}^{\frac{x}{2}}\cdots\right.}{120} \\ -\frac{x\,\mathrm{e}^{-\frac{x}{2}}}{16} & \frac{\left(128\,\mathrm{e}^{3x}-75\,\mathrm{e}^{\frac{x}{2}}x+192\,\mathrm{e}^{\frac{x}{2}}-320\right)\mathrm{e}^{-x}}{480} & \frac{\left(128\,\mathrm{e}^{3x}-5\,\mathrm{e}^{\frac{x}{2}}x+32\,\mathrm{e}^{\frac{x}{2}}-160\right)\mathrm{e}^{-x}}{160} & \frac{\left(128\,\mathrm{e}^{3x}+15\,\mathrm{e}^{\frac{x}{2}}x-48\,\mathrm{e}^{\frac{x}{2}}\cdots\right.}{240} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$
  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$
- Take the derivative of the particular solution
  $\vec{y}_p{}'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}\,'(x)$
- Substitute particular solution and its derivative into the system of ODEs
  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}\,'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
- The fundamental matrix has columns that are solutions to the homogeneous system so its der
  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}\,'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
- Cancel like terms
  $\Phi(x) \cdot \vec{v}\,'(x) = \vec{f}(x)$
- Multiply by the inverse of the fundamental matrix
  $\vec{v}\,'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$
- Integrate to solve for $\vec{v}(x)$
  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\,ds$

- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

  $\overrightarrow{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds\right)$
- Plug in the fundamental matrix and the forcing function and compute

$$\overrightarrow{y}_p(x) = \begin{bmatrix} \frac{\left(e^{3x}-4x\,e^{2x}+3\,e^{2x}-5\,e^{\frac{x}{2}}x-4\right)e^{-x}}{12} \\ \frac{\left(4\,e^{3x}-8x\,e^{2x}-2\,e^{2x}+5\,e^{\frac{x}{2}}x-10\,e^{\frac{x}{2}}+8\right)e^{-x}}{24} \\ \frac{e^{-x}\left(-\frac{5(-2+x)e^{\frac{x}{2}}}{2}-14x\,e^{2x}-5\,e^{2x}+8\,e^{3x}-8\right)}{24} \\ \frac{e^{-x}\left(\frac{5(-2+x)e^{\frac{x}{2}}}{2}-22x\,e^{2x}-43\,e^{2x}+32\,e^{3x}+16\right)}{48} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\overrightarrow{y}(x) = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2(x) + c_3\overrightarrow{y}_3(x) + c_4\overrightarrow{y}_4 + \begin{bmatrix} \frac{\left(e^{3x}-4x\,e^{2x}+3\,e^{2x}-5\,e^{\frac{x}{2}}x-4\right)e^{-x}}{12} \\ \frac{\left(4\,e^{3x}-8x\,e^{2x}-2\,e^{2x}+5\,e^{\frac{x}{2}}x-10\,e^{\frac{x}{2}}+8\right)e^{-x}}{24} \\ \frac{e^{-x}\left(-\frac{5(-2+x)e^{\frac{x}{2}}}{2}-14x\,e^{2x}-5\,e^{2x}+8\,e^{3x}-8\right)}{24} \\ \frac{e^{-x}\left(\frac{5(-2+x)e^{\frac{x}{2}}}{2}-22x\,e^{2x}-43\,e^{2x}+32\,e^{3x}+16\right)}{48} \end{bmatrix}$$

- First component of the vector is the solution to the ODE

  $y = -8\left(\left(\left(c_3 + \frac{5}{96}\right)x + c_2 + 2c_3\right)e^{\frac{x}{2}} + \left(\frac{x}{24} - \frac{1}{32}\right)e^{2x} + \left(-\frac{c_4}{64} - \frac{1}{96}\right)e^{3x} + \frac{c_1}{8} + \frac{1}{24}\right)e^{-x}$

ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 2y''' + 3y' - y = e^{x}\left(x^{2} + 4x + 3\right)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 2y''' + 3y' - y = 0$$

The characteristic equation is

$$\lambda^{4} - 2\lambda^{3} + 3\lambda - 1 = 0$$

The roots of the above equation are

$$\begin{aligned}
\lambda_1 &= \mathrm{RootOf}\left(_Z^{4} - 2_Z^{3} + 3_Z - 1, \mathrm{index} = 1\right) \\
\lambda_2 &= \mathrm{RootOf}\left(_Z^{4} - 2_Z^{3} + 3_Z - 1, \mathrm{index} = 2\right) \\
\lambda_3 &= \mathrm{RootOf}\left(_Z^{4} - 2_Z^{3} + 3_Z - 1, \mathrm{index} = 3\right) \\
\lambda_4 &= \mathrm{RootOf}\left(_Z^{4} - 2_Z^{3} + 3_Z - 1, \mathrm{index} = 4\right)
\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = \mathrm{e}^{\mathrm{RootOf}\left(\_Z^4-2\_Z^3+3\_Z-1, \mathrm{index}=3\right)x} c_1+\mathrm{e}^{\mathrm{RootOf}\left(\_Z^4-2\_Z^3+3\_Z-1, \mathrm{index}=2\right)x} c_2+\mathrm{e}^{\mathrm{RootOf}\left(\_Z^4-2\_Z^3+3\_Z-1, \mathrm{index}\right.}$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \mathrm{e}^{\mathrm{RootOf}\left(\_Z^4-2\_Z^3+3\_Z-1, \mathrm{index}=3\right)x}$$
$$y_2 = \mathrm{e}^{\mathrm{RootOf}\left(\_Z^4-2\_Z^3+3\_Z-1, \mathrm{index}=2\right)x}$$
$$y_3 = \mathrm{e}^{\mathrm{RootOf}\left(\_Z^4-2\_Z^3+3\_Z-1, \mathrm{index}=1\right)x}$$
$$y_4 = \mathrm{e}^{\mathrm{RootOf}\left(\_Z^4-2\_Z^3+3\_Z-1, \mathrm{index}=4\right)x}$$

Now the particular solution to the given ODE is found

$$y'''' - 2y''' + 3y' - y = \mathrm{e}^x \left(x^2 + 4x + 3\right)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$\mathrm{e}^x \left(x^2 + 4x + 3\right)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,\mathrm{e}^x, x^2\mathrm{e}^x, \mathrm{e}^x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{\mathrm{e}^{\mathrm{RootOf}\left(\_Z^4-2\_Z^3+3\_Z-1, \mathrm{index}=1\right)x}, \mathrm{e}^{\mathrm{RootOf}\left(\_Z^4-2\_Z^3+3\_Z-1, \mathrm{index}=2\right)x}, \mathrm{e}^{\mathrm{RootOf}\left(\_Z^4-2\_Z^3+3\_Z-1, \mathrm{index}=3\right)x}, \mathrm{e}^{\mathrm{RootOf}\left(\right.}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 x\,\mathrm{e}^x + A_2 x^2 \mathrm{e}^x + A_3 \mathrm{e}^x$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$A_1\mathrm{e}^x + A_1 x\,\mathrm{e}^x + 2A_2 x\,\mathrm{e}^x + A_2 x^2\mathrm{e}^x + A_3\mathrm{e}^x = \mathrm{e}^x \left(x^2 + 4x + 3\right)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 2, A_2 = 1, A_3 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = 2x\,e^x + x^2 e^x + e^x$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(e^{\mathrm{RootOf}(\_Z^4-2\_Z^3+3\_Z-1,\mathrm{index}=3)x} c_1 + e^{\mathrm{RootOf}(\_Z^4-2\_Z^3+3\_Z-1,\mathrm{index}=2)x} c_2 \right. \\ &\quad \left. + e^{\mathrm{RootOf}(\_Z^4-2\_Z^3+3\_Z-1,\mathrm{index}=1)x} c_3 + e^{\mathrm{RootOf}(\_Z^4-2\_Z^3+3\_Z-1,\mathrm{index}=4)x} c_4\right) \\ &\quad + \left(2x\,e^x + x^2 e^x + e^x\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y &= e^{\mathrm{RootOf}(\_Z^4-2\_Z^3+3\_Z-1,\mathrm{index}=3)x} c_1 + e^{\mathrm{RootOf}(\_Z^4-2\_Z^3+3\_Z-1,\mathrm{index}=2)x} c_2 \\ &\quad + e^{\mathrm{RootOf}(\_Z^4-2\_Z^3+3\_Z-1,\mathrm{index}=1)x} c_3 \\ &\quad + e^{\mathrm{RootOf}(\_Z^4-2\_Z^3+3\_Z-1,\mathrm{index}=4)x} c_4 + 2x\,e^x + x^2 e^x + e^x \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y &= e^{\mathrm{RootOf}(\_Z^4-2\_Z^3+3\_Z-1,\mathrm{index}=3)x} c_1 + e^{\mathrm{RootOf}(\_Z^4-2\_Z^3+3\_Z-1,\mathrm{index}=2)x} c_2 \\ &\quad + e^{\mathrm{RootOf}(\_Z^4-2\_Z^3+3\_Z-1,\mathrm{index}=1)x} c_3 \\ &\quad + e^{\mathrm{RootOf}(\_Z^4-2\_Z^3+3\_Z-1,\mathrm{index}=4)x} c_4 + 2x\,e^x + x^2 e^x + e^x \end{aligned}$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 4y''' + 6y'' - 4y' + 2y = \mathrm{e}^{2x}\left(x^4 + x + 24\right)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 4y''' + 6y'' - 4y' + 2y = 0$$

The characteristic equation is

$$\lambda^4 - 4\lambda^3 + 6\lambda^2 - 4\lambda + 2 = 0$$

The roots of the above equation are

$$
\begin{aligned}
\lambda_1 &= \frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}+1 \\
\lambda_2 &= -\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}+1 \\
\lambda_3 &= -\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}+1 \\
\lambda_4 &= \frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}+1
\end{aligned}
$$

Therefore the homogeneous solution is

$$
y_h(x) = \mathrm{e}^{\left(-\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}+1\right)x} c_1 + \mathrm{e}^{\left(\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}+1\right)x} c_2 + \mathrm{e}^{\left(\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}+1\right)x} c_3 + \mathrm{e}^{\left(-\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}+1\right)x} c_4
$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{\left(-\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}+1\right)x} \\
y_2 &= \mathrm{e}^{\left(\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}+1\right)x} \\
y_3 &= \mathrm{e}^{\left(\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}+1\right)x} \\
y_4 &= \mathrm{e}^{\left(-\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}+1\right)x}
\end{aligned}
$$

Now the particular solution to the given ODE is found

$$
y'''' - 4y''' + 6y'' - 4y' + 2y = \mathrm{e}^{2x}\left(x^4 + x + 24\right)
$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$
\mathrm{e}^{2x}\left(x^4 + x + 24\right)
$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$
[\{x\,\mathrm{e}^{2x}, x^2\mathrm{e}^{2x}, \mathrm{e}^{2x}x^3, \mathrm{e}^{2x}x^4, \mathrm{e}^{2x}\}]
$$

While the set of the basis functions for the homogeneous solution found earlier is

$$
\left\{\mathrm{e}^{\left(-\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}+1\right)x}, \mathrm{e}^{\left(-\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}+1\right)x}, \mathrm{e}^{\left(\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}+1\right)x}, \mathrm{e}^{\left(\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}+1\right)x}\right\}
$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 x\,\mathrm{e}^{2x} + A_2 x^2 \mathrm{e}^{2x} + A_3 \mathrm{e}^{2x} x^3 + A_4 \mathrm{e}^{2x} x^4 + A_5 \mathrm{e}^{2x}$$

The unknowns $\{A_1, A_2, A_3, A_4, A_5\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$\begin{aligned}&8A_2 x\,\mathrm{e}^{2x} + 12A_3 \mathrm{e}^{2x} x^2 + 16A_4 \mathrm{e}^{2x} x^3 + 36A_3 \mathrm{e}^{2x} x + 72A_4 \mathrm{e}^{2x} x^2 \\ &+ 96A_4 \mathrm{e}^{2x} x + 2A_4 \mathrm{e}^{2x} x^4 + 12A_2 \mathrm{e}^{2x} + 2A_5 \mathrm{e}^{2x} + 2A_2 x^2 \mathrm{e}^{2x} + 2A_3 \mathrm{e}^{2x} x^3 \\ &+ 4A_1 \mathrm{e}^{2x} + 2A_1 x\,\mathrm{e}^{2x} + 24A_3 \mathrm{e}^{2x} + 24A_4 \mathrm{e}^{2x} = \mathrm{e}^{2x}\left(x^4 + x + 24\right)\end{aligned}$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{49}{2}, A_2 = 6, A_3 = -4, A_4 = \frac{1}{2}, A_5 = -31\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{49x\,\mathrm{e}^{2x}}{2} + 6x^2 \mathrm{e}^{2x} - 4\,\mathrm{e}^{2x} x^3 + \frac{\mathrm{e}^{2x} x^4}{2} - 31\,\mathrm{e}^{2x}$$

Therefore the general solution is

$$\begin{aligned}y &= y_h + y_p \\ &= \left(\mathrm{e}^{\left(-\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}+1\right)x} c_1 + \mathrm{e}^{\left(\frac{\sqrt{2}}{2}+\frac{i\sqrt{2}}{2}+1\right)x} c_2 + \mathrm{e}^{\left(\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}+1\right)x} c_3 + \mathrm{e}^{\left(-\frac{\sqrt{2}}{2}-\frac{i\sqrt{2}}{2}+1\right)x} c_4\right) \\ &\quad + \left(\frac{49x\,\mathrm{e}^{2x}}{2} + 6x^2 \mathrm{e}^{2x} - 4\,\mathrm{e}^{2x} x^3 + \frac{\mathrm{e}^{2x} x^4}{2} - 31\,\mathrm{e}^{2x}\right)\end{aligned}$$

Which simplifies to

$$\begin{aligned}y &= \mathrm{e}^{\frac{\left(2+(-1+i)\sqrt{2}\right)x}{2}} c_1 + \mathrm{e}^{\frac{x\left(2+(1+i)\sqrt{2}\right)}{2}} c_2 + \mathrm{e}^{-\frac{\left(-2+(-1+i)\sqrt{2}\right)x}{2}} c_3 \\ &\quad + \mathrm{e}^{-\frac{\left(-2+(1+i)\sqrt{2}\right)x}{2}} c_4 + \frac{49x\,\mathrm{e}^{2x}}{2} + 6x^2 \mathrm{e}^{2x} - 4\,\mathrm{e}^{2x} x^3 + \frac{\mathrm{e}^{2x} x^4}{2} - 31\,\mathrm{e}^{2x}\end{aligned}$$

Summary
The solution(s) found are the following

$$
\begin{aligned}
y = {} & e^{\frac{\left(2+(-1+i)\sqrt{2}\right)x}{2}} c_1 + e^{\frac{x\left(2+(1+i)\sqrt{2}\right)}{2}} c_2 + e^{-\frac{\left(-2+(-1+i)\sqrt{2}\right)x}{2}} c_3 \\
& + e^{-\frac{\left(-2+(1+i)\sqrt{2}\right)x}{2}} c_4 + \frac{49x\, e^{2x}}{2} + 6x^2 e^{2x} - 4\, e^{2x} x^3 + \frac{e^{2x} x^4}{2} - 31\, e^{2x}
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y = {} & e^{\frac{\left(2+(-1+i)\sqrt{2}\right)x}{2}} c_1 + e^{\frac{x\left(2+(1+i)\sqrt{2}\right)}{2}} c_2 + e^{-\frac{\left(-2+(-1+i)\sqrt{2}\right)x}{2}} c_3 \\
& + e^{-\frac{\left(-2+(1+i)\sqrt{2}\right)x}{2}} c_4 + \frac{49x\, e^{2x}}{2} + 6x^2 e^{2x} - 4\, e^{2x} x^3 + \frac{e^{2x} x^4}{2} - 31\, e^{2x}
\end{aligned}
$$

Verified OK.

19.18.1 Maple step by step solution

Let's solve

$y'''' - 4y''' + 6y'' - 4y' + 2y = e^{2x}(x^4 + x + 24)$

- Highest derivative means the order of the ODE is 4

  y''''

- □ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$
  - Define new variable $y_2(x)$

    $y_2(x) = y'$
  - Define new variable $y_3(x)$

    $y_3(x) = y''$
  - Define new variable $y_4(x)$

    $y_4(x) = y'''$
  - Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = e^{2x} x^4 + x\, e^{2x} + 24\, e^{2x} + 4y_4(x) - 6y_3(x) + 4y_2(x) - 2y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = e^{2x} x^4 + x\, e^{2x} + 24\, e^{2x} + 4y_4(x) - 6y_3(x) +$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -2 & 4 & -6 & 4 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ \mathrm{e}^{2x} x^4 + x\,\mathrm{e}^{2x} + 24\,\mathrm{e}^{2x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ \mathrm{e}^{2x} x^4 + x\,\mathrm{e}^{2x} + 24\,\mathrm{e}^{2x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -2 & 4 & -6 & 4 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-\frac{\sqrt{2}}{2} - \frac{\mathrm{I}\sqrt{2}}{2} + 1, \begin{bmatrix} \frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1\right)^3} \\ \frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1\right)^2} \\ \frac{1}{-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1} \\ 1 \end{bmatrix}\right], \left[-\frac{\sqrt{2}}{2} + \frac{\mathrm{I}\sqrt{2}}{2} + 1, \begin{bmatrix} \frac{1}{\left(-\frac{\sqrt{2}}{2}+\frac{\mathrm{I}\sqrt{2}}{2}+1\right)^3} \\ \frac{1}{\left(-\frac{\sqrt{2}}{2}+\frac{\mathrm{I}\sqrt{2}}{2}+1\right)^2} \\ \frac{1}{-\frac{\sqrt{2}}{2}+\frac{\mathrm{I}\sqrt{2}}{2}+1} \\ 1 \end{bmatrix}\right], \left[\frac{\sqrt{2}}{2} - \frac{\mathrm{I}\sqrt{2}}{2} + 1, \right.\right.$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1, \left[\begin{array}{c} \frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1\right)^{3}} \\ \frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1\right)^{2}} \\ \frac{1}{-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$e^{\left(-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1\right)x} \cdot \left[\begin{array}{c} \frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1\right)^{3}} \\ \frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1\right)^{2}} \\ \frac{1}{-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^{\left(-\frac{\sqrt{2}}{2}+1\right)x} \cdot \left(\cos\left(\frac{\sqrt{2}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right) \cdot \left[\begin{array}{c} \frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1\right)^{3}} \\ \frac{1}{\left(-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1\right)^{2}} \\ \frac{1}{-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{\left(-\frac{\sqrt{2}}{2}+1\right)x} \cdot \left[\begin{array}{c} \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\left(-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1\right)^{3}} \\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\left(-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1\right)^{2}} \\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{-\frac{\sqrt{2}}{2}-\frac{\mathrm{I}\sqrt{2}}{2}+1} \\ \cos\left(\frac{\sqrt{2}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{2}\,x}{2}\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_1(x) = e^{\left(-\frac{\sqrt{2}}{2}+1\right)x} \cdot \left[\begin{array}{c} \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-2\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-\cos\left(\frac{\sqrt{2}\,x}{2}\right)+3\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\left(-2+\sqrt{2}\right)^3} \\ -\frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\left(-2+\sqrt{2}\right)^2} \\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-2\cos\left(\frac{\sqrt{2}\,x}{2}\right)}{2\left(-2+\sqrt{2}\right)} \\ \cos\left(\frac{\sqrt{2}\,x}{2}\right) \end{array}\right], \vec{y}_2(x) = e^{\left(-\frac{\sqrt{2}}{2}+1\right)x} \cdot \left[\begin{array}{c} - \end{array}\right.\right.$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[\frac{\sqrt{2}}{2} - \frac{I\sqrt{2}}{2} + 1, \left[\begin{array}{c} \frac{1}{\left(\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}+1\right)^3} \\ \frac{1}{\left(\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}+1\right)^2} \\ \frac{1}{\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}+1} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$e^{\left(\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}+1\right)x} \cdot \left[\begin{array}{c} \frac{1}{\left(\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}+1\right)^3} \\ \frac{1}{\left(\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}+1\right)^2} \\ \frac{1}{\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}+1} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^{\left(\frac{\sqrt{2}}{2}+1\right)x} \cdot \left(\cos\left(\frac{\sqrt{2}\,x}{2}\right) - I\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right) \cdot \left[\begin{array}{c} \frac{1}{\left(\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}+1\right)^3} \\ \frac{1}{\left(\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}+1\right)^2} \\ \frac{1}{\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}+1} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{\left(\frac{\sqrt{2}}{2}+1\right)x} \cdot \begin{bmatrix} \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right) - I\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\left(\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}+1\right)^3} \\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right) - I\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\left(\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}+1\right)^2} \\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right) - I\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\frac{\sqrt{2}}{2}-\frac{I\sqrt{2}}{2}+1} \\ \cos\left(\frac{\sqrt{2}\,x}{2}\right) - I\sin\left(\frac{\sqrt{2}\,x}{2}\right) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = e^{\left(\frac{\sqrt{2}}{2}+1\right)x} \cdot \begin{bmatrix} \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}+2\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}+\cos\left(\frac{\sqrt{2}\,x}{2}\right)+3\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\left(2+\sqrt{2}\right)^3} \\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}+\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}+\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{\left(2+\sqrt{2}\right)^2} \\ \frac{\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}+\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}+2\cos\left(\frac{\sqrt{2}\,x}{2}\right)}{2\left(2+\sqrt{2}\right)} \\ \cos\left(\frac{\sqrt{2}\,x}{2}\right) \end{bmatrix}, \vec{y}_4(x) = e^{\left(\frac{\sqrt{2}}{2}+1\right)x} \cdot \cdots\right.$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p(\cdots$

$\vec{y}(x) = c_1\vec{y}_1(x) + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst$\cdots$

$$\phi(x) = \begin{bmatrix} \frac{e^{\left(-\frac{\sqrt{2}}{2}+1\right)x}\left(\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-2\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-\cos\left(\frac{\sqrt{2}\,x}{2}\right)+3\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right)}{\left(-2+\sqrt{2}\right)^3} & \cdots \\ -\frac{e^{\left(-\frac{\sqrt{2}}{2}+1\right)x}\left(\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right)}{\left(-2+\sqrt{2}\right)^2} & \cdots \\ \frac{e^{\left(-\frac{\sqrt{2}}{2}+1\right)x}\left(\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-2\cos\left(\frac{\sqrt{2}\,x}{2}\right)\right)}{2\left(-2+\sqrt{2}\right)} & \cdots \\ e^{\left(-\frac{\sqrt{2}}{2}+1\right)x}\cos\left(\frac{\sqrt{2}\,x}{2}\right) & -e^{\left(-\frac{\sqrt{2}}{2}+1\right)x}\sin\cdots \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t$\cdots$

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \left[\begin{array}{cc} \frac{e^{\left(-\frac{\sqrt{2}}{2}+1\right)x}\left(\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-2\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-\cos\left(\frac{\sqrt{2}\,x}{2}\right)+3\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right)}{\left(-2+\sqrt{2}\right)^{3}} & -\frac{e^{\left(-\frac{\sqrt{2}}{2}+1\right)x}\left(2\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}+\sin\left(\frac{\sqrt{2}}{2}\cdots\right.\right.}{\left(-2+\sqrt{2}\cdots\right.} \\ -\frac{e^{\left(-\frac{\sqrt{2}}{2}+1\right)x}\left(\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right)}{\left(-2+\sqrt{2}\right)^{2}} & \frac{e^{\left(-\frac{\sqrt{2}}{2}+1\right)x}\left(\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}+\sin\left(\frac{\sqrt{2}\,x}{2}\cdots\right.\right.}{\left(-2+\sqrt{2}\right)\cdots} \\ \frac{e^{\left(-\frac{\sqrt{2}}{2}+1\right)x}\left(\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-\sin\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}-2\cos\left(\frac{\sqrt{2}\,x}{2}\right)\right)}{2\left(-2+\sqrt{2}\right)} & -\frac{e^{\left(-\frac{\sqrt{2}}{2}+1\right)x}\left(\cos\left(\frac{\sqrt{2}\,x}{2}\right)\sqrt{2}+\sin\cdots\right.}{2\left(-2+\cdots\right.} \\ e^{\left(-\frac{\sqrt{2}}{2}+1\right)x}\cos\left(\frac{\sqrt{2}\,x}{2}\right) & -e^{\left(-\frac{\sqrt{2}}{2}+1\right)x}\sin\cdots \end{array}\right.$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \left[\begin{array}{c} \frac{\left(\left(-8\sqrt{2}+12\right)\cos\left(\frac{\sqrt{2}\,x}{2}\right)-4\sin\left(\frac{\sqrt{2}\,x}{2}\right)\left(\sqrt{2}-1\right)\right)e^{-\frac{\left(-2+\sqrt{2}\right)x}{2}}-8\left(\left(\sqrt{2}-\frac{3}{2}\right)\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\frac{5\left(\sqrt{2}-\frac{7}{5}\right)\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{2}\right)e^{\frac{(2+\cdots}{}}\cdots}{\left(-2+\sqrt{2}\right)^{3}\left(2+\sqrt{2}\right)^{3}\left(-3+2\sqrt{2}\right)} \\ \frac{6\left(\left(\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right)e^{-\frac{\left(-2+\sqrt{2}\right)x}{2}}-\left(\cos\left(\frac{\sqrt{2}\,x}{2}\right)-\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right)e^{\frac{\left(2+\sqrt{2}\right)x}{2}}\right)\left(\sqrt{2}-\frac{4}{3}\right)}{\left(-2+\sqrt{2}\right)^{2}\left(2+\sqrt{2}\right)^{2}\left(-3+2\sqrt{2}\right)} \\ \frac{\left(\cos\left(\frac{\sqrt{2}\,x}{2}\right)\left(3\sqrt{2}-4\right)+\sin\left(\frac{\sqrt{2}\,x}{2}\right)\left(-10+7\sqrt{2}\right)\right)e^{-\frac{\left(-2+\sqrt{2}\right)x}{2}}-3\left(\left(\sqrt{2}-\frac{4}{3}\right)\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\frac{\left(-2+\sqrt{2}\right)\sin\left(\frac{\sqrt{2}\,x}{2}\right)}{3}\right)e^{\frac{(2+\cdots}{}}\cdots}{-6+4\sqrt{2}} \\ \frac{2\sin\left(\frac{\sqrt{2}\,x}{2}\right)\left(e^{-\frac{\left(-2+\sqrt{2}\right)x}{2}}\left(-3+2\sqrt{2}\right)+e^{\frac{\left(2+\sqrt{2}\right)x}{2}}\right)}{-2+\sqrt{2}} \end{array}\right.\cdots$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$
  $\vec{y}_p(x) = \Phi(x)\cdot\vec{v}(x)$
- Take the derivative of the particular solution
  $\vec{y}'_p(x) = \Phi'(x)\cdot\vec{v}(x) + \Phi(x)\cdot\vec{v}'(x)$
- Substitute particular solution and its derivative into the system of ODEs
  $\Phi'(x)\cdot\vec{v}(x) + \Phi(x)\cdot\vec{v}'(x) = A\cdot\Phi(x)\cdot\vec{v}(x) + \vec{f}(x)$
- The fundamental matrix has columns that are solutions to the homogeneous system so its der
  $A\cdot\Phi(x)\cdot\vec{v}(x) + \Phi(x)\cdot\vec{v}'(x) = A\cdot\Phi(x)\cdot\vec{v}(x) + \vec{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot \vec{v}'(x)=\vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x)=\frac{1}{\Phi(x)}\cdot \vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x)=\int_0^x \frac{1}{\Phi(s)}\cdot \vec{f}(s)\,ds$

- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x)=\Phi(x)\cdot\left(\int_0^x \frac{1}{\Phi(s)}\cdot \vec{f}(s)\,ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x)=\left[\begin{array}{c}\frac{\left(\left(-2267904\sqrt{2}+3207296\right)\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\left(-1956096\sqrt{2}+2766336\right)\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right)e^{-\frac{\left(-2+\sqrt{2}\right)x}{2}}+\left(\left(371200\sqrt{2}-524928\right)\right.}{\left(-2+\sqrt{2}\right)^{8}\left(-3+2\sqrt{2}\right)\left(\sqrt{2}-1\right)\left(4+\right.} \\ \frac{\left(\left(1244192\sqrt{2}-1759552\right)\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\left(2471456\sqrt{2}-3495168\right)\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right)e^{-\frac{\left(-2+\sqrt{2}\right)x}{2}}+\left(\left(-96992\sqrt{2}+13715\right.\right.}{\left(-2+\sqrt{2}\right)^{7}\left(-3+2\sqrt{2}\right)\left(\sqrt{2}-1\right)\left(4+\right.} \\ \frac{\left(\left(-548432\sqrt{2}+775600\right)\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\left(-7429520\sqrt{2}+10506928\right)\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right)e^{-\frac{\left(-2+\sqrt{2}\right)x}{2}}+\left(\left(-75632\sqrt{2}+10696\right.\right.}{\left(70\sqrt{2}-99\right)\left(2+\sqrt{2}\right)^{5}\left(-3\right.} \\ \frac{\left(\left(-740720\sqrt{2}+1047536\right)\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\left(2242592\sqrt{2}-3171504\right)\sin\left(\frac{\sqrt{2}\,x}{2}\right)\right)e^{-\frac{\left(-2+\sqrt{2}\right)x}{2}}+\left(\left(21808\sqrt{2}-30832\right.\right.}{\left(-2+\sqrt{2}\right)^{6}\left(70\sqrt{2}-9\right.}\end{array}\right.$$

- Plug particular solution back into general solution

$$\vec{y}(x)=c_1\vec{y}_1(x)+c_2\vec{y}_2(x)+c_3\vec{y}_3(x)+c_4\vec{y}_4(x)+\left[\begin{array}{c}\frac{\left(\left(-2267904\sqrt{2}+3207296\right)\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\left(-1956096\sqrt{2}+27\right.\right.}{} \\ \frac{\left(\left(1244192\sqrt{2}-1759552\right)\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\left(2471456\sqrt{2}-3\right.\right.}{} \\ \frac{\left(\left(-548432\sqrt{2}+775600\right)\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\left(-7429520\sqrt{2}+105\right.\right.}{} \\ \frac{\left(\left(-740720\sqrt{2}+1047536\right)\cos\left(\frac{\sqrt{2}\,x}{2}\right)+\left(2242592\sqrt{2}-\right.\right.}{}\end{array}\right.$$

- First component of the vector is the solution to the ODE

$$y = \frac{\left(\left((-3712c_1+8960c_2-2267904)\sqrt{2}+5248c_1-12672c_2+3207296\right)\cos\left(\frac{\sqrt{2}\,x}{2}\right)+8960\left(\left(c_1+\frac{29c_2}{70}-\frac{7641}{35}\right)\sqrt{2}-\frac{99c_1}{70}-\frac{41c_2}{70}+\frac{10806}{35}\right)\right.}{}$$

ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{2y'''' + 5y''' - 5y' - 2y = 18\,e^{x}(2x+5)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$2y'''' + 5y''' - 5y' - 2y = 0$$

The characteristic equation is

$$2\lambda^4 + 5\lambda^3 - 5\lambda - 2 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = -\frac{1}{2}$$
$$\lambda_3 = -2$$
$$\lambda_4 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{-2x} + c_3 e^{x} + e^{-\frac{x}{2}} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^{-x} \\ y_2 &= e^{-2x} \\ y_3 &= e^{x} \\ y_4 &= e^{-\frac{x}{2}} \end{aligned}$$

Now the particular solution to the given ODE is found

$$2y'''' + 5y''' - 5y' - 2y = 18\,e^{x}(2x + 5)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$18\,e^{x}(2x + 5)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,e^{x}, e^{x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\left\{e^{x}, e^{-2x}, e^{-x}, e^{-\frac{x}{2}}\right\}$$

Since e^{x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\,e^{x}, x^2 e^{x}\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x\,e^{x} + A_2 x^2 e^{x}$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$18A_1 e^{x} + 54A_2 e^{x} + 36A_2 x\,e^{x} = 18\,e^{x}(2x + 5)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 2, A_2 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = 2x\,\mathrm{e}^{x} + x^2\mathrm{e}^{x}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1\mathrm{e}^{-x} + c_2\mathrm{e}^{-2x} + c_3\mathrm{e}^{x} + \mathrm{e}^{-\frac{x}{2}}c_4\right) + \left(2x\,\mathrm{e}^{x} + x^2\mathrm{e}^{x}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1\mathrm{e}^{-x} + c_2\mathrm{e}^{-2x} + c_3\mathrm{e}^{x} + \mathrm{e}^{-\frac{x}{2}}c_4 + 2x\,\mathrm{e}^{x} + x^2\mathrm{e}^{x} \tag{1}$$

Verification of solutions

$$y = c_1\mathrm{e}^{-x} + c_2\mathrm{e}^{-2x} + c_3\mathrm{e}^{x} + \mathrm{e}^{-\frac{x}{2}}c_4 + 2x\,\mathrm{e}^{x} + x^2\mathrm{e}^{x}$$

Verified OK.

19.19.1 Maple step by step solution

Let's solve

$2y'''' + 5y''' - 5y' - 2y = 18\,\mathrm{e}^{x}(2x + 5)$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = y - \frac{5y'''}{2} + \frac{5y'}{2} + 18x\,\mathrm{e}^{x} + 45\,\mathrm{e}^{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'''' + \frac{5y'''}{2} - \frac{5y'}{2} - y = 9\,\mathrm{e}^{x}(2x + 5)$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

- Define new variable $y_2(x)$

  $y_2(x) = y'$
- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Define new variable $y_4(x)$

  $y_4(x) = y'''$
- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = 18x\,e^x + 45\,e^x - \frac{5y_4(x)}{2} + \frac{5y_2(x)}{2} + y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x)\,, y_3(x) = y_2'(x)\,, y_4(x) = y_3'(x)\,, y_4'(x) = 18x\,e^x + 45\,e^x - \frac{5y_4(x)}{2} + \frac{5y_2(x)}{2} + y_1(x)\right]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 1 & \frac{5}{2} & 0 & -\frac{5}{2} \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ 18x\,e^x + 45\,e^x \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 18x\,e^x + 45\,e^x \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 1 & \frac{5}{2} & 0 & -\frac{5}{2} \end{bmatrix}$$

- Rewrite the system as

  $$\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x) + \overrightarrow{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[-\frac{1}{2}, \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-2x} \cdot \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = e^{-x} \cdot \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-\frac{1}{2}, \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = e^{-\frac{x}{2}} \cdot \begin{bmatrix} -8 \\ 4 \\ -2 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_4 = e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3 + c_4\vec{y}_4 + \vec{y}_p(x)$$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x)=\begin{bmatrix} -\frac{e^{-2x}}{8} & -e^{-x} & -8\,e^{-\frac{x}{2}} & e^{x} \\ \frac{e^{-2x}}{4} & e^{-x} & 4\,e^{-\frac{x}{2}} & e^{x} \\ -\frac{e^{-2x}}{2} & -e^{-x} & -2\,e^{-\frac{x}{2}} & e^{x} \\ e^{-2x} & e^{-x} & e^{-\frac{x}{2}} & e^{x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t

  $\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x)=\begin{bmatrix} -\frac{e^{-2x}}{8} & -e^{-x} & -8\,e^{-\frac{x}{2}} & e^{x} \\ \frac{e^{-2x}}{4} & e^{-x} & 4\,e^{-\frac{x}{2}} & e^{x} \\ -\frac{e^{-2x}}{2} & -e^{-x} & -2\,e^{-\frac{x}{2}} & e^{x} \\ e^{-2x} & e^{-x} & e^{-\frac{x}{2}} & e^{x} \end{bmatrix}\cdot\frac{1}{\begin{bmatrix} -\frac{1}{8} & -1 & -8 & 1 \\ \frac{1}{4} & 1 & 4 & 1 \\ -\frac{1}{2} & -1 & -2 & 1 \\ 1 & 1 & 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x)=\begin{bmatrix} -\frac{\left(-e^{3x}-16\,e^{\frac{3x}{2}}+9\,e^{x}-1\right)e^{-2x}}{9} & -\frac{\left(-7\,e^{3x}-16\,e^{\frac{3x}{2}}+27\,e^{x}-4\right)e^{-2x}}{18} & \frac{\left(7\,e^{3x}-32\,e^{\frac{3x}{2}}+27\,e^{x}-2\right)e^{-2x}}{18} & \cdots \\ \frac{\left(e^{3x}-8\,e^{\frac{3x}{2}}+9\,e^{x}-2\right)e^{-2x}}{9} & \frac{\left(7\,e^{3x}-8\,e^{\frac{3x}{2}}+27\,e^{x}-8\right)e^{-2x}}{18} & -\frac{\left(-7\,e^{3x}-16\,e^{\frac{3x}{2}}+27\,e^{x}-4\right)e^{-2x}}{18} & \cdots \\ -\frac{\left(-e^{3x}-4\,e^{\frac{3x}{2}}+9\,e^{x}-4\right)e^{-2x}}{9} & -\frac{\left(-7\,e^{3x}-4\,e^{\frac{3x}{2}}+27\,e^{x}-16\right)e^{-2x}}{18} & \frac{\left(7\,e^{3x}-8\,e^{\frac{3x}{2}}+27\,e^{x}-8\right)e^{-2x}}{18} & \cdots \\ \frac{\left(e^{3x}-2\,e^{\frac{3x}{2}}+9\,e^{x}-8\right)e^{-2x}}{9} & \frac{\left(7\,e^{3x}-2\,e^{\frac{3x}{2}}+27\,e^{x}-32\right)e^{-2x}}{18} & -\frac{\left(-7\,e^{3x}-4\,e^{\frac{3x}{2}}+27\,e^{x}-16\right)e^{-2x}}{18} & \cdots \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x)=\Phi(x)\cdot\vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}_p'(x)=\Phi'(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)=A\cdot\Phi(x)\cdot\vec{v}(x)+\vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

$A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$

- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \left[\begin{array}{c} -\frac{\left(-9x^2 \mathrm{e}^{3x}-18x\,\mathrm{e}^{3x}+40\,\mathrm{e}^{3x}-176\,\mathrm{e}^{\frac{3x}{2}}+162\,\mathrm{e}^{x}-26\right)\mathrm{e}^{-2x}}{9} \\ \frac{\left(9x^2 \mathrm{e}^{3x}+36x\,\mathrm{e}^{3x}-22\,\mathrm{e}^{3x}-88\,\mathrm{e}^{\frac{3x}{2}}+162\,\mathrm{e}^{x}-52\right)\mathrm{e}^{-2x}}{9} \\ -\frac{\left(-9x^2 \mathrm{e}^{3x}-54x\,\mathrm{e}^{3x}-14\,\mathrm{e}^{3x}-44\,\mathrm{e}^{\frac{3x}{2}}+162\,\mathrm{e}^{x}-104\right)\mathrm{e}^{-2x}}{9} \\ \frac{\left(9x^2 \mathrm{e}^{3x}+72x\,\mathrm{e}^{3x}+68\,\mathrm{e}^{3x}-22\,\mathrm{e}^{\frac{3x}{2}}+162\,\mathrm{e}^{x}-208\right)\mathrm{e}^{-2x}}{9} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3 + c_4\vec{y}_4 + \left[\begin{array}{c} -\frac{\left(-9x^2 \mathrm{e}^{3x}-18x\,\mathrm{e}^{3x}+40\,\mathrm{e}^{3x}-176\,\mathrm{e}^{\frac{3x}{2}}+162\,\mathrm{e}^{x}-26\right)\mathrm{e}^{-2x}}{9} \\ \frac{\left(9x^2 \mathrm{e}^{3x}+36x\,\mathrm{e}^{3x}-22\,\mathrm{e}^{3x}-88\,\mathrm{e}^{\frac{3x}{2}}+162\,\mathrm{e}^{x}-52\right)\mathrm{e}^{-2x}}{9} \\ -\frac{\left(-9x^2 \mathrm{e}^{3x}-54x\,\mathrm{e}^{3x}-14\,\mathrm{e}^{3x}-44\,\mathrm{e}^{\frac{3x}{2}}+162\,\mathrm{e}^{x}-104\right)\mathrm{e}^{-2x}}{9} \\ \frac{\left(9x^2 \mathrm{e}^{3x}+72x\,\mathrm{e}^{3x}+68\,\mathrm{e}^{3x}-22\,\mathrm{e}^{\frac{3x}{2}}+162\,\mathrm{e}^{x}-208\right)\mathrm{e}^{-2x}}{9} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y = \left(\left(-8c_3 + \frac{176}{9}\right)\mathrm{e}^{\frac{3x}{2}} + \left(c_4 + x^2 + 2x - \frac{40}{9}\right)\mathrm{e}^{3x} + \left(-c_2 - 18\right)\mathrm{e}^{x} - \frac{c_1}{8} + \frac{26}{9}\right)\mathrm{e}^{-2x}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' + y''' - 2y'' - 6y' - 4y = -\mathrm{e}^{2x}\left(15x^2 + 28x + 4\right)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + y''' - 2y'' - 6y' - 4y = 0$$

The characteristic equation is

$$\lambda^4 + \lambda^3 - 2\lambda^2 - 6\lambda - 4 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = -1$$
$$\lambda_3 = -1 - i$$
$$\lambda_4 = -1 + i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + e^{(-1-i)x} c_2 + c_3 e^{2x} + e^{(-1+i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = e^{(-1-i)x}$$
$$y_3 = e^{2x}$$
$$y_4 = e^{(-1+i)x}$$

Now the particular solution to the given ODE is found

$$y'''' + y''' - 2y'' - 6y' - 4y = -e^{2x}(15x^2 + 28x + 4)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-e^{2x}(15x^2 + 28x + 4)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x e^{2x}, x^2 e^{2x}, e^{2x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^{(-1-i)x}, e^{(-1+i)x}, e^{-x}, e^{2x}\}$$

Since e^{2x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x e^{2x}, x^2 e^{2x}, e^{2x} x^3\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x e^{2x} + A_2 x^2 e^{2x} + A_3 e^{2x} x^3$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$90A_3 e^{2x} x^2 + 168A_3 e^{2x} x + 60A_2 x e^{2x} + 56A_2 e^{2x} + 30A_1 e^{2x} + 54A_3 e^{2x} = -e^{2x}(15x^2 + 28x + 4)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{1}{6}, A_2 = 0, A_3 = -\frac{1}{6}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{x\,\mathrm{e}^{2x}}{6} - \frac{\mathrm{e}^{2x}x^3}{6}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1\mathrm{e}^{-x} + \mathrm{e}^{(-1-i)x}c_2 + c_3\mathrm{e}^{2x} + \mathrm{e}^{(-1+i)x}c_4\right) + \left(\frac{x\,\mathrm{e}^{2x}}{6} - \frac{\mathrm{e}^{2x}x^3}{6}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1\mathrm{e}^{-x} + \mathrm{e}^{(-1-i)x}c_2 + c_3\mathrm{e}^{2x} + \mathrm{e}^{(-1+i)x}c_4 + \frac{x\,\mathrm{e}^{2x}}{6} - \frac{\mathrm{e}^{2x}x^3}{6} \tag{1}$$

Verification of solutions

$$y = c_1\mathrm{e}^{-x} + \mathrm{e}^{(-1-i)x}c_2 + c_3\mathrm{e}^{2x} + \mathrm{e}^{(-1+i)x}c_4 + \frac{x\,\mathrm{e}^{2x}}{6} - \frac{\mathrm{e}^{2x}x^3}{6}$$

Verified OK.

19.20.1 Maple step by step solution

Let's solve

$y'''' + y''' - 2y'' - 6y' - 4y = -\mathrm{e}^{2x}(15x^2 + 28x + 4)$

- Highest derivative means the order of the ODE is 4

  y''''

- ☐ Convert linear ODE into a system of first order ODEs
  - ◦ Define new variable $y_1(x)$

    $y_1(x) = y$
  - ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Define new variable $y_4(x)$

  $y_4(x) = y'''$
- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = -15x^2 e^{2x} - 28x\,e^{2x} - 4\,e^{2x} - y_4(x) + 2y_3(x) + 6y_2(x) + 4y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x)\,, y_3(x) = y_2'(x)\,, y_4(x) = y_3'(x)\,, y_4'(x) = -15x^2 e^{2x} - 28x\,e^{2x} - 4\,e^{2x} - y_4(x) + 2y_3($

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 4 & 6 & 2 & -1 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ -15x^2 e^{2x} - 28x\,e^{2x} - 4\,e^{2x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ -15x^2 e^{2x} - 28x\,e^{2x} - 4\,e^{2x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 4 & 6 & 2 & -1 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]\right], \left[2, \left[\begin{array}{c} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]\right], \left[-1-\mathrm{I}, \left[\begin{array}{c} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right], \left[-1+\mathrm{I}, \left[\begin{array}{c} \frac{1}{4}-\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ -\frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[2, \left[\begin{array}{c} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{2x} \cdot \left[\begin{array}{c} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-1-\mathrm{I}, \left[\begin{array}{c} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(-1-\mathrm{I})x} \cdot \left[\begin{array}{c} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{-x} \cdot (\cos(x) - \mathrm{I}\sin(x)) \cdot \left[\begin{array}{c} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Simplify expression

$$\mathrm{e}^{-x} \cdot \left[\begin{array}{c} \left(\frac{1}{4}+\frac{\mathrm{I}}{4}\right)(\cos(x) - \mathrm{I}\sin(x)) \\ -\frac{\mathrm{I}}{2}(\cos(x) - \mathrm{I}\sin(x)) \\ \left(-\frac{1}{2}+\frac{\mathrm{I}}{2}\right)(\cos(x) - \mathrm{I}\sin(x)) \\ \cos(x) - \mathrm{I}\sin(x) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} \frac{\sin(x)}{4}+\frac{\cos(x)}{4} \\ -\frac{\sin(x)}{2} \\ -\frac{\cos(x)}{2}+\frac{\sin(x)}{2} \\ \cos(x) \end{array}\right], \vec{y}_4(x) = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} \frac{\cos(x)}{4}-\frac{\sin(x)}{4} \\ -\frac{\cos(x)}{2} \\ \frac{\cos(x)}{2}+\frac{\sin(x)}{2} \\ -\sin(x) \end{array}\right]\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x)=\begin{bmatrix} -\mathrm{e}^{-x} & \frac{\mathrm{e}^{2x}}{8} & \mathrm{e}^{-x}\left(\frac{\sin(x)}{4}+\frac{\cos(x)}{4}\right) & \mathrm{e}^{-x}\left(\frac{\cos(x)}{4}-\frac{\sin(x)}{4}\right) \\ \mathrm{e}^{-x} & \frac{\mathrm{e}^{2x}}{4} & -\frac{\sin(x)\mathrm{e}^{-x}}{2} & -\frac{\cos(x)\mathrm{e}^{-x}}{2} \\ -\mathrm{e}^{-x} & \frac{\mathrm{e}^{2x}}{2} & \mathrm{e}^{-x}\left(-\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & \mathrm{e}^{-x}\left(\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) \\ \mathrm{e}^{-x} & \mathrm{e}^{2x} & \cos(x)\,\mathrm{e}^{-x} & -\sin(x)\,\mathrm{e}^{-x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t

  $\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x)=\begin{bmatrix} -\mathrm{e}^{-x} & \frac{\mathrm{e}^{2x}}{8} & \mathrm{e}^{-x}\left(\frac{\sin(x)}{4}+\frac{\cos(x)}{4}\right) & \mathrm{e}^{-x}\left(\frac{\cos(x)}{4}-\frac{\sin(x)}{4}\right) \\ \mathrm{e}^{-x} & \frac{\mathrm{e}^{2x}}{4} & -\frac{\sin(x)\mathrm{e}^{-x}}{2} & -\frac{\cos(x)\mathrm{e}^{-x}}{2} \\ -\mathrm{e}^{-x} & \frac{\mathrm{e}^{2x}}{2} & \mathrm{e}^{-x}\left(-\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & \mathrm{e}^{-x}\left(\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) \\ \mathrm{e}^{-x} & \mathrm{e}^{2x} & \cos(x)\,\mathrm{e}^{-x} & -\sin(x)\,\mathrm{e}^{-x} \end{bmatrix}\cdot\frac{1}{\begin{bmatrix} -1 & \frac{1}{8} & \frac{1}{4} & \frac{1}{4} \\ 1 & \frac{1}{4} & 0 & -\frac{1}{2} \\ -1 & \frac{1}{2} & -\frac{1}{2} & \frac{1}{2} \\ 1 & 1 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x)=\begin{bmatrix} \frac{2(10-3\cos(x)+6\sin(x))\mathrm{e}^{-x}}{15}+\frac{\mathrm{e}^{2x}}{15} & \frac{(10-12\cos(x)+9\sin(x))\mathrm{e}^{-x}}{15}+\frac{2\,\mathrm{e}^{2x}}{15} & \frac{(-\cos(x)-3\sin(x))\mathrm{e}^{-x}}{10}+ \\ \frac{2(-10+9\cos(x)-3\sin(x))\mathrm{e}^{-x}}{15}+\frac{2\,\mathrm{e}^{2x}}{15} & \frac{(-10+3\sin(x)+21\cos(x))\mathrm{e}^{-x}}{15}+\frac{4\,\mathrm{e}^{2x}}{15} & \frac{(2\sin(x)-\cos(x))\mathrm{e}^{-x}}{5}+ \\ \frac{4(5-3\sin(x)-6\cos(x))\mathrm{e}^{-x}}{15}+\frac{4\,\mathrm{e}^{2x}}{15} & \frac{2(5-9\cos(x)-12\sin(x))\mathrm{e}^{-x}}{15}+\frac{8\,\mathrm{e}^{2x}}{15} & \frac{(3\cos(x)-\sin(x))\mathrm{e}^{-x}}{5}+ \\ \frac{4(-5+3\cos(x)+9\sin(x))\mathrm{e}^{-x}}{15}+\frac{8\,\mathrm{e}^{2x}}{15} & \frac{2(-5-3\cos(x)+21\sin(x))\mathrm{e}^{-x}}{15}+\frac{16\,\mathrm{e}^{2x}}{15} & \frac{(-2\sin(x)-4\cos(x))\mathrm{e}^{-x}}{5}+ \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x)=\Phi(x)\cdot\vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}_p'(x)=\Phi'(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)=A\cdot\Phi(x)\cdot\vec{v}(x)+\vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

$$A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$$

- Cancel like terms

$$\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$$

- Multiply by the inverse of the fundamental matrix

$$\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$$

- Integrate to solve for $\vec{v}(x)$

$$\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$$

- Plug $\vec{v}(x)$ into the equation for the particular solution

$$\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \begin{bmatrix} \frac{(-9\cos(x)+18\sin(x)+20)e^{-x}}{90} - \frac{\left(x^3-x+\frac{11}{15}\right)e^{2x}}{6} \\ \frac{(-30x^3-45x^2+30x-7)e^{2x}}{90} + \frac{3\left(\cos(x)-\frac{\sin(x)}{3}-\frac{20}{27}\right)e^{-x}}{10} \\ \frac{(-30x^3-90x^2-15x+8)e^{2x}}{45} - \frac{2\left(\cos(x)+\frac{\sin(x)}{2}-\frac{5}{9}\right)e^{-x}}{5} \\ \frac{(-60x^3-270x^2-210x+1)e^{2x}}{45} + \frac{\left(\cos(x)+3\sin(x)-\frac{10}{9}\right)e^{-x}}{5} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \begin{bmatrix} \frac{(-9\cos(x)+18\sin(x)+20)e^{-x}}{90} - \frac{\left(x^3-x+\frac{11}{15}\right)e^{2x}}{6} \\ \frac{(-30x^3-45x^2+30x-7)e^{2x}}{90} + \frac{3\left(\cos(x)-\frac{\sin(x)}{3}-\frac{20}{27}\right)e^{-x}}{10} \\ \frac{(-30x^3-90x^2-15x+8)e^{2x}}{45} - \frac{2\left(\cos(x)+\frac{\sin(x)}{2}-\frac{5}{9}\right)e^{-x}}{5} \\ \frac{(-60x^3-270x^2-210x+1)e^{2x}}{45} + \frac{\left(\cos(x)+3\sin(x)-\frac{10}{9}\right)e^{-x}}{5} \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = \frac{((90c_3+90c_4-36)\cos(x)+(90c_3-90c_4+72)\sin(x)-360c_1+80)e^{-x}}{360} - \frac{\left(x^3-x-\frac{3}{4}c_2+\frac{11}{15}\right)e^{2x}}{6}$$

ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{2y'''' + y''' - 2y' - y = 3\,\mathrm{e}^{-\frac{x}{2}}(1 - 6x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$2y'''' + y''' - 2y' - y = 0$$

The characteristic equation is

$$2\lambda^4 + \lambda^3 - 2\lambda - 1 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = -\frac{1}{2}$$
$$\lambda_3 = -\frac{1}{2} - \frac{i\sqrt{3}}{2}$$
$$\lambda_4 = -\frac{1}{2} + \frac{i\sqrt{3}}{2}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + e^{\left(-\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x} c_2 + e^{-\frac{x}{2}} c_3 + e^{\left(-\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^x$$
$$y_2 = e^{\left(-\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x}$$
$$y_3 = e^{-\frac{x}{2}}$$
$$y_4 = e^{\left(-\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x}$$

Now the particular solution to the given ODE is found

$$2y'''' + y''' - 2y' - y = 3\,e^{-\frac{x}{2}}(1 - 6x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$3\,e^{-\frac{x}{2}}(1 - 6x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$\left[\left\{x\,e^{-\frac{x}{2}}, e^{-\frac{x}{2}}\right\}\right]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\left\{e^x, e^{\left(-\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x}, e^{\left(-\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x}, e^{-\frac{x}{2}}\right\}$$

Since $e^{-\frac{x}{2}}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$\left[\left\{x\,e^{-\frac{x}{2}}, e^{-\frac{x}{2}}x^2\right\}\right]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x\,e^{-\frac{x}{2}} + A_2 e^{-\frac{x}{2}} x^2$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$-\frac{9A_1 e^{-\frac{x}{2}}}{4} - \frac{9A_2 e^{-\frac{x}{2}} x}{2} + 3A_2 e^{-\frac{x}{2}} = 3\,e^{-\frac{x}{2}}(1-6x)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 4, A_2 = 4]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = 4x\,e^{-\frac{x}{2}} + 4\,e^{-\frac{x}{2}} x^2$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^x + e^{\left(-\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x} c_2 + e^{-\frac{x}{2}} c_3 + e^{\left(-\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x} c_4\right) + \left(4x\,e^{-\frac{x}{2}} + 4\,e^{-\frac{x}{2}} x^2\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 e^x + e^{\left(-\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x} c_2 + e^{-\frac{x}{2}} c_3 + e^{\left(-\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x} c_4 + 4x\,e^{-\frac{x}{2}} + 4\,e^{-\frac{x}{2}} x^2 \tag{1}$$

Verification of solutions

$$y = c_1 e^x + e^{\left(-\frac{1}{2}+\frac{i\sqrt{3}}{2}\right)x} c_2 + e^{-\frac{x}{2}} c_3 + e^{\left(-\frac{1}{2}-\frac{i\sqrt{3}}{2}\right)x} c_4 + 4x\,e^{-\frac{x}{2}} + 4\,e^{-\frac{x}{2}} x^2$$

Verified OK.

19.21.1 Maple step by step solution

Let's solve

$2y'''' + y''' - 2y' - y = 3\,e^{-\frac{x}{2}}(1-6x)$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

$y'''' = \frac{y}{2} - \frac{y'''}{2} + y' - 9x\,e^{-\frac{x}{2}} + \frac{3\,e^{-\frac{x}{2}}}{2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y'''' + \frac{y'''}{2} - y' - \frac{y}{2} = -\frac{3\,e^{-\frac{x}{2}}(-1+6x)}{2}$

□ Convert linear ODE into a system of first order ODEs

- ○ Define new variable $y_1(x)$

$y_1(x) = y$

- ○ Define new variable $y_2(x)$

$y_2(x) = y'$

- ○ Define new variable $y_3(x)$

$y_3(x) = y''$

- ○ Define new variable $y_4(x)$

$y_4(x) = y'''$

- ○ Isolate for $y_4'(x)$ using original ODE

$y_4'(x) = -9x\,e^{-\frac{x}{2}} + \frac{3\,e^{-\frac{x}{2}}}{2} - \frac{y_4(x)}{2} + y_2(x) + \frac{y_1(x)}{2}$

Convert linear ODE into a system of first order ODEs

$\left[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -9x\,e^{-\frac{x}{2}} + \frac{3\,e^{-\frac{x}{2}}}{2} - \frac{y_4(x)}{2} + y_2(x) + \frac{y_1(x)}{2}\right]$

- Define vector

$$\vec{y}(x) = \left[\begin{array}{c} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{array}\right]$$

- System to solve

$$\vec{y}'(x) = \left[\begin{array}{cccc} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ \frac{1}{2} & 1 & 0 & -\frac{1}{2} \end{array}\right] \cdot \vec{y}(x) + \left[\begin{array}{c} 0 \\ 0 \\ 0 \\ -9x\,e^{-\frac{x}{2}} + \frac{3\,e^{-\frac{x}{2}}}{2} \end{array}\right]$$

- Define the forcing function

$$\vec{f}(x) = \left[\begin{array}{c} 0 \\ 0 \\ 0 \\ -9x\,\mathrm{e}^{-\frac{x}{2}}+\frac{3\,\mathrm{e}^{-\frac{x}{2}}}{2} \end{array}\right]$$

- Define the coefficient matrix

$$A = \left[\begin{array}{cccc} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ \frac{1}{2} & 1 & 0 & -\frac{1}{2} \end{array}\right]$$

- Rewrite the system as

$$\vec{y}'(x) = A\cdot\vec{y}(x)+\vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \\ 1 \end{array}\right]\right], \left[-\frac{1}{2}, \left[\begin{array}{c} -8 \\ 4 \\ -2 \\ 1 \end{array}\right]\right], \left[-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}, \left[\begin{array}{c} \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}} \\ 1 \end{array}\right]\right], \left[-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}, \left[\begin{array}{c} \frac{1}{\left(-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{-\frac{1}{2}+\frac{\mathrm{I}\sqrt{3}}{2}} \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{x}\cdot\left[\begin{array}{c} 1 \\ 1 \\ 1 \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[-\frac{1}{2}, \left[\begin{array}{c} -8 \\ 4 \\ -2 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{-\frac{x}{2}} \cdot \left[\begin{array}{c} -8 \\ 4 \\ -2 \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-\frac{1}{2} - \frac{\mathrm{I}\sqrt{3}}{2}, \left[\begin{array}{c} \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)x} \cdot \left[\begin{array}{c} \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^{-\frac{x}{2}} \cdot \left(\cos\left(\frac{\sqrt{3}\,x}{2}\right) - \mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)\right) \cdot \left[\begin{array}{c} \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{3}} \\ \frac{1}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{2}} \\ \frac{1}{-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{-\frac{x}{2}} \cdot \left[\begin{array}{c} \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{3}} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{\left(-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}\right)^{2}} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)-\mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{-\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}} \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right) - \mathrm{I}\sin\left(\frac{\sqrt{3}\,x}{2}\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = e^{-\frac{x}{2}} \cdot \left[\begin{array}{c} \cos\left(\frac{\sqrt{3}\,x}{2}\right) \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2} - \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2} + \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} \\ \cos\left(\frac{\sqrt{3}\,x}{2}\right) \end{array}\right], \vec{y}_4(x) = e^{-\frac{x}{2}} \cdot \left[\begin{array}{c} -\sin\left(\frac{\sqrt{3}\,x}{2}\right) \\ -\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} + \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2} \\ \frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2} + \frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2} \\ -\sin\left(\frac{\sqrt{3}\,x}{2}\right) \end{array}\right]\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \vec{y}_p(x)$$

☐ Fundamental matrix

  ◦ Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} e^{x} & -8\,e^{-\frac{x}{2}} & e^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right) & -e^{-\frac{x}{2}}\sin\left(\frac{\sqrt{3}\,x}{2}\right) \\ e^{x} & 4\,e^{-\frac{x}{2}} & e^{-\frac{x}{2}}\left(-\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2}-\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2}\right) & e^{-\frac{x}{2}}\left(-\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2}\right) \\ e^{x} & -2\,e^{-\frac{x}{2}} & e^{-\frac{x}{2}}\left(-\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2}\right) & e^{-\frac{x}{2}}\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2}\right) \\ e^{x} & e^{-\frac{x}{2}} & e^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right) & -e^{-\frac{x}{2}}\sin\left(\frac{\sqrt{3}\,x}{2}\right) \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t
  $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$
- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} e^{x} & -8\,e^{-\frac{x}{2}} & e^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right) & -e^{-\frac{x}{2}}\sin\left(\frac{\sqrt{3}\,x}{2}\right) \\ e^{x} & 4\,e^{-\frac{x}{2}} & e^{-\frac{x}{2}}\left(-\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2}-\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2}\right) & e^{-\frac{x}{2}}\left(-\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2}\right) \\ e^{x} & -2\,e^{-\frac{x}{2}} & e^{-\frac{x}{2}}\left(-\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{2}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2}\right) & e^{-\frac{x}{2}}\left(\frac{\cos\left(\frac{\sqrt{3}\,x}{2}\right)\sqrt{3}}{2}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)}{2}\right) \\ e^{x} & e^{-\frac{x}{2}} & e^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right) & -e^{-\frac{x}{2}}\sin\left(\frac{\sqrt{3}\,x}{2}\right) \end{bmatrix} \cdot \frac{}{\begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{e^{x}}{9}+\frac{8\,e^{-\frac{x}{2}}}{9}+\frac{2\sin\left(\frac{\sqrt{3}\,x}{2}\right)e^{-\frac{x}{2}}\sqrt{3}}{9} & \frac{e^{x}}{3}-\frac{e^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)e^{-\frac{x}{2}}\sqrt{3}}{3} & \frac{e^{x}}{3}- \\ -\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)e^{-\frac{x}{2}}\sqrt{3}}{9}+\frac{e^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3}-\frac{4\,e^{-\frac{x}{2}}}{9}+\frac{e^{x}}{9} & \frac{2\,e^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3}+\frac{e^{x}}{3} & \frac{e^{x}}{3}- \\ -\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)e^{-\frac{x}{2}}\sqrt{3}}{9}-\frac{e^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3}+\frac{2\,e^{-\frac{x}{2}}}{9}+\frac{e^{x}}{9} & \frac{e^{x}}{3}-\frac{e^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3}-\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)e^{-\frac{x}{2}}\sqrt{3}}{3} & \\ \frac{e^{x}}{9}-\frac{e^{-\frac{x}{2}}}{9}+\frac{2\sin\left(\frac{\sqrt{3}\,x}{2}\right)e^{-\frac{x}{2}}\sqrt{3}}{9} & \frac{e^{x}}{3}-\frac{e^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3}+\frac{\sin\left(\frac{\sqrt{3}\,x}{2}\right)e^{-\frac{x}{2}}\sqrt{3}}{3} & \frac{e^{x}}{3}- \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$
  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$
- Take the derivative of the particular solution
  $\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$
- Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$
- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$
- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$
- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \left[\begin{array}{c} \frac{26\,\mathrm{e}^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3} - 2\sin\left(\frac{\sqrt{3}\,x}{2}\right)\mathrm{e}^{-\frac{x}{2}}\sqrt{3} + 4(x^2+x-2)\,\mathrm{e}^{-\frac{x}{2}} - \frac{2\,\mathrm{e}^{x}}{3} \\ -\frac{22\,\mathrm{e}^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3} - \frac{10\sin\left(\frac{\sqrt{3}\,x}{2}\right)\mathrm{e}^{-\frac{x}{2}}\sqrt{3}}{3} + 2(-x^2+3x+4)\,\mathrm{e}^{-\frac{x}{2}} - \frac{2\,\mathrm{e}^{x}}{3} \\ -\frac{4\,\mathrm{e}^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3} + \frac{16\sin\left(\frac{\sqrt{3}\,x}{2}\right)\mathrm{e}^{-\frac{x}{2}}\sqrt{3}}{3} + (x^2-7x+2)\,\mathrm{e}^{-\frac{x}{2}} - \frac{2\,\mathrm{e}^{x}}{3} \\ \frac{26\,\mathrm{e}^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3} - 2\sin\left(\frac{\sqrt{3}\,x}{2}\right)\mathrm{e}^{-\frac{x}{2}}\sqrt{3} + \frac{(-3x^2+33x-48)\,\mathrm{e}^{-\frac{x}{2}}}{6} - \frac{2\,\mathrm{e}^{x}}{3} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \left[\begin{array}{c} \frac{26\,\mathrm{e}^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3} - 2\sin\left(\frac{\sqrt{3}\,x}{2}\right)\mathrm{e}^{-\frac{x}{2}}\sqrt{3} + 4(x^2+x- \\ -\frac{22\,\mathrm{e}^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3} - \frac{10\sin\left(\frac{\sqrt{3}\,x}{2}\right)\mathrm{e}^{-\frac{x}{2}}\sqrt{3}}{3} + 2(-x^2+3x \\ -\frac{4\,\mathrm{e}^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3} + \frac{16\sin\left(\frac{\sqrt{3}\,x}{2}\right)\mathrm{e}^{-\frac{x}{2}}\sqrt{3}}{3} + (x^2-7x+ \\ \frac{26\,\mathrm{e}^{-\frac{x}{2}}\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3} - 2\sin\left(\frac{\sqrt{3}\,x}{2}\right)\mathrm{e}^{-\frac{x}{2}}\sqrt{3} + \frac{(-3x^2+33x}{6} \end{array}\right.$$

- First component of the vector is the solution to the ODE

$$y = \frac{\mathrm{e}^{-\frac{x}{2}}(3c_3+26)\cos\left(\frac{\sqrt{3}\,x}{2}\right)}{3} - \mathrm{e}^{-\frac{x}{2}}(c_4+2\sqrt{3})\sin\left(\frac{\sqrt{3}\,x}{2}\right) + 4(x^2-2c_2+x-2)\,\mathrm{e}^{-\frac{x}{2}} + \frac{\mathrm{e}^{x}(3c_1-2)}{3}$$

ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 5y'' + 4y = \mathrm{e}^{x}\left(-3x^{2} + x + 3\right)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 5y'' + 4y = 0$$

The characteristic equation is

$$\lambda^4 - 5\lambda^2 + 4 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = -2$$
$$\lambda_3 = 1$$
$$\lambda_4 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{-2x} + c_3 e^{x} + e^{2x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = e^{-2x}$$
$$y_3 = e^{x}$$
$$y_4 = e^{2x}$$

Now the particular solution to the given ODE is found

$$y'''' - 5y'' + 4y = e^{x}\left(-3x^2 + x + 3\right)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{x}\left(-3x^2 + x + 3\right)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\, e^{x}, x^2 e^{x}, e^{x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^{x}, e^{-2x}, e^{-x}, e^{2x}\}$$

Since e^{x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\, e^{x}, x^2 e^{x}, e^{x} x^3\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x\, e^{x} + A_2 x^2 e^{x} + A_3 e^{x} x^3$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$-6A_1 e^{x} + 2A_2 e^{x} - 12A_2 x\, e^{x} - 18A_3 e^{x} x^2 + 6A_3 e^{x} x + 24A_3 e^{x} = e^{x}\left(-3x^2 + x + 3\right)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{1}{6}, A_2 = 0, A_3 = \frac{1}{6}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{x\,e^x}{6} + \frac{e^x x^3}{6}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-x} + c_2 e^{-2x} + c_3 e^x + e^{2x} c_4\right) + \left(\frac{x\,e^x}{6} + \frac{e^x x^3}{6}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 e^{-x} + c_2 e^{-2x} + c_3 e^x + e^{2x} c_4 + \frac{x\,e^x}{6} + \frac{e^x x^3}{6} \tag{1}$$

Verification of solutions

$$y = c_1 e^{-x} + c_2 e^{-2x} + c_3 e^x + e^{2x} c_4 + \frac{x\,e^x}{6} + \frac{e^x x^3}{6}$$

Verified OK.

19.22.1 Maple step by step solution

Let's solve

$y'''' - 5y'' + 4y = e^x(-3x^2 + x + 3)$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = -4y - 3x^2 e^x + x\,e^x + 3\,e^x + 5y''$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'''' - 5y'' + 4y = -e^x(3x^2 - x - 3)$

□ Convert linear ODE into a system of first order ODEs

- Define new variable $y_1(x)$

  $y_1(x) = y$
- Define new variable $y_2(x)$

  $y_2(x) = y'$
- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Define new variable $y_4(x)$

  $y_4(x) = y'''$
- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = -3x^2 e^x + x e^x + 3 e^x + 5y_3(x) - 4y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -3x^2 e^x + x e^x + 3 e^x + 5y_3(x) - 4y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -4 & 0 & 5 & 0 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ -3x^2 e^x + x e^x + 3 e^x \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ -3x^2 e^x + x e^x + 3 e^x \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -4 & 0 & 5 & 0 \end{bmatrix}$$

- Rewrite the system as

  $$\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x) + \overrightarrow{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

  $$\left[\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

  $$\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

  $$\overrightarrow{y}_1 = \mathrm{e}^{-2x} \cdot \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

  $$\left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = e^{-x} \cdot \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_4 = e^{2x} \cdot \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$$\vec{y}(x) = c_1 \vec{y}_1 + c_2 \vec{y}_2 + c_3 \vec{y}_3 + c_4 \vec{y}_4 + \vec{y}_p(x)$$

☐ Fundamental matrix

  ◦ Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} -\frac{e^{-2x}}{8} & -e^{-x} & e^{x} & \frac{e^{2x}}{8} \\ \frac{e^{-2x}}{4} & e^{-x} & e^{x} & \frac{e^{2x}}{4} \\ -\frac{e^{-2x}}{2} & -e^{-x} & e^{x} & \frac{e^{2x}}{2} \\ e^{-2x} & e^{-x} & e^{x} & e^{2x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

  $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} -\frac{e^{-2x}}{8} & -e^{-x} & e^{x} & \frac{e^{2x}}{8} \\ \frac{e^{-2x}}{4} & e^{-x} & e^{x} & \frac{e^{2x}}{4} \\ -\frac{e^{-2x}}{2} & -e^{-x} & e^{x} & \frac{e^{2x}}{2} \\ e^{-2x} & e^{-x} & e^{x} & e^{2x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} -\frac{1}{8} & -1 & 1 & \frac{1}{8} \\ \frac{1}{4} & 1 & 1 & \frac{1}{4} \\ -\frac{1}{2} & -1 & 1 & \frac{1}{2} \\ 1 & 1 & 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{(-e^{4x}+4e^{3x}+4e^{x}-1)e^{-2x}}{6} & -\frac{(e^{4x}-8e^{3x}+8e^{x}-1)e^{-2x}}{12} & -\frac{(-e^{4x}+e^{3x}+e^{x}-1)e^{-2x}}{6} & \frac{(e^{4x}-2e^{3x}+2e^{x}-1)}{12} \\ -\frac{(e^{4x}-2e^{3x}+2e^{x}-1)e^{-2x}}{3} & \frac{(-e^{4x}+4e^{3x}+4e^{x}-1)e^{-2x}}{6} & \frac{(2e^{4x}-e^{3x}+e^{x}-2)e^{-2x}}{6} & -\frac{(-e^{4x}+e^{3x}+e^{x}-1}{6} \\ \frac{2(-e^{4x}+e^{3x}+e^{x}-1)e^{-2x}}{3} & -\frac{(e^{4x}-2e^{3x}+2e^{x}-1)e^{-2x}}{3} & -\frac{(-4e^{4x}+e^{3x}+e^{x}-4)e^{-2x}}{6} & \frac{(2e^{4x}-e^{3x}+e^{x}-2)e}{6} \\ -\frac{2(2e^{4x}-e^{3x}+e^{x}-2)e^{-2x}}{3} & \frac{2(-e^{4x}+e^{3x}+e^{x}-1)e^{-2x}}{3} & \frac{(8e^{4x}-e^{3x}+e^{x}-8)e^{-2x}}{6} & -\frac{(-4e^{4x}+e^{3x}+e^{x}-}{6} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot \vec{v}^{\prime}(x)=\vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}^{\prime}(x)=\frac{1}{\Phi(x)}\cdot \vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x)=\int_{0}^{x}\frac{1}{\Phi(s)}\cdot \vec{f}(s)\,ds$

- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_{p}(x)=\Phi(x)\cdot \left(\int_{0}^{x}\frac{1}{\Phi(s)}\cdot \vec{f}(s)\,ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_{p}(x)=\left[\begin{array}{c}\frac{{\mathrm e}^{-2 x} \left(\left(6 x^{3}+6 x +7\right) {\mathrm e}^{3 x}-3 \,{\mathrm e}^{x}-6 \,{\mathrm e}^{4 x}+2\right)}{36} \\ \frac{\left(\left(x^{3}+3 x^{2}+x +\frac{13}{6}\right) {\mathrm e}^{3 x}+\frac{{\mathrm e}^{x}}{2}-2 \,{\mathrm e}^{4 x}-\frac{2}{3}\right) {\mathrm e}^{-2 x}}{6} \\ \frac{\left(\left(x^{3}+6 x^{2}+7 x +\frac{19}{6}\right) {\mathrm e}^{3 x}-\frac{{\mathrm e}^{x}}{2}-4 \,{\mathrm e}^{4 x}+\frac{4}{3}\right) {\mathrm e}^{-2 x}}{6} \\ \frac{{\mathrm e}^{-2 x} \left(\left(x^{3}+9 x^{2}+19 x +\frac{61}{6}\right) {\mathrm e}^{3 x}+\frac{{\mathrm e}^{x}}{2}-8 \,{\mathrm e}^{4 x}-\frac{8}{3}\right)}{6} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x)=c_{1}\vec{y}_{1}+c_{2}\vec{y}_{2}+c_{3}\vec{y}_{3}+c_{4}\vec{y}_{4}+\left[\begin{array}{c}\frac{{\mathrm e}^{-2 x} \left(\left(6 x^{3}+6 x +7\right) {\mathrm e}^{3 x}-3 \,{\mathrm e}^{x}-6 \,{\mathrm e}^{4 x}+2\right)}{36} \\ \frac{\left(\left(x^{3}+3 x^{2}+x +\frac{13}{6}\right) {\mathrm e}^{3 x}+\frac{{\mathrm e}^{x}}{2}-2 \,{\mathrm e}^{4 x}-\frac{2}{3}\right) {\mathrm e}^{-2 x}}{6} \\ \frac{\left(\left(x^{3}+6 x^{2}+7 x +\frac{19}{6}\right) {\mathrm e}^{3 x}-\frac{{\mathrm e}^{x}}{2}-4 \,{\mathrm e}^{4 x}+\frac{4}{3}\right) {\mathrm e}^{-2 x}}{6} \\ \frac{{\mathrm e}^{-2 x} \left(\left(x^{3}+9 x^{2}+19 x +\frac{61}{6}\right) {\mathrm e}^{3 x}+\frac{{\mathrm e}^{x}}{2}-8 \,{\mathrm e}^{4 x}-\frac{8}{3}\right)}{6} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y=\frac{\left(\left(x^{3}+x +6 c_{3}+\frac{7}{6}\right) {\mathrm e}^{3 x}+\left(\frac{3 c_{4}}{4}-1\right) {\mathrm e}^{4 x}+\left(-6 c_{2}-\frac{1}{2}\right) {\mathrm e}^{x}-\frac{3 c_{1}}{4}+\frac{1}{3}\right) {\mathrm e}^{-2 x}}{6}$$

Problem number: section 9.3, problem 23.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 2y''' - 3y'' + 4y' + 4y = e^{2x}(18x^2 + 33x + 13)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 2y''' - 3y'' + 4y' + 4y = 0$$

The characteristic equation is

$$\lambda^4 - 2\lambda^3 - 3\lambda^2 + 4\lambda + 4 = 0$$

The roots of the above equation are

$$\lambda_1 = -1$$
$$\lambda_2 = -1$$
$$\lambda_3 = 2$$
$$\lambda_4 = 2$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + x\,e^{-x} c_2 + c_3 e^{2x} + x\,e^{2x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = x\,e^{-x}$$
$$y_3 = e^{2x}$$
$$y_4 = x\,e^{2x}$$

Now the particular solution to the given ODE is found

$$y'''' - 2y''' - 3y'' + 4y' + 4y = e^{2x}\left(18x^2 + 33x + 13\right)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{2x}\left(18x^2 + 33x + 13\right)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,e^{2x}, x^2 e^{2x}, e^{2x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\,e^{-x}, x\,e^{2x}, e^{-x}, e^{2x}\}$$

Since e^{2x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\,e^{2x}, x^2 e^{2x}, e^{2x} x^3\}]$$

Since $x\,e^{2x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 e^{2x}, e^{2x} x^3, e^{2x} x^4\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^2 e^{2x} + A_2 e^{2x} x^3 + A_3 e^{2x} x^4$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$144A_3e^{2x}x + 54A_2e^{2x}x + 108A_3e^{2x}x^2 + 18A_1e^{2x} + 36A_2e^{2x} + 24A_3e^{2x} \\ = e^{2x}(18x^2 + 33x + 13)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{1}{6}, A_2 = \frac{1}{6}, A_3 = \frac{1}{6}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{x^2e^{2x}}{6} + \frac{e^{2x}x^3}{6} + \frac{e^{2x}x^4}{6}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= (c_1e^{-x} + x\,e^{-x}c_2 + c_3e^{2x} + x\,e^{2x}c_4) + \left(\frac{x^2e^{2x}}{6} + \frac{e^{2x}x^3}{6} + \frac{e^{2x}x^4}{6}\right) \end{aligned}$$

Which simplifies to

$$y = (c_2x + c_1)e^{-x} + (c_4x + c_3)e^{2x} + \frac{x^2e^{2x}}{6} + \frac{e^{2x}x^3}{6} + \frac{e^{2x}x^4}{6}$$

Summary

The solution(s) found are the following

$$y = (c_2x + c_1)e^{-x} + (c_4x + c_3)e^{2x} + \frac{x^2e^{2x}}{6} + \frac{e^{2x}x^3}{6} + \frac{e^{2x}x^4}{6} \tag{1}$$

Verification of solutions

$$y = (c_2x + c_1)e^{-x} + (c_4x + c_3)e^{2x} + \frac{x^2e^{2x}}{6} + \frac{e^{2x}x^3}{6} + \frac{e^{2x}x^4}{6}$$

Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.3. Undetermined Coefficients for Higher Order Equations. Page 495
Problem number: section 9.3, problem 24.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_y]]
```

$$\boxed{y'''' - 3y''' + 4y' = e^{2x}(12x^2 + 26x + 15)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 3y''' + 4y' = 0$$

The characteristic equation is

$$\lambda^4 - 3\lambda^3 + 4\lambda = 0$$

The roots of the above equation are

$$\lambda_1 = 0$$
$$\lambda_2 = -1$$
$$\lambda_3 = 2$$
$$\lambda_4 = 2$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 + c_3 e^{2x} + x e^{2x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = 1$$
$$y_3 = e^{2x}$$
$$y_4 = x e^{2x}$$

Now the particular solution to the given ODE is found

$$y'''' - 3y''' + 4y' = e^{2x}(12x^2 + 26x + 15)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{2x}(12x^2 + 26x + 15)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x e^{2x}, x^2 e^{2x}, e^{2x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{1, x e^{2x}, e^{-x}, e^{2x}\}$$

Since e^{2x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x e^{2x}, x^2 e^{2x}, e^{2x} x^3\}]$$

Since $x e^{2x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 e^{2x}, e^{2x} x^3, e^{2x} x^4\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^2 e^{2x} + A_2 e^{2x} x^3 + A_3 e^{2x} x^4$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$
\begin{aligned}
&36A_2 e^{2x} x + 72A_3 e^{2x} x^2 + 120A_3 e^{2x} x + 30A_2 e^{2x} + 24A_3 e^{2x} + 12A_1 e^{2x} \\
&= e^{2x}\left(12x^2 + 26x + 15\right)
\end{aligned}
$$

Solving for the unknowns by comparing coefficients results in

$$
\left[A_1 = \frac{1}{2}, A_2 = \frac{1}{6}, A_3 = \frac{1}{6}\right]
$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$
y_p = \frac{x^2 e^{2x}}{2} + \frac{e^{2x} x^3}{6} + \frac{e^{2x} x^4}{6}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1 e^{-x} + c_2 + c_3 e^{2x} + x\, e^{2x} c_4\right) + \left(\frac{x^2 e^{2x}}{2} + \frac{e^{2x} x^3}{6} + \frac{e^{2x} x^4}{6}\right)
\end{aligned}
$$

Which simplifies to

$$
y = (c_4 x + c_3) e^{2x} + c_1 e^{-x} + c_2 + \frac{x^2 e^{2x}}{2} + \frac{e^{2x} x^3}{6} + \frac{e^{2x} x^4}{6}
$$

Summary

The solution(s) found are the following

$$
y = (c_4 x + c_3) e^{2x} + c_1 e^{-x} + c_2 + \frac{x^2 e^{2x}}{2} + \frac{e^{2x} x^3}{6} + \frac{e^{2x} x^4}{6} \tag{1}
$$

Verification of solutions

$$
y = (c_4 x + c_3) e^{2x} + c_1 e^{-x} + c_2 + \frac{x^2 e^{2x}}{2} + \frac{e^{2x} x^3}{6} + \frac{e^{2x} x^4}{6}
$$

Verified OK.

Problem number: section 9.3, problem 25.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 2y''' + 2y' - y = (x+1)\,e^{x}}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 2y''' + 2y' - y = 0$$

The characteristic equation is

$$\lambda^4 - 2\lambda^3 + 2\lambda - 1 = 0$$

The roots of the above equation are

$$\lambda_1 = -1$$
$$\lambda_2 = 1$$
$$\lambda_3 = 1$$
$$\lambda_4 = 1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{x} + x\,e^{x} c_3 + x^2 e^{x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^{-x} \\ y_2 &= e^{x} \\ y_3 &= x\,e^{x} \\ y_4 &= x^2 e^{x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' - 2y''' + 2y' - y = (x+1)\,e^{x}$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$(x+1)\,e^{x}$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,e^{x}, e^{x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\,e^{x}, x^2 e^{x}, e^{x}, e^{-x}\}$$

Since e^{x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\,e^{x}, x^2 e^{x}\}]$$

Since $x\,e^{x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 e^{x}, e^{x} x^3\}]$$

Since $x^2 e^{x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{e^{x} x^3, e^{x} x^4\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 e^{x} x^3 + A_2 e^{x} x^4$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$12A_1 e^x + 48A_2 e^x x + 24A_2 e^x = (x+1)\, e^x$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{1}{24}, A_2 = \frac{1}{48}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{e^x x^3}{24} + \frac{e^x x^4}{48}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-x} + c_2 e^x + x\, e^x c_3 + x^2 e^x c_4\right) + \left(\frac{e^x x^3}{24} + \frac{e^x x^4}{48}\right) \end{aligned}$$

Which simplifies to

$$y = c_1 e^{-x} + e^x \left(c_4 x^2 + c_3 x + c_2\right) + \frac{e^x x^3}{24} + \frac{e^x x^4}{48}$$

Summary

The solution(s) found are the following

$$y = c_1 e^{-x} + e^x \left(c_4 x^2 + c_3 x + c_2\right) + \frac{e^x x^3}{24} + \frac{e^x x^4}{48} \tag{1}$$

Verification of solutions

$$y = c_1 e^{-x} + e^x \left(c_4 x^2 + c_3 x + c_2\right) + \frac{e^x x^3}{24} + \frac{e^x x^4}{48}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

`[[_high_order, _linear, _nonhomogeneous]]`

$$\boxed{2y'''' - 5y''' + 3y'' + y' - y = e^{x}(11 + 12x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$2y'''' - 5y''' + 3y'' + y' - y = 0$$

The characteristic equation is

$$2\lambda^4 - 5\lambda^3 + 3\lambda^2 + \lambda - 1 = 0$$

The roots of the above equation are

$$\lambda_1 = -\frac{1}{2}$$
$$\lambda_2 = 1$$
$$\lambda_3 = 1$$
$$\lambda_4 = 1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + c_2 x\, e^x + x^2 e^x c_3 + e^{-\frac{x}{2}} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^x$$
$$y_2 = x\, e^x$$
$$y_3 = x^2 e^x$$
$$y_4 = e^{-\frac{x}{2}}$$

Now the particular solution to the given ODE is found

$$2y'''' - 5y''' + 3y'' + y' - y = e^x (11 + 12x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^x (11 + 12x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\, e^x, e^x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\left\{x\, e^x, x^2 e^x, e^x, e^{-\frac{x}{2}}\right\}$$

Since e^x is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\, e^x, x^2 e^x\}]$$

Since $x\, e^x$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 e^x, e^x x^3\}]$$

Since $x^2 e^x$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{e^x x^3, e^x x^4\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 e^x x^3 + A_2 e^x x^4$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$72A_2 e^x x + 48A_2 e^x + 18A_1 e^x = e^x(11 + 12x)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{1}{6}, A_2 = \frac{1}{6}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{e^x x^3}{6} + \frac{e^x x^4}{6}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^x + c_2 x\, e^x + x^2 e^x c_3 + e^{-\frac{x}{2}} c_4\right) + \left(\frac{e^x x^3}{6} + \frac{e^x x^4}{6}\right) \end{aligned}$$

Which simplifies to

$$y = e^{-\frac{x}{2}} c_4 + e^x\left(c_3 x^2 + c_2 x + c_1\right) + \frac{e^x x^3}{6} + \frac{e^x x^4}{6}$$

Summary

The solution(s) found are the following

$$y = e^{-\frac{x}{2}} c_4 + e^x\left(c_3 x^2 + c_2 x + c_1\right) + \frac{e^x x^3}{6} + \frac{e^x x^4}{6} \tag{1}$$

Verification of solutions

$$y = e^{-\frac{x}{2}} c_4 + e^x\left(c_3 x^2 + c_2 x + c_1\right) + \frac{e^x x^3}{6} + \frac{e^x x^4}{6}$$

Maple gives the following as the ode type

```
[[_high_order, _missing_y]]
```

$$\boxed{y'''' + 3y''' + 3y'' + y' = e^{-x}\left(10x^2 - 24x + 5\right)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + 3y''' + 3y'' + y' = 0$$

The characteristic equation is

$$\lambda^4 + 3\lambda^3 + 3\lambda^2 + \lambda = 0$$

The roots of the above equation are

$$\lambda_1 = 0$$
$$\lambda_2 = -1$$
$$\lambda_3 = -1$$
$$\lambda_4 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1\mathrm{e}^{-x} + x\,\mathrm{e}^{-x}c_2 + x^2\mathrm{e}^{-x}c_3 + c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned}
y_1 &= \mathrm{e}^{-x} \\
y_2 &= x\,\mathrm{e}^{-x} \\
y_3 &= x^2\mathrm{e}^{-x} \\
y_4 &= 1
\end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' + 3y''' + 3y'' + y' = \mathrm{e}^{-x}\left(10x^2 - 24x + 5\right)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$\mathrm{e}^{-x}\left(10x^2 - 24x + 5\right)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,\mathrm{e}^{-x}, x^2\mathrm{e}^{-x}, \mathrm{e}^{-x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

Since e^{-x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\,\mathrm{e}^{-x}, x^2\mathrm{e}^{-x}, \mathrm{e}^{-x}x^3\}]$$

Since $x\,\mathrm{e}^{-x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2\mathrm{e}^{-x}, \mathrm{e}^{-x}x^3, \mathrm{e}^{-x}x^4\}]$$

Since $x^2\mathrm{e}^{-x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^5\mathrm{e}^{-x}, \mathrm{e}^{-x}x^3, \mathrm{e}^{-x}x^4\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^5 e^{-x} + A_2 e^{-x} x^3 + A_3 e^{-x} x^4$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$120 A_1 x e^{-x} - 60 A_1 x^2 e^{-x} - 24 A_3 e^{-x} x + 24 A_3 e^{-x} - 6 A_2 e^{-x} = e^{-x} \left(10x^2 - 24x + 5\right)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = -\frac{1}{6}, A_2 = -\frac{1}{6}, A_3 = \frac{1}{6}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -\frac{x^5 e^{-x}}{6} - \frac{e^{-x} x^3}{6} + \frac{e^{-x} x^4}{6}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-x} + x e^{-x} c_2 + x^2 e^{-x} c_3 + c_4\right) + \left(-\frac{x^5 e^{-x}}{6} - \frac{e^{-x} x^3}{6} + \frac{e^{-x} x^4}{6}\right) \end{aligned}$$

Which simplifies to

$$y = e^{-x} \left(c_3 x^2 + c_2 x + c_1\right) + c_4 - \frac{x^5 e^{-x}}{6} - \frac{e^{-x} x^3}{6} + \frac{e^{-x} x^4}{6}$$

Summary

The solution(s) found are the following

$$y = e^{-x} \left(c_3 x^2 + c_2 x + c_1\right) + c_4 - \frac{x^5 e^{-x}}{6} - \frac{e^{-x} x^3}{6} + \frac{e^{-x} x^4}{6} \tag{1}$$

Verification of solutions

$$y = e^{-x} \left(c_3 x^2 + c_2 x + c_1\right) + c_4 - \frac{x^5 e^{-x}}{6} - \frac{e^{-x} x^3}{6} + \frac{e^{-x} x^4}{6}$$

Verified OK.

ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 7y''' + 18y'' - 20y' + 8y = e^{2x}(-5x^2 - 8x + 3)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 7y''' + 18y'' - 20y' + 8y = 0$$

The characteristic equation is

$$\lambda^4 - 7\lambda^3 + 18\lambda^2 - 20\lambda + 8 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 2$$
$$\lambda_3 = 2$$
$$\lambda_4 = 2$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{x} + c_2 \mathrm{e}^{2x} + c_3 x \,\mathrm{e}^{2x} + x^2 \mathrm{e}^{2x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \mathrm{e}^{x}$$
$$y_2 = \mathrm{e}^{2x}$$
$$y_3 = x \,\mathrm{e}^{2x}$$
$$y_4 = x^2 \mathrm{e}^{2x}$$

Now the particular solution to the given ODE is found

$$y'''' - 7y''' + 18y'' - 20y' + 8y = \mathrm{e}^{2x}\left(-5x^2 - 8x + 3\right)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$\mathrm{e}^{2x}\left(-5x^2 - 8x + 3\right)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x \,\mathrm{e}^{2x}, x^2 \mathrm{e}^{2x}, \mathrm{e}^{2x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x \,\mathrm{e}^{2x}, x^2 \mathrm{e}^{2x}, \mathrm{e}^{x}, \mathrm{e}^{2x}\}$$

Since e^{2x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x \,\mathrm{e}^{2x}, x^2 \mathrm{e}^{2x}, \mathrm{e}^{2x} x^3\}]$$

Since $x \,\mathrm{e}^{2x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 \mathrm{e}^{2x}, \mathrm{e}^{2x} x^3, \mathrm{e}^{2x} x^4\}]$$

Since $x^2 \mathrm{e}^{2x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^5 \mathrm{e}^{2x}, \mathrm{e}^{2x} x^3, \mathrm{e}^{2x} x^4\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^5 e^{2x} + A_2 e^{2x} x^3 + A_3 e^{2x} x^4$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$120 A_1 x\, e^{2x} + 60 A_1 x^2 e^{2x} + 24 A_3 e^{2x} x + 24 A_3 e^{2x} + 6 A_2 e^{2x} = e^{2x}\left(-5x^2 - 8x + 3\right)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = -\frac{1}{12}, A_2 = \frac{1}{6}, A_3 = \frac{1}{12}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -\frac{x^5 e^{2x}}{12} + \frac{e^{2x} x^3}{6} + \frac{e^{2x} x^4}{12}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^x + c_2 e^{2x} + c_3 x\, e^{2x} + x^2 e^{2x} c_4\right) + \left(-\frac{x^5 e^{2x}}{12} + \frac{e^{2x} x^3}{6} + \frac{e^{2x} x^4}{12}\right) \end{aligned}$$

Which simplifies to

$$y = \left(c_4 x^2 + c_3 x + c_2\right) e^{2x} + c_1 e^x - \frac{x^5 e^{2x}}{12} + \frac{e^{2x} x^3}{6} + \frac{e^{2x} x^4}{12}$$

Summary

The solution(s) found are the following

$$y = \left(c_4 x^2 + c_3 x + c_2\right) e^{2x} + c_1 e^x - \frac{x^5 e^{2x}}{12} + \frac{e^{2x} x^3}{6} + \frac{e^{2x} x^4}{12} \tag{1}$$

Verification of solutions

$$y = \left(c_4 x^2 + c_3 x + c_2\right) e^{2x} + c_1 e^x - \frac{x^5 e^{2x}}{12} + \frac{e^{2x} x^3}{6} + \frac{e^{2x} x^4}{12}$$

Verified OK.

ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - y'' - 4y' + 4y = \mathrm{e}^{-x}((16 + 10x)\cos(x) + (30 - 10x)\sin(x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - y'' - 4y' + 4y = 0$$

The characteristic equation is

$$\lambda^3 - \lambda^2 - 4\lambda + 4 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 2$$
$$\lambda_3 = -2$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-2x} + c_2 e^{x} + c_3 e^{2x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-2x}$$
$$y_2 = e^{x}$$
$$y_3 = e^{2x}$$

Now the particular solution to the given ODE is found

$$y''' - y'' - 4y' + 4y = e^{-x}((16+10x)\cos(x) + (30-10x)\sin(x))$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{-x}((16+10x)\cos(x) + (30-10x)\sin(x))$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{\cos(x) e^{-x}, \sin(x) e^{-x}, x\cos(x) e^{-x}, \sin(x) x e^{-x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^{x}, e^{-2x}, e^{2x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 \cos(x) e^{-x} + A_2 \sin(x) e^{-x} + A_3 x \cos(x) e^{-x} + A_4 \sin(x) x e^{-x}$$

The unknowns $\{A_1, A_2, A_3, A_4\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$\begin{aligned}&10A_3 x \cos(x) e^{-x} - 2A_3 \cos(x) e^{-x} + 10A_4 \sin(x) x e^{-x} - 8A_4 \cos(x) e^{-x} \\ &- 2A_4 \sin(x) e^{-x} + 10A_2 \sin(x) e^{-x} + 10A_1 \cos(x) e^{-x} \\ &+ 8A_3 \sin(x) e^{-x} = e^{-x}((16+10x)\cos(x) + (30-10x)\sin(x))\end{aligned}$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 1, A_2 = 2, A_3 = 1, A_4 = -1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \cos(x)\,\mathrm{e}^{-x} + 2\sin(x)\,\mathrm{e}^{-x} + x\cos(x)\,\mathrm{e}^{-x} - \sin(x)\,x\,\mathrm{e}^{-x}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1\mathrm{e}^{-2x} + c_2\mathrm{e}^{x} + c_3\mathrm{e}^{2x}\right) + \left(\cos(x)\,\mathrm{e}^{-x} + 2\sin(x)\,\mathrm{e}^{-x} + x\cos(x)\,\mathrm{e}^{-x} - \sin(x)\,x\,\mathrm{e}^{-x}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1\mathrm{e}^{-2x} + c_2\mathrm{e}^{x} + c_3\mathrm{e}^{2x} + \cos(x)\,\mathrm{e}^{-x} + 2\sin(x)\,\mathrm{e}^{-x} + x\cos(x)\,\mathrm{e}^{-x} - \sin(x)\,x\,\mathrm{e}^{-x} \tag{1}$$

Verification of solutions

$$y = c_1\mathrm{e}^{-2x} + c_2\mathrm{e}^{x} + c_3\mathrm{e}^{2x} + \cos(x)\,\mathrm{e}^{-x} + 2\sin(x)\,\mathrm{e}^{-x} + x\cos(x)\,\mathrm{e}^{-x} - \sin(x)\,x\,\mathrm{e}^{-x}$$

Verified OK.

19.29.1 Maple step by step solution

Let's solve

$y''' - y'' - 4y' + 4y = \mathrm{e}^{-x}((16 + 10x)\cos(x) + (30 - 10x)\sin(x))$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = -4y + 10x\cos(x)\,\mathrm{e}^{-x} - 10\sin(x)\,x\,\mathrm{e}^{-x} + 16\cos(x)\,\mathrm{e}^{-x} + 30\sin(x)\,\mathrm{e}^{-x} + y'' + 4y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - y'' - 4y' + 4y = 2\,\mathrm{e}^{-x}(-5\sin(x)\,x + 5x\cos(x) + 15\sin(x) + 8\cos(x))$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

- Define new variable $y_2(x)$

  $y_2(x) = y'$
- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = 10x\cos(x)\,\mathrm{e}^{-x} - 10\sin(x)\,x\,\mathrm{e}^{-x} + 16\cos(x)\,\mathrm{e}^{-x} + 30\sin(x)\,\mathrm{e}^{-x} + y_3(x) + 4y_2(x) - 4y_1$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 10x\cos(x)\,\mathrm{e}^{-x} - 10\sin(x)\,x\,\mathrm{e}^{-x} + 16\cos(x)\,\mathrm{e}^{-x} + 30\sin$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -4 & 4 & 1 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ -10\sin(x)\,x\,\mathrm{e}^{-x} + 10x\cos(x)\,\mathrm{e}^{-x} + 30\sin(x)\,\mathrm{e}^{-x} + 16\cos(x \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ -10\sin(x)\,x\,\mathrm{e}^{-x} + 10x\cos(x)\,\mathrm{e}^{-x} + 30\sin(x)\,\mathrm{e}^{-x} + 16\cos(x)\,\mathrm{e}^{-x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -4 & 4 & 1 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$
- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \left[\begin{array}{c}\frac{1}{4}\\ -\frac{1}{2}\\ 1\end{array}\right]\right], \left[1, \left[\begin{array}{c}1\\ 1\\ 1\end{array}\right]\right], \left[2, \left[\begin{array}{c}\frac{1}{4}\\ \frac{1}{2}\\ 1\end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-2, \left[\begin{array}{c}\frac{1}{4}\\ -\frac{1}{2}\\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-2x} \cdot \left[\begin{array}{c}\frac{1}{4}\\ -\frac{1}{2}\\ 1\end{array}\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c}1\\ 1\\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_2 = \mathrm{e}^{x} \cdot \left[\begin{array}{c}1\\ 1\\ 1\end{array}\right]$$

- Consider eigenpair

$$\left[2, \left[\begin{array}{c}\frac{1}{4}\\ \frac{1}{2}\\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_3 = \mathrm{e}^{2x} \cdot \left[\begin{array}{c}\frac{1}{4}\\ \frac{1}{2}\\ 1\end{array}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

$\overrightarrow{y}(x) = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2 + c_3\overrightarrow{y}_3 + \overrightarrow{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & e^x & \frac{e^{2x}}{4} \\ -\frac{e^{-2x}}{2} & e^x & \frac{e^{2x}}{2} \\ e^{-2x} & e^x & e^{2x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & e^x & \frac{e^{2x}}{4} \\ -\frac{e^{-2x}}{2} & e^x & \frac{e^{2x}}{2} \\ e^{-2x} & e^x & e^{2x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} \frac{1}{4} & 1 & \frac{1}{4} \\ -\frac{1}{2} & 1 & \frac{1}{2} \\ 1 & 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} -\frac{(3e^{4x}-8e^{3x}-1)e^{-2x}}{6} & -\frac{e^{-2x}}{4} + \frac{e^{2x}}{4} & \frac{(3e^{4x}-4e^{3x}+1)e^{-2x}}{12} \\ -\frac{(3e^{4x}-4e^{3x}+1)e^{-2x}}{3} & \frac{e^{-2x}}{2} + \frac{e^{2x}}{2} & \frac{(3e^{4x}-2e^{3x}-1)e^{-2x}}{6} \\ -\frac{2(3e^{4x}-2e^{3x}-1)e^{-2x}}{3} & -e^{-2x} + e^{2x} & -\frac{(-3e^{4x}+e^{3x}-1)e^{-2x}}{3} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

$\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$

- Take the derivative of the particular solution

$\overrightarrow{y}_p'(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

$A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot\vec{v}'(x)=\vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x)=\frac{1}{\Phi(x)}\cdot\vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x)=\int_0^x \frac{1}{\Phi(s)}\cdot\vec{f}(s)\,ds$

- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x)=\Phi(x)\cdot\left(\int_0^x \frac{1}{\Phi(s)}\cdot\vec{f}(s)\,ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

  $$\vec{y}_p(x)=\left[\begin{array}{c}(-4\,e^{3x}+2\,e^{4x}+1+((x+1)\cos(x)+(2-x)\sin(x))\,e^{x})\,e^{-2x}\\ -2(2\,e^{3x}-2\,e^{4x}+1+((x-1)\cos(x)+2\sin(x))\,e^{x})\,e^{-2x}\\ 2(-2\,e^{3x}+4\,e^{4x}+2+((x-4)\cos(x)+(x+1)\sin(x))\,e^{x})\,e^{-2x}\end{array}\right]$$

- Plug particular solution back into general solution

  $$\vec{y}(x)=c_1\vec{y}_1+c_2\vec{y}_2+c_3\vec{y}_3+\left[\begin{array}{c}(-4\,e^{3x}+2\,e^{4x}+1+((x+1)\cos(x)+(2-x)\sin(x))\,e^{x})\,e^{-2x}\\ -2(2\,e^{3x}-2\,e^{4x}+1+((x-1)\cos(x)+2\sin(x))\,e^{x})\,e^{-2x}\\ 2(-2\,e^{3x}+4\,e^{4x}+2+((x-4)\cos(x)+(x+1)\sin(x))\,e^{x})\,e^{-2x}\end{array}\right]$$

- First component of the vector is the solution to the ODE

  $y=\left((c_2-4)\,e^{3x}+\left(\frac{c_3}{4}+2\right)e^{4x}+((x+1)\cos(x)-(-2+x)\sin(x))\,e^{x}+\frac{c_1}{4}+1\right)e^{-2x}$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.3. Undetermined Coefficients for Higher Order Equations. Page 495
Problem number: section 9.3, problem 30.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' + y'' - 4y' - 4y = e^{-x}((1 - 22x)\cos(2x) - (1 + 6x)\sin(2x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' + y'' - 4y' - 4y = 0$$

The characteristic equation is

$$\lambda^3 + \lambda^2 - 4\lambda - 4 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = -2$$
$$\lambda_3 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{-2x} + c_3 e^{2x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = e^{-2x}$$
$$y_3 = e^{2x}$$

Now the particular solution to the given ODE is found

$$y''' + y'' - 4y' - 4y = e^{-x}((1 - 22x)\cos(2x) - (1 + 6x)\sin(2x))$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{-x}((1 - 22x)\cos(2x) - (1 + 6x)\sin(2x))$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{\cos(2x)\,e^{-x}, \sin(2x)\,e^{-x}, \cos(2x)\,e^{-x}x, \sin(2x)\,e^{-x}x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^{-2x}, e^{-x}, e^{2x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 \cos(2x)\,e^{-x} + A_2 \sin(2x)\,e^{-x} + A_3 \cos(2x)\,e^{-x}x + A_4 \sin(2x)\,e^{-x}x$$

The unknowns $\{A_1, A_2, A_3, A_4\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$\begin{aligned}
&8A_4 \sin(2x)\,e^{-x}x + 8A_3 \cos(2x)\,e^{-x}x - 15A_4 \sin(2x)\,e^{-x} - 14A_4 \cos(2x)\,e^{-x}x \\
&- 15A_3 \cos(2x)\,e^{-x} + 14A_3 \sin(2x)\,e^{-x}x + 8A_3 \sin(2x)\,e^{-x} \\
&- 8A_4 \cos(2x)\,e^{-x} + 14A_1 \sin(2x)\,e^{-x} - 14A_2 \cos(2x)\,e^{-x} + 8A_1 \cos(2x)\,e^{-x} \\
&+ 8A_2 \sin(2x)\,e^{-x} = e^{-x}((1 - 22x)\cos(2x) - (1 + 6x)\sin(2x))
\end{aligned}$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 1, A_2 = 1, A_3 = -1, A_4 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \cos(2x)\,e^{-x} + \sin(2x)\,e^{-x} - \cos(2x)\,e^{-x}x + \sin(2x)\,e^{-x}x$$

Therefore the general solution is

$$\begin{aligned}y &= y_h + y_p \\ &= \left(c_1 e^{-x} + c_2 e^{-2x} + c_3 e^{2x}\right) + \left(\cos(2x)\,e^{-x} + \sin(2x)\,e^{-x} - \cos(2x)\,e^{-x}x + \sin(2x)\,e^{-x}x\right)\end{aligned}$$

Which simplifies to

$$y = \left(e^{4x}c_3 + c_1 e^{x} + c_2\right)e^{-2x} + \cos(2x)\,e^{-x} + \sin(2x)\,e^{-x} - \cos(2x)\,e^{-x}x + \sin(2x)\,e^{-x}x$$

Summary

The solution(s) found are the following

$$\begin{aligned}y = {} & \left(e^{4x}c_3 + c_1 e^{x} + c_2\right)e^{-2x} + \cos(2x)\,e^{-x} \\ & + \sin(2x)\,e^{-x} - \cos(2x)\,e^{-x}x + \sin(2x)\,e^{-x}x\end{aligned} \tag{1}$$

Verification of solutions

$$y = \left(e^{4x}c_3 + c_1 e^{x} + c_2\right)e^{-2x} + \cos(2x)\,e^{-x} + \sin(2x)\,e^{-x} - \cos(2x)\,e^{-x}x + \sin(2x)\,e^{-x}x$$

Verified OK.

19.30.1 Maple step by step solution

Let's solve

$y''' + y'' - 4y' - 4y = e^{-x}((1-22x)\cos(2x) - (1+6x)\sin(2x))$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = 4y - 22\cos(2x)\,e^{-x}x - 6\sin(2x)\,e^{-x}x + \cos(2x)\,e^{-x} - \sin(2x)\,e^{-x} - y'' + 4y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$$y''' + y'' - 4y' - 4y = -\mathrm{e}^{-x}(6x\sin(2x) + 22x\cos(2x) + \sin(2x) - \cos(2x))$$

- ☐ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$
  - Define new variable $y_2(x)$

    $y_2(x) = y'$
  - Define new variable $y_3(x)$

    $y_3(x) = y''$
  - Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = -22\cos(2x)\mathrm{e}^{-x}x - 6\sin(2x)\mathrm{e}^{-x}x + \cos(2x)\mathrm{e}^{-x} - \sin(2x)\mathrm{e}^{-x} - y_3(x) + 4y_2(x) + 4y_1($

    Convert linear ODE into a system of first order ODEs

    $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = -22\cos(2x)\mathrm{e}^{-x}x - 6\sin(2x)\mathrm{e}^{-x}x + \cos(2x)\mathrm{e}^{-x} - \sin($
- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 4 & 4 & -1 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ -6\sin(2x)\mathrm{e}^{-x}x - 22\cos(2x)\mathrm{e}^{-x}x - \sin(2x)\mathrm{e}^{-x} + \cos(2x)\mathrm{e}\end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ -6\sin(2x)\mathrm{e}^{-x}x - 22\cos(2x)\mathrm{e}^{-x}x - \sin(2x)\mathrm{e}^{-x} + \cos(2x)\mathrm{e}^{-x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 4 & 4 & -1 \end{bmatrix}$$

- Rewrite the system as

$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right], \left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right], \left[2, \left[\begin{array}{c} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-2, \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-2x} \cdot \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[2, \left[\begin{array}{c} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = e^{2x} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

  $\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3 + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & e^{-x} & \frac{e^{2x}}{4} \\ -\frac{e^{-2x}}{2} & -e^{-x} & \frac{e^{2x}}{2} \\ e^{-2x} & e^{-x} & e^{2x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

  $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & e^{-x} & \frac{e^{2x}}{4} \\ -\frac{e^{-2x}}{2} & -e^{-x} & \frac{e^{2x}}{2} \\ e^{-2x} & e^{-x} & e^{2x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} \frac{1}{4} & 1 & \frac{1}{4} \\ -\frac{1}{2} & -1 & \frac{1}{2} \\ 1 & 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{(e^{4x}+8e^{x}-3)e^{-2x}}{6} & -\frac{e^{-2x}}{4} + \frac{e^{2x}}{4} & \frac{(e^{4x}-4e^{x}+3)e^{-2x}}{12} \\ \frac{(e^{4x}-4e^{x}+3)e^{-2x}}{3} & \frac{e^{-2x}}{2} + \frac{e^{2x}}{2} & \frac{(e^{4x}+2e^{x}-3)e^{-2x}}{6} \\ \frac{2(e^{4x}+2e^{x}-3)e^{-2x}}{3} & -e^{-2x} + e^{2x} & -\frac{(-e^{4x}+e^{x}-3)e^{-2x}}{3} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}'_p(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)=A\cdot\Phi(x)\cdot\vec{v}(x)+\vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A\cdot\Phi(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)=A\cdot\Phi(x)\cdot\vec{v}(x)+\vec{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot\vec{v}'(x)=\vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x)=\frac{1}{\Phi(x)}\cdot\vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x)=\int_0^x \frac{1}{\Phi(s)}\cdot\vec{f}(s)\,ds$

- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x)=\Phi(x)\cdot\left(\int_0^x \frac{1}{\Phi(s)}\cdot\vec{f}(s)\,ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x)=\begin{bmatrix} -\left((x-1)\,\mathrm{e}^x\cos(2x)-(x+1)\,\mathrm{e}^x\sin(2x)+\frac{5\,\mathrm{e}^x}{3}+\frac{\mathrm{e}^{4x}}{12}-\frac{3}{4}\right)\mathrm{e}^{-2x} \\ \mathrm{e}^{-2x}\left(\mathrm{e}^x(-2+x)\sin(2x)+3\cos(2x)\,\mathrm{e}^x x+\frac{5\,\mathrm{e}^x}{3}-\frac{\mathrm{e}^{4x}}{6}-\frac{3}{2}\right) \\ -\left((x+1)\,\mathrm{e}^x\cos(2x)+\mathrm{e}^x(7x-3)\sin(2x)+\frac{5\,\mathrm{e}^x}{3}+\frac{\mathrm{e}^{4x}}{3}-3\right)\mathrm{e}^{-2x} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x)=c_1\vec{y}_1+c_2\vec{y}_2+c_3\vec{y}_3+\begin{bmatrix} -\left((x-1)\,\mathrm{e}^x\cos(2x)-(x+1)\,\mathrm{e}^x\sin(2x)+\frac{5\,\mathrm{e}^x}{3}+\frac{\mathrm{e}^{4x}}{12}-\frac{3}{4}\right)\mathrm{e}^{-2 \\ \mathrm{e}^{-2x}\left(\mathrm{e}^x(-2+x)\sin(2x)+3\cos(2x)\,\mathrm{e}^x x+\frac{5\,\mathrm{e}^x}{3}-\frac{\mathrm{e}^{4x}}{6}-\frac{3}{2}\right) \\ -\left((x+1)\,\mathrm{e}^x\cos(2x)+\mathrm{e}^x(7x-3)\sin(2x)+\frac{5\,\mathrm{e}^x}{3}+\frac{\mathrm{e}^{4x}}{3}-3\right)\mathrm{e}^{- \end{bmatrix}$$

- First component of the vector is the solution to the ODE

  $y=-\left((x-1)\,\mathrm{e}^x\cos(2x)+\left(-\frac{c_3}{4}+\frac{1}{12}\right)\mathrm{e}^{4x}-(x+1)\,\mathrm{e}^x\sin(2x)+\left(-c_2+\frac{5}{3}\right)\mathrm{e}^x-\frac{c_1}{4}-\frac{3}{4}\right)\mathrm{e}^{-2x}$

Problem number: section 9.3, problem 31.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - y'' + 2y' - 2y = e^{2x}\left(\left(-x^2 + 5x + 27\right)\cos(x) + \left(9x^2 + 13x + 2\right)\sin(x)\right)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - y'' + 2y' - 2y = 0$$

The characteristic equation is

$$\lambda^3 - \lambda^2 + 2\lambda - 2 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = i\sqrt{2}$$
$$\lambda_3 = -i\sqrt{2}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + e^{-i\sqrt{2}\,x} c_2 + e^{i\sqrt{2}\,x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^x$$

$$y_2 = e^{-i\sqrt{2}\,x}$$

$$y_3 = e^{i\sqrt{2}\,x}$$

Now the particular solution to the given ODE is found

$$y''' - y'' + 2y' - 2y = e^{2x}\left(\left(-x^2 + 5x + 27\right)\cos(x) + \left(9x^2 + 13x + 2\right)\sin(x)\right)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{2x}\left(\left(-x^2 + 5x + 27\right)\cos(x) + \left(9x^2 + 13x + 2\right)\sin(x)\right)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{e^{2x}\cos(x), e^{2x}\sin(x), e^{2x}\cos(x)\,x, e^{2x}\cos(x)\,x^2, e^{2x}\sin(x)\,x, e^{2x}\sin(x)\,x^2\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\left\{e^x, e^{i\sqrt{2}\,x}, e^{-i\sqrt{2}\,x}\right\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$\begin{aligned} y_p = {} & A_1 e^{2x}\cos(x) + A_2 e^{2x}\sin(x) + A_3 e^{2x}\cos(x)\,x \\ & + A_4 e^{2x}\cos(x)\,x^2 + A_5 e^{2x}\sin(x)\,x + A_6 e^{2x}\sin(x)\,x^2 \end{aligned}$$

The unknowns $\{A_1, A_2, A_3, A_4, A_5, A_6\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$\begin{aligned} & A_3 e^{2x}\cos(x)\,x - 9A_3 e^{2x}\sin(x)\,x - 9A_4 e^{2x}\sin(x)\,x^2 + 9A_5 e^{2x}\cos(x)\,x + 7A_5 e^{2x}\sin(x) \\ & + 10A_5 e^{2x}\cos(x) + 9A_6 e^{2x}\cos(x)\,x^2 - 10A_3 e^{2x}\sin(x) + 10A_6 e^{2x}\sin(x) + 7A_3 e^{2x}\cos(x) \\ & + 14A_4 e^{2x}\cos(x)\,x + 14A_6 e^{2x}\sin(x)\,x + 20A_6 e^{2x}\cos(x)\,x + 10A_4 e^{2x}\cos(x) \\ & + A_4 e^{2x}\cos(x)\,x^2 + A_5 e^{2x}\sin(x)\,x + A_6 e^{2x}\sin(x)\,x^2 - 20A_4 e^{2x}\sin(x)\,x \\ & + 6A_6 e^{2x}\cos(x) + A_2 e^{2x}\sin(x) + A_1 e^{2x}\cos(x) - 6A_4 e^{2x}\sin(x) + 9A_2 e^{2x}\cos(x) \\ & - 9A_1 e^{2x}\sin(x) = e^{2x}\left(\left(-x^2 + 5x + 27\right)\cos(x) + \left(9x^2 + 13x + 2\right)\sin(x)\right) \end{aligned}$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 1, A_2 = 1, A_3 = 1, A_4 = -1, A_5 = 2, A_6 = 0]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = e^{2x} \cos(x) + e^{2x} \sin(x) + e^{2x} \cos(x) x - e^{2x} \cos(x) x^2 + 2 e^{2x} \sin(x) x$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^x + e^{-i\sqrt{2}\,x} c_2 + e^{i\sqrt{2}\,x} c_3\right) \\ &\quad + \left(e^{2x} \cos(x) + e^{2x} \sin(x) + e^{2x} \cos(x) x - e^{2x} \cos(x) x^2 + 2 e^{2x} \sin(x) x\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = {} & c_1 e^x + e^{-i\sqrt{2}\,x} c_2 + e^{i\sqrt{2}\,x} c_3 + e^{2x} \cos(x) + e^{2x} \sin(x) \\ & + e^{2x} \cos(x) x - e^{2x} \cos(x) x^2 + 2 e^{2x} \sin(x) x \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y = {} & c_1 e^x + e^{-i\sqrt{2}\,x} c_2 + e^{i\sqrt{2}\,x} c_3 + e^{2x} \cos(x) + e^{2x} \sin(x) \\ & + e^{2x} \cos(x) x - e^{2x} \cos(x) x^2 + 2 e^{2x} \sin(x) x \end{aligned}$$

Verified OK.

19.31.1 Maple step by step solution

Let's solve

$y''' - y'' + 2y' - 2y = e^{2x}((-x^2 + 5x + 27) \cos(x) + (9x^2 + 13x + 2) \sin(x))$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = 2y - e^{2x} \cos(x) x^2 + 9 e^{2x} \sin(x) x^2 + 5 e^{2x} \cos(x) x + 13 e^{2x} \sin(x) x + 27 e^{2x} \cos(x) + 2 e^{2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - y'' + 2y' - 2y = -e^{2x}(-9 \sin(x) x^2 + x^2 \cos(x) - 13 \sin(x) x - 5x \cos(x) - 2 \sin(x) - 27$

☐ Convert linear ODE into a system of first order ODEs

- Define new variable $y_1(x)$

  $y_1(x) = y$
- Define new variable $y_2(x)$

  $y_2(x) = y'$
- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = -e^{2x} \cos(x) x^2 + 9 e^{2x} \sin(x) x^2 + 5 e^{2x} \cos(x) x + 13 e^{2x} \sin(x) x + 27 e^{2x} \cos(x) + 2 e^{2x}$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = -e^{2x} \cos(x) x^2 + 9 e^{2x} \sin(x) x^2 + 5 e^{2x} \cos(x) x + 13 e^{2x}$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & -2 & 1 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 9 e^{2x} \sin(x) x^2 - e^{2x} \cos(x) x^2 + 13 e^{2x} \sin(x) x + 5 e^{2x} \cos(x) \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 9 e^{2x} \sin(x) x^2 - e^{2x} \cos(x) x^2 + 13 e^{2x} \sin(x) x + 5 e^{2x} \cos(x) x + 2 e^{2x} \sin(x) + 27 e^{2x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & -2 & 1 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right], \left[-\mathrm{I}\sqrt{2}, \left[\begin{array}{c} -\frac{1}{2} \\ \frac{\mathrm{I}}{2}\sqrt{2} \\ 1 \end{array}\right]\right], \left[\mathrm{I}\sqrt{2}, \left[\begin{array}{c} -\frac{1}{2} \\ -\frac{\mathrm{I}}{2}\sqrt{2} \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-\mathrm{I}\sqrt{2}, \left[\begin{array}{c} -\frac{1}{2} \\ \frac{\mathrm{I}}{2}\sqrt{2} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{-\mathrm{I}\sqrt{2}\,x} \cdot \left[\begin{array}{c} -\frac{1}{2} \\ \frac{\mathrm{I}}{2}\sqrt{2} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\left(\cos\left(\sqrt{2}\,x\right) - \mathrm{I}\sin\left(\sqrt{2}\,x\right)\right) \cdot \left[\begin{array}{c} -\frac{1}{2} \\ \frac{\mathrm{I}}{2}\sqrt{2} \\ 1 \end{array}\right]$$

- Simplify expression

$$\begin{bmatrix} -\frac{\cos\left(\sqrt{2}\,x\right)}{2} + \frac{\mathrm{I}\sin\left(\sqrt{2}\,x\right)}{2} \\ \frac{\mathrm{I}}{2}\left(\cos\left(\sqrt{2}\,x\right) - \mathrm{I}\sin\left(\sqrt{2}\,x\right)\right)\sqrt{2} \\ \cos\left(\sqrt{2}\,x\right) - \mathrm{I}\sin\left(\sqrt{2}\,x\right) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_2(x) = \begin{bmatrix} -\frac{\cos\left(\sqrt{2}\,x\right)}{2} \\ \frac{\sqrt{2}\,\sin\left(\sqrt{2}\,x\right)}{2} \\ \cos\left(\sqrt{2}\,x\right) \end{bmatrix}, \vec{y}_3(x) = \begin{bmatrix} \frac{\sin\left(\sqrt{2}\,x\right)}{2} \\ \frac{\sqrt{2}\,\cos\left(\sqrt{2}\,x\right)}{2} \\ -\sin\left(\sqrt{2}\,x\right) \end{bmatrix}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} \mathrm{e}^{x} & -\frac{\cos\left(\sqrt{2}\,x\right)}{2} & \frac{\sin\left(\sqrt{2}\,x\right)}{2} \\ \mathrm{e}^{x} & \frac{\sqrt{2}\,\sin\left(\sqrt{2}\,x\right)}{2} & \frac{\sqrt{2}\,\cos\left(\sqrt{2}\,x\right)}{2} \\ \mathrm{e}^{x} & \cos\left(\sqrt{2}\,x\right) & -\sin\left(\sqrt{2}\,x\right) \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} \mathrm{e}^{x} & -\frac{\cos\left(\sqrt{2}\,x\right)}{2} & \frac{\sin\left(\sqrt{2}\,x\right)}{2} \\ \mathrm{e}^{x} & \frac{\sqrt{2}\,\sin\left(\sqrt{2}\,x\right)}{2} & \frac{\sqrt{2}\,\cos\left(\sqrt{2}\,x\right)}{2} \\ \mathrm{e}^{x} & \cos\left(\sqrt{2}\,x\right) & -\sin\left(\sqrt{2}\,x\right) \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & -\frac{1}{2} & 0 \\ 1 & 0 & \frac{\sqrt{2}}{2} \\ 1 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{2\,\mathrm{e}^{x}}{3} + \frac{\cos\left(\sqrt{2}\,x\right)}{3} - \frac{\sqrt{2}\,\sin\left(\sqrt{2}\,x\right)}{3} & \frac{\sqrt{2}\,\sin\left(\sqrt{2}\,x\right)}{2} & \frac{\mathrm{e}^{x}}{3} - \frac{\cos\left(\sqrt{2}\,x\right)}{3} - \frac{\sqrt{2}\,\sin\left(\sqrt{2}\,x\right)}{6} \\ \frac{2\,\mathrm{e}^{x}}{3} - \frac{\sqrt{2}\,\sin\left(\sqrt{2}\,x\right)}{3} - \frac{2\cos\left(\sqrt{2}\,x\right)}{3} & \cos\left(\sqrt{2}\,x\right) & \frac{\mathrm{e}^{x}}{3} + \frac{\sqrt{2}\,\sin\left(\sqrt{2}\,x\right)}{3} - \frac{\cos\left(\sqrt{2}\,x\right)}{3} \\ \frac{2\,\mathrm{e}^{x}}{3} - \frac{2\cos\left(\sqrt{2}\,x\right)}{3} + \frac{2\sqrt{2}\,\sin\left(\sqrt{2}\,x\right)}{3} & -\sqrt{2}\,\sin\left(\sqrt{2}\,x\right) & \frac{\mathrm{e}^{x}}{3} + \frac{2\cos\left(\sqrt{2}\,x\right)}{3} + \frac{\sqrt{2}\,\sin\left(\sqrt{2}\,x\right)}{3} \end{bmatrix}$$

- ☐ Find a particular solution of the system of ODEs using variation of parameters
  - Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

    $\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$
  - Take the derivative of the particular solution

    $\overrightarrow{y}_p'(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$
  - Substitute particular solution and its derivative into the system of ODEs

    $\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
  - The fundamental matrix has columns that are solutions to the homogeneous system so its der

    $A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
  - Cancel like terms

    $\Phi(x) \cdot \overrightarrow{v}'(x) = \overrightarrow{f}(x)$
  - Multiply by the inverse of the fundamental matrix

    $\overrightarrow{v}'(x) = \frac{1}{\Phi(x)} \cdot \overrightarrow{f}(x)$
  - Integrate to solve for $\overrightarrow{v}(x)$

    $\overrightarrow{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\,ds$
  - Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

    $\overrightarrow{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\,ds\right)$
  - Plug in the fundamental matrix and the forcing function and compute

    $$\overrightarrow{y}_p(x) = \begin{bmatrix} 4\cos\left(\sqrt{2}\,x\right) + \frac{\sqrt{2}\,\sin\left(\sqrt{2}\,x\right)}{2} + \left(\left(-x^2+x+1\right)\cos(x) + \sin(x)\left(1+2x\right)\right)\mathrm{e}^{2x} - 5 \\ \cos\left(\sqrt{2}\,x\right) - 4\sqrt{2}\,\sin\left(\sqrt{2}\,x\right) + \left(\left(-2x^2+2x+4\right)\cos(x) + \left(x^2+3x+3\right)\sin(x)\right)\mathrm{e} \\ -8\cos\left(\sqrt{2}\,x\right) - \sqrt{2}\,\sin\left(\sqrt{2}\,x\right) + \left(\left(-3x^2+3x+13\right)\cos(x) + \left(4x^2+6x+5\right)\sin(x) \right. \end{bmatrix}$$
- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \left[\begin{array}{c} 4\cos\left(\sqrt{2}\,x\right) + \frac{\sqrt{2}\,\sin\left(\sqrt{2}\,x\right)}{2} + \left(\left(-x^2+x+1\right)\cos(\right. \\ \cos\left(\sqrt{2}\,x\right) - 4\sqrt{2}\,\sin\left(\sqrt{2}\,x\right) + \left(\left(-2x^2+2x+4\right)\cos(\right. \\ -8\cos\left(\sqrt{2}\,x\right) - \sqrt{2}\,\sin\left(\sqrt{2}\,x\right) + \left(\left(-3x^2+3x+13\right)\cos\right. \end{array}\right.$$

- First component of the vector is the solution to the ODE

$$y = \frac{(-c_2+8)\cos\left(\sqrt{2}\,x\right)}{2} + \frac{\left(c_3+\sqrt{2}\right)\sin\left(\sqrt{2}\,x\right)}{2} + \left(\left(-x^2+x+1\right)\cos(x) + \sin(x)(1+2x)\right)e^{2x} + e^x(-5+$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.3. Undetermined Coefficients for Higher Order Equations. Page 495
Problem number: section 9.3, problem 32.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - 2y'' + y' - 2y = -e^{x}\left(\left(4x^{2} + 5x + 9\right)\cos\left(2x\right) - \left(-3x^{2} - 5x + 6\right)\sin\left(2x\right)\right)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - 2y'' + y' - 2y = 0$$

The characteristic equation is

$$\lambda^{3} - 2\lambda^{2} + \lambda - 2 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = i$$
$$\lambda_3 = -i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{2x} + c_2 e^{-ix} + e^{ix} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{2x}$$
$$y_2 = e^{-ix}$$
$$y_3 = e^{ix}$$

Now the particular solution to the given ODE is found

$$y''' - 2y'' + y' - 2y = -e^x \left(\left(4x^2 + 5x + 9\right) \cos(2x) - \left(-3x^2 - 5x + 6\right) \sin(2x) \right)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-e^x \left(\left(4x^2 + 5x + 9\right) \cos(2x) - \left(-3x^2 - 5x + 6\right) \sin(2x) \right)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{e^x \cos(2x), e^x \sin(2x), \cos(2x) e^x x, \cos(2x) e^x x^2, \sin(2x) e^x x, \sin(2x) e^x x^2\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^{ix}, e^{2x}, e^{-ix}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$\begin{aligned} y_p = {} & A_1 e^x \cos(2x) + A_2 e^x \sin(2x) + A_3 \cos(2x) e^x x \\ & + A_4 \cos(2x) e^x x^2 + A_5 \sin(2x) e^x x + A_6 \sin(2x) e^x x^2 \end{aligned}$$

The unknowns $\{A_1, A_2, A_3, A_4, A_5, A_6\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$\begin{aligned} & -8A_6 \cos(2x) e^x x^2 - 4A_3 \sin(2x) e^x - 6A_3 \cos(2x) e^x x + 2A_6 \sin(2x) e^x \\ & + 2A_4 \cos(2x) e^x + 8A_4 \sin(2x) e^x x^2 - 12A_5 \sin(2x) e^x - 8A_5 \cos(2x) e^x x \\ & - 12A_3 \cos(2x) e^x + 8A_3 \sin(2x) e^x x - 6A_4 \cos(2x) e^x x^2 - 6A_5 \sin(2x) e^x x \\ & - 6A_6 \sin(2x) e^x x^2 - 24A_6 \sin(2x) e^x x - 8A_4 \sin(2x) e^x x + 4A_5 \cos(2x) e^x \\ & + 8A_6 \cos(2x) e^x x - 24A_4 \cos(2x) e^x x - 6A_1 e^x \cos(2x) - 12A_4 \sin(2x) e^x \\ & + 8A_1 e^x \sin(2x) + 12A_6 \cos(2x) e^x - 8A_2 e^x \cos(2x) - 6A_2 e^x \sin(2x) = \\ & \quad -e^x \left(\left(4x^2 + 5x + 9\right) \cos(2x) - \left(-3x^2 - 5x + 6\right) \sin(2x) \right) \end{aligned}$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{61}{50}, A_2 = -\frac{27}{50}, A_3 = \frac{11}{10}, A_4 = 0, A_5 = \frac{3}{10}, A_6 = \frac{1}{2}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{61\,\mathrm{e}^x \cos(2x)}{50} - \frac{27\,\mathrm{e}^x \sin(2x)}{50} + \frac{11\cos(2x)\,\mathrm{e}^x x}{10} + \frac{3\sin(2x)\,\mathrm{e}^x x}{10} + \frac{\sin(2x)\,\mathrm{e}^x x^2}{2}$$

Therefore the general solution is

$$\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1 \mathrm{e}^{2x} + c_2 \mathrm{e}^{-ix} + \mathrm{e}^{ix} c_3\right) \\
&\quad + \left(\frac{61\,\mathrm{e}^x \cos(2x)}{50} - \frac{27\,\mathrm{e}^x \sin(2x)}{50} + \frac{11\cos(2x)\,\mathrm{e}^x x}{10} + \frac{3\sin(2x)\,\mathrm{e}^x x}{10} + \frac{\sin(2x)\,\mathrm{e}^x x^2}{2}\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y = c_1 \mathrm{e}^{2x} + c_2 \mathrm{e}^{-ix} + \mathrm{e}^{ix} c_3 + \frac{61\,\mathrm{e}^x \cos(2x)}{50} - \frac{27\,\mathrm{e}^x \sin(2x)}{50} \\
+ \frac{11\cos(2x)\,\mathrm{e}^x x}{10} + \frac{3\sin(2x)\,\mathrm{e}^x x}{10} + \frac{\sin(2x)\,\mathrm{e}^x x^2}{2}
\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}
y = c_1 \mathrm{e}^{2x} + c_2 \mathrm{e}^{-ix} + \mathrm{e}^{ix} c_3 + \frac{61\,\mathrm{e}^x \cos(2x)}{50} - \frac{27\,\mathrm{e}^x \sin(2x)}{50} \\
+ \frac{11\cos(2x)\,\mathrm{e}^x x}{10} + \frac{3\sin(2x)\,\mathrm{e}^x x}{10} + \frac{\sin(2x)\,\mathrm{e}^x x^2}{2}
\end{aligned}$$

Verified OK.

19.32.1 Maple step by step solution

Let's solve

$y''' - 2y'' + y' - 2y = -\mathrm{e}^x\left((4x^2 + 5x + 9)\cos(2x) - (-3x^2 - 5x + 6)\sin(2x)\right)$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

$y''' = 2y - 4\cos(2x)\,e^x x^2 - 3\sin(2x)\,e^x x^2 - 5\cos(2x)\,e^x x - 5\sin(2x)\,e^x x - 9\,e^x\cos(2x) + 6\,e^x$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''' - 2y'' + y' - 2y = -e^x(3\sin(2x)\,x^2 + 4x^2\cos(2x) + 5x\sin(2x) + 5x\cos(2x) - 6\sin(2x) + 9$

☐ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

  - Define new variable $y_3(x)$

    $y_3(x) = y''$

  - Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = -4\cos(2x)\,e^x x^2 - 3\sin(2x)\,e^x x^2 - 5\cos(2x)\,e^x x - 5\sin(2x)\,e^x x - 9\,e^x\cos(2x) + 6\,e^x s$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = -4\cos(2x)\,e^x x^2 - 3\sin(2x)\,e^x x^2 - 5\cos(2x)\,e^x x - 5\sin$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & -1 & 2 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ -3\sin(2x)\,e^x x^2 - 4\cos(2x)\,e^x x^2 - 5\sin(2x)\,e^x x - 5\cos(2x) \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ -3\sin(2x)\,e^x x^2 - 4\cos(2x)\,e^x x^2 - 5\sin(2x)\,e^x x - 5\cos(2x)\,e^x x + 6\,e^x\sin(2x) - 9\,e \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & -1 & 2 \end{bmatrix}$$

- Rewrite the system as

$$\overrightarrow{y}^{\prime}(x) = A \cdot \overrightarrow{y}(x) + \overrightarrow{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[-\mathrm{I}, \begin{bmatrix} -1 \\ \mathrm{I} \\ 1 \end{bmatrix}\right], \left[\mathrm{I}, \begin{bmatrix} -1 \\ -\mathrm{I} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{2x} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-\mathrm{I}, \begin{bmatrix} -1 \\ \mathrm{I} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$\mathrm{e}^{-\mathrm{I}x} \cdot \begin{bmatrix} -1 \\ \mathrm{I} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$(\cos(x) - \mathrm{I}\sin(x)) \cdot \left[\begin{array}{c} -1 \\ \mathrm{I} \\ 1 \end{array}\right]$$

- Simplify expression

$$\left[\begin{array}{c} -\cos(x) + \mathrm{I}\sin(x) \\ \mathrm{I}(\cos(x) - \mathrm{I}\sin(x)) \\ \cos(x) - \mathrm{I}\sin(x) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\overrightarrow{y}_2(x) = \left[\begin{array}{c} -\cos(x) \\ \sin(x) \\ \cos(x) \end{array}\right], \overrightarrow{y}_3(x) = \left[\begin{array}{c} \sin(x) \\ \cos(x) \\ -\sin(x) \end{array}\right]\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

$\overrightarrow{y}(x) = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2(x) + c_3\overrightarrow{y}_3(x) + \overrightarrow{y}_p(x)$

☐ Fundamental matrix

- ○ Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \left[\begin{array}{ccc} \frac{e^{2x}}{4} & -\cos(x) & \sin(x) \\ \frac{e^{2x}}{2} & \sin(x) & \cos(x) \\ e^{2x} & \cos(x) & -\sin(x) \end{array}\right]$$

- ○ The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- ○ Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \left[\begin{array}{ccc} \frac{e^{2x}}{4} & -\cos(x) & \sin(x) \\ \frac{e^{2x}}{2} & \sin(x) & \cos(x) \\ e^{2x} & \cos(x) & -\sin(x) \end{array}\right] \cdot \frac{1}{\left[\begin{array}{ccc} \frac{1}{4} & -1 & 0 \\ \frac{1}{2} & 0 & 1 \\ 1 & 1 & 0 \end{array}\right]}$$

- ○ Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \left[\begin{array}{ccc} \frac{e^{2x}}{5}+\frac{4\cos(x)}{5}-\frac{2\sin(x)}{5} & \sin(x) & \frac{e^{2x}}{5}-\frac{\cos(x)}{5}-\frac{2\sin(x)}{5} \\ \frac{2e^{2x}}{5}-\frac{4\sin(x)}{5}-\frac{2\cos(x)}{5} & \cos(x) & \frac{2e^{2x}}{5}+\frac{\sin(x)}{5}-\frac{2\cos(x)}{5} \\ \frac{4e^{2x}}{5}-\frac{4\cos(x)}{5}+\frac{2\sin(x)}{5} & -\sin(x) & \frac{4e^{2x}}{5}+\frac{\cos(x)}{5}+\frac{2\sin(x)}{5} \end{array}\right]$$

- ☐ Find a particular solution of the system of ODEs using variation of parameters
  - Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

    $\overrightarrow{y}_p(x) = \Phi(x)\cdot\overrightarrow{v}(x)$
  - Take the derivative of the particular solution

    $\overrightarrow{y}'_p(x) = \Phi'(x)\cdot\overrightarrow{v}(x) + \Phi(x)\cdot\overrightarrow{v}'(x)$
  - Substitute particular solution and its derivative into the system of ODEs

    $\Phi'(x)\cdot\overrightarrow{v}(x) + \Phi(x)\cdot\overrightarrow{v}'(x) = A\cdot\Phi(x)\cdot\overrightarrow{v}(x) + \overrightarrow{f}(x)$
  - The fundamental matrix has columns that are solutions to the homogeneous system so its der

    $A\cdot\Phi(x)\cdot\overrightarrow{v}(x) + \Phi(x)\cdot\overrightarrow{v}'(x) = A\cdot\Phi(x)\cdot\overrightarrow{v}(x) + \overrightarrow{f}(x)$
  - Cancel like terms

    $\Phi(x)\cdot\overrightarrow{v}'(x) = \overrightarrow{f}(x)$
  - Multiply by the inverse of the fundamental matrix

    $\overrightarrow{v}'(x) = \frac{1}{\Phi(x)}\cdot\overrightarrow{f}(x)$
  - Integrate to solve for $\overrightarrow{v}(x)$

    $\overrightarrow{v}(x) = \int_0^x \frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds$
  - Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

    $\overrightarrow{y}_p(x) = \Phi(x)\cdot\left(\int_0^x \frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds\right)$
  - Plug in the fundamental matrix and the forcing function and compute

$$\overrightarrow{y}_p(x) = \left[\begin{array}{c} \frac{6e^{2x}}{25}+\frac{\left((110x+122)\cos(x)^2+(50x^2+30x-54)\sin(x)\cos(x)-55x-61\right)e^x}{50}-\frac{73\cos(x)}{50}-\frac{43\sin(x)}{25} \\ \frac{12e^{2x}}{25}+\frac{\left((100x^2+170x+124)\cos(x)^2+(50x^2-90x-268)\sin(x)\cos(x)-50x^2-85x-62\right)e^x}{50}-\frac{43\cos(x)}{25}+73 \\ \frac{24e^{2x}}{25}+\frac{\left((200x^2+190x-242)\cos(x)^2+(-150x^2-330x-606)\sin(x)\cos(x)-100x^2-95x+121\right)e^x}{50}+\frac{73\cos(x)}{50}+ \end{array}\right.$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1 \vec{y}_1 + c_2 \vec{y}_2(x) + c_3 \vec{y}_3(x) + \begin{bmatrix} \frac{6\,e^{2x}}{25} + \frac{\left((110x+122)\cos(x)^2+(50x^2+30x-54)\sin(x)\cos(x)-55 \right.}{50} \\ \frac{12\,e^{2x}}{25} + \frac{\left((100x^2+170x+124)\cos(x)^2+(50x^2-90x-268)\sin(x)\cos(x)-5 \right.}{50} \\ \frac{24\,e^{2x}}{25} + \frac{\left((200x^2+190x-242)\cos(x)^2+(-150x^2-330x-606)\sin(x)\cos(x)- \right.}{50} \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = \frac{(25c_1+24)e^{2x}}{100} + \frac{(55x+61)e^x\cos(x)^2}{25} + \frac{\left(-73+50\left(x^2+\frac{3}{5}x-\frac{27}{25}\right)\sin(x)e^x-50c_2\right)\cos(x)}{50} + \frac{(-55x-61)e^x}{50} + \frac{\sin(x)(25c_3-4}{25}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' + 3y'' + 4y' + 12y = 8\cos(2x) - 16\sin(2x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' + 3y'' + 4y' + 12y = 0$$

The characteristic equation is

$$\lambda^3 + 3\lambda^2 + 4\lambda + 12 = 0$$

The roots of the above equation are

$$\lambda_1 = -3$$
$$\lambda_2 = 2i$$
$$\lambda_3 = -2i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-3x} + \mathrm{e}^{2ix} c_2 + \mathrm{e}^{-2ix} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= \mathrm{e}^{-3x} \\ y_2 &= \mathrm{e}^{2ix} \\ y_3 &= \mathrm{e}^{-2ix} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y''' + 3y'' + 4y' + 12y = 8\cos(2x) - 16\sin(2x)$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} \mathrm{e}^{-3x} & \mathrm{e}^{2ix} & \mathrm{e}^{-2ix} \\ -3\,\mathrm{e}^{-3x} & 2i\mathrm{e}^{2ix} & -2i\mathrm{e}^{-2ix} \\ 9\,\mathrm{e}^{-3x} & -4\,\mathrm{e}^{2ix} & -4\,\mathrm{e}^{-2ix} \end{bmatrix}$$

$$|W| = -52i\mathrm{e}^{-3x}\mathrm{e}^{2ix}\mathrm{e}^{-2ix}$$

The determinant simplifies to

$$|W| = -52i e^{-3x}$$

Now we determine W_i for each U_i.

$$\begin{aligned} W_1(x) &= \det \begin{bmatrix} e^{2ix} & e^{-2ix} \\ 2ie^{2ix} & -2ie^{-2ix} \end{bmatrix} \\ &= -4i \end{aligned}$$

$$\begin{aligned} W_2(x) &= \det \begin{bmatrix} e^{-3x} & e^{-2ix} \\ -3\,e^{-3x} & -2ie^{-2ix} \end{bmatrix} \\ &= (3-2i)\,e^{(-3-2i)x} \end{aligned}$$

$$\begin{aligned} W_3(x) &= \det \begin{bmatrix} e^{-3x} & e^{2ix} \\ -3\,e^{-3x} & 2ie^{2ix} \end{bmatrix} \\ &= (3+2i)\,e^{(-3+2i)x} \end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{3-1} \int \frac{F(x)W_1(x)}{aW(x)}\,dx \\ &= (-1)^2 \int \frac{(8\cos(2x) - 16\sin(2x))(-4i)}{(1)(-52ie^{-3x})}\,dx \\ &= \int \frac{-4i(8\cos(2x) - 16\sin(2x))}{-52ie^{-3x}}\,dx \\ &= \int \left(\frac{8(\cos(2x) - 2\sin(2x))\,e^{3x}}{13}\right) dx \\ &= \frac{16(3\cos(x) + 2\sin(x))\,e^{3x}\cos(x)}{169} - \frac{24\,e^{3x}}{169} - \frac{16\,e^{3x}(3\sin(2x) - 2\cos(2x))}{169} \\ &= \frac{16(3\cos(x) + 2\sin(x))\,e^{3x}\cos(x)}{169} - \frac{24\,e^{3x}}{169} - \frac{16\,e^{3x}(3\sin(2x) - 2\cos(2x))}{169} \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{3-2} \int \frac{F(x) W_2(x)}{a W(x)}\, dx \\
&= (-1)^{1} \int \frac{(8\cos(2x) - 16\sin(2x))\left((3-2i)\,\mathrm{e}^{(-3-2i)x}\right)}{(1)\left(-52i\mathrm{e}^{-3x}\right)}\, dx \\
&= -\int \frac{(3-2i)\,(8\cos(2x) - 16\sin(2x))\,\mathrm{e}^{(-3-2i)x}}{-52i\mathrm{e}^{-3x}}\, dx \\
&= -\int \left(\left(\frac{4}{13} + \frac{6i}{13}\right)(\cos(2x) - 2\sin(2x))\,\mathrm{e}^{-2ix}\right) dx \\
&= \frac{4x}{13} - \frac{7ix}{13} - \frac{\mathrm{e}^{-4ix}}{52} - \frac{2i\mathrm{e}^{-4ix}}{13} \\
&= \frac{4x}{13} - \frac{7ix}{13} - \frac{\mathrm{e}^{-4ix}}{52} - \frac{2i\mathrm{e}^{-4ix}}{13}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x) W_3(x)}{a W(x)}\, dx \\
&= (-1)^{0} \int \frac{(8\cos(2x) - 16\sin(2x))\left((3+2i)\,\mathrm{e}^{(-3+2i)x}\right)}{(1)\left(-52i\mathrm{e}^{-3x}\right)}\, dx \\
&= \int \frac{(3+2i)\,(8\cos(2x) - 16\sin(2x))\,\mathrm{e}^{(-3+2i)x}}{-52i\mathrm{e}^{-3x}}\, dx \\
&= \int \left(\left(-\frac{4}{13} + \frac{6i}{13}\right)(\cos(2x) - 2\sin(2x))\,\mathrm{e}^{2ix}\right) dx \\
&= \frac{4x}{13} + \frac{7ix}{13} - \frac{\mathrm{e}^{4ix}}{52} + \frac{2i\mathrm{e}^{4ix}}{13} \\
&= \frac{4x}{13} + \frac{7ix}{13} - \frac{\mathrm{e}^{4ix}}{52} + \frac{2i\mathrm{e}^{4ix}}{13}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Hence

$$
\begin{aligned}
y_p = {} & \left(\frac{16(3\cos(x) + 2\sin(x))\,\mathrm{e}^{3x}\cos(x)}{169} - \frac{24\,\mathrm{e}^{3x}}{169} - \frac{16\,\mathrm{e}^{3x}(3\sin(2x) - 2\cos(2x))}{169}\right)\left(\mathrm{e}^{-3x}\right) \\
& + \left(\frac{4x}{13} - \frac{7ix}{13} - \frac{\mathrm{e}^{-4ix}}{52} - \frac{2i\mathrm{e}^{-4ix}}{13}\right)\left(\mathrm{e}^{2ix}\right) \\
& + \left(\frac{4x}{13} + \frac{7ix}{13} - \frac{\mathrm{e}^{4ix}}{52} + \frac{2i\mathrm{e}^{4ix}}{13}\right)\left(\mathrm{e}^{-2ix}\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \frac{(208x + 99)\cos(2x)}{338} + \frac{14(-6 + 13x)\sin(2x)}{169}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1 \mathrm{e}^{-3x} + \mathrm{e}^{2ix} c_2 + \mathrm{e}^{-2ix} c_3\right) + \left(\frac{(208x+99)\cos(2x)}{338} + \frac{14(-6+13x)\sin(2x)}{169}\right)
\end{aligned}
$$

Summary
The solution(s) found are the following

$$
y = c_1 \mathrm{e}^{-3x} + \mathrm{e}^{2ix} c_2 + \mathrm{e}^{-2ix} c_3 + \frac{(208x+99)\cos(2x)}{338} + \frac{14(-6+13x)\sin(2x)}{169} \tag{1}
$$

Verification of solutions

$$
y = c_1 \mathrm{e}^{-3x} + \mathrm{e}^{2ix} c_2 + \mathrm{e}^{-2ix} c_3 + \frac{(208x+99)\cos(2x)}{338} + \frac{14(-6+13x)\sin(2x)}{169}
$$

Verified OK.

19.33.1 Maple step by step solution

Let's solve

$y''' + 3y'' + 4y' + 12y = 8\cos(2x) - 16\sin(2x)$

- Highest derivative means the order of the ODE is 3

  y'''

☐ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

  - Define new variable $y_3(x)$

    $y_3(x) = y''$

  - Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = 8\cos(2x) - 16\sin(2x) - 3y_3(x) - 4y_2(x) - 12y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 8\cos(2x) - 16\sin(2x) - 3y_3(x) - 4y_2(x) - 12y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -12 & -4 & -3 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 8\cos(2x) - 16\sin(2x) \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 8\cos(2x) - 16\sin(2x) \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -12 & -4 & -3 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-3, \begin{bmatrix} \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{bmatrix}\right], \left[-2\,\mathrm{I}, \begin{bmatrix} -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[2\,\mathrm{I}, \begin{bmatrix} -\frac{1}{4} \\ -\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-3, \begin{bmatrix} \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = e^{-3x} \cdot \begin{bmatrix} \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-2\,\mathrm{I}, \begin{bmatrix} -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$e^{-2\,\mathrm{I}x} \cdot \begin{bmatrix} -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\left(\cos(2x) - \mathrm{I}\sin(2x)\right) \cdot \begin{bmatrix} -\frac{1}{4} \\ \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}$$

- Simplify expression

$$\begin{bmatrix} -\frac{\cos(2x)}{4} + \frac{\mathrm{I}\sin(2x)}{4} \\ \frac{\mathrm{I}}{2}\left(\cos(2x) - \mathrm{I}\sin(2x)\right) \\ \cos(2x) - \mathrm{I}\sin(2x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_2(x) = \begin{bmatrix} -\frac{\cos(2x)}{4} \\ \frac{\sin(2x)}{2} \\ \cos(2x) \end{bmatrix}, \vec{y}_3(x) = \begin{bmatrix} \frac{\sin(2x)}{4} \\ \frac{\cos(2x)}{2} \\ -\sin(2x) \end{bmatrix}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \vec{y}_p(x)$$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x)=\begin{bmatrix}\frac{e^{-3x}}{9} & -\frac{\cos(2x)}{4} & \frac{\sin(2x)}{4}\\ -\frac{e^{-3x}}{3} & \frac{\sin(2x)}{2} & \frac{\cos(2x)}{2}\\ e^{-3x} & \cos(2x) & -\sin(2x)\end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t

  $\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x)=\begin{bmatrix}\frac{e^{-3x}}{9} & -\frac{\cos(2x)}{4} & \frac{\sin(2x)}{4}\\ -\frac{e^{-3x}}{3} & \frac{\sin(2x)}{2} & \frac{\cos(2x)}{2}\\ e^{-3x} & \cos(2x) & -\sin(2x)\end{bmatrix}\cdot\frac{1}{\begin{bmatrix}\frac{1}{9} & -\frac{1}{4} & 0\\ -\frac{1}{3} & 0 & \frac{1}{2}\\ 1 & 1 & 0\end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x)=\begin{bmatrix}\frac{4e^{-3x}}{13}+\frac{9\cos(2x)}{13}+\frac{6\sin(2x)}{13} & \frac{\sin(2x)}{2} & \frac{e^{-3x}}{13}-\frac{\cos(2x)}{13}+\frac{3\sin(2x)}{26}\\ -\frac{12e^{-3x}}{13}-\frac{18\sin(2x)}{13}+\frac{12\cos(2x)}{13} & \cos(2x) & -\frac{3e^{-3x}}{13}+\frac{2\sin(2x)}{13}+\frac{3\cos(2x)}{13}\\ \frac{36e^{-3x}}{13}-\frac{36\cos(2x)}{13}-\frac{24\sin(2x)}{13} & -2\sin(2x) & \frac{9e^{-3x}}{13}+\frac{4\cos(2x)}{13}-\frac{6\sin(2x)}{13}\end{bmatrix}$$

□ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

  $\overrightarrow{y}_p(x)=\Phi(x)\cdot\overrightarrow{v}(x)$

- Take the derivative of the particular solution

  $\overrightarrow{y}'_p(x)=\Phi'(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)=A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\overrightarrow{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)=A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\overrightarrow{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot\overrightarrow{v}'(x)=\overrightarrow{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\overrightarrow{v}'(x)=\frac{1}{\Phi(x)}\cdot\overrightarrow{f}(x)$

- Integrate to solve for $\overrightarrow{v}(x)$

  $\overrightarrow{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds$

- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

  $\overrightarrow{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\overrightarrow{y}_p(x) = \left[\begin{array}{c} \frac{8(7+13x)\cos(2x)}{169} + \frac{2(91x-68)\sin(2x)}{169} - \frac{56\,\mathrm{e}^{-3x}}{169} \\ \frac{28(-6+13x)\cos(2x)}{169} + \frac{2(-104x+35)\sin(2x)}{169} + \frac{168\,\mathrm{e}^{-3x}}{169} \\ \frac{8(-52x+63)\cos(2x)}{169} + \frac{8(-91x+16)\sin(2x)}{169} - \frac{504\,\mathrm{e}^{-3x}}{169} \end{array}\right]$$

- Plug particular solution back into general solution

$$\overrightarrow{y}(x) = c_1 \overrightarrow{y}_1 + c_2 \overrightarrow{y}_2(x) + c_3 \overrightarrow{y}_3(x) + \left[\begin{array}{c} \frac{8(7+13x)\cos(2x)}{169} + \frac{2(91x-68)\sin(2x)}{169} - \frac{56\,\mathrm{e}^{-3x}}{169} \\ \frac{28(-6+13x)\cos(2x)}{169} + \frac{2(-104x+35)\sin(2x)}{169} + \frac{168\,\mathrm{e}^{-3x}}{169} \\ \frac{8(-52x+63)\cos(2x)}{169} + \frac{8(-91x+16)\sin(2x)}{169} - \frac{504\,\mathrm{e}^{-3x}}{169} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y = \frac{(224+416x-169c_2)\cos(2x)}{676} + \frac{(-544+728x+169c_3)\sin(2x)}{676} + \frac{\mathrm{e}^{-3x}(169c_1-504)}{1521}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - y'' + 2y = e^{x}((20 + 4x)\cos(x) - (12x + 12)\sin(x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - y'' + 2y = 0$$

The characteristic equation is

$$\lambda^3 - \lambda^2 + 2 = 0$$

The roots of the above equation are

$$\begin{aligned}\lambda_1 &= -1\\ \lambda_2 &= 1 - i\\ \lambda_3 &= 1 + i\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-x} + \mathrm{e}^{(1-i)x} c_2 + \mathrm{e}^{(1+i)x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= \mathrm{e}^{-x} \\ y_2 &= \mathrm{e}^{(1-i)x} \\ y_3 &= \mathrm{e}^{(1+i)x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y''' - y'' + 2y = \mathrm{e}^{x}((20 + 4x) \cos(x) - (12x + 12) \sin(x))$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} \mathrm{e}^{-x} & \mathrm{e}^{(1-i)x} & \mathrm{e}^{(1+i)x} \\ -\mathrm{e}^{-x} & (1-i)\,\mathrm{e}^{(1-i)x} & (1+i)\,\mathrm{e}^{(1+i)x} \\ \mathrm{e}^{-x} & -2i\mathrm{e}^{(1-i)x} & 2i\mathrm{e}^{(1+i)x} \end{bmatrix}$$

$$|W| = 10i\mathrm{e}^{-x} \mathrm{e}^{(1-i)x} \mathrm{e}^{(1+i)x}$$

The determinant simplifies to

$$|W| = 10i\mathrm{e}^{x}$$

Now we determine W_i for each U_i.

$$\begin{aligned}W_1(x) &= \det\begin{bmatrix}\mathrm{e}^{(1-i)x} & \mathrm{e}^{(1+i)x}\\ (1-i)\,\mathrm{e}^{(1-i)x} & (1+i)\,\mathrm{e}^{(1+i)x}\end{bmatrix}\\ &= 2i\mathrm{e}^{2x}\end{aligned}$$

$$\begin{aligned}W_2(x) &= \det\begin{bmatrix}\mathrm{e}^{-x} & \mathrm{e}^{(1+i)x}\\ -\mathrm{e}^{-x} & (1+i)\,\mathrm{e}^{(1+i)x}\end{bmatrix}\\ &= (2+i)\,\mathrm{e}^{ix}\end{aligned}$$

$$\begin{aligned}W_3(x) &= \det\begin{bmatrix}\mathrm{e}^{-x} & \mathrm{e}^{(1-i)x}\\ -\mathrm{e}^{-x} & (1-i)\,\mathrm{e}^{(1-i)x}\end{bmatrix}\\ &= (2-i)\,\mathrm{e}^{-ix}\end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned}U_1 &= (-1)^{3-1}\int \frac{F(x)W_1(x)}{aW(x)}\,dx\\ &= (-1)^{2}\int \frac{(\mathrm{e}^{x}((20+4x)\cos(x)-(12x+12)\sin(x)))\,(2i\mathrm{e}^{2x})}{(1)\,(10i\mathrm{e}^{x})}\,dx\\ &= \int \frac{2i\mathrm{e}^{x}((20+4x)\cos(x)-(12x+12)\sin(x))\,\mathrm{e}^{2x}}{10i\mathrm{e}^{x}}\,dx\\ &= \int \left(\frac{4((x+5)\cos(x)-3(x+1)\sin(x))\,\mathrm{e}^{2x}}{5}\right)\,dx\\ &= \frac{4\left(\frac{2x}{5}-\frac{3}{25}\right)\mathrm{e}^{2x}\cos(x)}{5} - \frac{4\left(-\frac{x}{5}+\frac{4}{25}\right)\mathrm{e}^{2x}\sin(x)}{5} - \frac{12\left(-\frac{x}{5}+\frac{4}{25}\right)\mathrm{e}^{2x}\cos(x)}{5} - \frac{12\left(\frac{2x}{5}-\frac{3}{25}\right)\mathrm{e}^{2x}\sin(x)}{5}\\ &= \frac{4\left(\frac{2x}{5}-\frac{3}{25}\right)\mathrm{e}^{2x}\cos(x)}{5} - \frac{4\left(-\frac{x}{5}+\frac{4}{25}\right)\mathrm{e}^{2x}\sin(x)}{5} - \frac{12\left(-\frac{x}{5}+\frac{4}{25}\right)\mathrm{e}^{2x}\cos(x)}{5} - \frac{12\left(\frac{2x}{5}-\frac{3}{25}\right)\mathrm{e}^{2x}\sin(x)}{5}\end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{3-2} \int \frac{F(x)W_2(x)}{aW(x)}\,dx \\
&= (-1)^1 \int \frac{(\mathrm{e}^x((20+4x)\cos(x)-(12x+12)\sin(x)))\,((2+i)\,\mathrm{e}^{ix})}{(1)\,(10i\mathrm{e}^x)}\,dx \\
&= -\int \frac{(2+i)\,\mathrm{e}^x((20+4x)\cos(x)-(12x+12)\sin(x))\,\mathrm{e}^{ix}}{10i\mathrm{e}^x}\,dx \\
&= -\int \left(\left(\frac{2}{5}-\frac{4i}{5}\right)((x+5)\cos(x)-3(x+1)\sin(x))\,\mathrm{e}^{ix}\right)\,dx \\
&= \frac{x^2}{2}+\frac{x}{5}+\frac{13ix}{5}+\frac{ix^2}{2}+\left(-\frac{1}{100}+\frac{7i}{100}\right)(14-7i+10x)\,\mathrm{e}^{2ix} \\
&= \frac{x^2}{2}+\frac{x}{5}+\frac{13ix}{5}+\frac{ix^2}{2}+\left(-\frac{1}{100}+\frac{7i}{100}\right)(14-7i+10x)\,\mathrm{e}^{2ix}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x)W_3(x)}{aW(x)}\,dx \\
&= (-1)^0 \int \frac{(\mathrm{e}^x((20+4x)\cos(x)-(12x+12)\sin(x)))\,((2-i)\,\mathrm{e}^{-ix})}{(1)\,(10i\mathrm{e}^x)}\,dx \\
&= \int \frac{(2-i)\,\mathrm{e}^x((20+4x)\cos(x)-(12x+12)\sin(x))\,\mathrm{e}^{-ix}}{10i\mathrm{e}^x}\,dx \\
&= \int \left(\left(-\frac{2}{5}-\frac{4i}{5}\right)((x+5)\cos(x)-3(x+1)\sin(x))\,\mathrm{e}^{-ix}\right)\,dx \\
&= \int \left(-\frac{2}{5}-\frac{4i}{5}\right)((x+5)\cos(x)-3(x+1)\sin(x))\,\mathrm{e}^{-ix}dx
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1y_1 + U_2y_2 + U_3y_3
$$

Hence

$$
\begin{aligned}
y_p = &\left(\frac{4\left(\frac{2x}{5}-\frac{3}{25}\right)\mathrm{e}^{2x}\cos(x)}{5}-\frac{4\left(-\frac{x}{5}+\frac{4}{25}\right)\mathrm{e}^{2x}\sin(x)}{5}-\frac{12\left(-\frac{x}{5}+\frac{4}{25}\right)\mathrm{e}^{2x}\cos(x)}{5}-\frac{12\left(\frac{2x}{5}-\frac{3}{25}\right)\mathrm{e}^{2x}\sin(x)}{5}\right. \\
&+\left(\frac{x^2}{2}+\frac{x}{5}+\frac{13ix}{5}+\frac{ix^2}{2}+\left(-\frac{1}{100}+\frac{7i}{100}\right)(14-7i+10x)\,\mathrm{e}^{2ix}\right)\left(\mathrm{e}^{(1-i)x}\right) \\
&+\left(\int\left(-\frac{2}{5}-\frac{4i}{5}\right)((x+5)\cos(x)-3(x+1)\sin(x))\,\mathrm{e}^{-ix}dx\right)\left(\mathrm{e}^{(1+i)x}\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \frac{23\left(\left(\frac{20}{23}x^2+\frac{25}{23}+i+\frac{20}{23}x\right)\cos(x)-\frac{21\left(-\frac{20}{21}x^2+\frac{65}{21}+i-\frac{20}{7}x\right)\sin(x)}{23}\right)\mathrm{e}^x}{20}
$$

Which simplifies to

$$y_p = \frac{23\left(\left(\frac{20}{23}x^2 + \frac{25}{23} + i + \frac{20}{23}x\right)\cos(x) - \frac{21\left(-\frac{20}{21}x^2 + \frac{65}{21} + i - \frac{20}{7}x\right)\sin(x)}{23}\right)\mathrm{e}^x}{20}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1\mathrm{e}^{-x} + \mathrm{e}^{(1-i)x}c_2 + \mathrm{e}^{(1+i)x}c_3\right) \\ &\quad + \left(\frac{23\left(\left(\frac{20}{23}x^2 + \frac{25}{23} + i + \frac{20}{23}x\right)\cos(x) - \frac{21\left(-\frac{20}{21}x^2 + \frac{65}{21} + i - \frac{20}{7}x\right)\sin(x)}{23}\right)\mathrm{e}^x}{20}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y &= c_1\mathrm{e}^{-x} + \mathrm{e}^{(1-i)x}c_2 + \mathrm{e}^{(1+i)x}c_3 \\ &\quad + \frac{23\left(\left(\frac{20}{23}x^2 + \frac{25}{23} + i + \frac{20}{23}x\right)\cos(x) - \frac{21\left(-\frac{20}{21}x^2 + \frac{65}{21} + i - \frac{20}{7}x\right)\sin(x)}{23}\right)\mathrm{e}^x}{20} \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y &= c_1\mathrm{e}^{-x} + \mathrm{e}^{(1-i)x}c_2 + \mathrm{e}^{(1+i)x}c_3 \\ &\quad + \frac{23\left(\left(\frac{20}{23}x^2 + \frac{25}{23} + i + \frac{20}{23}x\right)\cos(x) - \frac{21\left(-\frac{20}{21}x^2 + \frac{65}{21} + i - \frac{20}{7}x\right)\sin(x)}{23}\right)\mathrm{e}^x}{20} \end{aligned}$$

Verified OK.

19.34.1 Maple step by step solution

Let's solve

$y''' - y'' + 2y = \mathrm{e}^x((20 + 4x)\cos(x) - (12x + 12)\sin(x))$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = -2y + 4\,\mathrm{e}^x\cos(x)\,x - 12\,\mathrm{e}^x\sin(x)\,x + 20\cos(x)\,\mathrm{e}^x - 12\sin(x)\,\mathrm{e}^x + y''$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - y'' + 2y = 4\,\mathrm{e}^x(-3\sin(x)\,x + x\cos(x) - 3\sin(x) + 5\cos(x))$

☐ Convert linear ODE into a system of first order ODEs

- Define new variable $y_1(x)$

  $y_1(x) = y$

- Define new variable $y_2(x)$

  $y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$

- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = 4\,\mathrm{e}^{x} \cos\left(x\right) x - 12\,\mathrm{e}^{x} \sin\left(x\right) x + 20 \cos\left(x\right) \mathrm{e}^{x} - 12 \sin\left(x\right) \mathrm{e}^{x} + y_3(x) - 2y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 4\,\mathrm{e}^{x} \cos\left(x\right) x - 12\,\mathrm{e}^{x} \sin\left(x\right) x + 20 \cos\left(x\right) \mathrm{e}^{x} - 12 \sin\left(x\right) \mathrm{e}$

- Define vector

$$\vec{y}(x) = \left[\begin{array}{c} y_1(x) \\ y_2(x) \\ y_3(x) \end{array}\right]$$

- System to solve

$$\vec{y}'(x) = \left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -2 & 0 & 1 \end{array}\right] \cdot \vec{y}(x) + \left[\begin{array}{c} 0 \\ 0 \\ -12\,\mathrm{e}^{x} \sin\left(x\right) x + 4\,\mathrm{e}^{x} \cos\left(x\right) x - 12 \sin\left(x\right) \mathrm{e}^{x} + 20 \cos\left(x\right) \mathrm{e}^{x} \end{array}\right.$$

- Define the forcing function

$$\vec{f}(x) = \left[\begin{array}{c} 0 \\ 0 \\ -12\,\mathrm{e}^{x} \sin\left(x\right) x + 4\,\mathrm{e}^{x} \cos\left(x\right) x - 12 \sin\left(x\right) \mathrm{e}^{x} + 20 \cos\left(x\right) \mathrm{e}^{x} \end{array}\right]$$

- Define the coefficient matrix

$$A = \left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -2 & 0 & 1 \end{array}\right]$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right], \left[1-\mathrm{I}, \left[\begin{array}{c} \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right], \left[1+\mathrm{I}, \left[\begin{array}{c} -\frac{\mathrm{I}}{2} \\ \frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[1-\mathrm{I}, \left[\begin{array}{c} \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(1-\mathrm{I})x} \cdot \left[\begin{array}{c} \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{x} \cdot (\cos(x) - \mathrm{I}\sin(x)) \cdot \left[\begin{array}{c} \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{x} \cdot \begin{bmatrix} \frac{I}{2}(\cos(x) - I\sin(x)) \\ \left(\frac{1}{2} + \frac{I}{2}\right)(\cos(x) - I\sin(x)) \\ \cos(x) - I\sin(x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_2(x) = e^{x} \cdot \begin{bmatrix} \frac{\sin(x)}{2} \\ \frac{\cos(x)}{2} + \frac{\sin(x)}{2} \\ \cos(x) \end{bmatrix}, \vec{y}_3(x) = e^{x} \cdot \begin{bmatrix} \frac{\cos(x)}{2} \\ \frac{\cos(x)}{2} - \frac{\sin(x)}{2} \\ -\sin(x) \end{bmatrix}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \vec{y}_p(x)$

□ Fundamental matrix

◦ Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} e^{-x} & \frac{\sin(x)e^{x}}{2} & \frac{\cos(x)e^{x}}{2} \\ -e^{-x} & e^{x}\left(\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) & \left(\frac{\cos(x)}{2} - \frac{\sin(x)}{2}\right)e^{x} \\ e^{-x} & \cos(x)e^{x} & -\sin(x)e^{x} \end{bmatrix}$$

◦ The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

◦ Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} e^{-x} & \frac{\sin(x)e^{x}}{2} & \frac{\cos(x)e^{x}}{2} \\ -e^{-x} & e^{x}\left(\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) & \left(\frac{\cos(x)}{2} - \frac{\sin(x)}{2}\right)e^{x} \\ e^{-x} & \cos(x)e^{x} & -\sin(x)e^{x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & 0 & \frac{1}{2} \\ -1 & \frac{1}{2} & \frac{1}{2} \\ 1 & 1 & 0 \end{bmatrix}}$$

◦ Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{2e^{-x}}{5} + \frac{(3\cos(x)-\sin(x))e^{x}}{5} & -\frac{2e^{-x}}{5} + \frac{(2\cos(x)+\sin(x))e^{x}}{5} & \frac{e^{-x}}{5} + \frac{(2\sin(x)-\cos(x))e^{x}}{5} \\ -\frac{2e^{-x}}{5} + \frac{(-4\sin(x)+2\cos(x))e^{x}}{5} & \frac{2e^{-x}}{5} + \frac{(3\cos(x)-\sin(x))e^{x}}{5} & -\frac{e^{-x}}{5} + \frac{(\cos(x)+3\sin(x))e^{x}}{5} \\ \frac{2e^{-x}}{5} + \frac{(-2\cos(x)-6\sin(x))e^{x}}{5} & -\frac{2e^{-x}}{5} + \frac{(-4\sin(x)+2\cos(x))e^{x}}{5} & \frac{e^{-x}}{5} + \frac{(4\cos(x)+2\sin(x))e^{x}}{5} \end{bmatrix}$$

□ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

  $\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$
- Take the derivative of the particular solution

  $\overrightarrow{y}'_p(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$
- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
- Cancel like terms

  $\Phi(x) \cdot \overrightarrow{v}'(x) = \overrightarrow{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\overrightarrow{v}'(x) = \frac{1}{\Phi(x)} \cdot \overrightarrow{f}(x)$
- Integrate to solve for $\overrightarrow{v}(x)$

  $\overrightarrow{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds$
- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

  $\overrightarrow{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds\right)$
- Plug in the fundamental matrix and the forcing function and compute

  $$\overrightarrow{y}_p(x) = \left[\begin{array}{c} -\frac{8\,\mathrm{e}^{-x}}{5}+\frac{\left(\left(5x^2+5x+8\right)\cos(x)+\left(5x^2+15x-21\right)\sin(x)\right)\mathrm{e}^{x}}{5} \\ \frac{8\,\mathrm{e}^{-x}}{5}+\frac{2\left(\left(5x^2+15x-4\right)\cos(x)+\left(-7+10x\right)\sin(x)\right)\mathrm{e}^{x}}{5} \\ -\frac{8\,\mathrm{e}^{-x}}{5}+\frac{2\left(\left(5x^2+35x+4\right)\cos(x)+\left(-5x^2-5x+7\right)\sin(x)\right)\mathrm{e}^{x}}{5} \end{array}\right]$$

- Plug particular solution back into general solution

  $$\overrightarrow{y}(x) = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2(x) + c_3\overrightarrow{y}_3(x) + \left[\begin{array}{c} -\frac{8\,\mathrm{e}^{-x}}{5}+\frac{\left(\left(5x^2+5x+8\right)\cos(x)+\left(5x^2+15x-21\right)\sin(x)\right)\mathrm{e}^{x}}{5} \\ \frac{8\,\mathrm{e}^{-x}}{5}+\frac{2\left(\left(5x^2+15x-4\right)\cos(x)+\left(-7+10x\right)\sin(x)\right)\mathrm{e}^{x}}{5} \\ -\frac{8\,\mathrm{e}^{-x}}{5}+\frac{2\left(\left(5x^2+35x+4\right)\cos(x)+\left(-5x^2-5x+7\right)\sin(x)\right)\mathrm{e}^{x}}{5} \end{array}\right]$$

- First component of the vector is the solution to the ODE

  $y = \frac{(-8+5c_1)\mathrm{e}^{-x}}{5} + \left(\left(\frac{1}{2}c_3 + x^2 + x + \frac{8}{5}\right)\cos(x) + \sin(x)\left(x^2 + 3x + \frac{1}{2}c_2 - \frac{21}{5}\right)\right)\mathrm{e}^{x}$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$y''' - 7y'' + 20y' - 24y = -e^{2x}((13 - 8x)\cos(2x) - (8 - 4x)\sin(2x))$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - 7y'' + 20y' - 24y = 0$$

The characteristic equation is

$$\lambda^3 - 7\lambda^2 + 20\lambda - 24 = 0$$

The roots of the above equation are

$$\lambda_1 = 3$$
$$\lambda_2 = 2 - 2i$$
$$\lambda_3 = 2 + 2i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{3x} + e^{(2-2i)x} c_2 + e^{(2+2i)x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^{3x} \\ y_2 &= e^{(2-2i)x} \\ y_3 &= e^{(2+2i)x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y''' - 7y'' + 20y' - 24y = -e^{2x}((13 - 8x)\cos(2x) - (8 - 4x)\sin(2x))$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)}\, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} e^{3x} & e^{(2-2i)x} & e^{(2+2i)x} \\ 3\, e^{3x} & (2-2i)\, e^{(2-2i)x} & (2+2i)\, e^{(2+2i)x} \\ 9\, e^{3x} & -8i e^{(2-2i)x} & 8i e^{(2+2i)x} \end{bmatrix}$$

$$|W| = 20i e^{3x} e^{(2-2i)x} e^{(2+2i)x}$$

The determinant simplifies to

$$|W| = 20i\mathrm{e}^{7x}$$

Now we determine W_i for each U_i.

$$\begin{aligned} W_1(x) &= \det\begin{bmatrix} \mathrm{e}^{(2-2i)x} & \mathrm{e}^{(2+2i)x} \\ (2-2i)\,\mathrm{e}^{(2-2i)x} & (2+2i)\,\mathrm{e}^{(2+2i)x} \end{bmatrix} \\ &= 4i\mathrm{e}^{4x} \end{aligned}$$

$$\begin{aligned} W_2(x) &= \det\begin{bmatrix} \mathrm{e}^{3x} & \mathrm{e}^{(2+2i)x} \\ 3\,\mathrm{e}^{3x} & (2+2i)\,\mathrm{e}^{(2+2i)x} \end{bmatrix} \\ &= (-1+2i)\,\mathrm{e}^{(5+2i)x} \end{aligned}$$

$$\begin{aligned} W_3(x) &= \det\begin{bmatrix} \mathrm{e}^{3x} & \mathrm{e}^{(2-2i)x} \\ 3\,\mathrm{e}^{3x} & (2-2i)\,\mathrm{e}^{(2-2i)x} \end{bmatrix} \\ &= (-1-2i)\,\mathrm{e}^{(5-2i)x} \end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{3-1}\int \frac{F(x)W_1(x)}{aW(x)}\,dx \\ &= (-1)^2\int \frac{\left(-\mathrm{e}^{2x}((13-8x)\cos(2x)-(8-4x)\sin(2x))\right)\left(4i\mathrm{e}^{4x}\right)}{(1)\left(20i\mathrm{e}^{7x}\right)}\,dx \\ &= \int \frac{-4i\mathrm{e}^{2x}((13-8x)\cos(2x)-(8-4x)\sin(2x))\,\mathrm{e}^{4x}}{20i\mathrm{e}^{7x}}\,dx \\ &= \int \left(\frac{(-4x\sin(2x)+8x\cos(2x)+8\sin(2x)-13\cos(2x))\,\mathrm{e}^{-x}}{5}\right)dx \\ &= -\frac{4\left(-\frac{2x}{5}-\frac{4}{25}\right)\mathrm{e}^{-x}\cos(2x)}{5} - \frac{4\left(-\frac{x}{5}+\frac{3}{25}\right)\mathrm{e}^{-x}\sin(2x)}{5} + \frac{8\left(-\frac{x}{5}+\frac{3}{25}\right)\mathrm{e}^{-x}\cos(2x)}{5} - \frac{8\left(-\frac{2x}{5}-\frac{4}{25}\right)\mathrm{e}^{-}}{5} \\ &= -\frac{4\left(-\frac{2x}{5}-\frac{4}{25}\right)\mathrm{e}^{-x}\cos(2x)}{5} - \frac{4\left(-\frac{x}{5}+\frac{3}{25}\right)\mathrm{e}^{-x}\sin(2x)}{5} + \frac{8\left(-\frac{x}{5}+\frac{3}{25}\right)\mathrm{e}^{-x}\cos(2x)}{5} - \frac{8\left(-\frac{2x}{5}-\frac{4}{25}\right)\mathrm{e}^{-}}{5} \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{3-2} \int \frac{F(x) W_2(x)}{a W(x)}\,dx \\
&= (-1)^{1} \int \frac{\left(-\mathrm{e}^{2x}\left((13-8x)\cos(2x)-(8-4x)\sin(2x)\right)\right)\left((-1+2i)\,\mathrm{e}^{(5+2i)x}\right)}{(1)\left(20i\mathrm{e}^{7x}\right)}\,dx \\
&= -\int \frac{(1-2i)\,\mathrm{e}^{2x}\left((13-8x)\cos(2x)-(8-4x)\sin(2x)\right)\mathrm{e}^{(5+2i)x}}{20i\mathrm{e}^{7x}}\,dx \\
&= -\int \left(\left(\frac{1}{10}+\frac{i}{20}\right)\left(-4x\sin(2x)+8x\cos(2x)+8\sin(2x)-13\cos(2x)\right)\mathrm{e}^{2ix}\right)dx \\
&= -\frac{x^2}{4}+\frac{17x}{20}-\frac{3ix}{40}+\left(-\frac{1}{100}+\frac{3i}{400}\right)(-17+i+10x)\,\mathrm{e}^{4ix} \\
&= -\frac{x^2}{4}+\frac{17x}{20}-\frac{3ix}{40}+\left(-\frac{1}{100}+\frac{3i}{400}\right)(-17+i+10x)\,\mathrm{e}^{4ix}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x) W_3(x)}{a W(x)}\,dx \\
&= (-1)^{0} \int \frac{\left(-\mathrm{e}^{2x}\left((13-8x)\cos(2x)-(8-4x)\sin(2x)\right)\right)\left((-1-2i)\,\mathrm{e}^{(5-2i)x}\right)}{(1)\left(20i\mathrm{e}^{7x}\right)}\,dx \\
&= \int \frac{(1+2i)\,\mathrm{e}^{2x}\left((13-8x)\cos(2x)-(8-4x)\sin(2x)\right)\mathrm{e}^{(5-2i)x}}{20i\mathrm{e}^{7x}}\,dx \\
&= \int \left(\left(-\frac{1}{10}+\frac{i}{20}\right)\left(-4x\sin(2x)+8x\cos(2x)+8\sin(2x)-13\cos(2x)\right)\mathrm{e}^{-2ix}\right)dx \\
&= \frac{3ix}{40}-\frac{x^2}{4}+\frac{17x}{20}+\left(-\frac{1}{100}-\frac{3i}{400}\right)(-17-i+10x)\,\mathrm{e}^{-4ix} \\
&= \frac{3ix}{40}-\frac{x^2}{4}+\frac{17x}{20}+\left(-\frac{1}{100}-\frac{3i}{400}\right)(-17-i+10x)\,\mathrm{e}^{-4ix}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Hence

$$
\begin{aligned}
y_p = &\left(-\frac{4\left(-\frac{2x}{5}-\frac{4}{25}\right)\mathrm{e}^{-x}\cos(2x)}{5}-\frac{4\left(-\frac{x}{5}+\frac{3}{25}\right)\mathrm{e}^{-x}\sin(2x)}{5}+\frac{8\left(-\frac{x}{5}+\frac{3}{25}\right)\mathrm{e}^{-x}\cos(2x)}{5}-\frac{8\left(-\frac{2x}{5}-\frac{4}{25}\right)\mathrm{e}}{5}\right. \\
&+\left(-\frac{x^2}{4}+\frac{17x}{20}-\frac{3ix}{40}+\left(-\frac{1}{100}+\frac{3i}{400}\right)(-17+i+10x)\,\mathrm{e}^{4ix}\right)\left(\mathrm{e}^{(2-2i)x}\right) \\
&+\left(\frac{3ix}{40}-\frac{x^2}{4}+\frac{17x}{20}+\left(-\frac{1}{100}-\frac{3i}{400}\right)(-17-i+10x)\,\mathrm{e}^{-4ix}\right)\left(\mathrm{e}^{(2+2i)x}\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = -\frac{\left(\left(x^2-3x-\frac{21}{20}\right)\cos(2x)-\left(x-\frac{37}{20}\right)\sin(2x)\right)\mathrm{e}^{2x}}{2}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1 e^{3x} + e^{(2-2i)x} c_2 + e^{(2+2i)x} c_3\right) + \left(-\frac{\left(\left(x^2 - 3x - \frac{21}{20}\right)\cos(2x) - \left(x - \frac{37}{20}\right)\sin(2x)\right) e^{2x}}{2}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
y = c_1 e^{3x} + e^{(2-2i)x} c_2 + e^{(2+2i)x} c_3 - \frac{\left(\left(x^2 - 3x - \frac{21}{20}\right)\cos(2x) - \left(x - \frac{37}{20}\right)\sin(2x)\right) e^{2x}}{2} \tag{1}
$$

Verification of solutions

$$
y = c_1 e^{3x} + e^{(2-2i)x} c_2 + e^{(2+2i)x} c_3 - \frac{\left(\left(x^2 - 3x - \frac{21}{20}\right)\cos(2x) - \left(x - \frac{37}{20}\right)\sin(2x)\right) e^{2x}}{2}
$$

Verified OK.

19.35.1 Maple step by step solution

Let's solve

$y''' - 7y'' + 20y' - 24y = -e^{2x}((13 - 8x)\cos(2x) - (8 - 4x)\sin(2x))$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = 24y + 8\cos(2x) e^{2x} x - 4\sin(2x) e^{2x} x - 13\cos(2x) e^{2x} + 8\sin(2x) e^{2x} + 7y'' - 20y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - 7y'' + 20y' - 24y = e^{2x}(-4x\sin(2x) + 8x\cos(2x) + 8\sin(2x) - 13\cos(2x))$

- □ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$
  - Define new variable $y_2(x)$

    $y_2(x) = y'$
  - Define new variable $y_3(x)$

    $y_3(x) = y''$

- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = 8\cos(2x)\,\mathrm{e}^{2x}x - 4\sin(2x)\,\mathrm{e}^{2x}x - 13\cos(2x)\,\mathrm{e}^{2x} + 8\sin(2x)\,\mathrm{e}^{2x} + 7y_3(x) - 20y_2(x) + 24$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 8\cos(2x)\,\mathrm{e}^{2x}x - 4\sin(2x)\,\mathrm{e}^{2x}x - 13\cos(2x)\,\mathrm{e}^{2x} + 8\sin(2$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 24 & -20 & 7 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ -4\sin(2x)\,\mathrm{e}^{2x}x + 8\cos(2x)\,\mathrm{e}^{2x}x + 8\sin(2x)\,\mathrm{e}^{2x} - 13\cos(2$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ -4\sin(2x)\,\mathrm{e}^{2x}x + 8\cos(2x)\,\mathrm{e}^{2x}x + 8\sin(2x)\,\mathrm{e}^{2x} - 13\cos(2x)\,\mathrm{e}^{2x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 24 & -20 & 7 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}\right], \left[2 - 2\,\mathrm{I}, \begin{bmatrix} \frac{\mathrm{I}}{8} \\ \frac{1}{4} + \frac{\mathrm{I}}{4} \\ 1 \end{bmatrix}\right], \left[2 + 2\,\mathrm{I}, \begin{bmatrix} -\frac{\mathrm{I}}{8} \\ \frac{1}{4} - \frac{\mathrm{I}}{4} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[3, \left[\begin{array}{c} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{3x} \cdot \left[\begin{array}{c} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[2 - 2\,\mathrm{I}, \left[\begin{array}{c} \frac{\mathrm{I}}{8} \\ \frac{1}{4} + \frac{\mathrm{I}}{4} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(2-2\,\mathrm{I})x} \cdot \left[\begin{array}{c} \frac{\mathrm{I}}{8} \\ \frac{1}{4} + \frac{\mathrm{I}}{4} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{2x} \cdot (\cos(2x) - \mathrm{I}\sin(2x)) \cdot \left[\begin{array}{c} \frac{\mathrm{I}}{8} \\ \frac{1}{4} + \frac{\mathrm{I}}{4} \\ 1 \end{array}\right]$$

- Simplify expression

$$\mathrm{e}^{2x} \cdot \left[\begin{array}{c} \frac{\mathrm{I}}{8}(\cos(2x) - \mathrm{I}\sin(2x)) \\ \left(\frac{1}{4} + \frac{\mathrm{I}}{4}\right)(\cos(2x) - \mathrm{I}\sin(2x)) \\ \cos(2x) - \mathrm{I}\sin(2x) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\overrightarrow{y}_2(x) = \mathrm{e}^{2x} \cdot \left[\begin{array}{c} \frac{\sin(2x)}{8} \\ \frac{\sin(2x)}{4} + \frac{\cos(2x)}{4} \\ \cos(2x) \end{array}\right], \overrightarrow{y}_3(x) = \mathrm{e}^{2x} \cdot \left[\begin{array}{c} \frac{\cos(2x)}{8} \\ \frac{\cos(2x)}{4} - \frac{\sin(2x)}{4} \\ -\sin(2x) \end{array}\right]\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

  $\overrightarrow{y}(x)=c_1\overrightarrow{y}_1+c_2\overrightarrow{y}_2(x)+c_3\overrightarrow{y}_3(x)+\overrightarrow{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x)=\left[\begin{array}{ccc} \frac{e^{3x}}{9} & \frac{\sin(2x)e^{2x}}{8} & \frac{\cos(2x)e^{2x}}{8} \\ \frac{e^{3x}}{3} & e^{2x}\left(\frac{\sin(2x)}{4}+\frac{\cos(2x)}{4}\right) & e^{2x}\left(\frac{\cos(2x)}{4}-\frac{\sin(2x)}{4}\right) \\ e^{3x} & \cos(2x)e^{2x} & -\sin(2x)e^{2x} \end{array}\right]$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t

  $\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x)=\left[\begin{array}{ccc} \frac{e^{3x}}{9} & \frac{\sin(2x)e^{2x}}{8} & \frac{\cos(2x)e^{2x}}{8} \\ \frac{e^{3x}}{3} & e^{2x}\left(\frac{\sin(2x)}{4}+\frac{\cos(2x)}{4}\right) & e^{2x}\left(\frac{\cos(2x)}{4}-\frac{\sin(2x)}{4}\right) \\ e^{3x} & \cos(2x)e^{2x} & -\sin(2x)e^{2x} \end{array}\right]\cdot\frac{1}{\left[\begin{array}{ccc} \frac{1}{9} & 0 & \frac{1}{8} \\ \frac{1}{3} & \frac{1}{4} & \frac{1}{4} \\ 1 & 1 & 0 \end{array}\right]}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x)=\left[\begin{array}{ccc} \frac{(-3\cos(2x)-9\sin(2x))e^{2x}}{5}+\frac{8e^{3x}}{5} & \frac{(8\cos(2x)+9\sin(2x))e^{2x}}{10}-\frac{4e^{3x}}{5} & \frac{(-\sin(2x)-2\cos(2x))e^{2x}}{10}+\frac{e^{3x}}{5} \\ \frac{12(-\sin(2x)-2\cos(2x))e^{2x}}{5}+\frac{24e^{3x}}{5} & \frac{(17\cos(2x)+\sin(2x))e^{2x}}{5}-\frac{12e^{3x}}{5} & \frac{(-3\cos(2x)+\sin(2x))e^{2x}}{5}+\frac{3e^{3x}}{5} \\ \frac{24(-3\cos(2x)+\sin(2x))e^{2x}}{5}+\frac{72e^{3x}}{5} & \frac{4(9\cos(2x)-8\sin(2x))e^{2x}}{5}-\frac{36e^{3x}}{5} & \frac{(-4\cos(2x)+8\sin(2x))e^{2x}}{5}+\frac{9e^{3x}}{5} \end{array}\right.$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

  $\overrightarrow{y}_p(x)=\Phi(x)\cdot\overrightarrow{v}(x)$

- Take the derivative of the particular solution

  $\overrightarrow{y}_p'(x)=\Phi'(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)=A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\overrightarrow{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

$$A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$$

- Cancel like terms

$$\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$$

- Multiply by the inverse of the fundamental matrix

$$\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$$

- Integrate to solve for $\vec{v}(x)$

$$\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$$

- Plug $\vec{v}(x)$ into the equation for the particular solution

$$\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds \right)$$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \left[\begin{array}{c} \frac{\left(\left(-10x^2+30x+4\right)\cos(2x)+\sin(2x)(10x-13)\right)e^{2x}}{20} - \frac{e^{3x}}{5} \\ \frac{\left(\left(-5x^2+15x+3\right)\cos(2x)+5\sin(2x)\left(x^2-2x-\frac{6}{5}\right)\right)e^{2x}}{5} - \frac{3e^{3x}}{5} \\ \frac{e^{2x}\left(4\left(5x^2-10x-7\right)\sin(2x)-9e^x+9\cos(2x)\right)}{5} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1 \vec{y}_1 + c_2 \vec{y}_2(x) + c_3 \vec{y}_3(x) + \left[\begin{array}{c} \frac{\left(\left(-10x^2+30x+4\right)\cos(2x)+\sin(2x)(10x-13)\right)e^{2x}}{20} - \frac{e^{3x}}{5} \\ \frac{\left(\left(-5x^2+15x+3\right)\cos(2x)+5\sin(2x)\left(x^2-2x-\frac{6}{5}\right)\right)e^{2x}}{5} - \frac{3e^{3x}}{5} \\ \frac{e^{2x}\left(4\left(5x^2-10x-7\right)\sin(2x)-9e^x+9\cos(2x)\right)}{5} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y = \frac{\left(\left(-20x^2+5c_3+60x+8\right)\cos(2x)+20\sin(2x)\left(x+\frac{c_2}{4}-\frac{13}{10}\right)\right)e^{2x}}{40} + \frac{e^{3x}(5c_1-9)}{45}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_y]]
```

$$\boxed{y''' - 6y'' + 18y' = -e^{3x}((-3x + 2)\cos(3x) - (3 + 3x)\sin(3x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - 6y'' + 18y' = 0$$

The characteristic equation is

$$\lambda^3 - 6\lambda^2 + 18\lambda = 0$$

The roots of the above equation are

$$\lambda_1 = 0$$
$$\lambda_2 = 3 + 3i$$
$$\lambda_3 = 3 - 3i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 + e^{(3-3i)x}c_2 + e^{(3+3i)x}c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= 1 \\ y_2 &= e^{(3-3i)x} \\ y_3 &= e^{(3+3i)x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y''' - 6y'' + 18y' = -e^{3x}((-3x+2)\cos(3x) - (3+3x)\sin(3x))$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} 1 & e^{(3-3i)x} & e^{(3+3i)x} \\ 0 & (3-3i)\, e^{(3-3i)x} & (3+3i)\, e^{(3+3i)x} \\ 0 & -18i e^{(3-3i)x} & 18i e^{(3+3i)x} \end{bmatrix}$$

$$|W| = 108i e^{(3-3i)x} e^{(3+3i)x}$$

The determinant simplifies to

$$|W| = 108i\mathrm{e}^{6x}$$

Now we determine W_i for each U_i.

$$\begin{aligned} W_1(x) &= \det \begin{bmatrix} \mathrm{e}^{(3-3i)x} & \mathrm{e}^{(3+3i)x} \\ (3-3i)\,\mathrm{e}^{(3-3i)x} & (3+3i)\,\mathrm{e}^{(3+3i)x} \end{bmatrix} \\ &= 6i\mathrm{e}^{6x} \end{aligned}$$

$$\begin{aligned} W_2(x) &= \det \begin{bmatrix} 1 & \mathrm{e}^{(3+3i)x} \\ 0 & (3+3i)\,\mathrm{e}^{(3+3i)x} \end{bmatrix} \\ &= (3+3i)\,\mathrm{e}^{(3+3i)x} \end{aligned}$$

$$\begin{aligned} W_3(x) &= \det \begin{bmatrix} 1 & \mathrm{e}^{(3-3i)x} \\ 0 & (3-3i)\,\mathrm{e}^{(3-3i)x} \end{bmatrix} \\ &= (3-3i)\,\mathrm{e}^{(3-3i)x} \end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{3-1} \int \frac{F(x)W_1(x)}{aW(x)}\,dx \\ &= (-1)^2 \int \frac{\left(-\mathrm{e}^{3x}((-3x+2)\cos(3x) - (3+3x)\sin(3x))\right)\left(6i\mathrm{e}^{6x}\right)}{(1)\left(108i\mathrm{e}^{6x}\right)}\,dx \\ &= \int \frac{-6i\mathrm{e}^{3x}((-3x+2)\cos(3x) - (3+3x)\sin(3x))\,\mathrm{e}^{6x}}{108i\mathrm{e}^{6x}}\,dx \\ &= \int \left(-\frac{\mathrm{e}^{3x}((-3x+2)\cos(3x) - (3+3x)\sin(3x))}{18}\right)\,dx \\ &= \frac{\cos(3x)\,\mathrm{e}^{3x}x}{36} - \frac{\left(-\frac{3x}{2}+\frac{1}{2}\right)\mathrm{e}^{3x}\sin(3x)}{54} + \frac{\left(-\frac{3x}{2}+\frac{1}{2}\right)\mathrm{e}^{3x}\cos(3x)}{54} + \frac{\sin(3x)\,\mathrm{e}^{3x}x}{36} - \frac{5\cos(3x)\,\mathrm{e}^{3x}}{108} + \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{3-2}\int \frac{F(x)W_2(x)}{aW(x)}\,dx\\
&= (-1)^{1}\int \frac{\left(-\mathrm{e}^{3x}((-3x+2)\cos(3x)-(3+3x)\sin(3x))\right)\left((3+3i)\,\mathrm{e}^{(3+3i)x}\right)}{(1)\left(108i\mathrm{e}^{6x}\right)}\,dx\\
&= -\int \frac{(-3-3i)\,\mathrm{e}^{3x}((-3x+2)\cos(3x)-(3+3x)\sin(3x))\,\mathrm{e}^{(3+3i)x}}{108i\mathrm{e}^{6x}}\,dx\\
&= -\int \left(\left(\frac{1}{36}-\frac{i}{36}\right)(3x\sin(3x)+3x\cos(3x)+3\sin(3x)-2\cos(3x))\,\mathrm{e}^{3ix}\right)dx\\
&= -\frac{x^2}{24}-\frac{x}{72}-\frac{5ix}{72}+\frac{(1-4i+6x)\,\mathrm{e}^{6ix}}{432}\\
&= -\frac{x^2}{24}-\frac{x}{72}-\frac{5ix}{72}+\frac{(1-4i+6x)\,\mathrm{e}^{6ix}}{432}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3}\int \frac{F(x)W_3(x)}{aW(x)}\,dx\\
&= (-1)^{0}\int \frac{\left(-\mathrm{e}^{3x}((-3x+2)\cos(3x)-(3+3x)\sin(3x))\right)\left((3-3i)\,\mathrm{e}^{(3-3i)x}\right)}{(1)\left(108i\mathrm{e}^{6x}\right)}\,dx\\
&= \int \frac{(-3+3i)\,\mathrm{e}^{3x}((-3x+2)\cos(3x)-(3+3x)\sin(3x))\,\mathrm{e}^{(3-3i)x}}{108i\mathrm{e}^{6x}}\,dx\\
&= \int \left(\left(-\frac{1}{36}-\frac{i}{36}\right)(3x\sin(3x)+3x\cos(3x)+3\sin(3x)-2\cos(3x))\,\mathrm{e}^{-3ix}\right)dx\\
&= \frac{5ix}{72}-\frac{x^2}{24}-\frac{x}{72}+\frac{(1+4i+6x)\,\mathrm{e}^{-6ix}}{432}\\
&= \frac{5ix}{72}-\frac{x^2}{24}-\frac{x}{72}+\frac{(1+4i+6x)\,\mathrm{e}^{-6ix}}{432}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1y_1 + U_2y_2 + U_3y_3
$$

Hence

$$
\begin{aligned}
y_p = &\left(\frac{\cos(3x)\,\mathrm{e}^{3x}x}{36}-\frac{\left(-\frac{3x}{2}+\frac{1}{2}\right)\mathrm{e}^{3x}\sin(3x)}{54}+\frac{\left(-\frac{3x}{2}+\frac{1}{2}\right)\mathrm{e}^{3x}\cos(3x)}{54}+\frac{\sin(3x)\,\mathrm{e}^{3x}x}{36}-\frac{5\cos(3x)\,\mathrm{e}^{3x}}{108}+\right.\\
&+\left(-\frac{x^2}{24}-\frac{x}{72}-\frac{5ix}{72}+\frac{(1-4i+6x)\,\mathrm{e}^{6ix}}{432}\right)\left(\mathrm{e}^{(3-3i)x}\right)\\
&+\left(\frac{5ix}{72}-\frac{x^2}{24}-\frac{x}{72}+\frac{(1+4i+6x)\,\mathrm{e}^{-6ix}}{432}\right)\left(\mathrm{e}^{(3+3i)x}\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = -\frac{\mathrm{e}^{3x}(18\cos(3x)\,x^2+18x\sin(3x)+7\cos(3x)-4\sin(3x))}{216}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1 + \mathrm{e}^{(3-3i)x} c_2 + \mathrm{e}^{(3+3i)x} c_3\right) \\
&\quad + \left(-\frac{\mathrm{e}^{3x}(18\cos(3x)\, x^2 + 18x\sin(3x) + 7\cos(3x) - 4\sin(3x))}{216}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 + \mathrm{e}^{(3-3i)x} c_2 + \mathrm{e}^{(3+3i)x} c_3 \\
&\quad - \frac{\mathrm{e}^{3x}(18\cos(3x)\, x^2 + 18x\sin(3x) + 7\cos(3x) - 4\sin(3x))}{216}
\end{aligned} \tag{1}
$$

Verification of solutions

$$
y = c_1 + \mathrm{e}^{(3-3i)x} c_2 + \mathrm{e}^{(3+3i)x} c_3 - \frac{\mathrm{e}^{3x}(18\cos(3x)\, x^2 + 18x\sin(3x) + 7\cos(3x) - 4\sin(3x))}{216}
$$

Verified OK.

19.36.1 Maple step by step solution

Let's solve

$y''' - 6y'' + 18y' = -\mathrm{e}^{3x}((-3x+2)\cos(3x) - (3+3x)\sin(3x))$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = 3\cos(3x)\,\mathrm{e}^{3x} x + 3\sin(3x)\,\mathrm{e}^{3x} x - 2\cos(3x)\,\mathrm{e}^{3x} + 3\sin(3x)\,\mathrm{e}^{3x} + 6y'' - 18y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - 6y'' + 18y' = \mathrm{e}^{3x}(3x\sin(3x) + 3x\cos(3x) + 3\sin(3x) - 2\cos(3x))$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

$y_3(x) = y''$

- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = 3\cos(3x)\,\mathrm{e}^{3x}x + 3\sin(3x)\,\mathrm{e}^{3x}x - 2\cos(3x)\,\mathrm{e}^{3x} + 3\sin(3x)\,\mathrm{e}^{3x} + 6y_3(x) - 18y_2(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 3\cos(3x)\,\mathrm{e}^{3x}x + 3\sin(3x)\,\mathrm{e}^{3x}x - 2\cos(3x)\,\mathrm{e}^{3x} + 3\sin(3x$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & -18 & 6 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 3\sin(3x)\,\mathrm{e}^{3x}x + 3\cos(3x)\,\mathrm{e}^{3x}x + 3\sin(3x)\,\mathrm{e}^{3x} - 2\cos(3x)\,\mathrm{e} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 3\sin(3x)\,\mathrm{e}^{3x}x + 3\cos(3x)\,\mathrm{e}^{3x}x + 3\sin(3x)\,\mathrm{e}^{3x} - 2\cos(3x)\,\mathrm{e}^{3x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & -18 & 6 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[0, \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}\right], \left[3 - 3\,\mathrm{I}, \begin{bmatrix} \frac{\mathrm{I}}{18} \\ \frac{1}{6} + \frac{\mathrm{I}}{6} \\ 1 \end{bmatrix}\right], \left[3 + 3\,\mathrm{I}, \begin{bmatrix} -\frac{\mathrm{I}}{18} \\ \frac{1}{6} - \frac{\mathrm{I}}{6} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[0, \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[3 - 3\,\mathrm{I}, \begin{bmatrix} \frac{\mathrm{I}}{18} \\ \frac{1}{6} + \frac{\mathrm{I}}{6} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(3-3\,\mathrm{I})x} \cdot \begin{bmatrix} \frac{\mathrm{I}}{18} \\ \frac{1}{6} + \frac{\mathrm{I}}{6} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of sin and cos

$$\mathrm{e}^{3x} \cdot (\cos(3x) - \mathrm{I}\sin(3x)) \cdot \begin{bmatrix} \frac{\mathrm{I}}{18} \\ \frac{1}{6} + \frac{\mathrm{I}}{6} \\ 1 \end{bmatrix}$$

- Simplify expression

$$\mathrm{e}^{3x} \cdot \begin{bmatrix} \frac{\mathrm{I}}{18}(\cos(3x) - \mathrm{I}\sin(3x)) \\ \left(\frac{1}{6} + \frac{\mathrm{I}}{6}\right)(\cos(3x) - \mathrm{I}\sin(3x)) \\ \cos(3x) - \mathrm{I}\sin(3x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_2(x) = e^{3x} \cdot \begin{bmatrix} \frac{\sin(3x)}{18} \\ \frac{\cos(3x)}{6} + \frac{\sin(3x)}{6} \\ \cos(3x) \end{bmatrix}, \vec{y}_3(x) = e^{3x} \cdot \begin{bmatrix} \frac{\cos(3x)}{18} \\ -\frac{\sin(3x)}{6} + \frac{\cos(3x)}{6} \\ -\sin(3x) \end{bmatrix}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

  $\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} 1 & \frac{\sin(3x)e^{3x}}{18} & \frac{\cos(3x)e^{3x}}{18} \\ 0 & e^{3x}\left(\frac{\cos(3x)}{6} + \frac{\sin(3x)}{6}\right) & e^{3x}\left(-\frac{\sin(3x)}{6} + \frac{\cos(3x)}{6}\right) \\ 0 & \cos(3x)e^{3x} & -\sin(3x)e^{3x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

  $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} 1 & \frac{\sin(3x)e^{3x}}{18} & \frac{\cos(3x)e^{3x}}{18} \\ 0 & e^{3x}\left(\frac{\cos(3x)}{6} + \frac{\sin(3x)}{6}\right) & e^{3x}\left(-\frac{\sin(3x)}{6} + \frac{\cos(3x)}{6}\right) \\ 0 & \cos(3x)e^{3x} & -\sin(3x)e^{3x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & 0 & \frac{1}{18} \\ 0 & \frac{1}{6} & \frac{1}{6} \\ 0 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} 1 & -\frac{1}{3} + \frac{\cos(3x)e^{3x}}{3} & \frac{1}{18} + \frac{(\sin(3x)-\cos(3x))e^{3x}}{18} \\ 0 & e^{3x}(-\sin(3x) + \cos(3x)) & \frac{\sin(3x)e^{3x}}{3} \\ 0 & -6\sin(3x)e^{3x} & e^{3x}(\sin(3x) + \cos(3x)) \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

- Cancel like terms

  $\Phi(x) \cdot \overrightarrow{v}'(x) = \overrightarrow{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\overrightarrow{v}'(x) = \frac{1}{\Phi(x)} \cdot \overrightarrow{f}(x)$

- Integrate to solve for $\overrightarrow{v}(x)$

  $\overrightarrow{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds$

- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

  $\overrightarrow{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

  $$\overrightarrow{y}_p(x) = \left[\begin{array}{c} \frac{1}{27}+\frac{e^{3x}\left(-9\cos(3x)x^2-9x\sin(3x)-4\cos(3x)+4\sin(3x)\right)}{108} \\ -\frac{\left(\left(-x^2+x-\frac{5}{9}\right)\sin(3x)+\cos(3x)x\left(x+\frac{5}{3}\right)\right)e^{3x}}{4} \\ \frac{3\left(\left(x+\frac{1}{3}\right)^2\sin(3x)-\frac{5x\cos(3x)}{3}\right)e^{3x}}{2} \end{array}\right]$$

- Plug particular solution back into general solution

  $$\overrightarrow{y}(x) = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2(x) + c_3\overrightarrow{y}_3(x) + \left[\begin{array}{c} \frac{1}{27}+\frac{e^{3x}\left(-9\cos(3x)x^2-9x\sin(3x)-4\cos(3x)+4\sin(3x)\right)}{108} \\ -\frac{\left(\left(-x^2+x-\frac{5}{9}\right)\sin(3x)+\cos(3x)x\left(x+\frac{5}{3}\right)\right)e^{3x}}{4} \\ \frac{3\left(\left(x+\frac{1}{3}\right)^2\sin(3x)-\frac{5x\cos(3x)}{3}\right)e^{3x}}{2} \end{array}\right]$$

- First component of the vector is the solution to the ODE

  $$y = \frac{\left(\left(-9x^2+6c_3-4\right)\cos(3x)-9\left(x-\frac{2c_2}{3}-\frac{4}{9}\right)\sin(3x)\right)e^{3x}}{108} + c_1 + \frac{1}{27}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.3. Undetermined Coefficients for Higher Order Equations. Page 495
Problem number: section 9.3, problem 37.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' + 2y''' - 2y'' - 8y' - 8y = e^{x}(8\cos(x) + 16\sin(x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + 2y''' - 2y'' - 8y' - 8y = 0$$

The characteristic equation is

$$\lambda^4 + 2\lambda^3 - 2\lambda^2 - 8\lambda - 8 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = -2$$
$$\lambda_3 = -1 - i$$
$$\lambda_4 = -1 + i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-2x} + e^{(-1-i)x} c_2 + c_3 e^{2x} + e^{(-1+i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^{-2x} \\ y_2 &= e^{(-1-i)x} \\ y_3 &= e^{2x} \\ y_4 &= e^{(-1+i)x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' + 2y''' - 2y'' - 8y' - 8y = e^x (8\cos(x) + 16\sin(x))$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^x (8\cos(x) + 16\sin(x))$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{\cos(x) e^x, \sin(x) e^x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^{(-1-i)x}, e^{(-1+i)x}, e^{-2x}, e^{2x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 \cos(x) e^x + A_2 \sin(x) e^x$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$\begin{aligned} &-24A_1 \cos(x) e^x - 24A_2 \sin(x) e^x + 8A_1 \sin(x) e^x - 8A_2 \cos(x) e^x \\ &= e^x (8\cos(x) + 16\sin(x)) \end{aligned}$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = -\frac{1}{10}, A_2 = -\frac{7}{10}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -\frac{\cos(x)\, e^x}{10} - \frac{7\sin(x)\, e^x}{10}$$

Therefore the general solution is

$$\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1 e^{-2x} + e^{(-1-i)x} c_2 + c_3 e^{2x} + e^{(-1+i)x} c_4\right) + \left(-\frac{\cos(x)\, e^x}{10} - \frac{7\sin(x)\, e^x}{10}\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 e^{-2x} + e^{(-1-i)x} c_2 + c_3 e^{2x} + e^{(-1+i)x} c_4 - \frac{\cos(x)\, e^x}{10} - \frac{7\sin(x)\, e^x}{10} \tag{1}$$

Verification of solutions

$$y = c_1 e^{-2x} + e^{(-1-i)x} c_2 + c_3 e^{2x} + e^{(-1+i)x} c_4 - \frac{\cos(x)\, e^x}{10} - \frac{7\sin(x)\, e^x}{10}$$

Verified OK.

19.37.1 Maple step by step solution

Let's solve

$y'''' + 2y''' - 2y'' - 8y' - 8y = e^x(8\cos(x) + 16\sin(x))$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = 8y + 8\cos(x)\, e^x + 16\sin(x)\, e^x - 2y''' + 2y'' + 8y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'''' + 2y''' - 2y'' - 8y' - 8y = 8\, e^x(\cos(x) + 2\sin(x))$

□ Convert linear ODE into a system of first order ODEs

- Define new variable $y_1(x)$

  $y_1(x) = y$
- Define new variable $y_2(x)$

  $y_2(x) = y'$
- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Define new variable $y_4(x)$

  $y_4(x) = y'''$
- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = 8\cos(x)\,e^x + 16\sin(x)\,e^x - 2y_4(x) + 2y_3(x) + 8y_2(x) + 8y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x)\,, y_3(x) = y_2'(x)\,, y_4(x) = y_3'(x)\,, y_4'(x) = 8\cos(x)\,e^x + 16\sin(x)\,e^x - 2y_4(x) + 2y_3($

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 8 & 8 & 2 & -2 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ 16\sin(x)\,e^x + 8\cos(x)\,e^x \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 16\sin(x)\,e^x + 8\cos(x)\,e^x \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 8 & 8 & 2 & -2 \end{bmatrix}$$

- Rewrite the system as

  $\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x) + \overrightarrow{f}$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[-1 - \mathrm{I}, \begin{bmatrix} \frac{1}{4} + \frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2} + \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[-1 + \mathrm{I}, \begin{bmatrix} \frac{1}{4} - \frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ -\frac{1}{2} - \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-2x} \cdot \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_2 = \mathrm{e}^{2x} \cdot \left[\begin{array}{c} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-1-\mathrm{I}, \left[\begin{array}{c} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(-1-\mathrm{I})x} \cdot \left[\begin{array}{c} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of sin and cos

$$\mathrm{e}^{-x} \cdot (\cos(x) - \mathrm{I}\sin(x)) \cdot \left[\begin{array}{c} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Simplify expression

$$\mathrm{e}^{-x} \cdot \left[\begin{array}{c} \left(\frac{1}{4}+\frac{\mathrm{I}}{4}\right)(\cos(x) - \mathrm{I}\sin(x)) \\ -\frac{\mathrm{I}}{2}(\cos(x) - \mathrm{I}\sin(x)) \\ \left(-\frac{1}{2}+\frac{\mathrm{I}}{2}\right)(\cos(x) - \mathrm{I}\sin(x)) \\ \cos(x) - \mathrm{I}\sin(x) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = \mathrm{e}^{-x} \cdot \begin{bmatrix} \frac{\sin(x)}{4} + \frac{\cos(x)}{4} \\ -\frac{\sin(x)}{2} \\ -\frac{\cos(x)}{2} + \frac{\sin(x)}{2} \\ \cos(x) \end{bmatrix}, \vec{y}_4(x) = \mathrm{e}^{-x} \cdot \begin{bmatrix} \frac{\cos(x)}{4} - \frac{\sin(x)}{4} \\ -\frac{\cos(x)}{2} \\ \frac{\cos(x)}{2} + \frac{\sin(x)}{2} \\ -\sin(x) \end{bmatrix}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

  $\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} -\frac{\mathrm{e}^{-2x}}{8} & \frac{\mathrm{e}^{2x}}{8} & \mathrm{e}^{-x}\left(\frac{\sin(x)}{4} + \frac{\cos(x)}{4}\right) & \mathrm{e}^{-x}\left(\frac{\cos(x)}{4} - \frac{\sin(x)}{4}\right) \\ \frac{\mathrm{e}^{-2x}}{4} & \frac{\mathrm{e}^{2x}}{4} & -\frac{\sin(x)\mathrm{e}^{-x}}{2} & -\frac{\cos(x)\mathrm{e}^{-x}}{2} \\ -\frac{\mathrm{e}^{-2x}}{2} & \frac{\mathrm{e}^{2x}}{2} & \mathrm{e}^{-x}\left(-\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) & \mathrm{e}^{-x}\left(\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) \\ \mathrm{e}^{-2x} & \mathrm{e}^{2x} & \cos(x)\,\mathrm{e}^{-x} & -\sin(x)\,\mathrm{e}^{-x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

  $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} -\frac{\mathrm{e}^{-2x}}{8} & \frac{\mathrm{e}^{2x}}{8} & \mathrm{e}^{-x}\left(\frac{\sin(x)}{4} + \frac{\cos(x)}{4}\right) & \mathrm{e}^{-x}\left(\frac{\cos(x)}{4} - \frac{\sin(x)}{4}\right) \\ \frac{\mathrm{e}^{-2x}}{4} & \frac{\mathrm{e}^{2x}}{4} & -\frac{\sin(x)\mathrm{e}^{-x}}{2} & -\frac{\cos(x)\mathrm{e}^{-x}}{2} \\ -\frac{\mathrm{e}^{-2x}}{2} & \frac{\mathrm{e}^{2x}}{2} & \mathrm{e}^{-x}\left(-\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) & \mathrm{e}^{-x}\left(\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) \\ \mathrm{e}^{-2x} & \mathrm{e}^{2x} & \cos(x)\,\mathrm{e}^{-x} & -\sin(x)\,\mathrm{e}^{-x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} -\frac{1}{8} & \frac{1}{8} & \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & \frac{1}{4} & 0 & -\frac{1}{2} \\ -\frac{1}{2} & \frac{1}{2} & -\frac{1}{2} & \frac{1}{2} \\ 1 & 1 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{(\mathrm{e}^{4x}+4\cos(x)\mathrm{e}^{x}+12\sin(x)\mathrm{e}^{x}+5)\mathrm{e}^{-2x}}{10} & -\frac{2\left(-\frac{3\,\mathrm{e}^{4x}}{8}-\frac{5}{8}+(-2\sin(x)+\cos(x))\mathrm{e}^{x}\right)\mathrm{e}^{-2x}}{5} & \frac{(-\cos(x)-3\sin(x))\mathrm{e}^{-x}}{10} \\ \frac{(\mathrm{e}^{4x}-5+(4\cos(x)-8\sin(x))\mathrm{e}^{x})\mathrm{e}^{-2x}}{5} & \frac{(3\,\mathrm{e}^{4x}-5+(12\cos(x)-4\sin(x))\mathrm{e}^{x})\mathrm{e}^{-2x}}{10} & \frac{(2\sin(x)-\cos(x))\mathrm{e}^{-x}}{5} + \\ \frac{2(5+\mathrm{e}^{4x}+2(\sin(x)-3\cos(x))\mathrm{e}^{x})\mathrm{e}^{-2x}}{5} & \frac{(3\,\mathrm{e}^{4x}+5+(-8\cos(x)-4\sin(x))\mathrm{e}^{x})\mathrm{e}^{-2x}}{5} & \frac{(3\cos(x)-\sin(x))\mathrm{e}^{-x}}{5} + \\ \frac{4(-5+\mathrm{e}^{4x}+2(2\cos(x)+\sin(x))\mathrm{e}^{x})\mathrm{e}^{-2x}}{5} & \frac{4\left(\frac{3\,\mathrm{e}^{4x}}{2}-\frac{5}{2}+(\cos(x)+3\sin(x))\mathrm{e}^{x}\right)\mathrm{e}^{-2x}}{5} & \frac{(-4\cos(x)-2\sin(x))\mathrm{e}^{-x}}{5} \end{bmatrix}$$

- ☐ Find a particular solution of the system of ODEs using variation of parameters
  - Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

    $\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$
  - Take the derivative of the particular solution

    $\overrightarrow{y}'_p(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$
  - Substitute particular solution and its derivative into the system of ODEs

    $\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
  - The fundamental matrix has columns that are solutions to the homogeneous system so its der

    $A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
  - Cancel like terms

    $\Phi(x) \cdot \overrightarrow{v}'(x) = \overrightarrow{f}(x)$
  - Multiply by the inverse of the fundamental matrix

    $\overrightarrow{v}'(x) = \frac{1}{\Phi(x)} \cdot \overrightarrow{f}(x)$
  - Integrate to solve for $\overrightarrow{v}(x)$

    $\overrightarrow{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds$
  - Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

    $\overrightarrow{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds\right)$
  - Plug in the fundamental matrix and the forcing function and compute

$$\overrightarrow{y}_p(x) = \left[\begin{array}{c} \frac{e^{-2x} \left(-(\cos(x)+7\sin(x))e^{3x}-3\cos(x)e^{x}+\sin(x)e^{x}+3\,e^{4x}+1\right)}{10} \\ \frac{e^{-2x} \left((-3\sin(x)-4\cos(x))e^{3x}+2\cos(x)e^{x}+\sin(x)e^{x}+3\,e^{4x}-1\right)}{5} \\ -\frac{\left((7\cos(x)-\sin(x))e^{3x}+\cos(x)e^{x}+3\sin(x)e^{x}-6\,e^{4x}-2\right)e^{-2x}}{5} \\ -\frac{2\left((3\cos(x)-4\sin(x))e^{3x}+\cos(x)e^{x}-2\sin(x)e^{x}-6\,e^{4x}+2\right)e^{-2x}}{5} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \begin{bmatrix} \frac{e^{-2x}\left(-(\cos(x)+7\sin(x))e^{3x}-3\cos(x)e^{x}+\sin(x)e^{x}+3e^{4x}+1\right)}{10} \\ \frac{e^{-2x}\left((-3\sin(x)-4\cos(x))e^{3x}+2\cos(x)e^{x}+\sin(x)e^{x}+3e^{4x}-1\right)}{5} \\ -\frac{\left((7\cos(x)-\sin(x))e^{3x}+\cos(x)e^{x}+3\sin(x)e^{x}-6e^{4x}-2\right)e^{-2x}}{5} \\ -\frac{2\left((3\cos(x)-4\sin(x))e^{3x}+\cos(x)e^{x}-2\sin(x)e^{x}-6e^{4x}+2\right)e^{-2x}}{5} \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = -\frac{\left((\cos(x)+7\sin(x))e^{3x}+\left(-\frac{5c_2}{4}-3\right)e^{4x}+\left(\left(-\frac{5c_3}{2}-\frac{5c_4}{2}+3\right)\cos(x)-\frac{5\left(c_3-c_4+\frac{2}{5}\right)\sin(x)}{2}\right)e^{x}+\frac{5c_1}{4}-1\right)e^{-2x}}{10}$$

Problem number: section 9.3, problem 38.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 3y''' + 2y'' + 2y' - 4y = e^{x}(-\sin(2x) + 2\cos(2x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 3y''' + 2y'' + 2y' - 4y = 0$$

The characteristic equation is

$$\lambda^4 - 3\lambda^3 + 2\lambda^2 + 2\lambda - 4 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = -1$$
$$\lambda_3 = 1 - i$$
$$\lambda_4 = 1 + i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{2x} + e^{(1-i)x} c_3 + e^{(1+i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = e^{2x}$$
$$y_3 = e^{(1-i)x}$$
$$y_4 = e^{(1+i)x}$$

Now the particular solution to the given ODE is found

$$y'''' - 3y''' + 2y'' + 2y' - 4y = e^{x}(-\sin(2x) + 2\cos(2x))$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{x}(-\sin(2x) + 2\cos(2x))$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{e^{x}\cos(2x), e^{x}\sin(2x)\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^{(1-i)x}, e^{(1+i)x}, e^{-x}, e^{2x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 e^{x}\cos(2x) + A_2 e^{x}\sin(2x)$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$18A_1 e^{x}\cos(2x) + 6A_1 e^{x}\sin(2x) + 18A_2 e^{x}\sin(2x) - 6A_2 e^{x}\cos(2x) \\ = e^{x}(-\sin(2x) + 2\cos(2x))$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{1}{12}, A_2 = -\frac{1}{12}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{e^x \cos(2x)}{12} - \frac{e^x \sin(2x)}{12}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-x} + c_2 e^{2x} + e^{(1-i)x} c_3 + e^{(1+i)x} c_4\right) + \left(\frac{e^x \cos(2x)}{12} - \frac{e^x \sin(2x)}{12}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 e^{-x} + c_2 e^{2x} + e^{(1-i)x} c_3 + e^{(1+i)x} c_4 + \frac{e^x \cos(2x)}{12} - \frac{e^x \sin(2x)}{12} \tag{1}$$

Verification of solutions

$$y = c_1 e^{-x} + c_2 e^{2x} + e^{(1-i)x} c_3 + e^{(1+i)x} c_4 + \frac{e^x \cos(2x)}{12} - \frac{e^x \sin(2x)}{12}$$

Verified OK.

19.38.1 Maple step by step solution

Let's solve

$y'''' - 3y''' + 2y'' + 2y' - 4y = e^x(-\sin(2x) + 2\cos(2x))$

- Highest derivative means the order of the ODE is 4

  y''''

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Define new variable $y_4(x)$

  $y_4(x) = y'''$
- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = 2\,\mathrm{e}^x \cos(2x) - \mathrm{e}^x \sin(2x) + 3y_4(x) - 2y_3(x) - 2y_2(x) + 4y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = 2\,\mathrm{e}^x \cos(2x) - \mathrm{e}^x \sin(2x) + 3y_4(x) - 2y_3($

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 4 & -2 & -2 & 3 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ 2\,\mathrm{e}^x \cos(2x) - \mathrm{e}^x \sin(2x) \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 2\,\mathrm{e}^x \cos(2x) - \mathrm{e}^x \sin(2x) \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 4 & -2 & -2 & 3 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[1 - \mathrm{I}, \begin{bmatrix} -\frac{1}{4} + \frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2} + \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[1 + \mathrm{I}, \begin{bmatrix} -\frac{1}{4} - \frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ \frac{1}{2} - \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-x} \cdot \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{2x} \cdot \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[1-\mathrm{I}, \left[\begin{array}{c} -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$e^{(1-\mathrm{I})x} \cdot \left[\begin{array}{c} -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^{x} \cdot (\cos(x) - \mathrm{I}\sin(x)) \cdot \left[\begin{array}{c} -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{x} \cdot \left[\begin{array}{c} \left(-\frac{1}{4}+\frac{\mathrm{I}}{4}\right)(\cos(x) - \mathrm{I}\sin(x)) \\ \frac{\mathrm{I}}{2}(\cos(x) - \mathrm{I}\sin(x)) \\ \left(\frac{1}{2}+\frac{\mathrm{I}}{2}\right)(\cos(x) - \mathrm{I}\sin(x)) \\ \cos(x) - \mathrm{I}\sin(x) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = e^{x} \cdot \left[\begin{array}{c} -\frac{\cos(x)}{4}+\frac{\sin(x)}{4} \\ \frac{\sin(x)}{2} \\ \frac{\cos(x)}{2}+\frac{\sin(x)}{2} \\ \cos(x) \end{array}\right], \vec{y}_4(x) = e^{x} \cdot \left[\begin{array}{c} \frac{\sin(x)}{4}+\frac{\cos(x)}{4} \\ \frac{\cos(x)}{2} \\ \frac{\cos(x)}{2}-\frac{\sin(x)}{2} \\ -\sin(x) \end{array}\right]\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \vec{y}_p(x)$$

□ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} -\mathrm{e}^{-x} & \frac{\mathrm{e}^{2x}}{8} & \mathrm{e}^{x}\left(-\frac{\cos(x)}{4}+\frac{\sin(x)}{4}\right) & \mathrm{e}^{x}\left(\frac{\sin(x)}{4}+\frac{\cos(x)}{4}\right) \\ \mathrm{e}^{-x} & \frac{\mathrm{e}^{2x}}{4} & \frac{\sin(x)\mathrm{e}^{x}}{2} & \frac{\cos(x)\mathrm{e}^{x}}{2} \\ -\mathrm{e}^{-x} & \frac{\mathrm{e}^{2x}}{2} & \mathrm{e}^{x}\left(\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & \left(\frac{\cos(x)}{2}-\frac{\sin(x)}{2}\right)\mathrm{e}^{x} \\ \mathrm{e}^{-x} & \mathrm{e}^{2x} & \cos(x)\,\mathrm{e}^{x} & -\sin(x)\,\mathrm{e}^{x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} -\mathrm{e}^{-x} & \frac{\mathrm{e}^{2x}}{8} & \mathrm{e}^{x}\left(-\frac{\cos(x)}{4}+\frac{\sin(x)}{4}\right) & \mathrm{e}^{x}\left(\frac{\sin(x)}{4}+\frac{\cos(x)}{4}\right) \\ \mathrm{e}^{-x} & \frac{\mathrm{e}^{2x}}{4} & \frac{\sin(x)\mathrm{e}^{x}}{2} & \frac{\cos(x)\mathrm{e}^{x}}{2} \\ -\mathrm{e}^{-x} & \frac{\mathrm{e}^{2x}}{2} & \mathrm{e}^{x}\left(\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & \left(\frac{\cos(x)}{2}-\frac{\sin(x)}{2}\right)\mathrm{e}^{x} \\ \mathrm{e}^{-x} & \mathrm{e}^{2x} & \cos(x)\,\mathrm{e}^{x} & -\sin(x)\,\mathrm{e}^{x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} -1 & \frac{1}{8} & -\frac{1}{4} & \frac{1}{4} \\ 1 & \frac{1}{4} & 0 & \frac{1}{2} \\ -1 & \frac{1}{2} & \frac{1}{2} & \frac{1}{2} \\ 1 & 1 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{4\,\mathrm{e}^{-x}}{15}+\frac{\mathrm{e}^{2x}}{3}+\frac{2(-2\sin(x)+\cos(x))\mathrm{e}^{x}}{5} & -\frac{2\,\mathrm{e}^{-x}}{5}+\frac{(2\cos(x)+\sin(x))\mathrm{e}^{x}}{5} & \frac{4\,\mathrm{e}^{-x}}{15}-\frac{\mathrm{e}^{2x}}{6}+(-\cos(x)\cdots \\ -\frac{4\,\mathrm{e}^{-x}}{15}+\frac{2\,\mathrm{e}^{2x}}{3}+\frac{2(-\cos(x)-3\sin(x))\mathrm{e}^{x}}{5} & \frac{2\,\mathrm{e}^{-x}}{5}+\frac{(3\cos(x)-\sin(x))\mathrm{e}^{x}}{5} & -\frac{4\,\mathrm{e}^{-x}}{15}-\frac{\mathrm{e}^{2x}}{3}+(3\cos(x\cdots \\ \frac{4\,\mathrm{e}^{-x}}{15}+\frac{4\,\mathrm{e}^{2x}}{3}+\frac{4(-2\cos(x)-\sin(x))\mathrm{e}^{x}}{5} & -\frac{2\,\mathrm{e}^{-x}}{5}+\frac{(-4\sin(x)+2\cos(x))\mathrm{e}^{x}}{5} & \frac{4\,\mathrm{e}^{-x}}{15}-\frac{2\,\mathrm{e}^{2x}}{3}+(7\cos(x\cdots \\ -\frac{4\,\mathrm{e}^{-x}}{15}+\frac{8\,\mathrm{e}^{2x}}{3}+\frac{4(\sin(x)-3\cos(x))\mathrm{e}^{x}}{5} & \frac{2\,\mathrm{e}^{-x}}{5}+\frac{(-2\cos(x)-6\sin(x))\mathrm{e}^{x}}{5} & -\frac{4\,\mathrm{e}^{-x}}{15}-\frac{4\,\mathrm{e}^{2x}}{3}+2(4\cos(\cdots \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

$\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

$\vec{y}'_p(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

$$A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$$

- Cancel like terms

$$\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$$

- Multiply by the inverse of the fundamental matrix

$$\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$$

- Integrate to solve for $\vec{v}(x)$

$$\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$$

- Plug $\vec{v}(x)$ into the equation for the particular solution

$$\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \begin{bmatrix} \frac{e^{-x}}{20} + \frac{\left(10\cos(x)^2+(-10\sin(x)-8)\cos(x)+16\sin(x)-5\right)e^x}{60} \\ -\frac{e^{-x}}{20} + \frac{\left(-10\cos(x)^2+(-30\sin(x)+8)\cos(x)+24\sin(x)+5\right)e^x}{60} \\ \frac{e^{-x}}{20} + \frac{\left(-70\cos(x)^2+(-10\sin(x)+32)\cos(x)+16\sin(x)+35\right)e^x}{60} \\ -\frac{e^{-x}}{20} + \frac{\left(-90\cos(x)^2+(130\sin(x)+48)\cos(x)-16\sin(x)+45\right)e^x}{60} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \begin{bmatrix} \frac{e^{-x}}{20} + \frac{\left(10\cos(x)^2+(-10\sin(x)-8)\cos(x)+16\sin(x)-5\right)e^x}{60} \\ -\frac{e^{-x}}{20} + \frac{\left(-10\cos(x)^2+(-30\sin(x)+8)\cos(x)+24\sin(x)+5\right)e^x}{60} \\ \frac{e^{-x}}{20} + \frac{\left(-70\cos(x)^2+(-10\sin(x)+32)\cos(x)+16\sin(x)+35\right)e^x}{60} \\ -\frac{e^{-x}}{20} + \frac{\left(-90\cos(x)^2+(130\sin(x)+48)\cos(x)-16\sin(x)+45\right)e^x}{60} \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = \frac{(1-20c_1)e^{-x}}{20} + \frac{c_2 e^{2x}}{8} - \frac{\left(-\frac{2\cos(x)^2}{3}+\left(c_3-c_4+\frac{2\sin(x)}{3}+\frac{8}{15}\right)\cos(x)+\frac{1}{3}+\left(-c_3-c_4-\frac{16}{15}\right)\sin(x)\right)e^x}{4}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 8y''' + 24y'' - 32y' + 15y = e^{2x}(15x\cos(2x) + 32\sin(2x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 8y''' + 24y'' - 32y' + 15y = 0$$

The characteristic equation is

$$\lambda^4 - 8\lambda^3 + 24\lambda^2 - 32\lambda + 15 = 0$$

The roots of the above equation are

$$\lambda_1 = 3$$
$$\lambda_2 = 1$$
$$\lambda_3 = 2 + i$$
$$\lambda_4 = 2 - i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + c_2 e^{3x} + e^{(2+i)x} c_3 + e^{(2-i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^x$$
$$y_2 = e^{3x}$$
$$y_3 = e^{(2+i)x}$$
$$y_4 = e^{(2-i)x}$$

Now the particular solution to the given ODE is found

$$y'''' - 8y''' + 24y'' - 32y' + 15y = e^{2x}(15x \cos(2x) + 32 \sin(2x))$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{2x}(15x \cos(2x) + 32 \sin(2x))$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{\cos(2x) e^{2x}, \sin(2x) e^{2x}, \cos(2x) e^{2x} x, \sin(2x) e^{2x} x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^x, e^{(2-i)x}, e^{(2+i)x}, e^{3x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 \cos(2x) e^{2x} + A_2 \sin(2x) e^{2x} + A_3 \cos(2x) e^{2x} x + A_4 \sin(2x) e^{2x} x$$

The unknowns $\{A_1, A_2, A_3, A_4\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$\begin{aligned}&15A_4 \sin(2x) e^{2x} x + 15A_3 \cos(2x) e^{2x} x - 32A_4 \cos(2x) e^{2x} + 32A_3 \sin(2x) e^{2x} \\ &+ 15A_1 \cos(2x) e^{2x} + 15A_2 \sin(2x) e^{2x} = e^{2x}(15x \cos(2x) + 32 \sin(2x))\end{aligned}$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 0, A_2 = 0, A_3 = 1, A_4 = 0]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \cos(2x)\,e^{2x}x$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{x} + c_2 e^{3x} + e^{(2+i)x} c_3 + e^{(2-i)x} c_4\right) + \left(\cos(2x)\,e^{2x}x\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 e^{x} + c_2 e^{3x} + e^{(2+i)x} c_3 + e^{(2-i)x} c_4 + \cos(2x)\,e^{2x}x \tag{1}$$

Verification of solutions

$$y = c_1 e^{x} + c_2 e^{3x} + e^{(2+i)x} c_3 + e^{(2-i)x} c_4 + \cos(2x)\,e^{2x}x$$

Verified OK.

19.39.1 Maple step by step solution

Let's solve

$y'''' - 8y''' + 24y'' - 32y' + 15y = e^{2x}(15x\cos(2x) + 32\sin(2x))$

- Highest derivative means the order of the ODE is 4

  y''''

□ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

  - Define new variable $y_3(x)$

    $y_3(x) = y''$

- Define new variable $y_4(x)$

  $y_4(x) = y'''$
- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = 15\cos(2x)\,\mathrm{e}^{2x}x + 32\sin(2x)\,\mathrm{e}^{2x} + 8y_4(x) - 24y_3(x) + 32y_2(x) - 15y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = 15\cos(2x)\,\mathrm{e}^{2x}x + 32\sin(2x)\,\mathrm{e}^{2x} + 8y_4(x)$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -15 & 32 & -24 & 8 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ 15\cos(2x)\,\mathrm{e}^{2x}x + 32\sin(2x)\,\mathrm{e}^{2x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 15\cos(2x)\,\mathrm{e}^{2x}x + 32\sin(2x)\,\mathrm{e}^{2x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -15 & 32 & -24 & 8 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \left[\begin{array}{c}1\\1\\1\\1\end{array}\right]\right], \left[3, \left[\begin{array}{c}\frac{1}{27}\\\frac{1}{9}\\\frac{1}{3}\\1\end{array}\right]\right], \left[2-\mathrm{I}, \left[\begin{array}{c}\frac{2}{125}+\frac{11\,\mathrm{I}}{125}\\\frac{3}{25}+\frac{4\,\mathrm{I}}{25}\\\frac{2}{5}+\frac{\mathrm{I}}{5}\\1\end{array}\right]\right], \left[2+\mathrm{I}, \left[\begin{array}{c}\frac{2}{125}-\frac{11\,\mathrm{I}}{125}\\\frac{3}{25}-\frac{4\,\mathrm{I}}{25}\\\frac{2}{5}-\frac{\mathrm{I}}{5}\\1\end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c}1\\1\\1\\1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{x} \cdot \left[\begin{array}{c}1\\1\\1\\1\end{array}\right]$$

- Consider eigenpair

$$\left[3, \left[\begin{array}{c}\frac{1}{27}\\\frac{1}{9}\\\frac{1}{3}\\1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{3x} \cdot \left[\begin{array}{c}\frac{1}{27}\\\frac{1}{9}\\\frac{1}{3}\\1\end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[2-\mathrm{I}, \left[\begin{array}{c} \frac{2}{125}+\frac{11\,\mathrm{I}}{125} \\ \frac{3}{25}+\frac{4\,\mathrm{I}}{25} \\ \frac{2}{5}+\frac{\mathrm{I}}{5} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(2-\mathrm{I})x} \cdot \left[\begin{array}{c} \frac{2}{125}+\frac{11\,\mathrm{I}}{125} \\ \frac{3}{25}+\frac{4\,\mathrm{I}}{25} \\ \frac{2}{5}+\frac{\mathrm{I}}{5} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{2x} \cdot \left(\cos\left(x\right)-\mathrm{I}\sin\left(x\right)\right) \cdot \left[\begin{array}{c} \frac{2}{125}+\frac{11\,\mathrm{I}}{125} \\ \frac{3}{25}+\frac{4\,\mathrm{I}}{25} \\ \frac{2}{5}+\frac{\mathrm{I}}{5} \\ 1 \end{array}\right]$$

- Simplify expression

$$\mathrm{e}^{2x} \cdot \left[\begin{array}{c} \left(\frac{2}{125}+\frac{11\,\mathrm{I}}{125}\right)\left(\cos\left(x\right)-\mathrm{I}\sin\left(x\right)\right) \\ \left(\frac{3}{25}+\frac{4\,\mathrm{I}}{25}\right)\left(\cos\left(x\right)-\mathrm{I}\sin\left(x\right)\right) \\ \left(\frac{2}{5}+\frac{\mathrm{I}}{5}\right)\left(\cos\left(x\right)-\mathrm{I}\sin\left(x\right)\right) \\ \cos\left(x\right)-\mathrm{I}\sin\left(x\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x)=\mathrm{e}^{2x} \cdot \left[\begin{array}{c} \frac{2\cos(x)}{125}+\frac{11\sin(x)}{125} \\ \frac{3\cos(x)}{25}+\frac{4\sin(x)}{25} \\ \frac{\sin(x)}{5}+\frac{2\cos(x)}{5} \\ \cos\left(x\right) \end{array}\right], \vec{y}_4(x)=\mathrm{e}^{2x} \cdot \left[\begin{array}{c} -\frac{2\sin(x)}{125}+\frac{11\cos(x)}{125} \\ -\frac{3\sin(x)}{25}+\frac{4\cos(x)}{25} \\ -\frac{2\sin(x)}{5}+\frac{\cos(x)}{5} \\ -\sin\left(x\right) \end{array}\right]\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$$\vec{y}(x)=c_1\vec{y}_1+c_2\vec{y}_2+c_3\vec{y}_3(x)+c_4\vec{y}_4(x)+\vec{y}_p(x)$$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} e^{x} & \frac{e^{3x}}{27} & e^{2x}\left(\frac{2\cos(x)}{125}+\frac{11\sin(x)}{125}\right) & e^{2x}\left(-\frac{2\sin(x)}{125}+\frac{11\cos(x)}{125}\right) \\ e^{x} & \frac{e^{3x}}{9} & e^{2x}\left(\frac{3\cos(x)}{25}+\frac{4\sin(x)}{25}\right) & e^{2x}\left(-\frac{3\sin(x)}{25}+\frac{4\cos(x)}{25}\right) \\ e^{x} & \frac{e^{3x}}{3} & e^{2x}\left(\frac{\sin(x)}{5}+\frac{2\cos(x)}{5}\right) & e^{2x}\left(-\frac{2\sin(x)}{5}+\frac{\cos(x)}{5}\right) \\ e^{x} & e^{3x} & e^{2x}\cos(x) & -e^{2x}\sin(x) \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

  $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} e^{x} & \frac{e^{3x}}{27} & e^{2x}\left(\frac{2\cos(x)}{125}+\frac{11\sin(x)}{125}\right) & e^{2x}\left(-\frac{2\sin(x)}{125}+\frac{11\cos(x)}{125}\right) \\ e^{x} & \frac{e^{3x}}{9} & e^{2x}\left(\frac{3\cos(x)}{25}+\frac{4\sin(x)}{25}\right) & e^{2x}\left(-\frac{3\sin(x)}{25}+\frac{4\cos(x)}{25}\right) \\ e^{x} & \frac{e^{3x}}{3} & e^{2x}\left(\frac{\sin(x)}{5}+\frac{2\cos(x)}{5}\right) & e^{2x}\left(-\frac{2\sin(x)}{5}+\frac{\cos(x)}{5}\right) \\ e^{x} & e^{3x} & e^{2x}\cos(x) & -e^{2x}\sin(x) \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & \frac{1}{27} & \frac{2}{125} & \frac{11}{125} \\ 1 & \frac{1}{9} & \frac{3}{25} & \frac{4}{25} \\ 1 & \frac{1}{3} & \frac{2}{5} & \frac{1}{5} \\ 1 & 1 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{3(2\sin(x)-\cos(x))e^{2x}}{2}+\frac{15\,e^{x}}{4}-\frac{5\,e^{3x}}{4} & \frac{(8\cos(x)-22\sin(x))e^{2x}}{4}-\frac{17\,e^{x}}{4}+\frac{9\,e^{3x}}{4} & \frac{(-\cos(x)+6\,s}{2} \\ \frac{15\,e^{2x}\sin(x)}{2}+\frac{15\,e^{x}}{4}-\frac{15\,e^{3x}}{4} & \frac{(-6\cos(x)-52\sin(x))e^{2x}}{4}-\frac{17\,e^{x}}{4}+\frac{27\,e^{3x}}{4} & \frac{(8\cos(x)+26\,s}{4} \\ \frac{15(\cos(x)+2\sin(x))e^{2x}}{2}+\frac{15\,e^{x}}{4}-\frac{45\,e^{3x}}{4} & \frac{(-64\cos(x)-98\sin(x))e^{2x}}{4}-\frac{17\,e^{x}}{4}+\frac{81\,e^{3x}}{4} & \frac{(42\cos(x)+44}{4} \\ \frac{15(4\cos(x)+3\sin(x))e^{2x}}{2}+\frac{15\,e^{x}}{4}-\frac{135\,e^{3x}}{4} & \frac{(-113\cos(x)-66\sin(x))e^{2x}}{2}-\frac{17\,e^{x}}{4}+\frac{243\,e^{3x}}{4} & \frac{(64\cos(x)+23\,s}{2} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)=A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\overrightarrow{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot\overrightarrow{v}'(x)=\overrightarrow{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\overrightarrow{v}'(x)=\frac{1}{\Phi(x)}\cdot\overrightarrow{f}(x)$

- Integrate to solve for $\overrightarrow{v}(x)$

  $\overrightarrow{v}(x)=\int_0^x\frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds$

- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

  $\overrightarrow{y}_p(x)=\Phi(x)\cdot\left(\int_0^x\frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\overrightarrow{y}_p(x)=\left[\begin{array}{c}\frac{\mathrm{e}^{x}\left(8\,\mathrm{e}^{x}\cos(x)^{2}x-26\sin(x)\mathrm{e}^{x}-4x\,\mathrm{e}^{x}+11\,\mathrm{e}^{2x}-11\right)}{4}\\ 4\left(\frac{33\,\mathrm{e}^{2x}}{16}-\frac{11}{16}+\left(\left(x+\frac{1}{2}\right)\cos(x)^{2}+\left(-\sin(x)\,x-\frac{13}{8}\right)\cos(x)-\frac{x}{2}-\frac{13\sin(x)}{4}-\frac{1}{4}\right)\mathrm{e}^{x}\right)\\ -16\left(-\frac{99\,\mathrm{e}^{2x}}{64}+\frac{11}{64}+\left(-\frac{\cos(x)^{2}}{2}+\left(\frac{13}{8}+\left(x+\frac{1}{2}\right)\sin(x)\right)\cos(x)+\frac{39\sin(x)}{32}+\frac{1}{4}\right)\mathrm{e}^{x}\right)\mathrm{e}^{x}\\ -32\left(-\frac{297\,\mathrm{e}^{2x}}{128}+\frac{11}{128}+\left(\cos(x)^{2}x+\left(\frac{143}{64}+\left(x+\frac{3}{2}\right)\sin(x)\right)\cos(x)-\frac{x}{2}+\frac{13\sin(x)}{32}\right)\mathrm{e}^{x}\right)\end{array}\right.$$

- Plug particular solution back into general solution

$$\overrightarrow{y}(x)=c_1\overrightarrow{y}_1+c_2\overrightarrow{y}_2+c_3\overrightarrow{y}_3(x)+c_4\overrightarrow{y}_4(x)+\left[\begin{array}{c}\frac{\mathrm{e}^{x}\left(8\,\mathrm{e}^{x}\cos(x)^{2}x-26\sin(x)\mathrm{e}^{x}-4\right.}{4}\\ 4\left(\frac{33\,\mathrm{e}^{2x}}{16}-\frac{11}{16}+\left(\left(x+\frac{1}{2}\right)\cos(x)^{2}+\left(-\sin(x)\,x-\right.\right.\right.\\ -16\left(-\frac{99\,\mathrm{e}^{2x}}{64}+\frac{11}{64}+\left(-\frac{\cos(x)^{2}}{2}+\left(\frac{13}{8}+\left(x+\frac{1}{2}\right)\mathrm{s}\right.\right.\right.\\ -32\left(-\frac{297\,\mathrm{e}^{2x}}{128}+\frac{11}{128}+\left(\cos(x)^{2}x+\left(\frac{143}{64}+\left(x+\frac{3}{2}\right.\right.\right.\right.\end{array}\right.$$

- First component of the vector is the solution to the ODE

$$y=\frac{\left(27000\cos(x)^{2}x+(216c_3+1188c_4)\cos(x)+(1188c_3-216c_4-87750)\sin(x)-13500x\right)\mathrm{e}^{2x}}{13500}+\frac{(500c_2+37125)\mathrm{e}^{3x}}{13500}+\left(c_1-\frac{11}{4}\right.$$

Problem number: section 9.3, problem 40.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' + 6y''' + 13y'' + 12y' + 4y = e^{-x}((-x + 4)\cos(x) - (x + 5)\sin(x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + 6y''' + 13y'' + 12y' + 4y = 0$$

The characteristic equation is

$$\lambda^4 + 6\lambda^3 + 13\lambda^2 + 12\lambda + 4 = 0$$

The roots of the above equation are

$$\lambda_1 = -2$$
$$\lambda_2 = -2$$
$$\lambda_3 = -1$$
$$\lambda_4 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-x} + x\,\mathrm{e}^{-x} c_2 + \mathrm{e}^{-2x} c_3 + x\,\mathrm{e}^{-2x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= \mathrm{e}^{-x} \\ y_2 &= x\,\mathrm{e}^{-x} \\ y_3 &= \mathrm{e}^{-2x} \\ y_4 &= \mathrm{e}^{-2x} x \end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' + 6y''' + 13y'' + 12y' + 4y = \mathrm{e}^{-x}((-x+4)\cos(x) - (x+5)\sin(x))$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$\mathrm{e}^{-x}((-x+4)\cos(x) - (x+5)\sin(x))$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{\cos(x)\,\mathrm{e}^{-x}, \sin(x)\,\mathrm{e}^{-x}, x\cos(x)\,\mathrm{e}^{-x}, \sin(x)\,x\,\mathrm{e}^{-x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\,\mathrm{e}^{-x}, \mathrm{e}^{-2x} x, \mathrm{e}^{-2x}, \mathrm{e}^{-x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 \cos(x)\,\mathrm{e}^{-x} + A_2 \sin(x)\,\mathrm{e}^{-x} + A_3 x \cos(x)\,\mathrm{e}^{-x} + A_4 \sin(x)\,x\,\mathrm{e}^{-x}$$

The unknowns $\{A_1, A_2, A_3, A_4\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$\begin{aligned} &-2A_4 \cos(x)\,\mathrm{e}^{-x} + 2A_3 x \sin(x)\,\mathrm{e}^{-x} - 2A_4 \cos(x)\,x\,\mathrm{e}^{-x} \\ &- 6A_4 \sin(x)\,\mathrm{e}^{-x} - 6A_3 \cos(x)\,\mathrm{e}^{-x} - 2A_2 \cos(x)\,\mathrm{e}^{-x} + 2A_3 \sin(x)\,\mathrm{e}^{-x} \\ &+ 2A_1 \sin(x)\,\mathrm{e}^{-x} = \mathrm{e}^{-x}((-x+4)\cos(x) - (x+5)\sin(x)) \end{aligned}$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = -\frac{1}{2}, A_2 = -1, A_3 = -\frac{1}{2}, A_4 = \frac{1}{2}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -\frac{\cos(x)\,\mathrm{e}^{-x}}{2} - \sin(x)\,\mathrm{e}^{-x} - \frac{x\cos(x)\,\mathrm{e}^{-x}}{2} + \frac{\sin(x)\,x\,\mathrm{e}^{-x}}{2}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 \mathrm{e}^{-x} + x\,\mathrm{e}^{-x} c_2 + \mathrm{e}^{-2x} c_3 + x\,\mathrm{e}^{-2x} c_4\right) \\ &\quad + \left(-\frac{\cos(x)\,\mathrm{e}^{-x}}{2} - \sin(x)\,\mathrm{e}^{-x} - \frac{x\cos(x)\,\mathrm{e}^{-x}}{2} + \frac{\sin(x)\,x\,\mathrm{e}^{-x}}{2}\right) \end{aligned}$$

Which simplifies to

$$y = (c_4 x + c_3)\,\mathrm{e}^{-2x} + (c_2 x + c_1)\,\mathrm{e}^{-x} - \frac{\cos(x)\,\mathrm{e}^{-x}}{2} - \sin(x)\,\mathrm{e}^{-x} - \frac{x\cos(x)\,\mathrm{e}^{-x}}{2} + \frac{\sin(x)\,x\,\mathrm{e}^{-x}}{2}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = (c_4 x + c_3)\,\mathrm{e}^{-2x} + (c_2 x + c_1)\,\mathrm{e}^{-x} - \frac{\cos(x)\,\mathrm{e}^{-x}}{2} \\ - \sin(x)\,\mathrm{e}^{-x} - \frac{x\cos(x)\,\mathrm{e}^{-x}}{2} + \frac{\sin(x)\,x\,\mathrm{e}^{-x}}{2} \end{aligned} \tag{1}$$

Verification of solutions

$$y = (c_4 x + c_3)\,\mathrm{e}^{-2x} + (c_2 x + c_1)\,\mathrm{e}^{-x} - \frac{\cos(x)\,\mathrm{e}^{-x}}{2} - \sin(x)\,\mathrm{e}^{-x} - \frac{x\cos(x)\,\mathrm{e}^{-x}}{2} + \frac{\sin(x)\,x\,\mathrm{e}^{-x}}{2}$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' + 3y''' + 2y'' - 2y' - 4y = -e^{-x}(\cos(x) - \sin(x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + 3y''' + 2y'' - 2y' - 4y = 0$$

The characteristic equation is

$$\lambda^4 + 3\lambda^3 + 2\lambda^2 - 2\lambda - 4 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = -2$$
$$\lambda_3 = -1 - i$$
$$\lambda_4 = -1 + i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-2x} + c_2 \mathrm{e}^{x} + \mathrm{e}^{(-1-i)x} c_3 + \mathrm{e}^{(-1+i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \mathrm{e}^{-2x}$$

$$y_2 = \mathrm{e}^{x}$$

$$y_3 = \mathrm{e}^{(-1-i)x}$$

$$y_4 = \mathrm{e}^{(-1+i)x}$$

Now the particular solution to the given ODE is found

$$y'''' + 3y''' + 2y'' - 2y' - 4y = -\mathrm{e}^{-x}(\cos(x) - \sin(x))$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} \mathrm{e}^{-2x} & \mathrm{e}^{x} & \mathrm{e}^{(-1-i)x} & \mathrm{e}^{(-1+i)x} \\ -2\,\mathrm{e}^{-2x} & \mathrm{e}^{x} & (-1-i)\,\mathrm{e}^{(-1-i)x} & (-1+i)\,\mathrm{e}^{(-1+i)x} \\ 4\,\mathrm{e}^{-2x} & \mathrm{e}^{x} & 2i\mathrm{e}^{(-1-i)x} & -2i\mathrm{e}^{(-1+i)x} \\ -8\,\mathrm{e}^{-2x} & \mathrm{e}^{x} & (2-2i)\,\mathrm{e}^{(-1-i)x} & (2+2i)\,\mathrm{e}^{(-1+i)x} \end{bmatrix}$$

$$|W| = 60i\mathrm{e}^{-2x}\mathrm{e}^{x}\mathrm{e}^{(-1-i)x}\mathrm{e}^{(-1+i)x}$$

The determinant simplifies to

$$|W| = 60i\mathrm{e}^{-3x}$$

Now we determine W_i for each U_i.

$$W_1(x) = \det\begin{bmatrix} \mathrm{e}^{x} & \mathrm{e}^{(-1-i)x} & \mathrm{e}^{(-1+i)x} \\ \mathrm{e}^{x} & (-1-i)\,\mathrm{e}^{(-1-i)x} & (-1+i)\,\mathrm{e}^{(-1+i)x} \\ \mathrm{e}^{x} & 2i\mathrm{e}^{(-1-i)x} & -2i\mathrm{e}^{(-1+i)x} \end{bmatrix}$$
$$= 10i\mathrm{e}^{-x}$$

$$W_2(x) = \det\begin{bmatrix} \mathrm{e}^{-2x} & \mathrm{e}^{(-1-i)x} & \mathrm{e}^{(-1+i)x} \\ -2\,\mathrm{e}^{-2x} & (-1-i)\,\mathrm{e}^{(-1-i)x} & (-1+i)\,\mathrm{e}^{(-1+i)x} \\ 4\,\mathrm{e}^{-2x} & 2i\mathrm{e}^{(-1-i)x} & -2i\mathrm{e}^{(-1+i)x} \end{bmatrix}$$
$$= 4i\mathrm{e}^{-4x}$$

$$W_3(x) = \det\begin{bmatrix} \mathrm{e}^{-2x} & \mathrm{e}^{x} & \mathrm{e}^{(-1+i)x} \\ -2\,\mathrm{e}^{-2x} & \mathrm{e}^{x} & (-1+i)\,\mathrm{e}^{(-1+i)x} \\ 4\,\mathrm{e}^{-2x} & \mathrm{e}^{x} & -2i\mathrm{e}^{(-1+i)x} \end{bmatrix}$$
$$= (-9-3i)\,\mathrm{e}^{(-2+i)x}$$

$$W_4(x) = \det\begin{bmatrix} \mathrm{e}^{-2x} & \mathrm{e}^{x} & \mathrm{e}^{(-1-i)x} \\ -2\,\mathrm{e}^{-2x} & \mathrm{e}^{x} & (-1-i)\,\mathrm{e}^{(-1-i)x} \\ 4\,\mathrm{e}^{-2x} & \mathrm{e}^{x} & 2i\mathrm{e}^{(-1-i)x} \end{bmatrix}$$
$$= (-9+3i)\,\mathrm{e}^{(-2-i)x}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{4-1}\int \frac{F(x)W_1(x)}{aW(x)}\,dx \\ &= (-1)^{3}\int \frac{\left(-\mathrm{e}^{-x}(\cos(x)-\sin(x))\right)\left(10i\mathrm{e}^{-x}\right)}{(1)\left(60i\mathrm{e}^{-3x}\right)}\,dx \\ &= -\int \frac{-10i\mathrm{e}^{-2x}(\cos(x)-\sin(x))}{60i\mathrm{e}^{-3x}}\,dx \\ &= -\int \left(\frac{(-\cos(x)+\sin(x))\,\mathrm{e}^{x}}{6}\right)dx \\ &= \frac{\cos(x)\,\mathrm{e}^{x}}{6} \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\,dx \\
&= (-1)^2 \int \frac{(-\mathrm{e}^{-x}(\cos(x)-\sin(x)))\,(4i\mathrm{e}^{-4x})}{(1)\,(60i\mathrm{e}^{-3x})}\,dx \\
&= \int \frac{-4i\mathrm{e}^{-x}(\cos(x)-\sin(x))\,\mathrm{e}^{-4x}}{60i\mathrm{e}^{-3x}}\,dx \\
&= \int \left(\frac{(-\cos(x)+\sin(x))\,\mathrm{e}^{-2x}}{15}\right)dx \\
&= \frac{\mathrm{e}^{-2x}\cos(x)}{75} - \frac{\mathrm{e}^{-2x}\sin(x)}{25} \\
&= \frac{\mathrm{e}^{-2x}\cos(x)}{75} - \frac{\mathrm{e}^{-2x}\sin(x)}{25}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x)W_3(x)}{aW(x)}\,dx \\
&= (-1)^1 \int \frac{(-\mathrm{e}^{-x}(\cos(x)-\sin(x)))\,((-9-3i)\,\mathrm{e}^{(-2+i)x})}{(1)\,(60i\mathrm{e}^{-3x})}\,dx \\
&= -\int \frac{(9+3i)\,\mathrm{e}^{-x}(\cos(x)-\sin(x))\,\mathrm{e}^{(-2+i)x}}{60i\mathrm{e}^{-3x}}\,dx \\
&= -\int \left(\left(-\frac{1}{20}+\frac{3i}{20}\right)(-\cos(x)+\sin(x))\,\mathrm{e}^{ix}\right)dx \\
&= \frac{x}{20} + \frac{ix}{10} + \frac{\mathrm{e}^{2ix}}{40} + \frac{i\mathrm{e}^{2ix}}{20} \\
&= \frac{x}{20} + \frac{ix}{10} + \frac{\mathrm{e}^{2ix}}{40} + \frac{i\mathrm{e}^{2ix}}{20}
\end{aligned}
$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x)W_4(x)}{aW(x)}\,dx \\
&= (-1)^0 \int \frac{(-\mathrm{e}^{-x}(\cos(x)-\sin(x)))\,((-9+3i)\,\mathrm{e}^{(-2-i)x})}{(1)\,(60i\mathrm{e}^{-3x})}\,dx \\
&= \int \frac{(9-3i)\,\mathrm{e}^{-x}(\cos(x)-\sin(x))\,\mathrm{e}^{(-2-i)x}}{60i\mathrm{e}^{-3x}}\,dx \\
&= \int \left(\left(\frac{1}{20}+\frac{3i}{20}\right)(-\cos(x)+\sin(x))\,\mathrm{e}^{-ix}\right)dx \\
&= \int \left(\frac{1}{20}+\frac{3i}{20}\right)(-\cos(x)+\sin(x))\,\mathrm{e}^{-ix}dx
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1y_1 + U_2y_2 + U_3y_3 + U_4y_4
$$

Hence

$$
\begin{aligned}
y_p &= \left(\frac{\cos(x)\,\mathrm{e}^{x}}{6}\right)\left(\mathrm{e}^{-2x}\right) \\
&+ \left(\frac{\mathrm{e}^{-2x}\cos(x)}{75} - \frac{\mathrm{e}^{-2x}\sin(x)}{25}\right)\left(\mathrm{e}^{x}\right) \\
&+ \left(\frac{x}{20} + \frac{ix}{10} + \frac{\mathrm{e}^{2ix}}{40} + \frac{i\mathrm{e}^{2ix}}{20}\right)\left(\mathrm{e}^{(-1-i)x}\right) \\
&+ \left(\int \left(\frac{1}{20} + \frac{3i}{20}\right)\left(-\cos(x) + \sin(x)\right)\mathrm{e}^{-ix}dx\right)\left(\mathrm{e}^{(-1+i)x}\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \frac{\left(\left(\frac{41}{10} + i + 2x\right)\cos(x) - \frac{\left(\frac{38}{5} + i - 8x\right)\sin(x)}{2}\right)\mathrm{e}^{-x}}{20}
$$

Which simplifies to

$$
y_p = \frac{\left(\left(\frac{41}{10} + i + 2x\right)\cos(x) - \frac{\left(\frac{38}{5} + i - 8x\right)\sin(x)}{2}\right)\mathrm{e}^{-x}}{20}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1\mathrm{e}^{-2x} + c_2\mathrm{e}^{x} + \mathrm{e}^{(-1-i)x}c_3 + \mathrm{e}^{(-1+i)x}c_4\right) \\
&\quad + \left(\frac{\left(\left(\frac{41}{10} + i + 2x\right)\cos(x) - \frac{\left(\frac{38}{5} + i - 8x\right)\sin(x)}{2}\right)\mathrm{e}^{-x}}{20}\right)
\end{aligned}
$$

<u>Summary</u>

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1\mathrm{e}^{-2x} + c_2\mathrm{e}^{x} + \mathrm{e}^{(-1-i)x}c_3 + \mathrm{e}^{(-1+i)x}c_4 \\
&\quad + \frac{\left(\left(\frac{41}{10} + i + 2x\right)\cos(x) - \frac{\left(\frac{38}{5} + i - 8x\right)\sin(x)}{2}\right)\mathrm{e}^{-x}}{20}
\end{aligned} \tag{1}
$$

<u>Verification of solutions</u>

$$
y = c_1\mathrm{e}^{-2x} + c_2\mathrm{e}^{x} + \mathrm{e}^{(-1-i)x}c_3 + \mathrm{e}^{(-1+i)x}c_4 + \frac{\left(\left(\frac{41}{10} + i + 2x\right)\cos(x) - \frac{\left(\frac{38}{5} + i - 8x\right)\sin(x)}{2}\right)\mathrm{e}^{-x}}{20}
$$

Verified OK.

19.41.1 Maple step by step solution

Let's solve

$y'''' + 3y''' + 2y'' - 2y' - 4y = -e^{-x}(\cos(x) - \sin(x))$

- Highest derivative means the order of the ODE is 4

y''''

- Isolate 4th derivative

$y'''' = 4y + \sin(x)\, e^{-x} - \cos(x)\, e^{-x} - 3y''' - 2y'' + 2y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y'''' + 3y''' + 2y'' - 2y' - 4y = e^{-x}(-\cos(x) + \sin(x))$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

  $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

  $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

  $y_3(x) = y''$

  ◦ Define new variable $y_4(x)$

  $y_4(x) = y'''$

  ◦ Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = \sin(x)\, e^{-x} - \cos(x)\, e^{-x} - 3y_4(x) - 2y_3(x) + 2y_2(x) + 4y_1(x)$

Convert linear ODE into a system of first order ODEs

$[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = \sin(x)\, e^{-x} - \cos(x)\, e^{-x} - 3y_4(x) - 2y_3(x$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 4 & 2 & -2 & -3 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ \sin(x)\,\mathrm{e}^{-x} - \cos(x)\,\mathrm{e}^{-x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ \sin(x)\,\mathrm{e}^{-x} - \cos(x)\,\mathrm{e}^{-x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 4 & 2 & -2 & -3 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[-1-\mathrm{I}, \begin{bmatrix} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[-1+\mathrm{I}, \begin{bmatrix} \frac{1}{4}-\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ -\frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = e^{-2x} \cdot \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-1 - \mathrm{I}, \begin{bmatrix} \frac{1}{4} + \frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2} + \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$e^{(-1-\mathrm{I})x} \cdot \begin{bmatrix} \frac{1}{4} + \frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2} + \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^{-x} \cdot (\cos(x) - I\sin(x)) \cdot \begin{bmatrix} \frac{1}{4} + \frac{I}{4} \\ -\frac{I}{2} \\ -\frac{1}{2} + \frac{I}{2} \\ 1 \end{bmatrix}$$

- Simplify expression

$$e^{-x} \cdot \begin{bmatrix} \left(\frac{1}{4} + \frac{I}{4}\right)(\cos(x) - I\sin(x)) \\ -\frac{I}{2}(\cos(x) - I\sin(x)) \\ \left(-\frac{1}{2} + \frac{I}{2}\right)(\cos(x) - I\sin(x)) \\ \cos(x) - I\sin(x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = e^{-x} \cdot \begin{bmatrix} \frac{\sin(x)}{4} + \frac{\cos(x)}{4} \\ -\frac{\sin(x)}{2} \\ -\frac{\cos(x)}{2} + \frac{\sin(x)}{2} \\ \cos(x) \end{bmatrix}, \vec{y}_4(x) = e^{-x} \cdot \begin{bmatrix} \frac{\cos(x)}{4} - \frac{\sin(x)}{4} \\ -\frac{\cos(x)}{2} \\ \frac{\cos(x)}{2} + \frac{\sin(x)}{2} \\ -\sin(x) \end{bmatrix}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \vec{y}_p(x)$

□ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} -\frac{e^{-2x}}{8} & e^x & e^{-x}\left(\frac{\sin(x)}{4} + \frac{\cos(x)}{4}\right) & e^{-x}\left(\frac{\cos(x)}{4} - \frac{\sin(x)}{4}\right) \\ \frac{e^{-2x}}{4} & e^x & -\frac{\sin(x)e^{-x}}{2} & -\frac{\cos(x)e^{-x}}{2} \\ -\frac{e^{-2x}}{2} & e^x & e^{-x}\left(-\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) & e^{-x}\left(\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) \\ e^{-2x} & e^x & \cos(x)e^{-x} & -\sin(x)e^{-x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} -\frac{e^{-2x}}{8} & e^{x} & e^{-x}\left(\frac{\sin(x)}{4} + \frac{\cos(x)}{4}\right) & e^{-x}\left(\frac{\cos(x)}{4} - \frac{\sin(x)}{4}\right) \\ \frac{e^{-2x}}{4} & e^{x} & -\frac{\sin(x)e^{-x}}{2} & -\frac{\cos(x)e^{-x}}{2} \\ -\frac{e^{-2x}}{2} & e^{x} & e^{-x}\left(-\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) & e^{-x}\left(\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) \\ e^{-2x} & e^{x} & \cos(x)\,e^{-x} & -\sin(x)\,e^{-x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} -\frac{1}{8} & 1 & \frac{1}{4} & \frac{1}{4} \\ \frac{1}{4} & 1 & 0 & -\frac{1}{2} \\ -\frac{1}{2} & 1 & -\frac{1}{2} & \frac{1}{2} \\ 1 & 1 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{2\left(\frac{2e^{3x}}{3}+\frac{5}{6}+e^{x}(\cos(x)+2\sin(x))\right)e^{-2x}}{5} & \frac{(-2\cos(x)+\sin(x))e^{-x}}{5} + \frac{2e^{x}}{5} & -\frac{e^{-2x}\left(-\frac{8e^{3x}}{3}+\frac{5}{3}+(\cos(x)+7\sin(x \cdots\right.}{10} \\ \frac{2\left(\frac{2e^{3x}}{3}-\frac{5}{3}+(\cos(x)-3\sin(x))e^{x}\right)e^{-2x}}{5} & \frac{(3\cos(x)+\sin(x))e^{-x}}{5} + \frac{2e^{x}}{5} & -\frac{3e^{-2x}\left(-\frac{4e^{3x}}{9}-\frac{5}{9}+\left(\cos(x)-\frac{4\sin(\cdots}{3}\right.\right.}{5} \\ \frac{4(5+e^{3x}+3(-2\cos(x)+\sin(x))e^{x})e^{-2x}}{15} & \frac{(-2\cos(x)-4\sin(x))e^{-x}}{5} + \frac{2e^{x}}{5} & \frac{(4e^{3x}-10+(-3\sin(x)+21\cos(x))e^{x} \cdots}{15} \\ \frac{4(-10+e^{3x}+3(3\cos(x)+\sin(x))e^{x})e^{-2x}}{15} & \frac{(-2\cos(x)+6\sin(x))e^{-x}}{5} + \frac{2e^{x}}{5} & -\frac{8\left(-\frac{e^{3x}}{6}-\frac{5}{6}+\left(\cos(x)+\frac{3\sin(x)}{4}\right)e^{x} \cdots\right.}{5} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}'_p(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der…

  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\,ds$

- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

  $\overrightarrow{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds\right)$
- Plug in the fundamental matrix and the forcing function and compute

$$\overrightarrow{y}_p(x) = \begin{bmatrix} \frac{\left(-\frac{5}{3}-\frac{2\,\mathrm{e}^{3x}}{15}+\left(\left(x+\frac{9}{5}\right)\cos(x)+2\left(x-\frac{6}{5}\right)\sin(x)\right)\mathrm{e}^{x}\right)\mathrm{e}^{-2x}}{10} \\ \frac{\left(-\frac{2\,\mathrm{e}^{3x}}{15}+\frac{10}{3}+\left(\left(x-\frac{16}{5}\right)\cos(x)+\left(-3x+\frac{13}{5}\right)\sin(x)\right)\mathrm{e}^{x}\right)\mathrm{e}^{-2x}}{10} \\ -\frac{\left(-15\,\mathrm{e}^{x}\sin(x)x+30\,\mathrm{e}^{x}\cos(x)x+\mathrm{e}^{3x}+18\sin(x)\mathrm{e}^{x}-51\cos(x)\mathrm{e}^{x}+50\right)\mathrm{e}^{-2x}}{75} \\ \frac{3\left(-\frac{\mathrm{e}^{3x}}{45}+\frac{20}{9}+\left(\left(x-\frac{11}{5}\right)\cos(x)+\frac{\left(x-\frac{6}{5}\right)\sin(x)}{3}\right)\mathrm{e}^{x}\right)\mathrm{e}^{-2x}}{5} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\overrightarrow{y}(x) = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2 + c_3\overrightarrow{y}_3(x) + c_4\overrightarrow{y}_4(x) + \begin{bmatrix} \frac{\left(-\frac{5}{3}-\frac{2\,\mathrm{e}^{3x}}{15}+\left(\left(x+\frac{9}{5}\right)\cos(x)+2\left(x-\frac{6}{5}\right)\sin(x)\right)\mathrm{e}^{x}\right)\mathrm{e}^{-2x}}{10} \\ \frac{\left(-\frac{2\,\mathrm{e}^{3x}}{15}+\frac{10}{3}+\left(\left(x-\frac{16}{5}\right)\cos(x)+\left(-3x+\frac{13}{5}\right)\sin(x)\right)\mathrm{e}^{x}\right)\mathrm{e}^{-2x}}{10} \\ -\frac{\left(-15\,\mathrm{e}^{x}\sin(x)x+30\,\mathrm{e}^{x}\cos(x)x+\mathrm{e}^{3x}+18\sin(x)\mathrm{e}^{x}-51\cos(x)\mathrm{e}^{x}+50\right.}{75} \\ \frac{3\left(-\frac{\mathrm{e}^{3x}}{45}+\frac{20}{9}+\left(\left(x-\frac{11}{5}\right)\cos(x)+\frac{\left(x-\frac{6}{5}\right)\sin(x)}{3}\right)\mathrm{e}^{x}\right)\mathrm{e}^{-2x}}{5} \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = \frac{\left(\left(10c_2-\frac{2}{15}\right)\mathrm{e}^{3x}+\left(\left(x+\frac{5c_3}{2}+\frac{5c_4}{2}+\frac{9}{5}\right)\cos(x)+2\left(x+\frac{5c_3}{4}-\frac{5c_4}{4}-\frac{6}{5}\right)\sin(x)\right)\mathrm{e}^{x}-\frac{5c_1}{4}-\frac{5}{3}\right)\mathrm{e}^{-2x}}{10}$$

ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 5y''' + 13y'' - 19y' + 10y = \mathrm{e}^{x}(\cos(2x) + \sin(2x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 5y''' + 13y'' - 19y' + 10y = 0$$

The characteristic equation is

$$\lambda^4 - 5\lambda^3 + 13\lambda^2 - 19\lambda + 10 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 2$$
$$\lambda_3 = 1 - 2i$$
$$\lambda_4 = 1 + 2i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{x} + c_2 e^{2x} + e^{(1+2i)x} c_3 + e^{(1-2i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{x}$$
$$y_2 = e^{2x}$$
$$y_3 = e^{(1+2i)x}$$
$$y_4 = e^{(1-2i)x}$$

Now the particular solution to the given ODE is found

$$y'''' - 5y''' + 13y'' - 19y' + 10y = e^{x}(\cos(2x) + \sin(2x))$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} e^{x} & e^{2x} & e^{(1+2i)x} & e^{(1-2i)x} \\ e^{x} & 2 e^{2x} & (1+2i) e^{(1+2i)x} & (1-2i) e^{(1-2i)x} \\ e^{x} & 4 e^{2x} & (-3+4i) e^{(1+2i)x} & (-3-4i) e^{(1-2i)x} \\ e^{x} & 8 e^{2x} & (-11-2i) e^{(1+2i)x} & (-11+2i) e^{(1-2i)x} \end{bmatrix}$$

$$|W| = -80i e^{x} e^{2x} e^{(1+2i)x} e^{(1-2i)x}$$

The determinant simplifies to

$$|W| = -80ie^{5x}$$

Now we determine W_i for each U_i.

$$W_1(x) = \det \begin{bmatrix} e^{2x} & e^{(1+2i)x} & e^{(1-2i)x} \\ 2\,e^{2x} & (1+2i)\,e^{(1+2i)x} & (1-2i)\,e^{(1-2i)x} \\ 4\,e^{2x} & (-3+4i)\,e^{(1+2i)x} & (-3-4i)\,e^{(1-2i)x} \end{bmatrix}$$
$$= -20ie^{4x}$$

$$W_2(x) = \det \begin{bmatrix} e^{x} & e^{(1+2i)x} & e^{(1-2i)x} \\ e^{x} & (1+2i)\,e^{(1+2i)x} & (1-2i)\,e^{(1-2i)x} \\ e^{x} & (-3+4i)\,e^{(1+2i)x} & (-3-4i)\,e^{(1-2i)x} \end{bmatrix}$$
$$= -16ie^{3x}$$

$$W_3(x) = \det \begin{bmatrix} e^{x} & e^{2x} & e^{(1-2i)x} \\ e^{x} & 2\,e^{2x} & (1-2i)\,e^{(1-2i)x} \\ e^{x} & 4\,e^{2x} & (-3-4i)\,e^{(1-2i)x} \end{bmatrix}$$
$$= (-4+2i)\,e^{(4-2i)x}$$

$$W_4(x) = \det \begin{bmatrix} e^{x} & e^{2x} & e^{(1+2i)x} \\ e^{x} & 2\,e^{2x} & (1+2i)\,e^{(1+2i)x} \\ e^{x} & 4\,e^{2x} & (-3+4i)\,e^{(1+2i)x} \end{bmatrix}$$
$$= (-4-2i)\,e^{(4+2i)x}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{4-1} \int \frac{F(x)W_1(x)}{aW(x)}\,dx \\ &= (-1)^3 \int \frac{\left(e^x(\cos(2x)+\sin(2x))\right)\left(-20ie^{4x}\right)}{(1)\left(-80ie^{5x}\right)}\,dx \\ &= -\int \frac{-20ie^x(\cos(2x)+\sin(2x))\,e^{4x}}{-80ie^{5x}}\,dx \\ &= -\int \left(\frac{\sin(2x)}{4}+\frac{\cos(2x)}{4}\right)dx \\ &= -\frac{\sin(2x)}{8}+\frac{\cos(2x)}{8} \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\,dx \\
&= (-1)^2 \int \frac{(\mathrm{e}^x(\cos(2x)+\sin(2x)))\,(-16i\mathrm{e}^{3x})}{(1)\,(-80i\mathrm{e}^{5x})}\,dx \\
&= \int \frac{-16i\mathrm{e}^x(\cos(2x)+\sin(2x))\,\mathrm{e}^{3x}}{-80i\mathrm{e}^{5x}}\,dx \\
&= \int \left(\frac{(\cos(2x)+\sin(2x))\,\mathrm{e}^{-x}}{5}\right)dx \\
&= \frac{\mathrm{e}^{-x}(-\sin(2x)-2\cos(2x))}{25} + \frac{2(2\sin(x)-\cos(x))\,\mathrm{e}^{-x}\cos(x)}{25} + \frac{\mathrm{e}^{-x}}{25} \\
&= \frac{\mathrm{e}^{-x}(-\sin(2x)-2\cos(2x))}{25} + \frac{2(2\sin(x)-\cos(x))\,\mathrm{e}^{-x}\cos(x)}{25} + \frac{\mathrm{e}^{-x}}{25}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x)W_3(x)}{aW(x)}\,dx \\
&= (-1)^1 \int \frac{(\mathrm{e}^x(\cos(2x)+\sin(2x)))\,\left((-4+2i)\,\mathrm{e}^{(4-2i)x}\right)}{(1)\,(-80i\mathrm{e}^{5x})}\,dx \\
&= -\int \frac{(-4+2i)\,\mathrm{e}^x(\cos(2x)+\sin(2x))\,\mathrm{e}^{(4-2i)x}}{-80i\mathrm{e}^{5x}}\,dx \\
&= -\int \left(\left(-\frac{1}{40}-\frac{i}{20}\right)(\cos(2x)+\sin(2x))\,\mathrm{e}^{-2ix}\right)dx \\
&= \frac{3x}{80} + \frac{ix}{80} - \frac{3\,\mathrm{e}^{-4ix}}{320} - \frac{i\mathrm{e}^{-4ix}}{320} \\
&= \frac{3x}{80} + \frac{ix}{80} - \frac{3\,\mathrm{e}^{-4ix}}{320} - \frac{i\mathrm{e}^{-4ix}}{320}
\end{aligned}
$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x)W_4(x)}{aW(x)}\,dx \\
&= (-1)^0 \int \frac{(\mathrm{e}^x(\cos(2x)+\sin(2x)))\,\left((-4-2i)\,\mathrm{e}^{(4+2i)x}\right)}{(1)\,(-80i\mathrm{e}^{5x})}\,dx \\
&= \int \frac{(-4-2i)\,\mathrm{e}^x(\cos(2x)+\sin(2x))\,\mathrm{e}^{(4+2i)x}}{-80i\mathrm{e}^{5x}}\,dx \\
&= \int \left(\left(\frac{1}{40}-\frac{i}{20}\right)(\cos(2x)+\sin(2x))\,\mathrm{e}^{2ix}\right)dx \\
&= \frac{3x}{80} - \frac{ix}{80} - \frac{3\,\mathrm{e}^{4ix}}{320} + \frac{i\mathrm{e}^{4ix}}{320} \\
&= \frac{3x}{80} - \frac{ix}{80} - \frac{3\,\mathrm{e}^{4ix}}{320} + \frac{i\mathrm{e}^{4ix}}{320}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Hence

$$\begin{aligned} y_p = &\left(-\frac{\sin(2x)}{8} + \frac{\cos(2x)}{8}\right)(\mathrm{e}^{x}) \\ &+ \left(\frac{\mathrm{e}^{-x}(-\sin(2x) - 2\cos(2x))}{25} + \frac{2(2\sin(x) - \cos(x))\,\mathrm{e}^{-x}\cos(x)}{25} + \frac{\mathrm{e}^{-x}}{25}\right)(\mathrm{e}^{2x}) \\ &+ \left(\frac{3x}{80} + \frac{ix}{80} - \frac{3\,\mathrm{e}^{-4ix}}{320} - \frac{i\mathrm{e}^{-4ix}}{320}\right)\left(\mathrm{e}^{(1+2i)x}\right) \\ &+ \left(\frac{3x}{80} - \frac{ix}{80} - \frac{3\,\mathrm{e}^{4ix}}{320} + \frac{i\mathrm{e}^{4ix}}{320}\right)\left(\mathrm{e}^{(1-2i)x}\right) \end{aligned}$$

Therefore the particular solution is

$$y_p = \frac{\mathrm{e}^{x}(60x\cos(2x) - 20x\sin(2x) - 11\cos(2x) - 73\sin(2x))}{800}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1\mathrm{e}^{x} + c_2\mathrm{e}^{2x} + \mathrm{e}^{(1+2i)x}c_3 + \mathrm{e}^{(1-2i)x}c_4\right) \\ &\quad + \left(\frac{\mathrm{e}^{x}(60x\cos(2x) - 20x\sin(2x) - 11\cos(2x) - 73\sin(2x))}{800}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = &c_1\mathrm{e}^{x} + c_2\mathrm{e}^{2x} + \mathrm{e}^{(1+2i)x}c_3 + \mathrm{e}^{(1-2i)x}c_4 \\ &+ \frac{\mathrm{e}^{x}(60x\cos(2x) - 20x\sin(2x) - 11\cos(2x) - 73\sin(2x))}{800} \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y = &c_1\mathrm{e}^{x} + c_2\mathrm{e}^{2x} + \mathrm{e}^{(1+2i)x}c_3 + \mathrm{e}^{(1-2i)x}c_4 \\ &+ \frac{\mathrm{e}^{x}(60x\cos(2x) - 20x\sin(2x) - 11\cos(2x) - 73\sin(2x))}{800} \end{aligned}$$

Verified OK.

19.42.1 Maple step by step solution

Let's solve

$y'''' - 5y''' + 13y'' - 19y' + 10y = e^{x}(\cos(2x) + \sin(2x))$

- Highest derivative means the order of the ODE is 4

  y''''

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Define new variable $y_4(x)$

    $y_4(x) = y'''$

  ◦ Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = e^{x}\cos(2x) + e^{x}\sin(2x) + 5y_4(x) - 13y_3(x) + 19y_2(x) - 10y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = e^{x}\cos(2x) + e^{x}\sin(2x) + 5y_4(x) - 13y_3(x$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -10 & 19 & -13 & 5 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ e^{x}\cos(2x) + e^{x}\sin(2x) \end{bmatrix}$$

- Define the forcing function

$$\overrightarrow{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ e^{x} \cos(2x) + e^{x} \sin(2x) \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -10 & 19 & -13 & 5 \end{bmatrix}$$

- Rewrite the system as

$$\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x) + \overrightarrow{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[1-2\,\mathrm{I}, \begin{bmatrix} -\frac{11}{125} - \frac{2\,\mathrm{I}}{125} \\ -\frac{3}{25} + \frac{4\,\mathrm{I}}{25} \\ \frac{1}{5} + \frac{2\,\mathrm{I}}{5} \\ 1 \end{bmatrix}\right], \left[1+2\,\mathrm{I}, \begin{bmatrix} -\frac{11}{125} + \frac{2\,\mathrm{I}}{125} \\ -\frac{3}{25} - \frac{4\,\mathrm{I}}{25} \\ \frac{1}{5} - \frac{2\,\mathrm{I}}{5} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[2, \left[\begin{array}{c} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_{2} = e^{2x} \cdot \left[\begin{array}{c} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[1-2\mathrm{I}, \left[\begin{array}{c} -\frac{11}{125}-\frac{2\mathrm{I}}{125} \\ -\frac{3}{25}+\frac{4\mathrm{I}}{25} \\ \frac{1}{5}+\frac{2\mathrm{I}}{5} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$e^{(1-2\mathrm{I})x} \cdot \left[\begin{array}{c} -\frac{11}{125}-\frac{2\mathrm{I}}{125} \\ -\frac{3}{25}+\frac{4\mathrm{I}}{25} \\ \frac{1}{5}+\frac{2\mathrm{I}}{5} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of sin and cos

$$e^{x} \cdot \left(\cos\left(2x\right)-\mathrm{I}\sin\left(2x\right)\right) \cdot \left[\begin{array}{c} -\frac{11}{125}-\frac{2\mathrm{I}}{125} \\ -\frac{3}{25}+\frac{4\mathrm{I}}{25} \\ \frac{1}{5}+\frac{2\mathrm{I}}{5} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{x} \cdot \begin{bmatrix} \left(-\frac{11}{125}-\frac{2\,\mathrm{I}}{125}\right)\left(\cos(2x)-\mathrm{I}\sin(2x)\right) \\ \left(-\frac{3}{25}+\frac{4\,\mathrm{I}}{25}\right)\left(\cos(2x)-\mathrm{I}\sin(2x)\right) \\ \left(\frac{1}{5}+\frac{2\,\mathrm{I}}{5}\right)\left(\cos(2x)-\mathrm{I}\sin(2x)\right) \\ \cos(2x)-\mathrm{I}\sin(2x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = e^{x} \cdot \begin{bmatrix} -\frac{11\cos(2x)}{125}-\frac{2\sin(2x)}{125} \\ -\frac{3\cos(2x)}{25}+\frac{4\sin(2x)}{25} \\ \frac{\cos(2x)}{5}+\frac{2\sin(2x)}{5} \\ \cos(2x) \end{bmatrix}, \vec{y}_4(x) = e^{x} \cdot \begin{bmatrix} \frac{11\sin(2x)}{125}-\frac{2\cos(2x)}{125} \\ \frac{3\sin(2x)}{25}+\frac{4\cos(2x)}{25} \\ -\frac{\sin(2x)}{5}+\frac{2\cos(2x)}{5} \\ -\sin(2x) \end{bmatrix}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \vec{y}_p(x)$

☐ Fundamental matrix

◦ Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} e^{x} & \frac{e^{2x}}{8} & e^{x}\left(-\frac{11\cos(2x)}{125}-\frac{2\sin(2x)}{125}\right) & e^{x}\left(\frac{11\sin(2x)}{125}-\frac{2\cos(2x)}{125}\right) \\ e^{x} & \frac{e^{2x}}{4} & e^{x}\left(-\frac{3\cos(2x)}{25}+\frac{4\sin(2x)}{25}\right) & e^{x}\left(\frac{3\sin(2x)}{25}+\frac{4\cos(2x)}{25}\right) \\ e^{x} & \frac{e^{2x}}{2} & e^{x}\left(\frac{\cos(2x)}{5}+\frac{2\sin(2x)}{5}\right) & e^{x}\left(-\frac{\sin(2x)}{5}+\frac{2\cos(2x)}{5}\right) \\ e^{x} & e^{2x} & e^{x}\cos(2x) & -e^{x}\sin(2x) \end{bmatrix}$$

◦ The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

◦ Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} e^{x} & \frac{e^{2x}}{8} & e^{x}\left(-\frac{11\cos(2x)}{125}-\frac{2\sin(2x)}{125}\right) & e^{x}\left(\frac{11\sin(2x)}{125}-\frac{2\cos(2x)}{125}\right) \\ e^{x} & \frac{e^{2x}}{4} & e^{x}\left(-\frac{3\cos(2x)}{25}+\frac{4\sin(2x)}{25}\right) & e^{x}\left(\frac{3\sin(2x)}{25}+\frac{4\cos(2x)}{25}\right) \\ e^{x} & \frac{e^{2x}}{2} & e^{x}\left(\frac{\cos(2x)}{5}+\frac{2\sin(2x)}{5}\right) & e^{x}\left(-\frac{\sin(2x)}{5}+\frac{2\cos(2x)}{5}\right) \\ e^{x} & e^{2x} & e^{x}\cos(2x) & -e^{x}\sin(2x) \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & \frac{1}{8} & -\frac{11}{125} & -\frac{2}{125} \\ 1 & \frac{1}{4} & -\frac{3}{25} & \frac{4}{25} \\ 1 & \frac{1}{2} & \frac{1}{5} & \frac{2}{5} \\ 1 & 1 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} -\frac{e^{x}\cos(2x)}{2} + \frac{5e^{x}}{2} - e^{2x} & \frac{17e^{x}\cos(2x)}{20} - \frac{e^{x}\sin(2x)}{5} - \frac{9e^{x}}{4} + \frac{7e^{2x}}{5} & -\frac{2e^{x}}{\cdots} \\ -\frac{e^{x}\cos(2x)}{2} + e^{x}\sin(2x) + \frac{5e^{x}}{2} - 2e^{2x} & \frac{9e^{x}\cos(2x)}{20} - \frac{19e^{x}\sin(2x)}{10} - \frac{9e^{x}}{4} + \frac{14e^{2x}}{5} & \frac{e^{x}\cos\cdots}{5} \\ \frac{3e^{x}\cos(2x)}{2} + 2e^{x}\sin(2x) + \frac{5e^{x}}{2} - 4e^{2x} & -\frac{67e^{x}\cos(2x)}{20} - \frac{14e^{x}\sin(2x)}{5} - \frac{9e^{x}}{4} + \frac{28e^{2x}}{5} & \frac{12e^{x}\cos\cdots}{5} \\ \frac{5e^{x}}{2} - 8e^{2x} + \frac{11e^{x}\cos(2x)}{2} - e^{x}\sin(2x) & -\frac{9e^{x}}{4} + \frac{56e^{2x}}{5} - \frac{179e^{x}\cos(2x)}{20} + \frac{39e^{x}\sin(2x)}{10} & e^{x} - \cdots \end{bmatrix}$$

- [ ] Find a particular solution of the system of ODEs using variation of parameters
  - Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

    $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$
  - Take the derivative of the particular solution

    $\vec{y}'_p(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$
  - Substitute particular solution and its derivative into the system of ODEs

    $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
  - The fundamental matrix has columns that are solutions to the homogeneous system so its der

    $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
  - Cancel like terms

    $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$
  - Multiply by the inverse of the fundamental matrix

    $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$
  - Integrate to solve for $\vec{v}(x)$

    $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$
  - Plug $\vec{v}(x)$ into the equation for the particular solution

    $\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$
  - Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \begin{bmatrix} \frac{\left(30\cos(x)^2 x-10x\cos(x)\sin(x)+2\cos(x)^2-39\cos(x)\sin(x)+24\,e^x-15x-26\right)e^x}{200} \\ \frac{\left(10\cos(x)^2 x-70x\cos(x)\sin(x)-46\cos(x)^2-53\cos(x)\sin(x)+48\,e^x-5x-2\right)e^x}{200} \\ \frac{(-130x-142)e^x\cos(x)^2}{200} - \frac{9\sin(x)\left(x+\frac{31}{90}\right)e^x\cos(x)}{20} - \frac{(-65x-96\,e^x-46)e^x}{200} \\ \frac{(-310x-334)e^x\cos(x)^2}{200} + \frac{17\left(x+\frac{163}{170}\right)\sin(x)e^x\cos(x)}{20} - \frac{(-155x-192\,e^x-142)e^x}{200} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \begin{bmatrix} \frac{\left(30\cos(x)^2 x-10x\cos(x)\sin(x)+2\cos(x)^2-39\cos(x)\sin(x)+24\,e^x\right.}{200} \\ \frac{\left(10\cos(x)^2 x-70x\cos(x)\sin(x)-46\cos(x)^2-53\cos(x)\sin(x)+48\right.}{200} \\ \frac{(-130x-142)e^x\cos(x)^2}{200} - \frac{9\sin(x)\left(x+\frac{31}{90}\right)e^x\cos(x)}{20} - \frac{(-65x-}{} \\ \frac{(-310x-334)e^x\cos(x)^2}{200} + \frac{17\left(x+\frac{163}{170}\right)\sin(x)e^x\cos(x)}{20} - \frac{(-155x}{} \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = \frac{3\left(x-\frac{88c_3}{75}-\frac{16c_4}{75}+\frac{1}{15}\right)e^x\cos(2x)}{40} - \frac{\left(x+\frac{16c_3}{25}-\frac{88c_4}{25}+\frac{39}{10}\right)e^x\sin(2x)}{40} + \frac{(24+25c_2)e^{2x}}{200} + \frac{e^x(-1+8c_1)}{8}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' + 8y''' + 32y'' + 64y' + 39y = \mathrm{e}^{-2x}((4 - 15x)\cos(3x) - (4 + 15x)\sin(3x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + 8y''' + 32y'' + 64y' + 39y = 0$$

The characteristic equation is

$$\lambda^4 + 8\lambda^3 + 32\lambda^2 + 64\lambda + 39 = 0$$

The roots of the above equation are

$$\lambda_1 = -3$$
$$\lambda_2 = -1$$
$$\lambda_3 = -2 - 3i$$
$$\lambda_4 = -2 + 3i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-x} + \mathrm{e}^{-3x} c_2 + \mathrm{e}^{(-2+3i)x} c_3 + \mathrm{e}^{(-2-3i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \mathrm{e}^{-x}$$
$$y_2 = \mathrm{e}^{-3x}$$
$$y_3 = \mathrm{e}^{(-2+3i)x}$$
$$y_4 = \mathrm{e}^{(-2-3i)x}$$

Now the particular solution to the given ODE is found

$$y'''' + 8y''' + 32y'' + 64y' + 39y = \mathrm{e}^{-2x}((4 - 15x)\cos(3x) - (4 + 15x)\sin(3x))$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)}\, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} \mathrm{e}^{-x} & \mathrm{e}^{-3x} & \mathrm{e}^{(-2+3i)x} & \mathrm{e}^{(-2-3i)x} \\ -\mathrm{e}^{-x} & -3\,\mathrm{e}^{-3x} & (-2+3i)\,\mathrm{e}^{(-2+3i)x} & (-2-3i)\,\mathrm{e}^{(-2-3i)x} \\ \mathrm{e}^{-x} & 9\,\mathrm{e}^{-3x} & (-5-12i)\,\mathrm{e}^{(-2+3i)x} & (-5+12i)\,\mathrm{e}^{(-2-3i)x} \\ -\mathrm{e}^{-x} & -27\,\mathrm{e}^{-3x} & (46+9i)\,\mathrm{e}^{(-2+3i)x} & (46-9i)\,\mathrm{e}^{(-2-3i)x} \end{bmatrix}$$

$$|W| = 1200i \mathrm{e}^{-x} \mathrm{e}^{-3x} \mathrm{e}^{(-2+3i)x} \mathrm{e}^{(-2-3i)x}$$

The determinant simplifies to

$$|W| = 1200i\mathrm{e}^{-8x}$$

Now we determine W_i for each U_i.

$$\begin{aligned} W_1(x) &= \det \begin{bmatrix} \mathrm{e}^{-3x} & \mathrm{e}^{(-2+3i)x} & \mathrm{e}^{(-2-3i)x} \\ -3\,\mathrm{e}^{-3x} & (-2+3i)\,\mathrm{e}^{(-2+3i)x} & (-2-3i)\,\mathrm{e}^{(-2-3i)x} \\ 9\,\mathrm{e}^{-3x} & (-5-12i)\,\mathrm{e}^{(-2+3i)x} & (-5+12i)\,\mathrm{e}^{(-2-3i)x} \end{bmatrix} \\ &= -60i\mathrm{e}^{-7x} \end{aligned}$$

$$\begin{aligned} W_2(x) &= \det \begin{bmatrix} \mathrm{e}^{-x} & \mathrm{e}^{(-2+3i)x} & \mathrm{e}^{(-2-3i)x} \\ -\mathrm{e}^{-x} & (-2+3i)\,\mathrm{e}^{(-2+3i)x} & (-2-3i)\,\mathrm{e}^{(-2-3i)x} \\ \mathrm{e}^{-x} & (-5-12i)\,\mathrm{e}^{(-2+3i)x} & (-5+12i)\,\mathrm{e}^{(-2-3i)x} \end{bmatrix} \\ &= -60i\mathrm{e}^{-5x} \end{aligned}$$

$$\begin{aligned} W_3(x) &= \det \begin{bmatrix} \mathrm{e}^{-x} & \mathrm{e}^{-3x} & \mathrm{e}^{(-2-3i)x} \\ -\mathrm{e}^{-x} & -3\,\mathrm{e}^{-3x} & (-2-3i)\,\mathrm{e}^{(-2-3i)x} \\ \mathrm{e}^{-x} & 9\,\mathrm{e}^{-3x} & (-5+12i)\,\mathrm{e}^{(-2-3i)x} \end{bmatrix} \\ &= 20\,\mathrm{e}^{(-6-3i)x} \end{aligned}$$

$$\begin{aligned} W_4(x) &= \det \begin{bmatrix} \mathrm{e}^{-x} & \mathrm{e}^{-3x} & \mathrm{e}^{(-2+3i)x} \\ -\mathrm{e}^{-x} & -3\,\mathrm{e}^{-3x} & (-2+3i)\,\mathrm{e}^{(-2+3i)x} \\ \mathrm{e}^{-x} & 9\,\mathrm{e}^{-3x} & (-5-12i)\,\mathrm{e}^{(-2+3i)x} \end{bmatrix} \\ &= 20\,\mathrm{e}^{(-6+3i)x} \end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$U_1 = (-1)^{4-1} \int \frac{F(x)W_1(x)}{aW(x)}\,dx$$
$$= (-1)^3 \int \frac{\left(e^{-2x}((4-15x)\cos(3x) - (4+15x)\sin(3x))\right)\left(-60ie^{-7x}\right)}{(1)\left(1200ie^{-8x}\right)}\,dx$$
$$= -\int \frac{-60ie^{-2x}((4-15x)\cos(3x) - (4+15x)\sin(3x))\,e^{-7x}}{1200ie^{-8x}}\,dx$$
$$= -\int \left(\frac{(15x\sin(3x) + 15x\cos(3x) + 4\sin(3x) - 4\cos(3x))\,e^{-x}}{20}\right)dx$$
$$= -\frac{3\left(-\frac{3x}{10} - \frac{3}{50}\right)e^{-x}\cos(3x)}{4} - \frac{3\left(-\frac{x}{10} + \frac{2}{25}\right)e^{-x}\sin(3x)}{4} - \frac{3\left(-\frac{x}{10} + \frac{2}{25}\right)e^{-x}\cos(3x)}{4} + \frac{3\left(-\frac{3x}{10} - \frac{3}{50}\right)e}{4}$$
$$= -\frac{3\left(-\frac{3x}{10} - \frac{3}{50}\right)e^{-x}\cos(3x)}{4} - \frac{3\left(-\frac{x}{10} + \frac{2}{25}\right)e^{-x}\sin(3x)}{4} - \frac{3\left(-\frac{x}{10} + \frac{2}{25}\right)e^{-x}\cos(3x)}{4} + \frac{3\left(-\frac{3x}{10} - \frac{3}{50}\right)e}{4}$$

$$U_2 = (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\,dx$$
$$= (-1)^2 \int \frac{\left(e^{-2x}((4-15x)\cos(3x) - (4+15x)\sin(3x))\right)\left(-60ie^{-5x}\right)}{(1)\left(1200ie^{-8x}\right)}\,dx$$
$$= \int \frac{-60ie^{-2x}((4-15x)\cos(3x) - (4+15x)\sin(3x))\,e^{-5x}}{1200ie^{-8x}}\,dx$$
$$= \int \left(\frac{(15x\sin(3x) + 15x\cos(3x) + 4\sin(3x) - 4\cos(3x))\,e^{x}}{20}\right)dx$$
$$= \frac{3\left(-\frac{3x}{10} + \frac{3}{50}\right)e^{x}\cos(3x)}{4} + \frac{3\left(\frac{x}{10} + \frac{2}{25}\right)e^{x}\sin(3x)}{4} + \frac{3\left(\frac{x}{10} + \frac{2}{25}\right)e^{x}\cos(3x)}{4} - \frac{3\left(-\frac{3x}{10} + \frac{3}{50}\right)e^{x}\sin(3x)}{4}$$
$$= \frac{3\left(-\frac{3x}{10} + \frac{3}{50}\right)e^{x}\cos(3x)}{4} + \frac{3\left(\frac{x}{10} + \frac{2}{25}\right)e^{x}\sin(3x)}{4} + \frac{3\left(\frac{x}{10} + \frac{2}{25}\right)e^{x}\cos(3x)}{4} - \frac{3\left(-\frac{3x}{10} + \frac{3}{50}\right)e^{x}\sin(3x)}{4}$$

$$U_3 = (-1)^{4-3} \int \frac{F(x)W_3(x)}{aW(x)}\,dx$$
$$= (-1)^1 \int \frac{\left(e^{-2x}((4-15x)\cos(3x) - (4+15x)\sin(3x))\right)\left(20\,e^{(-6-3i)x}\right)}{(1)\left(1200ie^{-8x}\right)}\,dx$$
$$= -\int \frac{20\,e^{-2x}((4-15x)\cos(3x) - (4+15x)\sin(3x))\,e^{(-6-3i)x}}{1200ie^{-8x}}\,dx$$
$$= -\int \left(\frac{i(15x\sin(3x) + 15x\cos(3x) + 4\sin(3x) - 4\cos(3x))\,e^{-3ix}}{60}\right)dx$$
$$= \frac{ix}{30} - \frac{x^2}{16} - \frac{x}{30} - \frac{ix^2}{16} + \left(\frac{1}{480} + \frac{i}{480}\right)(i+10x)\,e^{-6ix}$$
$$= \frac{ix}{30} - \frac{x^2}{16} - \frac{x}{30} - \frac{ix^2}{16} + \left(\frac{1}{480} + \frac{i}{480}\right)(i+10x)\,e^{-6ix}$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x) W_4(x)}{a W(x)}\, dx \\
&= (-1)^0 \int \frac{\left(\mathrm{e}^{-2x}((4-15x)\cos(3x)-(4+15x)\sin(3x))\right)\left(20\,\mathrm{e}^{(-6+3i)x}\right)}{(1)\left(1200 i \mathrm{e}^{-8x}\right)}\, dx \\
&= \int \frac{20\,\mathrm{e}^{-2x}((4-15x)\cos(3x)-(4+15x)\sin(3x))\,\mathrm{e}^{(-6+3i)x}}{1200 i \mathrm{e}^{-8x}}\, dx \\
&= \int \left(\frac{i(15x\sin(3x)+15x\cos(3x)+4\sin(3x)-4\cos(3x))\,\mathrm{e}^{3ix}}{60}\right) dx \\
&= -\frac{ix}{30} - \frac{x^2}{16} - \frac{x}{30} + \frac{ix^2}{16} + \left(\frac{1}{480} - \frac{i}{480}\right)(-i+10x)\,\mathrm{e}^{6ix} \\
&= -\frac{ix}{30} - \frac{x^2}{16} - \frac{x}{30} + \frac{ix^2}{16} + \left(\frac{1}{480} - \frac{i}{480}\right)(-i+10x)\,\mathrm{e}^{6ix}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4
$$

Hence

$$
\begin{aligned}
y_p = &\left(-\frac{3\left(-\frac{3x}{10}-\frac{3}{50}\right)\mathrm{e}^{-x}\cos(3x)}{4} - \frac{3\left(-\frac{x}{10}+\frac{2}{25}\right)\mathrm{e}^{-x}\sin(3x)}{4} - \frac{3\left(-\frac{x}{10}+\frac{2}{25}\right)\mathrm{e}^{-x}\cos(3x)}{4} + \frac{3\left(-\frac{3x}{10}-\frac{3}{50}\right)}{4}\right. \\
&+ \left(\frac{3\left(-\frac{3x}{10}+\frac{3}{50}\right)\mathrm{e}^{x}\cos(3x)}{4} + \frac{3\left(\frac{x}{10}+\frac{2}{25}\right)\mathrm{e}^{x}\sin(3x)}{4} + \frac{3\left(\frac{x}{10}+\frac{2}{25}\right)\mathrm{e}^{x}\cos(3x)}{4} - \frac{3\left(-\frac{3x}{10}+\frac{3}{50}\right)\mathrm{e}^{x}\sin(3x}{4}\right. \\
&+ \left(\frac{ix}{30} - \frac{x^2}{16} - \frac{x}{30} - \frac{ix^2}{16} + \left(\frac{1}{480}+\frac{i}{480}\right)(i+10x)\,\mathrm{e}^{-6ix}\right)\left(\mathrm{e}^{(-2+3i)x}\right) \\
&+ \left(-\frac{ix}{30} - \frac{x^2}{16} - \frac{x}{30} + \frac{ix^2}{16} + \left(\frac{1}{480}-\frac{i}{480}\right)(-i+10x)\,\mathrm{e}^{6ix}\right)\left(\mathrm{e}^{(-2-3i)x}\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = -\frac{\left(\left(x^2-x-\frac{11}{30}\right)\cos(3x)-\left(x^2+x-\frac{11}{30}\right)\sin(3x)\right)\mathrm{e}^{-2x}}{8}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1 \mathrm{e}^{-x} + \mathrm{e}^{-3x} c_2 + \mathrm{e}^{(-2+3i)x} c_3 + \mathrm{e}^{(-2-3i)x} c_4\right) \\
&\quad + \left(-\frac{\left(\left(x^2-x-\frac{11}{30}\right)\cos(3x)-\left(x^2+x-\frac{11}{30}\right)\sin(3x)\right)\mathrm{e}^{-2x}}{8}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$y = c_1 \mathrm{e}^{-x} + \mathrm{e}^{-3x} c_2 + \mathrm{e}^{(-2+3i)x} c_3 + \mathrm{e}^{(-2-3i)x} c_4 - \frac{\left(\left(x^2 - x - \frac{11}{30}\right)\cos(3x) - \left(x^2 + x - \frac{11}{30}\right)\sin(3x)\right)\mathrm{e}^{-2x}}{8} \tag{1}$$

Verification of solutions

$$y = c_1 \mathrm{e}^{-x} + \mathrm{e}^{-3x} c_2 + \mathrm{e}^{(-2+3i)x} c_3 + \mathrm{e}^{(-2-3i)x} c_4 - \frac{\left(\left(x^2 - x - \frac{11}{30}\right)\cos(3x) - \left(x^2 + x - \frac{11}{30}\right)\sin(3x)\right)\mathrm{e}^{-2x}}{8}$$

Verified OK.

19.43.1 Maple step by step solution

Let's solve

$y'''' + 8y''' + 32y'' + 64y' + 39y = \mathrm{e}^{-2x}((4 - 15x)\cos(3x) - (4 + 15x)\sin(3x))$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = -39y - 15\cos(3x)\mathrm{e}^{-2x}x - 15\sin(3x)\mathrm{e}^{-2x}x + 4\cos(3x)\mathrm{e}^{-2x} - 4\sin(3x)\mathrm{e}^{-2x} - 8y''' - 32$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'''' + 8y''' + 32y'' + 64y' + 39y = -\mathrm{e}^{-2x}(15x\sin(3x) + 15x\cos(3x) + 4\sin(3x) - 4\cos(3x))$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Define new variable $y_4(x)$

    $y_4(x) = y'''$

  ◦ Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = -15\cos(3x)\mathrm{e}^{-2x}x - 15\sin(3x)\mathrm{e}^{-2x}x + 4\cos(3x)\mathrm{e}^{-2x} - 4\sin(3x)\mathrm{e}^{-2x} - 8y_4(x) - 32y_3$

Convert linear ODE into a system of first order ODEs

$[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -15\cos(3x)\,\mathrm{e}^{-2x}x - 15\sin(3x)\,\mathrm{e}^{-2x}x + 4$

- Define vector

$$\vec{y}(x) = \left[\begin{array}{c} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{array}\right]$$

- System to solve

$$\vec{y}'(x) = \left[\begin{array}{cccc} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -39 & -64 & -32 & -8 \end{array}\right] \cdot \vec{y}(x) + \left[\begin{array}{c} 0 \\ 0 \\ 0 \\ -15\sin(3x)\,\mathrm{e}^{-2x}x - 15\cos(3x)\,\mathrm{e}^{-2x}x - 4\sin(3x \end{array}\right.$$

- Define the forcing function

$$\vec{f}(x) = \left[\begin{array}{c} 0 \\ 0 \\ 0 \\ -15\sin(3x)\,\mathrm{e}^{-2x}x - 15\cos(3x)\,\mathrm{e}^{-2x}x - 4\sin(3x)\,\mathrm{e}^{-2x} + 4\cos(3x)\,\mathrm{e}^{-2x} \end{array}\right]$$

- Define the coefficient matrix

$$A = \left[\begin{array}{cccc} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -39 & -64 & -32 & -8 \end{array}\right]$$

- Rewrite the system as

$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-3, \left[\begin{array}{c} -\frac{1}{27} \\ \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{array}\right]\right], \left[-1, \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]\right], \left[-2-3\,\mathrm{I}, \left[\begin{array}{c} \frac{46}{2197}+\frac{9\,\mathrm{I}}{2197} \\ -\frac{5}{169}-\frac{12\,\mathrm{I}}{169} \\ -\frac{2}{13}+\frac{3\,\mathrm{I}}{13} \\ 1 \end{array}\right]\right], \left[-2+3\,\mathrm{I}, \left[\begin{array}{c} \frac{46}{2197}-\frac{9\,\mathrm{I}}{2197} \\ -\frac{5}{169}+\frac{12\,\mathrm{I}}{169} \\ -\frac{2}{13}-\frac{3\,\mathrm{I}}{13} \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-3, \left[\begin{array}{c} -\frac{1}{27} \\ \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-3x} \cdot \left[\begin{array}{c} -\frac{1}{27} \\ \frac{1}{9} \\ -\frac{1}{3} \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_2 = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-2-3\,\mathrm{I}, \begin{bmatrix} \frac{46}{2197}+\frac{9\,\mathrm{I}}{2197} \\ -\frac{5}{169}-\frac{12\,\mathrm{I}}{169} \\ -\frac{2}{13}+\frac{3\,\mathrm{I}}{13} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(-2-3\,\mathrm{I})x}\cdot\begin{bmatrix} \frac{46}{2197}+\frac{9\,\mathrm{I}}{2197} \\ -\frac{5}{169}-\frac{12\,\mathrm{I}}{169} \\ -\frac{2}{13}+\frac{3\,\mathrm{I}}{13} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{-2x}\cdot(\cos(3x)-\mathrm{I}\sin(3x))\cdot\begin{bmatrix} \frac{46}{2197}+\frac{9\,\mathrm{I}}{2197} \\ -\frac{5}{169}-\frac{12\,\mathrm{I}}{169} \\ -\frac{2}{13}+\frac{3\,\mathrm{I}}{13} \\ 1 \end{bmatrix}$$

- Simplify expression

$$\mathrm{e}^{-2x}\cdot\begin{bmatrix} \left(\frac{46}{2197}+\frac{9\,\mathrm{I}}{2197}\right)(\cos(3x)-\mathrm{I}\sin(3x)) \\ \left(-\frac{5}{169}-\frac{12\,\mathrm{I}}{169}\right)(\cos(3x)-\mathrm{I}\sin(3x)) \\ \left(-\frac{2}{13}+\frac{3\,\mathrm{I}}{13}\right)(\cos(3x)-\mathrm{I}\sin(3x)) \\ \cos(3x)-\mathrm{I}\sin(3x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x)=\mathrm{e}^{-2x}\cdot\begin{bmatrix} \frac{46\cos(3x)}{2197}+\frac{9\sin(3x)}{2197} \\ -\frac{5\cos(3x)}{169}-\frac{12\sin(3x)}{169} \\ -\frac{2\cos(3x)}{13}+\frac{3\sin(3x)}{13} \\ \cos(3x) \end{bmatrix}, \vec{y}_4(x)=\mathrm{e}^{-2x}\cdot\begin{bmatrix} -\frac{46\sin(3x)}{2197}+\frac{9\cos(3x)}{2197} \\ \frac{5\sin(3x)}{169}-\frac{12\cos(3x)}{169} \\ \frac{2\sin(3x)}{13}+\frac{3\cos(3x)}{13} \\ -\sin(3x) \end{bmatrix}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$$\vec{y}(x)=c_1\vec{y}_1+c_2\vec{y}_2+c_3\vec{y}_3(x)+c_4\vec{y}_4(x)+\vec{y}_p(x)$$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x)=\begin{bmatrix} -\frac{e^{-3x}}{27} & -e^{-x} & e^{-2x}\left(\frac{46\cos(3x)}{2197}+\frac{9\sin(3x)}{2197}\right) & e^{-2x}\left(-\frac{46\sin(3x)}{2197}+\frac{9\cos(3x)}{2197}\right) \\ \frac{e^{-3x}}{9} & e^{-x} & e^{-2x}\left(-\frac{5\cos(3x)}{169}-\frac{12\sin(3x)}{169}\right) & e^{-2x}\left(\frac{5\sin(3x)}{169}-\frac{12\cos(3x)}{169}\right) \\ -\frac{e^{-3x}}{3} & -e^{-x} & e^{-2x}\left(-\frac{2\cos(3x)}{13}+\frac{3\sin(3x)}{13}\right) & e^{-2x}\left(\frac{2\sin(3x)}{13}+\frac{3\cos(3x)}{13}\right) \\ e^{-3x} & e^{-x} & \cos(3x)\,e^{-2x} & -\sin(3x)\,e^{-2x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t

$\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x)=\begin{bmatrix} -\frac{e^{-3x}}{27} & -e^{-x} & e^{-2x}\left(\frac{46\cos(3x)}{2197}+\frac{9\sin(3x)}{2197}\right) & e^{-2x}\left(-\frac{46\sin(3x)}{2197}+\frac{9\cos(3x)}{2197}\right) \\ \frac{e^{-3x}}{9} & e^{-x} & e^{-2x}\left(-\frac{5\cos(3x)}{169}-\frac{12\sin(3x)}{169}\right) & e^{-2x}\left(\frac{5\sin(3x)}{169}-\frac{12\cos(3x)}{169}\right) \\ -\frac{e^{-3x}}{3} & -e^{-x} & e^{-2x}\left(-\frac{2\cos(3x)}{13}+\frac{3\sin(3x)}{13}\right) & e^{-2x}\left(\frac{2\sin(3x)}{13}+\frac{3\cos(3x)}{13}\right) \\ e^{-3x} & e^{-x} & \cos(3x)\,e^{-2x} & -\sin(3x)\,e^{-2x} \end{bmatrix}\cdot\frac{}{\begin{bmatrix} -\frac{1}{27} & -1 \\ \frac{1}{9} & 1 \\ -\frac{1}{3} & -1 \\ 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x)=\begin{bmatrix} \frac{(-6\cos(3x)-4\sin(3x))e^{-2x}}{20}-\frac{13e^{-3x}}{20}+\frac{39e^{-x}}{20} & \frac{(-24\cos(3x)-22\sin(3x))e^{-2x}}{60}-\frac{17e^{-3x}}{20}+\frac{5e^{-x}}{4} \\ \frac{13\sin(3x)e^{-2x}}{10}-\frac{39e^{-x}}{20}+\frac{39e^{-3x}}{20} & \frac{(-9\cos(3x)+58\sin(3x))e^{-2x}}{30}+\frac{51e^{-3x}}{20}-\frac{5e^{-x}}{4} \\ \frac{13(3\cos(3x)-2\sin(3x))e^{-2x}}{10}-\frac{117e^{-3x}}{20}+\frac{39e^{-x}}{20} & \frac{(192\cos(3x)-89\sin(3x))e^{-2x}}{30}-\frac{153e^{-3x}}{20}+\frac{5e^{-x}}{4} \\ \frac{13(-12\cos(3x)-5\sin(3x))e^{-2x}}{10}+\frac{351e^{-3x}}{20}-\frac{39e^{-x}}{20} & \frac{(-651\cos(3x)-398\sin(3x))e^{-2x}}{30}+\frac{459e^{-3x}}{20}-\frac{5e^{-x}}{4} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

$\overrightarrow{y}_p(x)=\Phi(x)\cdot\overrightarrow{v}(x)$

- Take the derivative of the particular solution

$\overrightarrow{y}'_p(x)=\Phi'(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)=A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\overrightarrow{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)=A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\overrightarrow{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot\overrightarrow{v}'(x)=\overrightarrow{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\overrightarrow{v}'(x)=\frac{1}{\Phi(x)}\cdot\overrightarrow{f}(x)$

- Integrate to solve for $\overrightarrow{v}(x)$

  $\overrightarrow{v}(x)=\int_0^x\frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds$

- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

  $\overrightarrow{y}_p(x)=\Phi(x)\cdot\left(\int_0^x\frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\overrightarrow{y}_p(x)=\left[\begin{array}{c}\frac{\left(\left(-5x^2+5x+2\right)\cos(3x)+5\left(x^2+x-\frac{1}{3}\right)\sin(3x)\right)e^{-2x}}{40}-\frac{e^{-3x}}{40}-\frac{e^{-x}}{40}\\ \frac{\left(\left(25x^2-5x-4\right)\cos(3x)+5\left(x^2-3x+\frac{7}{15}\right)\sin(3x)\right)e^{-2x}}{40}+\frac{3\,e^{-3x}}{40}+\frac{e^{-x}}{40}\\ \frac{\left(\left(-105x^2+45x+30\right)\cos(3x)+\left(-255x^2+165x-23\right)\sin(3x)\right)e^{-2x}}{120}-\frac{9\,e^{-3x}}{40}-\frac{e^{-x}}{40}\\ \frac{\left(\left(-185x^2+65x-28\right)\cos(3x)+275\left(x^2-\frac{13}{11}x+\frac{11}{75}\right)\sin(3x)\right)e^{-2x}}{40}+\frac{27\,e^{-3x}}{40}+\frac{e^{-x}}{40}\end{array}\right]$$

- Plug particular solution back into general solution

$$\overrightarrow{y}(x)=c_1\overrightarrow{y}_1+c_2\overrightarrow{y}_2+c_3\overrightarrow{y}_3(x)+c_4\overrightarrow{y}_4(x)+\left[\begin{array}{c}\frac{\left(\left(-5x^2+5x+2\right)\cos(3x)+5\left(x^2+x-\frac{1}{3}\right)\sin(3x)\right)e^{-2x}}{40}-\frac{e^{-3x}}{40}\\ \frac{\left(\left(25x^2-5x-4\right)\cos(3x)+5\left(x^2-3x+\frac{7}{15}\right)\sin(3x)\right)e^{-2x}}{40}+\frac{3\,e^{-}}{40}\\ \frac{\left(\left(-105x^2+45x+30\right)\cos(3x)+\left(-255x^2+165x-23\right)\sin(3x)\right)e^{-2x}}{120}-\\ \frac{\left(\left(-185x^2+65x-28\right)\cos(3x)+275\left(x^2-\frac{13}{11}x+\frac{11}{75}\right)\sin(3x)\right)e^{-2x}}{40}+\end{array}\right.$$

- First component of the vector is the solution to the ODE

$$y=\frac{\left(\left(-10985x^2+1840c_3+360c_4+10985x+4394\right)\cos(3x)+10985\sin(3x)\left(x^2+x+\frac{72}{2197}c_3-\frac{368}{2197}c_4-\frac{1}{3}\right)\right)e^{-2x}}{87880}+\frac{(-27-40c_1)e^{-3x}}{1080}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 5y''' + 13y'' - 19y' + 10y = e^{x}((8x + 7)\cos(2x) + (8 - 4x)\sin(2x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 5y''' + 13y'' - 19y' + 10y = 0$$

The characteristic equation is

$$\lambda^4 - 5\lambda^3 + 13\lambda^2 - 19\lambda + 10 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 2$$
$$\lambda_3 = 1 - 2i$$
$$\lambda_4 = 1 + 2i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + c_2 e^{2x} + e^{(1+2i)x} c_3 + e^{(1-2i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^x$$

$$y_2 = e^{2x}$$

$$y_3 = e^{(1+2i)x}$$

$$y_4 = e^{(1-2i)x}$$

Now the particular solution to the given ODE is found

$$y'''' - 5y''' + 13y'' - 19y' + 10y = e^x((8x + 7)\cos(2x) + (8 - 4x)\sin(2x))$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} e^x & e^{2x} & e^{(1+2i)x} & e^{(1-2i)x} \\ e^x & 2\,e^{2x} & (1+2i)\,e^{(1+2i)x} & (1-2i)\,e^{(1-2i)x} \\ e^x & 4\,e^{2x} & (-3+4i)\,e^{(1+2i)x} & (-3-4i)\,e^{(1-2i)x} \\ e^x & 8\,e^{2x} & (-11-2i)\,e^{(1+2i)x} & (-11+2i)\,e^{(1-2i)x} \end{bmatrix}$$

$$|W| = -80i e^x e^{2x} e^{(1+2i)x} e^{(1-2i)x}$$

The determinant simplifies to

$$|W| = -80i e^{5x}$$

Now we determine W_i for each U_i.

$$W_1(x) = \det \begin{bmatrix} e^{2x} & e^{(1+2i)x} & e^{(1-2i)x} \\ 2\,e^{2x} & (1+2i)\,e^{(1+2i)x} & (1-2i)\,e^{(1-2i)x} \\ 4\,e^{2x} & (-3+4i)\,e^{(1+2i)x} & (-3-4i)\,e^{(1-2i)x} \end{bmatrix}$$
$$= -20i e^{4x}$$

$$W_2(x) = \det \begin{bmatrix} e^{x} & e^{(1+2i)x} & e^{(1-2i)x} \\ e^{x} & (1+2i)\,e^{(1+2i)x} & (1-2i)\,e^{(1-2i)x} \\ e^{x} & (-3+4i)\,e^{(1+2i)x} & (-3-4i)\,e^{(1-2i)x} \end{bmatrix}$$
$$= -16i e^{3x}$$

$$W_3(x) = \det \begin{bmatrix} e^{x} & e^{2x} & e^{(1-2i)x} \\ e^{x} & 2\,e^{2x} & (1-2i)\,e^{(1-2i)x} \\ e^{x} & 4\,e^{2x} & (-3-4i)\,e^{(1-2i)x} \end{bmatrix}$$
$$= (-4+2i)\,e^{(4-2i)x}$$

$$W_4(x) = \det \begin{bmatrix} e^{x} & e^{2x} & e^{(1+2i)x} \\ e^{x} & 2\,e^{2x} & (1+2i)\,e^{(1+2i)x} \\ e^{x} & 4\,e^{2x} & (-3+4i)\,e^{(1+2i)x} \end{bmatrix}$$
$$= (-4-2i)\,e^{(4+2i)x}$$

Now we are ready to evaluate each $U_i(x)$.

$$
\begin{aligned}
U_1 &= (-1)^{4-1} \int \frac{F(x)W_1(x)}{aW(x)}\,dx \\
&= (-1)^3 \int \frac{\left(\mathrm{e}^x((8x+7)\cos(2x)+(8-4x)\sin(2x))\right)\left(-20i\mathrm{e}^{4x}\right)}{(1)\left(-80i\mathrm{e}^{5x}\right)}\,dx \\
&= -\int \frac{-20i\mathrm{e}^x((8x+7)\cos(2x)+(8-4x)\sin(2x))\,\mathrm{e}^{4x}}{-80i\mathrm{e}^{5x}}\,dx \\
&= -\int \left(\frac{(8x+7)\cos(2x)}{4} - (-2+x)\sin(2x)\right)dx \\
&= \frac{\cos(2x)}{2} - x\sin(2x) - \frac{5\sin(2x)}{8} - \frac{x\cos(2x)}{2} \\
&= \frac{\cos(2x)}{2} - x\sin(2x) - \frac{5\sin(2x)}{8} - \frac{x\cos(2x)}{2}
\end{aligned}
$$

$$
\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\,dx \\
&= (-1)^2 \int \frac{\left(\mathrm{e}^x((8x+7)\cos(2x)+(8-4x)\sin(2x))\right)\left(-16i\mathrm{e}^{3x}\right)}{(1)\left(-80i\mathrm{e}^{5x}\right)}\,dx \\
&= \int \frac{-16i\mathrm{e}^x((8x+7)\cos(2x)+(8-4x)\sin(2x))\,\mathrm{e}^{3x}}{-80i\mathrm{e}^{5x}}\,dx \\
&= \int \left(\frac{(-4x\sin(2x)+8x\cos(2x)+8\sin(2x)+7\cos(2x))\,\mathrm{e}^{-x}}{5}\right)dx \\
&= \frac{8\left(-\frac{x}{5}+\frac{3}{25}\right)\mathrm{e}^{-x}\cos(2x)}{5} - \frac{8\left(-\frac{2x}{5}-\frac{4}{25}\right)\mathrm{e}^{-x}\sin(2x)}{5} + \frac{7\,\mathrm{e}^{-x}}{25} - \frac{4\left(-\frac{2x}{5}-\frac{4}{25}\right)\mathrm{e}^{-x}\cos(2x)}{5} - \frac{4\left(-\frac{x}{5}+\right.}{} \\
&= \frac{8\left(-\frac{x}{5}+\frac{3}{25}\right)\mathrm{e}^{-x}\cos(2x)}{5} - \frac{8\left(-\frac{2x}{5}-\frac{4}{25}\right)\mathrm{e}^{-x}\sin(2x)}{5} + \frac{7\,\mathrm{e}^{-x}}{25} - \frac{4\left(-\frac{2x}{5}-\frac{4}{25}\right)\mathrm{e}^{-x}\cos(2x)}{5} - \frac{4\left(-\frac{x}{5}+\right.}{}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x)W_3(x)}{aW(x)}\,dx \\
&= (-1)^1 \int \frac{\left(\mathrm{e}^x((8x+7)\cos(2x)+(8-4x)\sin(2x))\right)\left((-4+2i)\,\mathrm{e}^{(4-2i)x}\right)}{(1)\left(-80i\mathrm{e}^{5x}\right)}\,dx \\
&= -\int \frac{(-4+2i)\,\mathrm{e}^x((8x+7)\cos(2x)+(8-4x)\sin(2x))\,\mathrm{e}^{(4-2i)x}}{-80i\mathrm{e}^{5x}}\,dx \\
&= -\int \left(\left(-\frac{1}{40}-\frac{i}{20}\right)(-4x\sin(2x)+8x\cos(2x)+8\sin(2x)+7\cos(2x))\,\mathrm{e}^{-2ix}\right)dx \\
&= \frac{23x}{80} + \frac{ix^2}{8} + \frac{3ix}{40} + \left(-\frac{3}{800}+\frac{i}{200}\right)(3+9i+10x)\,\mathrm{e}^{-4ix} \\
&= \frac{23x}{80} + \frac{ix^2}{8} + \frac{3ix}{40} + \left(-\frac{3}{800}+\frac{i}{200}\right)(3+9i+10x)\,\mathrm{e}^{-4ix}
\end{aligned}
$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x)W_4(x)}{aW(x)}\,dx \\
&= (-1)^{0} \int \frac{\left(\mathrm{e}^{x}\left((8x+7)\cos(2x)+(8-4x)\sin(2x)\right)\right)\left((-4-2i)\,\mathrm{e}^{(4+2i)x}\right)}{(1)\left(-80i\mathrm{e}^{5x}\right)}\,dx \\
&= \int \frac{(-4-2i)\,\mathrm{e}^{x}\left((8x+7)\cos(2x)+(8-4x)\sin(2x)\right)\mathrm{e}^{(4+2i)x}}{-80i\mathrm{e}^{5x}}\,dx \\
&= \int \left(\left(\frac{1}{40}-\frac{i}{20}\right)\left(-4x\sin(2x)+8x\cos(2x)+8\sin(2x)+7\cos(2x)\right)\mathrm{e}^{2ix}\right)dx \\
&= \frac{23x}{80}-\frac{ix^2}{8}-\frac{3ix}{40}+\left(-\frac{3}{800}-\frac{i}{200}\right)(3-9i+10x)\,\mathrm{e}^{4ix} \\
&= \frac{23x}{80}-\frac{ix^2}{8}-\frac{3ix}{40}+\left(-\frac{3}{800}-\frac{i}{200}\right)(3-9i+10x)\,\mathrm{e}^{4ix}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1y_1+U_2y_2+U_3y_3+U_4y_4
$$

Hence

$$
\begin{aligned}
y_p &= \left(\frac{\cos(2x)}{2}-x\sin(2x)-\frac{5\sin(2x)}{8}-\frac{x\cos(2x)}{2}\right)(\mathrm{e}^{x}) \\
&+ \left(\frac{8\left(-\frac{x}{5}+\frac{3}{25}\right)\mathrm{e}^{-x}\cos(2x)}{5}-\frac{8\left(-\frac{2x}{5}-\frac{4}{25}\right)\mathrm{e}^{-x}\sin(2x)}{5}+\frac{7\,\mathrm{e}^{-x}}{25}-\frac{4\left(-\frac{2x}{5}-\frac{4}{25}\right)\mathrm{e}^{-x}\cos(2x)}{5}-\frac{4\left(-\frac{x}{5}\right.}{}\right. \\
&+ \left(\frac{23x}{80}+\frac{ix^2}{8}+\frac{3ix}{40}+\left(-\frac{3}{800}+\frac{i}{200}\right)(3+9i+10x)\,\mathrm{e}^{-4ix}\right)\left(\mathrm{e}^{(1+2i)x}\right) \\
&+ \left(\frac{23x}{80}-\frac{ix^2}{8}-\frac{3ix}{40}+\left(-\frac{3}{800}-\frac{i}{200}\right)(3-9i+10x)\,\mathrm{e}^{4ix}\right)\left(\mathrm{e}^{(1-2i)x}\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = -\frac{\left(\left(x^2+x+\frac{21}{20}\right)\sin(2x)+\frac{17\cos(2x)}{20}\right)\mathrm{e}^{x}}{4}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1\mathrm{e}^{x}+c_2\mathrm{e}^{2x}+\mathrm{e}^{(1+2i)x}c_3+\mathrm{e}^{(1-2i)x}c_4\right)+\left(-\frac{\left(\left(x^2+x+\frac{21}{20}\right)\sin(2x)+\frac{17\cos(2x)}{20}\right)\mathrm{e}^{x}}{4}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$y = c_1 e^x + c_2 e^{2x} + e^{(1+2i)x} c_3 + e^{(1-2i)x} c_4 - \frac{\left(\left(x^2 + x + \frac{21}{20}\right)\sin(2x) + \frac{17\cos(2x)}{20}\right)e^x}{4} \tag{1}$$

Verification of solutions

$$y = c_1 e^x + c_2 e^{2x} + e^{(1+2i)x} c_3 + e^{(1-2i)x} c_4 - \frac{\left(\left(x^2 + x + \frac{21}{20}\right)\sin(2x) + \frac{17\cos(2x)}{20}\right)e^x}{4}$$

Verified OK.

19.44.1 Maple step by step solution

Let's solve

$y'''' - 5y''' + 13y'' - 19y' + 10y = e^x((8x + 7)\cos(2x) + (8 - 4x)\sin(2x))$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = -10y + 8\cos(2x) e^x x - 4\sin(2x) e^x x + 7 e^x \cos(2x) + 8 e^x \sin(2x) + 5y''' - 13y'' + 19y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'''' - 5y''' + 13y'' - 19y' + 10y = e^x(-4x\sin(2x) + 8x\cos(2x) + 8\sin(2x) + 7\cos(2x))$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Define new variable $y_4(x)$

    $y_4(x) = y'''$

  ◦ Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = 8\cos(2x) e^x x - 4\sin(2x) e^x x + 7 e^x \cos(2x) + 8 e^x \sin(2x) + 5y_4(x) - 13y_3(x) + 19y_2(x$

  Convert linear ODE into a system of first order ODEs

$[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = 8\cos(2x)\,\mathrm{e}^x x - 4\sin(2x)\,\mathrm{e}^x x + 7\,\mathrm{e}^x \cos(2$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -10 & 19 & -13 & 5 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ -4\sin(2x)\,\mathrm{e}^x x + 8\cos(2x)\,\mathrm{e}^x x + 8\,\mathrm{e}^x \sin(2x) + 7\,\mathrm{e}^x \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ -4\sin(2x)\,\mathrm{e}^x x + 8\cos(2x)\,\mathrm{e}^x x + 8\,\mathrm{e}^x \sin(2x) + 7\,\mathrm{e}^x \cos(2x) \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -10 & 19 & -13 & 5 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \left[\begin{array}{c}1\\1\\1\\1\end{array}\right]\right], \left[2, \left[\begin{array}{c}\frac{1}{8}\\\frac{1}{4}\\\frac{1}{2}\\1\end{array}\right]\right], \left[1-2\,\mathrm{I}, \left[\begin{array}{c}-\frac{11}{125}-\frac{2\,\mathrm{I}}{125}\\-\frac{3}{25}+\frac{4\,\mathrm{I}}{25}\\\frac{1}{5}+\frac{2\,\mathrm{I}}{5}\\1\end{array}\right]\right], \left[1+2\,\mathrm{I}, \left[\begin{array}{c}-\frac{11}{125}+\frac{2\,\mathrm{I}}{125}\\-\frac{3}{25}-\frac{4\,\mathrm{I}}{25}\\\frac{1}{5}-\frac{2\,\mathrm{I}}{5}\\1\end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c}1\\1\\1\\1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{x} \cdot \left[\begin{array}{c}1\\1\\1\\1\end{array}\right]$$

- Consider eigenpair

$$\left[2, \left[\begin{array}{c}\frac{1}{8}\\\frac{1}{4}\\\frac{1}{2}\\1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{2x} \cdot \left[\begin{array}{c}\frac{1}{8}\\\frac{1}{4}\\\frac{1}{2}\\1\end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[1-2\,\mathrm{I}, \begin{bmatrix} -\frac{11}{125}-\frac{2\,\mathrm{I}}{125} \\ -\frac{3}{25}+\frac{4\,\mathrm{I}}{25} \\ \frac{1}{5}+\frac{2\,\mathrm{I}}{5} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(1-2\,\mathrm{I})x}\cdot\begin{bmatrix} -\frac{11}{125}-\frac{2\,\mathrm{I}}{125} \\ -\frac{3}{25}+\frac{4\,\mathrm{I}}{25} \\ \frac{1}{5}+\frac{2\,\mathrm{I}}{5} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{x}\cdot\left(\cos(2x)-\mathrm{I}\sin(2x)\right)\cdot\begin{bmatrix} -\frac{11}{125}-\frac{2\,\mathrm{I}}{125} \\ -\frac{3}{25}+\frac{4\,\mathrm{I}}{25} \\ \frac{1}{5}+\frac{2\,\mathrm{I}}{5} \\ 1 \end{bmatrix}$$

- Simplify expression

$$\mathrm{e}^{x}\cdot\begin{bmatrix} \left(-\frac{11}{125}-\frac{2\,\mathrm{I}}{125}\right)\left(\cos(2x)-\mathrm{I}\sin(2x)\right) \\ \left(-\frac{3}{25}+\frac{4\,\mathrm{I}}{25}\right)\left(\cos(2x)-\mathrm{I}\sin(2x)\right) \\ \left(\frac{1}{5}+\frac{2\,\mathrm{I}}{5}\right)\left(\cos(2x)-\mathrm{I}\sin(2x)\right) \\ \cos(2x)-\mathrm{I}\sin(2x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x)=\mathrm{e}^{x}\cdot\begin{bmatrix} -\frac{11\cos(2x)}{125}-\frac{2\sin(2x)}{125} \\ -\frac{3\cos(2x)}{25}+\frac{4\sin(2x)}{25} \\ \frac{\cos(2x)}{5}+\frac{2\sin(2x)}{5} \\ \cos(2x) \end{bmatrix}, \vec{y}_4(x)=\mathrm{e}^{x}\cdot\begin{bmatrix} \frac{11\sin(2x)}{125}-\frac{2\cos(2x)}{125} \\ \frac{3\sin(2x)}{25}+\frac{4\cos(2x)}{25} \\ -\frac{\sin(2x)}{5}+\frac{2\cos(2x)}{5} \\ -\sin(2x) \end{bmatrix}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x)=c_1\vec{y}_1+c_2\vec{y}_2+c_3\vec{y}_3(x)+c_4\vec{y}_4(x)+\vec{y}_p(x)$

□ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x)=\begin{bmatrix} e^{x} & \frac{e^{2x}}{8} & e^{x}\left(-\frac{11\cos(2x)}{125}-\frac{2\sin(2x)}{125}\right) & e^{x}\left(\frac{11\sin(2x)}{125}-\frac{2\cos(2x)}{125}\right) \\ e^{x} & \frac{e^{2x}}{4} & e^{x}\left(-\frac{3\cos(2x)}{25}+\frac{4\sin(2x)}{25}\right) & e^{x}\left(\frac{3\sin(2x)}{25}+\frac{4\cos(2x)}{25}\right) \\ e^{x} & \frac{e^{2x}}{2} & e^{x}\left(\frac{\cos(2x)}{5}+\frac{2\sin(2x)}{5}\right) & e^{x}\left(-\frac{\sin(2x)}{5}+\frac{2\cos(2x)}{5}\right) \\ e^{x} & e^{2x} & e^{x}\cos(2x) & -e^{x}\sin(2x) \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t

  $\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x)=\begin{bmatrix} e^{x} & \frac{e^{2x}}{8} & e^{x}\left(-\frac{11\cos(2x)}{125}-\frac{2\sin(2x)}{125}\right) & e^{x}\left(\frac{11\sin(2x)}{125}-\frac{2\cos(2x)}{125}\right) \\ e^{x} & \frac{e^{2x}}{4} & e^{x}\left(-\frac{3\cos(2x)}{25}+\frac{4\sin(2x)}{25}\right) & e^{x}\left(\frac{3\sin(2x)}{25}+\frac{4\cos(2x)}{25}\right) \\ e^{x} & \frac{e^{2x}}{2} & e^{x}\left(\frac{\cos(2x)}{5}+\frac{2\sin(2x)}{5}\right) & e^{x}\left(-\frac{\sin(2x)}{5}+\frac{2\cos(2x)}{5}\right) \\ e^{x} & e^{2x} & e^{x}\cos(2x) & -e^{x}\sin(2x) \end{bmatrix}\cdot\frac{1}{\begin{bmatrix} 1 & \frac{1}{8} & -\frac{11}{125} & -\frac{2}{125} \\ 1 & \frac{1}{4} & -\frac{3}{25} & \frac{4}{25} \\ 1 & \frac{1}{2} & \frac{1}{5} & \frac{2}{5} \\ 1 & 1 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x)=\begin{bmatrix} -\frac{e^{x}\cos(2x)}{2}+\frac{5e^{x}}{2}-e^{2x} & \frac{17e^{x}\cos(2x)}{20}-\frac{e^{x}\sin(2x)}{5}-\frac{9e^{x}}{4}+\frac{7e^{2x}}{5} \\ -\frac{e^{x}\cos(2x)}{2}+e^{x}\sin(2x)+\frac{5e^{x}}{2}-2e^{2x} & \frac{9e^{x}\cos(2x)}{20}-\frac{19e^{x}\sin(2x)}{10}-\frac{9e^{x}}{4}+\frac{14e^{2x}}{5} \\ \frac{3e^{x}\cos(2x)}{2}+2e^{x}\sin(2x)+\frac{5e^{x}}{2}-4e^{2x} & -\frac{67e^{x}\cos(2x)}{20}-\frac{14e^{x}\sin(2x)}{5}-\frac{9e^{x}}{4}+\frac{28e^{2x}}{5} \\ \frac{5e^{x}}{2}-8e^{2x}+\frac{11e^{x}\cos(2x)}{2}-e^{x}\sin(2x) & -\frac{9e^{x}}{4}+\frac{56e^{2x}}{5}-\frac{179e^{x}\cos(2x)}{20}+\frac{39e^{x}\sin(2x)}{10} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x)=\Phi(x)\cdot\vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}'_p(x)=\Phi'(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)=A\cdot\Phi(x)\cdot\vec{v}(x)+\vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A\cdot\Phi(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}^{\prime}(x)=A\cdot\Phi(x)\cdot\vec{v}(x)+\vec{f}(x)$
- Cancel like terms

  $\Phi(x)\cdot\vec{v}^{\prime}(x)=\vec{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\vec{v}^{\prime}(x)=\frac{1}{\Phi(x)}\cdot\vec{f}(x)$
- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x)=\int_{0}^{x}\frac{1}{\Phi(s)}\cdot\vec{f}(s)\,ds$
- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_{p}(x)=\Phi(x)\cdot\left(\int_{0}^{x}\frac{1}{\Phi(s)}\cdot\vec{f}(s)\,ds\right)$
- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_{p}(x)=\left[\begin{array}{c}-\frac{\left(\left(x^{2}+x+\frac{6}{5}\right)\sin(2x)-\frac{12\,\mathrm{e}^{x}}{5}+\frac{2\cos(2x)}{5}+2\right)\mathrm{e}^{x}}{4}\\ -\frac{\left(x^{2}+x+\frac{7}{5}\right)\mathrm{e}^{x}\cos(2x)}{2}-\frac{\left(x^{2}+3x+\frac{7}{5}\right)\mathrm{e}^{x}\sin(2x)}{4}-\frac{\mathrm{e}^{x}}{2}+\frac{6\,\mathrm{e}^{2x}}{5}\\ -\left(x^{2}+3x+\frac{19}{10}\right)\mathrm{e}^{x}\cos\left(2x\right)+\frac{\mathrm{e}^{x}\left(15x^{2}-5x+6\right)\sin(2x)}{20}-\frac{\mathrm{e}^{x}}{2}+\frac{12\,\mathrm{e}^{2x}}{5}\\ \frac{\left(x^{2}-11x-\frac{43}{5}\right)\mathrm{e}^{x}\cos(2x)}{2}+\frac{11\left(x^{2}+\frac{29}{11}x+\frac{7}{5}\right)\mathrm{e}^{x}\sin(2x)}{4}-\frac{\mathrm{e}^{x}}{2}+\frac{24\,\mathrm{e}^{2x}}{5}\end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x)=c_{1}\vec{y}_{1}+c_{2}\vec{y}_{2}+c_{3}\vec{y}_{3}(x)+c_{4}\vec{y}_{4}(x)+\left[\begin{array}{c}-\frac{\left(\left(x^{2}+x+\frac{6}{5}\right)\sin(2x)-\frac{12\,\mathrm{e}^{x}}{5}+\frac{2\cos(2x)}{5}+2\right)\mathrm{e}^{x}}{4}\\ -\frac{\left(x^{2}+x+\frac{7}{5}\right)\mathrm{e}^{x}\cos(2x)}{2}-\frac{\left(x^{2}+3x+\frac{7}{5}\right)\mathrm{e}^{x}\sin(2x)}{4}-\frac{\mathrm{e}^{x}}{2}\\ -\left(x^{2}+3x+\frac{19}{10}\right)\mathrm{e}^{x}\cos\left(2x\right)+\frac{\mathrm{e}^{x}\left(15x^{2}-5x+6\right)\sin(2x)}{20}\\ \frac{\left(x^{2}-11x-\frac{43}{5}\right)\mathrm{e}^{x}\cos(2x)}{2}+\frac{11\left(x^{2}+\frac{29}{11}x+\frac{7}{5}\right)\mathrm{e}^{x}\sin(2x)}{4}-\frac{\mathrm{e}^{x}}{2}\end{array}\right.$$

- First component of the vector is the solution to the ODE

$$y=-\frac{\left(x^{2}+x+\frac{8}{125}c_{3}-\frac{44}{125}c_{4}+\frac{6}{5}\right)\mathrm{e}^{x}\sin(2x)}{4}-\frac{11\left(c_{3}+\frac{2c_{4}}{11}+\frac{25}{22}\right)\mathrm{e}^{x}\cos(2x)}{125}+\frac{(24+5c_{2})\mathrm{e}^{2x}}{40}+\frac{\mathrm{e}^{x}(-1+2c_{1})}{2}$$

Problem number: section 9.3, problem 45.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' + 4y''' + 8y'' + 8y' + 4y = -2\,\mathrm{e}^{x}(\cos(x) - \sin(x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + 4y''' + 8y'' + 8y' + 4y = 0$$

The characteristic equation is

$$\lambda^4 + 4\lambda^3 + 8\lambda^2 + 8\lambda + 4 = 0$$

The roots of the above equation are

$$\lambda_1 = -1 - i$$
$$\lambda_2 = -1 + i$$
$$\lambda_3 = -1 - i$$
$$\lambda_4 = -1 + i$$

Therefore the homogeneous solution is

$$y_h(x) = e^{(-1-i)x}c_1 + x\,e^{(-1-i)x}c_2 + e^{(-1+i)x}c_3 + x\,e^{(-1+i)x}c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{(-1-i)x}$$
$$y_2 = e^{(-1-i)x}x$$
$$y_3 = e^{(-1+i)x}$$
$$y_4 = x\,e^{(-1+i)x}$$

Now the particular solution to the given ODE is found

$$y'''' + 4y''' + 8y'' + 8y' + 4y = -2\,e^x(\cos(x) - \sin(x))$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-2\,e^x(\cos(x) - \sin(x))$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{\cos(x)\,e^x, \sin(x)\,e^x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\,e^{(-1+i)x}, e^{(-1-i)x}x, e^{(-1-i)x}, e^{(-1+i)x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1\cos(x)\,e^x + A_2\sin(x)\,e^x$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$-32A_1\sin(x)\,e^x + 32A_2\cos(x)\,e^x = -2\,e^x(\cos(x) - \sin(x))$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = -\frac{1}{16}, A_2 = -\frac{1}{16}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -\frac{\cos(x)\,e^x}{16} - \frac{\sin(x)\,e^x}{16}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(e^{(-1-i)x} c_1 + x\,e^{(-1-i)x} c_2 + e^{(-1+i)x} c_3 + x\,e^{(-1+i)x} c_4\right) + \left(-\frac{\cos(x)\,e^x}{16} - \frac{\sin(x)\,e^x}{16}\right) \end{aligned}$$

Which simplifies to

$$y = (c_2 x + c_1)\,e^{(-1-i)x} + e^{(-1+i)x}(c_4 x + c_3) - \frac{\cos(x)\,e^x}{16} - \frac{\sin(x)\,e^x}{16}$$

Summary

The solution(s) found are the following

$$y = (c_2 x + c_1)\,e^{(-1-i)x} + e^{(-1+i)x}(c_4 x + c_3) - \frac{\cos(x)\,e^x}{16} - \frac{\sin(x)\,e^x}{16} \tag{1}$$

Verification of solutions

$$y = (c_2 x + c_1)\,e^{(-1-i)x} + e^{(-1+i)x}(c_4 x + c_3) - \frac{\cos(x)\,e^x}{16} - \frac{\sin(x)\,e^x}{16}$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 8y''' + 32y'' - 64y' + 64y = e^{2x}(\cos(2x) - \sin(2x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 8y''' + 32y'' - 64y' + 64y = 0$$

The characteristic equation is

$$\lambda^4 - 8\lambda^3 + 32\lambda^2 - 64\lambda + 64 = 0$$

The roots of the above equation are

$$\lambda_1 = 2 - 2i$$
$$\lambda_2 = 2 + 2i$$
$$\lambda_3 = 2 - 2i$$
$$\lambda_4 = 2 + 2i$$

Therefore the homogeneous solution is

$$y_h(x) = \mathrm{e}^{(2-2i)x}c_1 + x\,\mathrm{e}^{(2-2i)x}c_2 + \mathrm{e}^{(2+2i)x}c_3 + x\,\mathrm{e}^{(2+2i)x}c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= \mathrm{e}^{(2-2i)x} \\ y_2 &= x\,\mathrm{e}^{(2-2i)x} \\ y_3 &= \mathrm{e}^{(2+2i)x} \\ y_4 &= x\,\mathrm{e}^{(2+2i)x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' - 8y''' + 32y'' - 64y' + 64y = \mathrm{e}^{2x}(\cos(2x) - \sin(2x))$$

Let the particular solution be

$$y_p = U_1y_1 + U_2y_2 + U_3y_3 + U_4y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i}\int \frac{F(x)W_i(x)}{aW(x)}\,dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} \mathrm{e}^{(2-2i)x} & x\,\mathrm{e}^{(2-2i)x} & \mathrm{e}^{(2+2i)x} & x\,\mathrm{e}^{(2+2i)x} \\ (2-2i)\,\mathrm{e}^{(2-2i)x} & -2\left(-\frac{1}{2} + (-1+i)\,x\right)\mathrm{e}^{(2-2i)x} & (2+2i)\,\mathrm{e}^{(2+2i)x} & (1+(2+2i)\,x)\,\mathrm{e}^{(2+ \\ -8i\mathrm{e}^{(2-2i)x} & (-8ix - 4i + 4)\,\mathrm{e}^{(2-2i)x} & 8i\mathrm{e}^{(2+2i)x} & (8ix + 4i + 4)\,\mathrm{e}^{(2+2 \\ (-16-16i)\,\mathrm{e}^{(2-2i)x} & -16\left(\frac{3i}{2} + (1+i)\,x\right)\mathrm{e}^{(2-2i)x} & (-16+16i)\,\mathrm{e}^{(2+2i)x} & 16\left(\frac{3i}{2} + (-1+i)\,x\right)\mathrm{e}^{(\end{bmatrix}$$

$$|W| = 256\,\mathrm{e}^{(4+4i)x}\mathrm{e}^{(4-4i)x}$$

The determinant simplifies to

$$|W| = 256\,\mathrm{e}^{8x}$$

Now we determine W_i for each U_i.

$$W_1(x) = \det\begin{bmatrix} x\,\mathrm{e}^{(2-2i)x} & \mathrm{e}^{(2+2i)x} & x\,\mathrm{e}^{(2+2i)x} \\ -2\left(-\frac{1}{2}+(-1+i)\,x\right)\mathrm{e}^{(2-2i)x} & (2+2i)\,\mathrm{e}^{(2+2i)x} & (1+(2+2i)\,x)\,\mathrm{e}^{(2+2i)x} \\ (-8ix-4i+4)\,\mathrm{e}^{(2-2i)x} & 8i\mathrm{e}^{(2+2i)x} & (8ix+4i+4)\,\mathrm{e}^{(2+2i)x} \end{bmatrix}$$
$$= -8\,\mathrm{e}^{(6+2i)x}(i+2x)$$

$$W_2(x) = \det\begin{bmatrix} \mathrm{e}^{(2-2i)x} & \mathrm{e}^{(2+2i)x} & x\,\mathrm{e}^{(2+2i)x} \\ (2-2i)\,\mathrm{e}^{(2-2i)x} & (2+2i)\,\mathrm{e}^{(2+2i)x} & (1+(2+2i)\,x)\,\mathrm{e}^{(2+2i)x} \\ -8i\mathrm{e}^{(2-2i)x} & 8i\mathrm{e}^{(2+2i)x} & (8ix+4i+4)\,\mathrm{e}^{(2+2i)x} \end{bmatrix}$$
$$= -16\,\mathrm{e}^{(6+2i)x}$$

$$W_3(x) = \det\begin{bmatrix} \mathrm{e}^{(2-2i)x} & x\,\mathrm{e}^{(2-2i)x} & x\,\mathrm{e}^{(2+2i)x} \\ (2-2i)\,\mathrm{e}^{(2-2i)x} & -2\left(-\frac{1}{2}+(-1+i)\,x\right)\mathrm{e}^{(2-2i)x} & (1+(2+2i)\,x)\,\mathrm{e}^{(2+2i)x} \\ -8i\mathrm{e}^{(2-2i)x} & (-8ix-4i+4)\,\mathrm{e}^{(2-2i)x} & (8ix+4i+4)\,\mathrm{e}^{(2+2i)x} \end{bmatrix}$$
$$= 8\,\mathrm{e}^{(6-2i)x}(i-2x)$$

$$W_4(x) = \det\begin{bmatrix} \mathrm{e}^{(2-2i)x} & x\,\mathrm{e}^{(2-2i)x} & \mathrm{e}^{(2+2i)x} \\ (2-2i)\,\mathrm{e}^{(2-2i)x} & -2\left(-\frac{1}{2}+(-1+i)\,x\right)\mathrm{e}^{(2-2i)x} & (2+2i)\,\mathrm{e}^{(2+2i)x} \\ -8i\mathrm{e}^{(2-2i)x} & (-8ix-4i+4)\,\mathrm{e}^{(2-2i)x} & 8i\mathrm{e}^{(2+2i)x} \end{bmatrix}$$
$$= -16\,\mathrm{e}^{(6-2i)x}$$

Now we are ready to evaluate each $U_i(x)$.

$$
\begin{aligned}
U_1 &= (-1)^{4-1} \int \frac{F(x)W_1(x)}{aW(x)}\,dx \\
&= (-1)^3 \int \frac{\left(\mathrm{e}^{2x}(\cos(2x) - \sin(2x))\right)\left(-8\,\mathrm{e}^{(6+2i)x}(i+2x)\right)}{(1)\left(256\,\mathrm{e}^{8x}\right)}\,dx \\
&= -\int \frac{-8\,\mathrm{e}^{2x}(\cos(2x)-\sin(2x))\,\mathrm{e}^{(6+2i)x}(i+2x)}{256\,\mathrm{e}^{8x}}\,dx \\
&= -\int \left(-\frac{(i+2x)(\cos(2x)-\sin(2x))\,\mathrm{e}^{2ix}}{32}\right)dx \\
&= -\left(\int -\frac{(i+2x)(\cos(2x)-\sin(2x))\,\mathrm{e}^{2ix}}{32}dx\right) \\
&= -\left(\int -\frac{(i+2x)(\cos(2x)-\sin(2x))\,\mathrm{e}^{2ix}}{32}dx\right)
\end{aligned}
$$

$$
\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\,dx \\
&= (-1)^2 \int \frac{\left(\mathrm{e}^{2x}(\cos(2x) - \sin(2x))\right)\left(-16\,\mathrm{e}^{(6+2i)x}\right)}{(1)\left(256\,\mathrm{e}^{8x}\right)}\,dx \\
&= \int \frac{-16\,\mathrm{e}^{2x}(\cos(2x)-\sin(2x))\,\mathrm{e}^{(6+2i)x}}{256\,\mathrm{e}^{8x}}\,dx \\
&= \int \left(-\frac{(\cos(2x)-\sin(2x))\,\mathrm{e}^{2ix}}{16}\right)dx \\
&= -\frac{x}{32} + \frac{ix}{32} - \frac{\mathrm{e}^{4ix}}{128} + \frac{i\mathrm{e}^{4ix}}{128} \\
&= -\frac{x}{32} + \frac{ix}{32} - \frac{\mathrm{e}^{4ix}}{128} + \frac{i\mathrm{e}^{4ix}}{128}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x) W_3(x)}{a W(x)}\, dx \\
&= (-1)^1 \int \frac{\left(\mathrm{e}^{2x} (\cos(2x) - \sin(2x))\right) \left(8\,\mathrm{e}^{(6-2i)x} (i - 2x)\right)}{(1) \left(256\,\mathrm{e}^{8x}\right)}\, dx \\
&= -\int \frac{8\,\mathrm{e}^{2x} (\cos(2x) - \sin(2x))\,\mathrm{e}^{(6-2i)x} (i - 2x)}{256\,\mathrm{e}^{8x}}\, dx \\
&= -\int \left(\frac{(i - 2x) (\cos(2x) - \sin(2x))\,\mathrm{e}^{-2ix}}{32}\right) dx \\
&= -\left(\int \frac{(i - 2x) (\cos(2x) - \sin(2x))\,\mathrm{e}^{-2ix}}{32} dx\right) \\
&= -\left(\int \frac{(i - 2x) (\cos(2x) - \sin(2x))\,\mathrm{e}^{-2ix}}{32} dx\right)
\end{aligned}
$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x) W_4(x)}{a W(x)}\, dx \\
&= (-1)^0 \int \frac{\left(\mathrm{e}^{2x} (\cos(2x) - \sin(2x))\right) \left(-16\,\mathrm{e}^{(6-2i)x}\right)}{(1) \left(256\,\mathrm{e}^{8x}\right)}\, dx \\
&= \int \frac{-16\,\mathrm{e}^{2x} (\cos(2x) - \sin(2x))\,\mathrm{e}^{(6-2i)x}}{256\,\mathrm{e}^{8x}}\, dx \\
&= \int \left(-\frac{(\cos(2x) - \sin(2x))\,\mathrm{e}^{-2ix}}{16}\right) dx \\
&= -\frac{x}{32} - \frac{ix}{32} - \frac{\mathrm{e}^{-4ix}}{128} - \frac{i\mathrm{e}^{-4ix}}{128} \\
&= -\frac{x}{32} - \frac{ix}{32} - \frac{\mathrm{e}^{-4ix}}{128} - \frac{i\mathrm{e}^{-4ix}}{128}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4
$$

Hence

$$
\begin{aligned}
y_p = &\left(-\left(\int -\frac{(i + 2x) (\cos(2x) - \sin(2x))\,\mathrm{e}^{2ix}}{32} dx\right)\right) \left(\mathrm{e}^{(2-2i)x}\right) \\
&+ \left(-\frac{x}{32} + \frac{ix}{32} - \frac{\mathrm{e}^{4ix}}{128} + \frac{i\mathrm{e}^{4ix}}{128}\right) \left(x\,\mathrm{e}^{(2-2i)x}\right) \\
&+ \left(-\left(\int \frac{(i - 2x) (\cos(2x) - \sin(2x))\,\mathrm{e}^{-2ix}}{32} dx\right)\right) \left(\mathrm{e}^{(2+2i)x}\right) \\
&+ \left(-\frac{x}{32} - \frac{ix}{32} - \frac{\mathrm{e}^{-4ix}}{128} - \frac{i\mathrm{e}^{-4ix}}{128}\right) \left(x\,\mathrm{e}^{(2+2i)x}\right)
\end{aligned}
$$

Therefore the particular solution is

$$y_p = -\frac{\left(\int (i-2x)\left(\cos(2x)-\sin(2x)\right)\mathrm{e}^{-2ix}dx\right)\mathrm{e}^{(2+2i)x}}{32}+\frac{\left(\int (i+2x)\left(\cos(2x)-\sin(2x)\right)\mathrm{e}^{2ix}dx\right)\mathrm{e}^{(2-2i)x}}{32}$$

Which simplifies to

$$y_p = -\frac{\left(-\left(\int (\cos(2x)-\sin(2x))\,(2x\cos(2x)-\sin(2x))\,dx\right)\cos(2x)-\left(\int (\cos(2x)-\sin(2x))\,(\cos(2x)\right.}{16}$$

Therefore the general solution is

$$\begin{aligned}
y &= y_h + y_p \\
&= \left(\mathrm{e}^{(2-2i)x}c_1 + x\,\mathrm{e}^{(2-2i)x}c_2 + \mathrm{e}^{(2+2i)x}c_3 + x\,\mathrm{e}^{(2+2i)x}c_4\right) \\
&\quad + \left(-\frac{\left(-\left(\int (\cos(2x)-\sin(2x))\,(2x\cos(2x)-\sin(2x))\,dx\right)\cos(2x)-\left(\int (\cos(2x)-\sin(2x))\,(\cos(2\right.}{16}\right.
\end{aligned}$$

Which simplifies to

$$y = (c_2x+c_1)\,\mathrm{e}^{(2-2i)x}+\mathrm{e}^{(2+2i)x}(c_4x+c_3) - \frac{\left(-\left(\int (\cos(2x)-\sin(2x))\,(2x\cos(2x)-\sin(2x))\,dx\right)\cos(2x)-\left(\int (\cos(2x)-\sin(2x))\,(\cos(2x)+\right.}{16}$$

Summary

The solution(s) found are the following

$$y = (c_2x+c_1)\,\mathrm{e}^{(2-2i)x}+\mathrm{e}^{(2+2i)x}(c_4x+c_3) - \frac{\left(-\left(\int (\cos(2x)-\sin(2x))\,(2x\cos(2x)-\sin(2x))\,dx\right)\cos(2x)-\left(\int (\cos(2x)-\sin(2x))\,(\cos(2x)+\right.}{16} \tag{1}$$

Verification of solutions

$$y = (c_2x+c_1)\,\mathrm{e}^{(2-2i)x}+\mathrm{e}^{(2+2i)x}(c_4x+c_3) - \frac{\left(-\left(\int (\cos(2x)-\sin(2x))\,(2x\cos(2x)-\sin(2x))\,dx\right)\cos(2x)-\left(\int (\cos(2x)-\sin(2x))\,(\cos(2x)+\right.}{16}$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 8y''' + 26y'' - 40y' + 25y = \mathrm{e}^{2x}(3\cos(x) - (3x+1)\sin(x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 8y''' + 26y'' - 40y' + 25y = 0$$

The characteristic equation is

$$\lambda^4 - 8\lambda^3 + 26\lambda^2 - 40\lambda + 25 = 0$$

The roots of the above equation are

$$\begin{aligned}\lambda_1 &= 2 - i\\ \lambda_2 &= 2 + i\\ \lambda_3 &= 2 - i\\ \lambda_4 &= 2 + i\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = e^{(2+i)x}c_1 + x\,e^{(2+i)x}c_2 + e^{(2-i)x}c_3 + x\,e^{(2-i)x}c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^{(2+i)x} \\ y_2 &= x\,e^{(2+i)x} \\ y_3 &= e^{(2-i)x} \\ y_4 &= x\,e^{(2-i)x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' - 8y''' + 26y'' - 40y' + 25y = e^{2x}(3\cos(x) - (3x+1)\sin(x))$$

Let the particular solution be

$$y_p = U_1y_1 + U_2y_2 + U_3y_3 + U_4y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i}\int \frac{F(x)W_i(x)}{aW(x)}\,dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} e^{(2+i)x} & x\,e^{(2+i)x} & e^{(2-i)x} & x\,e^{(2-i)x} \\ (2+i)\,e^{(2+i)x} & e^{(2+i)x}(1+(2+i)\,x) & (2-i)\,e^{(2-i)x} & -(-1+(-2+i)\,x)\,e^{(2-i)x} \\ (3+4i)\,e^{(2+i)x} & (4+2i+(3+4i)\,x)\,e^{(2+i)x} & (3-4i)\,e^{(2-i)x} & -4\,e^{(2-i)x}\left(-1+\frac{i}{2}+\left(-\frac{3}{4}+i \right.\right. \\ (2+11i)\,e^{(2+i)x} & (9+12i+(2+11i)\,x)\,e^{(2+i)x} & (2-11i)\,e^{(2-i)x} & (9-12i+(2-11i)\,x)\,e^{(2-i} \end{bmatrix}$$

$$|W| = 16\,e^{(4+2i)x}e^{(4-2i)x}$$

The determinant simplifies to

$$|W| = 16\,\mathrm{e}^{8x}$$

Now we determine W_i for each U_i.

$$W_1(x) = \det\begin{bmatrix} x\,\mathrm{e}^{(2+i)x} & \mathrm{e}^{(2-i)x} & x\,\mathrm{e}^{(2-i)x} \\ \mathrm{e}^{(2+i)x}(1+(2+i)\,x) & (2-i)\,\mathrm{e}^{(2-i)x} & -(-1+(-2+i)\,x)\,\mathrm{e}^{(2-i)x} \\ (4+2i+(3+4i)\,x)\,\mathrm{e}^{(2+i)x} & (3-4i)\,\mathrm{e}^{(2-i)x} & -4\,\mathrm{e}^{(2-i)x}\left(-1+\frac{i}{2}+\left(-\frac{3}{4}+i\right)x\right) \end{bmatrix}$$
$$= -4\,\mathrm{e}^{(6-i)x}(x-i)$$

$$W_2(x) = \det\begin{bmatrix} \mathrm{e}^{(2+i)x} & \mathrm{e}^{(2-i)x} & x\,\mathrm{e}^{(2-i)x} \\ (2+i)\,\mathrm{e}^{(2+i)x} & (2-i)\,\mathrm{e}^{(2-i)x} & -(-1+(-2+i)\,x)\,\mathrm{e}^{(2-i)x} \\ (3+4i)\,\mathrm{e}^{(2+i)x} & (3-4i)\,\mathrm{e}^{(2-i)x} & -4\,\mathrm{e}^{(2-i)x}\left(-1+\frac{i}{2}+\left(-\frac{3}{4}+i\right)x\right) \end{bmatrix}$$
$$= -4\,\mathrm{e}^{(6-i)x}$$

$$W_3(x) = \det\begin{bmatrix} \mathrm{e}^{(2+i)x} & x\,\mathrm{e}^{(2+i)x} & x\,\mathrm{e}^{(2-i)x} \\ (2+i)\,\mathrm{e}^{(2+i)x} & \mathrm{e}^{(2+i)x}(1+(2+i)\,x) & -(-1+(-2+i)\,x)\,\mathrm{e}^{(2-i)x} \\ (3+4i)\,\mathrm{e}^{(2+i)x} & (4+2i+(3+4i)\,x)\,\mathrm{e}^{(2+i)x} & -4\,\mathrm{e}^{(2-i)x}\left(-1+\frac{i}{2}+\left(-\frac{3}{4}+i\right)x\right) \end{bmatrix}$$
$$= -4\,\mathrm{e}^{(6+i)x}(x+i)$$

$$W_4(x) = \det\begin{bmatrix} \mathrm{e}^{(2+i)x} & x\,\mathrm{e}^{(2+i)x} & \mathrm{e}^{(2-i)x} \\ (2+i)\,\mathrm{e}^{(2+i)x} & \mathrm{e}^{(2+i)x}(1+(2+i)\,x) & (2-i)\,\mathrm{e}^{(2-i)x} \\ (3+4i)\,\mathrm{e}^{(2+i)x} & (4+2i+(3+4i)\,x)\,\mathrm{e}^{(2+i)x} & (3-4i)\,\mathrm{e}^{(2-i)x} \end{bmatrix}$$
$$= -4\,\mathrm{e}^{(6+i)x}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{4-1}\int \frac{F(x)W_1(x)}{aW(x)}\,dx \\ &= (-1)^3\int \frac{\left(\mathrm{e}^{2x}(3\cos(x)-(3x+1)\sin(x))\right)\left(-4\,\mathrm{e}^{(6-i)x}(x-i)\right)}{(1)\left(16\,\mathrm{e}^{8x}\right)}\,dx \\ &= -\int \frac{-4\,\mathrm{e}^{2x}(3\cos(x)-(3x+1)\sin(x))\,\mathrm{e}^{(6-i)x}(x-i)}{16\,\mathrm{e}^{8x}}\,dx \\ &= -\int \left(-\frac{(-x+i)\,(3\sin(x)\,x+\sin(x)-3\cos(x))\,\mathrm{e}^{-ix}}{4}\right)dx \\ &= -\left(\int -\frac{(-x+i)\,(3\sin(x)\,x+\sin(x)-3\cos(x))\,\mathrm{e}^{-ix}}{4}dx\right) \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\, dx \\
&= (-1)^2 \int \frac{\left(e^{2x}(3\cos(x) - (3x+1)\sin(x))\right)\left(-4\, e^{(6-i)x}\right)}{(1)\left(16\, e^{8x}\right)}\, dx \\
&= \int \frac{-4\, e^{2x}(3\cos(x) - (3x+1)\sin(x))\, e^{(6-i)x}}{16\, e^{8x}}\, dx \\
&= \int \left(\frac{((3x+1)\sin(x) - 3\cos(x))\, e^{-ix}}{4}\right) dx \\
&= \int \frac{((3x+1)\sin(x) - 3\cos(x))\, e^{-ix}}{4} dx
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x)W_3(x)}{aW(x)}\, dx \\
&= (-1)^1 \int \frac{\left(e^{2x}(3\cos(x) - (3x+1)\sin(x))\right)\left(-4\, e^{(6+i)x}(x+i)\right)}{(1)\left(16\, e^{8x}\right)}\, dx \\
&= -\int \frac{-4\, e^{2x}(3\cos(x) - (3x+1)\sin(x))\, e^{(6+i)x}(x+i)}{16\, e^{8x}}\, dx \\
&= -\int \left(\frac{(3\sin(x)\, x + \sin(x) - 3\cos(x))\, e^{ix}(x+i)}{4}\right) dx \\
&= -\left(\int \frac{(3\sin(x)\, x + \sin(x) - 3\cos(x))\, e^{ix}(x+i)}{4} dx\right)
\end{aligned}
$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x)W_4(x)}{aW(x)}\, dx \\
&= (-1)^0 \int \frac{\left(e^{2x}(3\cos(x) - (3x+1)\sin(x))\right)\left(-4\, e^{(6+i)x}\right)}{(1)\left(16\, e^{8x}\right)}\, dx \\
&= \int \frac{-4\, e^{2x}(3\cos(x) - (3x+1)\sin(x))\, e^{(6+i)x}}{16\, e^{8x}}\, dx \\
&= \int \left(\frac{((3x+1)\sin(x) - 3\cos(x))\, e^{ix}}{4}\right) dx \\
&= -\frac{3x}{8} + \frac{3ix^2}{16} + \frac{ix}{8} + \frac{\left(-\frac{1}{4} + \frac{3i}{8} - \frac{3x}{4}\right) e^{2ix}}{4} \\
&= -\frac{3x}{8} + \frac{3ix^2}{16} + \frac{ix}{8} + \frac{\left(-\frac{1}{4} + \frac{3i}{8} - \frac{3x}{4}\right) e^{2ix}}{4}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4
$$

Hence

$$y_p = \left(-\left(\int -\frac{(-x+i)\left(3\sin(x)x+\sin(x)-3\cos(x)\right)e^{-ix}}{4}dx\right)\right)\left(e^{(2+i)x}\right) + \left(\int \frac{((3x+1)\sin(x)-3\cos(x))e^{-ix}}{4}dx\right)\left(x\,e^{(2+i)x}\right) + \left(-\left(\int \frac{(3\sin(x)x+\sin(x)-3\cos(x))e^{ix}(x+i)}{4}dx\right)\right)\left(e^{(2-i)x}\right) + \left(-\frac{3x}{8}+\frac{3ix^2}{16}+\frac{ix}{8}+\frac{\left(-\frac{1}{4}+\frac{3i}{8}-\frac{3x}{4}\right)e^{2ix}}{4}\right)\left(x\,e^{(2-i)x}\right)$$

Therefore the particular solution is

$$y_p = -\frac{\left(\int -(-x+i)\left(3\sin(x)x+\sin(x)-3\cos(x)\right)e^{-ix}dx\right)e^{(2+i)x}}{4} + \frac{\left(\int -(3\sin(x)x+\sin(x)-3\cos(x\right.}{4}$$

Which simplifies to

$$y_p = \frac{9\left(-\frac{8\left(\int\left(-\sin(x)^2+3\left(x^2+\frac{1}{3}x+1\right)\cos(x)\sin(x)-3x\right)dx\right)(i\sin(x)+\cos(x))}{9} + \frac{8(-i\sin(x)+\cos(x))\left(\int(-3\sin(x)x-\sin(x)+3\cos(x))(x\,c\right.}{9}\right.}{}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(e^{(2+i)x}c_1 + x\,e^{(2+i)x}c_2 + e^{(2-i)x}c_3 + x\,e^{(2-i)x}c_4\right) \\ &\quad + \left(\frac{9\left(-\frac{8\left(\int\left(-\sin(x)^2+3\left(x^2+\frac{1}{3}x+1\right)\cos(x)\sin(x)-3x\right)dx\right)(i\sin(x)+\cos(x))}{9} + \frac{8(-i\sin(x)+\cos(x))\left(\int(-3\sin(x)x-\sin(x)+3\cos(x)\right)}{9}\right.}{}\right. \end{aligned}$$

Which simplifies to

$$y = (c_4x+c_3)e^{(2-i)x} + e^{(2+i)x}(c_2x+c_1) + \frac{9\left(-\frac{8\left(\int\left(-\sin(x)^2+3\left(x^2+\frac{1}{3}x+1\right)\cos(x)\sin(x)-3x\right)dx\right)(i\sin(x)+\cos(x))}{9} + \frac{8(-i\sin(x)+\cos(x))\left(\int(-3\sin(x)x-\sin(x)+3\cos(x))(x\,c\right.}{9}\right.}{}$$

<u>Summary</u>

The solution(s) found are the following

$$y = (c_4x+c_3)e^{(2-i)x} + e^{(2+i)x}(c_2x+c_1) + \frac{9\left(-\frac{8\left(\int\left(-\sin(x)^2+3\left(x^2+\frac{1}{3}x+1\right)\cos(x)\sin(x)-3x\right)dx\right)(i\sin(x)+\cos(x))}{9} + \frac{8(-i\sin(x)+\cos(x))\left(\int(-3\sin(x)x-\sin(x)+3\cos(x))(x\,c\right.}{9}\right.}{} \tag{1}$$

Verification of solutions

$$y = (c_4x + c_3)\,e^{(2-i)x} + e^{(2+i)x}(c_2x + c_1) + \frac{9\left(-\frac{8\left(\int\left(-\sin(x)^2+3\left(x^2+\frac{1}{3}x+1\right)\cos(x)\sin(x)-3x\right)dx\right)(i\sin(x)+\cos(x))}{9} + \frac{8(-i\sin(x)+\cos(x))\left(\int(-3\sin(x)x-\sin(x)+3\cos(x))(x\,\mathrm{co}\right.}{9}\right.}{}$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - 4y'' + 5y' - 2y = e^{2x} - 4\,e^{x} - 2\cos(x) + 4\sin(x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - 4y'' + 5y' - 2y = 0$$

The characteristic equation is

$$\lambda^3 - 4\lambda^2 + 5\lambda - 2 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = 1$$
$$\lambda_3 = 1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + c_2 x e^x + c_3 e^{2x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^x \\ y_2 &= x e^x \\ y_3 &= e^{2x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y''' - 4y'' + 5y' - 2y = e^{2x} - 4 e^x - 2 \cos(x) + 4 \sin(x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{2x} - 4 e^x - 2 \cos(x) + 4 \sin(x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{e^x\}, \{e^{2x}\}, \{\cos(x), \sin(x)\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x e^x, e^x, e^{2x}\}$$

Since e^x is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x e^x\}, \{e^{2x}\}, \{\cos(x), \sin(x)\}]$$

Since $x e^x$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 e^x\}, \{e^{2x}\}, \{\cos(x), \sin(x)\}]$$

Since e^{2x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 e^x\}, \{x e^{2x}\}, \{\cos(x), \sin(x)\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^2 e^x + A_2 x e^{2x} + A_3 \cos(x) + A_4 \sin(x)$$

The unknowns $\{A_1, A_2, A_3, A_4\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$-2A_1\mathrm{e}^{x} + A_2\mathrm{e}^{2x} - 4A_3\sin(x) + 4A_4\cos(x) + 2A_3\cos(x) + 2A_4\sin(x) \\ = \mathrm{e}^{2x} - 4\,\mathrm{e}^{x} - 2\cos(x) + 4\sin(x)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 2, A_2 = 1, A_3 = -1, A_4 = 0]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = 2x^2\mathrm{e}^{x} + x\,\mathrm{e}^{2x} - \cos(x)$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1\mathrm{e}^{x} + c_2x\,\mathrm{e}^{x} + c_3\mathrm{e}^{2x}\right) + \left(2x^2\mathrm{e}^{x} + x\,\mathrm{e}^{2x} - \cos(x)\right) \end{aligned}$$

Which simplifies to

$$y = c_3\mathrm{e}^{2x} + \mathrm{e}^{x}(c_2x + c_1) + 2x^2\mathrm{e}^{x} + x\,\mathrm{e}^{2x} - \cos(x)$$

Summary

The solution(s) found are the following

$$y = c_3\mathrm{e}^{2x} + \mathrm{e}^{x}(c_2x + c_1) + 2x^2\mathrm{e}^{x} + x\,\mathrm{e}^{2x} - \cos(x) \tag{1}$$

Verification of solutions

$$y = c_3\mathrm{e}^{2x} + \mathrm{e}^{x}(c_2x + c_1) + 2x^2\mathrm{e}^{x} + x\,\mathrm{e}^{2x} - \cos(x)$$

Verified OK.

19.48.1 Maple step by step solution

Let's solve

$y''' - 4y'' + 5y' - 2y = e^{2x} - 4\,e^{x} - 2\cos(x) + 4\sin(x)$

- Highest derivative means the order of the ODE is 3

  y'''

□ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

  - Define new variable $y_3(x)$

    $y_3(x) = y''$

  - Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = e^{2x} - 4\,e^{x} - 2\cos(x) + 4\sin(x) + 4y_3(x) - 5y_2(x) + 2y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = e^{2x} - 4\,e^{x} - 2\cos(x) + 4\sin(x) + 4y_3(x) - 5y_2(x) + 2y_1($

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & -5 & 4 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ e^{2x} - 4\,e^{x} - 2\cos(x) + 4\sin(x) \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ e^{2x} - 4\,e^{x} - 2\cos(x) + 4\sin(x) \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & -5 & 4 \end{bmatrix}$$

- Rewrite the system as

$$\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x) + \overrightarrow{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue 1

$$\overrightarrow{y}_1(x) = e^x \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 1$ is the eigenvalue, an

$$\overrightarrow{y}_2(x) = e^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_2(x)$ into the homogeneous system

$$\lambda e^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + e^{\lambda x}\overrightarrow{v} = \left(e^{\lambda x}A\right) \cdot \left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda e^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + e^{\lambda x}\overrightarrow{v} = e^{\lambda x}\left(\lambda x\overrightarrow{v} + A \cdot \overrightarrow{p}\right)$$

- Simplify equation

$\lambda\vec{p} + \vec{v} = A \cdot \vec{p}$

- Make use of the identity matrix I

  $(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$

- Condition $\vec{p}$ must meet for $\vec{y}_2(x)$ to be a solution to the homogeneous system

  $(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue 1

  $$\left(\begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & -5 & 4 \end{bmatrix} - 1 \cdot \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \cdot \vec{p} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- Choice of $\vec{p}$

  $$\vec{p} = \begin{bmatrix} -1 \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue 1

  $$\vec{y}_2(x) = \mathrm{e}^{x} \cdot \left(x \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} + \begin{bmatrix} -1 \\ 0 \\ 0 \end{bmatrix}\right)$$

- Consider eigenpair

  $$\left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

  $$\vec{y}_3 = \mathrm{e}^{2x} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

  $\vec{y}(x) = c_1\vec{y}_1(x) + c_2\vec{y}_2(x) + c_3\vec{y}_3 + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x)=\begin{bmatrix} e^{x} & (x-1)\,e^{x} & \frac{e^{2x}}{4} \\ e^{x} & x\,e^{x} & \frac{e^{2x}}{2} \\ e^{x} & x\,e^{x} & e^{2x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t

$\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x)=\begin{bmatrix} e^{x} & (x-1)\,e^{x} & \frac{e^{2x}}{4} \\ e^{x} & x\,e^{x} & \frac{e^{2x}}{2} \\ e^{x} & x\,e^{x} & e^{2x} \end{bmatrix}\cdot\frac{1}{\begin{bmatrix} 1 & -1 & \frac{1}{4} \\ 1 & 0 & \frac{1}{2} \\ 1 & 0 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x)=\begin{bmatrix} -(x-1)\,e^{x} & -\frac{e^{2x}}{2}+\frac{(3x+1)e^{x}}{2} & \frac{e^{2x}}{2}+\frac{e^{x}(-x-1)}{2} \\ -x\,e^{x} & 2\,e^{x}+\frac{3x\,e^{x}}{2}-e^{2x} & -e^{x}-\frac{x\,e^{x}}{2}+e^{2x} \\ -x\,e^{x} & 2\,e^{x}+\frac{3x\,e^{x}}{2}-2\,e^{2x} & -e^{x}-\frac{x\,e^{x}}{2}+2\,e^{2x} \end{bmatrix}$$

□ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

$\vec{y}_p(x)=\Phi(x)\cdot\vec{v}(x)$

- Take the derivative of the particular solution

$\vec{y}'_p(x)=\Phi'(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)=A\cdot\Phi(x)\cdot\vec{v}(x)+\vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

$A\cdot\Phi(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)=A\cdot\Phi(x)\cdot\vec{v}(x)+\vec{f}(x)$

- Cancel like terms

$\Phi(x)\cdot\vec{v}'(x)=\vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

$$\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$$

- Integrate to solve for $\vec{v}(x)$

$$\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$$

- Plug $\vec{v}(x)$ into the equation for the particular solution

$$\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \begin{bmatrix} \frac{(x-6)e^{2x}}{2} + \frac{(2x^2+4x+7)e^x}{2} - \frac{\cos(x)}{2} \\ \frac{(2x-11)e^{2x}}{2} + \frac{(2x^2+8x+11)e^x}{2} + \frac{\sin(x)}{2} \\ \frac{(4x-19)e^{2x}}{2} + \frac{(2x^2+8x+19)e^x}{2} - \frac{3\sin(x)}{2} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1 \vec{y}_1(x) + c_2 \vec{y}_2(x) + c_3 \vec{y}_3 + \begin{bmatrix} \frac{(x-6)e^{2x}}{2} + \frac{(2x^2+4x+7)e^x}{2} - \frac{\cos(x)}{2} \\ \frac{(2x-11)e^{2x}}{2} + \frac{(2x^2+8x+11)e^x}{2} + \frac{\sin(x)}{2} \\ \frac{(4x-19)e^{2x}}{2} + \frac{(2x^2+8x+19)e^x}{2} - \frac{3\sin(x)}{2} \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = \frac{(c_3+2x-12)e^{2x}}{4} + \frac{(7+2x^2+2(c_2+2)x+2c_1-2c_2)e^x}{2} - \frac{\cos(x)}{2}$$

ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - y'' + y' - y = 5\,e^{2x} + 2\,e^{x} - 4\cos(x) + 4\sin(x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - y'' + y' - y = 0$$

The characteristic equation is

$$\lambda^3 - \lambda^2 + \lambda - 1 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = i$$
$$\lambda_3 = -i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{x} + c_2 \mathrm{e}^{-ix} + \mathrm{e}^{ix} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= \mathrm{e}^{x} \\ y_2 &= \mathrm{e}^{-ix} \\ y_3 &= \mathrm{e}^{ix} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y''' - y'' + y' - y = 5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x)$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)}\, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} \mathrm{e}^{x} & \mathrm{e}^{-ix} & \mathrm{e}^{ix} \\ \mathrm{e}^{x} & -i\mathrm{e}^{-ix} & i\mathrm{e}^{ix} \\ \mathrm{e}^{x} & -\mathrm{e}^{-ix} & -\mathrm{e}^{ix} \end{bmatrix}$$

$$|W| = 4i\mathrm{e}^{x}\mathrm{e}^{-ix}\mathrm{e}^{ix}$$

The determinant simplifies to

$$|W| = 4i\mathrm{e}^{x}$$

Now we determine W_i for each U_i.

$$\begin{aligned} W_1(x) &= \det \begin{bmatrix} \mathrm{e}^{-ix} & \mathrm{e}^{ix} \\ -i\mathrm{e}^{-ix} & i\mathrm{e}^{ix} \end{bmatrix} \\ &= 2i \end{aligned}$$

$$\begin{aligned} W_2(x) &= \det \begin{bmatrix} \mathrm{e}^{x} & \mathrm{e}^{ix} \\ \mathrm{e}^{x} & i\mathrm{e}^{ix} \end{bmatrix} \\ &= (-1+i)\,\mathrm{e}^{(1+i)x} \end{aligned}$$

$$\begin{aligned} W_3(x) &= \det \begin{bmatrix} \mathrm{e}^{x} & \mathrm{e}^{-ix} \\ \mathrm{e}^{x} & -i\mathrm{e}^{-ix} \end{bmatrix} \\ &= (-1-i)\,\mathrm{e}^{(1-i)x} \end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{3-1} \int \frac{F(x)W_1(x)}{aW(x)}\, dx \\ &= (-1)^2 \int \frac{(5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x))\,(2i)}{(1)\,(4i\mathrm{e}^{x})}\, dx \\ &= \int \frac{2i(5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x))}{4i\mathrm{e}^{x}}\, dx \\ &= \int \left(1 + 2\,\mathrm{e}^{-x}(-\cos(x) + \sin(x)) + \frac{5\,\mathrm{e}^{x}}{2}\right) dx \\ &= x - 2\sin(x)\,\mathrm{e}^{-x} + \frac{5\,\mathrm{e}^{x}}{2} \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{3-2} \int \frac{F(x) W_2(x)}{a W(x)}\, dx \\
&= (-1)^1 \int \frac{\left(5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x)\right)\left((-1+i)\,\mathrm{e}^{(1+i)x}\right)}{(1)\,(4i\mathrm{e}^{x})}\, dx \\
&= -\int \frac{(-1+i)\left(5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x)\right)\mathrm{e}^{(1+i)x}}{4i\mathrm{e}^{x}}\, dx \\
&= -\int \left(\left(\frac{1}{4} + \frac{i}{4}\right)\left(5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x)\right)\mathrm{e}^{ix}\right) dx \\
&= x + \frac{\mathrm{e}^{2ix}}{2} - \frac{\mathrm{e}^{(1+i)x}}{2} - \frac{3\,\mathrm{e}^{(2+i)x}}{4} - \frac{i\mathrm{e}^{(2+i)x}}{4} \\
&= x + \frac{\mathrm{e}^{2ix}}{2} - \frac{\mathrm{e}^{(1+i)x}}{2} - \frac{3\,\mathrm{e}^{(2+i)x}}{4} - \frac{i\mathrm{e}^{(2+i)x}}{4}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x) W_3(x)}{a W(x)}\, dx \\
&= (-1)^0 \int \frac{\left(5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x)\right)\left((-1-i)\,\mathrm{e}^{(1-i)x}\right)}{(1)\,(4i\mathrm{e}^{x})}\, dx \\
&= \int \frac{(-1-i)\left(5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x)\right)\mathrm{e}^{(1-i)x}}{4i\mathrm{e}^{x}}\, dx \\
&= \int \left(\left(-\frac{1}{4} + \frac{i}{4}\right)\left(5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x)\right)\mathrm{e}^{-ix}\right) dx \\
&= \int \left(-\frac{1}{4} + \frac{i}{4}\right)\left(5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x)\right)\mathrm{e}^{-ix} dx
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Hence

$$
\begin{aligned}
y_p = {} & \left(x - 2\sin(x)\,\mathrm{e}^{-x} + \frac{5\,\mathrm{e}^{x}}{2}\right)(\mathrm{e}^{x}) \\
& + \left(x + \frac{\mathrm{e}^{2ix}}{2} - \frac{\mathrm{e}^{(1+i)x}}{2} - \frac{3\,\mathrm{e}^{(2+i)x}}{4} - \frac{i\mathrm{e}^{(2+i)x}}{4}\right)(\mathrm{e}^{-ix}) \\
& + \left(\int \left(-\frac{1}{4} + \frac{i}{4}\right)\left(5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x)\right)\mathrm{e}^{-ix} dx\right)(\mathrm{e}^{ix})
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \mathrm{e}^{2x} + \frac{(4x+1)\cos(x)}{2} + (x-1)\,\mathrm{e}^{x} + \left(-2 - \frac{i}{2}\right)\sin(x)
$$

Which simplifies to

$$y_p = e^{2x} + \frac{(4x+1)\cos(x)}{2} + (x-1)e^x + \left(-2 - \frac{i}{2}\right)\sin(x)$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^x + c_2 e^{-ix} + e^{ix} c_3\right) + \left(e^{2x} + \frac{(4x+1)\cos(x)}{2} + (x-1)e^x + \left(-2 - \frac{i}{2}\right)\sin(x)\right) \end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1 e^x + c_2 e^{-ix} + e^{ix} c_3 + e^{2x} + \frac{(4x+1)\cos(x)}{2} + (x-1)e^x + \left(-2 - \frac{i}{2}\right)\sin(x) \tag{1}$$

Verification of solutions

$$y = c_1 e^x + c_2 e^{-ix} + e^{ix} c_3 + e^{2x} + \frac{(4x+1)\cos(x)}{2} + (x-1)e^x + \left(-2 - \frac{i}{2}\right)\sin(x)$$

Verified OK.

19.49.1 Maple step by step solution

Let's solve

$y''' - y'' + y' - y = 5e^{2x} + 2e^x - 4\cos(x) + 4\sin(x)$

- Highest derivative means the order of the ODE is 3

  y'''

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Isolate for $y_3'(x)$ using original ODE

$$y_3'(x) = 5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x) + y_3(x) - y_2(x) + y_1(x)$$

Convert linear ODE into a system of first order ODEs

$$[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x) + y_3(x) - y_2(x) + y_1(x$$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & -1 & 1 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x) \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 5\,\mathrm{e}^{2x} + 2\,\mathrm{e}^{x} - 4\cos(x) + 4\sin(x) \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & -1 & 1 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[-\mathrm{I}, \begin{bmatrix} -1 \\ \mathrm{I} \\ 1 \end{bmatrix}\right], \left[\mathrm{I}, \begin{bmatrix} -1 \\ -\mathrm{I} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = e^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-\mathrm{I}, \left[\begin{array}{c} -1 \\ \mathrm{I} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$e^{-\mathrm{I}x} \cdot \left[\begin{array}{c} -1 \\ \mathrm{I} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$(-\mathrm{I}\sin(x) + \cos(x)) \cdot \left[\begin{array}{c} -1 \\ \mathrm{I} \\ 1 \end{array}\right]$$

- Simplify expression

$$\left[\begin{array}{c} \mathrm{I}\sin(x) - \cos(x) \\ \mathrm{I}(-\mathrm{I}\sin(x) + \cos(x)) \\ -\mathrm{I}\sin(x) + \cos(x) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_2(x) = \left[\begin{array}{c} -\cos(x) \\ \sin(x) \\ \cos(x) \end{array}\right], \vec{y}_3(x) = \left[\begin{array}{c} \sin(x) \\ \cos(x) \\ -\sin(x) \end{array}\right]\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\overrightarrow{y}(x) = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2(x) + c_3\overrightarrow{y}_3(x) + \overrightarrow{y}_p(x)$

- ☐ Fundamental matrix
  - Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

    $$\phi(x) = \begin{bmatrix} e^x & -\cos(x) & \sin(x) \\ e^x & \sin(x) & \cos(x) \\ e^x & \cos(x) & -\sin(x) \end{bmatrix}$$

  - The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

    $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

  - Substitute the value of $\phi(x)$ and $\phi(0)$

    $$\Phi(x) = \begin{bmatrix} e^x & -\cos(x) & \sin(x) \\ e^x & \sin(x) & \cos(x) \\ e^x & \cos(x) & -\sin(x) \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & -1 & 0 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix}}$$

  - Evaluate and simplify to get the fundamental matrix

    $$\Phi(x) = \begin{bmatrix} \frac{e^x}{2} + \frac{\cos(x)}{2} - \frac{\sin(x)}{2} & \sin(x) & \frac{e^x}{2} - \frac{\cos(x)}{2} - \frac{\sin(x)}{2} \\ \frac{e^x}{2} - \frac{\cos(x)}{2} - \frac{\sin(x)}{2} & \cos(x) & \frac{e^x}{2} + \frac{\sin(x)}{2} - \frac{\cos(x)}{2} \\ \frac{e^x}{2} + \frac{\sin(x)}{2} - \frac{\cos(x)}{2} & -\sin(x) & \frac{e^x}{2} + \frac{\cos(x)}{2} + \frac{\sin(x)}{2} \end{bmatrix}$$

- ☐ Find a particular solution of the system of ODEs using variation of parameters
  - Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

    $\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$

  - Take the derivative of the particular solution

    $\overrightarrow{y}'_p(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$

  - Substitute particular solution and its derivative into the system of ODEs

    $\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

  - The fundamental matrix has columns that are solutions to the homogeneous system so its der

    $A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

  - Cancel like terms

$$\Phi(x)\cdot \vec{v}'(x)=\vec{f}(x)$$

- Multiply by the inverse of the fundamental matrix

$$\vec{v}'(x)=\frac{1}{\Phi(x)}\cdot \vec{f}(x)$$

- Integrate to solve for $\vec{v}(x)$

$$\vec{v}(x)=\int_0^x \frac{1}{\Phi(s)}\cdot \vec{f}(s)\,ds$$

- Plug $\vec{v}(x)$ into the equation for the particular solution

$$\vec{y}_p(x)=\Phi(x)\cdot\left(\int_0^x \frac{1}{\Phi(s)}\cdot \vec{f}(s)\,ds\right)$$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x)=\left[\begin{array}{c} -\frac{3\sin(x)}{2}+e^{2x}+x\,e^{x}+2x\cos(x)-\frac{7\,e^{x}}{2}+\frac{5\cos(x)}{2} \\ -\frac{5\sin(x)}{2}-2\sin(x)\,x+2\,e^{2x}+x\,e^{x}-\frac{5\,e^{x}}{2}+\frac{\cos(x)}{2} \\ -\frac{5\sin(x)}{2}+4\,e^{2x}+x\,e^{x}-2x\cos(x)-\frac{3\,e^{x}}{2}-\frac{5\cos(x)}{2} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x)=c_1\vec{y}_1+c_2\vec{y}_2(x)+c_3\vec{y}_3(x)+\left[\begin{array}{c} -\frac{3\sin(x)}{2}+e^{2x}+x\,e^{x}+2x\cos(x)-\frac{7\,e^{x}}{2}+\frac{5\cos(x)}{2} \\ -\frac{5\sin(x)}{2}-2\sin(x)\,x+2\,e^{2x}+x\,e^{x}-\frac{5\,e^{x}}{2}+\frac{\cos(x)}{2} \\ -\frac{5\sin(x)}{2}+4\,e^{2x}+x\,e^{x}-2x\cos(x)-\frac{3\,e^{x}}{2}-\frac{5\cos(x)}{2} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y=e^{2x}+\frac{(4x-2c_2+5)\cos(x)}{2}+\frac{(2x+2c_1-7)e^{x}}{2}+\frac{(2c_3-3)\sin(x)}{2}$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_y]]
```

$$\boxed{y''' - y' = -2 - 2x + 4\,\mathrm{e}^{x} - 6\,\mathrm{e}^{-x} + 96\,\mathrm{e}^{3x}}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - y' = 0$$

The characteristic equation is

$$\lambda^3 - \lambda = 0$$

The roots of the above equation are

$$\lambda_1 = 0$$
$$\lambda_2 = 1$$
$$\lambda_3 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 + c_3 e^{x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^{-x} \\ y_2 &= 1 \\ y_3 &= e^{x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y''' - y' = -2 - 2x + 4 e^{x} - 6 e^{-x} + 96 e^{3x}$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-2 - 2x + 4 e^{x} - 6 e^{-x} + 96 e^{3x}$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{e^{x}\}, \{e^{-x}\}, \{e^{3x}\}, \{1, x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{1, e^{x}, e^{-x}\}$$

Since e^{-x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{e^{x}\}, \{x e^{-x}\}, \{e^{3x}\}, \{1, x\}]$$

Since 1 is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{e^{x}\}, \{x e^{-x}\}, \{e^{3x}\}, \{x, x^2\}]$$

Since e^{x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x e^{x}\}, \{x e^{-x}\}, \{e^{3x}\}, \{x, x^2\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x e^{x} + A_2 x e^{-x} + A_3 e^{3x} + A_4 x + A_5 x^2$$

The unknowns $\{A_1, A_2, A_3, A_4, A_5\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$2A_1\mathrm{e}^{x} + 2A_2\mathrm{e}^{-x} + 24A_3\mathrm{e}^{3x} - A_4 - 2A_5x = -2 - 2x + 4\,\mathrm{e}^{x} - 6\,\mathrm{e}^{-x} + 96\,\mathrm{e}^{3x}$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 2, A_2 = -3, A_3 = 4, A_4 = 2, A_5 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = 2x\,\mathrm{e}^{x} - 3x\,\mathrm{e}^{-x} + 4\,\mathrm{e}^{3x} + 2x + x^2$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1\mathrm{e}^{-x} + c_2 + c_3\mathrm{e}^{x}\right) + \left(2x\,\mathrm{e}^{x} - 3x\,\mathrm{e}^{-x} + 4\,\mathrm{e}^{3x} + 2x + x^2\right) \end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1\mathrm{e}^{-x} + c_2 + c_3\mathrm{e}^{x} + 2x\,\mathrm{e}^{x} - 3x\,\mathrm{e}^{-x} + 4\,\mathrm{e}^{3x} + 2x + x^2 \tag{1}$$

Verification of solutions

$$y = c_1\mathrm{e}^{-x} + c_2 + c_3\mathrm{e}^{x} + 2x\,\mathrm{e}^{x} - 3x\,\mathrm{e}^{-x} + 4\,\mathrm{e}^{3x} + 2x + x^2$$

Verified OK.

19.50.1 Maple step by step solution

Let's solve

$y''' - y' = -2 - 2x + 4\,\mathrm{e}^{x} - 6\,\mathrm{e}^{-x} + 96\,\mathrm{e}^{3x}$

- Highest derivative means the order of the ODE is 3

  y'''

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

- Define new variable $y_2(x)$

  $y_2(x) = y'$
- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = -2 - 2x + 4\,e^{x} - 6\,e^{-x} + 96\,e^{3x} + y_2(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x)\,, y_3(x) = y_2'(x)\,, y_3'(x) = -2 - 2x + 4\,e^{x} - 6\,e^{-x} + 96\,e^{3x} + y_2(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ -2 - 2x + 4\,e^{x} - 6\,e^{-x} + 96\,e^{3x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ -2 - 2x + 4\,e^{x} - 6\,e^{-x} + 96\,e^{3x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$
- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \left[\begin{array}{c}1 \\ -1 \\ 1\end{array}\right]\right], \left[0, \left[\begin{array}{c}1 \\ 0 \\ 0\end{array}\right]\right], \left[1, \left[\begin{array}{c}1 \\ 1 \\ 1\end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c}1 \\ -1 \\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-x} \cdot \left[\begin{array}{c}1 \\ -1 \\ 1\end{array}\right]$$

- Consider eigenpair

$$\left[0, \left[\begin{array}{c}1 \\ 0 \\ 0\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \left[\begin{array}{c}1 \\ 0 \\ 0\end{array}\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c}1 \\ 1 \\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = \mathrm{e}^{x} \cdot \left[\begin{array}{c}1 \\ 1 \\ 1\end{array}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3 + \vec{y}_p(x)$

- ☐ Fundamental matrix
  - Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

    $$\phi(x) = \begin{bmatrix} e^{-x} & 1 & e^{x} \\ -e^{-x} & 0 & e^{x} \\ e^{-x} & 0 & e^{x} \end{bmatrix}$$

  - The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

    $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$
  - Substitute the value of $\phi(x)$ and $\phi(0)$

    $$\Phi(x) = \begin{bmatrix} e^{-x} & 1 & e^{x} \\ -e^{-x} & 0 & e^{x} \\ e^{-x} & 0 & e^{x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & 1 & 1 \\ -1 & 0 & 1 \\ 1 & 0 & 1 \end{bmatrix}}$$

  - Evaluate and simplify to get the fundamental matrix

    $$\Phi(x) = \begin{bmatrix} 1 & -\frac{e^{-x}}{2} + \frac{e^{x}}{2} & \frac{e^{-x}}{2} - 1 + \frac{e^{x}}{2} \\ 0 & \frac{e^{x}}{2} + \frac{e^{-x}}{2} & -\frac{e^{-x}}{2} + \frac{e^{x}}{2} \\ 0 & -\frac{e^{-x}}{2} + \frac{e^{x}}{2} & \frac{e^{x}}{2} + \frac{e^{-x}}{2} \end{bmatrix}$$

- ☐ Find a particular solution of the system of ODEs using variation of parameters
  - Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

    $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$
  - Take the derivative of the particular solution

    $\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$
  - Substitute particular solution and its derivative into the system of ODEs

    $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
  - The fundamental matrix has columns that are solutions to the homogeneous system so its der

    $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
  - Cancel like terms

$$\Phi(x) \cdot \overrightarrow{v}'(x) = \overrightarrow{f}(x)$$

- Multiply by the inverse of the fundamental matrix

$$\overrightarrow{v}'(x) = \frac{1}{\Phi(x)} \cdot \overrightarrow{f}(x)$$

- Integrate to solve for $\overrightarrow{v}(x)$

$$\overrightarrow{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds$$

- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

$$\overrightarrow{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds\right)$$

- Plug in the fundamental matrix and the forcing function and compute

$$\overrightarrow{y}_p(x) = \left[\begin{array}{c} -3x\,\mathrm{e}^{-x} + 2x + 2x\,\mathrm{e}^{x} + 4\,\mathrm{e}^{3x} + 44 - \frac{35\,\mathrm{e}^{-x}}{2} - \frac{61\,\mathrm{e}^{x}}{2} + x^2 \\ 3x\,\mathrm{e}^{-x} + 2x + 2x\,\mathrm{e}^{x} + 12\,\mathrm{e}^{3x} + 2 + \frac{29\,\mathrm{e}^{-x}}{2} - \frac{57\,\mathrm{e}^{x}}{2} \\ -3x\,\mathrm{e}^{-x} + 2x\,\mathrm{e}^{x} + 36\,\mathrm{e}^{3x} + 2 - \frac{23\,\mathrm{e}^{-x}}{2} - \frac{53\,\mathrm{e}^{x}}{2} \end{array}\right]$$

- Plug particular solution back into general solution

$$\overrightarrow{y}(x) = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2 + c_3\overrightarrow{y}_3 + \left[\begin{array}{c} -3x\,\mathrm{e}^{-x} + 2x + 2x\,\mathrm{e}^{x} + 4\,\mathrm{e}^{3x} + 44 - \frac{35\,\mathrm{e}^{-x}}{2} - \frac{61\,\mathrm{e}^{x}}{2} + x^2 \\ 3x\,\mathrm{e}^{-x} + 2x + 2x\,\mathrm{e}^{x} + 12\,\mathrm{e}^{3x} + 2 + \frac{29\,\mathrm{e}^{-x}}{2} - \frac{57\,\mathrm{e}^{x}}{2} \\ -3x\,\mathrm{e}^{-x} + 2x\,\mathrm{e}^{x} + 36\,\mathrm{e}^{3x} + 2 - \frac{23\,\mathrm{e}^{-x}}{2} - \frac{53\,\mathrm{e}^{x}}{2} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y = \frac{(-6x+2c_1-35)\mathrm{e}^{-x}}{2} + 4\,\mathrm{e}^{3x} + \frac{(4x+2c_3-61)\mathrm{e}^{x}}{2} + x^2 + 2x + c_2 + 44$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - 4y'' + 9y' - 10y = 10\,\mathrm{e}^{2x} + 20\,\mathrm{e}^{x} \sin(2x) - 10}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - 4y'' + 9y' - 10y = 0$$

The characteristic equation is

$$\lambda^3 - 4\lambda^2 + 9\lambda - 10 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = 1 - 2i$$
$$\lambda_3 = 1 + 2i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{2x} + e^{(1+2i)x} c_2 + e^{(1-2i)x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{2x}$$
$$y_2 = e^{(1+2i)x}$$
$$y_3 = e^{(1-2i)x}$$

Now the particular solution to the given ODE is found

$$y''' - 4y'' + 9y' - 10y = 10\,e^{2x} + 20\,e^{x} \sin(2x) - 10$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)}\, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} e^{2x} & e^{(1+2i)x} & e^{(1-2i)x} \\ 2\,e^{2x} & (1+2i)\,e^{(1+2i)x} & (1-2i)\,e^{(1-2i)x} \\ 4\,e^{2x} & (-3+4i)\,e^{(1+2i)x} & (-3-4i)\,e^{(1-2i)x} \end{bmatrix}$$
$$|W| = -20i e^{2x} e^{(1+2i)x} e^{(1-2i)x}$$

The determinant simplifies to

$$|W| = -20ie^{4x}$$

Now we determine W_i for each U_i.

$$W_1(x) = \det \begin{bmatrix} e^{(1+2i)x} & e^{(1-2i)x} \\ (1+2i)\,e^{(1+2i)x} & (1-2i)\,e^{(1-2i)x} \end{bmatrix}$$
$$= -4ie^{2x}$$

$$W_2(x) = \det \begin{bmatrix} e^{2x} & e^{(1-2i)x} \\ 2\,e^{2x} & (1-2i)\,e^{(1-2i)x} \end{bmatrix}$$
$$= (-1-2i)\,e^{(3-2i)x}$$

$$W_3(x) = \det \begin{bmatrix} e^{2x} & e^{(1+2i)x} \\ 2\,e^{2x} & (1+2i)\,e^{(1+2i)x} \end{bmatrix}$$
$$= (-1+2i)\,e^{(3+2i)x}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned}
U_1 &= (-1)^{3-1} \int \frac{F(x)W_1(x)}{aW(x)}\,dx \\
&= (-1)^2 \int \frac{\left(10\,e^{2x} + 20\,e^{x}\sin(2x) - 10\right)\left(-4ie^{2x}\right)}{(1)\left(-20ie^{4x}\right)}\,dx \\
&= \int \frac{-4i(10\,e^{2x} + 20\,e^{x}\sin(2x) - 10)\,e^{2x}}{-20ie^{4x}}\,dx \\
&= \int \left(\left(4\,e^{x}\sin(2x) + 2\,e^{2x} - 2\right)e^{-2x}\right)\,dx \\
&= \frac{4\,e^{-x}(-\sin(2x) - 2\cos(2x))}{5} + 2x + e^{-2x}
\end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{3-2} \int \frac{F(x) W_2(x)}{a W(x)}\, dx \\
&= (-1)^{1} \int \frac{\left(10\,\mathrm{e}^{2x} + 20\,\mathrm{e}^{x} \sin(2x) - 10\right)\left((-1-2i)\,\mathrm{e}^{(3-2i)x}\right)}{(1)\left(-20i\mathrm{e}^{4x}\right)}\, dx \\
&= -\int \frac{(-1-2i)\left(10\,\mathrm{e}^{2x} + 20\,\mathrm{e}^{x} \sin(2x) - 10\right)\mathrm{e}^{(3-2i)x}}{-20i\mathrm{e}^{4x}}\, dx \\
&= -\int \left(\left(1 - \frac{i}{2}\right)\left(-1 + \mathrm{e}^{2x} + 2\,\mathrm{e}^{x} \sin(2x)\right)\mathrm{e}^{(-1-2i)x}\right) dx \\
&= \frac{i\mathrm{e}^{(-1-2i)x}}{2} - \frac{2\,\mathrm{e}^{(1-2i)x}}{5} - \frac{3i\mathrm{e}^{(1-2i)x}}{10} + \frac{x}{2} + ix + \frac{\mathrm{e}^{-4ix}}{4} - \frac{i\mathrm{e}^{-4ix}}{8} \\
&= \frac{i\mathrm{e}^{(-1-2i)x}}{2} - \frac{2\,\mathrm{e}^{(1-2i)x}}{5} - \frac{3i\mathrm{e}^{(1-2i)x}}{10} + \frac{x}{2} + ix + \frac{\mathrm{e}^{-4ix}}{4} - \frac{i\mathrm{e}^{-4ix}}{8}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x) W_3(x)}{a W(x)}\, dx \\
&= (-1)^{0} \int \frac{\left(10\,\mathrm{e}^{2x} + 20\,\mathrm{e}^{x} \sin(2x) - 10\right)\left((-1+2i)\,\mathrm{e}^{(3+2i)x}\right)}{(1)\left(-20i\mathrm{e}^{4x}\right)}\, dx \\
&= \int \frac{(-1+2i)\left(10\,\mathrm{e}^{2x} + 20\,\mathrm{e}^{x} \sin(2x) - 10\right)\mathrm{e}^{(3+2i)x}}{-20i\mathrm{e}^{4x}}\, dx \\
&= \int \left(\left(-1 - \frac{i}{2}\right)\left(-1 + \mathrm{e}^{2x} + 2\,\mathrm{e}^{x} \sin(2x)\right)\mathrm{e}^{(-1+2i)x}\right) dx \\
&= -\frac{i\mathrm{e}^{(-1+2i)x}}{2} - \frac{2\,\mathrm{e}^{(1+2i)x}}{5} + \frac{3i\mathrm{e}^{(1+2i)x}}{10} + \frac{\mathrm{e}^{4ix}}{4} + \frac{i\mathrm{e}^{4ix}}{8} + \frac{x}{2} - ix \\
&= -\frac{i\mathrm{e}^{(-1+2i)x}}{2} - \frac{2\,\mathrm{e}^{(1+2i)x}}{5} + \frac{3i\mathrm{e}^{(1+2i)x}}{10} + \frac{\mathrm{e}^{4ix}}{4} + \frac{i\mathrm{e}^{4ix}}{8} + \frac{x}{2} - ix
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Hence

$$
\begin{aligned}
y_p = &\left(\frac{4\,\mathrm{e}^{-x}(-\sin(2x) - 2\cos(2x))}{5} + 2x + \mathrm{e}^{-2x}\right)\left(\mathrm{e}^{2x}\right) \\
&+ \left(\frac{i\mathrm{e}^{(-1-2i)x}}{2} - \frac{2\,\mathrm{e}^{(1-2i)x}}{5} - \frac{3i\mathrm{e}^{(1-2i)x}}{10} + \frac{x}{2} + ix + \frac{\mathrm{e}^{-4ix}}{4} - \frac{i\mathrm{e}^{-4ix}}{8}\right)\left(\mathrm{e}^{(1+2i)x}\right) \\
&+ \left(-\frac{i\mathrm{e}^{(-1+2i)x}}{2} - \frac{2\,\mathrm{e}^{(1+2i)x}}{5} + \frac{3i\mathrm{e}^{(1+2i)x}}{10} + \frac{\mathrm{e}^{4ix}}{4} + \frac{i\mathrm{e}^{4ix}}{8} + \frac{x}{2} - ix\right)\left(\mathrm{e}^{(1-2i)x}\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = 1 + \frac{(10x - 11)\,\mathrm{e}^{x} \cos(2x)}{10} + \frac{2(-2 + 5x)\,\mathrm{e}^{2x}}{5} + \frac{(-40x - 21)\,\mathrm{e}^{x} \sin(2x)}{20}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1 e^{2x} + e^{(1+2i)x} c_2 + e^{(1-2i)x} c_3\right) \\
&\quad + \left(1 + \frac{(10x-11)\,e^{x}\cos(2x)}{10} + \frac{2(-2+5x)\,e^{2x}}{5} + \frac{(-40x-21)\,e^{x}\sin(2x)}{20}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = {} & c_1 e^{2x} + e^{(1+2i)x} c_2 + e^{(1-2i)x} c_3 + 1 + \frac{(10x-11)\,e^{x}\cos(2x)}{10} \\
& + \frac{2(-2+5x)\,e^{2x}}{5} + \frac{(-40x-21)\,e^{x}\sin(2x)}{20}
\end{aligned}
\tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y = {} & c_1 e^{2x} + e^{(1+2i)x} c_2 + e^{(1-2i)x} c_3 + 1 + \frac{(10x-11)\,e^{x}\cos(2x)}{10} \\
& + \frac{2(-2+5x)\,e^{2x}}{5} + \frac{(-40x-21)\,e^{x}\sin(2x)}{20}
\end{aligned}
$$

Verified OK.

19.51.1 Maple step by step solution

Let's solve

$y''' - 4y'' + 9y' - 10y = 10\,e^{2x} + 20\,e^{x}\sin(2x) - 10$

- Highest derivative means the order of the ODE is 3

  y'''

- □ Convert linear ODE into a system of first order ODEs
  - ◦ Define new variable $y_1(x)$

    $y_1(x) = y$
  - ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$
  - ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$
  - ◦ Isolate for $y_3'(x)$ using original ODE

$y_3'(x) = 20\,\mathrm{e}^{x} \sin(2x) + 10\,\mathrm{e}^{2x} + 4 y_3(x) - 9 y_2(x) + 10 y_1(x) - 10$

Convert linear ODE into a system of first order ODEs

$[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 20\,\mathrm{e}^{x} \sin(2x) + 10\,\mathrm{e}^{2x} + 4 y_3(x) - 9 y_2(x) + 10 y_1(x) - 10]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 10 & -9 & 4 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 10\,\mathrm{e}^{2x} + 20\,\mathrm{e}^{x} \sin(2x) - 10 \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 10\,\mathrm{e}^{2x} + 20\,\mathrm{e}^{x} \sin(2x) - 10 \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 10 & -9 & 4 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[1 - 2\,\mathrm{I}, \begin{bmatrix} -\frac{3}{25} + \frac{4\,\mathrm{I}}{25} \\ \frac{1}{5} + \frac{2\,\mathrm{I}}{5} \\ 1 \end{bmatrix}\right], \left[1 + 2\,\mathrm{I}, \begin{bmatrix} -\frac{3}{25} - \frac{4\,\mathrm{I}}{25} \\ \frac{1}{5} - \frac{2\,\mathrm{I}}{5} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[2, \left[\begin{array}{c} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{2x} \cdot \left[\begin{array}{c} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[1 - 2\,\mathrm{I}, \left[\begin{array}{c} -\frac{3}{25} + \frac{4\,\mathrm{I}}{25} \\ \frac{1}{5} + \frac{2\,\mathrm{I}}{5} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(1-2\,\mathrm{I})x} \cdot \left[\begin{array}{c} -\frac{3}{25} + \frac{4\,\mathrm{I}}{25} \\ \frac{1}{5} + \frac{2\,\mathrm{I}}{5} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{x} \cdot \left(\cos\left(2x\right) - \mathrm{I}\sin\left(2x\right)\right) \cdot \left[\begin{array}{c} -\frac{3}{25} + \frac{4\,\mathrm{I}}{25} \\ \frac{1}{5} + \frac{2\,\mathrm{I}}{5} \\ 1 \end{array}\right]$$

- Simplify expression

$$\mathrm{e}^{x} \cdot \left[\begin{array}{c} \left(-\frac{3}{25} + \frac{4\,\mathrm{I}}{25}\right)\left(\cos\left(2x\right) - \mathrm{I}\sin\left(2x\right)\right) \\ \left(\frac{1}{5} + \frac{2\,\mathrm{I}}{5}\right)\left(\cos\left(2x\right) - \mathrm{I}\sin\left(2x\right)\right) \\ \cos\left(2x\right) - \mathrm{I}\sin\left(2x\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\overrightarrow{y}_2(x) = \mathrm{e}^{x} \cdot \left[\begin{array}{c} -\frac{3\cos(2x)}{25} + \frac{4\sin(2x)}{25} \\ \frac{\cos(2x)}{5} + \frac{2\sin(2x)}{5} \\ \cos\left(2x\right) \end{array}\right], \overrightarrow{y}_3(x) = \mathrm{e}^{x} \cdot \left[\begin{array}{c} \frac{3\sin(2x)}{25} + \frac{4\cos(2x)}{25} \\ -\frac{\sin(2x)}{5} + \frac{2\cos(2x)}{5} \\ -\sin\left(2x\right) \end{array}\right]\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

  $\overrightarrow{y}(x) = c_1 \overrightarrow{y}_1 + c_2 \overrightarrow{y}_2(x) + c_3 \overrightarrow{y}_3(x) + \overrightarrow{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} \frac{e^{2x}}{4} & e^x\left(-\frac{3\cos(2x)}{25} + \frac{4\sin(2x)}{25}\right) & e^x\left(\frac{3\sin(2x)}{25} + \frac{4\cos(2x)}{25}\right) \\ \frac{e^{2x}}{2} & e^x\left(\frac{\cos(2x)}{5} + \frac{2\sin(2x)}{5}\right) & e^x\left(-\frac{\sin(2x)}{5} + \frac{2\cos(2x)}{5}\right) \\ e^{2x} & e^x\cos(2x) & -e^x\sin(2x) \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

  $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} \frac{e^{2x}}{4} & e^x\left(-\frac{3\cos(2x)}{25} + \frac{4\sin(2x)}{25}\right) & e^x\left(\frac{3\sin(2x)}{25} + \frac{4\cos(2x)}{25}\right) \\ \frac{e^{2x}}{2} & e^x\left(\frac{\cos(2x)}{5} + \frac{2\sin(2x)}{5}\right) & e^x\left(-\frac{\sin(2x)}{5} + \frac{2\cos(2x)}{5}\right) \\ e^{2x} & e^x\cos(2x) & -e^x\sin(2x) \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} \frac{1}{4} & -\frac{3}{25} & \frac{4}{25} \\ \frac{1}{2} & \frac{1}{5} & \frac{2}{5} \\ 1 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} -e^x\sin(2x) + e^{2x} & \frac{7e^x\sin(2x)}{10} + \frac{2e^x\cos(2x)}{5} - \frac{2e^{2x}}{5} & -\frac{e^x\sin(2x)}{10} - \frac{e^x \text{co}}{} \\ -e^x\sin(2x) - 2e^x\cos(2x) + 2e^{2x} & -\frac{e^x\sin(2x)}{10} + \frac{9e^x\cos(2x)}{5} - \frac{4e^{2x}}{5} & \frac{2e^{2x}}{5} - \frac{2e^x\cos(2x)}{5} - \\ 4e^{2x} - 4e^x\cos(2x) + 3e^x\sin(2x) & -\frac{8e^{2x}}{5} + \frac{8e^x\cos(2x)}{5} - \frac{37e^x\sin(2x)}{10} & \frac{4e^{2x}}{5} + \frac{e^x\cos(2x)}{5} + \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

  $\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$

- Take the derivative of the particular solution

  $\overrightarrow{y}_p'(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

$$A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$$

- Cancel like terms

  $$\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$$

- Multiply by the inverse of the fundamental matrix

  $$\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$$

- Integrate to solve for $\vec{v}(x)$

  $$\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$$

- Plug $\vec{v}(x)$ into the equation for the particular solution

  $$\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$$

- Plug in the fundamental matrix and the forcing function and compute

  $$\vec{y}_p(x) = \left[\begin{array}{c} 1+\frac{(5x-4)\mathrm{e}^{x}\cos(2x)}{5}+\frac{(10x-1)\mathrm{e}^{2x}}{5}+\frac{(-20x-9)\mathrm{e}^{x}\sin(2x)}{10} \\ \frac{\mathrm{e}^{x}(40x\,\mathrm{e}^{x}-40x\sin(2x)-30x\cos(2x)+16\,\mathrm{e}^{x}-13\sin(2x)-16\cos(2x))}{10} \\ \frac{\mathrm{e}^{x}(80x\,\mathrm{e}^{x}+20x\sin(2x)-110x\cos(2x)+72\,\mathrm{e}^{x}-21\sin(2x)-72\cos(2x))}{10} \end{array}\right]$$

- Plug particular solution back into general solution

  $$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \left[\begin{array}{c} 1+\frac{(5x-4)\mathrm{e}^{x}\cos(2x)}{5}+\frac{(10x-1)\mathrm{e}^{2x}}{5}+\frac{(-20x-9)\mathrm{e}^{x}\sin(2x)}{10} \\ \frac{\mathrm{e}^{x}(40x\,\mathrm{e}^{x}-40x\sin(2x)-30x\cos(2x)+16\,\mathrm{e}^{x}-13\sin(2x)-16\cos(2x))}{10} \\ \frac{\mathrm{e}^{x}(80x\,\mathrm{e}^{x}+20x\sin(2x)-110x\cos(2x)+72\,\mathrm{e}^{x}-21\sin(2x)-72\cos(2x))}{10} \end{array}\right]$$

- First component of the vector is the solution to the ODE

  $$y = 1 + \left(x - \frac{3c_2}{25} + \frac{4c_3}{25} - \frac{4}{5}\right)\mathrm{e}^{x}\cos(2x) - 2\left(x - \frac{2c_2}{25} - \frac{3c_3}{50} + \frac{9}{20}\right)\mathrm{e}^{x}\sin(2x) + \frac{(-4+40x+5c_1)\mathrm{e}^{2x}}{20}$$

Problem number: section 9.3, problem 52.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' + 3y'' + 3y' + y = 12\,\mathrm{e}^{-x} + 9\cos(2x) - 13\sin(2x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' + 3y'' + 3y' + y = 0$$

The characteristic equation is

$$\lambda^3 + 3\lambda^2 + 3\lambda + 1 = 0$$

The roots of the above equation are

$$\lambda_1 = -1$$
$$\lambda_2 = -1$$
$$\lambda_3 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-x} + x\,\mathrm{e}^{-x} c_2 + x^2 \mathrm{e}^{-x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= \mathrm{e}^{-x} \\ y_2 &= x\,\mathrm{e}^{-x} \\ y_3 &= x^2 \mathrm{e}^{-x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y''' + 3y'' + 3y' + y = 12\,\mathrm{e}^{-x} + 9\cos(2x) - 13\sin(2x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$12\,\mathrm{e}^{-x} + 9\cos(2x) - 13\sin(2x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{\mathrm{e}^{-x}\}, \{\cos(2x), \sin(2x)\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\,\mathrm{e}^{-x}, x^2 \mathrm{e}^{-x}, \mathrm{e}^{-x}\}$$

Since e^{-x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\,\mathrm{e}^{-x}\}, \{\cos(2x), \sin(2x)\}]$$

Since $x\,\mathrm{e}^{-x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 \mathrm{e}^{-x}\}, \{\cos(2x), \sin(2x)\}]$$

Since $x^2 \mathrm{e}^{-x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{\mathrm{e}^{-x} x^3\}, \{\cos(2x), \sin(2x)\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 \mathrm{e}^{-x} x^3 + A_2 \cos(2x) + A_3 \sin(2x)$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$\begin{aligned}&6A_1\mathrm{e}^{-x} + 2A_2 \sin(2x) - 2A_3 \cos(2x) - 11A_2 \cos(2x) - 11A_3 \sin(2x) \\&= 12\,\mathrm{e}^{-x} + 9\cos(2x) - 13\sin(2x)\end{aligned}$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 2, A_2 = -1, A_3 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = 2\,\mathrm{e}^{-x}x^3 - \cos(2x) + \sin(2x)$$

Therefore the general solution is

$$\begin{aligned}y &= y_h + y_p \\&= \left(c_1\mathrm{e}^{-x} + x\,\mathrm{e}^{-x}c_2 + x^2\mathrm{e}^{-x}c_3\right) + \left(2\,\mathrm{e}^{-x}x^3 - \cos(2x) + \sin(2x)\right)\end{aligned}$$

Which simplifies to

$$y = \mathrm{e}^{-x}\left(c_3x^2 + c_2x + c_1\right) + 2\,\mathrm{e}^{-x}x^3 - \cos(2x) + \sin(2x)$$

Summary

The solution(s) found are the following

$$y = \mathrm{e}^{-x}\left(c_3x^2 + c_2x + c_1\right) + 2\,\mathrm{e}^{-x}x^3 - \cos(2x) + \sin(2x) \tag{1}$$

Verification of solutions

$$y = \mathrm{e}^{-x}\left(c_3x^2 + c_2x + c_1\right) + 2\,\mathrm{e}^{-x}x^3 - \cos(2x) + \sin(2x)$$

Verified OK.

ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' + y'' - y' - y = 4\,\mathrm{e}^{-x}(1 - 6x) - 2x\cos(x) + 2(x + 1)\sin(x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' + y'' - y' - y = 0$$

The characteristic equation is

$$\lambda^3 + \lambda^2 - \lambda - 1 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = -1$$
$$\lambda_3 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-x} + x\,\mathrm{e}^{-x} c_2 + c_3 \mathrm{e}^{x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned}
y_1 &= \mathrm{e}^{-x} \\
y_2 &= x\,\mathrm{e}^{-x} \\
y_3 &= \mathrm{e}^{x}
\end{aligned}$$

Now the particular solution to the given ODE is found

$$y''' + y'' - y' - y = 4\,\mathrm{e}^{-x}(1 - 6x) - 2x\cos(x) + 2(x + 1)\sin(x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$4\,\mathrm{e}^{-x}(1 - 6x) - 2x\cos(x) + 2(x + 1)\sin(x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,\mathrm{e}^{-x}, \mathrm{e}^{-x}\}, \{x\cos(x), \sin(x)\,x, \cos(x), \sin(x)\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\,\mathrm{e}^{-x}, \mathrm{e}^{x}, \mathrm{e}^{-x}\}$$

Since e^{-x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\,\mathrm{e}^{-x}, x^2\mathrm{e}^{-x}\}, \{x\cos(x), \sin(x)\,x, \cos(x), \sin(x)\}]$$

Since $x\,\mathrm{e}^{-x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2\mathrm{e}^{-x}, \mathrm{e}^{-x}x^3\}, \{x\cos(x), \sin(x)\,x, \cos(x), \sin(x)\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^2 \mathrm{e}^{-x} + A_2 \mathrm{e}^{-x} x^3 + A_3 x\cos(x) + A_4 \sin(x)\,x + A_5 \cos(x) + A_6 \sin(x)$$

The unknowns $\{A_1, A_2, A_3, A_4, A_5, A_6\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$
\begin{aligned}
&-12A_2\mathrm{e}^{-x}x - 4A_4\sin(x) - 2A_6\cos(x) + 2A_3x\sin(x) - 2A_3\sin(x) - 2A_5\cos(x) \\
&- 2A_6\sin(x) - 2A_3x\cos(x) + 2A_4\cos(x) - 4A_3\cos(x) + 2A_5\sin(x) - 2A_4\cos(x)\,x \\
&+ 6A_2\mathrm{e}^{-x} - 4A_1\mathrm{e}^{-x} - 2A_4\sin(x)\,x = 4\,\mathrm{e}^{-x}(1-6x) - 2x\cos(x) + 2(x+1)\sin(x)
\end{aligned}
$$

Solving for the unknowns by comparing coefficients results in

$$
[A_1 = 2, A_2 = 2, A_3 = 1, A_4 = 0, A_5 = 0, A_6 = -2]
$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$
y_p = 2x^2\mathrm{e}^{-x} + 2\,\mathrm{e}^{-x}x^3 + x\cos(x) - 2\sin(x)
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1\mathrm{e}^{-x} + x\,\mathrm{e}^{-x}c_2 + c_3\mathrm{e}^{x}\right) + \left(2x^2\mathrm{e}^{-x} + 2\,\mathrm{e}^{-x}x^3 + x\cos(x) - 2\sin(x)\right)
\end{aligned}
$$

Which simplifies to

$$
y = (c_2x + c_1)\,\mathrm{e}^{-x} + c_3\mathrm{e}^{x} + 2x^2\mathrm{e}^{-x} + 2\,\mathrm{e}^{-x}x^3 + x\cos(x) - 2\sin(x)
$$

Summary

The solution(s) found are the following

$$
y = (c_2x + c_1)\,\mathrm{e}^{-x} + c_3\mathrm{e}^{x} + 2x^2\mathrm{e}^{-x} + 2\,\mathrm{e}^{-x}x^3 + x\cos(x) - 2\sin(x) \tag{1}
$$

Verification of solutions

$$
y = (c_2x + c_1)\,\mathrm{e}^{-x} + c_3\mathrm{e}^{x} + 2x^2\mathrm{e}^{-x} + 2\,\mathrm{e}^{-x}x^3 + x\cos(x) - 2\sin(x)
$$

Verified OK.

19.53.1 Maple step by step solution

Let's solve

$y''' + y'' - y' - y = 4\,\mathrm{e}^{-x}(1-6x) - 2x\cos(x) + 2(x+1)\sin(x)$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = y - 24x\,\mathrm{e}^{-x} - 2x\cos(x) + 2\sin(x)\,x + 4\,\mathrm{e}^{-x} + 2\sin(x) - y'' + y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' + y'' - y' - y = 2\sin(x)\,x - 2x\cos(x) - 24x\,\mathrm{e}^{-x} + 2\sin(x) + 4\,\mathrm{e}^{-x}$

☐ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

  $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

  $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

  $y_3(x) = y''$

  ◦ Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = -24x\,\mathrm{e}^{-x} - 2x\cos(x) + 2\sin(x)\,x + 4\,\mathrm{e}^{-x} + 2\sin(x) - y_3(x) + y_2(x) + y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = -24x\,\mathrm{e}^{-x} - 2x\cos(x) + 2\sin(x)\,x + 4\,\mathrm{e}^{-x} + 2\sin(x) - y$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}\,'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 1 & -1 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 2\sin(x)\,x - 2x\cos(x) - 24x\,\mathrm{e}^{-x} + 2\sin(x) + 4\,\mathrm{e}^{-x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 2\sin(x)\,x - 2x\cos(x) - 24x\,\mathrm{e}^{-x} + 2\sin(x) + 4\,\mathrm{e}^{-x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 1 & 1 & -1 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue -1

$$\vec{y}_1(x) = \mathrm{e}^{-x} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = -1$ is the eigenvalue, a

$$\vec{y}_2(x) = \mathrm{e}^{\lambda x}\left(x\vec{v} + \vec{p}\right)$$

- Note that the x multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\vec{y}_2(x)$ into the homogeneous system

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\vec{v} + \vec{p}\right) + \mathrm{e}^{\lambda x}\vec{v} = \left(\mathrm{e}^{\lambda x} A\right) \cdot \left(x\vec{v} + \vec{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

  $\lambda \mathrm{e}^{\lambda x}\left(x\overrightarrow{v}+\overrightarrow{p}\right)+\mathrm{e}^{\lambda x}\overrightarrow{v}=\mathrm{e}^{\lambda x}\left(\lambda x\overrightarrow{v}+A\cdot\overrightarrow{p}\right)$

- Simplify equation

  $\lambda\overrightarrow{p}+\overrightarrow{v}=A\cdot\overrightarrow{p}$

- Make use of the identity matrix I

  $(\lambda\cdot I)\cdot\overrightarrow{p}+\overrightarrow{v}=A\cdot\overrightarrow{p}$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_2(x)$ to be a solution to the homogeneous system

  $(A-\lambda\cdot I)\cdot\overrightarrow{p}=\overrightarrow{v}$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue -1

  $$\left(\left[\begin{array}{ccc}0 & 1 & 0\\ 0 & 0 & 1\\ 1 & 1 & -1\end{array}\right]-(-1)\cdot\left[\begin{array}{ccc}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{array}\right]\right)\cdot\overrightarrow{p}=\left[\begin{array}{c}1\\ -1\\ 1\end{array}\right]$$

- Choice of $\overrightarrow{p}$

  $$\overrightarrow{p}=\left[\begin{array}{c}1\\ 0\\ 0\end{array}\right]$$

- Second solution from eigenvalue -1

  $$\overrightarrow{y}_2(x)=\mathrm{e}^{-x}\cdot\left(x\cdot\left[\begin{array}{c}1\\ -1\\ 1\end{array}\right]+\left[\begin{array}{c}1\\ 0\\ 0\end{array}\right]\right)$$

- Consider eigenpair

  $$\left[1,\left[\begin{array}{c}1\\ 1\\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

  $$\overrightarrow{y}_3=\mathrm{e}^{x}\cdot\left[\begin{array}{c}1\\ 1\\ 1\end{array}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

  $\vec{y}(x) = c_1\vec{y}_1(x) + c_2\vec{y}_2(x) + c_3\vec{y}_3 + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

  $$\phi(x) = \begin{bmatrix} \mathrm{e}^{-x} & (x+1)\,\mathrm{e}^{-x} & \mathrm{e}^{x} \\ -\mathrm{e}^{-x} & -x\,\mathrm{e}^{-x} & \mathrm{e}^{x} \\ \mathrm{e}^{-x} & x\,\mathrm{e}^{-x} & \mathrm{e}^{x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

  $\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

  $$\Phi(x) = \begin{bmatrix} \mathrm{e}^{-x} & (x+1)\,\mathrm{e}^{-x} & \mathrm{e}^{x} \\ -\mathrm{e}^{-x} & -x\,\mathrm{e}^{-x} & \mathrm{e}^{x} \\ \mathrm{e}^{-x} & x\,\mathrm{e}^{-x} & \mathrm{e}^{x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & 1 & 1 \\ -1 & 0 & 1 \\ 1 & 0 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

  $$\Phi(x) = \begin{bmatrix} (x+1)\,\mathrm{e}^{-x} & -\frac{\mathrm{e}^{-x}}{2} + \frac{\mathrm{e}^{x}}{2} & -\frac{\mathrm{e}^{-x}}{2} - x\,\mathrm{e}^{-x} + \frac{\mathrm{e}^{x}}{2} \\ -x\,\mathrm{e}^{-x} & \frac{\mathrm{e}^{x}}{2} + \frac{\mathrm{e}^{-x}}{2} & -\frac{\mathrm{e}^{-x}}{2} + x\,\mathrm{e}^{-x} + \frac{\mathrm{e}^{x}}{2} \\ x\,\mathrm{e}^{-x} & -\frac{\mathrm{e}^{-x}}{2} + \frac{\mathrm{e}^{x}}{2} & \frac{\mathrm{e}^{-x}}{2} - x\,\mathrm{e}^{-x} + \frac{\mathrm{e}^{x}}{2} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot \vec{v}'(x)=\vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x)=\frac{1}{\Phi(x)}\cdot \vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x)=\int_0^x \frac{1}{\Phi(s)}\cdot \vec{f}(s)\,ds$

- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x)=\Phi(x)\cdot\left(\int_0^x \frac{1}{\Phi(s)}\cdot \vec{f}(s)\,ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x)=\left[\begin{array}{c}(4x^3+4x^2+4x+1)\,\mathrm{e}^{-x}+2x\cos(x)-\mathrm{e}^{x}-4\sin(x)\\ (-4x^3+8x^2+4x+3)\,\mathrm{e}^{-x}-2\sin(x)\,x-2\cos(x)-\mathrm{e}^{x}\\ (4x^3-8x^2+8x+1)\,\mathrm{e}^{-x}-\mathrm{e}^{x}-2\sin(x)\end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x)=c_1\vec{y}_1(x)+c_2\vec{y}_2(x)+c_3\vec{y}_3+\left[\begin{array}{c}(4x^3+4x^2+4x+1)\,\mathrm{e}^{-x}+2x\cos(x)-\mathrm{e}^{x}-4\sin(x)\\ (-4x^3+8x^2+4x+3)\,\mathrm{e}^{-x}-2\sin(x)\,x-2\cos(x)-\mathrm{e}^{x}\\ (4x^3-8x^2+8x+1)\,\mathrm{e}^{-x}-\mathrm{e}^{x}-2\sin(x)\end{array}\right]$$

- First component of the vector is the solution to the ODE

  $y=(4x^3+4x^2+(c_2+4)\,x+c_1+c_2+1)\,\mathrm{e}^{-x}+(c_3-1)\,\mathrm{e}^{x}+2x\cos(x)-4\sin(x)$

ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 5y'' + 4y = -12\,\mathrm{e}^{x} + 6\,\mathrm{e}^{-x} + 10\cos(x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 5y'' + 4y = 0$$

The characteristic equation is

$$\lambda^4 - 5\lambda^2 + 4 = 0$$

The roots of the above equation are

$$\lambda_1 = 2$$
$$\lambda_2 = -2$$
$$\lambda_3 = 1$$
$$\lambda_4 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{-2x} + c_3 e^{x} + e^{2x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^{-x} \\ y_2 &= e^{-2x} \\ y_3 &= e^{x} \\ y_4 &= e^{2x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' - 5y'' + 4y = -12\,e^{x} + 6\,e^{-x} + 10\cos(x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-12\,e^{x} + 6\,e^{-x} + 10\cos(x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{e^{x}\}, \{e^{-x}\}, \{\cos(x), \sin(x)\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^{x}, e^{-2x}, e^{-x}, e^{2x}\}$$

Since e^{-x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{e^{x}\}, \{x\,e^{-x}\}, \{\cos(x), \sin(x)\}]$$

Since e^{x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\,e^{x}\}, \{x\,e^{-x}\}, \{\cos(x), \sin(x)\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x\,e^{x} + A_2 x\,e^{-x} + A_3\cos(x) + A_4\sin(x)$$

The unknowns $\{A_1, A_2, A_3, A_4\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$-6A_1e^x + 6A_2e^{-x} + 10A_3\cos(x) + 10A_4\sin(x) = -12\,e^x + 6\,e^{-x} + 10\cos(x)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 2, A_2 = 1, A_3 = 1, A_4 = 0]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = 2x\,e^x + x\,e^{-x} + \cos(x)$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1e^{-x} + c_2e^{-2x} + c_3e^x + e^{2x}c_4\right) + \left(2x\,e^x + x\,e^{-x} + \cos(x)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1e^{-x} + c_2e^{-2x} + c_3e^x + e^{2x}c_4 + 2x\,e^x + x\,e^{-x} + \cos(x) \tag{1}$$

Verification of solutions

$$y = c_1e^{-x} + c_2e^{-2x} + c_3e^x + e^{2x}c_4 + 2x\,e^x + x\,e^{-x} + \cos(x)$$

Verified OK.

19.54.1 Maple step by step solution

Let's solve

$y'''' - 5y'' + 4y = -12\,e^x + 6\,e^{-x} + 10\cos(x)$

- Highest derivative means the order of the ODE is 4

  y''''

- □ Convert linear ODE into a system of first order ODEs
  - ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

- Define new variable $y_2(x)$

  $y_2(x) = y'$
- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Define new variable $y_4(x)$

  $y_4(x) = y'''$
- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = -12\,\mathrm{e}^{x} + 6\,\mathrm{e}^{-x} + 10\cos(x) + 5y_3(x) - 4y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -12\,\mathrm{e}^{x} + 6\,\mathrm{e}^{-x} + 10\cos(x) + 5y_3(x) - 4y_1$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -4 & 0 & 5 & 0 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ -12\,\mathrm{e}^{x} + 6\,\mathrm{e}^{-x} + 10\cos(x) \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ -12\,\mathrm{e}^{x} + 6\,\mathrm{e}^{-x} + 10\cos(x) \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -4 & 0 & 5 & 0 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = e^{-2x} \cdot \begin{bmatrix} -\frac{1}{8} \\ \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = e^{-x} \cdot \begin{bmatrix} -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\begin{bmatrix} 1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} \end{bmatrix}$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\begin{bmatrix} 2, \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix} \end{bmatrix}$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_4 = e^{2x} \cdot \begin{bmatrix} \frac{1}{8} \\ \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1 \vec{y}_1 + c_2 \vec{y}_2 + c_3 \vec{y}_3 + c_4 \vec{y}_4 + \vec{y}_p(x)$

□ Fundamental matrix

  - Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x)=\begin{bmatrix} -\frac{e^{-2x}}{8} & -e^{-x} & e^{x} & \frac{e^{2x}}{8} \\ \frac{e^{-2x}}{4} & e^{-x} & e^{x} & \frac{e^{2x}}{4} \\ -\frac{e^{-2x}}{2} & -e^{-x} & e^{x} & \frac{e^{2x}}{2} \\ e^{-2x} & e^{-x} & e^{x} & e^{2x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t…

  $\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x)=\begin{bmatrix} -\frac{e^{-2x}}{8} & -e^{-x} & e^{x} & \frac{e^{2x}}{8} \\ \frac{e^{-2x}}{4} & e^{-x} & e^{x} & \frac{e^{2x}}{4} \\ -\frac{e^{-2x}}{2} & -e^{-x} & e^{x} & \frac{e^{2x}}{2} \\ e^{-2x} & e^{-x} & e^{x} & e^{2x} \end{bmatrix}\cdot\frac{1}{\begin{bmatrix} -\frac{1}{8} & -1 & 1 & \frac{1}{8} \\ \frac{1}{4} & 1 & 1 & \frac{1}{4} \\ -\frac{1}{2} & -1 & 1 & \frac{1}{2} \\ 1 & 1 & 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x)=\begin{bmatrix} \frac{(-e^{4x}+4e^{3x}+4e^{x}-1)e^{-2x}}{6} & -\frac{(e^{4x}-8e^{3x}+8e^{x}-1)e^{-2x}}{12} & -\frac{(-e^{4x}+e^{3x}+e^{x}-1)e^{-2x}}{6} & \frac{(e^{4x}-2e^{3x}+2e^{x}-1)\ldots}{12} \\ -\frac{(e^{4x}-2e^{3x}+2e^{x}-1)e^{-2x}}{3} & \frac{(-e^{4x}+4e^{3x}+4e^{x}-1)e^{-2x}}{6} & \frac{(2e^{4x}-e^{3x}+e^{x}-2)e^{-2x}}{6} & -\frac{(-e^{4x}+e^{3x}+e^{x}-1\ldots}{6} \\ \frac{2(-e^{4x}+e^{3x}+e^{x}-1)e^{-2x}}{3} & -\frac{(e^{4x}-2e^{3x}+2e^{x}-1)e^{-2x}}{3} & -\frac{(-4e^{4x}+e^{3x}+e^{x}-4)e^{-2x}}{6} & \frac{(2e^{4x}-e^{3x}+e^{x}-2)\ldots}{6} \\ -\frac{2(2e^{4x}-e^{3x}+e^{x}-2)e^{-2x}}{3} & \frac{2(-e^{4x}+e^{3x}+e^{x}-1)e^{-2x}}{3} & \frac{(8e^{4x}-e^{3x}+e^{x}-8)e^{-2x}}{6} & -\frac{(-4e^{4x}+e^{3x}+e^{x}-\ldots}{6} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x)=\Phi(x)\cdot\vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}_p'(x)=\Phi'(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)=A\cdot\Phi(x)\cdot\vec{v}(x)+\vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der…

  $A\cdot\Phi(x)\cdot\vec{v}(x)+\Phi(x)\cdot\vec{v}'(x)=A\cdot\Phi(x)\cdot\vec{v}(x)+\vec{f}(x)$

- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$

- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \begin{bmatrix} \frac{e^{-2x}\left(-e^{4x}+4x\,e^{3x}-2\,e^{3x}+2\,e^{2x}\cos(x)+2x\,e^{x}+1\right)}{2} \\ -\left((-1-2x)\,e^{3x}+e^{2x}\sin(x)+e^{4x}+1+(x-1)\,e^{x}\right)e^{-2x} \\ \left((2x+3)\,e^{3x}-e^{2x}\cos(x)-2\,e^{4x}+2+(-2+x)\,e^{x}\right)e^{-2x} \\ -\left((-2x-5)\,e^{3x}-e^{2x}\sin(x)+4\,e^{4x}+4+(x-3)\,e^{x}\right)e^{-2x} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3 + c_4\vec{y}_4 + \begin{bmatrix} \frac{e^{-2x}\left(-e^{4x}+4x\,e^{3x}-2\,e^{3x}+2\,e^{2x}\cos(x)+2x\,e^{x}+1\right)}{2} \\ -\left((-1-2x)\,e^{3x}+e^{2x}\sin(x)+e^{4x}+1+(x-1)\,e^{x}\right)e^{-2x} \\ \left((2x+3)\,e^{3x}-e^{2x}\cos(x)-2\,e^{4x}+2+(-2+x)\,e^{x}\right)e^{-2x} \\ -\left((-2x-5)\,e^{3x}-e^{2x}\sin(x)+4\,e^{4x}+4+(x-3)\,e^{x}\right)e^{-2x} \end{bmatrix}$$

- First component of the vector is the solution to the ODE

  $y = e^{-2x}\left((2x+c_3-1)\,e^{3x} + x\,e^{x} + \frac{c_4 e^{4x}}{8} - c_2 e^{x} + e^{2x}\cos(x) - \frac{e^{4x}}{2} - \frac{c_1}{8} + \frac{1}{2}\right)$

Problem number: section 9.3, problem 55.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 4y''' + 11y'' - 14y' + 10y = -e^{x}(\sin(x) + 2\cos(2x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 4y''' + 11y'' - 14y' + 10y = 0$$

The characteristic equation is

$$\lambda^4 - 4\lambda^3 + 11\lambda^2 - 14\lambda + 10 = 0$$

The roots of the above equation are

$$\lambda_1 = 1 - i$$
$$\lambda_2 = 1 + i$$
$$\lambda_3 = 1 - 2i$$
$$\lambda_4 = 1 + 2i$$

Therefore the homogeneous solution is

$$y_h(x) = \mathrm{e}^{(1+2i)x} c_1 + \mathrm{e}^{(1-i)x} c_2 + \mathrm{e}^{(1+i)x} c_3 + \mathrm{e}^{(1-2i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \mathrm{e}^{(1+2i)x}$$
$$y_2 = \mathrm{e}^{(1-i)x}$$
$$y_3 = \mathrm{e}^{(1+i)x}$$
$$y_4 = \mathrm{e}^{(1-2i)x}$$

Now the particular solution to the given ODE is found

$$y'''' - 4y''' + 11y'' - 14y' + 10y = -\mathrm{e}^{x}(\sin(x) + 2\cos(2x))$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)}\, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} \mathrm{e}^{(1+2i)x} & \mathrm{e}^{(1-i)x} & \mathrm{e}^{(1+i)x} & \mathrm{e}^{(1-2i)x} \\ (1+2i)\,\mathrm{e}^{(1+2i)x} & (1-i)\,\mathrm{e}^{(1-i)x} & (1+i)\,\mathrm{e}^{(1+i)x} & (1-2i)\,\mathrm{e}^{(1-2i)x} \\ (-3+4i)\,\mathrm{e}^{(1+2i)x} & -2i\mathrm{e}^{(1-i)x} & 2i\mathrm{e}^{(1+i)x} & (-3-4i)\,\mathrm{e}^{(1-2i)x} \\ (-11-2i)\,\mathrm{e}^{(1+2i)x} & (-2-2i)\,\mathrm{e}^{(1-i)x} & (-2+2i)\,\mathrm{e}^{(1+i)x} & (-11+2i)\,\mathrm{e}^{(1-2i)x} \end{bmatrix}$$

$$|W| = 72\,\mathrm{e}^{(1+2i)x}\mathrm{e}^{(1-i)x}\mathrm{e}^{(1+i)x}\mathrm{e}^{(1-2i)x}$$

The determinant simplifies to

$$|W| = 72\,e^{4x}$$

Now we determine W_i for each U_i.

$$W_1(x) = \det\begin{bmatrix} e^{(1-i)x} & e^{(1+i)x} & e^{(1-2i)x} \\ (1-i)\,e^{(1-i)x} & (1+i)\,e^{(1+i)x} & (1-2i)\,e^{(1-2i)x} \\ -2ie^{(1-i)x} & 2ie^{(1+i)x} & (-3-4i)\,e^{(1-2i)x} \end{bmatrix}$$
$$= -6ie^{(3-2i)x}$$

$$W_2(x) = \det\begin{bmatrix} e^{(1+2i)x} & e^{(1+i)x} & e^{(1-2i)x} \\ (1+2i)\,e^{(1+2i)x} & (1+i)\,e^{(1+i)x} & (1-2i)\,e^{(1-2i)x} \\ (-3+4i)\,e^{(1+2i)x} & 2ie^{(1+i)x} & (-3-4i)\,e^{(1-2i)x} \end{bmatrix}$$
$$= 12ie^{(3+i)x}$$

$$W_3(x) = \det\begin{bmatrix} e^{(1+2i)x} & e^{(1-i)x} & e^{(1-2i)x} \\ (1+2i)\,e^{(1+2i)x} & (1-i)\,e^{(1-i)x} & (1-2i)\,e^{(1-2i)x} \\ (-3+4i)\,e^{(1+2i)x} & -2ie^{(1-i)x} & (-3-4i)\,e^{(1-2i)x} \end{bmatrix}$$
$$= 12ie^{(3-i)x}$$

$$W_4(x) = \det\begin{bmatrix} e^{(1+2i)x} & e^{(1-i)x} & e^{(1+i)x} \\ (1+2i)\,e^{(1+2i)x} & (1-i)\,e^{(1-i)x} & (1+i)\,e^{(1+i)x} \\ (-3+4i)\,e^{(1+2i)x} & -2ie^{(1-i)x} & 2ie^{(1+i)x} \end{bmatrix}$$
$$= -6ie^{(3+2i)x}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{4-1}\int \frac{F(x)W_1(x)}{aW(x)}\,dx \\ &= (-1)^3\int \frac{\left(-e^x(\sin(x)+2\cos(2x))\right)\left(-6ie^{(3-2i)x}\right)}{(1)\,(72\,e^{4x})}\,dx \\ &= -\int \frac{6ie^x(\sin(x)+2\cos(2x))\,e^{(3-2i)x}}{72\,e^{4x}}\,dx \\ &= -\int \left(\frac{i(\sin(x)+2\cos(2x))\,e^{-2ix}}{12}\right)dx \\ &= -\left(\int \frac{i(\sin(x)+2\cos(2x))\,e^{-2ix}}{12}dx\right) \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\,dx \\
&= (-1)^2 \int \frac{\left(-\mathrm{e}^x(\sin(x)+2\cos(2x))\right)\left(12i\mathrm{e}^{(3+i)x}\right)}{(1)\left(72\,\mathrm{e}^{4x}\right)}\,dx \\
&= \int \frac{-12i\mathrm{e}^x(\sin(x)+2\cos(2x))\,\mathrm{e}^{(3+i)x}}{72\,\mathrm{e}^{4x}}\,dx \\
&= \int \left(-\frac{i(\sin(x)+2\cos(2x))\,\mathrm{e}^{ix}}{6}\right)dx \\
&= \int -\frac{i(\sin(x)+2\cos(2x))\,\mathrm{e}^{ix}}{6}dx
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x)W_3(x)}{aW(x)}\,dx \\
&= (-1)^1 \int \frac{\left(-\mathrm{e}^x(\sin(x)+2\cos(2x))\right)\left(12i\mathrm{e}^{(3-i)x}\right)}{(1)\left(72\,\mathrm{e}^{4x}\right)}\,dx \\
&= -\int \frac{-12i\mathrm{e}^x(\sin(x)+2\cos(2x))\,\mathrm{e}^{(3-i)x}}{72\,\mathrm{e}^{4x}}\,dx \\
&= -\int \left(-\frac{i(\sin(x)+2\cos(2x))\,\mathrm{e}^{-ix}}{6}\right)dx \\
&= -\left(\int -\frac{i(\sin(x)+2\cos(2x))\,\mathrm{e}^{-ix}}{6}dx\right)
\end{aligned}
$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x)W_4(x)}{aW(x)}\,dx \\
&= (-1)^0 \int \frac{\left(-\mathrm{e}^x(\sin(x)+2\cos(2x))\right)\left(-6i\mathrm{e}^{(3+2i)x}\right)}{(1)\left(72\,\mathrm{e}^{4x}\right)}\,dx \\
&= \int \frac{6i\mathrm{e}^x(\sin(x)+2\cos(2x))\,\mathrm{e}^{(3+2i)x}}{72\,\mathrm{e}^{4x}}\,dx \\
&= \int \left(\frac{i(\sin(x)+2\cos(2x))\,\mathrm{e}^{2ix}}{12}\right)dx \\
&= \int \frac{i(\sin(x)+2\cos(2x))\,\mathrm{e}^{2ix}}{12}dx
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1y_1 + U_2y_2 + U_3y_3 + U_4y_4
$$

Hence

$$y_p = \left(-\left(\int \frac{i(\sin(x)+2\cos(2x))\,e^{-2ix}}{12}dx\right)\right)\left(e^{(1+2i)x}\right) + \left(\int -\frac{i(\sin(x)+2\cos(2x))\,e^{ix}}{6}dx\right)\left(e^{(1-i)x}\right) + \left(-\left(\int -\frac{i(\sin(x)+2\cos(2x))\,e^{-ix}}{6}dx\right)\right)\left(e^{(1+i)x}\right) + \left(\int \frac{i(\sin(x)+2\cos(2x))\,e^{2ix}}{12}dx\right)\left(e^{(1-2i)x}\right)$$

Therefore the particular solution is

$$y_p = -\frac{i\left(2\left(\int(\sin(x)+2\cos(2x))\,e^{ix}dx\right)e^{(1-i)x} - \left(\int(\sin(x)+2\cos(2x))\,e^{2ix}dx\right)e^{(1-2i)x} + \left(\int(\sin(x)+\right.\right.}{12}$$

Which simplifies to

$$y_p = -\frac{e^{x}\left(\left(\int(\sin(x)+2\cos(2x))\sin(2x)\,dx\right)\cos(2x) + 2\left(\int(\sin(x)+2\cos(2x))\cos(x)\,dx\right)\sin(x) - 2\left(\right.\right.}{6}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(e^{(1+2i)x}c_1 + e^{(1-i)x}c_2 + e^{(1+i)x}c_3 + e^{(1-2i)x}c_4\right) \\ &\quad + \left(-\frac{e^{x}\left(\left(\int(\sin(x)+2\cos(2x))\sin(2x)\,dx\right)\cos(2x) + 2\left(\int(\sin(x)+2\cos(2x))\cos(x)\,dx\right)\sin(x) - \right.}{6}\right. \end{aligned}$$

<u>Summary</u>

The solution(s) found are the following

$$y = e^{(1+2i)x}c_1 + e^{(1-i)x}c_2 + e^{(1+i)x}c_3 + e^{(1-2i)x}c_4 - \frac{e^{x}\left(\left(\int(\sin(x)+2\cos(2x))\sin(2x)\,dx\right)\cos(2x) + 2\left(\int(\sin(x)+2\cos(2x))\cos(x)\,dx\right)\sin(x) - 2\left(\int\right.\right.}{6} \quad (1)$$

<u>Verification of solutions</u>

$$y = e^{(1+2i)x}c_1 + e^{(1-i)x}c_2 + e^{(1+i)x}c_3 + e^{(1-2i)x}c_4 - \frac{e^{x}\left(\left(\int(\sin(x)+2\cos(2x))\sin(2x)\,dx\right)\cos(2x) + 2\left(\int(\sin(x)+2\cos(2x))\cos(x)\,dx\right)\sin(x) - 2\left(\int\right.\right.}{6}$$

Verified OK.

19.55.1 Maple step by step solution

Let's solve

$y'''' - 4y''' + 11y'' - 14y' + 10y = -e^{x}(\sin(x) + 2\cos(2x))$

- Highest derivative means the order of the ODE is 4

  y''''

□ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

  - Define new variable $y_2(x)$

    $y_2(x) = y'$

  - Define new variable $y_3(x)$

    $y_3(x) = y''$

  - Define new variable $y_4(x)$

    $y_4(x) = y'''$

  - Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = -2\,e^{x}\cos(2x) - \sin(x)\,e^{x} + 4y_4(x) - 11y_3(x) + 14y_2(x) - 10y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -2\,e^{x}\cos(2x) - \sin(x)\,e^{x} + 4y_4(x) - 11y_3$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -10 & 14 & -11 & 4 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ -2\,e^{x}\cos(2x) - \sin(x)\,e^{x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \left[\begin{array}{c} 0 \\ 0 \\ 0 \\ -2\,{\mathrm e}^{x} \cos\left(2 x\right)-\sin\left(x\right) {\mathrm e}^{x} \end{array}\right]$$

- Define the coefficient matrix

$$A = \left[\begin{array}{cccc} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -10 & 14 & -11 & 4 \end{array}\right]$$

- Rewrite the system as

$$\vec{y}^{\prime}(x) = A\cdot \vec{y}(x)+\vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1-2\,\mathrm{I}, \left[\begin{array}{c} -\frac{11}{125}-\frac{2\,\mathrm{I}}{125} \\ -\frac{3}{25}+\frac{4\,\mathrm{I}}{25} \\ \frac{1}{5}+\frac{2\,\mathrm{I}}{5} \\ 1 \end{array}\right]\right], \left[1-\mathrm{I}, \left[\begin{array}{c} -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right], \left[1+\mathrm{I}, \left[\begin{array}{c} -\frac{1}{4}-\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ \frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right], \left[1+2\,\mathrm{I}, \left[\begin{array}{c} -\frac{11}{125}+ \\ -\frac{3}{25}- \\ \frac{1}{5}-\frac{2\,\mathrm{I}}{5} \\ 1 \end{array}\right.\right.$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[1-2\,\mathrm{I}, \left[\begin{array}{c} -\frac{11}{125}-\frac{2\,\mathrm{I}}{125} \\ -\frac{3}{25}+\frac{4\,\mathrm{I}}{25} \\ \frac{1}{5}+\frac{2\,\mathrm{I}}{5} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$${\mathrm e}^{\left(1-2\,\mathrm{I}\right) x}\cdot \left[\begin{array}{c} -\frac{11}{125}-\frac{2\,\mathrm{I}}{125} \\ -\frac{3}{25}+\frac{4\,\mathrm{I}}{25} \\ \frac{1}{5}+\frac{2\,\mathrm{I}}{5} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^{x} \cdot (\cos(2x) - I\sin(2x)) \cdot \begin{bmatrix} -\frac{11}{125} - \frac{2I}{125} \\ -\frac{3}{25} + \frac{4I}{25} \\ \frac{1}{5} + \frac{2I}{5} \\ 1 \end{bmatrix}$$

- Simplify expression

$$e^{x} \cdot \begin{bmatrix} \left(-\frac{11}{125} - \frac{2I}{125}\right)(\cos(2x) - I\sin(2x)) \\ \left(-\frac{3}{25} + \frac{4I}{25}\right)(\cos(2x) - I\sin(2x)) \\ \left(\frac{1}{5} + \frac{2I}{5}\right)(\cos(2x) - I\sin(2x)) \\ \cos(2x) - I\sin(2x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_1(x) = e^{x} \cdot \begin{bmatrix} -\frac{11\cos(2x)}{125} - \frac{2\sin(2x)}{125} \\ -\frac{3\cos(2x)}{25} + \frac{4\sin(2x)}{25} \\ \frac{\cos(2x)}{5} + \frac{2\sin(2x)}{5} \\ \cos(2x) \end{bmatrix}, \vec{y}_2(x) = e^{x} \cdot \begin{bmatrix} \frac{11\sin(2x)}{125} - \frac{2\cos(2x)}{125} \\ \frac{3\sin(2x)}{25} + \frac{4\cos(2x)}{25} \\ -\frac{\sin(2x)}{5} + \frac{2\cos(2x)}{5} \\ -\sin(2x) \end{bmatrix}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[1 - I, \begin{bmatrix} -\frac{1}{4} + \frac{I}{4} \\ \frac{I}{2} \\ \frac{1}{2} + \frac{I}{2} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$e^{(1-I)x} \cdot \begin{bmatrix} -\frac{1}{4} + \frac{I}{4} \\ \frac{I}{2} \\ \frac{1}{2} + \frac{I}{2} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^{x} \cdot \left(-\mathrm{I}\sin\left(x\right)+\cos\left(x\right)\right) \cdot \left[\begin{array}{c} -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{x} \cdot \left[\begin{array}{c} \left(-\frac{1}{4}+\frac{\mathrm{I}}{4}\right)\left(-\mathrm{I}\sin\left(x\right)+\cos\left(x\right)\right) \\ \frac{\mathrm{I}}{2}\left(-\mathrm{I}\sin\left(x\right)+\cos\left(x\right)\right) \\ \left(\frac{1}{2}+\frac{\mathrm{I}}{2}\right)\left(-\mathrm{I}\sin\left(x\right)+\cos\left(x\right)\right) \\ -\mathrm{I}\sin\left(x\right)+\cos\left(x\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_{3}(x)=e^{x} \cdot \left[\begin{array}{c} -\frac{\cos(x)}{4}+\frac{\sin(x)}{4} \\ \frac{\sin(x)}{2} \\ \frac{\cos(x)}{2}+\frac{\sin(x)}{2} \\ \cos\left(x\right) \end{array}\right], \vec{y}_{4}(x)=e^{x} \cdot \left[\begin{array}{c} \frac{\sin(x)}{4}+\frac{\cos(x)}{4} \\ \frac{\cos(x)}{2} \\ \frac{\cos(x)}{2}-\frac{\sin(x)}{2} \\ -\sin\left(x\right) \end{array}\right]\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_{p}($

$$\vec{y}(x)=c_{1}\vec{y}_{1}(x)+c_{2}\vec{y}_{2}(x)+c_{3}\vec{y}_{3}(x)+c_{4}\vec{y}_{4}(x)+\vec{y}_{p}(x)$$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x)=\left[\begin{array}{cccc} e^{x}\left(-\frac{11\cos(2x)}{125}-\frac{2\sin(2x)}{125}\right) & e^{x}\left(\frac{11\sin(2x)}{125}-\frac{2\cos(2x)}{125}\right) & e^{x}\left(-\frac{\cos(x)}{4}+\frac{\sin(x)}{4}\right) & e^{x}\left(\frac{\sin(x)}{4}+\frac{\mathrm{co}}{}\right. \\ e^{x}\left(-\frac{3\cos(2x)}{25}+\frac{4\sin(2x)}{25}\right) & e^{x}\left(\frac{3\sin(2x)}{25}+\frac{4\cos(2x)}{25}\right) & \frac{\sin(x)e^{x}}{2} & \frac{\cos(x)e^{x}}{2} \\ e^{x}\left(\frac{\cos(2x)}{5}+\frac{2\sin(2x)}{5}\right) & e^{x}\left(-\frac{\sin(2x)}{5}+\frac{2\cos(2x)}{5}\right) & e^{x}\left(\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & \left(\frac{\cos(x)}{2}-\frac{\sin(x}{2}\right. \\ e^{x}\cos\left(2x\right) & -e^{x}\sin\left(2x\right) & \cos\left(x\right)e^{x} & -\sin\left(x\right)e \end{array}\right.$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t

$$\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} e^x\left(-\frac{11\cos(2x)}{125} - \frac{2\sin(2x)}{125}\right) & e^x\left(\frac{11\sin(2x)}{125} - \frac{2\cos(2x)}{125}\right) & e^x\left(-\frac{\cos(x)}{4} + \frac{\sin(x)}{4}\right) & e^x\left(\frac{\sin(x)}{4} + \frac{\mathrm{co}}{}\right. \\ e^x\left(-\frac{3\cos(2x)}{25} + \frac{4\sin(2x)}{25}\right) & e^x\left(\frac{3\sin(2x)}{25} + \frac{4\cos(2x)}{25}\right) & \frac{\sin(x)e^x}{2} & \frac{\cos(x)e^x}{2} \\ e^x\left(\frac{\cos(2x)}{5} + \frac{2\sin(2x)}{5}\right) & e^x\left(-\frac{\sin(2x)}{5} + \frac{2\cos(2x)}{5}\right) & e^x\left(\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) & \left(\frac{\cos(x)}{2} - \frac{\sin(x}{2}\right. \\ e^x\cos(2x) & -e^x\sin(2x) & \cos(x)\,e^x & -\sin(x)\,e \end{bmatrix}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{e^x(-2\cos(2x)-5\sin(x)+5\cos(x)+\sin(2x))}{3} & \frac{e^x(2\cos(2x)-2\sin(2x)-2\cos(x)+7\sin(x))}{3} & \frac{(-2\cos(x)+3\,\mathrm{s}}{} \\ -\frac{5e^x(-\sin(2x)+2\sin(x))}{3} & -\frac{e^x(2\cos(2x)+6\sin(2x)-9\sin(x)-5\cos(x))}{3} & \frac{e^x(4\cos(2x)+7\,\mathrm{si}}{} \\ \frac{10(\cos(x)-1)(2\cos(x)+\sin(x)+1)e^x}{3} & -\frac{2(\cos(x)-1)(14\cos(x)+2\sin(x)+7)e^x}{3} & -\frac{e^x(-18\cos(2x)+\mathrm{s}}{} \\ \frac{5e^x(4\cos(2x)-3\sin(2x)-4\cos(x))}{3} & -\frac{2e^x(9\cos(2x)-13\sin(2x)-9\cos(x)+5\sin(x))}{3} & \frac{e^x(16\cos(2x)-37\,\mathrm{s}}{} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x)\cdot\vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}'_p(x) = \Phi'(x)\cdot\vec{v}(x) + \Phi(x)\cdot\vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x)\cdot\vec{v}(x) + \Phi(x)\cdot\vec{v}'(x) = A\cdot\Phi(x)\cdot\vec{v}(x) + \vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A\cdot\Phi(x)\cdot\vec{v}(x) + \Phi(x)\cdot\vec{v}'(x) = A\cdot\Phi(x)\cdot\vec{v}(x) + \vec{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot\vec{v}'(x) = \vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)}\cdot\vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)}\cdot\vec{f}(s)\,ds$

- Plug $\vec{v}(x)$ into the equation for the particular solution

$$\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \left[\begin{array}{c} \frac{\left(6x\cos(x)\sin(x)-2\cos(x)\sin(x)+8\cos(x)^2+3x\cos(x)-\sin(x)-4\cos(x)-4\right)e^x}{18} \\ \frac{(12x+4)e^x\cos(x)^2}{18} + \frac{(6\sin(x)x+3x-12\sin(x)-2)e^x\cos(x)}{18} + \frac{(-3\sin(x)x-6x+3\sin(x)-2)e^x}{18} \\ \frac{(12x-4)e^x\cos(x)^2}{9} + \frac{((-9x-7)e^x\sin(x)+2e^x)\cos(x)}{9} - \frac{\left(x-\frac{1}{3}\right)(\sin(x)+2)e^x}{3} \\ \frac{e^x\left(-2(x+1)\cos(x)^2-\frac{(33\sin(x)x+3x+8\sin(x)-3)\cos(x)}{3}-\sin(x)x+x-\frac{4\sin(x)}{3}+1\right)}{3} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1(x) + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \left[\begin{array}{c} \frac{\left(6x\cos(x)\sin(x)-2\cos(x)\sin(x)+8\cos(x)^2+3x\cos\right.}{18} \\ \frac{(12x+4)e^x\cos(x)^2}{18} + \frac{(6\sin(x)x+3x-12\sin(x)-2)e^x\cos(}{18} \\ \frac{(12x-4)e^x\cos(x)^2}{9} + \frac{((-9x-7)e^x\sin(x)+2e^x)\cos}{9} \\ \frac{e^x\left(-2(x+1)\cos(x)^2-\frac{(33\sin(x)x+3x+8\sin(x)-3)\cos}{3}\right.}{3} \end{array}\right.$$

- First component of the vector is the solution to the ODE

$$y = \frac{e^x\left(\left(-\frac{66c_1}{125}-\frac{12c_2}{125}+\frac{4}{3}\right)\cos(x)^2+\left(\left(x-\frac{12c_1}{125}+\frac{66c_2}{125}-\frac{1}{3}\right)\sin(x)+\frac{x}{2}-\frac{3c_3}{4}+\frac{3c_4}{4}-\frac{2}{3}\right)\cos(x)+\left(\frac{3c_3}{4}+\frac{3c_4}{4}-\frac{1}{6}\right)\sin(x)+\frac{33c_1}{125}+\frac{6c_2}{125}-\frac{2}{3}}{3}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.3. Undetermined Coefficients for Higher Order Equations. Page 495
Problem number: section 9.3, problem 56.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' + 2y''' - 3y'' - 4y' + 4y = 2(x+1)\,\mathrm{e}^{x} + \mathrm{e}^{-2x}}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + 2y''' - 3y'' - 4y' + 4y = 0$$

The characteristic equation is

$$\lambda^4 + 2\lambda^3 - 3\lambda^2 - 4\lambda + 4 = 0$$

The roots of the above equation are

$$\begin{aligned}
\lambda_1 &= -2 \\
\lambda_2 &= -2 \\
\lambda_3 &= 1 \\
\lambda_4 &= 1
\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-2x} + x\,\mathrm{e}^{-2x} c_2 + c_3 \mathrm{e}^{x} + c_4 x\,\mathrm{e}^{x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \mathrm{e}^{-2x}$$
$$y_2 = \mathrm{e}^{-2x} x$$
$$y_3 = \mathrm{e}^{x}$$
$$y_4 = x\,\mathrm{e}^{x}$$

Now the particular solution to the given ODE is found

$$y'''' + 2y''' - 3y'' - 4y' + 4y = 2(x+1)\,\mathrm{e}^{x} + \mathrm{e}^{-2x}$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$2(x+1)\,\mathrm{e}^{x} + \mathrm{e}^{-2x}$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{\mathrm{e}^{-2x}\}, \{x\,\mathrm{e}^{x}, \mathrm{e}^{x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\,\mathrm{e}^{x}, \mathrm{e}^{-2x} x, \mathrm{e}^{x}, \mathrm{e}^{-2x}\}$$

Since e^{-2x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{\mathrm{e}^{-2x} x\}, \{x\,\mathrm{e}^{x}, \mathrm{e}^{x}\}]$$

Since $\mathrm{e}^{-2x} x$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 \mathrm{e}^{-2x}\}, \{x\,\mathrm{e}^{x}, \mathrm{e}^{x}\}]$$

Since e^{x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 \mathrm{e}^{-2x}\}, \{x\,\mathrm{e}^{x}, x^2 \mathrm{e}^{x}\}]$$

Since $x\,\mathrm{e}^{x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 \mathrm{e}^{-2x}\}, \{x^2 \mathrm{e}^{x}, \mathrm{e}^{x} x^3\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^2 \mathrm{e}^{-2x} + A_2 x^2 \mathrm{e}^{x} + A_3 \mathrm{e}^{x} x^3$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$54A_3 \mathrm{e}^{x} x + 18A_2 \mathrm{e}^{x} + 36A_3 \mathrm{e}^{x} + 18A_1 \mathrm{e}^{-2x} = 2(x+1)\,\mathrm{e}^{x} + \mathrm{e}^{-2x}$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{1}{18}, A_2 = \frac{1}{27}, A_3 = \frac{1}{27}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{x^2 \mathrm{e}^{-2x}}{18} + \frac{x^2 \mathrm{e}^{x}}{27} + \frac{\mathrm{e}^{x} x^3}{27}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 \mathrm{e}^{-2x} + x\,\mathrm{e}^{-2x} c_2 + c_3 \mathrm{e}^{x} + c_4 x\,\mathrm{e}^{x}\right) + \left(\frac{x^2 \mathrm{e}^{-2x}}{18} + \frac{x^2 \mathrm{e}^{x}}{27} + \frac{\mathrm{e}^{x} x^3}{27}\right) \end{aligned}$$

Which simplifies to

$$y = \left((c_4 x + c_3)\,\mathrm{e}^{3x} + c_2 x + c_1\right)\mathrm{e}^{-2x} + \frac{x^2 \mathrm{e}^{-2x}}{18} + \frac{x^2 \mathrm{e}^{x}}{27} + \frac{\mathrm{e}^{x} x^3}{27}$$

Summary

The solution(s) found are the following

$$y = \left((c_4 x + c_3)\,\mathrm{e}^{3x} + c_2 x + c_1\right)\mathrm{e}^{-2x} + \frac{x^2 \mathrm{e}^{-2x}}{18} + \frac{x^2 \mathrm{e}^{x}}{27} + \frac{\mathrm{e}^{x} x^3}{27} \tag{1}$$

Verification of solutions

$$y = \left((c_4 x + c_3)\,\mathrm{e}^{3x} + c_2 x + c_1\right)\mathrm{e}^{-2x} + \frac{x^2 \mathrm{e}^{-2x}}{18} + \frac{x^2 \mathrm{e}^{x}}{27} + \frac{\mathrm{e}^{x} x^3}{27}$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' + 4y = \sinh(x)\cos(x) - \cosh(x)\sin(x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + 4y = 0$$

The characteristic equation is

$$\lambda^4 + 4 = 0$$

The roots of the above equation are

$$\lambda_1 = 1 - i$$
$$\lambda_2 = 1 + i$$
$$\lambda_3 = -1 - i$$
$$\lambda_4 = -1 + i$$

Therefore the homogeneous solution is

$$y_h(x) = \mathrm{e}^{(-1-i)x} c_1 + \mathrm{e}^{(-1+i)x} c_2 + \mathrm{e}^{(1-i)x} c_3 + \mathrm{e}^{(1+i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \mathrm{e}^{(-1-i)x}$$
$$y_2 = \mathrm{e}^{(-1+i)x}$$
$$y_3 = \mathrm{e}^{(1-i)x}$$
$$y_4 = \mathrm{e}^{(1+i)x}$$

Now the particular solution to the given ODE is found

$$y'''' + 4y = \sinh(x)\cos(x) - \cosh(x)\sin(x)$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} \mathrm{e}^{(-1-i)x} & \mathrm{e}^{(-1+i)x} & \mathrm{e}^{(1-i)x} & \mathrm{e}^{(1+i)x} \\ (-1-i)\,\mathrm{e}^{(-1-i)x} & (-1+i)\,\mathrm{e}^{(-1+i)x} & (1-i)\,\mathrm{e}^{(1-i)x} & (1+i)\,\mathrm{e}^{(1+i)x} \\ 2i\mathrm{e}^{(-1-i)x} & -2i\mathrm{e}^{(-1+i)x} & -2i\mathrm{e}^{(1-i)x} & 2i\mathrm{e}^{(1+i)x} \\ (2-2i)\,\mathrm{e}^{(-1-i)x} & (2+2i)\,\mathrm{e}^{(-1+i)x} & (-2-2i)\,\mathrm{e}^{(1-i)x} & (-2+2i)\,\mathrm{e}^{(1+i)x} \end{bmatrix}$$

$$|W| = -128\,\mathrm{e}^{(-1-i)x}\mathrm{e}^{(-1+i)x}\mathrm{e}^{(1+i)x}\mathrm{e}^{(1-i)x}$$

The determinant simplifies to

$$|W| = -128$$

Now we determine W_i for each U_i.

$$W_1(x) = \det \begin{bmatrix} e^{(-1+i)x} & e^{(1-i)x} & e^{(1+i)x} \\ (-1+i)\, e^{(-1+i)x} & (1-i)\, e^{(1-i)x} & (1+i)\, e^{(1+i)x} \\ -2ie^{(-1+i)x} & -2ie^{(1-i)x} & 2ie^{(1+i)x} \end{bmatrix}$$
$$= (8+8i)\, e^{(1+i)x}$$

$$W_2(x) = \det \begin{bmatrix} e^{(-1-i)x} & e^{(1-i)x} & e^{(1+i)x} \\ (-1-i)\, e^{(-1-i)x} & (1-i)\, e^{(1-i)x} & (1+i)\, e^{(1+i)x} \\ 2ie^{(-1-i)x} & -2ie^{(1-i)x} & 2ie^{(1+i)x} \end{bmatrix}$$
$$= (-8+8i)\, e^{(1-i)x}$$

$$W_3(x) = \det \begin{bmatrix} e^{(-1-i)x} & e^{(-1+i)x} & e^{(1+i)x} \\ (-1-i)\, e^{(-1-i)x} & (-1+i)\, e^{(-1+i)x} & (1+i)\, e^{(1+i)x} \\ 2ie^{(-1-i)x} & -2ie^{(-1+i)x} & 2ie^{(1+i)x} \end{bmatrix}$$
$$= (-8+8i)\, e^{(-1+i)x}$$

$$W_4(x) = \det \begin{bmatrix} e^{(-1-i)x} & e^{(-1+i)x} & e^{(1-i)x} \\ (-1-i)\, e^{(-1-i)x} & (-1+i)\, e^{(-1+i)x} & (1-i)\, e^{(1-i)x} \\ 2ie^{(-1-i)x} & -2ie^{(-1+i)x} & -2ie^{(1-i)x} \end{bmatrix}$$
$$= (8+8i)\, e^{(-1-i)x}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{4-1} \int \frac{F(x) W_1(x)}{a W(x)}\, dx \\ &= (-1)^3 \int \frac{(\sinh(x)\cos(x) - \cosh(x)\sin(x))\left((8+8i)\, e^{(1+i)x}\right)}{(1)\,(-128)}\, dx \\ &= -\int \frac{(8+8i)\,(\sinh(x)\cos(x) - \cosh(x)\sin(x))\, e^{(1+i)x}}{-128}\, dx \\ &= -\int \left(\left(-\frac{1}{16} - \frac{i}{16}\right)(\sinh(x)\cos(x) - \cosh(x)\sin(x))\, e^{(1+i)x}\right) dx \\ &= \frac{ie^{2ix}}{64} + \frac{e^{(2+2i)x}}{128} + \frac{ie^{(2+2i)x}}{128} + \frac{e^{2x}}{64} - \frac{ix}{32} \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x) W_2(x)}{a W(x)}\, dx \\
&= (-1)^2 \int \frac{(\sinh(x)\cos(x) - \cosh(x)\sin(x))\left((-8+8i)\,\mathrm{e}^{(1-i)x}\right)}{(1)(-128)}\, dx \\
&= \int \frac{(-8+8i)(\sinh(x)\cos(x) - \cosh(x)\sin(x))\,\mathrm{e}^{(1-i)x}}{-128}\, dx \\
&= \int \left(\left(\frac{1}{16} - \frac{i}{16}\right)(\sinh(x)\cos(x) - \cosh(x)\sin(x))\,\mathrm{e}^{(1-i)x}\right) dx \\
&= \frac{\mathrm{e}^{2x}}{64} + \frac{ix}{32} - \frac{i\mathrm{e}^{-2ix}}{64} + \frac{\mathrm{e}^{(2-2i)x}}{128} - \frac{i\mathrm{e}^{(2-2i)x}}{128}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x) W_3(x)}{a W(x)}\, dx \\
&= (-1)^1 \int \frac{(\sinh(x)\cos(x) - \cosh(x)\sin(x))\left((-8+8i)\,\mathrm{e}^{(-1+i)x}\right)}{(1)(-128)}\, dx \\
&= -\int \frac{(-8+8i)(\sinh(x)\cos(x) - \cosh(x)\sin(x))\,\mathrm{e}^{(-1+i)x}}{-128}\, dx \\
&= -\int \left(\left(\frac{1}{16} - \frac{i}{16}\right)(\sinh(x)\cos(x) - \cosh(x)\sin(x))\,\mathrm{e}^{(-1+i)x}\right) dx \\
&= -\frac{\mathrm{e}^{(-2+2i)x}}{128} + \frac{i\mathrm{e}^{2ix}}{64} + \frac{i\mathrm{e}^{(-2+2i)x}}{128} + \frac{ix}{32} - \frac{\mathrm{e}^{-2x}}{64}
\end{aligned}
$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x) W_4(x)}{a W(x)}\, dx \\
&= (-1)^0 \int \frac{(\sinh(x)\cos(x) - \cosh(x)\sin(x))\left((8+8i)\,\mathrm{e}^{(-1-i)x}\right)}{(1)(-128)}\, dx \\
&= \int \frac{(8+8i)(\sinh(x)\cos(x) - \cosh(x)\sin(x))\,\mathrm{e}^{(-1-i)x}}{-128}\, dx \\
&= \int \left(\left(-\frac{1}{16} - \frac{i}{16}\right)(\sinh(x)\cos(x) - \cosh(x)\sin(x))\,\mathrm{e}^{(-1-i)x}\right) dx \\
&= -\frac{ix}{32} - \frac{\mathrm{e}^{-2x}}{64} - \frac{\mathrm{e}^{(-2-2i)x}}{128} - \frac{i\mathrm{e}^{-2ix}}{64} - \frac{i\mathrm{e}^{(-2-2i)x}}{128}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4
$$

Hence

$$y_p = \left(\frac{i e^{2ix}}{64} + \frac{e^{(2+2i)x}}{128} + \frac{i e^{(2+2i)x}}{128} + \frac{e^{2x}}{64} - \frac{ix}{32}\right)\left(e^{(-1-i)x}\right)$$
$$+ \left(\frac{e^{2x}}{64} + \frac{ix}{32} - \frac{i e^{-2ix}}{64} + \frac{e^{(2-2i)x}}{128} - \frac{i e^{(2-2i)x}}{128}\right)\left(e^{(-1+i)x}\right)$$
$$+ \left(-\frac{e^{(-2+2i)x}}{128} + \frac{i e^{2ix}}{64} + \frac{i e^{(-2+2i)x}}{128} + \frac{ix}{32} - \frac{e^{-2x}}{64}\right)\left(e^{(1-i)x}\right)$$
$$+ \left(-\frac{ix}{32} - \frac{e^{-2x}}{64} - \frac{e^{(-2-2i)x}}{128} - \frac{i e^{-2ix}}{64} - \frac{i e^{(-2-2i)x}}{128}\right)\left(e^{(1+i)x}\right)$$

Therefore the particular solution is

$$y_p = \frac{(-4ix - 3i - 3)\, e^{(-1-i)x}}{128} + \frac{(4ix - 3i + 3)\, e^{(1-i)x}}{128} + \frac{(4ix + 3i - 3)\, e^{(-1+i)x}}{128} - \frac{\left(ix - \frac{3}{4} - \frac{3}{4}i\right) e^{(1+i)x}}{32}$$

Which simplifies to

$$y_p = \frac{((-4x - 3)\sin(x) - 3\cos(x))\, e^{-x}}{64} + \frac{\left(\left(x - \frac{3}{4}\right)\sin(x) + \frac{3\cos(x)}{4}\right) e^{x}}{16}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(e^{(-1-i)x} c_1 + e^{(-1+i)x} c_2 + e^{(1-i)x} c_3 + e^{(1+i)x} c_4\right) \\ &\quad + \left(\frac{((-4x - 3)\sin(x) - 3\cos(x))\, e^{-x}}{64} + \frac{\left(\left(x - \frac{3}{4}\right)\sin(x) + \frac{3\cos(x)}{4}\right) e^{x}}{16}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y &= e^{(-1-i)x} c_1 + e^{(-1+i)x} c_2 + e^{(1-i)x} c_3 + e^{(1+i)x} c_4 \\ &\quad + \frac{((-4x - 3)\sin(x) - 3\cos(x))\, e^{-x}}{64} + \frac{\left(\left(x - \frac{3}{4}\right)\sin(x) + \frac{3\cos(x)}{4}\right) e^{x}}{16} \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y &= e^{(-1-i)x} c_1 + e^{(-1+i)x} c_2 + e^{(1-i)x} c_3 + e^{(1+i)x} c_4 \\ &\quad + \frac{((-4x - 3)\sin(x) - 3\cos(x))\, e^{-x}}{64} + \frac{\left(\left(x - \frac{3}{4}\right)\sin(x) + \frac{3\cos(x)}{4}\right) e^{x}}{16} \end{aligned}$$

Verified OK.

19.57.1 Maple step by step solution

Let's solve

$y'''' + 4y = \sinh(x)\cos(x) - \cosh(x)\sin(x)$

- Highest derivative means the order of the ODE is 4

  y''''

- □ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$
  - Define new variable $y_2(x)$

    $y_2(x) = y'$
  - Define new variable $y_3(x)$

    $y_3(x) = y''$
  - Define new variable $y_4(x)$

    $y_4(x) = y'''$
  - Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = -\cosh(x)\sin(x) + \sinh(x)\cos(x) - 4y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -\cosh(x)\sin(x) + \sinh(x)\cos(x) - 4y_1($

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -4 & 0 & 0 & 0 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ \sinh(x)\cos(x) - \cosh(x)\sin(x) \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -4 & 0 & 0 & 0 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1-\mathrm{I}, \begin{bmatrix} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[-1+\mathrm{I}, \begin{bmatrix} \frac{1}{4}-\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ -\frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[1-\mathrm{I}, \begin{bmatrix} -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[1+\mathrm{I}, \begin{bmatrix} -\frac{1}{4}-\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ \frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-1-\mathrm{I}, \begin{bmatrix} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(-1-\mathrm{I})x} \cdot \begin{bmatrix} \frac{1}{4}+\frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^{-x} \cdot (-I\sin(x) + \cos(x)) \cdot \begin{bmatrix} \frac{1}{4} + \frac{I}{4} \\ -\frac{I}{2} \\ -\frac{1}{2} + \frac{I}{2} \\ 1 \end{bmatrix}$$

- Simplify expression

$$e^{-x} \cdot \begin{bmatrix} \left(\frac{1}{4} + \frac{I}{4}\right)(-I\sin(x) + \cos(x)) \\ -\frac{I}{2}(-I\sin(x) + \cos(x)) \\ \left(-\frac{1}{2} + \frac{I}{2}\right)(-I\sin(x) + \cos(x)) \\ -I\sin(x) + \cos(x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_1(x) = e^{-x} \cdot \begin{bmatrix} \frac{\sin(x)}{4} + \frac{\cos(x)}{4} \\ -\frac{\sin(x)}{2} \\ -\frac{\cos(x)}{2} + \frac{\sin(x)}{2} \\ \cos(x) \end{bmatrix}, \vec{y}_2(x) = e^{-x} \cdot \begin{bmatrix} \frac{\cos(x)}{4} - \frac{\sin(x)}{4} \\ -\frac{\cos(x)}{2} \\ \frac{\cos(x)}{2} + \frac{\sin(x)}{2} \\ -\sin(x) \end{bmatrix}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[1 - I, \begin{bmatrix} -\frac{1}{4} + \frac{I}{4} \\ \frac{I}{2} \\ \frac{1}{2} + \frac{I}{2} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$e^{(1-I)x} \cdot \begin{bmatrix} -\frac{1}{4} + \frac{I}{4} \\ \frac{I}{2} \\ \frac{1}{2} + \frac{I}{2} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^{x} \cdot \left(-\mathrm{I}\sin\left(x\right)+\cos\left(x\right)\right) \cdot \left[\begin{array}{c} -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Simplify expression

$$e^{x} \cdot \left[\begin{array}{c} \left(-\frac{1}{4}+\frac{\mathrm{I}}{4}\right)\left(-\mathrm{I}\sin\left(x\right)+\cos\left(x\right)\right) \\ \frac{\mathrm{I}}{2}\left(-\mathrm{I}\sin\left(x\right)+\cos\left(x\right)\right) \\ \left(\frac{1}{2}+\frac{\mathrm{I}}{2}\right)\left(-\mathrm{I}\sin\left(x\right)+\cos\left(x\right)\right) \\ -\mathrm{I}\sin\left(x\right)+\cos\left(x\right) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_{3}(x)=e^{x} \cdot \left[\begin{array}{c} -\frac{\cos(x)}{4}+\frac{\sin(x)}{4} \\ \frac{\sin(x)}{2} \\ \frac{\cos(x)}{2}+\frac{\sin(x)}{2} \\ \cos\left(x\right) \end{array}\right], \vec{y}_{4}(x)=e^{x} \cdot \left[\begin{array}{c} \frac{\sin(x)}{4}+\frac{\cos(x)}{4} \\ \frac{\cos(x)}{2} \\ \frac{\cos(x)}{2}-\frac{\sin(x)}{2} \\ -\sin\left(x\right) \end{array}\right]\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_{p}($

$$\vec{y}(x)=c_{1}\vec{y}_{1}(x)+c_{2}\vec{y}_{2}(x)+c_{3}\vec{y}_{3}(x)+c_{4}\vec{y}_{4}(x)+\vec{y}_{p}(x)$$

□ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x)=\left[\begin{array}{cccc} e^{-x}\left(\frac{\sin(x)}{4}+\frac{\cos(x)}{4}\right) & e^{-x}\left(\frac{\cos(x)}{4}-\frac{\sin(x)}{4}\right) & e^{x}\left(-\frac{\cos(x)}{4}+\frac{\sin(x)}{4}\right) & e^{x}\left(\frac{\sin(x)}{4}+\frac{\cos(x)}{4}\right) \\ -\frac{\sin(x)e^{-x}}{2} & -\frac{\cos(x)e^{-x}}{2} & \frac{\sin(x)e^{x}}{2} & \frac{\cos(x)e^{x}}{2} \\ e^{-x}\left(-\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & e^{-x}\left(\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & e^{x}\left(\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & \left(\frac{\cos(x)}{2}-\frac{\sin(x)}{2}\right)e^{x} \\ \cos\left(x\right)e^{-x} & -\sin\left(x\right)e^{-x} & \cos\left(x\right)e^{x} & -\sin\left(x\right)e^{x} \end{array}\right]$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t

$$\Phi(x)=\phi(x) \cdot \frac{1}{\phi(0)}$$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \left[\begin{array}{cccc} \mathrm{e}^{-x}\left(\frac{\sin(x)}{4}+\frac{\cos(x)}{4}\right) & \mathrm{e}^{-x}\left(\frac{\cos(x)}{4}-\frac{\sin(x)}{4}\right) & \mathrm{e}^{x}\left(-\frac{\cos(x)}{4}+\frac{\sin(x)}{4}\right) & \mathrm{e}^{x}\left(\frac{\sin(x)}{4}+\frac{\cos(x)}{4}\right) \\ -\frac{\sin(x)\mathrm{e}^{-x}}{2} & -\frac{\cos(x)\mathrm{e}^{-x}}{2} & \frac{\sin(x)\mathrm{e}^{x}}{2} & \frac{\cos(x)\mathrm{e}^{x}}{2} \\ \mathrm{e}^{-x}\left(-\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & \mathrm{e}^{-x}\left(\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & \mathrm{e}^{x}\left(\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & \left(\frac{\cos(x)}{2}-\frac{\sin(x)}{2}\right)\mathrm{e}^{x} \\ \cos(x)\,\mathrm{e}^{-x} & -\sin(x)\,\mathrm{e}^{-x} & \cos(x)\,\mathrm{e}^{x} & -\sin(x)\,\mathrm{e}^{x} \end{array}\right]$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \left[\begin{array}{ccc} \frac{\cos(x)\left(\mathrm{e}^{x}+\mathrm{e}^{-x}\right)}{2} & \frac{\mathrm{e}^{-x}(-\cos(x)+\sin(x))}{4}+\frac{\mathrm{e}^{x}(\cos(x)+\sin(x))}{4} & \\ \frac{(-\cos(x)-\sin(x))\mathrm{e}^{-x}}{2}+\frac{\mathrm{e}^{x}(\cos(x)-\sin(x))}{2} & \frac{\cos(x)\left(\mathrm{e}^{x}+\mathrm{e}^{-x}\right)}{2} & \frac{\mathrm{e}^{-x}(-}{} \\ -\sin(x)\left(\mathrm{e}^{x}-\mathrm{e}^{-x}\right) & \frac{(-\cos(x)-\sin(x))\mathrm{e}^{-x}}{2}+\frac{\mathrm{e}^{x}(\cos(x)-\sin(x))}{2} & \\ \mathrm{e}^{-x}(\cos(x)-\sin(x))-\mathrm{e}^{x}(\cos(x)+\sin(x)) & -\sin(x)\left(\mathrm{e}^{x}-\mathrm{e}^{-x}\right) & \frac{(-\cos}{} \end{array}\right.$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

  $\overrightarrow{y}_p(x) = \Phi(x)\cdot\overrightarrow{v}(x)$
- Take the derivative of the particular solution

  $\overrightarrow{y}_p'(x) = \Phi'(x)\cdot\overrightarrow{v}(x) + \Phi(x)\cdot\overrightarrow{v}'(x)$
- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x)\cdot\overrightarrow{v}(x) + \Phi(x)\cdot\overrightarrow{v}'(x) = A\cdot\Phi(x)\cdot\overrightarrow{v}(x) + \overrightarrow{f}(x)$
- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A\cdot\Phi(x)\cdot\overrightarrow{v}(x) + \Phi(x)\cdot\overrightarrow{v}'(x) = A\cdot\Phi(x)\cdot\overrightarrow{v}(x) + \overrightarrow{f}(x)$
- Cancel like terms

  $\Phi(x)\cdot\overrightarrow{v}'(x) = \overrightarrow{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\overrightarrow{v}'(x) = \frac{1}{\Phi(x)}\cdot\overrightarrow{f}(x)$
- Integrate to solve for $\overrightarrow{v}(x)$

  $\overrightarrow{v}(x) = \int_0^x \frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds$
- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

$$\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \left[\begin{array}{c} \frac{((-3-2x)\sin(x)-3\cos(x))\,\mathrm{e}^{-x}}{32} + \frac{\left(\left(x-\frac{3}{2}\right)\sin(x)+\frac{3\cos(x)}{2}\right)\mathrm{e}^{x}}{16} \\ \frac{((2+x)\sin(x)-x\cos(x))\,\mathrm{e}^{-x}}{16} + \frac{\mathrm{e}^{x}((-2+x)\sin(x)+x\cos(x))}{16} \\ \frac{((1+2x)\cos(x)-\sin(x))\,\mathrm{e}^{-x}}{16} + \frac{\left(\left(x-\frac{1}{2}\right)\cos(x)-\frac{\sin(x)}{2}\right)\mathrm{e}^{x}}{8} \\ \frac{((-\cos(x)-\sin(x))\,\mathrm{e}^{-x}+\mathrm{e}^{x}(\cos(x)-\sin(x)))\,x}{8} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1(x) + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \left[\begin{array}{c} \frac{((-3-2x)\sin(x)-3\cos(x))\,\mathrm{e}^{-x}}{32} + \frac{\left(\left(x-\frac{3}{2}\right)\sin(x)+\frac{3\cos(x)}{2}\right)\mathrm{e}^{x}}{16} \\ \frac{((2+x)\sin(x)-x\cos(x))\,\mathrm{e}^{-x}}{16} + \frac{\mathrm{e}^{x}((-2+x)\sin(x)+x\cos(x))}{16} \\ \frac{((1+2x)\cos(x)-\sin(x))\,\mathrm{e}^{-x}}{16} + \frac{\left(\left(x-\frac{1}{2}\right)\cos(x)-\frac{\sin(x)}{2}\right)\mathrm{e}^{x}}{8} \\ \frac{((-\cos(x)-\sin(x))\,\mathrm{e}^{-x}+\mathrm{e}^{x}(\cos(x)-\sin(x)))\,x}{8} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y = \frac{\left((-2x+8c_1-8c_2-3)\sin(x)+8\left(c_1+c_2-\frac{3}{8}\right)\cos(x)\right)\mathrm{e}^{-x}}{32} + \frac{\mathrm{e}^{x}\left(\left(x+4c_3+4c_4-\frac{3}{2}\right)\sin(x)-4\left(c_3-c_4-\frac{3}{8}\right)\cos(x)\right)}{16}$$

Problem number: section 9.3, problem 58.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' + 5y''' + 9y'' + 7y' + 2y = \mathrm{e}^{-x}(30 + 24x) - \mathrm{e}^{-2x}}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + 5y''' + 9y'' + 7y' + 2y = 0$$

The characteristic equation is

$$\lambda^4 + 5\lambda^3 + 9\lambda^2 + 7\lambda + 2 = 0$$

The roots of the above equation are

$$\lambda_1 = -2$$
$$\lambda_2 = -1$$
$$\lambda_3 = -1$$
$$\lambda_4 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + x\,e^{-x} c_2 + x^2 e^{-x} c_3 + e^{-2x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned}
y_1 &= e^{-x} \\
y_2 &= x\,e^{-x} \\
y_3 &= x^2 e^{-x} \\
y_4 &= e^{-2x}
\end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' + 5y''' + 9y'' + 7y' + 2y = e^{-x}(30 + 24x) - e^{-2x}$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{-x}(30 + 24x) - e^{-2x}$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{e^{-2x}\}, \{x\,e^{-x}, e^{-x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\,e^{-x}, x^2 e^{-x}, e^{-2x}, e^{-x}\}$$

Since e^{-x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{e^{-2x}\}, \{x\,e^{-x}, x^2 e^{-x}\}]$$

Since $x\,e^{-x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{e^{-2x}\}, \{x^2 e^{-x}, e^{-x} x^3\}]$$

Since $x^2 e^{-x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{e^{-2x}\}, \{e^{-x} x^3, e^{-x} x^4\}]$$

Since e^{-2x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{e^{-2x} x\}, \{e^{-x} x^3, e^{-x} x^4\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 \mathrm{e}^{-2x} x + A_2 \mathrm{e}^{-x} x^3 + A_3 \mathrm{e}^{-x} x^4$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$24A_3 \mathrm{e}^{-x} x - A_1 \mathrm{e}^{-2x} + 24A_3 \mathrm{e}^{-x} + 6A_2 \mathrm{e}^{-x} = \mathrm{e}^{-x}(30 + 24x) - \mathrm{e}^{-2x}$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 1, A_2 = 1, A_3 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \mathrm{e}^{-2x} x + \mathrm{e}^{-x} x^3 + \mathrm{e}^{-x} x^4$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 \mathrm{e}^{-x} + x\,\mathrm{e}^{-x} c_2 + x^2 \mathrm{e}^{-x} c_3 + \mathrm{e}^{-2x} c_4\right) + \left(\mathrm{e}^{-2x} x + \mathrm{e}^{-x} x^3 + \mathrm{e}^{-x} x^4\right) \end{aligned}$$

Which simplifies to

$$y = \mathrm{e}^{-x}\left(c_3 x^2 + c_2 x + c_1\right) + \mathrm{e}^{-2x} c_4 + \mathrm{e}^{-2x} x + \mathrm{e}^{-x} x^3 + \mathrm{e}^{-x} x^4$$

Summary

The solution(s) found are the following

$$y = \mathrm{e}^{-x}\left(c_3 x^2 + c_2 x + c_1\right) + \mathrm{e}^{-2x} c_4 + \mathrm{e}^{-2x} x + \mathrm{e}^{-x} x^3 + \mathrm{e}^{-x} x^4 \tag{1}$$

Verification of solutions

$$y = \mathrm{e}^{-x}\left(c_3 x^2 + c_2 x + c_1\right) + \mathrm{e}^{-2x} c_4 + \mathrm{e}^{-2x} x + \mathrm{e}^{-x} x^3 + \mathrm{e}^{-x} x^4$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 4y''' + 7y'' - 6y' + 2y = \mathrm{e}^{x}(12x - 2\cos(x) + 2\sin(x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 4y''' + 7y'' - 6y' + 2y = 0$$

The characteristic equation is

$$\lambda^4 - 4\lambda^3 + 7\lambda^2 - 6\lambda + 2 = 0$$

The roots of the above equation are

$$\lambda_1 = 1 - i$$
$$\lambda_2 = 1 + i$$
$$\lambda_3 = 1$$
$$\lambda_4 = 1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + c_2 x\, e^x + e^{(1-i)x} c_3 + e^{(1+i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^x$$
$$y_2 = x\, e^x$$
$$y_3 = e^{(1-i)x}$$
$$y_4 = e^{(1+i)x}$$

Now the particular solution to the given ODE is found

$$y'''' - 4y''' + 7y'' - 6y' + 2y = e^x(12x - 2\cos(x) + 2\sin(x))$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)}\, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} e^x & x\, e^x & e^{(1-i)x} & e^{(1+i)x} \\ e^x & (x+1)\, e^x & (1-i)\, e^{(1-i)x} & (1+i)\, e^{(1+i)x} \\ e^x & e^x(2+x) & -2i e^{(1-i)x} & 2i e^{(1+i)x} \\ e^x & e^x(x+3) & (-2-2i)\, e^{(1-i)x} & (-2+2i)\, e^{(1+i)x} \end{bmatrix}$$

$$|W| = 2i e^{2x} e^{(1+i)x} e^{(1-i)x}$$

The determinant simplifies to

$$|W| = 2i\mathrm{e}^{4x}$$

Now we determine W_i for each U_i.

$$W_1(x) = \det \begin{bmatrix} x\,\mathrm{e}^{x} & \mathrm{e}^{(1-i)x} & \mathrm{e}^{(1+i)x} \\ (x+1)\,\mathrm{e}^{x} & (1-i)\,\mathrm{e}^{(1-i)x} & (1+i)\,\mathrm{e}^{(1+i)x} \\ \mathrm{e}^{x}(2+x) & -2i\mathrm{e}^{(1-i)x} & 2i\mathrm{e}^{(1+i)x} \end{bmatrix}$$
$$= 2ix\,\mathrm{e}^{3x}$$

$$W_2(x) = \det \begin{bmatrix} \mathrm{e}^{x} & \mathrm{e}^{(1-i)x} & \mathrm{e}^{(1+i)x} \\ \mathrm{e}^{x} & (1-i)\,\mathrm{e}^{(1-i)x} & (1+i)\,\mathrm{e}^{(1+i)x} \\ \mathrm{e}^{x} & -2i\mathrm{e}^{(1-i)x} & 2i\mathrm{e}^{(1+i)x} \end{bmatrix}$$
$$= 2i\mathrm{e}^{3x}$$

$$W_3(x) = \det \begin{bmatrix} \mathrm{e}^{x} & x\,\mathrm{e}^{x} & \mathrm{e}^{(1+i)x} \\ \mathrm{e}^{x} & (x+1)\,\mathrm{e}^{x} & (1+i)\,\mathrm{e}^{(1+i)x} \\ \mathrm{e}^{x} & \mathrm{e}^{x}(2+x) & 2i\mathrm{e}^{(1+i)x} \end{bmatrix}$$
$$= -\mathrm{e}^{(3+i)x}$$

$$W_4(x) = \det \begin{bmatrix} \mathrm{e}^{x} & x\,\mathrm{e}^{x} & \mathrm{e}^{(1-i)x} \\ \mathrm{e}^{x} & (x+1)\,\mathrm{e}^{x} & (1-i)\,\mathrm{e}^{(1-i)x} \\ \mathrm{e}^{x} & \mathrm{e}^{x}(2+x) & -2i\mathrm{e}^{(1-i)x} \end{bmatrix}$$
$$= -\mathrm{e}^{(3-i)x}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned}
U_1 &= (-1)^{4-1} \int \frac{F(x)W_1(x)}{aW(x)}\,dx \\
&= (-1)^{3} \int \frac{\left(\mathrm{e}^{x}(12x - 2\cos(x) + 2\sin(x))\right)\left(2ix\,\mathrm{e}^{3x}\right)}{(1)\left(2i\mathrm{e}^{4x}\right)}\,dx \\
&= -\int \frac{2i\mathrm{e}^{x}(12x - 2\cos(x) + 2\sin(x))\,x\,\mathrm{e}^{3x}}{2i\mathrm{e}^{4x}}\,dx \\
&= -\int \left(x(12x - 2\cos(x) + 2\sin(x))\right)\,dx \\
&= -4x^{3} + 2\cos(x) + 2\sin(x)\,x - 2\sin(x) + 2x\cos(x) \\
&= -4x^{3} + 2\cos(x) + 2\sin(x)\,x - 2\sin(x) + 2x\cos(x)
\end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\,dx \\
&= (-1)^2 \int \frac{\left(\mathrm{e}^x(12x - 2\cos(x) + 2\sin(x))\right)\left(2i\mathrm{e}^{3x}\right)}{(1)\left(2i\mathrm{e}^{4x}\right)}\,dx \\
&= \int \frac{2i\mathrm{e}^x(12x - 2\cos(x) + 2\sin(x))\,\mathrm{e}^{3x}}{2i\mathrm{e}^{4x}}\,dx \\
&= \int (12x - 2\cos(x) + 2\sin(x))\,\,dx \\
&= 6x^2 - 2\sin(x) - 2\cos(x)
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x)W_3(x)}{aW(x)}\,dx \\
&= (-1)^1 \int \frac{\left(\mathrm{e}^x(12x - 2\cos(x) + 2\sin(x))\right)\left(-\mathrm{e}^{(3+i)x}\right)}{(1)\left(2i\mathrm{e}^{4x}\right)}\,dx \\
&= -\int \frac{-\mathrm{e}^x(12x - 2\cos(x) + 2\sin(x))\,\mathrm{e}^{(3+i)x}}{2i\mathrm{e}^{4x}}\,dx \\
&= -\int \left(i(6x - \cos(x) + \sin(x))\,\mathrm{e}^{ix}\right)\,dx \\
&= -\frac{12i\mathrm{e}^{ix} + \left(\frac{11}{2} - \frac{i}{2}\right)x\,\mathrm{e}^{ix} + (13-i)\,\mathrm{e}^{ix}\tan\left(\frac{x}{2}\right) + (-1+i)\,x\,\mathrm{e}^{ix}\tan\left(\frac{x}{2}\right) + \left(\frac{13}{2} + \frac{i}{2}\right)x\,\mathrm{e}^{ix}\tan\left(\frac{x}{2}\right)^2}{1 + \tan\left(\frac{x}{2}\right)^2} \\
&= -\frac{12i\mathrm{e}^{ix} + \left(\frac{11}{2} - \frac{i}{2}\right)x\,\mathrm{e}^{ix} + (13-i)\,\mathrm{e}^{ix}\tan\left(\frac{x}{2}\right) + (-1+i)\,x\,\mathrm{e}^{ix}\tan\left(\frac{x}{2}\right) + \left(\frac{13}{2} + \frac{i}{2}\right)x\,\mathrm{e}^{ix}\tan\left(\frac{x}{2}\right)^2}{1 + \tan\left(\frac{x}{2}\right)^2}
\end{aligned}
$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x)W_4(x)}{aW(x)}\,dx \\
&= (-1)^0 \int \frac{\left(\mathrm{e}^x(12x - 2\cos(x) + 2\sin(x))\right)\left(-\mathrm{e}^{(3-i)x}\right)}{(1)\left(2i\mathrm{e}^{4x}\right)}\,dx \\
&= \int \frac{-\mathrm{e}^x(12x - 2\cos(x) + 2\sin(x))\,\mathrm{e}^{(3-i)x}}{2i\mathrm{e}^{4x}}\,dx \\
&= \int \left(i(6x - \cos(x) + \sin(x))\,\mathrm{e}^{-ix}\right)\,dx \\
&= \frac{12i\mathrm{e}^{-ix} + \left(-\frac{11}{2} - \frac{i}{2}\right)x\,\mathrm{e}^{-ix} + (-13-i)\,\mathrm{e}^{-ix}\tan\left(\frac{x}{2}\right) + (1+i)\,x\,\mathrm{e}^{-ix}\tan\left(\frac{x}{2}\right) + \left(-\frac{13}{2} + \frac{i}{2}\right)x\,\mathrm{e}^{-ix}\tan\left(\right.}{1 + \tan\left(\frac{x}{2}\right)^2} \\
&= \frac{12i\mathrm{e}^{-ix} + \left(-\frac{11}{2} - \frac{i}{2}\right)x\,\mathrm{e}^{-ix} + (-13-i)\,\mathrm{e}^{-ix}\tan\left(\frac{x}{2}\right) + (1+i)\,x\,\mathrm{e}^{-ix}\tan\left(\frac{x}{2}\right) + \left(-\frac{13}{2} + \frac{i}{2}\right)x\,\mathrm{e}^{-ix}\tan\left(\right.}{1 + \tan\left(\frac{x}{2}\right)^2}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Hence

$$\begin{aligned} y_p = & \left(-4x^3 + 2\cos(x) + 2\sin(x)x - 2\sin(x) + 2x\cos(x)\right)(e^x) \\ & + \left(6x^2 - 2\sin(x) - 2\cos(x)\right)(x\,e^x) \\ & + \left(-\frac{12i e^{ix} + \left(\frac{11}{2} - \frac{i}{2}\right) x\,e^{ix} + (13 - i)\,e^{ix}\tan\left(\frac{x}{2}\right) + (-1 + i)\,x\,e^{ix}\tan\left(\frac{x}{2}\right) + \left(\frac{13}{2} + \frac{i}{2}\right) x\,e^{ix}\tan\left(\frac{x}{2}\right)^2}{1 + \tan\left(\frac{x}{2}\right)^2}\right) (\\ & + \left(\frac{12i e^{-ix} + \left(-\frac{11}{2} - \frac{i}{2}\right) x\,e^{-ix} + (-13 - i)\,e^{-ix}\tan\left(\frac{x}{2}\right) + (1 + i)\,x\,e^{-ix}\tan\left(\frac{x}{2}\right) + \left(-\frac{13}{2} + \frac{i}{2}\right) x\,e^{-ix}\tan}{1 + \tan\left(\frac{x}{2}\right)^2}\right. \end{aligned}$$

Therefore the particular solution is

$$y_p = e^x\left(x\cos(x) - 12x + \sin(x)x - 15\sin(x) + 2x^3 + 2\cos(x)\right)$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^x + c_2 x\,e^x + e^{(1-i)x} c_3 + e^{(1+i)x} c_4\right) \\ &\quad + \left(e^x\left(x\cos(x) - 12x + \sin(x)x - 15\sin(x) + 2x^3 + 2\cos(x)\right)\right) \end{aligned}$$

Which simplifies to

$$\begin{aligned} y = & e^{(1-i)x} c_3 + e^{(1+i)x} c_4 + e^x(c_2 x + c_1) \\ & + e^x\left(x\cos(x) - 12x + \sin(x)x - 15\sin(x) + 2x^3 + 2\cos(x)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = & e^{(1-i)x} c_3 + e^{(1+i)x} c_4 + e^x(c_2 x + c_1) \\ & + e^x\left(x\cos(x) - 12x + \sin(x)x - 15\sin(x) + 2x^3 + 2\cos(x)\right) \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y = & e^{(1-i)x} c_3 + e^{(1+i)x} c_4 + e^x(c_2 x + c_1) \\ & + e^x\left(x\cos(x) - 12x + \sin(x)x - 15\sin(x) + 2x^3 + 2\cos(x)\right) \end{aligned}$$

Verified OK.

19.59.1 Maple step by step solution

Let's solve

$y'''' - 4y''' + 7y'' - 6y' + 2y = e^x(12x - 2\cos(x) + 2\sin(x))$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = -2y - 2\cos(x)\,e^x + 2\sin(x)\,e^x + 12x\,e^x + 4y''' - 7y'' + 6y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'''' - 4y''' + 7y'' - 6y' + 2y = -2\,e^x(-6x + \cos(x) - \sin(x))$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Define new variable $y_4(x)$

    $y_4(x) = y'''$

  ◦ Isolate for $y_4'(x)$ using original ODE

    $y_4'(x) = -2\cos(x)\,e^x + 2\sin(x)\,e^x + 12x\,e^x + 4y_4(x) - 7y_3(x) + 6y_2(x) - 2y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = -2\cos(x)\,e^x + 2\sin(x)\,e^x + 12x\,e^x + 4y_4($

- Define vector

  $$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \left[\begin{array}{cccc} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -2 & 6 & -7 & 4 \end{array}\right] \cdot \vec{y}(x) + \left[\begin{array}{c} 0 \\ 0 \\ 0 \\ 2\sin(x)\,\mathrm{e}^{x} - 2\cos(x)\,\mathrm{e}^{x} + 12x\,\mathrm{e}^{x} \end{array}\right]$$

- Define the forcing function

$$\vec{f}(x) = \left[\begin{array}{c} 0 \\ 0 \\ 0 \\ 2\sin(x)\,\mathrm{e}^{x} - 2\cos(x)\,\mathrm{e}^{x} + 12x\,\mathrm{e}^{x} \end{array}\right]$$

- Define the coefficient matrix

$$A = \left[\begin{array}{cccc} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -2 & 6 & -7 & 4 \end{array}\right]$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \\ 1 \end{array}\right]\right], \left[1, \left[\begin{array}{c} 0 \\ 0 \\ 0 \\ 0 \end{array}\right]\right], \left[1 - \mathrm{I}, \left[\begin{array}{c} -\frac{1}{4} + \frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2} + \frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right], \left[1 + \mathrm{I}, \left[\begin{array}{c} -\frac{1}{4} - \frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ \frac{1}{2} - \frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue 1

$$\overrightarrow{y}_1(x) = \mathrm{e}^x \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 1$ is the eigenvalue, an

$$\overrightarrow{y}_2(x) = \mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_2(x)$ into the homogeneous system

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \left(\mathrm{e}^{\lambda x} A\right) \cdot \left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \mathrm{e}^{\lambda x}\left(\lambda x\overrightarrow{v} + A \cdot \overrightarrow{p}\right)$$

- Simplify equation

$$\lambda\overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_2(x)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \overrightarrow{p} = \overrightarrow{v}$$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue 1

$$\left(\begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -2 & 6 & -7 & 4 \end{bmatrix} - 1 \cdot \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}\right) \cdot \overrightarrow{p} = \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p} = \begin{bmatrix} -1 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue 1

$$\vec{y}_2(x) = e^x \cdot \left(x \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} + \begin{bmatrix} -1 \\ 0 \\ 0 \\ 0 \end{bmatrix} \right)$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[1 - I, \begin{bmatrix} -\frac{1}{4} + \frac{I}{4} \\ \frac{I}{2} \\ \frac{1}{2} + \frac{I}{2} \\ 1 \end{bmatrix} \right]$$

- Solution from eigenpair

$$e^{(1-I)x} \cdot \begin{bmatrix} -\frac{1}{4} + \frac{I}{4} \\ \frac{I}{2} \\ \frac{1}{2} + \frac{I}{2} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^x \cdot (-I\sin(x) + \cos(x)) \cdot \begin{bmatrix} -\frac{1}{4} + \frac{I}{4} \\ \frac{I}{2} \\ \frac{1}{2} + \frac{I}{2} \\ 1 \end{bmatrix}$$

- Simplify expression

$$e^x \cdot \begin{bmatrix} \left(-\frac{1}{4} + \frac{I}{4}\right)(-I\sin(x) + \cos(x)) \\ \frac{I}{2}(-I\sin(x) + \cos(x)) \\ \left(\frac{1}{2} + \frac{I}{2}\right)(-I\sin(x) + \cos(x)) \\ -I\sin(x) + \cos(x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = e^x \cdot \left[\begin{array}{c} -\frac{\cos(x)}{4} + \frac{\sin(x)}{4} \\ \frac{\sin(x)}{2} \\ \frac{\cos(x)}{2} + \frac{\sin(x)}{2} \\ \cos(x) \end{array}\right], \vec{y}_4(x) = e^x \cdot \left[\begin{array}{c} \frac{\sin(x)}{4} + \frac{\cos(x)}{4} \\ \frac{\cos(x)}{2} \\ \frac{\cos(x)}{2} - \frac{\sin(x)}{2} \\ -\sin(x) \end{array}\right]\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1\vec{y}_1(x) + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \left[\begin{array}{cccc} e^x & (x-1)e^x & e^x\left(-\frac{\cos(x)}{4} + \frac{\sin(x)}{4}\right) & e^x\left(\frac{\sin(x)}{4} + \frac{\cos(x)}{4}\right) \\ e^x & x e^x & \frac{\sin(x)e^x}{2} & \frac{\cos(x)e^x}{2} \\ e^x & x e^x & e^x\left(\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) & \left(\frac{\cos(x)}{2} - \frac{\sin(x)}{2}\right)e^x \\ e^x & x e^x & \cos(x)e^x & -\sin(x)e^x \end{array}\right]$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \left[\begin{array}{cccc} e^x & (x-1)e^x & e^x\left(-\frac{\cos(x)}{4} + \frac{\sin(x)}{4}\right) & e^x\left(\frac{\sin(x)}{4} + \frac{\cos(x)}{4}\right) \\ e^x & x e^x & \frac{\sin(x)e^x}{2} & \frac{\cos(x)e^x}{2} \\ e^x & x e^x & e^x\left(\frac{\cos(x)}{2} + \frac{\sin(x)}{2}\right) & \left(\frac{\cos(x)}{2} - \frac{\sin(x)}{2}\right)e^x \\ e^x & x e^x & \cos(x)e^x & -\sin(x)e^x \end{array}\right] \cdot \frac{1}{\left[\begin{array}{cccc} 1 & -1 & -\frac{1}{4} & \frac{1}{4} \\ 1 & 0 & 0 & \frac{1}{2} \\ 1 & 0 & \frac{1}{2} & \frac{1}{2} \\ 1 & 0 & 1 & 0 \end{array}\right]}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \left[\begin{array}{cccc} -(x-1)e^x & e^x(2x - \sin(x)) & \frac{e^x(-1-3x+\cos(x)+3\sin(x))}{2} & -\frac{e^x(-1-x+\cos(x)+}{2} \\ -x e^x & e^x(2 + 2x - \sin(x) - \cos(x)) & \frac{e^x(-4-3x+2\sin(x)+4\cos(x))}{2} & \frac{e^x(2+x-2\cos(x}{2} \\ -x e^x & -2e^x(-1 - x + \cos(x)) & \frac{e^x(-4-3x+6\cos(x)-2\sin(x))}{2} & \frac{e^x(2+x-2\cos(x)+2}{2} \\ -x e^x & 2e^x(1 + x - \cos(x) + \sin(x)) & \frac{e^x(-4-3x+4\cos(x)-8\sin(x))}{2} & \frac{e^x(2+x+4\sin(x}{2} \end{array}\right.$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

  $\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$
- Take the derivative of the particular solution

  $\overrightarrow{y}'_p(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$
- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
- Cancel like terms

  $\Phi(x) \cdot \overrightarrow{v}'(x) = \overrightarrow{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\overrightarrow{v}'(x) = \frac{1}{\Phi(x)} \cdot \overrightarrow{f}(x)$
- Integrate to solve for $\overrightarrow{v}(x)$

  $\overrightarrow{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds$
- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

  $\overrightarrow{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds\right)$
- Plug in the fundamental matrix and the forcing function and compute

$$\overrightarrow{y}_p(x) = \left[\begin{array}{c} \left(\left(x+6\right) \cos \left(x\right)+x^{3}+3 x^{2}-5 x+4 \sin \left(x\right)-6\right) {\mathrm e}^{x} \\ \left(\left(x+11\right) \cos \left(x\right)+\left(-x-2\right) \sin \left(x\right)+x^{3}+6 x^{2}+x-11\right) {\mathrm e}^{x} \\ \left(\left(-2 x-13\right) \sin \left(x\right)+x^{3}+6 x^{2}+11 \cos \left(x\right)+13 x-11\right) {\mathrm e}^{x} \\ \left(\left(-1-2 x\right) \cos \left(x\right)+\left(-2 x-25\right) \sin \left(x\right)+x^{3}+6 x^{2}+25 x+1\right) {\mathrm e}^{x} \end{array}\right]$$

- Plug particular solution back into general solution

$$\overrightarrow{y}(x) = c_1 \overrightarrow{y}_1(x) + c_2 \overrightarrow{y}_2(x) + c_3 \overrightarrow{y}_3(x) + c_4 \overrightarrow{y}_4(x) + \left[\begin{array}{c} \left(\left(x+6\right) \cos \left(x\right)+x^{3}+3 x^{2}-5 x+4 \\ \left(\left(x+11\right) \cos \left(x\right)+\left(-x-2\right) \sin \left(x\right)+x^{3} \\ \left(\left(-2 x-13\right) \sin \left(x\right)+x^{3}+6 x^{2}+11 \cos \\ \left(\left(-1-2 x\right) \cos \left(x\right)+\left(-2 x-25\right) \sin \left(x\right)+ \end{array}\right.$$

- First component of the vector is the solution to the ODE

$$y = \left(\left(-\frac{c_3}{4} + \frac{c_4}{4} + x + 6\right)\cos(x) + \left(\frac{c_3}{4} + \frac{c_4}{4} + 4\right)\sin(x) + x^3 + 3x^2 + (-5 + c_2)x + c_1 - c_2 - 6\right)$$

ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - y'' - y' + y = e^{2x}(10 + 3x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - y'' - y' + y = 0$$

The characteristic equation is

$$\lambda^3 - \lambda^2 - \lambda + 1 = 0$$

The roots of the above equation are

$$\lambda_1 = -1$$
$$\lambda_2 = 1$$
$$\lambda_3 = 1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{x} + x\,e^{x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = e^{x}$$
$$y_3 = x\,e^{x}$$

Now the particular solution to the given ODE is found

$$y''' - y'' - y' + y = e^{2x}(10 + 3x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{2x}(10 + 3x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,e^{2x}, e^{2x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\,e^{x}, e^{x}, e^{-x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 x\,e^{2x} + A_2 e^{2x}$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$7A_1 e^{2x} + 3A_1 x\,e^{2x} + 3A_2 e^{2x} = e^{2x}(10 + 3x)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 1, A_2 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = x\,e^{2x} + e^{2x}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-x} + c_2 e^{x} + x\,e^{x} c_3\right) + \left(x\,e^{2x} + e^{2x}\right) \end{aligned}$$

Which simplifies to

$$y = c_1 e^{-x} + e^{x}(c_3 x + c_2) + x\,e^{2x} + e^{2x}$$

Summary

The solution(s) found are the following

$$y = c_1 e^{-x} + e^{x}(c_3 x + c_2) + x\,e^{2x} + e^{2x} \tag{1}$$

Verification of solutions

$$y = c_1 e^{-x} + e^{x}(c_3 x + c_2) + x\,e^{2x} + e^{2x}$$

Verified OK.

19.60.1 Maple step by step solution

Let's solve

$y''' - y'' - y' + y = e^{2x}(10 + 3x)$

- Highest derivative means the order of the ODE is 3

  y'''

- ☐ Convert linear ODE into a system of first order ODEs
  - ○ Define new variable $y_1(x)$

    $y_1(x) = y$
  - ○ Define new variable $y_2(x)$

    $y_2(x) = y'$
  - ○ Define new variable $y_3(x)$

    $y_3(x) = y''$

- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = 3x\,\mathrm{e}^{2x} + y_3(x) + y_2(x) - y_1(x) + 10\,\mathrm{e}^{2x}$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 3x\,\mathrm{e}^{2x} + y_3(x) + y_2(x) - y_1(x) + 10\,\mathrm{e}^{2x}]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & 1 & 1 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 3x\,\mathrm{e}^{2x} + 10\,\mathrm{e}^{2x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 3x\,\mathrm{e}^{2x} + 10\,\mathrm{e}^{2x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & 1 & 1 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_{1} = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue 1

$$\overrightarrow{y}_{2}(x) = \mathrm{e}^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 1$ is the eigenvalue, an

$$\overrightarrow{y}_{3}(x) = \mathrm{e}^{\lambda x} \left(x \overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_{3}(x)$ into the homogeneous system

$$\lambda \,\mathrm{e}^{\lambda x} \left(x \overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x} \overrightarrow{v} = \left(\mathrm{e}^{\lambda x} A\right) \cdot \left(x \overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda \,\mathrm{e}^{\lambda x} \left(x \overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x} \overrightarrow{v} = \mathrm{e}^{\lambda x} \left(\lambda x \overrightarrow{v} + A \cdot \overrightarrow{p}\right)$$

- Simplify equation

$$\lambda \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_{3}(x)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \overrightarrow{p} = \overrightarrow{v}$$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue 1

$$\left(\left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & 1 & 1 \end{array}\right] - 1 \cdot \left[\begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{array}\right]\right) \cdot \overrightarrow{p} = \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p} = \left[\begin{array}{c} -1 \\ 0 \\ 0 \end{array}\right]$$

- Second solution from eigenvalue 1

$$\overrightarrow{y}_3(x) = \mathrm{e}^x \cdot \left(x \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right] + \left[\begin{array}{c} -1 \\ 0 \\ 0 \end{array}\right]\right)$$

- General solution of the system of ODEs can be written in terms of the particular solution $\overrightarrow{y}_p($

$\overrightarrow{y}(x) = c_1 \overrightarrow{y}_1 + c_2 \overrightarrow{y}_2(x) + c_3 \overrightarrow{y}_3(x) + \overrightarrow{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \left[\begin{array}{ccc} \mathrm{e}^{-x} & \mathrm{e}^x & (x-1)\,\mathrm{e}^x \\ -\mathrm{e}^{-x} & \mathrm{e}^x & x\,\mathrm{e}^x \\ \mathrm{e}^{-x} & \mathrm{e}^x & x\,\mathrm{e}^x \end{array}\right]$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \left[\begin{array}{ccc} \mathrm{e}^{-x} & \mathrm{e}^x & (x-1)\,\mathrm{e}^x \\ -\mathrm{e}^{-x} & \mathrm{e}^x & x\,\mathrm{e}^x \\ \mathrm{e}^{-x} & \mathrm{e}^x & x\,\mathrm{e}^x \end{array}\right] \cdot \frac{1}{\left[\begin{array}{ccc} 1 & 1 & -1 \\ -1 & 1 & 0 \\ 1 & 1 & 0 \end{array}\right]}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x)=\begin{bmatrix} -(x-1)\,\mathrm{e}^{x} & -\frac{\mathrm{e}^{-x}}{2}+\frac{\mathrm{e}^{x}}{2} & \frac{\mathrm{e}^{-x}}{2}-\frac{\mathrm{e}^{x}}{2}+x\,\mathrm{e}^{x} \\ -x\,\mathrm{e}^{x} & \frac{\mathrm{e}^{x}}{2}+\frac{\mathrm{e}^{-x}}{2} & -\frac{\mathrm{e}^{-x}}{2}+\frac{\mathrm{e}^{x}}{2}+x\,\mathrm{e}^{x} \\ -x\,\mathrm{e}^{x} & -\frac{\mathrm{e}^{-x}}{2}+\frac{\mathrm{e}^{x}}{2} & \frac{\mathrm{e}^{-x}}{2}+\frac{\mathrm{e}^{x}}{2}+x\,\mathrm{e}^{x} \end{bmatrix}$$

- ☐ Find a particular solution of the system of ODEs using variation of parameters
  - Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

    $\overrightarrow{y}_p(x)=\Phi(x)\cdot\overrightarrow{v}(x)$
  - Take the derivative of the particular solution

    $\overrightarrow{y}'_p(x)=\Phi'(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)$
  - Substitute particular solution and its derivative into the system of ODEs

    $\Phi'(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)=A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\overrightarrow{f}(x)$
  - The fundamental matrix has columns that are solutions to the homogeneous system so its der

    $A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)=A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\overrightarrow{f}(x)$
  - Cancel like terms

    $\Phi(x)\cdot\overrightarrow{v}'(x)=\overrightarrow{f}(x)$
  - Multiply by the inverse of the fundamental matrix

    $\overrightarrow{v}'(x)=\frac{1}{\Phi(x)}\cdot\overrightarrow{f}(x)$
  - Integrate to solve for $\overrightarrow{v}(x)$

    $\overrightarrow{v}(x)=\int_0^x \frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds$
  - Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

    $\overrightarrow{y}_p(x)=\Phi(x)\cdot\left(\int_0^x \frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds\right)$
  - Plug in the fundamental matrix and the forcing function and compute

$$\overrightarrow{y}_p(x)=\begin{bmatrix} 2\,\mathrm{e}^{2x}(x+1)-\frac{3\,\mathrm{e}^{-x}}{2}+\frac{(-14x-1)\mathrm{e}^{x}}{2} \\ 6\,\mathrm{e}^{2x}+\frac{3\,\mathrm{e}^{-x}}{2}-\frac{15\,\mathrm{e}^{x}}{2}-7x\,\mathrm{e}^{x}+4x\,\mathrm{e}^{2x} \\ (9+5x)\,\mathrm{e}^{2x}-\frac{3\,\mathrm{e}^{-x}}{2}+\frac{(-14x-15)\mathrm{e}^{x}}{2} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \begin{bmatrix} 2\,e^{2x}(x+1) - \frac{3\,e^{-x}}{2} + \frac{(-14x-1)e^{x}}{2} \\ 6\,e^{2x} + \frac{3\,e^{-x}}{2} - \frac{15\,e^{x}}{2} - 7x\,e^{x} + 4x\,e^{2x} \\ (9+5x)\,e^{2x} - \frac{3\,e^{-x}}{2} + \frac{(-14x-15)e^{x}}{2} \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = \frac{(2c_1-3)e^{-x}}{2} + 2\,e^{2x}(x+1) + \left((c_3-7)\,x + c_2 - c_3 - \frac{1}{2}\right)e^{x}$$

ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

`[[_3rd_order, _linear, _nonhomogeneous]]`

$$\boxed{y''' + y'' - 2y = -e^{3x}(17x^2 + 67x + 9)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' + y'' - 2y = 0$$

The characteristic equation is

$$\lambda^3 + \lambda^2 - 2 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = -1 - i$$
$$\lambda_3 = -1 + i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + e^{(-1-i)x} c_2 + e^{(-1+i)x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^x \\ y_2 &= e^{(-1-i)x} \\ y_3 &= e^{(-1+i)x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y''' + y'' - 2y = -e^{3x}(17x^2 + 67x + 9)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-e^{3x}(17x^2 + 67x + 9)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x e^{3x}, x^2 e^{3x}, e^{3x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^x, e^{(-1-i)x}, e^{(-1+i)x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 x e^{3x} + A_2 x^2 e^{3x} + A_3 e^{3x}$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$\begin{aligned} &33A_1 e^{3x} + 34A_1 x e^{3x} + 20A_2 e^{3x} + 66A_2 x e^{3x} + 34A_2 x^2 e^{3x} + 34A_3 e^{3x} \\ &= -e^{3x}(17x^2 + 67x + 9) \end{aligned}$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = -1, A_2 = -\frac{1}{2}, A_3 = 1\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -x\,\mathrm{e}^{3x} - \frac{x^2\mathrm{e}^{3x}}{2} + \mathrm{e}^{3x}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1\mathrm{e}^{x} + \mathrm{e}^{(-1-i)x}c_2 + \mathrm{e}^{(-1+i)x}c_3\right) + \left(-x\,\mathrm{e}^{3x} - \frac{x^2\mathrm{e}^{3x}}{2} + \mathrm{e}^{3x}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1\mathrm{e}^{x} + \mathrm{e}^{(-1-i)x}c_2 + \mathrm{e}^{(-1+i)x}c_3 - x\,\mathrm{e}^{3x} - \frac{x^2\mathrm{e}^{3x}}{2} + \mathrm{e}^{3x} \tag{1}$$

Verification of solutions

$$y = c_1\mathrm{e}^{x} + \mathrm{e}^{(-1-i)x}c_2 + \mathrm{e}^{(-1+i)x}c_3 - x\,\mathrm{e}^{3x} - \frac{x^2\mathrm{e}^{3x}}{2} + \mathrm{e}^{3x}$$

Verified OK.

19.61.1 Maple step by step solution

Let's solve

$y''' + y'' - 2y = -\mathrm{e}^{3x}(17x^2 + 67x + 9)$

- Highest derivative means the order of the ODE is 3

  y'''

- □ Convert linear ODE into a system of first order ODEs
  - ∘ Define new variable $y_1(x)$

    $y_1(x) = y$
  - ∘ Define new variable $y_2(x)$

    $y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$

- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = -17x^2 e^{3x} - 67x\,e^{3x} - y_3(x) + 2y_1(x) - 9\,e^{3x}$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x)\,, y_3(x) = y_2'(x)\,, y_3'(x) = -17x^2 e^{3x} - 67x\,e^{3x} - y_3(x) + 2y_1(x) - 9\,e^{3x}]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & 0 & -1 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ -17x^2 e^{3x} - 67x\,e^{3x} - 9\,e^{3x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ -17x^2 e^{3x} - 67x\,e^{3x} - 9\,e^{3x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & 0 & -1 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right], \left[-1-\mathrm{I}, \left[\begin{array}{c} -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right], \left[-1+\mathrm{I}, \left[\begin{array}{c} \frac{\mathrm{I}}{2} \\ -\frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_{1} = \mathrm{e}^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-1-\mathrm{I}, \left[\begin{array}{c} -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(-1-\mathrm{I})x} \cdot \left[\begin{array}{c} -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{-x} \cdot (-\mathrm{I}\sin(x) + \cos(x)) \cdot \left[\begin{array}{c} -\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{array}\right]$$

- Simplify expression

$$\mathrm{e}^{-x} \cdot \left[\begin{array}{c} -\frac{\mathrm{I}}{2}(-\mathrm{I}\sin(x) + \cos(x)) \\ \left(-\frac{1}{2}+\frac{\mathrm{I}}{2}\right)(-\mathrm{I}\sin(x) + \cos(x)) \\ -\mathrm{I}\sin(x) + \cos(x) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_2(x)=\mathrm{e}^{-x}\cdot\left[\begin{array}{c}-\frac{\sin(x)}{2}\\ -\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\\ \cos(x)\end{array}\right], \vec{y}_3(x)=\mathrm{e}^{-x}\cdot\left[\begin{array}{c}-\frac{\cos(x)}{2}\\ \frac{\cos(x)}{2}+\frac{\sin(x)}{2}\\ -\sin(x)\end{array}\right]\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x)=c_1\vec{y}_1+c_2\vec{y}_2(x)+c_3\vec{y}_3(x)+\vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x)=\left[\begin{array}{ccc}\mathrm{e}^{x} & -\frac{\sin(x)\mathrm{e}^{-x}}{2} & -\frac{\cos(x)\mathrm{e}^{-x}}{2}\\ \mathrm{e}^{x} & \mathrm{e}^{-x}\left(-\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & \mathrm{e}^{-x}\left(\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right)\\ \mathrm{e}^{x} & \cos(x)\,\mathrm{e}^{-x} & -\sin(x)\,\mathrm{e}^{-x}\end{array}\right]$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t

$\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x)=\left[\begin{array}{ccc}\mathrm{e}^{x} & -\frac{\sin(x)\mathrm{e}^{-x}}{2} & -\frac{\cos(x)\mathrm{e}^{-x}}{2}\\ \mathrm{e}^{x} & \mathrm{e}^{-x}\left(-\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & \mathrm{e}^{-x}\left(\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right)\\ \mathrm{e}^{x} & \cos(x)\,\mathrm{e}^{-x} & -\sin(x)\,\mathrm{e}^{-x}\end{array}\right]\cdot\frac{1}{\left[\begin{array}{ccc}1 & 0 & -\frac{1}{2}\\ 1 & -\frac{1}{2} & \frac{1}{2}\\ 1 & 1 & 0\end{array}\right]}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x)=\left[\begin{array}{ccc}\frac{(3\cos(x)+\sin(x))\mathrm{e}^{-x}}{5}+\frac{2\,\mathrm{e}^{x}}{5} & \frac{(-2\cos(x)+\sin(x))\mathrm{e}^{-x}}{5}+\frac{2\,\mathrm{e}^{x}}{5} & \frac{(-\cos(x)-2\sin(x))\mathrm{e}^{-x}}{5}+\frac{\mathrm{e}^{x}}{5}\\ \frac{(-4\sin(x)-2\cos(x))\mathrm{e}^{-x}}{5}+\frac{2\,\mathrm{e}^{x}}{5} & \frac{(3\cos(x)+\sin(x))\mathrm{e}^{-x}}{5}+\frac{2\,\mathrm{e}^{x}}{5} & \frac{(-\cos(x)+3\sin(x))\mathrm{e}^{-x}}{5}+\frac{\mathrm{e}^{x}}{5}\\ \frac{(-2\cos(x)+6\sin(x))\mathrm{e}^{-x}}{5}+\frac{2\,\mathrm{e}^{x}}{5} & \frac{(-4\sin(x)-2\cos(x))\mathrm{e}^{-x}}{5}+\frac{2\,\mathrm{e}^{x}}{5} & \frac{(4\cos(x)-2\sin(x))\mathrm{e}^{-x}}{5}+\frac{\mathrm{e}^{x}}{5}\end{array}\right]$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

$\vec{y}_p(x)=\Phi(x)\cdot\vec{v}(x)$

- Take the derivative of the particular solution

$\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$

- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \left[\begin{array}{c} \frac{\left(-x^{2}-2x+2\right) e^{3x}}{2}+\frac{\left(3\cos\left(x\right)+\sin\left(x\right)\right) e^{-x}}{5}-\frac{8\,e^{x}}{5} \\ \frac{\left(-3x^{2}-8x+4\right) e^{3x}}{2}+\frac{2\left(-\cos\left(x\right)-2\sin\left(x\right)\right) e^{-x}}{5}-\frac{8\,e^{x}}{5} \\ \frac{\left(-9x^{2}-30x+4\right) e^{3x}}{2}+\frac{2\left(-\cos\left(x\right)+3\sin\left(x\right)\right) e^{-x}}{5}-\frac{8\,e^{x}}{5} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1 \vec{y}_1 + c_2 \vec{y}_2(x) + c_3 \vec{y}_3(x) + \left[\begin{array}{c} \frac{\left(-x^{2}-2x+2\right) e^{3x}}{2}+\frac{\left(3\cos\left(x\right)+\sin\left(x\right)\right) e^{-x}}{5}-\frac{8\,e^{x}}{5} \\ \frac{\left(-3x^{2}-8x+4\right) e^{3x}}{2}+\frac{2\left(-\cos\left(x\right)-2\sin\left(x\right)\right) e^{-x}}{5}-\frac{8\,e^{x}}{5} \\ \frac{\left(-9x^{2}-30x+4\right) e^{3x}}{2}+\frac{2\left(-\cos\left(x\right)+3\sin\left(x\right)\right) e^{-x}}{5}-\frac{8\,e^{x}}{5} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y = \frac{\left(\left(-5c_3+6\right)\cos\left(x\right)+\left(-5c_2+2\right)\sin\left(x\right)\right) e^{-x}}{10}+\frac{\left(-x^{2}-2x+2\right) e^{3x}}{2}+\frac{e^{x}\left(5c_1-8\right)}{5}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.3. Undetermined Coefficients for Higher Order Equations. Page 495
Problem number: section 9.3, problem 62.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - 6y'' + 11y' - 6y = e^{2x}\left(-3x^2 - 4x + 5\right)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - 6y'' + 11y' - 6y = 0$$

The characteristic equation is

$$\lambda^3 - 6\lambda^2 + 11\lambda - 6 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 2$$
$$\lambda_3 = 3$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + c_2 e^{2x} + c_3 e^{3x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^x$$
$$y_2 = e^{2x}$$
$$y_3 = e^{3x}$$

Now the particular solution to the given ODE is found

$$y''' - 6y'' + 11y' - 6y = e^{2x}(-3x^2 - 4x + 5)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{2x}(-3x^2 - 4x + 5)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,e^{2x}, x^2 e^{2x}, e^{2x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^x, e^{2x}, e^{3x}\}$$

Since e^{2x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\,e^{2x}, x^2 e^{2x}, e^{2x} x^3\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x\,e^{2x} + A_2 x^2 e^{2x} + A_3 e^{2x} x^3$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$-2A_2 x\,e^{2x} - 3A_3 e^{2x} x^2 + 6A_3 e^{2x} - A_1 e^{2x} = e^{2x}(-3x^2 - 4x + 5)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 1, A_2 = 2, A_3 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = x\,e^{2x} + 2x^2e^{2x} + e^{2x}x^3$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1e^x + c_2e^{2x} + c_3e^{3x}\right) + \left(x\,e^{2x} + 2x^2e^{2x} + e^{2x}x^3\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1e^x + c_2e^{2x} + c_3e^{3x} + x\,e^{2x} + 2x^2e^{2x} + e^{2x}x^3 \tag{1}$$

Verification of solutions

$$y = c_1e^x + c_2e^{2x} + c_3e^{3x} + x\,e^{2x} + 2x^2e^{2x} + e^{2x}x^3$$

Verified OK.

19.62.1 Maple step by step solution

Let's solve

$y''' - 6y'' + 11y' - 6y = e^{2x}(-3x^2 - 4x + 5)$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = 6y - 3x^2e^{2x} - 4x\,e^{2x} + 5\,e^{2x} + 6y'' - 11y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - 6y'' + 11y' - 6y = -e^{2x}(3x^2 + 4x - 5)$

- ☐ Convert linear ODE into a system of first order ODEs
  - ○ Define new variable $y_1(x)$

    $y_1(x) = y$

- Define new variable $y_2(x)$

  $y_2(x) = y'$
- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = -3x^2 e^{2x} - 4x\,e^{2x} + 5\,e^{2x} + 6y_3(x) - 11y_2(x) + 6y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x)\,, y_3(x) = y_2'(x)\,, y_3'(x) = -3x^2 e^{2x} - 4x\,e^{2x} + 5\,e^{2x} + 6y_3(x) - 11y_2(x) + 6y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 6 & -11 & 6 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ -3x^2 e^{2x} - 4x\,e^{2x} + 5\,e^{2x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ -3x^2 e^{2x} - 4x\,e^{2x} + 5\,e^{2x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 6 & -11 & 6 \end{bmatrix}$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$
- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{2x} \cdot \begin{bmatrix} \frac{1}{4} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = \mathrm{e}^{3x} \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3 + \vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} e^{x} & \frac{e^{2x}}{4} & \frac{e^{3x}}{9} \\ e^{x} & \frac{e^{2x}}{2} & \frac{e^{3x}}{3} \\ e^{x} & e^{2x} & e^{3x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} e^{x} & \frac{e^{2x}}{4} & \frac{e^{3x}}{9} \\ e^{x} & \frac{e^{2x}}{2} & \frac{e^{3x}}{3} \\ e^{x} & e^{2x} & e^{3x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & \frac{1}{4} & \frac{1}{9} \\ 1 & \frac{1}{2} & \frac{1}{3} \\ 1 & 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} 3\,e^{x} - 3\,e^{2x} + e^{3x} & -\frac{5\,e^{x}}{2} + 4\,e^{2x} - \frac{3\,e^{3x}}{2} & \frac{e^{x}}{2} - e^{2x} + \frac{e^{3x}}{2} \\ 3\,e^{x} - 6\,e^{2x} + 3\,e^{3x} & -\frac{5\,e^{x}}{2} + 8\,e^{2x} - \frac{9\,e^{3x}}{2} & \frac{e^{x}}{2} - 2\,e^{2x} + \frac{3\,e^{3x}}{2} \\ 3\,e^{x} - 12\,e^{2x} + 9\,e^{3x} & -\frac{5\,e^{x}}{2} + 16\,e^{2x} - \frac{27\,e^{3x}}{2} & \frac{e^{x}}{2} - 4\,e^{2x} + \frac{9\,e^{3x}}{2} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

$\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

$\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

$A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot \vec{v}'(x)=\vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x)=\frac{1}{\Phi(x)}\cdot \vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x)=\int_0^x \frac{1}{\Phi(s)}\cdot \vec{f}(s)\,ds$

- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x)=\Phi(x)\cdot \left(\int_0^x \frac{1}{\Phi(s)}\cdot \vec{f}(s)\,ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x)=\left[\begin{array}{c} (x^3+2x^2+x+4)\,\mathrm{e}^{2x}-\frac{3\,\mathrm{e}^{x}}{2}-\frac{5\,\mathrm{e}^{3x}}{2} \\ (2x^3+7x^2+6x+9)\,\mathrm{e}^{2x}-\frac{3\,\mathrm{e}^{x}}{2}-\frac{15\,\mathrm{e}^{3x}}{2} \\ 2(2x^3+10x^2+13x+12)\,\mathrm{e}^{2x}-\frac{3\,\mathrm{e}^{x}}{2}-\frac{45\,\mathrm{e}^{3x}}{2} \end{array}\right]$$

- Plug particular solution back into general solution

$$\vec{y}(x)=c_1\vec{y}_1+c_2\vec{y}_2+c_3\vec{y}_3+\left[\begin{array}{c} (x^3+2x^2+x+4)\,\mathrm{e}^{2x}-\frac{3\,\mathrm{e}^{x}}{2}-\frac{5\,\mathrm{e}^{3x}}{2} \\ (2x^3+7x^2+6x+9)\,\mathrm{e}^{2x}-\frac{3\,\mathrm{e}^{x}}{2}-\frac{15\,\mathrm{e}^{3x}}{2} \\ 2(2x^3+10x^2+13x+12)\,\mathrm{e}^{2x}-\frac{3\,\mathrm{e}^{x}}{2}-\frac{45\,\mathrm{e}^{3x}}{2} \end{array}\right]$$

- First component of the vector is the solution to the ODE

$$y=\frac{(4x^3+8x^2+c_2+4x+16)\,\mathrm{e}^{2x}}{4}+\frac{(-45+2c_3)\,\mathrm{e}^{3x}}{18}+\frac{\mathrm{e}^{x}(2c_1-3)}{2}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.3. Undetermined Coefficients for Higher Order Equations. Page 495
Problem number: section 9.3, problem 63.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _missing_y]]
```

$$\boxed{y''' + 2y'' + y' = -2\,\mathrm{e}^{-x}(6x^2 - 18x + 7)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' + 2y'' + y' = 0$$

The characteristic equation is

$$\lambda^3 + 2\lambda^2 + \lambda = 0$$

The roots of the above equation are

$$\lambda_1 = 0$$
$$\lambda_2 = -1$$
$$\lambda_3 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1\mathrm{e}^{-x} + x\,\mathrm{e}^{-x}c_2 + c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \mathrm{e}^{-x} \\
y_2 &= x\,\mathrm{e}^{-x} \\
y_3 &= 1
\end{aligned}
$$

Now the particular solution to the given ODE is found

$$
y''' + 2y'' + y' = -2\,\mathrm{e}^{-x}\left(6x^2 - 18x + 7\right)
$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$
-2\,\mathrm{e}^{-x}\left(6x^2 - 18x + 7\right)
$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$
[\{x\,\mathrm{e}^{-x}, x^2\mathrm{e}^{-x}, \mathrm{e}^{-x}\}]
$$

While the set of the basis functions for the homogeneous solution found earlier is

$$
\{1, x\,\mathrm{e}^{-x}, \mathrm{e}^{-x}\}
$$

Since e^{-x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$
[\{x\,\mathrm{e}^{-x}, x^2\mathrm{e}^{-x}, \mathrm{e}^{-x}x^3\}]
$$

Since $x\,\mathrm{e}^{-x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$
[\{x^2\mathrm{e}^{-x}, \mathrm{e}^{-x}x^3, \mathrm{e}^{-x}x^4\}]
$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$
y_p = A_1x^2\mathrm{e}^{-x} + A_2\mathrm{e}^{-x}x^3 + A_3\mathrm{e}^{-x}x^4
$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$
24A_3\mathrm{e}^{-x}x - 6A_2\mathrm{e}^{-x}x - 12A_3\mathrm{e}^{-x}x^2 - 2A_1\mathrm{e}^{-x} + 6A_2\mathrm{e}^{-x} = -2\,\mathrm{e}^{-x}\left(6x^2 - 18x + 7\right)
$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 1, A_2 = -2, A_3 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = x^2 e^{-x} - 2\,e^{-x} x^3 + e^{-x} x^4$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-x} + x\,e^{-x} c_2 + c_3\right) + \left(x^2 e^{-x} - 2\,e^{-x} x^3 + e^{-x} x^4\right) \end{aligned}$$

Which simplifies to

$$y = (c_2 x + c_1)\,e^{-x} + c_3 + x^2 e^{-x} - 2\,e^{-x} x^3 + e^{-x} x^4$$

Summary

The solution(s) found are the following

$$y = (c_2 x + c_1)\,e^{-x} + c_3 + x^2 e^{-x} - 2\,e^{-x} x^3 + e^{-x} x^4 \tag{1}$$

Verification of solutions

$$y = (c_2 x + c_1)\,e^{-x} + c_3 + x^2 e^{-x} - 2\,e^{-x} x^3 + e^{-x} x^4$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - 3y'' + 3y' - y = (x+1)\,e^{x}}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - 3y'' + 3y' - y = 0$$

The characteristic equation is

$$\lambda^3 - 3\lambda^2 + 3\lambda - 1 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 1$$
$$\lambda_3 = 1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^x + c_2 x\, e^x + x^2 e^x c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^x$$
$$y_2 = x\, e^x$$
$$y_3 = x^2 e^x$$

Now the particular solution to the given ODE is found

$$y''' - 3y'' + 3y' - y = (x + 1)\, e^x$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$(x + 1)\, e^x$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\, e^x, e^x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\, e^x, x^2 e^x, e^x\}$$

Since e^x is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\, e^x, x^2 e^x\}]$$

Since $x\, e^x$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2 e^x, e^x x^3\}]$$

Since $x^2 e^x$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{e^x x^3, e^x x^4\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 e^x x^3 + A_2 e^x x^4$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$6A_1 e^x + 24A_2 e^x x = (x+1) e^x$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = \frac{1}{6}, A_2 = \frac{1}{24}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{e^x x^3}{6} + \frac{e^x x^4}{24}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^x + c_2 x\, e^x + x^2 e^x c_3\right) + \left(\frac{e^x x^3}{6} + \frac{e^x x^4}{24}\right) \end{aligned}$$

Which simplifies to

$$y = e^x \left(c_3 x^2 + c_2 x + c_1\right) + \frac{e^x x^3}{6} + \frac{e^x x^4}{24}$$

Summary

The solution(s) found are the following

$$y = e^x \left(c_3 x^2 + c_2 x + c_1\right) + \frac{e^x x^3}{6} + \frac{e^x x^4}{24} \tag{1}$$

Verification of solutions

$$y = e^x \left(c_3 x^2 + c_2 x + c_1\right) + \frac{e^x x^3}{6} + \frac{e^x x^4}{24}$$

Verified OK.

ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

`[[_high_order, _linear, _nonhomogeneous]]`

$$\boxed{y'''' - 2y'' + y = -\mathrm{e}^{-x}(3x^2 - 9x + 4)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 2y'' + y = 0$$

The characteristic equation is

$$\lambda^4 - 2\lambda^2 + 1 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 1$$
$$\lambda_3 = -1$$
$$\lambda_4 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-x} + x\,\mathrm{e}^{-x} c_2 + c_3 \mathrm{e}^{x} + c_4 x\,\mathrm{e}^{x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= \mathrm{e}^{-x} \\ y_2 &= x\,\mathrm{e}^{-x} \\ y_3 &= \mathrm{e}^{x} \\ y_4 &= x\,\mathrm{e}^{x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' - 2y'' + y = -\mathrm{e}^{-x}\left(3x^2 - 9x + 4\right)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-\mathrm{e}^{-x}\left(3x^2 - 9x + 4\right)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,\mathrm{e}^{-x}, x^2\mathrm{e}^{-x}, \mathrm{e}^{-x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\,\mathrm{e}^{x}, x\,\mathrm{e}^{-x}, \mathrm{e}^{x}, \mathrm{e}^{-x}\}$$

Since e^{-x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\,\mathrm{e}^{-x}, x^2\mathrm{e}^{-x}, \mathrm{e}^{-x}x^3\}]$$

Since $x\,\mathrm{e}^{-x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2\mathrm{e}^{-x}, \mathrm{e}^{-x}x^3, \mathrm{e}^{-x}x^4\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^2 \mathrm{e}^{-x} + A_2 \mathrm{e}^{-x} x^3 + A_3 \mathrm{e}^{-x} x^4$$

The unknowns $\{A_1, A_2, A_3\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$
\begin{aligned}
&8A_1 e^{-x} + 24A_2 e^{-x} x - 24A_2 e^{-x} + 48A_3 e^{-x} x^2 - 96A_3 e^{-x} x + 24A_3 e^{-x} \\
&= -e^{-x}\left(3x^2 - 9x + 4\right)
\end{aligned}
$$

Solving for the unknowns by comparing coefficients results in

$$
\left[A_1 = \frac{1}{16}, A_2 = \frac{1}{8}, A_3 = -\frac{1}{16}\right]
$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$
y_p = \frac{x^2 e^{-x}}{16} + \frac{e^{-x} x^3}{8} - \frac{e^{-x} x^4}{16}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1 e^{-x} + x\,e^{-x} c_2 + c_3 e^{x} + c_4 x\,e^{x}\right) + \left(\frac{x^2 e^{-x}}{16} + \frac{e^{-x} x^3}{8} - \frac{e^{-x} x^4}{16}\right)
\end{aligned}
$$

Which simplifies to

$$
y = (c_2 x + c_1)\,e^{-x} + e^{x}(c_4 x + c_3) + \frac{x^2 e^{-x}}{16} + \frac{e^{-x} x^3}{8} - \frac{e^{-x} x^4}{16}
$$

Summary

The solution(s) found are the following

$$
y = (c_2 x + c_1)\,e^{-x} + e^{x}(c_4 x + c_3) + \frac{x^2 e^{-x}}{16} + \frac{e^{-x} x^3}{8} - \frac{e^{-x} x^4}{16} \tag{1}
$$

Verification of solutions

$$
y = (c_2 x + c_1)\,e^{-x} + e^{x}(c_4 x + c_3) + \frac{x^2 e^{-x}}{16} + \frac{e^{-x} x^3}{8} - \frac{e^{-x} x^4}{16}
$$

Verified OK.

Problem number: section 9.3, problem 66.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$
\boxed{y''' + 2y'' - y' - 2y = \mathrm{e}^{-2x}((23 - 2x)\cos(x) + (8 - 9x)\sin(x))}
$$

This is higher order nonhomogeneous ODE. Let the solution be

$$
y = y_h + y_p
$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$
y''' + 2y'' - y' - 2y = 0
$$

The characteristic equation is

$$
\lambda^3 + 2\lambda^2 - \lambda - 2 = 0
$$

The roots of the above equation are

$$
\begin{aligned}
\lambda_1 &= 1 \\
\lambda_2 &= -2 \\
\lambda_3 &= -1
\end{aligned}
$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{-2x} + c_3 e^{x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = e^{-2x}$$
$$y_3 = e^{x}$$

Now the particular solution to the given ODE is found

$$y''' + 2y'' - y' - 2y = e^{-2x}((23 - 2x)\cos(x) + (8 - 9x)\sin(x))$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^{-2x}((23 - 2x)\cos(x) + (8 - 9x)\sin(x))$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{e^{-2x}\cos(x), e^{-2x}\sin(x), e^{-2x}\cos(x)x, e^{-2x}\sin(x)x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^{x}, e^{-2x}, e^{-x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 e^{-2x}\cos(x) + A_2 e^{-2x}\sin(x) + A_3 e^{-2x}\cos(x)x + A_4 e^{-2x}\sin(x)x$$

The unknowns $\{A_1, A_2, A_3, A_4\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$\begin{aligned}&4A_4 e^{-2x}\sin(x)x + 4A_3 e^{-2x}\cos(x)x - 8A_4 e^{-2x}\cos(x) - 2A_3 e^{-2x}\sin(x)x \\ &+ 2A_4 e^{-2x}\cos(x)x + 8A_3 e^{-2x}\sin(x) + 2A_2 e^{-2x}\cos(x) - 2A_1 e^{-2x}\sin(x) \\ &+ 4A_1 e^{-2x}\cos(x) + 4A_2 e^{-2x}\sin(x) = e^{-2x}((23 - 2x)\cos(x) + (8 - 9x)\sin(x))\end{aligned}$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = 1, A_2 = \frac{3}{2}, A_3 = \frac{1}{2}, A_4 = -2\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = e^{-2x} \cos(x) + \frac{3 e^{-2x} \sin(x)}{2} + \frac{e^{-2x} \cos(x) x}{2} - 2 e^{-2x} \sin(x) x$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-x} + c_2 e^{-2x} + c_3 e^{x}\right) + \left(e^{-2x} \cos(x) + \frac{3 e^{-2x} \sin(x)}{2} + \frac{e^{-2x} \cos(x) x}{2} - 2 e^{-2x} \sin(x) x\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = {} & c_1 e^{-x} + c_2 e^{-2x} + c_3 e^{x} + e^{-2x} \cos(x) \\ & + \frac{3 e^{-2x} \sin(x)}{2} + \frac{e^{-2x} \cos(x) x}{2} - 2 e^{-2x} \sin(x) x \end{aligned} \tag{1}$$

Verification of solutions

$$y = c_1 e^{-x} + c_2 e^{-2x} + c_3 e^{x} + e^{-2x} \cos(x) + \frac{3 e^{-2x} \sin(x)}{2} + \frac{e^{-2x} \cos(x) x}{2} - 2 e^{-2x} \sin(x) x$$

Verified OK.

19.66.1 Maple step by step solution

Let's solve

$y''' + 2y'' - y' - 2y = e^{-2x}((23 - 2x) \cos(x) + (8 - 9x) \sin(x))$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = 2y - 2 e^{-2x} \cos(x) x - 9 e^{-2x} \sin(x) x + 23 e^{-2x} \cos(x) + 8 e^{-2x} \sin(x) - 2y'' + y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' + 2y'' - y' - 2y = -e^{-2x}(9 \sin(x) x + 2x \cos(x) - 8 \sin(x) - 23 \cos(x))$

□ Convert linear ODE into a system of first order ODEs

- Define new variable $y_1(x)$

  $y_1(x) = y$

- Define new variable $y_2(x)$

  $y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$

- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = -2\,\mathrm{e}^{-2x}\cos(x)\,x - 9\,\mathrm{e}^{-2x}\sin(x)\,x + 23\,\mathrm{e}^{-2x}\cos(x) + 8\,\mathrm{e}^{-2x}\sin(x) - 2y_3(x) + y_2(x) + 2$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = -2\,\mathrm{e}^{-2x}\cos(x)\,x - 9\,\mathrm{e}^{-2x}\sin(x)\,x + 23\,\mathrm{e}^{-2x}\cos(x) + 8\,\mathrm{e}^{-}$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & 1 & -2 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ -9\,\mathrm{e}^{-2x}\sin(x)\,x - 2\,\mathrm{e}^{-2x}\cos(x)\,x + 8\,\mathrm{e}^{-2x}\sin(x) + 23\,\mathrm{e}^{-2x}\mathrm{c}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ -9\,\mathrm{e}^{-2x}\sin(x)\,x - 2\,\mathrm{e}^{-2x}\cos(x)\,x + 8\,\mathrm{e}^{-2x}\sin(x) + 23\,\mathrm{e}^{-2x}\cos(x) \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ 2 & 1 & -2 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right], \left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right], \left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-2, \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-2x} \cdot \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = \mathrm{e}^{-x} \cdot \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = e^x \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$$\vec{y}(x) = c_1 \vec{y}_1 + c_2 \vec{y}_2 + c_3 \vec{y}_3 + \vec{y}_p(x)$$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & e^{-x} & e^x \\ -\frac{e^{-2x}}{2} & -e^{-x} & e^x \\ e^{-2x} & e^{-x} & e^x \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & e^{-x} & e^x \\ -\frac{e^{-2x}}{2} & -e^{-x} & e^x \\ e^{-2x} & e^{-x} & e^x \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} \frac{1}{4} & 1 & 1 \\ -\frac{1}{2} & -1 & 1 \\ 1 & 1 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{(e^{3x}+3e^x-1)e^{-2x}}{3} & -\frac{e^{-x}}{2} + \frac{e^x}{2} & \frac{(e^{3x}-3e^x+2)e^{-2x}}{6} \\ \frac{(e^{3x}-3e^x+2)e^{-2x}}{3} & \frac{e^x}{2} + \frac{e^{-x}}{2} & \frac{(e^{3x}+3e^x-4)e^{-2x}}{6} \\ \frac{(e^{3x}+3e^x-4)e^{-2x}}{3} & -\frac{e^{-x}}{2} + \frac{e^x}{2} & \frac{(e^{3x}-3e^x+8)e^{-2x}}{6} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

$$\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$$

- Take the derivative of the particular solution

$$\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$$

- Substitute particular solution and its derivative into the system of ODEs

$\Phi'(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)=A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\overrightarrow{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\Phi(x)\cdot\overrightarrow{v}'(x)=A\cdot\Phi(x)\cdot\overrightarrow{v}(x)+\overrightarrow{f}(x)$

- Cancel like terms

  $\Phi(x)\cdot\overrightarrow{v}'(x)=\overrightarrow{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\overrightarrow{v}'(x)=\frac{1}{\Phi(x)}\cdot\overrightarrow{f}(x)$

- Integrate to solve for $\overrightarrow{v}(x)$

  $\overrightarrow{v}(x)=\int_0^x \frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds$

- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

  $\overrightarrow{y}_p(x)=\Phi(x)\cdot\left(\int_0^x \frac{1}{\Phi(s)}\cdot\overrightarrow{f}(s)\,ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

  $$\overrightarrow{y}_p(x)=\left[\begin{array}{c}\frac{\left(7\,e^{3x}+(3x+6)\cos(x)+(-12x+9)\sin(x)-33\,e^{x}+20\right)e^{-2x}}{6}\\ \frac{\left(7\,e^{3x}+(21x-36)\sin(x)-18x\cos(x)+33\,e^{x}-40\right)e^{-2x}}{6}\\ \frac{\left(7\,e^{3x}+(57x-54)\cos(x)+(-24x+93)\sin(x)-33\,e^{x}+80\right)e^{-2x}}{6}\end{array}\right]$$

- Plug particular solution back into general solution

  $$\overrightarrow{y}(x)=c_1\overrightarrow{y}_1+c_2\overrightarrow{y}_2+c_3\overrightarrow{y}_3+\left[\begin{array}{c}\frac{\left(7\,e^{3x}+(3x+6)\cos(x)+(-12x+9)\sin(x)-33\,e^{x}+20\right)e^{-2x}}{6}\\ \frac{\left(7\,e^{3x}+(21x-36)\sin(x)-18x\cos(x)+33\,e^{x}-40\right)e^{-2x}}{6}\\ \frac{\left(7\,e^{3x}+(57x-54)\cos(x)+(-24x+93)\sin(x)-33\,e^{x}+80\right)e^{-2x}}{6}\end{array}\right]$$

- First component of the vector is the solution to the ODE

  $$y=\frac{\left(12c_3e^{3x}+14\,e^{3x}+6x\cos(x)-24\sin(x)x+12c_2e^{x}+12\cos(x)+18\sin(x)-66\,e^{x}+3c_1+40\right)e^{-2x}}{12}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.3. Undetermined Coefficients for Higher Order Equations. Page 495
Problem number: section 9.3, problem 67.
ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _missing_y]]
```

$$\boxed{y'''' - 3y''' + 4y'' - 2y' = \mathrm{e}^{x}((28 + 6x)\cos(2x) + (11 - 12x)\sin(2x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 3y''' + 4y'' - 2y' = 0$$

The characteristic equation is

$$\lambda^4 - 3\lambda^3 + 4\lambda^2 - 2\lambda = 0$$

The roots of the above equation are

$$\begin{aligned}\lambda_1 &= 0\\ \lambda_2 &= 1\\ \lambda_3 &= 1 - i\\ \lambda_4 &= 1 + i\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 + c_2 e^x + e^{(1-i)x} c_3 + e^{(1+i)x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = 1$$
$$y_2 = e^x$$
$$y_3 = e^{(1-i)x}$$
$$y_4 = e^{(1+i)x}$$

Now the particular solution to the given ODE is found

$$y'''' - 3y''' + 4y'' - 2y' = e^x((28 + 6x)\cos(2x) + (11 - 12x)\sin(2x))$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$e^x((28 + 6x)\cos(2x) + (11 - 12x)\sin(2x))$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{e^x \cos(2x), e^x \sin(2x), \cos(2x) e^x x, \sin(2x) e^x x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{1, e^x, e^{(1-i)x}, e^{(1+i)x}\}$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 e^x \cos(2x) + A_2 e^x \sin(2x) + A_3 \cos(2x) e^x x + A_4 \sin(2x) e^x x$$

The unknowns $\{A_1, A_2, A_3, A_4\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$12A_3 \cos(2x) e^x x - 11A_4 \sin(2x) e^x - 6A_4 \cos(2x) e^x x - 28A_4 \cos(2x) e^x - 11A_3 \cos(2x) e^x + 6A_3 \sin(2x) e^x x + 28A_3 \sin(2x) e^x + 12A_4 \sin(2x) e^x x - 6A_2 e^x \cos(2x) + 6A_1 e^x \sin(2x) + 12A_1 e^x \cos(2x) + 12A_2 e^x \sin(2x) = e^x((28 + 6x)\cos(2x) + (11 - 12x)\sin(2x))$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 0, A_2 = 0, A_3 = 0, A_4 = -1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -\sin(2x)\,e^x x$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 + c_2 e^x + e^{(1-i)x} c_3 + e^{(1+i)x} c_4\right) + \left(-\sin(2x)\,e^x x\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 + c_2 e^x + e^{(1-i)x} c_3 + e^{(1+i)x} c_4 - \sin(2x)\,e^x x \tag{1}$$

Verification of solutions

$$y = c_1 + c_2 e^x + e^{(1-i)x} c_3 + e^{(1+i)x} c_4 - \sin(2x)\,e^x x$$

Verified OK.

19.67.1 Maple step by step solution

Let's solve

$y'''' - 3y''' + 4y'' - 2y' = e^x\left((28 + 6x)\cos(2x) + (11 - 12x)\sin(2x)\right)$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = 6\cos(2x)\,e^x x - 12\sin(2x)\,e^x x + 28\,e^x \cos(2x) + 11\,e^x \sin(2x) + 3y''' - 4y'' + 2y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'''' - 3y''' + 4y'' - 2y' = e^x\left(-12x\sin(2x) + 6x\cos(2x) + 11\sin(2x) + 28\cos(2x)\right)$

□ Convert linear ODE into a system of first order ODEs

  - Define new variable $y_1(x)$

    $y_1(x) = y$

- Define new variable $y_2(x)$

  $y_2(x) = y'$
- Define new variable $y_3(x)$

  $y_3(x) = y''$
- Define new variable $y_4(x)$

  $y_4(x) = y'''$
- Isolate for $y_4'(x)$ using original ODE

  $y_4'(x) = 6\cos(2x)\,e^x x - 12\sin(2x)\,e^x x + 28\,e^x\cos(2x) + 11\,e^x\sin(2x) + 3y_4(x) - 4y_3(x) + 2y_2($

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_4(x) = y_3'(x), y_4'(x) = 6\cos(2x)\,e^x x - 12\sin(2x)\,e^x x + 28\,e^x \cos$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 2 & -4 & 3 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ -12\sin(2x)\,e^x x + 6\cos(2x)\,e^x x + 11\,e^x\sin(2x) + 28\,e^x \text{co} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ -12\sin(2x)\,e^x x + 6\cos(2x)\,e^x x + 11\,e^x\sin(2x) + 28\,e^x\cos(2x) \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 2 & -4 & 3 \end{bmatrix}$$

- Rewrite the system as

$$\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x) + \overrightarrow{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[0, \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[1 - \mathrm{I}, \begin{bmatrix} -\frac{1}{4} + \frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2} + \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[1 + \mathrm{I}, \begin{bmatrix} -\frac{1}{4} - \frac{\mathrm{I}}{4} \\ -\frac{\mathrm{I}}{2} \\ \frac{1}{2} - \frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[0, \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[1-\mathrm{I}, \begin{bmatrix} -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$e^{(1-\mathrm{I})x} \cdot \begin{bmatrix} -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of sin and cos

$$e^{x} \cdot (-\mathrm{I}\sin(x)+\cos(x)) \cdot \begin{bmatrix} -\frac{1}{4}+\frac{\mathrm{I}}{4} \\ \frac{\mathrm{I}}{2} \\ \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}$$

- Simplify expression

$$e^{x} \cdot \begin{bmatrix} \left(-\frac{1}{4}+\frac{\mathrm{I}}{4}\right)(-\mathrm{I}\sin(x)+\cos(x)) \\ \frac{\mathrm{I}}{2}(-\mathrm{I}\sin(x)+\cos(x)) \\ \left(\frac{1}{2}+\frac{\mathrm{I}}{2}\right)(-\mathrm{I}\sin(x)+\cos(x)) \\ -\mathrm{I}\sin(x)+\cos(x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x)=e^{x}\cdot\begin{bmatrix}-\frac{\cos(x)}{4}+\frac{\sin(x)}{4}\\ \frac{\sin(x)}{2}\\ \frac{\cos(x)}{2}+\frac{\sin(x)}{2}\\ \cos(x)\end{bmatrix},\ \vec{y}_4(x)=e^{x}\cdot\begin{bmatrix}\frac{\sin(x)}{4}+\frac{\cos(x)}{4}\\ \frac{\cos(x)}{2}\\ \frac{\cos(x)}{2}-\frac{\sin(x)}{2}\\ -\sin(x)\end{bmatrix}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($…

$\vec{y}(x)=c_1\vec{y}_1+c_2\vec{y}_2+c_3\vec{y}_3(x)+c_4\vec{y}_4(x)+\vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst…

$$\phi(x)=\begin{bmatrix}1 & e^{x} & e^{x}\left(-\frac{\cos(x)}{4}+\frac{\sin(x)}{4}\right) & e^{x}\left(\frac{\sin(x)}{4}+\frac{\cos(x)}{4}\right)\\ 0 & e^{x} & \frac{\sin(x)e^{x}}{2} & \frac{\cos(x)e^{x}}{2}\\ 0 & e^{x} & e^{x}\left(\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & \left(\frac{\cos(x)}{2}-\frac{\sin(x)}{2}\right)e^{x}\\ 0 & e^{x} & \cos(x)e^{x} & -\sin(x)e^{x}\end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t…

$\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x)=\begin{bmatrix}1 & e^{x} & e^{x}\left(-\frac{\cos(x)}{4}+\frac{\sin(x)}{4}\right) & e^{x}\left(\frac{\sin(x)}{4}+\frac{\cos(x)}{4}\right)\\ 0 & e^{x} & \frac{\sin(x)e^{x}}{2} & \frac{\cos(x)e^{x}}{2}\\ 0 & e^{x} & e^{x}\left(\frac{\cos(x)}{2}+\frac{\sin(x)}{2}\right) & \left(\frac{\cos(x)}{2}-\frac{\sin(x)}{2}\right)e^{x}\\ 0 & e^{x} & \cos(x)e^{x} & -\sin(x)e^{x}\end{bmatrix}\cdot\frac{1}{\begin{bmatrix}1 & 1 & -\frac{1}{4} & \frac{1}{4}\\ 0 & 1 & 0 & \frac{1}{2}\\ 0 & 1 & \frac{1}{2} & \frac{1}{2}\\ 0 & 1 & 1 & 0\end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x)=\begin{bmatrix}1 & -2+(-\sin(x)+2)e^{x} & \frac{3}{2}+\frac{(-4+\cos(x)+3\sin(x))e^{x}}{2} & -\frac{1}{2}+\frac{e^{x}(2-\cos(x)-\sin(\dots}{2}\\ 0 & -e^{x}(\cos(x)+\sin(x)-2) & e^{x}(-2+2\cos(x)+\sin(x)) & -e^{x}(\cos(x)-1)\\ 0 & -2e^{x}(\cos(x)-1) & e^{x}(-2+3\cos(x)-\sin(x)) & -e^{x}(\cos(x)-\sin(x)\dots\\ 0 & -2e^{x}(\cos(x)-\sin(x)-1) & 2e^{x}(-1-2\sin(x)+\cos(x)) & e^{x}(1+2\sin(x))\end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$
- Take the derivative of the particular solution

  $\vec{y}'_p(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$
- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$
- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$
- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$
- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \left[\begin{array}{c} -2(\sin(x)\, x + 2)\, \mathrm{e}^{x} \cos(x) + 4\, \mathrm{e}^{x} \\ -2\left(2\cos(x)^{2} x + x\cos(x)\sin(x) + \cos(x)\sin(x) + 2\cos(x) - 2\sin(x) - x - 2\right) \mathrm{e}^{x} \\ -2\left(4\cos(x)^{2} x - 3x\cos(x)\sin(x) + 2\cos(x)\sin(x) - 4\sin(x)^{2} - 4\sin(x) - 2x\right) \mathrm{e}^{x} \\ 4\left(4 + (x-6)\cos(x)^{2} + \left(2 + \frac{(11x+9)\sin(x)}{2}\right)\cos(x) - \frac{x}{2} + 2\sin(x)\right) \mathrm{e}^{x} \end{array}\right.$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \left[\begin{array}{c} -2(\sin(x)\, x + 2)\, \mathrm{e}^{x} \cos(\\ -2\left(2\cos(x)^{2} x + x\cos(x)\sin(x) + \cos(x)\sin(x \right. \\ -2\left(4\cos(x)^{2} x - 3x\cos(x)\sin(x) + 2\cos(x)\sin \right. \\ 4\left(4 + (x-6)\cos(x)^{2} + \left(2 + \frac{(11x+9)\sin(x)}{2}\right.\right. \end{array}\right.$$

- First component of the vector is the solution to the ODE

  $y = \frac{((-8\sin(x)x-c_3+c_4-16)\cos(x)+(c_3+c_4)\sin(x)+4c_2+16)e^x}{4} + c_1$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 4y''' + 14y'' - 20y' + 25y = e^{x}((6x + 2)\cos(2x) + 3\sin(2x))}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 4y''' + 14y'' - 20y' + 25y = 0$$

The characteristic equation is

$$\lambda^4 - 4\lambda^3 + 14\lambda^2 - 20\lambda + 25 = 0$$

The roots of the above equation are

$$\lambda_1 = 1 - 2i$$
$$\lambda_2 = 1 + 2i$$
$$\lambda_3 = 1 - 2i$$
$$\lambda_4 = 1 + 2i$$

Therefore the homogeneous solution is

$$y_h(x) = e^{(1+2i)x}c_1 + x\,e^{(1+2i)x}c_2 + e^{(1-2i)x}c_3 + x\,e^{(1-2i)x}c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^{(1+2i)x} \\ y_2 &= x\,e^{(1+2i)x} \\ y_3 &= e^{(1-2i)x} \\ y_4 &= x\,e^{(1-2i)x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' - 4y''' + 14y'' - 20y' + 25y = e^x((6x+2)\cos(2x) + 3\sin(2x))$$

Let the particular solution be

$$y_p = U_1y_1 + U_2y_2 + U_3y_3 + U_4y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i}\int \frac{F(x)W_i(x)}{aW(x)}\,dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} e^{(1+2i)x} & x\,e^{(1+2i)x} & e^{(1-2i)x} & x\,e^{(1-2i)x} \\ (1+2i)\,e^{(1+2i)x} & (1+(1+2i)\,x)\,e^{(1+2i)x} & (1-2i)\,e^{(1-2i)x} & e^{(1-2i)x}(-2ix+ \\ (-3+4i)\,e^{(1+2i)x} & (2+4i+(-3+4i)\,x)\,e^{(1+2i)x} & (-3-4i)\,e^{(1-2i)x} & -4\,e^{(1-2i)x}\left(-\frac{1}{2}+i+\right. \\ (-11-2i)\,e^{(1+2i)x} & -2\left(\frac{9}{2}-6i+\left(\frac{11}{2}+i\right)x\right)e^{(1+2i)x} & (-11+2i)\,e^{(1-2i)x} & (-9-12i+(-11+ \end{bmatrix}$$

$$|W| = 256\,e^{(2+4i)x}e^{(2-4i)x}$$

The determinant simplifies to

$$|W| = 256\,\mathrm{e}^{4x}$$

Now we determine W_i for each U_i.

$$W_1(x) = \det\begin{bmatrix} x\,\mathrm{e}^{(1+2i)x} & \mathrm{e}^{(1-2i)x} & x\,\mathrm{e}^{(1-2i)x} \\ (1+(1+2i)\,x)\,\mathrm{e}^{(1+2i)x} & (1-2i)\,\mathrm{e}^{(1-2i)x} & \mathrm{e}^{(1-2i)x}(-2ix+x+1) \\ (2+4i+(-3+4i)\,x)\,\mathrm{e}^{(1+2i)x} & (-3-4i)\,\mathrm{e}^{(1-2i)x} & -4\,\mathrm{e}^{(1-2i)x}\left(-\frac{1}{2}+i+\left(\frac{3}{4}+i\right)x\right) \end{bmatrix}$$
$$= 8\,\mathrm{e}^{(3-2i)x}(i-2x)$$

$$W_2(x) = \det\begin{bmatrix} \mathrm{e}^{(1+2i)x} & \mathrm{e}^{(1-2i)x} & x\,\mathrm{e}^{(1-2i)x} \\ (1+2i)\,\mathrm{e}^{(1+2i)x} & (1-2i)\,\mathrm{e}^{(1-2i)x} & \mathrm{e}^{(1-2i)x}(-2ix+x+1) \\ (-3+4i)\,\mathrm{e}^{(1+2i)x} & (-3-4i)\,\mathrm{e}^{(1-2i)x} & -4\,\mathrm{e}^{(1-2i)x}\left(-\frac{1}{2}+i+\left(\frac{3}{4}+i\right)x\right) \end{bmatrix}$$
$$= -16\,\mathrm{e}^{(3-2i)x}$$

$$W_3(x) = \det\begin{bmatrix} \mathrm{e}^{(1+2i)x} & x\,\mathrm{e}^{(1+2i)x} & x\,\mathrm{e}^{(1-2i)x} \\ (1+2i)\,\mathrm{e}^{(1+2i)x} & (1+(1+2i)\,x)\,\mathrm{e}^{(1+2i)x} & \mathrm{e}^{(1-2i)x}(-2ix+x+1) \\ (-3+4i)\,\mathrm{e}^{(1+2i)x} & (2+4i+(-3+4i)\,x)\,\mathrm{e}^{(1+2i)x} & -4\,\mathrm{e}^{(1-2i)x}\left(-\frac{1}{2}+i+\left(\frac{3}{4}+i\right)x\right) \end{bmatrix}$$
$$= -8\,\mathrm{e}^{(3+2i)x}(i+2x)$$

$$W_4(x) = \det\begin{bmatrix} \mathrm{e}^{(1+2i)x} & x\,\mathrm{e}^{(1+2i)x} & \mathrm{e}^{(1-2i)x} \\ (1+2i)\,\mathrm{e}^{(1+2i)x} & (1+(1+2i)\,x)\,\mathrm{e}^{(1+2i)x} & (1-2i)\,\mathrm{e}^{(1-2i)x} \\ (-3+4i)\,\mathrm{e}^{(1+2i)x} & (2+4i+(-3+4i)\,x)\,\mathrm{e}^{(1+2i)x} & (-3-4i)\,\mathrm{e}^{(1-2i)x} \end{bmatrix}$$
$$= -16\,\mathrm{e}^{(3+2i)x}$$

Now we are ready to evaluate each $U_i(x)$.

$$
\begin{aligned}
U_1 &= (-1)^{4-1} \int \frac{F(x)W_1(x)}{aW(x)}\,dx \\
&= (-1)^3 \int \frac{\left(\mathrm{e}^{x}((6x+2)\cos(2x)+3\sin(2x))\right)\left(8\,\mathrm{e}^{(3-2i)x}(i-2x)\right)}{(1)\left(256\,\mathrm{e}^{4x}\right)}\,dx \\
&= -\int \frac{8\,\mathrm{e}^{x}((6x+2)\cos(2x)+3\sin(2x))\,\mathrm{e}^{(3-2i)x}(i-2x)}{256\,\mathrm{e}^{4x}}\,dx \\
&= -\int \left(\frac{(i-2x)\,(6x\cos(2x)+3\sin(2x)+2\cos(2x))\,\mathrm{e}^{-2ix}}{32}\right)dx \\
&= -\left(\int \frac{(i-2x)\,(6x\cos(2x)+3\sin(2x)+2\cos(2x))\,\mathrm{e}^{-2ix}}{32}dx\right) \\
&= -\left(\int \frac{(i-2x)\,(6x\cos(2x)+3\sin(2x)+2\cos(2x))\,\mathrm{e}^{-2ix}}{32}dx\right)
\end{aligned}
$$

$$
\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\,dx \\
&= (-1)^2 \int \frac{\left(\mathrm{e}^{x}((6x+2)\cos(2x)+3\sin(2x))\right)\left(-16\,\mathrm{e}^{(3-2i)x}\right)}{(1)\left(256\,\mathrm{e}^{4x}\right)}\,dx \\
&= \int \frac{-16\,\mathrm{e}^{x}((6x+2)\cos(2x)+3\sin(2x))\,\mathrm{e}^{(3-2i)x}}{256\,\mathrm{e}^{4x}}\,dx \\
&= \int \left(\frac{((-6x-2)\cos(2x)-3\sin(2x))\,\mathrm{e}^{-2ix}}{16}\right)dx \\
&= \frac{3ix}{32} - \frac{3x^2}{32} - \frac{x}{16} - \frac{i(4+3i+12x)\,\mathrm{e}^{-4ix}}{256} \\
&= \frac{3ix}{32} - \frac{3x^2}{32} - \frac{x}{16} - \frac{i(4+3i+12x)\,\mathrm{e}^{-4ix}}{256}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x)W_3(x)}{aW(x)}\, dx \\
&= (-1)^1 \int \frac{\left(\mathrm{e}^x((6x+2)\cos(2x)+3\sin(2x))\right)\left(-8\,\mathrm{e}^{(3+2i)x}(i+2x)\right)}{(1)\left(256\,\mathrm{e}^{4x}\right)}\, dx \\
&= -\int \frac{-8\,\mathrm{e}^x((6x+2)\cos(2x)+3\sin(2x))\,\mathrm{e}^{(3+2i)x}(i+2x)}{256\,\mathrm{e}^{4x}}\, dx \\
&= -\int \left(-\frac{(i+2x)\left(6x\cos(2x)+3\sin(2x)+2\cos(2x)\right)\mathrm{e}^{2ix}}{32}\right) dx \\
&= -\left(\int -\frac{(i+2x)\left(6x\cos(2x)+3\sin(2x)+2\cos(2x)\right)\mathrm{e}^{2ix}}{32} dx\right) \\
&= -\left(\int -\frac{(i+2x)\left(6x\cos(2x)+3\sin(2x)+2\cos(2x)\right)\mathrm{e}^{2ix}}{32} dx\right)
\end{aligned}
$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x)W_4(x)}{aW(x)}\, dx \\
&= (-1)^0 \int \frac{\left(\mathrm{e}^x((6x+2)\cos(2x)+3\sin(2x))\right)\left(-16\,\mathrm{e}^{(3+2i)x}\right)}{(1)\left(256\,\mathrm{e}^{4x}\right)}\, dx \\
&= \int \frac{-16\,\mathrm{e}^x((6x+2)\cos(2x)+3\sin(2x))\,\mathrm{e}^{(3+2i)x}}{256\,\mathrm{e}^{4x}}\, dx \\
&= \int \left(\frac{((-6x-2)\cos(2x)-3\sin(2x))\,\mathrm{e}^{2ix}}{16}\right) dx \\
&= -\frac{3ix}{32}-\frac{3x^2}{32}-\frac{x}{16}+\frac{i(4-3i+12x)\,\mathrm{e}^{4ix}}{256} \\
&= -\frac{3ix}{32}-\frac{3x^2}{32}-\frac{x}{16}+\frac{i(4-3i+12x)\,\mathrm{e}^{4ix}}{256}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1y_1 + U_2y_2 + U_3y_3 + U_4y_4
$$

Hence

$$
\begin{aligned}
y_p = &\left(-\left(\int \frac{(i-2x)\left(6x\cos(2x)+3\sin(2x)+2\cos(2x)\right)\mathrm{e}^{-2ix}}{32} dx\right)\right)\left(\mathrm{e}^{(1+2i)x}\right) \\
&+ \left(\frac{3ix}{32}-\frac{3x^2}{32}-\frac{x}{16}-\frac{i(4+3i+12x)\,\mathrm{e}^{-4ix}}{256}\right)\left(x\,\mathrm{e}^{(1+2i)x}\right) \\
&+ \left(-\left(\int -\frac{(i+2x)\left(6x\cos(2x)+3\sin(2x)+2\cos(2x)\right)\mathrm{e}^{2ix}}{32} dx\right)\right)\left(\mathrm{e}^{(1-2i)x}\right) \\
&+ \left(-\frac{3ix}{32}-\frac{3x^2}{32}-\frac{x}{16}+\frac{i(4-3i+12x)\,\mathrm{e}^{4ix}}{256}\right)\left(x\,\mathrm{e}^{(1-2i)x}\right)
\end{aligned}
$$

Therefore the particular solution is

$$y_p = -\frac{\left(\int (i-2x)\left(6x\cos(2x)+3\sin(2x)+2\cos(2x)\right)\mathrm{e}^{-2ix}dx\right)\mathrm{e}^{(1+2i)x}}{32} + \frac{\left(\int (i+2x)\left(6x\cos(2x)+3\sin\right.\right.}{3}$$

Which simplifies to

$$y_p = -\frac{\mathrm{e}^{x}\left(24x^3\cos(2x)+16x^2\cos(2x)+4i\left(\int \left((-12x^2-4x)\cos(2x)^2+2\cos(2x)\sin(2x)+3\sin(2x)^2\right)\right.\right.}{}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(\mathrm{e}^{(1+2i)x}c_1 + x\,\mathrm{e}^{(1+2i)x}c_2 + \mathrm{e}^{(1-2i)x}c_3 + x\,\mathrm{e}^{(1-2i)x}c_4\right) \\ &\quad + \left(-\frac{\mathrm{e}^{x}\left(24x^3\cos(2x)+16x^2\cos(2x)+4i\left(\int \left((-12x^2-4x)\cos(2x)^2+2\cos(2x)\sin(2x)+3\sin(2x\right.\right.\right.}{}\right. \end{aligned}$$

Which simplifies to

$$\begin{aligned} y &= (c_4x+c_3)\,\mathrm{e}^{(1-2i)x} + \mathrm{e}^{(1+2i)x}(c_2x+c_1) \\ &\quad - \frac{\mathrm{e}^{x}\left(24x^3\cos(2x)+16x^2\cos(2x)+4i\left(\int \left((-12x^2-4x)\cos(2x)^2+2\cos(2x)\sin(2x)+3\sin(2x)^2\right)dx\right.\right.}{} \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y &= (c_4x+c_3)\,\mathrm{e}^{(1-2i)x} + \mathrm{e}^{(1+2i)x}(c_2x+c_1) \\ &\quad - \frac{\mathrm{e}^{x}\left(24x^3\cos(2x)+16x^2\cos(2x)+4i\left(\int \left((-12x^2-4x)\cos(2x)^2+2\cos(2x)\sin(2x)+3\sin(2x)^2\right)dx\right.\right.}{} \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y &= (c_4x+c_3)\,\mathrm{e}^{(1-2i)x} + \mathrm{e}^{(1+2i)x}(c_2x+c_1) \\ &\quad - \frac{\mathrm{e}^{x}\left(24x^3\cos(2x)+16x^2\cos(2x)+4i\left(\int \left((-12x^2-4x)\cos(2x)^2+2\cos(2x)\sin(2x)+3\sin(2x)^2\right)dx\right.\right.}{} \end{aligned}$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - 2y'' - 5y' + 6y = 2\,\mathrm{e}^{x}(1 - 6x)}$$

With initial conditions

$$[y(0) = 2, y'(0) = 7, y''(0) = 9]$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - 2y'' - 5y' + 6y = 0$$

The characteristic equation is

$$\lambda^3 - 2\lambda^2 - 5\lambda + 6 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = 3$$
$$\lambda_3 = -2$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-2x} + c_2 e^x + c_3 e^{3x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-2x}$$
$$y_2 = e^x$$
$$y_3 = e^{3x}$$

Now the particular solution to the given ODE is found

$$y''' - 2y'' - 5y' + 6y = 2\,e^x(1 - 6x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$2\,e^x(1 - 6x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,e^x, e^x\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{e^x, e^{-2x}, e^{3x}\}$$

Since e^x is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\,e^x, x^2 e^x\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x\,e^x + A_2 x^2 e^x$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$-6A_1e^x + 2A_2e^x - 12A_2x\,e^x = 2\,e^x(1-6x)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 0, A_2 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = x^2e^x$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1e^{-2x} + c_2e^x + c_3e^{3x}\right) + \left(x^2e^x\right) \end{aligned}$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$y = c_1e^{-2x} + c_2e^x + c_3e^{3x} + x^2e^x \tag{1}$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 2$ and $x = 0$ in the above gives

$$2 = c_1 + c_2 + c_3 \tag{1A}$$

Taking derivative of the solution gives

$$y' = -2c_1e^{-2x} + c_2e^x + 3c_3e^{3x} + 2x\,e^x + x^2e^x$$

substituting $y' = 7$ and $x = 0$ in the above gives

$$7 = -2c_1 + c_2 + 3c_3 \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = 4c_1e^{-2x} + c_2e^x + 9c_3e^{3x} + 4x\,e^x + 2\,e^x + x^2e^x$$

substituting $y'' = 9$ and $x = 0$ in the above gives

$$9 = 4c_1 + c_2 + 9c_3 + 2 \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$c_1 = -1$$
$$c_2 = 2$$
$$c_3 = 1$$

Substituting these values back in above solution results in

$$y = x^2 e^x - e^{-2x} + e^{3x} + 2 e^x$$

Summary

The solution(s) found are the following

$$y = x^2 e^x - e^{-2x} + e^{3x} + 2 e^x \tag{1}$$

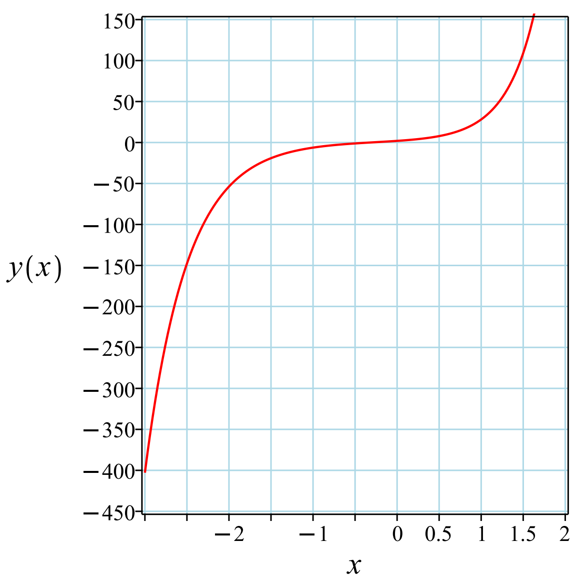

Figure 553: Solution plot

Verification of solutions

$$y = x^2 e^x - e^{-2x} + e^{3x} + 2 e^x$$

Verified OK.

19.69.1 Maple step by step solution

Let's solve

$$\left[y''' - 2y'' - 5y' + 6y = 2\,\mathrm{e}^{x}(1-6x)\,, y(0) = 2, y'\Big|_{\{x=0\}} = 7, y''\Big|_{\{x=0\}} = 9\right]$$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = -6y - 12x\,\mathrm{e}^{x} + 2y'' + 5y' + 2\,\mathrm{e}^{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - 2y'' - 5y' + 6y = -2\,\mathrm{e}^{x}(-1+6x)$

□ Convert linear ODE into a system of first order ODEs

  ○ Define new variable $y_1(x)$

    $y_1(x) = y$

  ○ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ○ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ○ Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = -12x\,\mathrm{e}^{x} + 2y_3(x) + 5y_2(x) - 6y_1(x) + 2\,\mathrm{e}^{x}$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x)\,, y_3(x) = y_2'(x)\,, y_3'(x) = -12x\,\mathrm{e}^{x} + 2y_3(x) + 5y_2(x) - 6y_1(x) + 2\,\mathrm{e}^{x}]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & 5 & 2 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ -12x\,\mathrm{e}^{x} + 2\,\mathrm{e}^{x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \left[\begin{array}{c} 0 \\ 0 \\ -12x\,\mathrm{e}^{x}+2\,\mathrm{e}^{x} \end{array}\right]$$

- Define the coefficient matrix

$$A = \left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & 5 & 2 \end{array}\right]$$

- Rewrite the system as

$$\vec{y}'(x) = A\cdot \vec{y}(x)+\vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right], \left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right], \left[3, \left[\begin{array}{c} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-2, \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_{1} = \mathrm{e}^{-2x}\cdot \left[\begin{array}{c} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_2 = e^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\begin{bmatrix} 3, \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix} \end{bmatrix}$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = e^{3x} \cdot \begin{bmatrix} \frac{1}{9} \\ \frac{1}{3} \\ 1 \end{bmatrix}$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3 + \vec{y}_p(x)$

☐ Fundamental matrix

  ◦ Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & e^{x} & \frac{e^{3x}}{9} \\ -\frac{e^{-2x}}{2} & e^{x} & \frac{e^{3x}}{3} \\ e^{-2x} & e^{x} & e^{3x} \end{bmatrix}$$

  ◦ The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

  ◦ Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} \frac{e^{-2x}}{4} & e^{x} & \frac{e^{3x}}{9} \\ -\frac{e^{-2x}}{2} & e^{x} & \frac{e^{3x}}{3} \\ e^{-2x} & e^{x} & e^{3x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} \frac{1}{4} & 1 & \frac{1}{9} \\ -\frac{1}{2} & 1 & \frac{1}{3} \\ 1 & 1 & 1 \end{bmatrix}}$$

  ◦ Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} -\frac{(e^{5x}-5e^{3x}-1)e^{-2x}}{5} & \frac{(3e^{5x}+5e^{3x}-8)e^{-2x}}{30} & \frac{(3e^{5x}-5e^{3x}+2)e^{-2x}}{30} \\ -\frac{(3e^{5x}-5e^{3x}+2)e^{-2x}}{5} & \frac{(9e^{5x}+5e^{3x}+16)e^{-2x}}{30} & \frac{(9e^{5x}-5e^{3x}-4)e^{-2x}}{30} \\ -\frac{(9e^{5x}-5e^{3x}-4)e^{-2x}}{5} & \frac{(27e^{5x}+5e^{3x}-32)e^{-2x}}{30} & \frac{(27e^{5x}-5e^{3x}+8)e^{-2x}}{30} \end{bmatrix}$$

- ☐ Find a particular solution of the system of ODEs using variation of parameters
  - Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

    $\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$
  - Take the derivative of the particular solution

    $\overrightarrow{y}'_p(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$
  - Substitute particular solution and its derivative into the system of ODEs

    $\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
  - The fundamental matrix has columns that are solutions to the homogeneous system so its der

    $A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
  - Cancel like terms

    $\Phi(x) \cdot \overrightarrow{v}'(x) = \overrightarrow{f}(x)$
  - Multiply by the inverse of the fundamental matrix

    $\overrightarrow{v}'(x) = \frac{1}{\Phi(x)} \cdot \overrightarrow{f}(x)$
  - Integrate to solve for $\overrightarrow{v}(x)$

    $\overrightarrow{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds$
  - Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

    $\overrightarrow{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\, ds\right)$
  - Plug in the fundamental matrix and the forcing function and compute

    $$\overrightarrow{y}_p(x) = \begin{bmatrix} \frac{(-3e^{5x}+15x^2e^{3x}+5e^{3x}-2)e^{-2x}}{15} \\ \frac{(15x^2+30x+5)e^{-2x}e^{3x}}{15} + \frac{(-9e^{5x}+4)e^{-2x}}{15} \\ \frac{(15x^2+60x+35)e^{-2x}e^{3x}}{15} + \frac{(-27e^{5x}-8)e^{-2x}}{15} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2 + c_3\vec{y}_3 + \left[\begin{array}{c} \frac{\left(-3\,\mathrm{e}^{5x}+15x^2\mathrm{e}^{3x}+5\,\mathrm{e}^{3x}-2\right)\mathrm{e}^{-2x}}{15} \\ \frac{\left(15x^2+30x+5\right)\mathrm{e}^{-2x}\mathrm{e}^{3x}}{15} + \frac{\left(-9\,\mathrm{e}^{5x}+4\right)\mathrm{e}^{-2x}}{15} \\ \frac{\left(15x^2+60x+35\right)\mathrm{e}^{-2x}\mathrm{e}^{3x}}{15} + \frac{\left(-27\,\mathrm{e}^{5x}-8\right)\mathrm{e}^{-2x}}{15} \end{array}\right]$$

- First component of the vector is the solution to the ODE

  $y = \frac{\left(180x^2+180c_2+60\right)\mathrm{e}^{-2x}\mathrm{e}^{3x}}{180} + \frac{\left(20c_3\mathrm{e}^{5x}+45c_1-36\,\mathrm{e}^{5x}-24\right)\mathrm{e}^{-2x}}{180}$

- Use the initial condition $y(0) = 2$

  $2 = c_2 + \frac{c_3}{9} + \frac{c_1}{4}$

- Calculate the 1st derivative of the solution

  $y' = 2x\,\mathrm{e}^{-2x}\mathrm{e}^{3x} + \frac{\left(180x^2+180c_2+60\right)\mathrm{e}^{-2x}\mathrm{e}^{3x}}{180} + \frac{\left(100c_3\mathrm{e}^{5x}-180\,\mathrm{e}^{5x}\right)\mathrm{e}^{-2x}}{180} - \frac{\left(20c_3\mathrm{e}^{5x}+45c_1-36\,\mathrm{e}^{5x}-24\right)\mathrm{e}^{-2x}}{90}$

- Use the initial condition $y'\Big|_{\{x=0\}} = 7$

  $7 = c_2 + \frac{c_3}{3} - \frac{c_1}{2}$

- Calculate the 2nd derivative of the solution

  $y'' = 2\,\mathrm{e}^{-2x}\mathrm{e}^{3x} + 4x\,\mathrm{e}^{-2x}\mathrm{e}^{3x} + \frac{\left(180x^2+180c_2+60\right)\mathrm{e}^{-2x}\mathrm{e}^{3x}}{180} + \frac{\left(500c_3\mathrm{e}^{5x}-900\,\mathrm{e}^{5x}\right)\mathrm{e}^{-2x}}{180} - \frac{\left(100c_3\mathrm{e}^{5x}-180\,\mathrm{e}^{5x}\right)\mathrm{e}^{-2x}}{45} +$

- Use the initial condition $y''\Big|_{\{x=0\}} = 9$

  $9 = c_1 + c_2 + c_3$

- Solve for the unknown coefficients

  $\left\{c_1 = -\frac{52}{15}, c_2 = \frac{5}{3}, c_3 = \frac{54}{5}\right\}$

- Solution to the IVP

  $y = \left(\mathrm{e}^{5x} + x^2\mathrm{e}^{3x} + 2\,\mathrm{e}^{3x} - 1\right)\mathrm{e}^{-2x}$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 9 Introduction to Linear Higher Order Equations. Section 9.3. Undetermined Coefficients for Higher Order Equations. Page 495
Problem number: section 9.3, problem 70.
ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' - y'' - y' + y = -e^{-x}(4 - 8x)}$$

With initial conditions

$$[y(0) = 2, y'(0) = 0, y''(0) = 0]$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' - y'' - y' + y = 0$$

The characteristic equation is

$$\lambda^3 - \lambda^2 - \lambda + 1 = 0$$

The roots of the above equation are

$$\lambda_1 = -1$$
$$\lambda_2 = 1$$
$$\lambda_3 = 1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{x} + x e^{x} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = e^{-x}$$
$$y_2 = e^{x}$$
$$y_3 = x e^{x}$$

Now the particular solution to the given ODE is found

$$y''' - y'' - y' + y = -e^{-x}(4 - 8x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-e^{-x}(4 - 8x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x e^{-x}, e^{-x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x e^{x}, e^{x}, e^{-x}\}$$

Since e^{-x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x e^{-x}, x^2 e^{-x}\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x e^{-x} + A_2 x^2 e^{-x}$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$4A_1\mathrm{e}^{-x} - 8A_2\mathrm{e}^{-x} + 8A_2x\,\mathrm{e}^{-x} = -\mathrm{e}^{-x}(4-8x)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 1, A_2 = 1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = x\,\mathrm{e}^{-x} + x^2\mathrm{e}^{-x}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1\mathrm{e}^{-x} + c_2\mathrm{e}^{x} + x\,\mathrm{e}^{x}c_3\right) + \left(x\,\mathrm{e}^{-x} + x^2\mathrm{e}^{-x}\right) \end{aligned}$$

Which simplifies to

$$y = c_1\mathrm{e}^{-x} + \mathrm{e}^{x}(c_3x + c_2) + x\,\mathrm{e}^{-x} + x^2\mathrm{e}^{-x}$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$y = c_1\mathrm{e}^{-x} + \mathrm{e}^{x}(c_3x + c_2) + x\,\mathrm{e}^{-x} + x^2\mathrm{e}^{-x} \tag{1}$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 2$ and $x = 0$ in the above gives

$$2 = c_1 + c_2 \tag{1A}$$

Taking derivative of the solution gives

$$y' = -c_1\mathrm{e}^{-x} + \mathrm{e}^{x}(c_3x + c_2) + c_3\mathrm{e}^{x} + \mathrm{e}^{-x} + x\,\mathrm{e}^{-x} - x^2\mathrm{e}^{-x}$$

substituting $y' = 0$ and $x = 0$ in the above gives

$$0 = 1 - c_1 + c_2 + c_3 \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = c_1 e^{-x} + e^{x}(c_3 x + c_2) + 2c_3 e^{x} - 3x\, e^{-x} + x^2 e^{-x}$$

substituting $y'' = 0$ and $x = 0$ in the above gives

$$0 = c_1 + c_2 + 2c_3 \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$\begin{aligned} c_1 &= 1 \\ c_2 &= 1 \\ c_3 &= -1 \end{aligned}$$

Substituting these values back in above solution results in

$$y = x^2 e^{-x} + x\, e^{-x} - x\, e^{x} + e^{-x} + e^{x}$$

Which simplifies to

$$y = (x^2 + x + 1)\, e^{-x} - (x - 1)\, e^{x}$$

Summary

The solution(s) found are the following

$$y = (x^2 + x + 1)\, e^{-x} - (x - 1)\, e^{x} \tag{1}$$

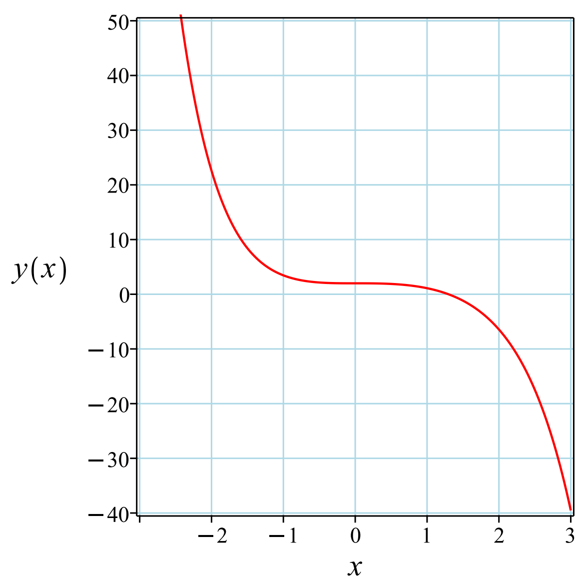

Figure 554: Solution plot

Verification of solutions

$$y = (x^2 + x + 1) e^{-x} - (x - 1) e^{x}$$

Verified OK.

19.70.1 Maple step by step solution

Let's solve

$$\left[y''' - y'' - y' + y = -e^{-x}(4 - 8x), y(0) = 2, y'\Big|_{\{x=0\}} = 0, y''\Big|_{\{x=0\}} = 0\right]$$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = -y + 8x e^{-x} - 4 e^{-x} + y'' + y'$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - y'' - y' + y = 4 e^{-x}(2x - 1)$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

    $y_1(x) = y$

  ◦ Define new variable $y_2(x)$

    $y_2(x) = y'$

  ◦ Define new variable $y_3(x)$

    $y_3(x) = y''$

  ◦ Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = 8x e^{-x} - 4 e^{-x} + y_3(x) + y_2(x) - y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 8x e^{-x} - 4 e^{-x} + y_3(x) + y_2(x) - y_1(x)]$

- Define vector

  $$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & 1 & 1 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 8x\,\mathrm{e}^{-x} - 4\,\mathrm{e}^{-x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 8x\,\mathrm{e}^{-x} - 4\,\mathrm{e}^{-x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & 1 & 1 \end{bmatrix}$$

- Rewrite the system as

$$\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_1 = \mathrm{e}^{-x} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue 1

$$\overrightarrow{y}_{2}(x) = \mathrm{e}^{x} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 1$ is the eigenvalue, an

$$\overrightarrow{y}_{3}(x) = \mathrm{e}^{\lambda x} \left(x \overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_{3}(x)$ into the homogeneous system

$$\lambda \,\mathrm{e}^{\lambda x} \left(x \overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x} \overrightarrow{v} = \left(\mathrm{e}^{\lambda x} A\right) \cdot \left(x \overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda \,\mathrm{e}^{\lambda x} \left(x \overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x} \overrightarrow{v} = \mathrm{e}^{\lambda x} \left(\lambda x \overrightarrow{v} + A \cdot \overrightarrow{p}\right)$$

- Simplify equation

$$\lambda \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_{3}(x)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \overrightarrow{p} = \overrightarrow{v}$$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue 1

$$\left(\left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & 1 & 1 \end{array}\right] - 1 \cdot \left[\begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{array}\right]\right) \cdot \overrightarrow{p} = \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- Choice of $\overrightarrow{p}$

$$\vec{p} = \begin{bmatrix} -1 \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue 1

$$\vec{y}_3(x) = e^x \cdot \left(x \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} + \begin{bmatrix} -1 \\ 0 \\ 0 \end{bmatrix} \right)$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \vec{y}_p(x)$

☐ Fundamental matrix

- ◦ Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} e^{-x} & e^x & (x-1)\,e^x \\ -e^{-x} & e^x & x\,e^x \\ e^{-x} & e^x & x\,e^x \end{bmatrix}$$

- ◦ The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- ◦ Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} e^{-x} & e^x & (x-1)\,e^x \\ -e^{-x} & e^x & x\,e^x \\ e^{-x} & e^x & x\,e^x \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 1 & 1 & -1 \\ -1 & 1 & 0 \\ 1 & 1 & 0 \end{bmatrix}}$$

- ◦ Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} -(x-1)\,e^x & -\frac{e^{-x}}{2} + \frac{e^x}{2} & \frac{e^{-x}}{2} - \frac{e^x}{2} + x\,e^x \\ -x\,e^x & \frac{e^x}{2} + \frac{e^{-x}}{2} & -\frac{e^{-x}}{2} + \frac{e^x}{2} + x\,e^x \\ -x\,e^x & -\frac{e^{-x}}{2} + \frac{e^x}{2} & \frac{e^{-x}}{2} + \frac{e^x}{2} + x\,e^x \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- ◦ Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

$\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}'_p(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$

- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

  $$\vec{y}_p(x) = \left[\begin{array}{c} (2x^2+2x+1)\,\mathrm{e}^{-x} - \mathrm{e}^{x} \\ (-2x^2+2x+1)\,\mathrm{e}^{-x} - \mathrm{e}^{x} \\ (2x^2-2x+1)\,\mathrm{e}^{-x} - \mathrm{e}^{x} \end{array}\right]$$

- Plug particular solution back into general solution

  $$\vec{y}(x) = c_1\vec{y}_1 + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + \left[\begin{array}{c} (2x^2+2x+1)\,\mathrm{e}^{-x} - \mathrm{e}^{x} \\ (-2x^2+2x+1)\,\mathrm{e}^{-x} - \mathrm{e}^{x} \\ (2x^2-2x+1)\,\mathrm{e}^{-x} - \mathrm{e}^{x} \end{array}\right]$$

- First component of the vector is the solution to the ODE

  $y = (2x^2 + c_1 + 2x + 1)\,\mathrm{e}^{-x} + \mathrm{e}^{x}(c_3 x + c_2 - c_3 - 1)$

- Use the initial condition $y(0) = 2$

  $2 = c_1 + c_2 - c_3$

- Calculate the 1st derivative of the solution

  $y' = (4x+2)\,e^{-x} - (2x^2 + c_1 + 2x + 1)\,e^{-x} + e^x(c_3 x + c_2 - c_3 - 1) + c_3 e^x$

- Use the initial condition $y'\Big|_{\{x=0\}} = 0$

  $0 = -c_1 + c_2$

- Calculate the 2nd derivative of the solution

  $y'' = 4\,e^{-x} - 2(4x+2)\,e^{-x} + (2x^2 + c_1 + 2x + 1)\,e^{-x} + e^x(c_3 x + c_2 - c_3 - 1) + 2c_3 e^x$

- Use the initial condition $y''\Big|_{\{x=0\}} = 0$

  $0 = c_1 + c_2 + c_3$

- Solve for the unknown coefficients

  $\left\{c_1 = \frac{1}{2}, c_2 = \frac{1}{2}, c_3 = -1\right\}$

- Solution to the IVP

  $y = \frac{(4x^2+4x+3)\,e^{-x}}{2} + \frac{(1-2x)\,e^x}{2}$

ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{4y''' - 3y' - y = e^{-\frac{x}{2}}(-3x + 2)}$$

With initial conditions

$$[y(0) = -1, y'(0) = 15, y''(0) = -17]$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$4y''' - 3y' - y = 0$$

The characteristic equation is

$$4\lambda^3 - 3\lambda - 1 = 0$$

The roots of the above equation are

$$
\begin{aligned}
\lambda_1 &= 1 \\
\lambda_2 &= -\frac{1}{2} \\
\lambda_3 &= -\frac{1}{2}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
y_h(x) = c_1 e^{x} + c_2 e^{-\frac{x}{2}} + c_3 x \, e^{-\frac{x}{2}}
$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= e^{x} \\
y_2 &= e^{-\frac{x}{2}} \\
y_3 &= x \, e^{-\frac{x}{2}}
\end{aligned}
$$

Now the particular solution to the given ODE is found

$$
4y''' - 3y' - y = e^{-\frac{x}{2}} (-3x + 2)
$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$
e^{-\frac{x}{2}} (-3x + 2)
$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$
[\{x \, e^{-\frac{x}{2}}, e^{-\frac{x}{2}}\}]
$$

While the set of the basis functions for the homogeneous solution found earlier is

$$
\{x \, e^{-\frac{x}{2}}, e^{x}, e^{-\frac{x}{2}}\}
$$

Since $e^{-\frac{x}{2}}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$
[\{x \, e^{-\frac{x}{2}}, e^{-\frac{x}{2}} x^2\}]
$$

Since $x \, e^{-\frac{x}{2}}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$
[\{e^{-\frac{x}{2}} x^2, e^{-\frac{x}{2}} x^3\}]
$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 e^{-\frac{x}{2}} x^2 + A_2 e^{-\frac{x}{2}} x^3$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$-12A_1 e^{-\frac{x}{2}} - 36A_2 e^{-\frac{x}{2}} x + 24A_2 e^{-\frac{x}{2}} = e^{-\frac{x}{2}}(-3x + 2)$$

Solving for the unknowns by comparing coefficients results in

$$\left[A_1 = 0, A_2 = \frac{1}{12}\right]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = \frac{e^{-\frac{x}{2}} x^3}{12}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^x + c_2 e^{-\frac{x}{2}} + c_3 x\, e^{-\frac{x}{2}}\right) + \left(\frac{e^{-\frac{x}{2}} x^3}{12}\right) \end{aligned}$$

Which simplifies to

$$y = (c_3 x + c_2)\, e^{-\frac{x}{2}} + c_1 e^x + \frac{e^{-\frac{x}{2}} x^3}{12}$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$y = (c_3 x + c_2)\, e^{-\frac{x}{2}} + c_1 e^x + \frac{e^{-\frac{x}{2}} x^3}{12} \tag{1}$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = -1$ and $x = 0$ in the above gives

$$-1 = c_1 + c_2 \tag{1A}$$

Taking derivative of the solution gives

$$y' = e^{-\frac{x}{2}} c_3 - \frac{(c_3 x + c_2) e^{-\frac{x}{2}}}{2} + c_1 e^x - \frac{e^{-\frac{x}{2}} x^3}{24} + \frac{e^{-\frac{x}{2}} x^2}{4}$$

substituting $y' = 15$ and $x = 0$ in the above gives

$$15 = c_3 - \frac{c_2}{2} + c_1 \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = -e^{-\frac{x}{2}} c_3 + \frac{(c_3 x + c_2) e^{-\frac{x}{2}}}{4} + c_1 e^x + \frac{e^{-\frac{x}{2}} x^3}{48} - \frac{e^{-\frac{x}{2}} x^2}{4} + \frac{x e^{-\frac{x}{2}}}{2}$$

substituting $y'' = -17$ and $x = 0$ in the above gives

$$-17 = -c_3 + \frac{c_2}{4} + c_1 \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$\begin{aligned} c_1 &= -1 \\ c_2 &= 0 \\ c_3 &= 16 \end{aligned}$$

Substituting these values back in above solution results in

$$y = 16x e^{-\frac{x}{2}} - e^x + \frac{e^{-\frac{x}{2}} x^3}{12}$$

Which simplifies to

$$y = \frac{(x^3 + 192x) e^{-\frac{x}{2}}}{12} - e^x$$

Summary

The solution(s) found are the following

$$y = \frac{(x^3 + 192x) e^{-\frac{x}{2}}}{12} - e^x \tag{1}$$

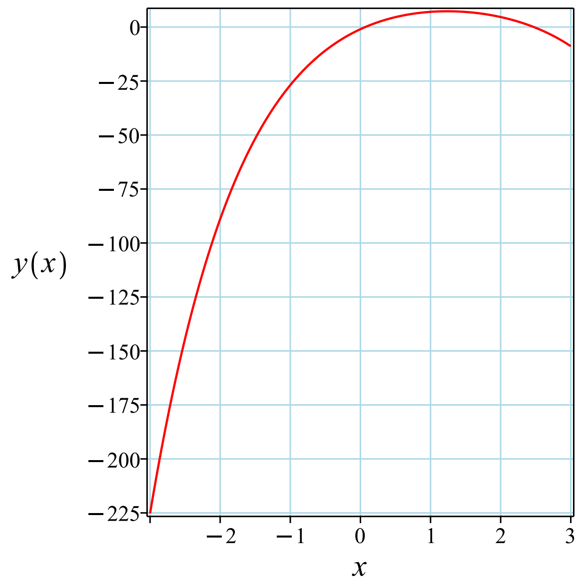

Figure 555: Solution plot

Verification of solutions

$$y = \frac{(x^3 + 192x)\,e^{-\frac{x}{2}}}{12} - e^x$$

Verified OK.

19.71.1 Maple step by step solution

Let's solve

$$\left[4y''' - 3y' - y = e^{-\frac{x}{2}}(-3x+2)\,, y(0) = -1, y'\Big|_{\{x=0\}} = 15, y''\Big|_{\{x=0\}} = -17\right]$$

- Highest derivative means the order of the ODE is 3

  y'''

- Isolate 3rd derivative

  $y''' = \frac{y}{4} + \frac{3y'}{4} - \frac{3x\,e^{-\frac{x}{2}}}{4} + \frac{e^{-\frac{x}{2}}}{2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''' - \frac{3y'}{4} - \frac{y}{4} = -\frac{e^{-\frac{x}{2}}(3x-2)}{4}$

□ Convert linear ODE into a system of first order ODEs

  ◦ Define new variable $y_1(x)$

$y_1(x) = y$

- Define new variable $y_2(x)$

  $y_2(x) = y'$

- Define new variable $y_3(x)$

  $y_3(x) = y''$

- Isolate for $y_3'(x)$ using original ODE

  $y_3'(x) = -\frac{3x\,\mathrm{e}^{-\frac{x}{2}}}{4} + \frac{\mathrm{e}^{-\frac{x}{2}}}{2} + \frac{3y_2(x)}{4} + \frac{y_1(x)}{4}$

  Convert linear ODE into a system of first order ODEs

  $\left[y_2(x) = y_1'(x)\,, y_3(x) = y_2'(x)\,, y_3'(x) = -\frac{3x\,\mathrm{e}^{-\frac{x}{2}}}{4} + \frac{\mathrm{e}^{-\frac{x}{2}}}{2} + \frac{3y_2(x)}{4} + \frac{y_1(x)}{4}\right]$

- Define vector

  $$\vec{y}(x) = \left[\begin{array}{c} y_1(x) \\ y_2(x) \\ y_3(x) \end{array}\right]$$

- System to solve

  $$\vec{y}'(x) = \left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{1}{4} & \frac{3}{4} & 0 \end{array}\right] \cdot \vec{y}(x) + \left[\begin{array}{c} 0 \\ 0 \\ -\frac{3x\,\mathrm{e}^{-\frac{x}{2}}}{4} + \frac{\mathrm{e}^{-\frac{x}{2}}}{2} \end{array}\right]$$

- Define the forcing function

  $$\vec{f}(x) = \left[\begin{array}{c} 0 \\ 0 \\ -\frac{3x\,\mathrm{e}^{-\frac{x}{2}}}{4} + \frac{\mathrm{e}^{-\frac{x}{2}}}{2} \end{array}\right]$$

- Define the coefficient matrix

  $$A = \left[\begin{array}{ccc} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{1}{4} & \frac{3}{4} & 0 \end{array}\right]$$

- Rewrite the system as

  $\vec{y}'(x) = A \cdot \vec{y}(x) + \vec{f}$

- To solve the system, find the eigenvalues and eigenvectors of A

- Eigenpairs of A

$$\left[\left[-\frac{1}{2}, \left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]\right], \left[-\frac{1}{2}, \left[\begin{array}{c} 0 \\ 0 \\ 0 \end{array}\right]\right], \left[1, \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[-\frac{1}{2}, \left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue $-\frac{1}{2}$

$$\overrightarrow{y}_1(x) = \mathrm{e}^{-\frac{x}{2}} \cdot \left[\begin{array}{c} 4 \\ -2 \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = -\frac{1}{2}$ is the eigenvalue, a

$$\overrightarrow{y}_2(x) = \mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the x multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\overrightarrow{y}_2(x)$ into the homogeneous system

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \left(\mathrm{e}^{\lambda x} A\right) \cdot \left(x\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda x}\overrightarrow{v} = \mathrm{e}^{\lambda x}\left(\lambda x\overrightarrow{v} + A \cdot \overrightarrow{p}\right)$$

- Simplify equation

$$\lambda\overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_2(x)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \overrightarrow{p} = \overrightarrow{v}$$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue $-\frac{1}{2}$

$$\left(\begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ \frac{1}{4} & \frac{3}{4} & 0 \end{bmatrix} - -\frac{1}{2} \cdot \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \cdot \vec{p} = \begin{bmatrix} 4 \\ -2 \\ 1 \end{bmatrix}$$

- Choice of $\vec{p}$

$$\vec{p} = \begin{bmatrix} 8 \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue $-\frac{1}{2}$

$$\vec{y}_2(x) = \mathrm{e}^{-\frac{x}{2}} \cdot \left(x \cdot \begin{bmatrix} 4 \\ -2 \\ 1 \end{bmatrix} + \begin{bmatrix} 8 \\ 0 \\ 0 \end{bmatrix}\right)$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = \mathrm{e}^{x} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$$\vec{y}(x) = c_1\vec{y}_1(x) + c_2\vec{y}_2(x) + c_3\vec{y}_3 + \vec{y}_p(x)$$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} 4\,\mathrm{e}^{-\frac{x}{2}} & \mathrm{e}^{-\frac{x}{2}}(8+4x) & \mathrm{e}^{x} \\ -2\,\mathrm{e}^{-\frac{x}{2}} & -2x\,\mathrm{e}^{-\frac{x}{2}} & \mathrm{e}^{x} \\ \mathrm{e}^{-\frac{x}{2}} & x\,\mathrm{e}^{-\frac{x}{2}} & \mathrm{e}^{x} \end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} 4\,\mathrm{e}^{-\frac{x}{2}} & \mathrm{e}^{-\frac{x}{2}}(8+4x) & \mathrm{e}^{x} \\ -2\,\mathrm{e}^{-\frac{x}{2}} & -2x\,\mathrm{e}^{-\frac{x}{2}} & \mathrm{e}^{x} \\ \mathrm{e}^{-\frac{x}{2}} & x\,\mathrm{e}^{-\frac{x}{2}} & \mathrm{e}^{x} \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} 4 & 8 & 1 \\ -2 & 0 & 1 \\ 1 & 0 & 1 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{\mathrm{e}^{-\frac{x}{2}}(2+x)}{2} & \frac{\mathrm{e}^{-\frac{x}{2}}(3x-2)}{6} + \frac{\mathrm{e}^{x}}{3} & -\frac{2\,\mathrm{e}^{-\frac{x}{2}}}{3} - x\,\mathrm{e}^{-\frac{x}{2}} + \frac{2\,\mathrm{e}^{x}}{3} \\ -\frac{x\,\mathrm{e}^{-\frac{x}{2}}}{4} & \frac{(-3x+8)\mathrm{e}^{-\frac{x}{2}}}{12} + \frac{\mathrm{e}^{x}}{3} & \frac{(3x-4)\mathrm{e}^{-\frac{x}{2}}}{6} + \frac{2\,\mathrm{e}^{x}}{3} \\ \frac{x\,\mathrm{e}^{-\frac{x}{2}}}{8} & \frac{(3x-8)\mathrm{e}^{-\frac{x}{2}}}{24} + \frac{\mathrm{e}^{x}}{3} & \frac{(4-3x)\mathrm{e}^{-\frac{x}{2}}}{12} + \frac{2\,\mathrm{e}^{x}}{3} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\overrightarrow{v}(x)$ and solve for $\overrightarrow{v}(x)$

  $\overrightarrow{y}_p(x) = \Phi(x) \cdot \overrightarrow{v}(x)$
- Take the derivative of the particular solution

  $\overrightarrow{y}_p'(x) = \Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x)$
- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \Phi(x) \cdot \overrightarrow{v}'(x) = A \cdot \Phi(x) \cdot \overrightarrow{v}(x) + \overrightarrow{f}(x)$
- Cancel like terms

  $\Phi(x) \cdot \overrightarrow{v}'(x) = \overrightarrow{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\overrightarrow{v}'(x) = \frac{1}{\Phi(x)} \cdot \overrightarrow{f}(x)$
- Integrate to solve for $\overrightarrow{v}(x)$

  $\overrightarrow{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\,ds$
- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

  $\overrightarrow{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \overrightarrow{f}(s)\,ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \begin{bmatrix} \frac{e^{-\frac{x}{2}} x^3}{8} \\ -\frac{e^{-\frac{x}{2}} x^2 (x-6)}{16} \\ \frac{e^{-\frac{x}{2}} x(x^2-6x+16)}{32} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1 \vec{y}_1(x) + c_2 \vec{y}_2(x) + c_3 \vec{y}_3 + \begin{bmatrix} \frac{e^{-\frac{x}{2}} x^3}{8} \\ -\frac{e^{-\frac{x}{2}} x^2 (x-6)}{16} \\ \frac{e^{-\frac{x}{2}} x(x^2-6x+16)}{32} \end{bmatrix}$$

- First component of the vector is the solution to the ODE

$$y = \frac{(32(2+x)c_2 + x^3 + 32c_1) e^{-\frac{x}{2}}}{8} + c_3 e^x$$

- Use the initial condition $y(0) = -1$

$$-1 = 8c_2 + 4c_1 + c_3$$

- Calculate the 1st derivative of the solution

$$y' = \frac{(3x^2 + 32c_2) e^{-\frac{x}{2}}}{8} - \frac{(32(2+x)c_2 + x^3 + 32c_1) e^{-\frac{x}{2}}}{16} + c_3 e^x$$

- Use the initial condition $y'\Big|_{\{x=0\}} = 15$

$$15 = -2c_1 + c_3$$

- Calculate the 2nd derivative of the solution

$$y'' = \frac{3x e^{-\frac{x}{2}}}{4} - \frac{(3x^2 + 32c_2) e^{-\frac{x}{2}}}{8} + \frac{(32(2+x)c_2 + x^3 + 32c_1) e^{-\frac{x}{2}}}{32} + c_3 e^x$$

- Use the initial condition $y''\Big|_{\{x=0\}} = -17$

$$-17 = -2c_2 + c_1 + c_3$$

- Solve for the unknown coefficients

$$\{c_1 = -8, c_2 = 4, c_3 = -1\}$$

- Solution to the IVP

$$y = \frac{(x^3 + 128x) e^{-\frac{x}{2}}}{8} - e^x$$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' + 2y''' + 2y'' + 2y' + y = \mathrm{e}^{-x}(20 - 12x)}$$

With initial conditions

$$[y(0) = 3, y'(0) = -4, y''(0) = 7, y'''(0) = -22]$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' + 2y''' + 2y'' + 2y' + y = 0$$

The characteristic equation is

$$\lambda^4 + 2\lambda^3 + 2\lambda^2 + 2\lambda + 1 = 0$$

The roots of the above equation are

$$\lambda_1 = i$$
$$\lambda_2 = -i$$
$$\lambda_3 = -1$$
$$\lambda_4 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-x} + x\,\mathrm{e}^{-x} c_2 + \mathrm{e}^{-ix} c_3 + \mathrm{e}^{ix} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \mathrm{e}^{-x}$$
$$y_2 = x\,\mathrm{e}^{-x}$$
$$y_3 = \mathrm{e}^{-ix}$$
$$y_4 = \mathrm{e}^{ix}$$

Now the particular solution to the given ODE is found

$$y'''' + 2y''' + 2y'' + 2y' + y = \mathrm{e}^{-x}(20 - 12x)$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$\mathrm{e}^{-x}(20 - 12x)$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{x\,\mathrm{e}^{-x}, \mathrm{e}^{-x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\{x\,\mathrm{e}^{-x}, \mathrm{e}^{ix}, \mathrm{e}^{-x}, \mathrm{e}^{-ix}\}$$

Since e^{-x} is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x\,\mathrm{e}^{-x}, x^2\mathrm{e}^{-x}\}]$$

Since $x\,\mathrm{e}^{-x}$ is duplicated in the UC_set, then this basis is multiplied by extra x. The UC_set becomes

$$[\{x^2\mathrm{e}^{-x}, \mathrm{e}^{-x}x^3\}]$$

Since there was duplication between the basis functions in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis function in the above updated UC_set.

$$y_p = A_1 x^2 e^{-x} + A_2 e^{-x} x^3$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$12A_2 e^{-x} x - 12A_2 e^{-x} + 4A_1 e^{-x} = e^{-x}(20 - 12x)$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = 2, A_2 = -1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = 2x^2 e^{-x} - e^{-x} x^3$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 e^{-x} + x\, e^{-x} c_2 + e^{-ix} c_3 + e^{ix} c_4\right) + \left(2x^2 e^{-x} - e^{-x} x^3\right) \end{aligned}$$

Which simplifies to

$$y = e^{-ix} c_3 + e^{ix} c_4 + (c_2 x + c_1)\, e^{-x} + 2x^2 e^{-x} - e^{-x} x^3$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$y = e^{-ix} c_3 + e^{ix} c_4 + (c_2 x + c_1)\, e^{-x} + 2x^2 e^{-x} - e^{-x} x^3 \tag{1}$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 3$ and $x = 0$ in the above gives

$$3 = c_3 + c_4 + c_1 \tag{1A}$$

Taking derivative of the solution gives

$$y' = -i e^{-ix} c_3 + i e^{ix} c_4 + c_2 e^{-x} - (c_2 x + c_1) e^{-x} + 4x e^{-x} - 5x^2 e^{-x} + e^{-x} x^3$$

substituting $y' = -4$ and $x = 0$ in the above gives

$$-4 = -c_3 i + c_4 i - c_1 + c_2 \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = -e^{-ix} c_3 - e^{ix} c_4 - 2c_2 e^{-x} + (c_2 x + c_1) e^{-x} + 4 e^{-x} - 14x e^{-x} + 8x^2 e^{-x} - e^{-x} x^3$$

substituting $y'' = 7$ and $x = 0$ in the above gives

$$7 = -c_3 - c_4 - 2c_2 + c_1 + 4 \tag{3A}$$

Taking three derivatives of the solution gives

$$y''' = i e^{-ix} c_3 - i e^{ix} c_4 + 3c_2 e^{-x} - (c_2 x + c_1) e^{-x} - 18 e^{-x} + 30x e^{-x} - 11x^2 e^{-x} + e^{-x} x^3$$

substituting $y''' = -22$ and $x = 0$ in the above gives

$$-22 = c_3 i - c_4 i - c_1 + 3c_2 - 18 \tag{4A}$$

Equations {1A,2A,3A,4A} are now solved for $\{c_1, c_2, c_3, c_4\}$. Solving for the constants gives

$$\begin{aligned} c_1 &= 2 \\ c_2 &= -1 \\ c_3 &= \frac{1}{2} - \frac{i}{2} \\ c_4 &= \frac{1}{2} + \frac{i}{2} \end{aligned}$$

Substituting these values back in above solution results in

$$y = -e^{-x} x^3 + 2x^2 e^{-x} - x e^{-x} + 2 e^{-x} + \cos(x) - \sin(x)$$

Which simplifies to

$$y = (-x^3 + 2x^2 - x + 2) e^{-x} + \cos(x) - \sin(x)$$

Summary

The solution(s) found are the following

$$y = (-x^3 + 2x^2 - x + 2) e^{-x} + \cos(x) - \sin(x) \tag{1}$$

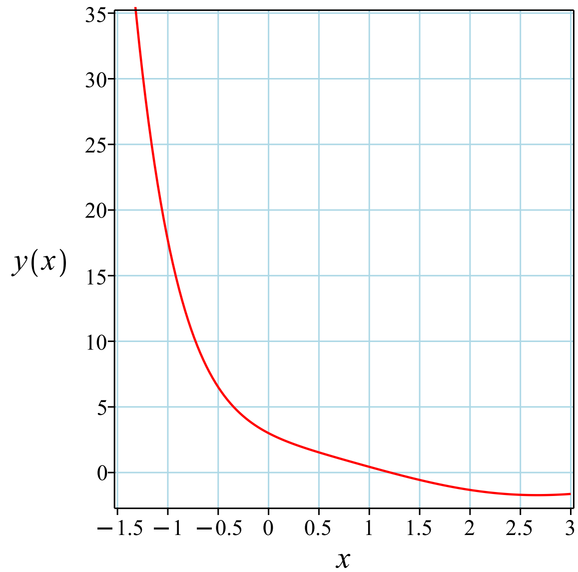

Figure 556: Solution plot

Verification of solutions

$$y = \left(-x^3 + 2x^2 - x + 2\right) e^{-x} + \cos(x) - \sin(x)$$

Verified OK.

19.72.1 Maple step by step solution

Let's solve

$$\left[y'''' + 2y''' + 2y'' + 2y' + y = e^{-x}(20 - 12x), y(0) = 3, y'\Big|_{\{x=0\}} = -4, y''\Big|_{\{x=0\}} = 7, y'''\Big|_{\{x=0\}} = \right.$$

- Highest derivative means the order of the ODE is 4

  y''''

- Isolate 4th derivative

  $y'''' = -y - 12x e^{-x} + 20 e^{-x} - 2y''' - 2y'' - 2y'$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \\ y_4(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -1 & -2 & -2 & -2 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 0 \\ -12x\,\mathrm{e}^{-x} + 20\,\mathrm{e}^{-x} \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 0 \\ -12x\,\mathrm{e}^{-x} + 20\,\mathrm{e}^{-x} \end{bmatrix}$$

- Define the coefficient matrix

$$A = \left[\begin{array}{cccc} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ -1 & -2 & -2 & -2 \end{array}\right]$$

- Rewrite the system as

$$\vec{y}'(x) = A\cdot \vec{y}(x)+\vec{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]\right], \left[-1, \left[\begin{array}{c} 0 \\ 0 \\ 0 \\ 0 \end{array}\right]\right], \left[-\mathrm{I}, \left[\begin{array}{c} -\mathrm{I} \\ -1 \\ \mathrm{I} \\ 1 \end{array}\right]\right], \left[\mathrm{I}, \left[\begin{array}{c} \mathrm{I} \\ -1 \\ -\mathrm{I} \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[-1, \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue -1

$$\vec{y}_1(x) = \mathrm{e}^{-x}\cdot \left[\begin{array}{c} -1 \\ 1 \\ -1 \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = -1$ is the eigenvalue, a

$$\vec{y}_2(x) = \mathrm{e}^{\lambda x}\left(x\vec{v}+\vec{p}\right)$$

- Note that the x multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obt
- Substitute $\vec{y}_2(x)$ into the homogeneous system

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\vec{v}+\vec{p}\right)+\mathrm{e}^{\lambda x}\vec{v} = \left(\mathrm{e}^{\lambda x}A\right)\cdot\left(x\vec{v}+\vec{p}\right)$$

- Use the fact that $\vec{v}$ is an eigenvector of A

$$\lambda\,\mathrm{e}^{\lambda x}\left(x\vec{v}+\vec{p}\right)+\mathrm{e}^{\lambda x}\vec{v}=\mathrm{e}^{\lambda x}\left(\lambda x\vec{v}+A\cdot\vec{p}\right)$$

- Simplify equation

$$\lambda\vec{p}+\vec{v}=A\cdot\vec{p}$$

- Make use of the identity matrix I

$$(\lambda\cdot I)\cdot\vec{p}+\vec{v}=A\cdot\vec{p}$$

- Condition $\vec{p}$ must meet for $\vec{y}_2(x)$ to be a solution to the homogeneous system

$$(A-\lambda\cdot I)\cdot\vec{p}=\vec{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue -1

$$\left(\left[\begin{array}{cccc}0 & 1 & 0 & 0\\ 0 & 0 & 1 & 0\\ 0 & 0 & 0 & 1\\ -1 & -2 & -2 & -2\end{array}\right]-(-1)\cdot\left[\begin{array}{cccc}1 & 0 & 0 & 0\\ 0 & 1 & 0 & 0\\ 0 & 0 & 1 & 0\\ 0 & 0 & 0 & 1\end{array}\right]\right)\cdot\vec{p}=\left[\begin{array}{c}-1\\ 1\\ -1\\ 1\end{array}\right]$$

- Choice of $\vec{p}$

$$\vec{p}=\left[\begin{array}{c}-1\\ 0\\ 0\\ 0\end{array}\right]$$

- Second solution from eigenvalue -1

$$\vec{y}_2(x)=\mathrm{e}^{-x}\cdot\left(x\cdot\left[\begin{array}{c}-1\\ 1\\ -1\\ 1\end{array}\right]+\left[\begin{array}{c}-1\\ 0\\ 0\\ 0\end{array}\right]\right)$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-\mathrm{I},\left[\begin{array}{c}-\mathrm{I}\\ -1\\ \mathrm{I}\\ 1\end{array}\right]\right]$$

- Solution from eigenpair

$$e^{-Ix} \cdot \begin{bmatrix} -I \\ -1 \\ I \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of sin and cos

$$(-I\sin(x) + \cos(x)) \cdot \begin{bmatrix} -I \\ -1 \\ I \\ 1 \end{bmatrix}$$

- Simplify expression

$$\begin{bmatrix} -I(-I\sin(x) + \cos(x)) \\ I\sin(x) - \cos(x) \\ I(-I\sin(x) + \cos(x)) \\ -I\sin(x) + \cos(x) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_3(x) = \begin{bmatrix} -\sin(x) \\ -\cos(x) \\ \sin(x) \\ \cos(x) \end{bmatrix}, \vec{y}_4(x) = \begin{bmatrix} -\cos(x) \\ \sin(x) \\ \cos(x) \\ -\sin(x) \end{bmatrix}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x) = c_1\vec{y}_1(x) + c_2\vec{y}_2(x) + c_3\vec{y}_3(x) + c_4\vec{y}_4(x) + \vec{y}_p(x)$

☐ Fundamental matrix

- ○ Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x) = \begin{bmatrix} -e^{-x} & e^{-x}(-x-1) & -\sin(x) & -\cos(x) \\ e^{-x} & x\,e^{-x} & -\cos(x) & \sin(x) \\ -e^{-x} & -x\,e^{-x} & \sin(x) & \cos(x) \\ e^{-x} & x\,e^{-x} & \cos(x) & -\sin(x) \end{bmatrix}$$

- ○ The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0) = I$ where I is t

$\Phi(x) = \phi(x) \cdot \frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x) = \begin{bmatrix} -e^{-x} & e^{-x}(-x-1) & -\sin(x) & -\cos(x) \\ e^{-x} & x\,e^{-x} & -\cos(x) & \sin(x) \\ -e^{-x} & -x\,e^{-x} & \sin(x) & \cos(x) \\ e^{-x} & x\,e^{-x} & \cos(x) & -\sin(x) \end{bmatrix} \cdot \frac{1}{\begin{bmatrix} -1 & -1 & 0 & -1 \\ 1 & 0 & -1 & 0 \\ -1 & 0 & 0 & 1 \\ 1 & 0 & 1 & 0 \end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} (x+1)\,e^{-x} & x\,e^{-x} - \frac{\cos(x)}{2} + \frac{\sin(x)}{2} + \frac{e^{-x}}{2} & x\,e^{-x} - \cos(x) + e^{-x} & x\,e^{-x} - \frac{\cos(x)}{2} - \frac{\sin \\ -x\,e^{-x} & \frac{e^{-x}}{2} - x\,e^{-x} + \frac{\cos(x)}{2} + \frac{\sin(x)}{2} & -x\,e^{-x} + \sin(x) & \frac{e^{-x}}{2} - x\,e^{-x} - \frac{\cos(\\ x\,e^{-x} & -\frac{e^{-x}}{2} + x\,e^{-x} - \frac{\sin(x)}{2} + \frac{\cos(x)}{2} & x\,e^{-x} + \cos(x) & -\frac{e^{-x}}{2} + x\,e^{-x} + \frac{\sin(\\ -x\,e^{-x} & \frac{e^{-x}}{2} - x\,e^{-x} - \frac{\cos(x)}{2} - \frac{\sin(x)}{2} & -x\,e^{-x} - \sin(x) & \frac{e^{-x}}{2} - x\,e^{-x} + \frac{\cos(\end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$

- Take the derivative of the particular solution

  $\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$

- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$

- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$

- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$

- Integrate to solve for $\vec{v}(x)$

$\overrightarrow{v}(x)=\int_0^x \frac{1}{\Phi(s)}\cdot \overrightarrow{f}(s)\,ds$

- Plug $\overrightarrow{v}(x)$ into the equation for the particular solution

  $\overrightarrow{y}_p(x)=\Phi(x)\cdot\left(\int_0^x \frac{1}{\Phi(s)}\cdot \overrightarrow{f}(s)\,ds\right)$

- Plug in the fundamental matrix and the forcing function and compute

  $$\overrightarrow{y}_p(x)=\left[\begin{array}{c}\left(-2x^3+7x^2+10x+3\right)\mathrm{e}^{-x}-3\cos(x)-7\sin(x)\\ \left(2x^3-13x^2+4x+7\right)\mathrm{e}^{-x}-7\cos(x)+3\sin(x)\\ \left(-2x^3+13x^2-10x-3\right)\mathrm{e}^{-x}+3\cos(x)+7\sin(x)\\ \left(2x^3-13x^2+16x-7\right)\mathrm{e}^{-x}+7\cos(x)-3\sin(x)\end{array}\right]$$

- Plug particular solution back into general solution

  $$\overrightarrow{y}(x)=c_1\overrightarrow{y}_1(x)+c_2\overrightarrow{y}_2(x)+c_3\overrightarrow{y}_3(x)+c_4\overrightarrow{y}_4(x)+\left[\begin{array}{c}\left(-2x^3+7x^2+10x+3\right)\mathrm{e}^{-x}-3\cos(x)-\\ \left(2x^3-13x^2+4x+7\right)\mathrm{e}^{-x}-7\cos(x)+3\\ \left(-2x^3+13x^2-10x-3\right)\mathrm{e}^{-x}+3\cos(x)+\\ \left(2x^3-13x^2+16x-7\right)\mathrm{e}^{-x}+7\cos(x)-\end{array}\right.$$

- First component of the vector is the solution to the ODE

  $y=\left(-2x^3+7x^2+\left(-c_2+10\right)x-c_1-c_2+3\right)\mathrm{e}^{-x}+\left(-c_4-3\right)\cos(x)-\sin(x)\left(c_3+7\right)$

- Use the initial condition $y(0)=3$

  $3=-c_1-c_2-c_4$

- Calculate the 1st derivative of the solution

  $y'=\left(-6x^2-c_2+14x+10\right)\mathrm{e}^{-x}-\left(-2x^3+7x^2+\left(-c_2+10\right)x-c_1-c_2+3\right)\mathrm{e}^{-x}-\left(-c_4-3\right)\mathrm{s}$

- Use the initial condition $y'\Big|_{\{x=0\}}=-4$

  $-4=c_1-c_3$

- Calculate the 2nd derivative of the solution

  $y''=\left(-12x+14\right)\mathrm{e}^{-x}-2\left(-6x^2-c_2+14x+10\right)\mathrm{e}^{-x}+\left(-2x^3+7x^2+\left(-c_2+10\right)x-c_1-c_2+\right.$

- Use the initial condition $y''\Big|_{\{x=0\}}=7$

  $7=c_2-c_1+c_4$

- Calculate the 3rd derivative of the solution

  $y'''=-12\,\mathrm{e}^{-x}-3\left(-12x+14\right)\mathrm{e}^{-x}+3\left(-6x^2-c_2+14x+10\right)\mathrm{e}^{-x}-\left(-2x^3+7x^2+\left(-c_2+10\right)\right.$

- Use the initial condition $y'''\Big|_{\{x=0\}} = -22$

  $-22 = -20 - 2c_2 + c_1 + c_3$
- Solve for the unknown coefficients

  $\{c_1 = -5, c_2 = -2, c_3 = -1, c_4 = 4\}$
- Solution to the IVP

  $y = (-2x^3 + 7x^2 + 12x + 10)\,\mathrm{e}^{-x} - 7\cos(x) - 6\sin(x)$

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' + 2y'' + y' + 2y = 30\cos(x) - 10\sin(x)}$$

With initial conditions

$$[y(0) = 3, y'(0) = -4, y''(0) = 16]$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' + 2y'' + y' + 2y = 0$$

The characteristic equation is

$$\lambda^3 + 2\lambda^2 + \lambda + 2 = 0$$

The roots of the above equation are

$$\lambda_1 = -2$$
$$\lambda_2 = i$$
$$\lambda_3 = -i$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 \mathrm{e}^{-2x} + c_2 \mathrm{e}^{-ix} + \mathrm{e}^{ix} c_3$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \mathrm{e}^{-2x}$$
$$y_2 = \mathrm{e}^{-ix}$$
$$y_3 = \mathrm{e}^{ix}$$

Now the particular solution to the given ODE is found

$$y''' + 2y'' + y' + 2y = 30\cos(x) - 10\sin(x)$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} e^{-2x} & e^{-ix} & e^{ix} \\ -2\,e^{-2x} & -ie^{-ix} & ie^{ix} \\ 4\,e^{-2x} & -e^{-ix} & -e^{ix} \end{bmatrix}$$
$$|W| = 10ie^{-2x}e^{-ix}e^{ix}$$

The determinant simplifies to

$$|W| = 10ie^{-2x}$$

Now we determine W_i for each U_i.

$$W_1(x) = \det \begin{bmatrix} e^{-ix} & e^{ix} \\ -ie^{-ix} & ie^{ix} \end{bmatrix}$$
$$= 2i$$

$$W_2(x) = \det \begin{bmatrix} e^{-2x} & e^{ix} \\ -2\,e^{-2x} & ie^{ix} \end{bmatrix}$$
$$= (2+i)\,e^{(-2+i)x}$$

$$W_3(x) = \det \begin{bmatrix} e^{-2x} & e^{-ix} \\ -2\,e^{-2x} & -ie^{-ix} \end{bmatrix}$$
$$= (2-i)\,e^{(-2-i)x}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{3-1} \int \frac{F(x)W_1(x)}{aW(x)}\,dx \\ &= (-1)^2 \int \frac{(30\cos(x) - 10\sin(x))\,(2i)}{(1)\,(10ie^{-2x})}\,dx \\ &= \int \frac{2i(30\cos(x) - 10\sin(x))}{10ie^{-2x}}\,dx \\ &= \int \left((6\cos(x) - 2\sin(x))\,e^{2x}\right)\,dx \\ &= \frac{14\,e^{2x}\cos(x)}{5} + \frac{2\,e^{2x}\sin(x)}{5} \\ &= \frac{14\,e^{2x}\cos(x)}{5} + \frac{2\,e^{2x}\sin(x)}{5} \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{3-2}\int \frac{F(x)W_2(x)}{aW(x)}\,dx\\
&= (-1)^{1}\int \frac{\left(30\cos\left(x\right)-10\sin\left(x\right)\right)\left(\left(2+i\right){\mathrm e}^{\left(-2+i\right)x}\right)}{\left(1\right)\left(10i{\mathrm e}^{-2x}\right)}\,dx\\
&= -\int \frac{\left(2+i\right)\left(30\cos\left(x\right)-10\sin\left(x\right)\right){\mathrm e}^{\left(-2+i\right)x}}{10i{\mathrm e}^{-2x}}\,dx\\
&= -\int \left(\left(-1+2i\right)\left(-3\cos\left(x\right)+\sin\left(x\right)\right){\mathrm e}^{ix}\right)\,dx\\
&= -\frac{\left(\frac{1}{2}-\frac{7i}{2}\right)x\,{\mathrm e}^{ix}+\left(5-5i\right){\mathrm e}^{ix}\tan\left(\frac{x}{2}\right)+\left(-7-i\right)x\,{\mathrm e}^{ix}\tan\left(\frac{x}{2}\right)+\left(-\frac{1}{2}+\frac{7i}{2}\right)x\,{\mathrm e}^{ix}\tan\left(\frac{x}{2}\right)^{2}}{1+\tan\left(\frac{x}{2}\right)^{2}}\\
&= -\frac{\left(\frac{1}{2}-\frac{7i}{2}\right)x\,{\mathrm e}^{ix}+\left(5-5i\right){\mathrm e}^{ix}\tan\left(\frac{x}{2}\right)+\left(-7-i\right)x\,{\mathrm e}^{ix}\tan\left(\frac{x}{2}\right)+\left(-\frac{1}{2}+\frac{7i}{2}\right)x\,{\mathrm e}^{ix}\tan\left(\frac{x}{2}\right)^{2}}{1+\tan\left(\frac{x}{2}\right)^{2}}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3}\int \frac{F(x)W_3(x)}{aW(x)}\,dx\\
&= (-1)^{0}\int \frac{\left(30\cos\left(x\right)-10\sin\left(x\right)\right)\left(\left(2-i\right){\mathrm e}^{\left(-2-i\right)x}\right)}{\left(1\right)\left(10i{\mathrm e}^{-2x}\right)}\,dx\\
&= \int \frac{\left(2-i\right)\left(30\cos\left(x\right)-10\sin\left(x\right)\right){\mathrm e}^{\left(-2-i\right)x}}{10i{\mathrm e}^{-2x}}\,dx\\
&= \int \left(\left(1+2i\right)\left(-3\cos\left(x\right)+\sin\left(x\right)\right){\mathrm e}^{-ix}\right)\,dx\\
&= \frac{\left(-\frac{1}{2}-\frac{7i}{2}\right)x\,{\mathrm e}^{-ix}+\left(-5-5i\right){\mathrm e}^{-ix}\tan\left(\frac{x}{2}\right)+\left(7-i\right)x\,{\mathrm e}^{-ix}\tan\left(\frac{x}{2}\right)+\left(\frac{1}{2}+\frac{7i}{2}\right)x\,{\mathrm e}^{-ix}\tan\left(\frac{x}{2}\right)^{2}}{1+\tan\left(\frac{x}{2}\right)^{2}}\\
&= \frac{\left(-\frac{1}{2}-\frac{7i}{2}\right)x\,{\mathrm e}^{-ix}+\left(-5-5i\right){\mathrm e}^{-ix}\tan\left(\frac{x}{2}\right)+\left(7-i\right)x\,{\mathrm e}^{-ix}\tan\left(\frac{x}{2}\right)+\left(\frac{1}{2}+\frac{7i}{2}\right)x\,{\mathrm e}^{-ix}\tan\left(\frac{x}{2}\right)^{2}}{1+\tan\left(\frac{x}{2}\right)^{2}}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1y_1+U_2y_2+U_3y_3
$$

Hence

$$
\begin{aligned}
y_p &= \left(\frac{14\,{\mathrm e}^{2x}\cos\left(x\right)}{5}+\frac{2\,{\mathrm e}^{2x}\sin\left(x\right)}{5}\right)\left({\mathrm e}^{-2x}\right)\\
&\quad+\left(-\frac{\left(\frac{1}{2}-\frac{7i}{2}\right)x\,{\mathrm e}^{ix}+\left(5-5i\right){\mathrm e}^{ix}\tan\left(\frac{x}{2}\right)+\left(-7-i\right)x\,{\mathrm e}^{ix}\tan\left(\frac{x}{2}\right)+\left(-\frac{1}{2}+\frac{7i}{2}\right)x\,{\mathrm e}^{ix}\tan\left(\frac{x}{2}\right)^{2}}{1+\tan\left(\frac{x}{2}\right)^{2}}\right)\left({\mathrm e}^{-ix}\right)\\
&\quad+\left(\frac{\left(-\frac{1}{2}-\frac{7i}{2}\right)x\,{\mathrm e}^{-ix}+\left(-5-5i\right){\mathrm e}^{-ix}\tan\left(\frac{x}{2}\right)+\left(7-i\right)x\,{\mathrm e}^{-ix}\tan\left(\frac{x}{2}\right)+\left(\frac{1}{2}+\frac{7i}{2}\right)x\,{\mathrm e}^{-ix}\tan\left(\frac{x}{2}\right)^{2}}{1+\tan\left(\frac{x}{2}\right)^{2}}\right)\left({\mathrm e}^{ix}\right)
\end{aligned}
$$

Therefore the particular solution is

$$y_p = \frac{(-5x+14)\cos(x)}{5} + \frac{\sin(x)(35x-23)}{5}$$

Therefore the general solution is

$$\begin{aligned} y &= y_h + y_p \\ &= \left(c_1 \mathrm{e}^{-2x} + c_2 \mathrm{e}^{-ix} + \mathrm{e}^{ix} c_3\right) + \left(\frac{(-5x+14)\cos(x)}{5} + \frac{\sin(x)(35x-23)}{5}\right) \end{aligned}$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$y = c_1 \mathrm{e}^{-2x} + c_2 \mathrm{e}^{-ix} + \mathrm{e}^{ix} c_3 + \frac{(-5x+14)\cos(x)}{5} + \frac{\sin(x)(35x-23)}{5} \tag{1}$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 3$ and $x = 0$ in the above gives

$$3 = c_1 + c_2 + c_3 + \frac{14}{5} \tag{1A}$$

Taking derivative of the solution gives

$$y' = -2c_1 \mathrm{e}^{-2x} - ic_2 \mathrm{e}^{-ix} + i\mathrm{e}^{ix} c_3 - \cos(x) - \frac{(-5x+14)\sin(x)}{5} + \frac{\cos(x)(35x-23)}{5} + 7\sin(x)$$

substituting $y' = -4$ and $x = 0$ in the above gives

$$-4 = ic_3 - ic_2 - 2c_1 - \frac{28}{5} \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = 4c_1 \mathrm{e}^{-2x} - c_2 \mathrm{e}^{-ix} - \mathrm{e}^{ix} c_3 + 2\sin(x) - \frac{(-5x+14)\cos(x)}{5} - \frac{\sin(x)(35x-23)}{5} + 14\cos(x)$$

substituting $y'' = 16$ and $x = 0$ in the above gives

$$16 = -c_3 - c_2 + 4c_1 + \frac{56}{5} \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$\begin{aligned} c_1 &= 1 \\ c_2 &= -\frac{2}{5} + \frac{9i}{5} \\ c_3 &= -\frac{2}{5} - \frac{9i}{5} \end{aligned}$$

Substituting these values back in above solution results in

$$y = e^{-2x} - x\cos(x) + 2\cos(x) + 7\sin(x)\, x - \sin(x)$$

Which simplifies to

$$y = e^{-2x} + (2 - x)\cos(x) + (7x - 1)\sin(x)$$

Summary

The solution(s) found are the following

$$y = e^{-2x} + (2 - x)\cos(x) + (7x - 1)\sin(x) \tag{1}$$

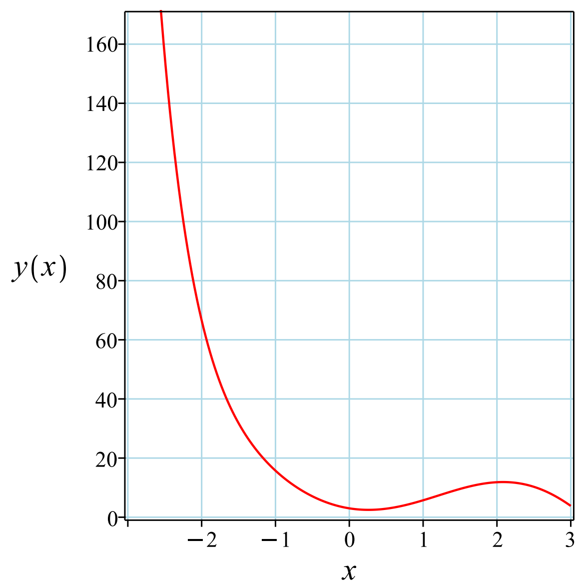

Figure 557: Solution plot

Verification of solutions

$$y = e^{-2x} + (2 - x)\cos(x) + (7x - 1)\sin(x)$$

Verified OK.

19.73.1 Maple step by step solution

Let's solve

$$\left[y''' + 2y'' + y' + 2y = 30\cos(x) - 10\sin(x), y(0) = 3, y'\Big|_{\{x=0\}} = -4, y''\Big|_{\{x=0\}} = 16\right]$$

- Highest derivative means the order of the ODE is 3

  y'''

- □ Convert linear ODE into a system of first order ODEs
  - Define new variable $y_1(x)$

    $y_1(x) = y$
  - Define new variable $y_2(x)$

    $y_2(x) = y'$
  - Define new variable $y_3(x)$

    $y_3(x) = y''$
  - Isolate for $y_3'(x)$ using original ODE

    $y_3'(x) = 30\cos(x) - 10\sin(x) - 2y_3(x) - y_2(x) - 2y_1(x)$

  Convert linear ODE into a system of first order ODEs

  $[y_2(x) = y_1'(x), y_3(x) = y_2'(x), y_3'(x) = 30\cos(x) - 10\sin(x) - 2y_3(x) - y_2(x) - 2y_1(x)]$

- Define vector

$$\vec{y}(x) = \begin{bmatrix} y_1(x) \\ y_2(x) \\ y_3(x) \end{bmatrix}$$

- System to solve

$$\vec{y}'(x) = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -2 & -1 & -2 \end{bmatrix} \cdot \vec{y}(x) + \begin{bmatrix} 0 \\ 0 \\ 30\cos(x) - 10\sin(x) \end{bmatrix}$$

- Define the forcing function

$$\vec{f}(x) = \begin{bmatrix} 0 \\ 0 \\ 30\cos(x) - 10\sin(x) \end{bmatrix}$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -2 & -1 & -2 \end{bmatrix}$$

- Rewrite the system as

$$\overrightarrow{y}'(x) = A \cdot \overrightarrow{y}(x) + \overrightarrow{f}$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right], \left[-\mathrm{I}, \begin{bmatrix} -1 \\ \mathrm{I} \\ 1 \end{bmatrix}\right], \left[\mathrm{I}, \begin{bmatrix} -1 \\ -\mathrm{I} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_1 = \mathrm{e}^{-2x} \cdot \begin{bmatrix} \frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-\mathrm{I}, \begin{bmatrix} -1 \\ \mathrm{I} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$\mathrm{e}^{-\mathrm{I}x} \cdot \begin{bmatrix} -1 \\ \mathrm{I} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of sin and cos

$$(-\mathrm{I}\sin(x)+\cos(x))\cdot\begin{bmatrix}-1\\ \mathrm{I}\\ 1\end{bmatrix}$$

- Simplify expression

$$\begin{bmatrix}\mathrm{I}\sin(x)-\cos(x)\\ \mathrm{I}(-\mathrm{I}\sin(x)+\cos(x))\\ -\mathrm{I}\sin(x)+\cos(x)\end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\vec{y}_2(x)=\begin{bmatrix}-\cos(x)\\ \sin(x)\\ \cos(x)\end{bmatrix},\vec{y}_3(x)=\begin{bmatrix}\sin(x)\\ \cos(x)\\ -\sin(x)\end{bmatrix}\right]$$

- General solution of the system of ODEs can be written in terms of the particular solution $\vec{y}_p($

$\vec{y}(x)=c_1\vec{y}_1+c_2\vec{y}_2(x)+c_3\vec{y}_3(x)+\vec{y}_p(x)$

☐ Fundamental matrix

- Let $\phi(x)$ be the matrix whose columns are the independent solutions of the homogeneous syst

$$\phi(x)=\begin{bmatrix}\frac{\mathrm{e}^{-2x}}{4} & -\cos(x) & \sin(x)\\ -\frac{\mathrm{e}^{-2x}}{2} & \sin(x) & \cos(x)\\ \mathrm{e}^{-2x} & \cos(x) & -\sin(x)\end{bmatrix}$$

- The fundamental matrix, $\Phi(x)$ is a normalized version of $\phi(x)$ satisfying $\Phi(0)=I$ where I is t

$\Phi(x)=\phi(x)\cdot\frac{1}{\phi(0)}$

- Substitute the value of $\phi(x)$ and $\phi(0)$

$$\Phi(x)=\begin{bmatrix}\frac{\mathrm{e}^{-2x}}{4} & -\cos(x) & \sin(x)\\ -\frac{\mathrm{e}^{-2x}}{2} & \sin(x) & \cos(x)\\ \mathrm{e}^{-2x} & \cos(x) & -\sin(x)\end{bmatrix}\cdot\frac{1}{\begin{bmatrix}\frac{1}{4} & -1 & 0\\ -\frac{1}{2} & 0 & 1\\ 1 & 1 & 0\end{bmatrix}}$$

- Evaluate and simplify to get the fundamental matrix

$$\Phi(x) = \begin{bmatrix} \frac{e^{-2x}}{5} + \frac{4\cos(x)}{5} + \frac{2\sin(x)}{5} & \sin(x) & \frac{e^{-2x}}{5} - \frac{\cos(x)}{5} + \frac{2\sin(x)}{5} \\ -\frac{2e^{-2x}}{5} - \frac{4\sin(x)}{5} + \frac{2\cos(x)}{5} & \cos(x) & -\frac{2e^{-2x}}{5} + \frac{\sin(x)}{5} + \frac{2\cos(x)}{5} \\ \frac{4e^{-2x}}{5} - \frac{4\cos(x)}{5} - \frac{2\sin(x)}{5} & -\sin(x) & \frac{4e^{-2x}}{5} + \frac{\cos(x)}{5} - \frac{2\sin(x)}{5} \end{bmatrix}$$

☐ Find a particular solution of the system of ODEs using variation of parameters

- Let the particular solution be the fundamental matrix multiplied by $\vec{v}(x)$ and solve for $\vec{v}(x)$

  $\vec{y}_p(x) = \Phi(x) \cdot \vec{v}(x)$
- Take the derivative of the particular solution

  $\vec{y}_p'(x) = \Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x)$
- Substitute particular solution and its derivative into the system of ODEs

  $\Phi'(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
- The fundamental matrix has columns that are solutions to the homogeneous system so its der

  $A \cdot \Phi(x) \cdot \vec{v}(x) + \Phi(x) \cdot \vec{v}'(x) = A \cdot \Phi(x) \cdot \vec{v}(x) + \vec{f}(x)$
- Cancel like terms

  $\Phi(x) \cdot \vec{v}'(x) = \vec{f}(x)$
- Multiply by the inverse of the fundamental matrix

  $\vec{v}'(x) = \frac{1}{\Phi(x)} \cdot \vec{f}(x)$
- Integrate to solve for $\vec{v}(x)$

  $\vec{v}(x) = \int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds$
- Plug $\vec{v}(x)$ into the equation for the particular solution

  $\vec{y}_p(x) = \Phi(x) \cdot \left(\int_0^x \frac{1}{\Phi(s)} \cdot \vec{f}(s)\, ds\right)$
- Plug in the fundamental matrix and the forcing function and compute

$$\vec{y}_p(x) = \begin{bmatrix} -\frac{23\sin(x)}{5} + 7\sin(x)\,x + \frac{14\cos(x)}{5} - x\cos(x) - \frac{14\,e^{-2x}}{5} \\ \frac{28\,e^{-2x}}{5} + \frac{7(5x-4)\cos(x)}{5} + \frac{(5x+21)\sin(x)}{5} \\ \frac{33\sin(x)}{5} - 7\sin(x)\,x + \frac{56\cos(x)}{5} + x\cos(x) - \frac{56\,e^{-2x}}{5} \end{bmatrix}$$

- Plug particular solution back into general solution

$$\vec{y}(x) = c_1 \vec{y}_1 + c_2 \vec{y}_2(x) + c_3 \vec{y}_3(x) + \left[\begin{array}{c} -\frac{23 \sin(x)}{5} + 7 \sin(x) x + \frac{14 \cos(x)}{5} - x \cos(x) - \frac{14 \,\mathrm{e}^{-2x}}{5} \\ \frac{28 \,\mathrm{e}^{-2x}}{5} + \frac{7(5x-4) \cos(x)}{5} + \frac{(5x+21) \sin(x)}{5} \\ \frac{33 \sin(x)}{5} - 7 \sin(x) x + \frac{56 \cos(x)}{5} + x \cos(x) - \frac{56 \,\mathrm{e}^{-2x}}{5} \end{array}\right]$$

- First component of the vector is the solution to the ODE

  $y = \frac{(5c_1-56)\mathrm{e}^{-2x}}{20} + \frac{(14-5x-5c_2)\cos(x)}{5} + 7\left(x + \frac{c_3}{7} - \frac{23}{35}\right)\sin(x)$

- Use the initial condition $y(0) = 3$

  $3 = \frac{c_1}{4} - c_2$

- Calculate the 1st derivative of the solution

  $y' = -\frac{(5c_1-56)\mathrm{e}^{-2x}}{10} - \cos(x) - \frac{(14-5x-5c_2)\sin(x)}{5} + 7\sin(x) + 7\left(x + \frac{c_3}{7} - \frac{23}{35}\right)\cos(x)$

- Use the initial condition $y'\Big|_{\{x=0\}} = -4$

  $-4 = -\frac{c_1}{2} + c_3$

- Calculate the 2nd derivative of the solution

  $y'' = \frac{(5c_1-56)\mathrm{e}^{-2x}}{5} + 2\sin(x) - \frac{(14-5x-5c_2)\cos(x)}{5} + 14\cos(x) - 7\left(x + \frac{c_3}{7} - \frac{23}{35}\right)\sin(x)$

- Use the initial condition $y''\Big|_{\{x=0\}} = 16$

  $16 = c_1 + c_2$

- Solve for the unknown coefficients

  $\left\{c_1 = \frac{76}{5}, c_2 = \frac{4}{5}, c_3 = \frac{18}{5}\right\}$

- Solution to the IVP

  $y = \mathrm{e}^{-2x} + (2-x)\cos(x) + (7x-1)\sin(x)$

ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

`[[_high_order, _missing_y]]`

$$\boxed{y'''' - 3y''' + 5y'' - 2y' = -2\,\mathrm{e}^{x}(\cos(x) - \sin(x))}$$

With initial conditions

$$[y(0) = 2, y'(0) = 0, y''(0) = -1, y'''(0) = -5]$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 3y''' + 5y'' - 2y' = 0$$

The characteristic equation is

$$\lambda^4 - 3\lambda^3 + 5\lambda^2 - 2\lambda = 0$$

The roots of the above equation are

$$\lambda_1 = 0$$

$$\lambda_2 = -\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} + \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1$$

$$\lambda_3 = \frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{12} - \frac{2}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1 + \frac{i\sqrt{3}\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} - \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}\right)}{2}$$

$$\lambda_4 = \frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{12} - \frac{2}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1 - \frac{i\sqrt{3}\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} - \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}\right)}{2}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 + \mathrm{e}^{\left(\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{12} - \frac{2}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1 + \frac{i\sqrt{3}\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} - \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}\right)}{2}\right)x} c_2 + \mathrm{e}^{\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} + \frac{4}{\left(108+12\sqrt{17\right.}}\right.}$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = 1$$

$$y_2 = \mathrm{e}^{\left(\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{12} - \frac{2}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1 + \frac{i\sqrt{3}\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} - \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}\right)}{2}\right)x}$$

$$y_3 = \mathrm{e}^{\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} + \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1\right)x}$$

$$y_4 = \mathrm{e}^{\left(\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{12} - \frac{2}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1 - \frac{i\sqrt{3}\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} - \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}\right)}{2}\right)x}$$

Now the particular solution to the given ODE is found

$$y'''' - 3y''' + 5y'' - 2y' = -2\,\mathrm{e}^{x}(\cos(x) - \sin(x))$$

The particular solution is found using the method of undetermined coefficients. Looking at the RHS of the ode, which is

$$-2\,e^{x}(\cos (x)-\sin (x))$$

Shows that the corresponding undetermined set of the basis functions (UC_set) for the trial solution is

$$[\{\cos (x)\,e^{x}, \sin (x)\,e^{x}\}]$$

While the set of the basis functions for the homogeneous solution found earlier is

$$\left\{1, e^{\left(-\frac{(108+12\sqrt{177})^{\frac{1}{3}}}{6}+\frac{4}{(108+12\sqrt{177})^{\frac{1}{3}}}+1\right)x}, e^{\left(\frac{(108+12\sqrt{177})^{\frac{1}{3}}}{12}-\frac{2}{(108+12\sqrt{177})^{\frac{1}{3}}}+1-\frac{i\sqrt{3}\left(-\frac{(108+12\sqrt{177})^{\frac{1}{3}}}{6}-\frac{4}{(108+12\sqrt{177})^{\frac{1}{3}}}\right)}{2}\right)x}, e\right.$$

Since there is no duplication between the basis function in the UC_set and the basis functions of the homogeneous solution, the trial solution is a linear combination of all the basis in the UC_set.

$$y_p = A_1 \cos (x)\,e^{x} + A_2 \sin (x)\,e^{x}$$

The unknowns $\{A_1, A_2\}$ are found by substituting the above trial solution y_p into the ODE and comparing coefficients. Substituting the trial solution into the ODE and simplifying gives

$$-2A_1 \sin (x)\,e^{x} + 2A_2 \cos (x)\,e^{x} = -2\,e^{x}(\cos (x)-\sin (x))$$

Solving for the unknowns by comparing coefficients results in

$$[A_1 = -1, A_2 = -1]$$

Substituting the above back in the above trial solution y_p, gives the particular solution

$$y_p = -\cos (x)\,e^{x} - \sin (x)\,e^{x}$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1 + \mathrm{e}^{\left(\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{12} - \frac{2}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1 + \frac{i\sqrt{3}\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} - \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}\right)}{2}\right)x} c_2 \right. \\
&\quad + \mathrm{e}^{\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} + \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1\right)x} c_3 \\
&\quad \left. + \mathrm{e}^{\left(\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{12} - \frac{2}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1 - \frac{i\sqrt{3}\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} - \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}\right)}{2}\right)x} c_4 \right) \\
&\quad + \left(-\cos\left(x\right)\mathrm{e}^{x} - \sin\left(x\right)\mathrm{e}^{x}\right)
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = c_1 + \mathrm{e}^{\left(\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{12} - \frac{2}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1 + \frac{i\sqrt{3}\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} - \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}\right)}{2}\right)x} c_2 + \mathrm{e}^{\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} + \frac{4}{\left(108+12\sqrt{177}\right)}\right.} \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 2$ and $x = 0$ in the above gives

$$
2 = -1 + c_1 + c_2 + c_3 + c_4 \tag{1A}
$$

Taking derivative of the solution gives

$$y' = \left(\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{12} - \frac{2}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1 + \frac{i\sqrt{3}\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} - \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}\right)}{2}\right) e^{\left(\frac{\left(108+12\sqrt{}\right.}{12}\right.}$$

substituting $y'=0$ and $x=0$ in the above gives

$$0 = \frac{\left(108+12\sqrt{177}\right)^{\frac{2}{3}}\left(-i(c_2-c_4)\sqrt{3}+c_2-2c_3+c_4\right) - 12(2-c_2-c_3-c_4)\left(108+12\sqrt{177}\right)^{\frac{1}{3}} - 24i(c_2}{12\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = \left(\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{12} - \frac{2}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1 + \frac{i\sqrt{3}\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} - \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}\right)}{2}\right)^2 e^{\left(\frac{\left(108+12\right.}{}\right.}$$

substituting $y''=-1$ and $x=0$ in the above gives

$$-1 = \frac{\frac{11\left(-\frac{(c_2-2c_3+c_4)\sqrt{177}}{33} - \frac{i(c_2-c_4)\sqrt{59}}{11} - i(c_2-c_4)\sqrt{3} - c_2+2c_3-c_4\right)\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{2} - \left(2+\frac{c_2}{3}+\frac{c_3}{3}+\frac{c_4}{3}\right)\left(108+12\sqrt{177}\right)}{\left(108+12\sqrt{177}\right.} \tag{3A}$$

Taking three derivatives of the solution gives

$$y''' = \left(\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{12} - \frac{2}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}} + 1 + \frac{i\sqrt{3}\left(-\frac{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}{6} - \frac{4}{\left(108+12\sqrt{177}\right)^{\frac{1}{3}}}\right)}{2}\right)^3 e^{\left(\frac{\left(108+1\right.}{}\right.}$$

substituting $y'''=-5$ and $x=0$ in the above gives

$$-5 = \frac{2\left(108+12\sqrt{177}\right)^{\frac{1}{3}}\left((c_2-2c_3+c_4)\sqrt{177}+3i(-c_2+c_4)\sqrt{59}+15i(c_2-c_4)\sqrt{3}-15c_2+30c_3-15\right.}{} \tag{4A}$$

Equations {1A,2A,3A,4A} are now solved for $\{c_1, c_2, c_3, c_4\}$. Solving for the constants gives

$$c_1 = 2$$

$$c_2 = -\frac{144\left(-1067\left(108+12\sqrt{177}\right)^{\frac{2}{3}}\sqrt{177}+1575\left(108+12\sqrt{177}\right)^{\frac{1}{3}}\sqrt{177}+28362\sqrt{177}-13971\left(\right.\right.}{\left(\left(108+12\sqrt{177}\right)^{\frac{2}{3}}-6\left(108+12\sqrt{177}\right)^{\frac{1}{3}}-24\right)\left(43\sqrt{59}+177\sqrt{3}\right)\left(-3\left(108+12\sqrt{177}\right)^{\frac{2}{3}}\sqrt{59}-\right.}$$

$$c_3 = \frac{11895552\left(108+12\sqrt{3}\,\sqrt{59}\right)^{\frac{2}{3}}\sqrt{59}+52607232\left(108+12\sqrt{3}\,\sqrt{59}\right)^{\frac{2}{3}}\sqrt{3}-361827648}{\left(96\left(108+12\sqrt{3}\,\sqrt{59}\right)^{\frac{1}{3}}\sqrt{3}\,\sqrt{59}+\left(108+12\sqrt{3}\,\sqrt{59}\right)^{\frac{2}{3}}\sqrt{3}\,\sqrt{59}-540\sqrt{3}\,\sqrt{59}+1248\left(108+12\sqrt{3}\right.\right.}$$

$$c_4 = \frac{10i\left(108+12\sqrt{3}\,\sqrt{59}\right)^{\frac{2}{3}}\sqrt{3}\,\sqrt{59}-153i\left(108+12\sqrt{3}\,\sqrt{59}\right)^{\frac{1}{3}}\sqrt{3}\,\sqrt{59}+1050i\sqrt{3}\,\sqrt{59}+97\left(108+12\right.}{}$$

Substituting these values back in above solution results in

$$y = \text{Expression too large to display}$$

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_3rd_order, _with_linear_symmetries]]
```

$$\boxed{x^3y''' - 3x^2y'' + 6y'x - 6y = 2x}$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$x^3y''' - 3x^2y'' + 6y'x - 6y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned}
y' &= \lambda\, x^{\lambda-1} \\
y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\
y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3}
\end{aligned}$$

Substituting these back into

$$x^3y''' - 3x^2y'' + 6y'x - 6y = 2x$$

gives

$$6x\lambda\, x^{\lambda-1}-3x^{2}\lambda(\lambda-1)\, x^{\lambda-2}+x^{3}\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3}-6x^{\lambda}=0$$

Which simplifies to

$$6\lambda\, x^{\lambda}-3\lambda(\lambda-1)\, x^{\lambda}+\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda}-6x^{\lambda}=0$$

And since $x^{\lambda}\neq 0$ then dividing through by x^{λ}, the above becomes

$$6\lambda-3\lambda(\lambda-1)+\lambda(\lambda-1)\,(\lambda-2)-6=0$$

Simplifying gives the characteristic equation as

$$\lambda^{3}-6\lambda^{2}+11\lambda-6=0$$

Solving the above gives the following roots

$$\begin{aligned}\lambda_1&=1\\ \lambda_2&=2\\ \lambda_3&=3\end{aligned}$$

This table summarises the result

root	multiplicity	type of root
1	1	real root
2	1	real root
3	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^{λ} basis solution. Each real root of multiplicty two, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ and $c_3x^{\lambda}\ln(x)^{2}$ basis solutions, and so on. Each complex root $\alpha\pm i\beta$ of multiplicity one generates $x^{\alpha}(c_1\cos(\beta\ln(x))+c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha\pm i\beta$ of multiplicity two generates $\ln(x)\, x^{\alpha}(c_1\cos(\beta\ln(x))+c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha\pm i\beta$ of multiplicity three generates $\ln(x)^{2}\, x^{\alpha}(c_1\cos(\beta\ln(x))+c_2$ basis solutions. And so on. Using the above show that the solution is

$$y=c_3x^{3}+c_2x^{2}+c_1x$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = x$$
$$y_2 = x^2$$
$$y_3 = x^3$$

Now the particular solution to the given ODE is found

$$x^3y''' - 3x^2y'' + 6y'x - 6y = 2x$$

Let the particular solution be

$$y_p = U_1y_1 + U_2y_2 + U_3y_3$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x)W_i(x)}{aW(x)} \, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} x & x^2 & x^3 \\ 1 & 2x & 3x^2 \\ 0 & 2 & 6x \end{bmatrix}$$
$$|W| = 2x^3$$

The determinant simplifies to

$$|W| = 2x^3$$

Now we determine W_i for each U_i.

$$\begin{aligned} W_1(x) &= \det \begin{bmatrix} x^2 & x^3 \\ 2x & 3x^2 \end{bmatrix} \\ &= x^4 \end{aligned}$$

$$\begin{aligned} W_2(x) &= \det \begin{bmatrix} x & x^3 \\ 1 & 3x^2 \end{bmatrix} \\ &= 2x^3 \end{aligned}$$

$$\begin{aligned} W_3(x) &= \det \begin{bmatrix} x & x^2 \\ 1 & 2x \end{bmatrix} \\ &= x^2 \end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{3-1} \int \frac{F(x) W_1(x)}{a W(x)} \, dx \\ &= (-1)^2 \int \frac{(2x)(x^4)}{(x^3)(2x^3)} \, dx \\ &= \int \frac{2x^5}{2x^6} \, dx \\ &= \int \left(\frac{1}{x}\right) \, dx \\ &= \ln(x) \end{aligned}$$

$$\begin{aligned} U_2 &= (-1)^{3-2} \int \frac{F(x) W_2(x)}{a W(x)} \, dx \\ &= (-1)^1 \int \frac{(2x)(2x^3)}{(x^3)(2x^3)} \, dx \\ &= -\int \frac{4x^4}{2x^6} \, dx \\ &= -\int \left(\frac{2}{x^2}\right) \, dx \\ &= \frac{2}{x} \end{aligned}$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x) W_3(x)}{a W(x)}\, dx \\
&= (-1)^{0} \int \frac{(2x)\left(x^2\right)}{\left(x^3\right)\left(2x^3\right)}\, dx \\
&= \int \frac{2x^3}{2x^6}\, dx \\
&= \int \left(\frac{1}{x^3}\right) dx \\
&= -\frac{1}{2x^2}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Hence

$$
\begin{aligned}
y_p = & (\ln(x))(x) \\
& + \left(\frac{2}{x}\right)\left(x^2\right) \\
& + \left(-\frac{1}{2x^2}\right)\left(x^3\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \left(\ln(x) + \frac{3}{2}\right) x
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_3 x^3 + c_2 x^2 + c_1 x\right) + \left(\left(\ln(x) + \frac{3}{2}\right) x\right)
\end{aligned}
$$

Which simplifies to

$$
y = x\left(c_3 x^2 + c_2 x + c_1\right) + \left(\ln(x) + \frac{3}{2}\right) x
$$

<u>Summary</u>

The solution(s) found are the following

$$
y = x\left(c_3 x^2 + c_2 x + c_1\right) + \left(\ln(x) + \frac{3}{2}\right) x \tag{1}
$$

Verification of solutions

$$y = x(c_3x^2 + c_2x + c_1) + \left(\ln(x) + \frac{3}{2}\right)x$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_3rd_order, _with_linear_symmetries]]
```

$$\boxed{4x^3y''' + 4x^2y'' - 5y'x + 2y = 30x^2}$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$4x^3y''' + 4x^2y'' - 5y'x + 2y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned} y' &= \lambda\, x^{\lambda-1} \\ y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\ y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \end{aligned}$$

Substituting these back into

$$4x^3y''' + 4x^2y'' - 5y'x + 2y = 30x^2$$

gives

$$-5x\lambda\, x^{\lambda-1}+4x^{2}\lambda(\lambda-1)\, x^{\lambda-2}+4x^{3}\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3}+2x^{\lambda}=0$$

Which simplifies to

$$-5\lambda\, x^{\lambda}+4\lambda(\lambda-1)\, x^{\lambda}+4\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda}+2x^{\lambda}=0$$

And since $x^{\lambda}\neq 0$ then dividing through by x^{λ}, the above becomes

$$-5\lambda+4\lambda(\lambda-1)+4\lambda(\lambda-1)\,(\lambda-2)+2=0$$

Simplifying gives the characteristic equation as

$$4\lambda^{3}-8\lambda^{2}-\lambda+2=0$$

Solving the above gives the following roots

$$\begin{aligned}\lambda_{1}&=2\\ \lambda_{2}&=-\frac{1}{2}\\ \lambda_{3}&=\frac{1}{2}\end{aligned}$$

This table summarises the result

root	multiplicity	type of root
2	1	real root
$-\frac{1}{2}$	1	real root
$\frac{1}{2}$	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^{λ} basis solution. Each real root of multiplicty two, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ and $c_3x^{\lambda}\ln(x)^{2}$ basis solutions, and so on. Each complex root $\alpha\pm i\beta$ of multiplicity one generates $x^{\alpha}(c_1\cos(\beta\ln(x))+c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha\pm i\beta$ of multiplicity two generates $\ln(x)\, x^{\alpha}(c_1\cos(\beta\ln(x))+c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha\pm i\beta$ of multiplicity three generates $\ln(x)^{2} x^{\alpha}(c_1\cos(\beta\ln(x))+c_2$ basis solutions. And so on. Using the above show that the solution is

$$y=c_1x^{2}+\frac{c_2}{\sqrt{x}}+c_3\sqrt{x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= x^2 \\
y_2 &= \frac{1}{\sqrt{x}} \\
y_3 &= \sqrt{x}
\end{aligned}
$$

Now the particular solution to the given ODE is found

$$4x^3y''' + 4x^2y'' - 5y'x + 2y = 30x^2$$

Let the particular solution be

$$y_p = U_1y_1 + U_2y_2 + U_3y_3$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x)W_i(x)}{aW(x)}\,dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$
\begin{aligned}
W &= \begin{bmatrix} x^2 & \frac{1}{\sqrt{x}} & \sqrt{x} \\ 2x & -\frac{1}{2x^{\frac{3}{2}}} & \frac{1}{2\sqrt{x}} \\ 2 & \frac{3}{4x^{\frac{5}{2}}} & -\frac{1}{4x^{\frac{3}{2}}} \end{bmatrix} \\
|W| &= \frac{15}{4x}
\end{aligned}
$$

The determinant simplifies to

$$|W| = \frac{15}{4x}$$

Now we determine W_i for each U_i.

$$\begin{aligned}W_1(x) &= \det \begin{bmatrix} \frac{1}{\sqrt{x}} & \sqrt{x} \\ -\frac{1}{2x^{\frac{3}{2}}} & \frac{1}{2\sqrt{x}} \end{bmatrix} \\ &= \frac{1}{x}\end{aligned}$$

$$\begin{aligned}W_2(x) &= \det \begin{bmatrix} x^2 & \sqrt{x} \\ 2x & \frac{1}{2\sqrt{x}} \end{bmatrix} \\ &= -\frac{3x^{\frac{3}{2}}}{2}\end{aligned}$$

$$\begin{aligned}W_3(x) &= \det \begin{bmatrix} x^2 & \frac{1}{\sqrt{x}} \\ 2x & -\frac{1}{2x^{\frac{3}{2}}} \end{bmatrix} \\ &= -\frac{5\sqrt{x}}{2}\end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned}U_1 &= (-1)^{3-1} \int \frac{F(x)W_1(x)}{aW(x)}\, dx \\ &= (-1)^2 \int \frac{(30x^2)\left(\frac{1}{x}\right)}{(4x^3)\left(\frac{15}{4x}\right)}\, dx \\ &= \int \frac{30x}{15x^2}\, dx \\ &= \int \left(\frac{2}{x}\right) dx \\ &= 2\ln(x)\end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{3-2} \int \frac{F(x)W_2(x)}{aW(x)}\,dx \\
&= (-1)^1 \int \frac{(30x^2)\left(-\frac{3x^{\frac{3}{2}}}{2}\right)}{(4x^3)\left(\frac{15}{4x}\right)}\,dx \\
&= -\int \frac{-45x^{\frac{7}{2}}}{15x^2}\,dx \\
&= -\int \left(-3x^{\frac{3}{2}}\right)\,dx \\
&= \frac{6x^{\frac{5}{2}}}{5}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x)W_3(x)}{aW(x)}\,dx \\
&= (-1)^0 \int \frac{(30x^2)\left(-\frac{5\sqrt{x}}{2}\right)}{(4x^3)\left(\frac{15}{4x}\right)}\,dx \\
&= \int \frac{-75x^{\frac{5}{2}}}{15x^2}\,dx \\
&= \int \left(-5\sqrt{x}\right)\,dx \\
&= -\frac{10x^{\frac{3}{2}}}{3}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1y_1 + U_2y_2 + U_3y_3
$$

Hence

$$
\begin{aligned}
y_p = &(2\ln(x))\left(x^2\right) \\
&+ \left(\frac{6x^{\frac{5}{2}}}{5}\right)\left(\frac{1}{\sqrt{x}}\right) \\
&+ \left(-\frac{10x^{\frac{3}{2}}}{3}\right)\left(\sqrt{x}\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = 2x^2\left(-\frac{16}{15} + \ln(x)\right)
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1 x^2 + \frac{c_2}{\sqrt{x}} + c_3\sqrt{x}\right) + \left(2x^2\left(-\frac{16}{15} + \ln\left(x\right)\right)\right)
\end{aligned}
$$

Which simplifies to

$$
y = \frac{c_1 x^{\frac{5}{2}} + c_3 x + c_2}{\sqrt{x}} + 2x^2\left(-\frac{16}{15} + \ln\left(x\right)\right)
$$

Summary

The solution(s) found are the following

$$
y = \frac{c_1 x^{\frac{5}{2}} + c_3 x + c_2}{\sqrt{x}} + 2x^2\left(-\frac{16}{15} + \ln\left(x\right)\right) \tag{1}
$$

Verification of solutions

$$
y = \frac{c_1 x^{\frac{5}{2}} + c_3 x + c_2}{\sqrt{x}} + 2x^2\left(-\frac{16}{15} + \ln\left(x\right)\right)
$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_3rd_order, _exact, _linear, _nonhomogeneous]]
```

$$\boxed{x^3y''' + x^2y'' - 2y'x + 2y = x^2}$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$x^3y''' + x^2y'' - 2y'x + 2y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned} y' &= \lambda\, x^{\lambda-1} \\ y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\ y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \end{aligned}$$

Substituting these back into

$$x^3y''' + x^2y'' - 2y'x + 2y = x^2$$

gives

$$-2x\lambda\, x^{\lambda-1} + x^2\lambda(\lambda-1)\, x^{\lambda-2} + x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} + 2x^\lambda = 0$$

Which simplifies to

$$-2\lambda\, x^\lambda + \lambda(\lambda-1)\, x^\lambda + \lambda(\lambda-1)\,(\lambda-2)\, x^\lambda + 2x^\lambda = 0$$

And since $x^\lambda \neq 0$ then dividing through by x^λ, the above becomes

$$-2\lambda + \lambda(\lambda-1) + \lambda(\lambda-1)\,(\lambda-2) + 2 = 0$$

Simplifying gives the characteristic equation as

$$\lambda^3 - 2\lambda^2 - \lambda + 2 = 0$$

Solving the above gives the following roots

$$\lambda_1 = 1$$
$$\lambda_2 = 2$$
$$\lambda_3 = -1$$

This table summarises the result

root	multiplicity	type of root
-1	1	real root
1	1	real root
2	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a $c_1 x^\lambda$ basis solution. Each real root of multiplicty two, generates $c_1 x^\lambda$ and $c_2 x^\lambda \ln(x)$ basis solutions. Each real root of multiplicty three, generates $c_1 x^\lambda$ and $c_2 x^\lambda \ln(x)$ and $c_3 x^\lambda \ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^\alpha (c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x)\, x^\alpha (c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2\, x^\alpha (c_1 \cos(\beta \ln(x)) + c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = \frac{c_1}{x} + c_2 x + c_3 x^2$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \frac{1}{x} \\
y_2 &= x \\
y_3 &= x^2
\end{aligned}
$$

Now the particular solution to the given ODE is found

$$
x^3 y''' + x^2 y'' - 2y'x + 2y = x^2
$$

Let the particular solution be

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$
U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx
$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$
W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}
$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$
\begin{aligned}
W &= \begin{bmatrix} \frac{1}{x} & x & x^2 \\ -\frac{1}{x^2} & 1 & 2x \\ \frac{2}{x^3} & 0 & 2 \end{bmatrix} \\
|W| &= \frac{6}{x}
\end{aligned}
$$

The determinant simplifies to

$$|W| = \frac{6}{x}$$

Now we determine W_i for each U_i.

$$\begin{aligned} W_1(x) &= \det \begin{bmatrix} x & x^2 \\ 1 & 2x \end{bmatrix} \\ &= x^2 \end{aligned}$$

$$\begin{aligned} W_2(x) &= \det \begin{bmatrix} \frac{1}{x} & x^2 \\ -\frac{1}{x^2} & 2x \end{bmatrix} \\ &= 3 \end{aligned}$$

$$\begin{aligned} W_3(x) &= \det \begin{bmatrix} \frac{1}{x} & x \\ -\frac{1}{x^2} & 1 \end{bmatrix} \\ &= \frac{2}{x} \end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{3-1} \int \frac{F(x)W_1(x)}{aW(x)}\,dx \\ &= (-1)^2 \int \frac{(x^2)\,(x^2)}{(x^3)\left(\frac{6}{x}\right)}\,dx \\ &= \int \frac{x^4}{6x^2}\,dx \\ &= \int \left(\frac{x^2}{6}\right)\,dx \\ &= \frac{x^3}{18} \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{3-2} \int \frac{F(x) W_2(x)}{a W(x)} \, dx \\
&= (-1)^1 \int \frac{(x^2)(3)}{(x^3)\left(\frac{6}{x}\right)} \, dx \\
&= -\int \frac{3x^2}{6x^2} \, dx \\
&= -\int \left(\frac{1}{2}\right) \, dx \\
&= -\frac{x}{2}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x) W_3(x)}{a W(x)} \, dx \\
&= (-1)^0 \int \frac{(x^2)\left(\frac{2}{x}\right)}{(x^3)\left(\frac{6}{x}\right)} \, dx \\
&= \int \frac{2x}{6x^2} \, dx \\
&= \int \left(\frac{1}{3x}\right) \, dx \\
&= \frac{\ln(x)}{3}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Hence

$$
\begin{aligned}
y_p = &\left(\frac{x^3}{18}\right)\left(\frac{1}{x}\right) \\
&+ \left(-\frac{x}{2}\right)(x) \\
&+ \left(\frac{\ln(x)}{3}\right)(x^2)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \frac{x^2(-4 + 3\ln(x))}{9}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(\frac{c_1}{x} + c_2 x + c_3 x^2\right) + \left(\frac{x^2(-4 + 3\ln(x))}{9}\right)
\end{aligned}
$$

Summary
The solution(s) found are the following

$$y = \frac{c_1}{x} + c_2 x + c_3 x^2 + \frac{x^2(-4 + 3\ln(x))}{9} \tag{1}$$

Verification of solutions

$$y = \frac{c_1}{x} + c_2 x + c_3 x^2 + \frac{x^2(-4 + 3\ln(x))}{9}$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_high_order, _with_linear_symmetries]]
```

$$\boxed{16x^4y'''' + 96x^3y''' + 72x^2y'' - 24y'x + 9y = 96x^{\frac{5}{2}}}$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$16x^4y'''' + 96x^3y''' + 72x^2y'' - 24y'x + 9y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned}
y' &= \lambda\, x^{\lambda-1} \\
y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\
y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \\
y'''' &= \lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4}
\end{aligned}$$

Substituting these back into

$$16x^4y'''' + 96x^3y''' + 72x^2y'' - 24y'x + 9y = 96x^{\frac{5}{2}}$$

gives

$$-24x\lambda\, x^{\lambda-1}+72x^{2}\lambda(\lambda-1)\, x^{\lambda-2}+96x^{3}\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3}$$
$$+16x^{4}\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4}+9x^{\lambda}=0$$

Which simplifies to

$$-24\lambda\, x^{\lambda}+72\lambda(\lambda-1)\, x^{\lambda}+96\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda}+16\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda}+9x^{\lambda}$$
$$=0$$

And since $x^{\lambda}\neq 0$ then dividing through by x^{λ}, the above becomes

$$-24\lambda+72\lambda(\lambda-1)+96\lambda(\lambda-1)\,(\lambda-2)+16\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)+9=0$$

Simplifying gives the characteristic equation as

$$16\lambda^{4}-40\lambda^{2}+9=0$$

Solving the above gives the following roots

$$\lambda_1=-\frac{3}{2}$$
$$\lambda_2=\frac{3}{2}$$
$$\lambda_3=-\frac{1}{2}$$
$$\lambda_4=\frac{1}{2}$$

This table summarises the result

root	multiplicity	type of root
$-\frac{1}{2}$	1	real root
$\frac{1}{2}$	1	real root
$-\frac{3}{2}$	1	real root
$\frac{3}{2}$	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^{λ} basis solution. Each real root of multiplicty two, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^{λ} and

$c_2x^\lambda \ln(x)$ and $c_3x^\lambda \ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^\alpha(c_1\cos(\beta\ln(x)) + c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x)\, x^\alpha(c_1\cos(\beta\ln(x)) + c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha\pm i\beta$ of multiplicity three generates $\ln(x)^2\, x^\alpha(c_1\cos(\beta\ln(x)) + c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = \frac{c_1}{\sqrt{x}} + \sqrt{x}\, c_2 + \frac{c_3}{x^{\frac{3}{2}}} + c_4 x^{\frac{3}{2}}$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \frac{1}{\sqrt{x}}$$
$$y_2 = \sqrt{x}$$
$$y_3 = \frac{1}{x^{\frac{3}{2}}}$$
$$y_4 = x^{\frac{3}{2}}$$

Now the particular solution to the given ODE is found

$$16x^4y'''' + 96x^3y''' + 72x^2y'' - 24y'x + 9y = 96x^{\frac{5}{2}}$$

Let the particular solution be

$$y_p = U_1y_1 + U_2y_2 + U_3y_3 + U_4y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x)W_i(x)}{aW(x)}\, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$
W = \begin{bmatrix} \frac{1}{\sqrt{x}} & \sqrt{x} & \frac{1}{x^{\frac{3}{2}}} & x^{\frac{3}{2}} \\ -\frac{1}{2x^{\frac{3}{2}}} & \frac{1}{2\sqrt{x}} & -\frac{3}{2x^{\frac{5}{2}}} & \frac{3\sqrt{x}}{2} \\ \frac{3}{4x^{\frac{5}{2}}} & -\frac{1}{4x^{\frac{3}{2}}} & \frac{15}{4x^{\frac{7}{2}}} & \frac{3}{4\sqrt{x}} \\ -\frac{15}{8x^{\frac{7}{2}}} & \frac{3}{8x^{\frac{5}{2}}} & -\frac{105}{8x^{\frac{9}{2}}} & -\frac{3}{8x^{\frac{3}{2}}} \end{bmatrix}
$$

$$
|W| = \frac{12}{x^6}
$$

The determinant simplifies to

$$
|W| = \frac{12}{x^6}
$$

Now we determine W_i for each U_i.

$$
\begin{aligned}
W_1(x) &= \det \begin{bmatrix} \sqrt{x} & \frac{1}{x^{\frac{3}{2}}} & x^{\frac{3}{2}} \\ \frac{1}{2\sqrt{x}} & -\frac{3}{2x^{\frac{5}{2}}} & \frac{3\sqrt{x}}{2} \\ -\frac{1}{4x^{\frac{3}{2}}} & \frac{15}{4x^{\frac{7}{2}}} & \frac{3}{4\sqrt{x}} \end{bmatrix} \\
&= -\frac{6}{x^{\frac{5}{2}}}
\end{aligned}
$$

$$
\begin{aligned}
W_2(x) &= \det \begin{bmatrix} \frac{1}{\sqrt{x}} & \frac{1}{x^{\frac{3}{2}}} & x^{\frac{3}{2}} \\ -\frac{1}{2x^{\frac{3}{2}}} & -\frac{3}{2x^{\frac{5}{2}}} & \frac{3\sqrt{x}}{2} \\ \frac{3}{4x^{\frac{5}{2}}} & \frac{15}{4x^{\frac{7}{2}}} & \frac{3}{4\sqrt{x}} \end{bmatrix} \\
&= -\frac{6}{x^{\frac{7}{2}}}
\end{aligned}
$$

$$
\begin{aligned}
W_3(x) &= \det \begin{bmatrix} \frac{1}{\sqrt{x}} & \sqrt{x} & x^{\frac{3}{2}} \\ -\frac{1}{2x^{\frac{3}{2}}} & \frac{1}{2\sqrt{x}} & \frac{3\sqrt{x}}{2} \\ \frac{3}{4x^{\frac{5}{2}}} & -\frac{1}{4x^{\frac{3}{2}}} & \frac{3}{4\sqrt{x}} \end{bmatrix} \\
&= \frac{2}{x^{\frac{3}{2}}}
\end{aligned}
$$

$$
\begin{aligned}
W_4(x) &= \det \begin{bmatrix} \frac{1}{\sqrt{x}} & \sqrt{x} & \frac{1}{x^{\frac{3}{2}}} \\ -\frac{1}{2x^{\frac{3}{2}}} & \frac{1}{2\sqrt{x}} & -\frac{3}{2x^{\frac{5}{2}}} \\ \frac{3}{4x^{\frac{5}{2}}} & -\frac{1}{4x^{\frac{3}{2}}} & \frac{15}{4x^{\frac{7}{2}}} \end{bmatrix} \\
&= \frac{2}{x^{\frac{9}{2}}}
\end{aligned}
$$

Now we are ready to evaluate each $U_i(x)$.

$$
\begin{aligned}
U_1 &= (-1)^{4-1} \int \frac{F(x)W_1(x)}{aW(x)}\, dx \\
&= (-1)^3 \int \frac{\left(96x^{\frac{5}{2}}\right)\left(-\frac{6}{x^{\frac{5}{2}}}\right)}{(16x^4)\left(\frac{12}{x^6}\right)}\, dx \\
&= -\int \frac{-576}{\frac{192}{x^2}}\, dx \\
&= -\int \left(-3x^2\right)\, dx \\
&= x^3
\end{aligned}
$$

$$
\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\, dx \\
&= (-1)^2 \int \frac{\left(96x^{\frac{5}{2}}\right)\left(-\frac{6}{x^{\frac{7}{2}}}\right)}{(16x^4)\left(\frac{12}{x^6}\right)}\, dx \\
&= \int \frac{-\frac{576}{x}}{\frac{192}{x^2}}\, dx \\
&= \int (-3x)\, dx \\
&= -\frac{3x^2}{2}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x)W_3(x)}{aW(x)}\,dx \\
&= (-1)^1 \int \frac{\left(96x^{\frac{5}{2}}\right)\left(\frac{2}{x^{\frac{3}{2}}}\right)}{\left(16x^4\right)\left(\frac{12}{x^6}\right)}\,dx \\
&= -\int \frac{192x}{\frac{192}{x^2}}\,dx \\
&= -\int \left(x^3\right)\,dx \\
&= -\frac{x^4}{4}
\end{aligned}
$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x)W_4(x)}{aW(x)}\,dx \\
&= (-1)^0 \int \frac{\left(96x^{\frac{5}{2}}\right)\left(\frac{2}{x^{\frac{9}{2}}}\right)}{\left(16x^4\right)\left(\frac{12}{x^6}\right)}\,dx \\
&= \int \frac{\frac{192}{x^2}}{\frac{192}{x^2}}\,dx \\
&= \int (1)\,dx \\
&= x
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1y_1 + U_2y_2 + U_3y_3 + U_4y_4
$$

Hence

$$
\begin{aligned}
y_p = &\left(x^3\right)\left(\frac{1}{\sqrt{x}}\right) \\
&+ \left(-\frac{3x^2}{2}\right)\left(\sqrt{x}\right) \\
&+ \left(-\frac{x^4}{4}\right)\left(\frac{1}{x^{\frac{3}{2}}}\right) \\
&+ (x)\left(x^{\frac{3}{2}}\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \frac{x^{\frac{5}{2}}}{4}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(\frac{c_1}{\sqrt{x}} + \sqrt{x}\, c_2 + \frac{c_3}{x^{\frac{3}{2}}} + c_4 x^{\frac{3}{2}}\right) + \left(\frac{x^{\frac{5}{2}}}{4}\right)
\end{aligned}
$$

Which simplifies to

$$
y = \frac{c_4 x^3 + c_2 x^2 + c_1 x + c_3}{x^{\frac{3}{2}}} + \frac{x^{\frac{5}{2}}}{4}
$$

Summary

The solution(s) found are the following

$$
y = \frac{c_4 x^3 + c_2 x^2 + c_1 x + c_3}{x^{\frac{3}{2}}} + \frac{x^{\frac{5}{2}}}{4} \tag{1}
$$

Verification of solutions

$$
y = \frac{c_4 x^3 + c_2 x^2 + c_1 x + c_3}{x^{\frac{3}{2}}} + \frac{x^{\frac{5}{2}}}{4}
$$

Verified OK.

ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_high_order, _with_linear_symmetries]]
```

$$\boxed{x^4y'''' - 4x^3y''' + 12x^2y'' - 24y'x + 24y = x^4}$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$x^4y'''' - 4x^3y''' + 12x^2y'' - 24y'x + 24y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned}
y' &= \lambda\, x^{\lambda-1} \\
y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\
y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \\
y'''' &= \lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4}
\end{aligned}$$

Substituting these back into

$$x^4y'''' - 4x^3y''' + 12x^2y'' - 24y'x + 24y = x^4$$

gives

$$
\begin{aligned}
&-24x\lambda\, x^{\lambda-1}+12x^{2}\lambda(\lambda-1)\, x^{\lambda-2}-4x^{3}\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3}\\
&+x^{4}\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4}+24x^{\lambda}=0
\end{aligned}
$$

Which simplifies to

$$
-24\lambda\, x^{\lambda}+12\lambda(\lambda-1)\, x^{\lambda}-4\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda}+\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda}+24x^{\lambda}=0
$$

And since $x^{\lambda}\neq 0$ then dividing through by x^{λ}, the above becomes

$$
-24\lambda+12\lambda(\lambda-1)-4\lambda(\lambda-1)\,(\lambda-2)+\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)+24=0
$$

Simplifying gives the characteristic equation as

$$
\lambda^{4}-10\lambda^{3}+35\lambda^{2}-50\lambda+24=0
$$

Solving the above gives the following roots

$$
\begin{aligned}
\lambda_{1}&=1\\
\lambda_{2}&=2\\
\lambda_{3}&=3\\
\lambda_{4}&=4
\end{aligned}
$$

This table summarises the result

root	multiplicity	type of root
1	1	real root
2	1	real root
3	1	real root
4	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^{λ} basis solution. Each real root of multiplicty two, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ and $c_3x^{\lambda}\ln(x)^2$ basis solutions, and so on. Each complex root $\alpha\pm i\beta$ of multiplicity one generates $x^{\alpha}(c_1\cos(\beta\ln(x))+c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha\pm i\beta$ of multiplicity two generates $\ln(x)\,x^{\alpha}(c_1\cos(\beta\ln(x))+c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha\pm i\beta$ of multiplicity three generates $\ln(x)^2\,x^{\alpha}(c_1\cos(\beta\ln(x))+c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = c_4x^4 + c_3x^3 + c_2x^2 + c_1x$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = x$$

$$y_2 = x^2$$

$$y_3 = x^3$$

$$y_4 = x^4$$

Now the particular solution to the given ODE is found

$$x^4y'''' - 4x^3y''' + 12x^2y'' - 24y'x + 24y = x^4$$

Let the particular solution be

$$y_p = U_1y_1 + U_2y_2 + U_3y_3 + U_4y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x)W_i(x)}{aW(x)}\,dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} x & x^2 & x^3 & x^4 \\ 1 & 2x & 3x^2 & 4x^3 \\ 0 & 2 & 6x & 12x^2 \\ 0 & 0 & 6 & 24x \end{bmatrix}$$

$$|W| = 12x^4$$

The determinant simplifies to

$$|W| = 12x^4$$

Now we determine W_i for each U_i.

$$W_1(x) = \det \begin{bmatrix} x^2 & x^3 & x^4 \\ 2x & 3x^2 & 4x^3 \\ 2 & 6x & 12x^2 \end{bmatrix}$$
$$= 2x^6$$

$$W_2(x) = \det \begin{bmatrix} x & x^3 & x^4 \\ 1 & 3x^2 & 4x^3 \\ 0 & 6x & 12x^2 \end{bmatrix}$$
$$= 6x^5$$

$$W_3(x) = \det \begin{bmatrix} x & x^2 & x^4 \\ 1 & 2x & 4x^3 \\ 0 & 2 & 12x^2 \end{bmatrix}$$
$$= 6x^4$$

$$W_4(x) = \det \begin{bmatrix} x & x^2 & x^3 \\ 1 & 2x & 3x^2 \\ 0 & 2 & 6x \end{bmatrix}$$
$$= 2x^3$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{4-1} \int \frac{F(x) W_1(x)}{a W(x)} \, dx \\ &= (-1)^3 \int \frac{(x^4)(2x^6)}{(x^4)(12x^4)} \, dx \\ &= -\int \frac{2x^{10}}{12x^8} \, dx \\ &= -\int \left(\frac{x^2}{6}\right) \, dx \\ &= -\frac{x^3}{18} \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x) W_2(x)}{a W(x)} \, dx \\
&= (-1)^2 \int \frac{(x^4)(6x^5)}{(x^4)(12x^4)} \, dx \\
&= \int \frac{6x^9}{12x^8} \, dx \\
&= \int \left(\frac{x}{2}\right) \, dx \\
&= \frac{x^2}{4}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x) W_3(x)}{a W(x)} \, dx \\
&= (-1)^1 \int \frac{(x^4)(6x^4)}{(x^4)(12x^4)} \, dx \\
&= -\int \frac{6x^8}{12x^8} \, dx \\
&= -\int \left(\frac{1}{2}\right) \, dx \\
&= -\frac{x}{2}
\end{aligned}
$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x) W_4(x)}{a W(x)} \, dx \\
&= (-1)^0 \int \frac{(x^4)(2x^3)}{(x^4)(12x^4)} \, dx \\
&= \int \frac{2x^7}{12x^8} \, dx \\
&= \int \left(\frac{1}{6x}\right) \, dx \\
&= \frac{\ln(x)}{6}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4
$$

Hence

$$
\begin{aligned}
y_p = &\left(-\frac{x^3}{18}\right)(x) \\
&+\left(\frac{x^2}{4}\right)(x^2) \\
&+\left(-\frac{x}{2}\right)(x^3) \\
&+\left(\frac{\ln(x)}{6}\right)(x^4)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \frac{x^4(-11+6\ln(x))}{36}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_4x^4 + c_3x^3 + c_2x^2 + c_1x\right) + \left(\frac{x^4(-11+6\ln(x))}{36}\right)
\end{aligned}
$$

Which simplifies to

$$
y = x\left(c_4x^3 + c_3x^2 + c_2x + c_1\right) + \frac{x^4(-11+6\ln(x))}{36}
$$

Summary

The solution(s) found are the following

$$
y = x\left(c_4x^3 + c_3x^2 + c_2x + c_1\right) + \frac{x^4(-11+6\ln(x))}{36} \tag{1}
$$

Verification of solutions

$$
y = x\left(c_4x^3 + c_3x^2 + c_2x + c_1\right) + \frac{x^4(-11+6\ln(x))}{36}
$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_high_order, _exact, _linear, _nonhomogeneous]]
```

$$\boxed{x^4y'''' + 6x^3y''' + 2x^2y'' - 4y'x + 4y = 12x^2}$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$x^4y'''' + 6x^3y''' + 2x^2y'' - 4y'x + 4y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned}
y' &= \lambda\, x^{\lambda-1} \\
y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\
y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \\
y'''' &= \lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4}
\end{aligned}$$

Substituting these back into

$$x^4y'''' + 6x^3y''' + 2x^2y'' - 4y'x + 4y = 12x^2$$

gives

$$-4x\lambda\, x^{\lambda-1}+2x^{2}\lambda(\lambda-1)\, x^{\lambda-2}+6x^{3}\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \\ +x^{4}\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4}+4x^{\lambda}=0$$

Which simplifies to

$$-4\lambda\, x^{\lambda}+2\lambda(\lambda-1)\, x^{\lambda}+6\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda}+\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda}+4x^{\lambda}=0$$

And since $x^{\lambda}\neq 0$ then dividing through by x^{λ}, the above becomes

$$-4\lambda+2\lambda(\lambda-1)+6\lambda(\lambda-1)\,(\lambda-2)+\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)+4=0$$

Simplifying gives the characteristic equation as

$$\lambda^{4}-5\lambda^{2}+4=0$$

Solving the above gives the following roots

$$\lambda_1 = 2$$
$$\lambda_2 = -2$$
$$\lambda_3 = 1$$
$$\lambda_4 = -1$$

This table summarises the result

root	multiplicity	type of root
-1	1	real root
-2	1	real root
1	1	real root
2	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^{λ} basis solution. Each real root of multiplicty two, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ and $c_3x^{\lambda}\ln(x)^{2}$ basis solutions, and so on. Each complex root $\alpha\pm i\beta$ of multiplicity one generates $x^{\alpha}(c_1\cos(\beta\ln(x))+c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha\pm i\beta$ of multiplicity two generates $\ln(x)\, x^{\alpha}(c_1\cos(\beta\ln(x))+c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha\pm i\beta$ of multiplicity three generates $\ln(x)^{2}\, x^{\alpha}(c_1\cos(\beta\ln(x))+c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = \frac{c_1}{x} + \frac{c_2}{x^2} + c_3 x + c_4 x^2$$

The fundamental set of solutions for the homogeneous solution are the following

$$y_1 = \frac{1}{x}$$
$$y_2 = \frac{1}{x^2}$$
$$y_3 = x$$
$$y_4 = x^2$$

Now the particular solution to the given ODE is found

$$x^4 y'''' + 6x^3 y''' + 2x^2 y'' - 4y' x + 4y = 12x^2$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)}\, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} \frac{1}{x} & \frac{1}{x^2} & x & x^2 \\ -\frac{1}{x^2} & -\frac{2}{x^3} & 1 & 2x \\ \frac{2}{x^3} & \frac{6}{x^4} & 0 & 2 \\ -\frac{6}{x^4} & -\frac{24}{x^5} & 0 & 0 \end{bmatrix}$$

$$|W| = -\frac{72}{x^6}$$

The determinant simplifies to

$$|W| = -\frac{72}{x^6}$$

Now we determine W_i for each U_i.

$$\begin{aligned} W_1(x) &= \det \begin{bmatrix} \frac{1}{x^2} & x & x^2 \\ -\frac{2}{x^3} & 1 & 2x \\ \frac{6}{x^4} & 0 & 2 \end{bmatrix} \\ &= \frac{12}{x^2} \end{aligned}$$

$$\begin{aligned} W_2(x) &= \det \begin{bmatrix} \frac{1}{x} & x & x^2 \\ -\frac{1}{x^2} & 1 & 2x \\ \frac{2}{x^3} & 0 & 2 \end{bmatrix} \\ &= \frac{6}{x} \end{aligned}$$

$$\begin{aligned} W_3(x) &= \det \begin{bmatrix} \frac{1}{x} & \frac{1}{x^2} & x^2 \\ -\frac{1}{x^2} & -\frac{2}{x^3} & 2x \\ \frac{2}{x^3} & \frac{6}{x^4} & 2 \end{bmatrix} \\ &= -\frac{12}{x^4} \end{aligned}$$

$$\begin{aligned} W_4(x) &= \det \begin{bmatrix} \frac{1}{x} & \frac{1}{x^2} & x \\ -\frac{1}{x^2} & -\frac{2}{x^3} & 1 \\ \frac{2}{x^3} & \frac{6}{x^4} & 0 \end{bmatrix} \\ &= -\frac{6}{x^5} \end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned}
U_1 &= (-1)^{4-1} \int \frac{F(x)W_1(x)}{aW(x)}\, dx \\
&= (-1)^3 \int \frac{(12x^2)\left(\frac{12}{x^2}\right)}{(x^4)\left(-\frac{72}{x^6}\right)}\, dx \\
&= -\int \frac{144}{-\frac{72}{x^2}}\, dx \\
&= -\int \left(-2x^2\right)\, dx \\
&= \frac{2x^3}{3}
\end{aligned}$$

$$\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\, dx \\
&= (-1)^2 \int \frac{(12x^2)\left(\frac{6}{x}\right)}{(x^4)\left(-\frac{72}{x^6}\right)}\, dx \\
&= \int \frac{72x}{-\frac{72}{x^2}}\, dx \\
&= \int \left(-x^3\right)\, dx \\
&= -\frac{x^4}{4}
\end{aligned}$$

$$\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x)W_3(x)}{aW(x)}\, dx \\
&= (-1)^1 \int \frac{(12x^2)\left(-\frac{12}{x^4}\right)}{(x^4)\left(-\frac{72}{x^6}\right)}\, dx \\
&= -\int \frac{-\frac{144}{x^2}}{-\frac{72}{x^2}}\, dx \\
&= -\int (2)\, dx \\
&= -2x
\end{aligned}$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x)W_4(x)}{aW(x)}\,dx \\
&= (-1)^0 \int \frac{(12x^2)\left(-\frac{6}{x^5}\right)}{(x^4)\left(-\frac{72}{x^6}\right)}\,dx \\
&= \int \frac{-\frac{72}{x^3}}{-\frac{72}{x^2}}\,dx \\
&= \int \left(\frac{1}{x}\right)\,dx \\
&= \ln(x)
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1y_1 + U_2y_2 + U_3y_3 + U_4y_4
$$

Hence

$$
\begin{aligned}
y_p = &\left(\frac{2x^3}{3}\right)\left(\frac{1}{x}\right) \\
&+ \left(-\frac{x^4}{4}\right)\left(\frac{1}{x^2}\right) \\
&+ (-2x)(x) \\
&+ (\ln(x))\left(x^2\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = x^2\left(-\frac{19}{12} + \ln(x)\right)
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(\frac{c_1}{x} + \frac{c_2}{x^2} + c_3x + c_4x^2\right) + \left(x^2\left(-\frac{19}{12} + \ln(x)\right)\right)
\end{aligned}
$$

<u>Summary</u>

The solution(s) found are the following

$$
y = \frac{c_1}{x} + \frac{c_2}{x^2} + c_3x + c_4x^2 + x^2\left(-\frac{19}{12} + \ln(x)\right) \tag{1}
$$

<u>Verification of solutions</u>

$$
y = \frac{c_1}{x} + \frac{c_2}{x^2} + c_3x + c_4x^2 + x^2\left(-\frac{19}{12} + \ln(x)\right)
$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_3rd_order, _with_linear_symmetries]]
```

$$\boxed{x^3y''' - 2x^2y'' + 3y'x - 3y = 4x}$$

With initial conditions

$$[y(1) = 4, y'(1) = 4, y''(1) = 2]$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$x^3y''' - 2x^2y'' + 3y'x - 3y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned}y' &= \lambda\, x^{\lambda-1} \\ y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\ y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3}\end{aligned}$$

Substituting these back into

$$x^3y''' - 2x^2y'' + 3y'x - 3y = 4x$$

gives

$$3x\lambda\, x^{\lambda-1} - 2x^2\lambda(\lambda-1)\, x^{\lambda-2} + x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} - 3x^{\lambda} = 0$$

Which simplifies to

$$3\lambda\, x^{\lambda} - 2\lambda(\lambda-1)\, x^{\lambda} + \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda} - 3x^{\lambda} = 0$$

And since $x^{\lambda} \neq 0$ then dividing through by x^{λ}, the above becomes

$$3\lambda - 2\lambda(\lambda-1) + \lambda(\lambda-1)\,(\lambda-2) - 3 = 0$$

Simplifying gives the characteristic equation as

$$(\lambda-3)\,(\lambda-1)^2 = 0$$

Solving the above gives the following roots

$$\lambda_1 = 3$$
$$\lambda_2 = 1$$
$$\lambda_3 = 1$$

This table summarises the result

root	multiplicity	type of root
1	2	real root
3	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^{λ} basis solution. Each real root of multiplicty two, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ and $c_3x^{\lambda}\ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^{\alpha}(c_1\cos(\beta\ln(x)) + c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x)\, x^{\alpha}(c_1\cos(\beta\ln(x)) + c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2\, x^{\alpha}(c_1\cos(\beta\ln(x)) + c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = c_1x + \ln(x)\, c_2x + c_3x^3$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= x \\
y_2 &= x \ln(x) \\
y_3 &= x^3
\end{aligned}
$$

Now the particular solution to the given ODE is found

$$x^3 y''' - 2x^2 y'' + 3y'x - 3y = 4x$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$
\begin{aligned}
W &= \begin{bmatrix} x & x \ln(x) & x^3 \\ 1 & \ln(x) + 1 & 3x^2 \\ 0 & \frac{1}{x} & 6x \end{bmatrix} \\
|W| &= 4x^2
\end{aligned}
$$

The determinant simplifies to

$$|W| = 4x^2$$

Now we determine W_i for each U_i.

$$\begin{aligned}W_1(x) &= \det\begin{bmatrix} x\ln(x) & x^3 \\ \ln(x)+1 & 3x^2 \end{bmatrix} \\ &= x^3(2\ln(x)-1)\end{aligned}$$

$$\begin{aligned}W_2(x) &= \det\begin{bmatrix} x & x^3 \\ 1 & 3x^2 \end{bmatrix} \\ &= 2x^3\end{aligned}$$

$$\begin{aligned}W_3(x) &= \det\begin{bmatrix} x & x\ln(x) \\ 1 & \ln(x)+1 \end{bmatrix} \\ &= x\end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned}U_1 &= (-1)^{3-1}\int \frac{F(x)W_1(x)}{aW(x)}\,dx \\ &= (-1)^2\int \frac{(4x)\left(x^3(2\ln(x)-1)\right)}{(x^3)(4x^2)}\,dx \\ &= \int \frac{4x^4(2\ln(x)-1)}{4x^5}\,dx \\ &= \int \left(\frac{2\ln(x)-1}{x}\right)dx \\ &= \ln(x)^2-\ln(x)\end{aligned}$$

$$\begin{aligned}U_2 &= (-1)^{3-2}\int \frac{F(x)W_2(x)}{aW(x)}\,dx \\ &= (-1)^1\int \frac{(4x)(2x^3)}{(x^3)(4x^2)}\,dx \\ &= -\int \frac{8x^4}{4x^5}\,dx \\ &= -\int \left(\frac{2}{x}\right)dx \\ &= -2\ln(x)\end{aligned}$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x)W_3(x)}{aW(x)}\, dx \\
&= (-1)^0 \int \frac{(4x)\,(x)}{(x^3)\,(4x^2)}\, dx \\
&= \int \frac{4x^2}{4x^5}\, dx \\
&= \int \left(\frac{1}{x^3}\right) dx \\
&= -\frac{1}{2x^2}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Hence

$$
\begin{aligned}
y_p = &\left(\ln(x)^2 - \ln(x)\right)(x) \\
&+ (-2\ln(x))\,(x\ln(x)) \\
&+ \left(-\frac{1}{2x^2}\right)(x^3)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = x\left(-\frac{1}{2} - \ln(x)^2 - \ln(x)\right)
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1 x + \ln(x)\, c_2 x + c_3 x^3\right) + \left(x\left(-\frac{1}{2} - \ln(x)^2 - \ln(x)\right)\right)
\end{aligned}
$$

Which simplifies to

$$
y = x\left(c_3 x^2 + c_2 \ln(x) + c_1\right) + x\left(-\frac{1}{2} - \ln(x)^2 - \ln(x)\right)
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = x\left(c_3 x^2 + c_2 \ln(x) + c_1\right) + x\left(-\frac{1}{2} - \ln(x)^2 - \ln(x)\right) \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 4$ and $x = 1$ in the above gives

$$4 = c_3 + c_1 - \frac{1}{2} \tag{1A}$$

Taking derivative of the solution gives

$$y' = c_3 x^2 + c_2 \ln(x) + c_1 + x\left(2c_3 x + \frac{c_2}{x}\right) - \frac{1}{2} - \ln(x)^2 - \ln(x) + x\left(-\frac{2\ln(x)}{x} - \frac{1}{x}\right)$$

substituting $y' = 4$ and $x = 1$ in the above gives

$$4 = c_1 + c_2 + 3c_3 - \frac{3}{2} \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = 4c_3 x + \frac{2c_2}{x} + x\left(2c_3 - \frac{c_2}{x^2}\right) - \frac{4\ln(x)}{x} - \frac{2}{x} + x\left(-\frac{1}{x^2} + \frac{2\ln(x)}{x^2}\right)$$

substituting $y'' = 2$ and $x = 1$ in the above gives

$$2 = c_2 + 6c_3 - 3 \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$\begin{aligned} c_1 &= \frac{7}{2} \\ c_2 &= -1 \\ c_3 &= 1 \end{aligned}$$

Substituting these values back in above solution results in

$$y = -x\ln(x)^2 + x^3 - 2x\ln(x) + 3x$$

Which simplifies to

$$y = \left(x^2 - \ln(x)^2 - 2\ln(x) + 3\right) x$$

Summary
The solution(s) found are the following

$$y = \left(x^2 - \ln(x)^2 - 2\ln(x) + 3\right) x \tag{1}$$

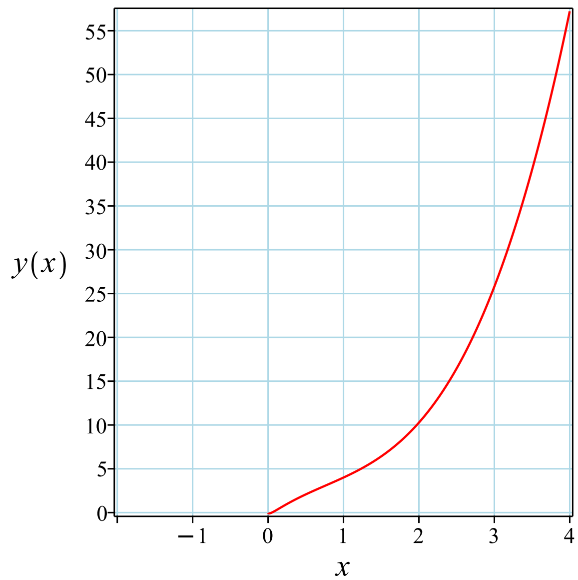

Figure 558: Solution plot

Verification of solutions

$$y = \left(x^2 - \ln(x)^2 - 2\ln(x) + 3\right)x$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_3rd_order, _with_linear_symmetries]]
```

$$\boxed{x^3y''' - 5x^2y'' + 14y'x - 18y = x^3}$$

With initial conditions

$$[y(1) = 0, y'(1) = 1, y''(1) = 7]$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$x^3y''' - 5x^2y'' + 14y'x - 18y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned} y' &= \lambda\, x^{\lambda-1} \\ y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\ y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \end{aligned}$$

Substituting these back into

$$x^3y''' - 5x^2y'' + 14y'x - 18y = x^3$$

gives

$$14x\lambda\, x^{\lambda-1} - 5x^2\lambda(\lambda-1)\, x^{\lambda-2} + x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} - 18x^\lambda = 0$$

Which simplifies to

$$14\lambda\, x^\lambda - 5\lambda(\lambda-1)\, x^\lambda + \lambda(\lambda-1)\,(\lambda-2)\, x^\lambda - 18x^\lambda = 0$$

And since $x^\lambda \neq 0$ then dividing through by x^λ, the above becomes

$$14\lambda - 5\lambda(\lambda-1) + \lambda(\lambda-1)\,(\lambda-2) - 18 = 0$$

Simplifying gives the characteristic equation as

$$(\lambda-2)\,(\lambda-3)^2 = 0$$

Solving the above gives the following roots

$$\lambda_1 = 2$$
$$\lambda_2 = 3$$
$$\lambda_3 = 3$$

This table summarises the result

root	multiplicity	type of root
2	1	real root
3	2	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^λ basis solution. Each real root of multiplicty two, generates c_1x^λ and $c_2x^\lambda \ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^λ and $c_2x^\lambda \ln(x)$ and $c_3x^\lambda \ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^\alpha(c_1\cos(\beta\ln(x)) + c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x)\, x^\alpha(c_1\cos(\beta\ln(x)) + c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2\, x^\alpha(c_1\cos(\beta\ln(x)) + c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = c_2 x^3 + c_1 x^2 + c_3 \ln(x)\, x^3$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= x^2 \\ y_2 &= x^3 \\ y_3 &= x^3 \ln(x) \end{aligned}$$

Now the particular solution to the given ODE is found

$$x^3 y''' - 5x^2 y'' + 14y'x - 18y = x^3$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)}\, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} x^2 & x^3 & x^3 \ln(x) \\ 2x & 3x^2 & x^2(1 + 3\ln(x)) \\ 2 & 6x & x(6\ln(x) + 5) \end{bmatrix}$$

$$|W| = x^5$$

The determinant simplifies to

$$|W| = x^5$$

Now we determine W_i for each U_i.

$$\begin{aligned} W_1(x) &= \det \begin{bmatrix} x^3 & x^3 \ln(x) \\ 3x^2 & x^2(1 + 3\ln(x)) \end{bmatrix} \\ &= x^5 \end{aligned}$$

$$\begin{aligned} W_2(x) &= \det \begin{bmatrix} x^2 & x^3 \ln(x) \\ 2x & x^2(1 + 3\ln(x)) \end{bmatrix} \\ &= x^4(\ln(x) + 1) \end{aligned}$$

$$\begin{aligned} W_3(x) &= \det \begin{bmatrix} x^2 & x^3 \\ 2x & 3x^2 \end{bmatrix} \\ &= x^4 \end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{3-1} \int \frac{F(x)W_1(x)}{aW(x)}\, dx \\ &= (-1)^2 \int \frac{(x^3)(x^5)}{(x^3)(x^5)}\, dx \\ &= \int \frac{x^8}{x^8}\, dx \\ &= \int (1)\, dx \\ &= x \end{aligned}$$

$$\begin{aligned} U_2 &= (-1)^{3-2} \int \frac{F(x)W_2(x)}{aW(x)}\, dx \\ &= (-1)^1 \int \frac{(x^3)(x^4(\ln(x) + 1))}{(x^3)(x^5)}\, dx \\ &= -\int \frac{x^7(\ln(x) + 1)}{x^8}\, dx \\ &= -\int \left(\frac{\ln(x) + 1}{x}\right) dx \\ &= -\frac{\ln(x)^2}{2} - \ln(x) \end{aligned}$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x) W_3(x)}{a W(x)}\, dx \\
&= (-1)^0 \int \frac{(x^3)(x^4)}{(x^3)(x^5)}\, dx \\
&= \int \frac{x^7}{x^8}\, dx \\
&= \int \left(\frac{1}{x}\right) dx \\
&= \ln(x)
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Hence

$$
\begin{aligned}
y_p &= (x)(x^2) \\
&+ \left(-\frac{\ln(x)^2}{2} - \ln(x)\right)(x^3) \\
&+ (\ln(x))(x^3 \ln(x))
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = x^3 \left(1 + \frac{\ln(x)^2}{2} - \ln(x)\right)
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= (c_2 x^3 + c_1 x^2 + c_3 \ln(x) x^3) + \left(x^3 \left(1 + \frac{\ln(x)^2}{2} - \ln(x)\right)\right)
\end{aligned}
$$

Which simplifies to

$$
y = x^2(\ln(x) c_3 x + c_2 x + c_1) + x^3 \left(1 + \frac{\ln(x)^2}{2} - \ln(x)\right)
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$y = x^2(\ln(x) c_3 x + c_2 x + c_1) + x^3 \left(1 + \frac{\ln(x)^2}{2} - \ln(x)\right) \tag{1}$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 0$ and $x = 1$ in the above gives

$$0 = c_2 + c_1 + 1 \tag{1A}$$

Taking derivative of the solution gives

$$y' = 2x(\ln(x) c_3 x + c_2 x + c_1) + x^2(c_3 + \ln(x) c_3 + c_2) + 3x^2 \left(1 + \frac{\ln(x)^2}{2} - \ln(x)\right) + x^3 \left(\frac{\ln(x)}{x} - \frac{1}{x}\right)$$

substituting $y' = 1$ and $x = 1$ in the above gives

$$1 = 3c_2 + 2c_1 + c_3 + 2 \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = 2\ln(x) c_3 x + 2c_2 x + 2c_1 + 4x(c_3 + \ln(x) c_3 + c_2) + c_3 x + 6x \left(1 + \frac{\ln(x)^2}{2} - \ln(x)\right) + 6x^2 \left(\frac{\ln(x)}{x} -$$

substituting $y'' = 7$ and $x = 1$ in the above gives

$$7 = 6c_2 + 2c_1 + 5c_3 + 2 \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$\begin{aligned} c_1 &= 1 \\ c_2 &= -2 \\ c_3 &= 3 \end{aligned}$$

Substituting these values back in above solution results in

$$y = \frac{\ln(x)^2 x^3}{2} + 2x^3 \ln(x) - x^3 + x^2$$

Which simplifies to

$$y = \frac{(x \ln(x)^2 + 4x \ln(x) - 2x + 2) x^2}{2}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(x \ln \left(x\right)^{2}+4 x \ln \left(x\right)-2 x +2\right) x^{2}}{2} \tag{1}$$

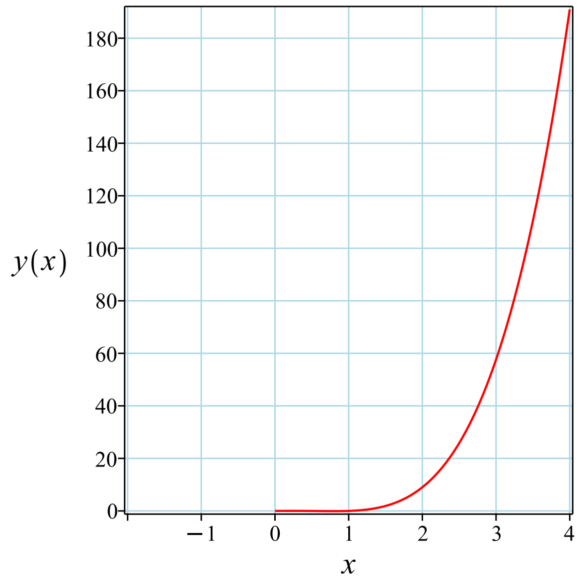

Figure 559: Solution plot

Verification of solutions

$$y = \frac{\left(x \ln \left(x\right)^{2}+4 x \ln \left(x\right)-2 x +2\right) x^{2}}{2}$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_3rd_order, _with_linear_symmetries]]
```

$$\boxed{x^3y''' - 6x^2y'' + 16y'x - 16y = 9x^4}$$

With initial conditions

$$[y(1) = 2, y'(1) = 1, y''(1) = 5]$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$x^3y''' - 6x^2y'' + 16y'x - 16y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned}
y' &= \lambda\, x^{\lambda-1} \\
y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\
y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3}
\end{aligned}$$

Substituting these back into

$$x^3y''' - 6x^2y'' + 16y'x - 16y = 9x^4$$

gives

$$16x\lambda\, x^{\lambda-1} - 6x^2\lambda(\lambda-1)\, x^{\lambda-2} + x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} - 16x^{\lambda} = 0$$

Which simplifies to

$$16\lambda\, x^{\lambda} - 6\lambda(\lambda-1)\, x^{\lambda} + \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda} - 16x^{\lambda} = 0$$

And since $x^{\lambda} \neq 0$ then dividing through by x^{λ}, the above becomes

$$16\lambda - 6\lambda(\lambda-1) + \lambda(\lambda-1)\,(\lambda-2) - 16 = 0$$

Simplifying gives the characteristic equation as

$$(\lambda-1)\,(\lambda-4)^2 = 0$$

Solving the above gives the following roots

$$\lambda_1 = 1$$
$$\lambda_2 = 4$$
$$\lambda_3 = 4$$

This table summarises the result

root	multiplicity	type of root
1	1	real root
4	2	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^{λ} basis solution. Each real root of multiplicty two, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ and $c_3x^{\lambda}\ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^{\alpha}(c_1\cos(\beta\ln(x)) + c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x)\, x^{\alpha}(c_1\cos(\beta\ln(x)) + c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2\, x^{\alpha}(c_1\cos(\beta\ln(x)) + c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = c_2x^4 + c_1x + c_3 \ln (x) x^4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= x \\ y_2 &= x^4 \\ y_3 &= \ln (x) x^4 \end{aligned}$$

Now the particular solution to the given ODE is found

$$x^3y''' - 6x^2y'' + 16y'x - 16y = 9x^4$$

Let the particular solution be

$$y_p = U_1y_1 + U_2y_2 + U_3y_3$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x)W_i(x)}{aW(x)} dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} x & x^4 & \ln (x) x^4 \\ 1 & 4x^3 & x^3(1 + 4\ln (x)) \\ 0 & 12x^2 & x^2(7 + 12\ln (x)) \end{bmatrix}$$

$$|W| = 9x^6$$

The determinant simplifies to

$$|W| = 9x^6$$

Now we determine W_i for each U_i.

$$W_1(x) = \det \begin{bmatrix} x^4 & \ln(x)\, x^4 \\ 4x^3 & x^3(1+4\ln(x)) \end{bmatrix}$$
$$= x^7$$

$$W_2(x) = \det \begin{bmatrix} x & \ln(x)\, x^4 \\ 1 & x^3(1+4\ln(x)) \end{bmatrix}$$
$$= x^4(1+3\ln(x))$$

$$W_3(x) = \det \begin{bmatrix} x & x^4 \\ 1 & 4x^3 \end{bmatrix}$$
$$= 3x^4$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{3-1} \int \frac{F(x)W_1(x)}{aW(x)}\, dx \\ &= (-1)^2 \int \frac{(9x^4)(x^7)}{(x^3)(9x^6)}\, dx \\ &= \int \frac{9x^{11}}{9x^9}\, dx \\ &= \int (x^2)\, dx \\ &= \frac{x^3}{3} \end{aligned}$$

$$\begin{aligned} U_2 &= (-1)^{3-2} \int \frac{F(x)W_2(x)}{aW(x)}\, dx \\ &= (-1)^1 \int \frac{(9x^4)(x^4(1+3\ln(x)))}{(x^3)(9x^6)}\, dx \\ &= -\int \frac{9x^8(1+3\ln(x))}{9x^9}\, dx \\ &= -\int \left(\frac{1+3\ln(x)}{x}\right) dx \\ &= -\frac{3\ln(x)^2}{2} - \ln(x) \end{aligned}$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x)W_3(x)}{aW(x)}\, dx \\
&= (-1)^0 \int \frac{(9x^4)(3x^4)}{(x^3)(9x^6)}\, dx \\
&= \int \frac{27x^8}{9x^9}\, dx \\
&= \int \left(\frac{3}{x}\right) dx \\
&= 3\ln(x)
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Hence

$$
\begin{aligned}
y_p = &\left(\frac{x^3}{3}\right)(x) \\
&+ \left(-\frac{3\ln(x)^2}{2} - \ln(x)\right)(x^4) \\
&+ (3\ln(x))\left(\ln(x)\, x^4\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \frac{x^4(9\ln(x)^2 - 6\ln(x) + 2)}{6}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_2x^4 + c_1x + c_3\ln(x)\, x^4\right) + \left(\frac{x^4(9\ln(x)^2 - 6\ln(x) + 2)}{6}\right)
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = c_2x^4 + c_1x + c_3\ln(x)\, x^4 + \frac{x^4(9\ln(x)^2 - 6\ln(x) + 2)}{6} \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 2$ and $x = 1$

in the above gives

$$2 = c_2 + c_1 + \frac{1}{3} \tag{1A}$$

Taking derivative of the solution gives

$$y' = 4c_2x^3 + c_1 + c_3x^3 + 4c_3 \ln(x)\, x^3 + \frac{2x^3 (9 \ln(x)^2 - 6 \ln(x) + 2)}{3} + \frac{x^4 \left(\frac{18 \ln(x)}{x} - \frac{6}{x}\right)}{6}$$

substituting $y' = 1$ and $x = 1$ in the above gives

$$1 = 4c_2 + c_1 + c_3 + \frac{1}{3} \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = 12c_2x^2 + 7c_3x^2 + 12c_3 \ln(x)\, x^2 + 2x^2 (9 \ln(x)^2 - 6 \ln(x) + 2) + \frac{4x^3 \left(\frac{18 \ln(x)}{x} - \frac{6}{x}\right)}{3} + \frac{x^4 \left(\frac{24}{x^2} - \frac{18 \ln(x)}{x^2}\right)}{6}$$

substituting $y'' = 5$ and $x = 1$ in the above gives

$$5 = 12c_2 + 7c_3 \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$c_1 = 3$$
$$c_2 = -\frac{4}{3}$$
$$c_3 = 3$$

Substituting these values back in above solution results in

$$y = \frac{3 \ln(x)^2 x^4}{2} + 2 \ln(x)\, x^4 - x^4 + 3x$$

<u>Summary</u>
The solution(s) found are the following

$$y = \frac{3 \ln(x)^2 x^4}{2} + 2 \ln(x)\, x^4 - x^4 + 3x \tag{1}$$

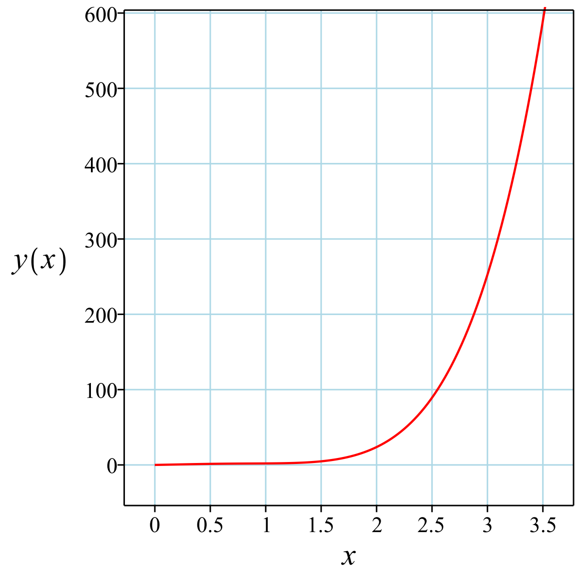

Figure 560: Solution plot

Verification of solutions

$$y = \frac{3\ln(x)^2 x^4}{2} + 2\ln(x)\, x^4 - x^4 + 3x$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_3rd_order, _exact, _linear, _nonhomogeneous]]
```

$$\boxed{x^3y''' + x^2y'' - 2y'x + 2y = x(x+1)}$$

With initial conditions

$$\left[y(-1) = -6, y'(-1) = \frac{43}{6}, y''(-1) = -\frac{5}{2}\right]$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$x^3y''' + x^2y'' - 2y'x + 2y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned}
y' &= \lambda\, x^{\lambda-1} \\
y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\
y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3}
\end{aligned}$$

Substituting these back into

$$x^3y''' + x^2y'' - 2y'x + 2y = x(x+1)$$

gives

$$-2x\lambda\, x^{\lambda-1} + x^2\lambda(\lambda-1)\, x^{\lambda-2} + x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} + 2x^\lambda = 0$$

Which simplifies to

$$-2\lambda\, x^\lambda + \lambda(\lambda-1)\, x^\lambda + \lambda(\lambda-1)\,(\lambda-2)\, x^\lambda + 2x^\lambda = 0$$

And since $x^\lambda \neq 0$ then dividing through by x^λ, the above becomes

$$-2\lambda + \lambda(\lambda-1) + \lambda(\lambda-1)\,(\lambda-2) + 2 = 0$$

Simplifying gives the characteristic equation as

$$\lambda^3 - 2\lambda^2 - \lambda + 2 = 0$$

Solving the above gives the following roots

$$\lambda_1 = 1$$
$$\lambda_2 = 2$$
$$\lambda_3 = -1$$

This table summarises the result

root	multiplicity	type of root
-1	1	real root
1	1	real root
2	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^λ basis solution. Each real root of multiplicty two, generates c_1x^λ and $c_2x^\lambda \ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^λ and $c_2x^\lambda \ln(x)$ and $c_3x^\lambda \ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^\alpha(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x)\, x^\alpha(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2\, x^\alpha(c_1 \cos(\beta \ln(x)) + c_2$ basis solutions. And so on. Using the above show that the solution is

$$
y = \frac{c_1}{x} + c_2 x + c_3 x^2
$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \frac{1}{x} \\
y_2 &= x \\
y_3 &= x^2
\end{aligned}
$$

Now the particular solution to the given ODE is found

$$
x^3 y''' + x^2 y'' - 2y'x + 2y = x(x+1)
$$

Let the particular solution be

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$
U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx
$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$
W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}
$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$
\begin{aligned}
W &= \begin{bmatrix} \frac{1}{x} & x & x^2 \\ -\frac{1}{x^2} & 1 & 2x \\ \frac{2}{x^3} & 0 & 2 \end{bmatrix} \\
|W| &= \frac{6}{x}
\end{aligned}
$$

The determinant simplifies to

$$|W| = \frac{6}{x}$$

Now we determine W_i for each U_i.

$$\begin{aligned} W_1(x) &= \det \begin{bmatrix} x & x^2 \\ 1 & 2x \end{bmatrix} \\ &= x^2 \end{aligned}$$

$$\begin{aligned} W_2(x) &= \det \begin{bmatrix} \frac{1}{x} & x^2 \\ -\frac{1}{x^2} & 2x \end{bmatrix} \\ &= 3 \end{aligned}$$

$$\begin{aligned} W_3(x) &= \det \begin{bmatrix} \frac{1}{x} & x \\ -\frac{1}{x^2} & 1 \end{bmatrix} \\ &= \frac{2}{x} \end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{3-1} \int \frac{F(x)W_1(x)}{aW(x)}\, dx \\ &= (-1)^2 \int \frac{(x(x+1))\,(x^2)}{(x^3)\left(\frac{6}{x}\right)}\, dx \\ &= \int \frac{x^3(x+1)}{6x^2}\, dx \\ &= \int \left(\frac{x(x+1)}{6}\right) dx \\ &= \frac{1}{18}x^3 + \frac{1}{12}x^2 \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{3-2} \int \frac{F(x) W_2(x)}{a W(x)}\, dx \\
&= (-1)^1 \int \frac{(x(x+1))\,(3)}{(x^3)\left(\frac{6}{x}\right)}\, dx \\
&= -\int \frac{3x(x+1)}{6x^2}\, dx \\
&= -\int \left(\frac{x+1}{2x}\right) dx \\
&= -\frac{x}{2} - \frac{\ln(x)}{2}
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x) W_3(x)}{a W(x)}\, dx \\
&= (-1)^0 \int \frac{(x(x+1))\left(\frac{2}{x}\right)}{(x^3)\left(\frac{6}{x}\right)}\, dx \\
&= \int \frac{2+2x}{6x^2}\, dx \\
&= \int \left(\frac{x+1}{3x^2}\right) dx \\
&= \frac{\ln(x)}{3} - \frac{1}{3x}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Hence

$$
\begin{aligned}
y_p = &\left(\frac{1}{18}x^3 + \frac{1}{12}x^2\right)\left(\frac{1}{x}\right) \\
&+ \left(-\frac{x}{2} - \frac{\ln(x)}{2}\right)(x) \\
&+ \left(\frac{\ln(x)}{3} - \frac{1}{3x}\right)(x^2)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \frac{x(12x\ln(x) - 18\ln(x) - 16x - 9)}{36}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(\frac{c_1}{x} + c_2 x + c_3 x^2\right) + \left(\frac{x(12x\ln(x) - 18\ln(x) - 16x - 9)}{36}\right)
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$y = \frac{c_1}{x} + c_2 x + c_3 x^2 + \frac{x(12x \ln(x) - 18\ln(x) - 16x - 9)}{36} \tag{1}$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = -6$ and $x = -1$ in the above gives

$$-6 = \frac{5i\pi}{6} - c_1 - c_2 + c_3 - \frac{7}{36} \tag{1A}$$

Taking derivative of the solution gives

$$y' = -\frac{c_1}{x^2} + c_2 + 2c_3 x + \frac{x\ln(x)}{3} - \frac{\ln(x)}{2} - \frac{4x}{9} - \frac{1}{4} + \frac{x\left(12\ln(x) - 4 - \frac{18}{x}\right)}{36}$$

substituting $y' = \frac{43}{6}$ and $x = -1$ in the above gives

$$\frac{43}{6} = -\frac{7i\pi}{6} - c_1 + c_2 - 2c_3 - \frac{7}{36} \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = \frac{2c_1}{x^3} + 2c_3 + \frac{2\ln(x)}{3} - \frac{2}{9} - \frac{1}{x} + \frac{x\left(\frac{12}{x} + \frac{18}{x^2}\right)}{36}$$

substituting $y'' = -\frac{5}{2}$ and $x = -1$ in the above gives

$$-\frac{5}{2} = \frac{2i\pi}{3} - 2c_1 + 2c_3 + \frac{11}{18} \tag{3A}$$

Equations {1A,2A,3A} are now solved for $\{c_1, c_2, c_3\}$. Solving for the constants gives

$$\begin{aligned} c_1 &= 0 \\ c_2 &= \frac{i\pi}{2} + \frac{17}{4} \\ c_3 &= -\frac{i\pi}{3} - \frac{14}{9} \end{aligned}$$

Substituting these values back in above solution results in

$$y = -\frac{i x^2 \pi}{3} + \frac{\ln(x) x^2}{3} + \frac{i x \pi}{2} - \frac{x\ln(x)}{2} - 2x^2 + 4x$$

Summary

The solution(s) found are the following

$$y = \frac{(-2ix\pi + 2x\ln(x) + 3i\pi - 3\ln(x) - 12x + 24)\, x}{6} \tag{1}$$

Verification of solutions

$$y = \frac{(-2ix\pi + 2x\ln(x) + 3i\pi - 3\ln(x) - 12x + 24)\,x}{6}$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_high_order, _exact, _linear, _nonhomogeneous]]
```

$$\boxed{x^4 y'''' + 3x^3 y''' - x^2 y'' + 2y'x - 2y = 9x^2}$$

With initial conditions

$$[y(1) = -7, y'(1) = -11, y''(1) = -5, y'''(1) = 6]$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$x^4 y'''' + 3x^3 y''' - x^2 y'' + 2y'x - 2y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned}
y' &= \lambda\, x^{\lambda-1} \\
y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\
y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \\
y'''' &= \lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4}
\end{aligned}$$

Substituting these back into

$$x^4y'''' + 3x^3y''' - x^2y'' + 2y'x - 2y = 9x^2$$

gives

$$\begin{aligned}2x\lambda\, x^{\lambda-1} - x^2\lambda(\lambda-1)\, x^{\lambda-2} + 3x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \\ + x^4\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4} - 2x^\lambda = 0\end{aligned}$$

Which simplifies to

$$2\lambda\, x^\lambda - \lambda(\lambda-1)\, x^\lambda + 3\lambda(\lambda-1)\,(\lambda-2)\, x^\lambda + \lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^\lambda - 2x^\lambda = 0$$

And since $x^\lambda \neq 0$ then dividing through by x^λ, the above becomes

$$2\lambda - \lambda(\lambda-1) + 3\lambda(\lambda-1)\,(\lambda-2) + \lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3) - 2 = 0$$

Simplifying gives the characteristic equation as

$$(\lambda+1)\,(\lambda-2)\,(\lambda-1)^2 = 0$$

Solving the above gives the following roots

$$\begin{aligned}\lambda_1 &= -1\\ \lambda_2 &= 2\\ \lambda_3 &= 1\\ \lambda_4 &= 1\end{aligned}$$

This table summarises the result

root	multiplicity	type of root
-1	1	real root
1	2	real root
2	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^λ basis solution. Each real root of multiplicty two, generates c_1x^λ and $c_2x^\lambda \ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^λ and $c_2x^\lambda \ln(x)$ and $c_3x^\lambda \ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^\alpha(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x)\, x^\alpha(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$

basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2 x^\alpha (c_1 \cos(\beta \ln(x)) + c_2$
basis solutions. And so on. Using the above show that the solution is

$$y = \frac{c_1}{x} + c_2 x + \ln(x) c_3 x + c_4 x^2$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= \frac{1}{x} \\ y_2 &= x \\ y_3 &= x \ln(x) \\ y_4 &= x^2 \end{aligned}$$

Now the particular solution to the given ODE is found

$$x^4 y'''' + 3x^3 y''' - x^2 y'' + 2y'x - 2y = 9x^2$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} \frac{1}{x} & x & x\ln(x) & x^2 \\ -\frac{1}{x^2} & 1 & \ln(x)+1 & 2x \\ \frac{2}{x^3} & 0 & \frac{1}{x} & 2 \\ -\frac{6}{x^4} & 0 & -\frac{1}{x^2} & 0 \end{bmatrix}$$

$$|W| = \frac{12}{x^3}$$

The determinant simplifies to

$$|W| = \frac{12}{x^3}$$

Now we determine W_i for each U_i.

$$W_1(x) = \det \begin{bmatrix} x & x\ln(x) & x^2 \\ 1 & \ln(x)+1 & 2x \\ 0 & \frac{1}{x} & 2 \end{bmatrix}$$

$$= x$$

$$W_2(x) = \det \begin{bmatrix} \frac{1}{x} & x\ln(x) & x^2 \\ -\frac{1}{x^2} & \ln(x)+1 & 2x \\ \frac{2}{x^3} & \frac{1}{x} & 2 \end{bmatrix}$$

$$= \frac{6\ln(x)-3}{x}$$

$$W_3(x) = \det \begin{bmatrix} \frac{1}{x} & x & x^2 \\ -\frac{1}{x^2} & 1 & 2x \\ \frac{2}{x^3} & 0 & 2 \end{bmatrix}$$

$$= \frac{6}{x}$$

$$W_4(x) = \det \begin{bmatrix} \frac{1}{x} & x & x\ln(x) \\ -\frac{1}{x^2} & 1 & \ln(x)+1 \\ \frac{2}{x^3} & 0 & \frac{1}{x} \end{bmatrix}$$

$$= \frac{4}{x^2}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned}
U_1 &= (-1)^{4-1} \int \frac{F(x)W_1(x)}{aW(x)} \, dx \\
&= (-1)^3 \int \frac{(9x^2)\,(x)}{(x^4)\left(\frac{12}{x^3}\right)} \, dx \\
&= -\int \frac{9x^3}{12x} \, dx \\
&= -\int \left(\frac{3x^2}{4}\right) dx \\
&= -\frac{x^3}{4}
\end{aligned}$$

$$\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)} \, dx \\
&= (-1)^2 \int \frac{(9x^2)\left(\frac{6\ln(x)-3}{x}\right)}{(x^4)\left(\frac{12}{x^3}\right)} \, dx \\
&= \int \frac{9x(6\ln(x)-3)}{12x} \, dx \\
&= \int \left(\frac{9\ln(x)}{2} - \frac{9}{4}\right) dx \\
&= -\frac{27x}{4} + \frac{9x\ln(x)}{2}
\end{aligned}$$

$$\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x)W_3(x)}{aW(x)} \, dx \\
&= (-1)^1 \int \frac{(9x^2)\left(\frac{6}{x}\right)}{(x^4)\left(\frac{12}{x^3}\right)} \, dx \\
&= -\int \frac{54x}{12x} \, dx \\
&= -\int \left(\frac{9}{2}\right) dx \\
&= -\frac{9x}{2}
\end{aligned}$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x) W_4(x)}{a W(x)}\, dx \\
&= (-1)^0 \int \frac{(9x^2)\left(\frac{4}{x^2}\right)}{(x^4)\left(\frac{12}{x^3}\right)}\, dx \\
&= \int \frac{36}{12x}\, dx \\
&= \int \left(\frac{3}{x}\right) dx \\
&= 3\ln(x)
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4
$$

Hence

$$
\begin{aligned}
y_p = &\left(-\frac{x^3}{4}\right)\left(\frac{1}{x}\right) \\
&+ \left(-\frac{27x}{4} + \frac{9x\ln(x)}{2}\right)(x) \\
&+ \left(-\frac{9x}{2}\right)(x\ln(x)) \\
&+ (3\ln(x))\left(x^2\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = x^2(-7 + 3\ln(x))
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(\frac{c_1}{x} + c_2 x + \ln(x) c_3 x + c_4 x^2\right) + \left(x^2(-7 + 3\ln(x))\right)
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = \frac{c_1}{x} + c_2 x + \ln(x) c_3 x + c_4 x^2 + x^2(-7 + 3\ln(x)) \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = -7$ and $x = 1$ in the above gives

$$
-7 = c_1 + c_2 + c_4 - 7 \tag{1A}
$$

Taking derivative of the solution gives

$$y' = -\frac{c_1}{x^2} + c_2 + c_3 + \ln(x)\, c_3 + 2c_4 x + 2x(-7 + 3\ln(x)) + 3x$$

substituting $y' = -11$ and $x = 1$ in the above gives

$$-11 = -c_1 + c_2 + c_3 + 2c_4 - 11 \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = \frac{2c_1}{x^3} + \frac{c_3}{x} + 2c_4 - 5 + 6\ln(x)$$

substituting $y'' = -5$ and $x = 1$ in the above gives

$$-5 = 2c_1 + c_3 + 2c_4 - 5 \tag{3A}$$

Taking three derivatives of the solution gives

$$y''' = -\frac{6c_1}{x^4} - \frac{c_3}{x^2} + \frac{6}{x}$$

substituting $y''' = 6$ and $x = 1$ in the above gives

$$6 = -6c_1 - c_3 + 6 \tag{4A}$$

Equations {1A,2A,3A,4A} are now solved for $\{c_1, c_2, c_3, c_4\}$. Solving for the constants gives

$$\begin{aligned} c_1 &= 0 \\ c_2 &= 0 \\ c_3 &= 0 \\ c_4 &= 0 \end{aligned}$$

Substituting these values back in above solution results in

$$y = 3\ln(x)\, x^2 - 7x^2$$

Which simplifies to

$$y = x^2(-7 + 3\ln(x))$$

Summary

The solution(s) found are the following

$$y = x^2(-7 + 3\ln(x)) \tag{1}$$

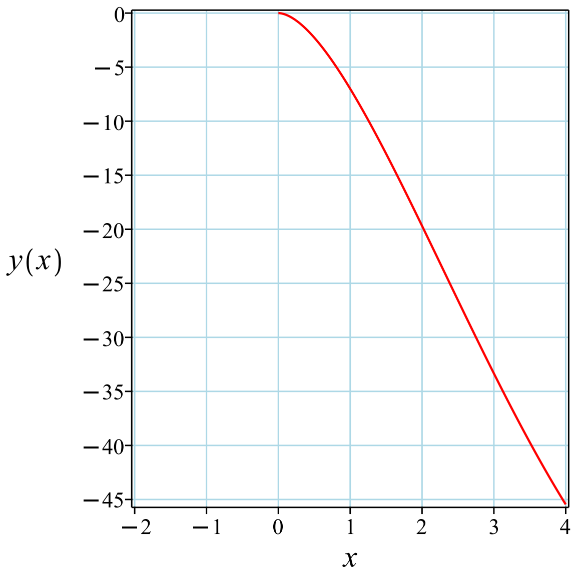

Figure 561: Solution plot

Verification of solutions

$$y = x^2(-7 + 3\ln(x))$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_high_order, _exact, _linear, _nonhomogeneous]]
```

$$\boxed{4x^4y'''' + 24x^3y''' + 23x^2y'' - y'x + y = 6x}$$

With initial conditions

$$\left[y(1) = 2, y'(1) = 0, y''(1) = 4, y'''(1) = -\frac{37}{4}\right]$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$4x^4y'''' + 24x^3y''' + 23x^2y'' - y'x + y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned} y' &= \lambda\, x^{\lambda-1} \\ y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\ y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \\ y'''' &= \lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4} \end{aligned}$$

Substituting these back into

$$4x^4y'''' + 24x^3y''' + 23x^2y'' - y'x + y = 6x$$

gives

$$-x\lambda\, x^{\lambda-1} + 23x^2\lambda(\lambda-1)\, x^{\lambda-2} + 24x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} + 4x^4\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4} + x^\lambda = 0$$

Which simplifies to

$$-\lambda\, x^\lambda + 23\lambda(\lambda-1)\, x^\lambda + 24\lambda(\lambda-1)\,(\lambda-2)\, x^\lambda + 4\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^\lambda + x^\lambda = 0$$

And since $x^\lambda \neq 0$ then dividing through by x^λ, the above becomes

$$-\lambda + 23\lambda(\lambda-1) + 24\lambda(\lambda-1)\,(\lambda-2) + 4\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3) + 1 = 0$$

Simplifying gives the characteristic equation as

$$4\lambda^4 - 5\lambda^2 + 1 = 0$$

Solving the above gives the following roots

$$\lambda_1 = 1$$
$$\lambda_2 = -1$$
$$\lambda_3 = -\frac{1}{2}$$
$$\lambda_4 = \frac{1}{2}$$

This table summarises the result

root	multiplicity	type of root
-1	1	real root
1	1	real root
$-\frac{1}{2}$	1	real root
$\frac{1}{2}$	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^λ basis solution. Each real root of multiplicty two, generates c_1x^λ and $c_2x^\lambda \ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^λ and

$c_2 x^\lambda \ln(x)$ and $c_3 x^\lambda \ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^\alpha(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x)\, x^\alpha(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2\, x^\alpha(c_1 \cos(\beta \ln(x)) + c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = \frac{c_1}{x} + c_2 x + \frac{c_3}{\sqrt{x}} + c_4 \sqrt{x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= \frac{1}{x} \\ y_2 &= x \\ y_3 &= \frac{1}{\sqrt{x}} \\ y_4 &= \sqrt{x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$4x^4 y'''' + 24x^3 y''' + 23x^2 y'' - y'x + y = 6x$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)}\, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W=\begin{bmatrix}\frac{1}{x} & x & \frac{1}{\sqrt{x}} & \sqrt{x}\\ -\frac{1}{x^2} & 1 & -\frac{1}{2x^{\frac{3}{2}}} & \frac{1}{2\sqrt{x}}\\ \frac{2}{x^3} & 0 & \frac{3}{4x^{\frac{5}{2}}} & -\frac{1}{4x^{\frac{3}{2}}}\\ -\frac{6}{x^4} & 0 & -\frac{15}{8x^{\frac{7}{2}}} & \frac{3}{8x^{\frac{5}{2}}}\end{bmatrix}$$
$$|W|=\frac{9}{8x^6}$$

The determinant simplifies to

$$|W|=\frac{9}{8x^6}$$

Now we determine W_i for each U_i.

$$W_1(x)=\det\begin{bmatrix}x & \frac{1}{\sqrt{x}} & \sqrt{x}\\ 1 & -\frac{1}{2x^{\frac{3}{2}}} & \frac{1}{2\sqrt{x}}\\ 0 & \frac{3}{4x^{\frac{5}{2}}} & -\frac{1}{4x^{\frac{3}{2}}}\end{bmatrix}$$
$$=\frac{3}{4x^2}$$

$$W_2(x)=\det\begin{bmatrix}\frac{1}{x} & \frac{1}{\sqrt{x}} & \sqrt{x}\\ -\frac{1}{x^2} & -\frac{1}{2x^{\frac{3}{2}}} & \frac{1}{2\sqrt{x}}\\ \frac{2}{x^3} & \frac{3}{4x^{\frac{5}{2}}} & -\frac{1}{4x^{\frac{3}{2}}}\end{bmatrix}$$
$$=\frac{3}{4x^4}$$

$$W_3(x)=\det\begin{bmatrix}\frac{1}{x} & x & \sqrt{x}\\ -\frac{1}{x^2} & 1 & \frac{1}{2\sqrt{x}}\\ \frac{2}{x^3} & 0 & -\frac{1}{4x^{\frac{3}{2}}}\end{bmatrix}$$
$$=-\frac{3}{2x^{\frac{5}{2}}}$$

$$W_4(x) = \det \begin{bmatrix} \frac{1}{x} & x & \frac{1}{\sqrt{x}} \\ -\frac{1}{x^2} & 1 & -\frac{1}{2x^{\frac{3}{2}}} \\ \frac{2}{x^3} & 0 & \frac{3}{4x^{\frac{5}{2}}} \end{bmatrix}$$
$$= -\frac{3}{2x^{\frac{7}{2}}}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{4-1} \int \frac{F(x)W_1(x)}{aW(x)}\, dx \\ &= (-1)^3 \int \frac{(6x)\left(\frac{3}{4x^2}\right)}{(4x^4)\left(\frac{9}{8x^6}\right)}\, dx \\ &= -\int \frac{\frac{9}{2x}}{\frac{9}{2x^2}}\, dx \\ &= -\int (x)\, dx \\ &= -\frac{x^2}{2} \end{aligned}$$

$$\begin{aligned} U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\, dx \\ &= (-1)^2 \int \frac{(6x)\left(\frac{3}{4x^4}\right)}{(4x^4)\left(\frac{9}{8x^6}\right)}\, dx \\ &= \int \frac{\frac{9}{2x^3}}{\frac{9}{2x^2}}\, dx \\ &= \int \left(\frac{1}{x}\right)\, dx \\ &= \ln(x) \end{aligned}$$

$$
\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x) W_3(x)}{a W(x)}\, dx \\
&= (-1)^1 \int \frac{(6x)\left(-\frac{3}{2x^{\frac{5}{2}}}\right)}{(4x^4)\left(\frac{9}{8x^6}\right)}\, dx \\
&= -\int \frac{-\frac{9}{x^{\frac{3}{2}}}}{\frac{9}{2x^2}}\, dx \\
&= -\int \left(-2\sqrt{x}\right) dx \\
&= \frac{4x^{\frac{3}{2}}}{3}
\end{aligned}
$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x) W_4(x)}{a W(x)}\, dx \\
&= (-1)^0 \int \frac{(6x)\left(-\frac{3}{2x^{\frac{7}{2}}}\right)}{(4x^4)\left(\frac{9}{8x^6}\right)}\, dx \\
&= \int \frac{-\frac{9}{x^{\frac{5}{2}}}}{\frac{9}{2x^2}}\, dx \\
&= \int \left(-\frac{2}{\sqrt{x}}\right) dx \\
&= -4\sqrt{x}
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4
$$

Hence

$$
\begin{aligned}
y_p = &\left(-\frac{x^2}{2}\right)\left(\frac{1}{x}\right) \\
&+ (\ln(x))(x) \\
&+ \left(\frac{4x^{\frac{3}{2}}}{3}\right)\left(\frac{1}{\sqrt{x}}\right) \\
&+ \left(-4\sqrt{x}\right)\left(\sqrt{x}\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = x\left(-\frac{19}{6} + \ln(x)\right)
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(\frac{c_1}{x} + c_2 x + \frac{c_3}{\sqrt{x}} + c_4\sqrt{x}\right) + \left(x\left(-\frac{19}{6} + \ln(x)\right)\right)
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = \frac{c_1}{x} + c_2 x + \frac{c_3}{\sqrt{x}} + c_4\sqrt{x} + x\left(-\frac{19}{6} + \ln(x)\right) \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = 2$ and $x = 1$ in the above gives

$$
2 = c_1 + c_2 - \frac{19}{6} + c_3 + c_4 \tag{1A}
$$

Taking derivative of the solution gives

$$
y' = -\frac{c_1}{x^2} + c_2 - \frac{c_3}{2x^{\frac{3}{2}}} + \frac{c_4}{2\sqrt{x}} - \frac{13}{6} + \ln(x)
$$

substituting $y' = 0$ and $x = 1$ in the above gives

$$
0 = -c_1 + c_2 - \frac{13}{6} - \frac{c_3}{2} + \frac{c_4}{2} \tag{2A}
$$

Taking two derivatives of the solution gives

$$
y'' = \frac{2c_1}{x^3} + \frac{3c_3}{4x^{\frac{5}{2}}} - \frac{c_4}{4x^{\frac{3}{2}}} + \frac{1}{x}
$$

substituting $y'' = 4$ and $x = 1$ in the above gives

$$
4 = 2c_1 + 1 + \frac{3c_3}{4} - \frac{c_4}{4} \tag{3A}
$$

Taking three derivatives of the solution gives

$$
y''' = -\frac{6c_1}{x^4} - \frac{15c_3}{8x^{\frac{7}{2}}} + \frac{3c_4}{8x^{\frac{5}{2}}} - \frac{1}{x^2}
$$

substituting $y''' = -\frac{37}{4}$ and $x = 1$ in the above gives

$$
-\frac{37}{4} = -6c_1 - 1 - \frac{15c_3}{8} + \frac{3c_4}{8} \tag{4A}
$$

Equations {1A,2A,3A,4A} are now solved for $\{c_1, c_2, c_3, c_4\}$. Solving for the constants gives

$$c_1 = 1$$
$$c_2 = \frac{25}{6}$$
$$c_3 = 1$$
$$c_4 = -1$$

Substituting these values back in above solution results in

$$y = \frac{x^{\frac{5}{2}} \ln(x) - x^2 + x^{\frac{5}{2}} + \sqrt{x} + x}{x^{\frac{3}{2}}}$$

Summary

The solution(s) found are the following

$$y = \frac{x^{\frac{5}{2}} \ln(x) - x^2 + x^{\frac{5}{2}} + \sqrt{x} + x}{x^{\frac{3}{2}}} \tag{1}$$

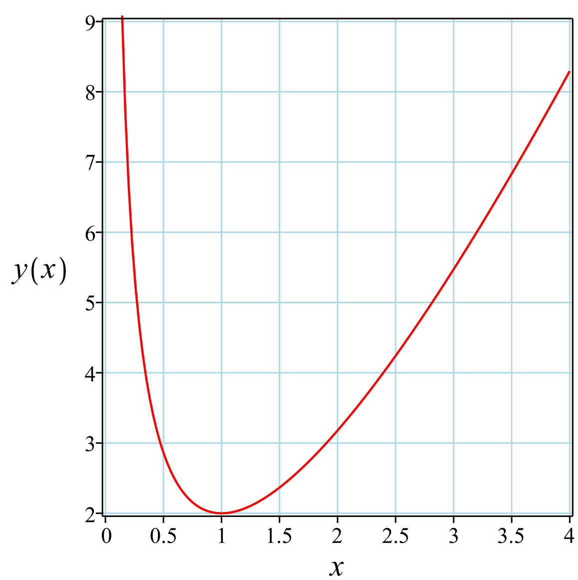

Figure 562: Solution plot

Verification of solutions

$$y = \frac{x^{\frac{5}{2}} \ln(x) - x^2 + x^{\frac{5}{2}} + \sqrt{x} + x}{x^{\frac{3}{2}}}$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_high_order, _exact, _linear, _nonhomogeneous]]
```

$$\boxed{x^4y'''' + 5x^3y''' - 3x^2y'' - 6y'x + 6y = 40x^3}$$

With initial conditions

$$[y(-1) = -1, y'(-1) = -7, y''(-1) = -1, y'''(-1) = -31]$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$x^4y'''' + 5x^3y''' - 3x^2y'' - 6y'x + 6y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned}
y' &= \lambda\, x^{\lambda-1} \\
y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\
y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \\
y'''' &= \lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4}
\end{aligned}$$

Substituting these back into

$$x^4y'''' + 5x^3y''' - 3x^2y'' - 6y'x + 6y = 40x^3$$

gives

$$-6x\lambda\, x^{\lambda-1} - 3x^2\lambda(\lambda-1)\, x^{\lambda-2} + 5x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \\ + x^4\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4} + 6x^\lambda = 0$$

Which simplifies to

$$-6\lambda\, x^\lambda - 3\lambda(\lambda-1)\, x^\lambda + 5\lambda(\lambda-1)\,(\lambda-2)\, x^\lambda + \lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^\lambda + 6x^\lambda = 0$$

And since $x^\lambda \neq 0$ then dividing through by x^λ, the above becomes

$$-6\lambda - 3\lambda(\lambda-1) + 5\lambda(\lambda-1)\,(\lambda-2) + \lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3) + 6 = 0$$

Simplifying gives the characteristic equation as

$$\lambda^4 - \lambda^3 - 7\lambda^2 + \lambda + 6 = 0$$

Solving the above gives the following roots

$$\lambda_1 = 1$$
$$\lambda_2 = 3$$
$$\lambda_3 = -2$$
$$\lambda_4 = -1$$

This table summarises the result

root	multiplicity	type of root
-1	1	real root
-2	1	real root
1	1	real root
3	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^λ basis solution. Each real root of multiplicty two, generates c_1x^λ and $c_2x^\lambda \ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^λ and $c_2x^\lambda \ln(x)$ and $c_3x^\lambda \ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^\alpha(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x)\, x^\alpha(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$

basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2 x^\alpha (c_1 \cos(\beta \ln(x)) + c_2$
basis solutions. And so on. Using the above show that the solution is

$$y = \frac{c_1}{x} + \frac{c_2}{x^2} + c_3 x + c_4 x^3$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= \frac{1}{x} \\ y_2 &= \frac{1}{x^2} \\ y_3 &= x \\ y_4 &= x^3 \end{aligned}$$

Now the particular solution to the given ODE is found

$$x^4 y'''' + 5x^3 y''' - 3x^2 y'' - 6y'x + 6y = 40x^3$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} \frac{1}{x} & \frac{1}{x^2} & x & x^3 \\ -\frac{1}{x^2} & -\frac{2}{x^3} & 1 & 3x^2 \\ \frac{2}{x^3} & \frac{6}{x^4} & 0 & 6x \\ -\frac{6}{x^4} & -\frac{24}{x^5} & 0 & 6 \end{bmatrix}$$
$$|W| = -\frac{240}{x^5}$$

The determinant simplifies to

$$|W| = -\frac{240}{x^5}$$

Now we determine W_i for each U_i.

$$W_1(x) = \det \begin{bmatrix} \frac{1}{x^2} & x & x^3 \\ -\frac{2}{x^3} & 1 & 3x^2 \\ \frac{6}{x^4} & 0 & 6x \end{bmatrix}$$
$$= \frac{30}{x}$$

$$W_2(x) = \det \begin{bmatrix} \frac{1}{x} & x & x^3 \\ -\frac{1}{x^2} & 1 & 3x^2 \\ \frac{2}{x^3} & 0 & 6x \end{bmatrix}$$
$$= 16$$

$$W_3(x) = \det \begin{bmatrix} \frac{1}{x} & \frac{1}{x^2} & x^3 \\ -\frac{1}{x^2} & -\frac{2}{x^3} & 3x^2 \\ \frac{2}{x^3} & \frac{6}{x^4} & 6x \end{bmatrix}$$
$$= -\frac{20}{x^3}$$

$$W_4(x) = \det \begin{bmatrix} \frac{1}{x} & \frac{1}{x^2} & x \\ -\frac{1}{x^2} & -\frac{2}{x^3} & 1 \\ \frac{2}{x^3} & \frac{6}{x^4} & 0 \end{bmatrix}$$
$$= -\frac{6}{x^5}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned}
U_1 &= (-1)^{4-1} \int \frac{F(x)W_1(x)}{aW(x)}\,dx \\
&= (-1)^3 \int \frac{(40x^3)\left(\frac{30}{x}\right)}{(x^4)\left(-\frac{240}{x^5}\right)}\,dx \\
&= -\int \frac{1200x^2}{-\frac{240}{x}}\,dx \\
&= -\int \left(-5x^3\right)\,dx \\
&= \frac{5x^4}{4}
\end{aligned}$$

$$\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\,dx \\
&= (-1)^2 \int \frac{(40x^3)(16)}{(x^4)\left(-\frac{240}{x^5}\right)}\,dx \\
&= \int \frac{640x^3}{-\frac{240}{x}}\,dx \\
&= \int \left(-\frac{8x^4}{3}\right)\,dx \\
&= -\frac{8x^5}{15}
\end{aligned}$$

$$\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x)W_3(x)}{aW(x)}\,dx \\
&= (-1)^1 \int \frac{(40x^3)\left(-\frac{20}{x^3}\right)}{(x^4)\left(-\frac{240}{x^5}\right)}\,dx \\
&= -\int \frac{-800}{-\frac{240}{x}}\,dx \\
&= -\int \left(\frac{10x}{3}\right)\,dx \\
&= -\frac{5x^2}{3}
\end{aligned}$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x) W_4(x)}{a W(x)}\, dx \\
&= (-1)^0 \int \frac{(40x^3)\left(-\frac{6}{x^5}\right)}{(x^4)\left(-\frac{240}{x^5}\right)}\, dx \\
&= \int \frac{-\frac{240}{x^2}}{-\frac{240}{x}}\, dx \\
&= \int \left(\frac{1}{x}\right) dx \\
&= \ln(x)
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4
$$

Hence

$$
\begin{aligned}
y_p = &\left(\frac{5x^4}{4}\right)\left(\frac{1}{x}\right) \\
&+ \left(-\frac{8x^5}{15}\right)\left(\frac{1}{x^2}\right) \\
&+ \left(-\frac{5x^2}{3}\right)(x) \\
&+ (\ln(x))\left(x^3\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = x^3\left(-\frac{19}{20} + \ln(x)\right)
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(\frac{c_1}{x} + \frac{c_2}{x^2} + c_3 x + c_4 x^3\right) + \left(x^3\left(-\frac{19}{20} + \ln(x)\right)\right)
\end{aligned}
$$

Initial conditions are used to solve for the constants of integration.

Looking at the above solution

$$
y = \frac{c_1}{x} + \frac{c_2}{x^2} + c_3 x + c_4 x^3 + x^3\left(-\frac{19}{20} + \ln(x)\right) \tag{1}
$$

Initial conditions are now substituted in the above solution. This will generate the required equations to solve for the integration constants. substituting $y = -1$ and $x = -1$ in the above gives

$$-1 = \frac{19}{20} - c_1 + c_2 - c_3 - c_4 - i\pi \tag{1A}$$

Taking derivative of the solution gives

$$y' = -\frac{c_1}{x^2} - \frac{2c_2}{x^3} + c_3 + 3c_4x^2 + 3x^2\left(-\frac{19}{20} + \ln(x)\right) + x^2$$

substituting $y' = -7$ and $x = -1$ in the above gives

$$-7 = -\frac{37}{20} - c_1 + 2c_2 + c_3 + 3c_4 + 3i\pi \tag{2A}$$

Taking two derivatives of the solution gives

$$y'' = \frac{2c_1}{x^3} + \frac{6c_2}{x^4} + 6c_4x + 6x\left(-\frac{19}{20} + \ln(x)\right) + 5x$$

substituting $y'' = -1$ and $x = -1$ in the above gives

$$-1 = -6i\pi - 2c_1 + 6c_2 - 6c_4 + \frac{7}{10} \tag{3A}$$

Taking three derivatives of the solution gives

$$y''' = -\frac{6c_1}{x^4} - \frac{24c_2}{x^5} + 6c_4 + \frac{53}{10} + 6\ln(x)$$

substituting $y''' = -31$ and $x = -1$ in the above gives

$$-31 = 6i\pi - 6c_1 + 24c_2 + 6c_4 + \frac{53}{10} \tag{4A}$$

Equations {1A,2A,3A,4A} are now solved for $\{c_1, c_2, c_3, c_4\}$. Solving for the constants gives

$$\begin{aligned} c_1 &= 1 \\ c_2 &= -1 \\ c_3 &= 1 \\ c_4 &= -i\pi - \frac{21}{20} \end{aligned}$$

Substituting these values back in above solution results in

$$y = \frac{x^5\ln(x) - ix^5\pi - 2x^5 + x^3 + x - 1}{x^2}$$

Summary

The solution(s) found are the following

$$y = \frac{x^5 \ln(x) - 1 + (-i\pi - 2) x^5 + x^3 + x}{x^2} \tag{1}$$

Verification of solutions

$$y = \frac{x^5 \ln(x) - 1 + (-i\pi - 2) x^5 + x^3 + x}{x^2}$$

Verified OK.

ODE order: 3.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_3rd_order, _linear, _nonhomogeneous]]
```

$$\boxed{y''' + 2y'' - y' - 2y = F(x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y''' + 2y'' - y' - 2y = 0$$

The characteristic equation is

$$\lambda^3 + 2\lambda^2 - \lambda - 2 = 0$$

The roots of the above equation are

$$\lambda_1 = 1$$
$$\lambda_2 = -2$$
$$\lambda_3 = -1$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{-2x} + c_3 e^{x}$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^{-x} \\ y_2 &= e^{-2x} \\ y_3 &= e^{x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y''' + 2y'' - y' - 2y = F(x)$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)}\, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} e^{-x} & e^{-2x} & e^{x} \\ -e^{-x} & -2\,e^{-2x} & e^{x} \\ e^{-x} & 4\,e^{-2x} & e^{x} \end{bmatrix}$$

$$|W| = -6\,e^{-x} e^{-2x} e^{x}$$

The determinant simplifies to

$$|W| = -6\,e^{-2x}$$

Now we determine W_i for each U_i.

$$\begin{aligned} W_1(x) &= \det \begin{bmatrix} e^{-2x} & e^{x} \\ -2\,e^{-2x} & e^{x} \end{bmatrix} \\ &= 3\,e^{-x} \end{aligned}$$

$$\begin{aligned} W_2(x) &= \det \begin{bmatrix} e^{-x} & e^{x} \\ -e^{-x} & e^{x} \end{bmatrix} \\ &= 2 \end{aligned}$$

$$\begin{aligned} W_3(x) &= \det \begin{bmatrix} e^{-x} & e^{-2x} \\ -e^{-x} & -2\,e^{-2x} \end{bmatrix} \\ &= -e^{-3x} \end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{3-1} \int \frac{F(x) W_1(x)}{a W(x)}\,dx \\ &= (-1)^2 \int \frac{(F(x))\,(3\,e^{-x})}{(1)\,(-6\,e^{-2x})}\,dx \\ &= \int \frac{3F(x)\,e^{-x}}{-6\,e^{-2x}}\,dx \\ &= \int \left(-\frac{F(x)\,e^{x}}{2}\right)\,dx \\ &= \int -\frac{F(x)\,e^{x}}{2}\,dx \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{3-2} \int \frac{F(x) W_2(x)}{a W(x)}\, dx \\
&= (-1)^1 \int \frac{(F(x))\,(2)}{(1)\,(-6\,\mathrm{e}^{-2x})}\, dx \\
&= -\int \frac{2F(x)}{-6\,\mathrm{e}^{-2x}}\, dx \\
&= -\int \left(-\frac{F(x)\,\mathrm{e}^{2x}}{3}\right) dx \\
&= -\left(\int -\frac{F(x)\,\mathrm{e}^{2x}}{3} dx\right)
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x) W_3(x)}{a W(x)}\, dx \\
&= (-1)^0 \int \frac{(F(x))\,(-\mathrm{e}^{-3x})}{(1)\,(-6\,\mathrm{e}^{-2x})}\, dx \\
&= \int \frac{-F(x)\,\mathrm{e}^{-3x}}{-6\,\mathrm{e}^{-2x}}\, dx \\
&= \int \left(\frac{F(x)\,\mathrm{e}^{-x}}{6}\right) dx \\
&= \int \frac{F(x)\,\mathrm{e}^{-x}}{6} dx
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Hence

$$
\begin{aligned}
y_p = &\left(\int -\frac{F(x)\,\mathrm{e}^{x}}{2} dx\right) (\mathrm{e}^{-x}) \\
&+ \left(-\left(\int -\frac{F(x)\,\mathrm{e}^{2x}}{3} dx\right)\right) (\mathrm{e}^{-2x}) \\
&+ \left(\int \frac{F(x)\,\mathrm{e}^{-x}}{6} dx\right) (\mathrm{e}^{x})
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \frac{\left(\left(\int F(x)\,\mathrm{e}^{-x} dx\right) \mathrm{e}^{3x} - 3\left(\int F(x)\,\mathrm{e}^{x} dx\right) \mathrm{e}^{x} + 2\left(\int F(x)\,\mathrm{e}^{2x} dx\right)\right) \mathrm{e}^{-2x}}{6}
$$

Therefore the general solution is

$$y = y_h + y_p$$
$$= \left(c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{-2x} + c_3 \mathrm{e}^{x}\right) + \left(\frac{\left(\left(\int F(x)\,\mathrm{e}^{-x} dx\right) \mathrm{e}^{3x} - 3\left(\int F(x)\,\mathrm{e}^{x} dx\right) \mathrm{e}^{x} + 2\left(\int F(x)\,\mathrm{e}^{2x} dx\right)\right) \mathrm{e}^{-2x}}{6}\right)$$

Summary

The solution(s) found are the following

$$y = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{-2x} + c_3 \mathrm{e}^{x} + \frac{\left(\left(\int F(x)\,\mathrm{e}^{-x} dx\right) \mathrm{e}^{3x} - 3\left(\int F(x)\,\mathrm{e}^{x} dx\right) \mathrm{e}^{x} + 2\left(\int F(x)\,\mathrm{e}^{2x} dx\right)\right) \mathrm{e}^{-2x}}{6} \tag{1}$$

Verification of solutions

$$y = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{-2x} + c_3 \mathrm{e}^{x} + \frac{\left(\left(\int F(x)\,\mathrm{e}^{-x} dx\right) \mathrm{e}^{3x} - 3\left(\int F(x)\,\mathrm{e}^{x} dx\right) \mathrm{e}^{x} + 2\left(\int F(x)\,\mathrm{e}^{2x} dx\right)\right) \mathrm{e}^{-2x}}{6}$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_3rd_order, _exact, _linear, _nonhomogeneous]]
```

$$\boxed{x^3y''' + x^2y'' - 2y'x + 2y = F(x)}$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$x^3y''' + x^2y'' - 2y'x + 2y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned} y' &= \lambda\, x^{\lambda-1} \\ y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\ y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \end{aligned}$$

Substituting these back into

$$x^3y''' + x^2y'' - 2y'x + 2y = F(x)$$

gives

$$-2x\lambda\, x^{\lambda-1} + x^2\lambda(\lambda-1)\, x^{\lambda-2} + x^3\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} + 2x^\lambda = 0$$

Which simplifies to

$$-2\lambda\, x^\lambda + \lambda(\lambda-1)\, x^\lambda + \lambda(\lambda-1)\,(\lambda-2)\, x^\lambda + 2x^\lambda = 0$$

And since $x^\lambda \neq 0$ then dividing through by x^λ, the above becomes

$$-2\lambda + \lambda(\lambda-1) + \lambda(\lambda-1)\,(\lambda-2) + 2 = 0$$

Simplifying gives the characteristic equation as

$$\lambda^3 - 2\lambda^2 - \lambda + 2 = 0$$

Solving the above gives the following roots

$$\lambda_1 = 1$$
$$\lambda_2 = 2$$
$$\lambda_3 = -1$$

This table summarises the result

root	multiplicity	type of root
-1	1	real root
1	1	real root
2	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^λ basis solution. Each real root of multiplicty two, generates c_1x^λ and $c_2x^\lambda \ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^λ and $c_2x^\lambda \ln(x)$ and $c_3x^\lambda \ln(x)^2$ basis solutions, and so on. Each complex root $\alpha \pm i\beta$ of multiplicity one generates $x^\alpha(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity two generates $\ln(x)\, x^\alpha(c_1 \cos(\beta \ln(x)) + c_2 \sin(\beta \ln(x)))$ basis solutions. And each complex root $\alpha \pm i\beta$ of multiplicity three generates $\ln(x)^2\, x^\alpha(c_1 \cos(\beta \ln(x)) + c_2$ basis solutions. And so on. Using the above show that the solution is

$$y = \frac{c_1}{x} + c_2x + c_3x^2$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \frac{1}{x} \\
y_2 &= x \\
y_3 &= x^2
\end{aligned}
$$

Now the particular solution to the given ODE is found

$$
x^3 y''' + x^2 y'' - 2y' x + 2y = F(x)
$$

Let the particular solution be

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$
U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx
$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$
W(x) = \begin{vmatrix} y_1 & y_2 & y_3 \\ y_1' & y_2' & y_3' \\ y_1'' & y_2'' & y_3'' \end{vmatrix}
$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$
\begin{aligned}
W &= \begin{bmatrix} \frac{1}{x} & x & x^2 \\ -\frac{1}{x^2} & 1 & 2x \\ \frac{2}{x^3} & 0 & 2 \end{bmatrix} \\
|W| &= \frac{6}{x}
\end{aligned}
$$

The determinant simplifies to

$$|W| = \frac{6}{x}$$

Now we determine W_i for each U_i.

$$\begin{aligned}W_1(x) &= \det\begin{bmatrix} x & x^2 \\ 1 & 2x \end{bmatrix} \\ &= x^2\end{aligned}$$

$$\begin{aligned}W_2(x) &= \det\begin{bmatrix} \frac{1}{x} & x^2 \\ -\frac{1}{x^2} & 2x \end{bmatrix} \\ &= 3\end{aligned}$$

$$\begin{aligned}W_3(x) &= \det\begin{bmatrix} \frac{1}{x} & x \\ -\frac{1}{x^2} & 1 \end{bmatrix} \\ &= \frac{2}{x}\end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned}U_1 &= (-1)^{3-1}\int \frac{F(x)W_1(x)}{aW(x)}\,dx \\ &= (-1)^2\int \frac{(F(x))\,(x^2)}{(x^3)\left(\frac{6}{x}\right)}\,dx \\ &= \int \frac{F(x)\,x^2}{6x^2}\,dx \\ &= \int \left(\frac{F(x)}{6}\right)\,dx \\ &= \int \frac{F(x)}{6}dx\end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{3-2} \int \frac{F(x) W_2(x)}{a W(x)}\, dx \\
&= (-1)^1 \int \frac{(F(x))\,(3)}{(x^3)\left(\frac{6}{x}\right)}\, dx \\
&= -\int \frac{3F(x)}{6x^2}\, dx \\
&= -\int \left(\frac{F(x)}{2x^2}\right) dx \\
&= -\left(\int \frac{F(x)}{2x^2} dx\right)
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{3-3} \int \frac{F(x) W_3(x)}{a W(x)}\, dx \\
&= (-1)^0 \int \frac{(F(x))\left(\frac{2}{x}\right)}{(x^3)\left(\frac{6}{x}\right)}\, dx \\
&= \int \frac{\frac{2F(x)}{x}}{6x^2}\, dx \\
&= \int \left(\frac{F(x)}{3x^3}\right) dx \\
&= \int \frac{F(x)}{3x^3} dx
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3
$$

Hence

$$
\begin{aligned}
y_p = &\left(\int \frac{F(x)}{6} dx\right)\left(\frac{1}{x}\right) \\
&+ \left(-\left(\int \frac{F(x)}{2x^2} dx\right)\right)(x) \\
&+ \left(\int \frac{F(x)}{3x^3} dx\right)\left(x^2\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \frac{2\left(\int \frac{F(x)}{x^3} dx\right) x^3 - 3\left(\int \frac{F(x)}{x^2} dx\right) x^2 + \int F(x)\, dx}{6x}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(\frac{c_1}{x} + c_2 x + c_3 x^2\right) + \left(\frac{2\left(\int \frac{F(x)}{x^3}dx\right)x^3 - 3\left(\int \frac{F(x)}{x^2}dx\right)x^2 + \int F(x)\,dx}{6x}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
y = \frac{c_1}{x} + c_2 x + c_3 x^2 + \frac{2\left(\int \frac{F(x)}{x^3}dx\right)x^3 - 3\left(\int \frac{F(x)}{x^2}dx\right)x^2 + \int F(x)\,dx}{6x} \tag{1}
$$

Verification of solutions

$$
y = \frac{c_1}{x} + c_2 x + c_3 x^2 + \frac{2\left(\int \frac{F(x)}{x^3}dx\right)x^3 - 3\left(\int \frac{F(x)}{x^2}dx\right)x^2 + \int F(x)\,dx}{6x}
$$

Verified OK.

The type(s) of ODE detected by this program : **"higher_order_linear_constant_coefficients_ODE"**

Maple gives the following as the ode type

```
[[_high_order, _linear, _nonhomogeneous]]
```

$$\boxed{y'''' - 5y'' + 4y = F(x)}$$

This is higher order nonhomogeneous ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous ODE And y_p is a particular solution to the nonhomogeneous ODE. y_h is the solution to

$$y'''' - 5y'' + 4y = 0$$

The characteristic equation is

$$\lambda^4 - 5\lambda^2 + 4 = 0$$

The roots of the above equation are

$$\begin{aligned}\lambda_1 &= 2\\ \lambda_2 &= -2\\ \lambda_3 &= 1\\ \lambda_4 &= -1\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 e^{-x} + c_2 e^{-2x} + c_3 e^{x} + e^{2x} c_4$$

The fundamental set of solutions for the homogeneous solution are the following

$$\begin{aligned} y_1 &= e^{-x} \\ y_2 &= e^{-2x} \\ y_3 &= e^{x} \\ y_4 &= e^{2x} \end{aligned}$$

Now the particular solution to the given ODE is found

$$y'''' - 5y'' + 4y = F(x)$$

Let the particular solution be

$$y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} e^{-x} & e^{-2x} & e^{x} & e^{2x} \\ -e^{-x} & -2\,e^{-2x} & e^{x} & 2\,e^{2x} \\ e^{-x} & 4\,e^{-2x} & e^{x} & 4\,e^{2x} \\ -e^{-x} & -8\,e^{-2x} & e^{x} & 8\,e^{2x} \end{bmatrix}$$

$$|W| = -72\,e^{-x} e^{-2x} e^{x} e^{2x}$$

The determinant simplifies to

$$|W| = -72$$

Now we determine W_i for each U_i.

$$\begin{aligned} W_1(x) &= \det \begin{bmatrix} e^{-2x} & e^{x} & e^{2x} \\ -2\,e^{-2x} & e^{x} & 2\,e^{2x} \\ 4\,e^{-2x} & e^{x} & 4\,e^{2x} \end{bmatrix} \\ &= 12\,e^{x} \end{aligned}$$

$$\begin{aligned} W_2(x) &= \det \begin{bmatrix} e^{-x} & e^{x} & e^{2x} \\ -e^{-x} & e^{x} & 2\,e^{2x} \\ e^{-x} & e^{x} & 4\,e^{2x} \end{bmatrix} \\ &= 6\,e^{2x} \end{aligned}$$

$$\begin{aligned} W_3(x) &= \det \begin{bmatrix} e^{-x} & e^{-2x} & e^{2x} \\ -e^{-x} & -2\,e^{-2x} & 2\,e^{2x} \\ e^{-x} & 4\,e^{-2x} & 4\,e^{2x} \end{bmatrix} \\ &= -12\,e^{-x} \end{aligned}$$

$$\begin{aligned} W_4(x) &= \det \begin{bmatrix} e^{-x} & e^{-2x} & e^{x} \\ -e^{-x} & -2\,e^{-2x} & e^{x} \\ e^{-x} & 4\,e^{-2x} & e^{x} \end{bmatrix} \\ &= -6\,e^{-2x} \end{aligned}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned} U_1 &= (-1)^{4-1} \int \frac{F(x) W_1(x)}{a W(x)}\,dx \\ &= (-1)^3 \int \frac{(F(x))\,(12\,e^{x})}{(1)\,(-72)}\,dx \\ &= -\int \frac{12 F(x)\,e^{x}}{-72}\,dx \\ &= -\int \left(-\frac{F(x)\,e^{x}}{6}\right)\,dx \\ &= -\left(\int -\frac{F(x)\,e^{x}}{6}\,dx\right) \end{aligned}$$

$$
\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x) W_2(x)}{a W(x)} \, dx \\
&= (-1)^2 \int \frac{(F(x))\left(6\,\mathrm{e}^{2x}\right)}{(1)\,(-72)} \, dx \\
&= \int \frac{6 F(x)\,\mathrm{e}^{2x}}{-72} \, dx \\
&= \int \left(-\frac{F(x)\,\mathrm{e}^{2x}}{12}\right) dx \\
&= \int -\frac{F(x)\,\mathrm{e}^{2x}}{12} dx
\end{aligned}
$$

$$
\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x) W_3(x)}{a W(x)} \, dx \\
&= (-1)^1 \int \frac{(F(x))\left(-12\,\mathrm{e}^{-x}\right)}{(1)\,(-72)} \, dx \\
&= -\int \frac{-12 F(x)\,\mathrm{e}^{-x}}{-72} \, dx \\
&= -\int \left(\frac{F(x)\,\mathrm{e}^{-x}}{6}\right) dx \\
&= -\left(\int \frac{F(x)\,\mathrm{e}^{-x}}{6} dx\right)
\end{aligned}
$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x) W_4(x)}{a W(x)} \, dx \\
&= (-1)^0 \int \frac{(F(x))\left(-6\,\mathrm{e}^{-2x}\right)}{(1)\,(-72)} \, dx \\
&= \int \frac{-6 F(x)\,\mathrm{e}^{-2x}}{-72} \, dx \\
&= \int \left(\frac{F(x)\,\mathrm{e}^{-2x}}{12}\right) dx \\
&= \int \frac{F(x)\,\mathrm{e}^{-2x}}{12} dx
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4
$$

Hence

$$
\begin{aligned}
y_p = & \left(-\left(\int -\frac{F(x)\,\mathrm{e}^{x}}{6}dx\right)\right)\left(\mathrm{e}^{-x}\right) \\
& + \left(\int -\frac{F(x)\,\mathrm{e}^{2x}}{12}dx\right)\left(\mathrm{e}^{-2x}\right) \\
& + \left(-\left(\int \frac{F(x)\,\mathrm{e}^{-x}}{6}dx\right)\right)\left(\mathrm{e}^{x}\right) \\
& + \left(\int \frac{F(x)\,\mathrm{e}^{-2x}}{12}dx\right)\left(\mathrm{e}^{2x}\right)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \frac{\left(\left(\int F(x)\,\mathrm{e}^{-2x}dx\right)\mathrm{e}^{4x} - 2\left(\int F(x)\,\mathrm{e}^{-x}dx\right)\mathrm{e}^{3x} + 2\left(\int F(x)\,\mathrm{e}^{x}dx\right)\mathrm{e}^{x} - \left(\int F(x)\,\mathrm{e}^{2x}dx\right)\right)\mathrm{e}^{-2x}}{12}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(c_1\mathrm{e}^{-x} + c_2\mathrm{e}^{-2x} + c_3\mathrm{e}^{x} + \mathrm{e}^{2x}c_4\right) \\
&\quad + \left(\frac{\left(\left(\int F(x)\,\mathrm{e}^{-2x}dx\right)\mathrm{e}^{4x} - 2\left(\int F(x)\,\mathrm{e}^{-x}dx\right)\mathrm{e}^{3x} + 2\left(\int F(x)\,\mathrm{e}^{x}dx\right)\mathrm{e}^{x} - \left(\int F(x)\,\mathrm{e}^{2x}dx\right)\right)\mathrm{e}^{-2x}}{12}\right)
\end{aligned}
$$

<u>Summary</u>
The solution(s) found are the following

$$
\begin{aligned}
y = {} & c_1\mathrm{e}^{-x} + c_2\mathrm{e}^{-2x} + c_3\mathrm{e}^{x} + \mathrm{e}^{2x}c_4 \\
& + \frac{\left(\left(\int F(x)\,\mathrm{e}^{-2x}dx\right)\mathrm{e}^{4x} - 2\left(\int F(x)\,\mathrm{e}^{-x}dx\right)\mathrm{e}^{3x} + 2\left(\int F(x)\,\mathrm{e}^{x}dx\right)\mathrm{e}^{x} - \left(\int F(x)\,\mathrm{e}^{2x}dx\right)\right)\mathrm{e}^{-2x}}{12}
\end{aligned} \tag{1}
$$

<u>Verification of solutions</u>

$$
\begin{aligned}
y = {} & c_1\mathrm{e}^{-x} + c_2\mathrm{e}^{-2x} + c_3\mathrm{e}^{x} + \mathrm{e}^{2x}c_4 \\
& + \frac{\left(\left(\int F(x)\,\mathrm{e}^{-2x}dx\right)\mathrm{e}^{4x} - 2\left(\int F(x)\,\mathrm{e}^{-x}dx\right)\mathrm{e}^{3x} + 2\left(\int F(x)\,\mathrm{e}^{x}dx\right)\mathrm{e}^{x} - \left(\int F(x)\,\mathrm{e}^{2x}dx\right)\right)\mathrm{e}^{-2x}}{12}
\end{aligned}
$$

Verified OK.

ODE order: 4.
ODE degree: 1.

The type(s) of ODE detected by this program : **"higher_order_ODE_non_constant_coefficients_of_type_Euler"**

Maple gives the following as the ode type

```
[[_high_order, _exact, _linear, _nonhomogeneous]]
```

$$\boxed{x^4y'''' + 6x^3y''' + 2x^2y'' - 4y'x + 4y = F(x)}$$

This is higher order nonhomogeneous Euler type ODE. Let the solution be

$$y = y_h + y_p$$

Where y_h is the solution to the homogeneous Euler ODE And y_p is a particular solution to the nonhomogeneous Euler ODE. y_h is the solution to

$$x^4y'''' + 6x^3y''' + 2x^2y'' - 4y'x + 4y = 0$$

This is Euler ODE of higher order. Let $y = x^\lambda$. Hence

$$\begin{aligned} y' &= \lambda\, x^{\lambda-1} \\ y'' &= \lambda(\lambda-1)\, x^{\lambda-2} \\ y''' &= \lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3} \\ y'''' &= \lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4} \end{aligned}$$

Substituting these back into

$$x^4y'''' + 6x^3y''' + 2x^2y'' - 4y'x + 4y = F(x)$$

gives

$$
-4x\lambda\, x^{\lambda-1}+2x^{2}\lambda(\lambda-1)\, x^{\lambda-2}+6x^{3}\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda-3}
+x^{4}\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda-4}+4x^{\lambda}=0
$$

Which simplifies to

$$
-4\lambda\, x^{\lambda}+2\lambda(\lambda-1)\, x^{\lambda}+6\lambda(\lambda-1)\,(\lambda-2)\, x^{\lambda}+\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)\, x^{\lambda}+4x^{\lambda}=0
$$

And since $x^{\lambda}\neq 0$ then dividing through by x^{λ}, the above becomes

$$
-4\lambda+2\lambda(\lambda-1)+6\lambda(\lambda-1)\,(\lambda-2)+\lambda(\lambda-1)\,(\lambda-2)\,(\lambda-3)+4=0
$$

Simplifying gives the characteristic equation as

$$
\lambda^{4}-5\lambda^{2}+4=0
$$

Solving the above gives the following roots

$$
\begin{aligned}
\lambda_1 &= 2\\
\lambda_2 &= -2\\
\lambda_3 &= 1\\
\lambda_4 &= -1
\end{aligned}
$$

This table summarises the result

root	multiplicity	type of root
-1	1	real root
-2	1	real root
1	1	real root
2	1	real root

The solution is generated by going over the above table. For each real root λ of multiplicity one generates a c_1x^{λ} basis solution. Each real root of multiplicty two, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ basis solutions. Each real root of multiplicty three, generates c_1x^{λ} and $c_2x^{\lambda}\ln(x)$ and $c_3x^{\lambda}\ln(x)^2$ basis solutions, and so on. Each complex root $\alpha\pm i\beta$ of multiplicity one generates $x^{\alpha}(c_1\cos(\beta\ln(x))+c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha\pm i\beta$ of multiplicity two generates $\ln(x)\,x^{\alpha}(c_1\cos(\beta\ln(x))+c_2\sin(\beta\ln(x)))$ basis solutions. And each complex root $\alpha\pm i\beta$ of multiplicity three generates $\ln(x)^2\,x^{\alpha}(c_1\cos(\beta\ln(x))+c_2$ basis solutions. And so on. Using the above show that the solution is

$$
y = \frac{c_1}{x} + \frac{c_2}{x^2} + c_3 x + c_4 x^2
$$

The fundamental set of solutions for the homogeneous solution are the following

$$
\begin{aligned}
y_1 &= \frac{1}{x} \\
y_2 &= \frac{1}{x^2} \\
y_3 &= x \\
y_4 &= x^2
\end{aligned}
$$

Now the particular solution to the given ODE is found

$$
x^4 y'''' + 6x^3 y''' + 2x^2 y'' - 4y'x + 4y = F(x)
$$

Let the particular solution be

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4
$$

Where y_i are the basis solutions found above for the homogeneous solution y_h and $U_i(x)$ are functions to be determined as follows

$$
U_i = (-1)^{n-i} \int \frac{F(x) W_i(x)}{a W(x)} \, dx
$$

Where $W(x)$ is the Wronskian and $W_i(x)$ is the Wronskian that results after deleting the last row and the i-th column of the determinant and n is the order of the ODE or equivalently, the number of basis solutions, and a is the coefficient of the leading derivative in the ODE, and $F(x)$ is the RHS of the ODE. Therefore, the first step is to find the Wronskian $W(x)$. This is given by

$$
W(x) = \begin{vmatrix} y_1 & y_2 & y_3 & y_4 \\ y_1' & y_2' & y_3' & y_4' \\ y_1'' & y_2'' & y_3'' & y_4'' \\ y_1''' & y_2''' & y_3''' & y_4''' \end{vmatrix}
$$

Substituting the fundamental set of solutions y_i found above in the Wronskian gives

$$W = \begin{bmatrix} \frac{1}{x} & \frac{1}{x^2} & x & x^2 \\ -\frac{1}{x^2} & -\frac{2}{x^3} & 1 & 2x \\ \frac{2}{x^3} & \frac{6}{x^4} & 0 & 2 \\ -\frac{6}{x^4} & -\frac{24}{x^5} & 0 & 0 \end{bmatrix}$$

$$|W| = -\frac{72}{x^6}$$

The determinant simplifies to

$$|W| = -\frac{72}{x^6}$$

Now we determine W_i for each U_i.

$$W_1(x) = \det \begin{bmatrix} \frac{1}{x^2} & x & x^2 \\ -\frac{2}{x^3} & 1 & 2x \\ \frac{6}{x^4} & 0 & 2 \end{bmatrix}$$

$$= \frac{12}{x^2}$$

$$W_2(x) = \det \begin{bmatrix} \frac{1}{x} & x & x^2 \\ -\frac{1}{x^2} & 1 & 2x \\ \frac{2}{x^3} & 0 & 2 \end{bmatrix}$$

$$= \frac{6}{x}$$

$$W_3(x) = \det \begin{bmatrix} \frac{1}{x} & \frac{1}{x^2} & x^2 \\ -\frac{1}{x^2} & -\frac{2}{x^3} & 2x \\ \frac{2}{x^3} & \frac{6}{x^4} & 2 \end{bmatrix}$$

$$= -\frac{12}{x^4}$$

$$W_4(x) = \det \begin{bmatrix} \frac{1}{x} & \frac{1}{x^2} & x \\ -\frac{1}{x^2} & -\frac{2}{x^3} & 1 \\ \frac{2}{x^3} & \frac{6}{x^4} & 0 \end{bmatrix}$$

$$= -\frac{6}{x^5}$$

Now we are ready to evaluate each $U_i(x)$.

$$\begin{aligned}
U_1 &= (-1)^{4-1} \int \frac{F(x)W_1(x)}{aW(x)}\, dx \\
&= (-1)^3 \int \frac{(F(x))\left(\frac{12}{x^2}\right)}{(x^4)\left(-\frac{72}{x^6}\right)}\, dx \\
&= -\int \frac{\frac{12F(x)}{x^2}}{-\frac{72}{x^2}}\, dx \\
&= -\int \left(-\frac{F(x)}{6}\right)\, dx \\
&= -\left(\int -\frac{F(x)}{6} dx\right)
\end{aligned}$$

$$\begin{aligned}
U_2 &= (-1)^{4-2} \int \frac{F(x)W_2(x)}{aW(x)}\, dx \\
&= (-1)^2 \int \frac{(F(x))\left(\frac{6}{x}\right)}{(x^4)\left(-\frac{72}{x^6}\right)}\, dx \\
&= \int \frac{\frac{6F(x)}{x}}{-\frac{72}{x^2}}\, dx \\
&= \int \left(-\frac{F(x)\,x}{12}\right)\, dx \\
&= \int -\frac{F(x)\,x}{12} dx
\end{aligned}$$

$$\begin{aligned}
U_3 &= (-1)^{4-3} \int \frac{F(x)W_3(x)}{aW(x)}\, dx \\
&= (-1)^1 \int \frac{(F(x))\left(-\frac{12}{x^4}\right)}{(x^4)\left(-\frac{72}{x^6}\right)}\, dx \\
&= -\int \frac{-\frac{12F(x)}{x^4}}{-\frac{72}{x^2}}\, dx \\
&= -\int \left(\frac{F(x)}{6x^2}\right)\, dx \\
&= -\left(\int \frac{F(x)}{6x^2} dx\right)
\end{aligned}$$

$$
\begin{aligned}
U_4 &= (-1)^{4-4} \int \frac{F(x) W_4(x)}{a W(x)}\, dx \\
&= (-1)^0 \int \frac{(F(x)) \left(-\frac{6}{x^5}\right)}{(x^4)\left(-\frac{72}{x^6}\right)}\, dx \\
&= \int \frac{-\frac{6F(x)}{x^5}}{-\frac{72}{x^2}}\, dx \\
&= \int \left(\frac{F(x)}{12x^3}\right) dx \\
&= \int \frac{F(x)}{12x^3} dx
\end{aligned}
$$

Now that all the U_i functions have been determined, the particular solution is found from

$$
y_p = U_1 y_1 + U_2 y_2 + U_3 y_3 + U_4 y_4
$$

Hence

$$
\begin{aligned}
y_p = &\left(-\left(\int -\frac{F(x)}{6} dx\right)\right)\left(\frac{1}{x}\right) \\
&+ \left(\int -\frac{F(x)\, x}{12} dx\right)\left(\frac{1}{x^2}\right) \\
&+ \left(-\left(\int \frac{F(x)}{6x^2} dx\right)\right)(x) \\
&+ \left(\int \frac{F(x)}{12x^3} dx\right)(x^2)
\end{aligned}
$$

Therefore the particular solution is

$$
y_p = \frac{\left(\int \frac{F(x)}{x^3} dx\right) x^4 - 2\left(\int \frac{F(x)}{x^2} dx\right) x^3 + 2\left(\int F(x)\, dx\right) x - \left(\int F(x)\, x dx\right)}{12x^2}
$$

Therefore the general solution is

$$
\begin{aligned}
y &= y_h + y_p \\
&= \left(\frac{c_1}{x} + \frac{c_2}{x^2} + c_3 x + c_4 x^2\right) \\
&\quad + \left(\frac{\left(\int \frac{F(x)}{x^3} dx\right) x^4 - 2\left(\int \frac{F(x)}{x^2} dx\right) x^3 + 2\left(\int F(x)\, dx\right) x - \left(\int F(x)\, x dx\right)}{12x^2}\right)
\end{aligned}
$$

Summary
The solution(s) found are the following

$$
\begin{align*}
y &= \frac{c_1}{x}+\frac{c_2}{x^2}+c_3 x+c_4 x^2 \\
&+ \frac{\left(\int \frac{F(x)}{x^3}dx\right)x^4-2\left(\int \frac{F(x)}{x^2}dx\right)x^3+2\left(\int F(x)\,dx\right)x-\left(\int F(x)\,x dx\right)}{12x^2} \tag{1}
\end{align*}
$$

Verification of solutions

$$
\begin{align*}
y &= \frac{c_1}{x}+\frac{c_2}{x^2}+c_3 x+c_4 x^2 \\
&+ \frac{\left(\int \frac{F(x)}{x^3}dx\right)x^4-2\left(\int \frac{F(x)}{x^2}dx\right)x^3+2\left(\int F(x)\,dx\right)x-\left(\int F(x)\,x dx\right)}{12x^2}
\end{align*}
$$

Verified OK.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= y_1(t) + 2y_2(t) \\
y_2'(t) &= 2y_1(t) + y_2(t)
\end{aligned}
$$

21.1.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} \frac{\mathrm{e}^{-t}}{2} + \frac{\mathrm{e}^{3t}}{2} & \frac{\mathrm{e}^{3t}}{2} - \frac{\mathrm{e}^{-t}}{2} \\ \frac{\mathrm{e}^{3t}}{2} - \frac{\mathrm{e}^{-t}}{2} & \frac{\mathrm{e}^{-t}}{2} + \frac{\mathrm{e}^{3t}}{2} \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} \frac{e^{-t}}{2} + \frac{e^{3t}}{2} & \frac{e^{3t}}{2} - \frac{e^{-t}}{2} \\ \frac{e^{3t}}{2} - \frac{e^{-t}}{2} & \frac{e^{-t}}{2} + \frac{e^{3t}}{2} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} \left(\frac{e^{-t}}{2} + \frac{e^{3t}}{2}\right) c_1 + \left(\frac{e^{3t}}{2} - \frac{e^{-t}}{2}\right) c_2 \\ \left(\frac{e^{3t}}{2} - \frac{e^{-t}}{2}\right) c_1 + \left(\frac{e^{-t}}{2} + \frac{e^{3t}}{2}\right) c_2 \end{bmatrix} \\
&= \begin{bmatrix} \frac{(c_1-c_2)e^{-t}}{2} + \frac{e^{3t}(c_1+c_2)}{2} \\ \frac{(-c_1+c_2)e^{-t}}{2} + \frac{e^{3t}(c_1+c_2)}{2} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.1.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 1-\lambda & 2 \\ 2 & 1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 - 2\lambda - 3 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 3$$
$$\lambda_2 = -1$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-1	1	real eigenvalue
3	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix} - (-1)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} 2 & 2 \\ 2 & 2 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} 2 & 2 & 0 \\ 2 & 2 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{cc|c} 2 & 2 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 2 & 2 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 3$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix} - (3) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 2 \\ 2 & -2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -2 & 2 & 0 \\ 2 & -2 & 0 \end{array}\right]$$

$$R_2 = R_2 + R_1 \Longrightarrow \left[\begin{array}{cc|c} -2 & 2 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -2 & 2 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t\}$

Hence the solution is

$$\begin{bmatrix} t \\ t \end{bmatrix} = \begin{bmatrix} t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
3	1	1	No	$\begin{bmatrix} 1 \\ 1 \end{bmatrix}$
-1	1	1	No	$\begin{bmatrix} -1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue 3 is real and distinct then the

corresponding eigenvector solution is

$$\vec{x}_1(t) = \vec{v}_1 e^{3t}$$
$$= \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{3t}$$

Since eigenvalue -1 is real and distinct then the corresponding eigenvector solution is

$$\vec{x}_2(t) = \vec{v}_2 e^{-t}$$
$$= \begin{bmatrix} -1 \\ 1 \end{bmatrix} e^{-t}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} \mathrm{e}^{3t} \\ \mathrm{e}^{3t} \end{bmatrix} + c_2 \begin{bmatrix} -\mathrm{e}^{-t} \\ \mathrm{e}^{-t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} c_1 \mathrm{e}^{3t} - c_2 \mathrm{e}^{-t} \\ c_1 \mathrm{e}^{3t} + c_2 \mathrm{e}^{-t} \end{bmatrix}$$

The following is the phase plot of the system.

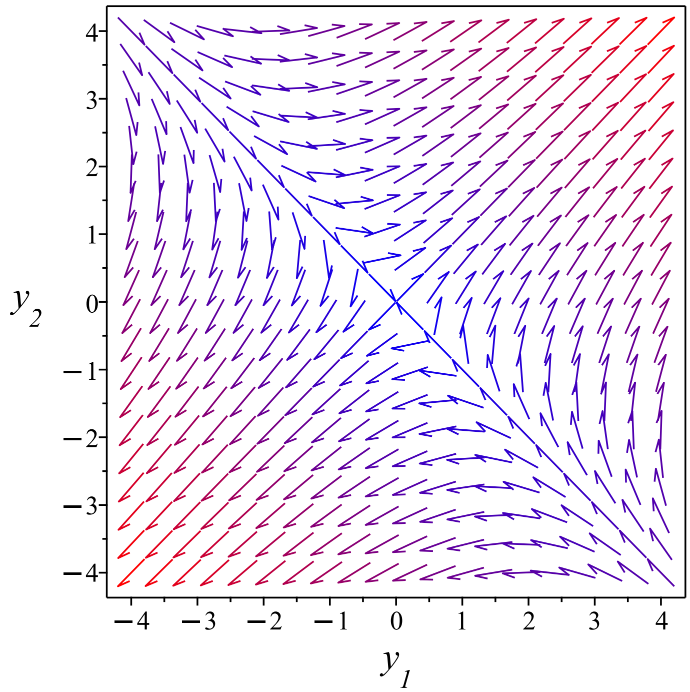

Figure 563: Phase plot

21.1.3 Maple step by step solution

Let's solve

$$[y_1'(t) = y_1(t) + 2y_2(t)\,, y_2'(t) = 2y_1(t) + y_2(t)]$$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow}{}'(t) = \begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow}{}'(t) = \begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix}$$

- Rewrite the system as

$$\underline{\vec{y}}'(t) = A \cdot \underline{\vec{y}}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} -1 \\ 1 \end{bmatrix}\right], \left[3, \begin{bmatrix} 1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_1 = \mathrm{e}^{-t} \cdot \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[3, \begin{bmatrix} 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_2 = \mathrm{e}^{3t} \cdot \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_1 + c_2 \underline{\vec{y}}_2$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 \mathrm{e}^{-t} \cdot \begin{bmatrix} -1 \\ 1 \end{bmatrix} + c_2 \mathrm{e}^{3t} \cdot \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} -c_1 e^{-t} + c_2 e^{3t} \\ c_1 e^{-t} + c_2 e^{3t} \end{bmatrix}$$

- Solution to the system of ODEs

  $\{y_1(t) = -c_1 e^{-t} + c_2 e^{3t}, y_2(t) = c_1 e^{-t} + c_2 e^{3t}\}$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -\frac{5y_1(t)}{4} + \frac{3y_2(t)}{4} \\
y_2'(t) &= \frac{3y_1(t)}{4} - \frac{5y_2(t)}{4}
\end{aligned}
$$

21.2.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -\frac{5}{4} & \frac{3}{4} \\ \frac{3}{4} & -\frac{5}{4} \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{e^{-2t}}{2} + \frac{e^{-\frac{t}{2}}}{2} & \frac{e^{-\frac{t}{2}}}{2} - \frac{e^{-2t}}{2} \\ \frac{e^{-\frac{t}{2}}}{2} - \frac{e^{-2t}}{2} & \frac{e^{-2t}}{2} + \frac{e^{-\frac{t}{2}}}{2} \end{bmatrix}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} \frac{e^{-2t}}{2}+\frac{e^{-\frac{t}{2}}}{2} & \frac{e^{-\frac{t}{2}}}{2}-\frac{e^{-2t}}{2} \\ \frac{e^{-\frac{t}{2}}}{2}-\frac{e^{-2t}}{2} & \frac{e^{-2t}}{2}+\frac{e^{-\frac{t}{2}}}{2} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} \left(\frac{e^{-2t}}{2}+\frac{e^{-\frac{t}{2}}}{2}\right)c_1+\left(\frac{e^{-\frac{t}{2}}}{2}-\frac{e^{-2t}}{2}\right)c_2 \\ \left(\frac{e^{-\frac{t}{2}}}{2}-\frac{e^{-2t}}{2}\right)c_1+\left(\frac{e^{-2t}}{2}+\frac{e^{-\frac{t}{2}}}{2}\right)c_2 \end{bmatrix} \\
&= \begin{bmatrix} \frac{(c_1-c_2)e^{-2t}}{2}+\frac{e^{-\frac{t}{2}}(c_1+c_2)}{2} \\ \frac{e^{-\frac{t}{2}}(c_1+c_2)}{2}-\frac{(c_1-c_2)e^{-2t}}{2} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.2.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -\frac{5}{4} & \frac{3}{4} \\ \frac{3}{4} & -\frac{5}{4} \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -\frac{5}{4} & \frac{3}{4} \\ \frac{3}{4} & -\frac{5}{4} \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -\frac{5}{4}-\lambda & \frac{3}{4} \\ \frac{3}{4} & -\frac{5}{4}-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 + \frac{5}{2}\lambda + 1 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -\frac{1}{2}$$
$$\lambda_2 = -2$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-2	1	real eigenvalue
$-\frac{1}{2}$	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -\frac{5}{4} & \frac{3}{4} \\ \frac{3}{4} & -\frac{5}{4} \end{bmatrix} - (-2)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} \frac{3}{4} & \frac{3}{4} \\ \frac{3}{4} & \frac{3}{4} \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} \frac{3}{4} & \frac{3}{4} & 0 \\ \frac{3}{4} & \frac{3}{4} & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{cc|c} \frac{3}{4} & \frac{3}{4} & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} \frac{3}{4} & \frac{3}{4} \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = -\frac{1}{2}$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -\frac{5}{4} & \frac{3}{4} \\ \frac{3}{4} & -\frac{5}{4} \end{bmatrix} - \left(-\frac{1}{2}\right) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -\frac{3}{4} & \frac{3}{4} \\ \frac{3}{4} & -\frac{3}{4} \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -\frac{3}{4} & \frac{3}{4} & 0 \\ \frac{3}{4} & -\frac{3}{4} & 0 \end{array}\right]$$

$$R_2 = R_2 + R_1 \Longrightarrow \left[\begin{array}{cc|c} -\frac{3}{4} & \frac{3}{4} & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -\frac{3}{4} & \frac{3}{4} \\ 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t\}$

Hence the solution is

$$\begin{bmatrix} t \\ t \end{bmatrix} = \begin{bmatrix} t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
$-\frac{1}{2}$	1	1	No	$\begin{bmatrix} 1 \\ 1 \end{bmatrix}$
-2	1	1	No	$\begin{bmatrix} -1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue $-\frac{1}{2}$ is real and distinct then the

corresponding eigenvector solution is

$$\vec{x}_1(t) = \vec{v}_1 e^{-\frac{t}{2}}$$
$$= \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{-\frac{t}{2}}$$

Since eigenvalue -2 is real and distinct then the corresponding eigenvector solution is

$$\vec{x}_2(t) = \vec{v}_2 e^{-2t}$$
$$= \begin{bmatrix} -1 \\ 1 \end{bmatrix} e^{-2t}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} \mathrm{e}^{-\frac{t}{2}} \\ \mathrm{e}^{-\frac{t}{2}} \end{bmatrix} + c_2 \begin{bmatrix} -\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} c_1 \mathrm{e}^{-\frac{t}{2}} - c_2 \mathrm{e}^{-2t} \\ c_1 \mathrm{e}^{-\frac{t}{2}} + c_2 \mathrm{e}^{-2t} \end{bmatrix}$$

The following is the phase plot of the system.

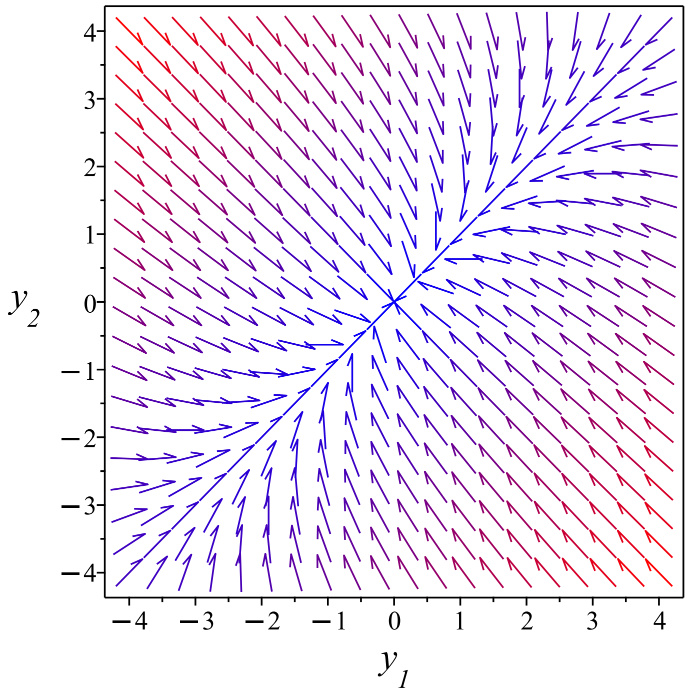

Figure 564: Phase plot

21.2.3 Maple step by step solution

Let's solve

$$\left[y_1'(t) = -\frac{5y_1(t)}{4} + \frac{3y_2(t)}{4}, y_2'(t) = \frac{3y_1(t)}{4} - \frac{5y_2(t)}{4}\right]$$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -\frac{5}{4} & \frac{3}{4} \\ \frac{3}{4} & -\frac{5}{4} \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -\frac{5}{4} & \frac{3}{4} \\ \frac{3}{4} & -\frac{5}{4} \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -\frac{5}{4} & \frac{3}{4} \\ \frac{3}{4} & -\frac{5}{4} \end{bmatrix}$$

- Rewrite the system as

$$\underline{\vec{y}}'(t) = A \cdot \underline{\vec{y}}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} -1 \\ 1 \end{bmatrix}\right], \left[-\frac{1}{2}, \begin{bmatrix} 1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_1 = e^{-2t} \cdot \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-\frac{1}{2}, \begin{bmatrix} 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_2 = e^{-\frac{t}{2}} \cdot \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_1 + c_2 \underline{\vec{y}}_2$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 e^{-2t} \cdot \begin{bmatrix} -1 \\ 1 \end{bmatrix} + c_2 e^{-\frac{t}{2}} \cdot \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} -c_1 \mathrm{e}^{-2t} + c_2 \mathrm{e}^{-\frac{t}{2}} \\ c_1 \mathrm{e}^{-2t} + c_2 \mathrm{e}^{-\frac{t}{2}} \end{bmatrix}$$

- Solution to the system of ODEs

  $$\left\{y_1(t) = -c_1 \mathrm{e}^{-2t} + c_2 \mathrm{e}^{-\frac{t}{2}}, y_2(t) = c_1 \mathrm{e}^{-2t} + c_2 \mathrm{e}^{-\frac{t}{2}}\right\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -\frac{4y_1(t)}{5} + \frac{3y_2(t)}{5} \\
y_2'(t) &= -\frac{2y_1(t)}{5} - \frac{11y_2(t)}{5}
\end{aligned}
$$

21.3.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -\frac{4}{5} & \frac{3}{5} \\ -\frac{2}{5} & -\frac{11}{5} \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} -\frac{e^{-2t}}{5} + \frac{6\,e^{-t}}{5} & \frac{3\,e^{-t}}{5} - \frac{3\,e^{-2t}}{5} \\ -\frac{2\,e^{-t}}{5} + \frac{2\,e^{-2t}}{5} & \frac{6\,e^{-2t}}{5} - \frac{e^{-t}}{5} \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} -\frac{e^{-2t}}{5} + \frac{6\,e^{-t}}{5} & \frac{3\,e^{-t}}{5} - \frac{3\,e^{-2t}}{5} \\ -\frac{2\,e^{-t}}{5} + \frac{2\,e^{-2t}}{5} & \frac{6\,e^{-2t}}{5} - \frac{e^{-t}}{5} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} \left(-\frac{e^{-2t}}{5} + \frac{6\,e^{-t}}{5}\right) c_1 + \left(\frac{3\,e^{-t}}{5} - \frac{3\,e^{-2t}}{5}\right) c_2 \\ \left(-\frac{2\,e^{-t}}{5} + \frac{2\,e^{-2t}}{5}\right) c_1 + \left(\frac{6\,e^{-2t}}{5} - \frac{e^{-t}}{5}\right) c_2 \end{bmatrix} \\
&= \begin{bmatrix} \frac{(-c_1-3c_2)e^{-2t}}{5} + \frac{6\left(c_1+\frac{c_2}{2}\right)e^{-t}}{5} \\ \frac{(2c_1+6c_2)e^{-2t}}{5} - \frac{2\left(c_1+\frac{c_2}{2}\right)e^{-t}}{5} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.3.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -\frac{4}{5} & \frac{3}{5} \\ -\frac{2}{5} & -\frac{11}{5} \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$
\det\left(A - \lambda I\right) = 0
$$

Expanding gives

$$
\det\left(\begin{bmatrix} -\frac{4}{5} & \frac{3}{5} \\ -\frac{2}{5} & -\frac{11}{5} \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0
$$

Therefore

$$
\det\left(\begin{bmatrix} -\frac{4}{5} - \lambda & \frac{3}{5} \\ -\frac{2}{5} & -\frac{11}{5} - \lambda \end{bmatrix}\right) = 0
$$

Which gives the characteristic equation

$$\lambda^2 + 3\lambda + 2 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -2$$
$$\lambda_2 = -1$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-1	1	real eigenvalue
-2	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -\frac{4}{5} & \frac{3}{5} \\ -\frac{2}{5} & -\frac{11}{5} \end{bmatrix} - (-2)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} \frac{6}{5} & \frac{3}{5} \\ -\frac{2}{5} & -\frac{1}{5} \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} \frac{6}{5} & \frac{3}{5} & 0 \\ -\frac{2}{5} & -\frac{1}{5} & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{R_1}{3} \Longrightarrow \left[\begin{array}{cc|c} \frac{6}{5} & \frac{3}{5} & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} \frac{6}{5} & \frac{3}{5} \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = -\frac{t}{2}\right\}$

Hence the solution is

$$\begin{bmatrix} -\frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{t}{2} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -\frac{t}{2} \\ t \end{bmatrix} = t \begin{bmatrix} -\frac{1}{2} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -\frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{1}{2} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} -\frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ 2 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = -1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -\frac{4}{5} & \frac{3}{5} \\ -\frac{2}{5} & -\frac{11}{5} \end{bmatrix} - (-1) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} \frac{1}{5} & \frac{3}{5} \\ -\frac{2}{5} & -\frac{6}{5} \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} \frac{1}{5} & \frac{3}{5} & 0 \\ -\frac{2}{5} & -\frac{6}{5} & 0 \end{array}\right]$$

$$R_2 = R_2 + 2R_1 \implies \left[\begin{array}{cc|c} \frac{1}{5} & \frac{3}{5} & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} \frac{1}{5} & \frac{3}{5} \\ 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -3t\}$

Hence the solution is

$$\begin{bmatrix} -3t \\ t \end{bmatrix} = \begin{bmatrix} -3t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -3t \\ t \end{bmatrix} = t \begin{bmatrix} -3 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -3t \\ t \end{bmatrix} = \begin{bmatrix} -3 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-2	1	1	No	$\begin{bmatrix} -\frac{1}{2} \\ 1 \end{bmatrix}$
-1	1	1	No	$\begin{bmatrix} -3 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue -2 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{-2t} \\
&= \begin{bmatrix} -\frac{1}{2} \\ 1 \end{bmatrix} e^{-2t}
\end{aligned}
$$

Since eigenvalue -1 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_2(t) &= \vec{v}_2 e^{-t} \\
&= \begin{bmatrix} -3 \\ 1 \end{bmatrix} e^{-t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} -\frac{\mathrm{e}^{-2t}}{2} \\ \mathrm{e}^{-2t} \end{bmatrix} + c_2 \begin{bmatrix} -3\,\mathrm{e}^{-t} \\ \mathrm{e}^{-t} \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} -\frac{c_1 \mathrm{e}^{-2t}}{2} - 3 c_2 \mathrm{e}^{-t} \\ c_1 \mathrm{e}^{-2t} + c_2 \mathrm{e}^{-t} \end{bmatrix}
$$

The following is the phase plot of the system.

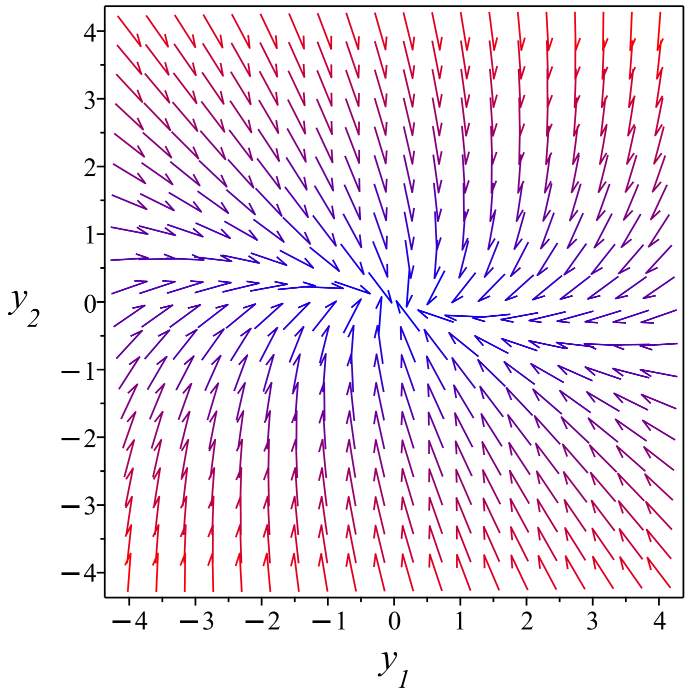

Figure 565: Phase plot

21.3.3 Maple step by step solution

Let's solve

$$\left[y_1'(t) = -\frac{4y_1(t)}{5} + \frac{3y_2(t)}{5}, y_2'(t) = -\frac{2y_1(t)}{5} - \frac{11y_2(t)}{5}\right]$$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -\frac{4}{5} & \frac{3}{5} \\ -\frac{2}{5} & -\frac{11}{5} \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -\frac{4}{5} & \frac{3}{5} \\ -\frac{2}{5} & -\frac{11}{5} \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \left[\begin{array}{cc} -\frac{4}{5} & \frac{3}{5} \\ -\frac{2}{5} & -\frac{11}{5} \end{array}\right]$$

- Rewrite the system as

$$\underline{\vec{y}}'(t) = A \cdot \underline{\vec{y}}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \left[\begin{array}{c} -\frac{1}{2} \\ 1 \end{array}\right]\right], \left[-1, \left[\begin{array}{c} -3 \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[-2, \left[\begin{array}{c} -\frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_1 = \mathrm{e}^{-2t} \cdot \left[\begin{array}{c} -\frac{1}{2} \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[-1, \left[\begin{array}{c} -3 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_2 = \mathrm{e}^{-t} \cdot \left[\begin{array}{c} -3 \\ 1 \end{array}\right]$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_1 + c_2 \underline{\vec{y}}_2$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 \mathrm{e}^{-2t} \cdot \left[\begin{array}{c} -\frac{1}{2} \\ 1 \end{array}\right] + c_2 \mathrm{e}^{-t} \cdot \left[\begin{array}{c} -3 \\ 1 \end{array}\right]$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} -\frac{c_1 e^{-2t}}{2} - 3c_2 e^{-t} \\ c_1 e^{-2t} + c_2 e^{-t} \end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{y_1(t) = -\frac{c_1 e^{-2t}}{2} - 3c_2 e^{-t}, y_2(t) = c_1 e^{-2t} + c_2 e^{-t}\right\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$y_1'(t) = -y_1(t) - 4y_2(t)$$
$$y_2'(t) = -y_1(t) - y_2(t)$$

21.4.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -1 & -4 \\ -1 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{(e^{4t}+1)e^{-3t}}{2} & -(e^{4t}-1)\,e^{-3t} \\ -\frac{(e^{4t}-1)e^{-3t}}{4} & \frac{(e^{4t}+1)e^{-3t}}{2} \end{bmatrix}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} \frac{(e^{4t}+1)e^{-3t}}{2} & -(e^{4t}-1)e^{-3t} \\ -\frac{(e^{4t}-1)e^{-3t}}{4} & \frac{(e^{4t}+1)e^{-3t}}{2} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} \frac{(e^{4t}+1)e^{-3t}c_1}{2} - (e^{4t}-1)e^{-3t}c_2 \\ -\frac{(e^{4t}-1)e^{-3t}c_1}{4} + \frac{(e^{4t}+1)e^{-3t}c_2}{2} \end{bmatrix} \\
&= \begin{bmatrix} \frac{((c_1-2c_2)e^{4t}+c_1+2c_2)e^{-3t}}{2} \\ -\frac{((c_1-2c_2)e^{4t}-c_1-2c_2)e^{-3t}}{4} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.4.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -1 & -4 \\ -1 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -1 & -4 \\ -1 & -1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -1-\lambda & -4 \\ -1 & -1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 + 2\lambda - 3 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 1$$
$$\lambda_2 = -3$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
1	1	real eigenvalue
-3	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -3$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -1 & -4 \\ -1 & -1 \end{bmatrix} - (-3)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} 2 & -4 \\ -1 & 2 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} 2 & -4 & 0 \\ -1 & 2 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{R_1}{2} \Longrightarrow \left[\begin{array}{cc|c} 2 & -4 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 2 & -4 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 2t\}$

Hence the solution is

$$\begin{bmatrix} 2t \\ t \end{bmatrix} = \begin{bmatrix} 2t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} 2t \\ t \end{bmatrix} = t \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} 2t \\ t \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -1 & -4 \\ -1 & -1 \end{bmatrix} - (1) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 & -4 \\ -1 & -2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -2 & -4 & 0 \\ -1 & -2 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{2} \Longrightarrow \left[\begin{array}{cc|c} -2 & -4 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -2 & -4 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -2t\}$

Hence the solution is

$$\begin{bmatrix} -2t \\ t \end{bmatrix} = \begin{bmatrix} -2t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -2t \\ t \end{bmatrix} = t \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -2t \\ t \end{bmatrix} = \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
1	1	1	No	$\begin{bmatrix} -2 \\ 1 \end{bmatrix}$
-3	1	1	No	$\begin{bmatrix} 2 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue 1 is real and distinct then the

corresponding eigenvector solution is

$$\vec{x}_1(t) = \vec{v}_1 e^t$$
$$= \begin{bmatrix} -2 \\ 1 \end{bmatrix} e^t$$

Since eigenvalue -3 is real and distinct then the corresponding eigenvector solution is

$$\vec{x}_2(t) = \vec{v}_2 e^{-3t}$$
$$= \begin{bmatrix} 2 \\ 1 \end{bmatrix} e^{-3t}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} -2\,\mathrm{e}^t \\ \mathrm{e}^t \end{bmatrix} + c_2 \begin{bmatrix} 2\,\mathrm{e}^{-3t} \\ \mathrm{e}^{-3t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} -2(c_1 \mathrm{e}^{4t} - c_2)\,\mathrm{e}^{-3t} \\ (c_1 \mathrm{e}^{4t} + c_2)\,\mathrm{e}^{-3t} \end{bmatrix}$$

The following is the phase plot of the system.

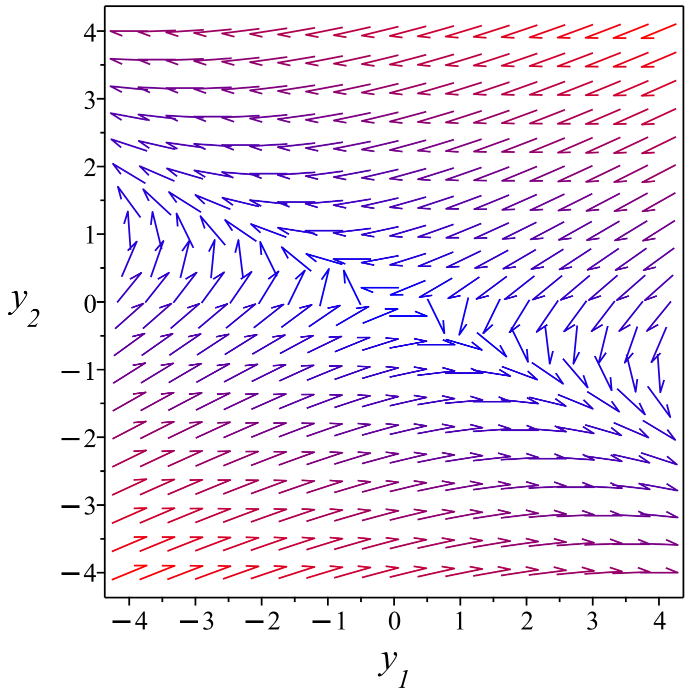

Figure 566: Phase plot

21.4.3 Maple step by step solution

Let's solve

$[y_1'(t) = -y_1(t) - 4y_2(t), y_2'(t) = -y_1(t) - y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -1 & -4 \\ -1 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -1 & -4 \\ -1 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -1 & -4 \\ -1 & -1 \end{bmatrix}$$

- Rewrite the system as

$$\underline{\vec{y}}'(t) = A \cdot \underline{\vec{y}}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-3, \begin{bmatrix} 2 \\ 1 \end{bmatrix}\right], \left[1, \begin{bmatrix} -2 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-3, \begin{bmatrix} 2 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_1 = e^{-3t} \cdot \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} -2 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_2 = e^{t} \cdot \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_1 + c_2 \underline{\vec{y}}_2$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 e^{-3t} \cdot \begin{bmatrix} 2 \\ 1 \end{bmatrix} + c_2 e^{t} \cdot \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} 2(-c_2 \mathrm{e}^{4t} + c_1) \mathrm{e}^{-3t} \\ (c_2 \mathrm{e}^{4t} + c_1) \mathrm{e}^{-3t} \end{bmatrix}$$

- Solution to the system of ODEs

  $\{y_1(t) = 2(-c_2 \mathrm{e}^{4t} + c_1) \mathrm{e}^{-3t}, y_2(t) = (c_2 \mathrm{e}^{4t} + c_1) \mathrm{e}^{-3t}\}$

✓ Solution by Maple

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$y_1'(t) = 2y_1(t) - 4y_2(t)$$
$$y_2'(t) = -y_1(t) - y_2(t)$$

21.5.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 2 & -4 \\ -1 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{(4\,e^{5t}+1)e^{-2t}}{5} & -\frac{4(e^{5t}-1)e^{-2t}}{5} \\ -\frac{(e^{5t}-1)e^{-2t}}{5} & \frac{(e^{5t}+4)e^{-2t}}{5} \end{bmatrix}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} \frac{(4\,\mathrm{e}^{5t}+1)\mathrm{e}^{-2t}}{5} & -\frac{4(\mathrm{e}^{5t}-1)\mathrm{e}^{-2t}}{5} \\ -\frac{(\mathrm{e}^{5t}-1)\mathrm{e}^{-2t}}{5} & \frac{(\mathrm{e}^{5t}+4)\mathrm{e}^{-2t}}{5} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} \frac{(4\,\mathrm{e}^{5t}+1)\mathrm{e}^{-2t}c_1}{5} - \frac{4(\mathrm{e}^{5t}-1)\mathrm{e}^{-2t}c_2}{5} \\ -\frac{(\mathrm{e}^{5t}-1)\mathrm{e}^{-2t}c_1}{5} + \frac{(\mathrm{e}^{5t}+4)\mathrm{e}^{-2t}c_2}{5} \end{bmatrix} \\
&= \begin{bmatrix} \frac{4\left((c_1-c_2)\mathrm{e}^{5t}+\frac{c_1}{4}+c_2\right)\mathrm{e}^{-2t}}{5} \\ -\frac{\mathrm{e}^{-2t}\left((c_1-c_2)\mathrm{e}^{5t}-c_1-4c_2\right)}{5} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.5.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 2 & -4 \\ -1 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$
\det(A - \lambda I) = 0
$$

Expanding gives

$$
\det\left(\begin{bmatrix} 2 & -4 \\ -1 & -1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0
$$

Therefore

$$
\det\left(\begin{bmatrix} 2-\lambda & -4 \\ -1 & -1-\lambda \end{bmatrix}\right) = 0
$$

Which gives the characteristic equation

$$\lambda^2 - \lambda - 6 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 3$$
$$\lambda_2 = -2$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-2	1	real eigenvalue
3	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 2 & -4 \\ -1 & -1 \end{bmatrix} - (-2)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} 4 & -4 \\ -1 & 1 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} 4 & -4 & 0 \\ -1 & 1 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{R_1}{4} \Longrightarrow \left[\begin{array}{cc|c} 4 & -4 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 4 & -4 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t\}$

Hence the solution is

$$\begin{bmatrix} t \\ t \end{bmatrix} = \begin{bmatrix} t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 3$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 2 & -4 \\ -1 & -1 \end{bmatrix} - (3) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -1 & -4 \\ -1 & -4 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -1 & -4 & 0 \\ -1 & -4 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{cc|c} -1 & -4 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -1 & -4 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -4t\}$

Hence the solution is

$$\begin{bmatrix} -4t \\ t \end{bmatrix} = \begin{bmatrix} -4t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -4t \\ t \end{bmatrix} = t \begin{bmatrix} -4 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -4t \\ t \end{bmatrix} = \begin{bmatrix} -4 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
3	1	1	No	$\begin{bmatrix} -4 \\ 1 \end{bmatrix}$
-2	1	1	No	$\begin{bmatrix} 1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue 3 is real and distinct then the

corresponding eigenvector solution is

$$\vec{x}_1(t) = \vec{v}_1 e^{3t}$$
$$= \begin{bmatrix} -4 \\ 1 \end{bmatrix} e^{3t}$$

Since eigenvalue -2 is real and distinct then the corresponding eigenvector solution is

$$\vec{x}_2(t) = \vec{v}_2 e^{-2t}$$
$$= \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{-2t}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} -4\,\mathrm{e}^{3t} \\ \mathrm{e}^{3t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} (-4c_1 \mathrm{e}^{5t} + c_2)\,\mathrm{e}^{-2t} \\ (c_1 \mathrm{e}^{5t} + c_2)\,\mathrm{e}^{-2t} \end{bmatrix}$$

The following is the phase plot of the system.

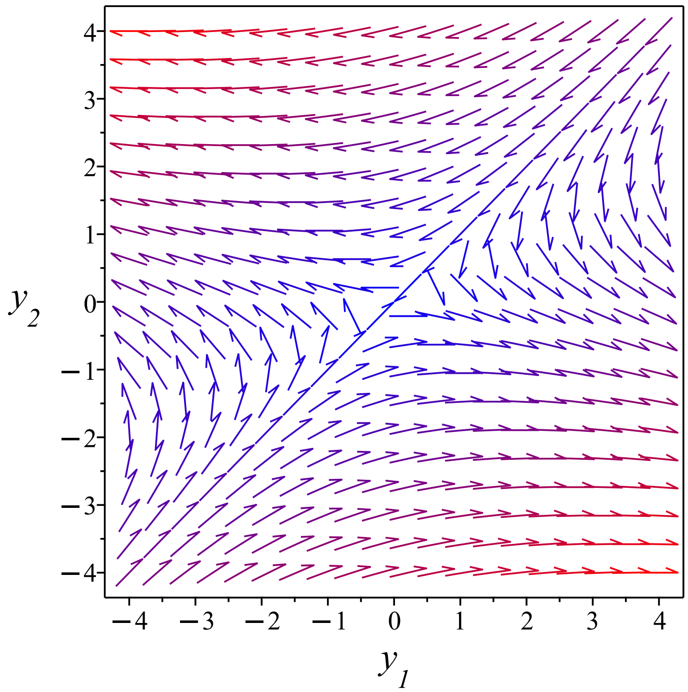

Figure 567: Phase plot

21.5.3 Maple step by step solution

Let's solve

$[y_1'(t) = 2y_1(t) - 4y_2(t), y_2'(t) = -y_1(t) - y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 2 & -4 \\ -1 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 2 & -4 \\ -1 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 2 & -4 \\ -1 & -1 \end{bmatrix}$$

- Rewrite the system as

$$\underline{\vec{y}}'(t) = A \cdot \underline{\vec{y}}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} 1 \\ 1 \end{bmatrix}\right], \left[3, \begin{bmatrix} -4 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_1 = \mathrm{e}^{-2t} \cdot \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[3, \begin{bmatrix} -4 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_2 = \mathrm{e}^{3t} \cdot \begin{bmatrix} -4 \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_1 + c_2 \underline{\vec{y}}_2$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 \mathrm{e}^{-2t} \cdot \begin{bmatrix} 1 \\ 1 \end{bmatrix} + c_2 \mathrm{e}^{3t} \cdot \begin{bmatrix} -4 \\ 1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \left(-4c_2 \mathrm{e}^{5t} + c_1\right) \mathrm{e}^{-2t} \\ \left(c_2 \mathrm{e}^{5t} + c_1\right) \mathrm{e}^{-2t} \end{bmatrix}$$

- Solution to the system of ODEs
  $\{y_1(t) = \left(-4c_2 \mathrm{e}^{5t} + c_1\right) \mathrm{e}^{-2t}, y_2(t) = \left(c_2 \mathrm{e}^{5t} + c_1\right) \mathrm{e}^{-2t}\}$

✓ Solution by Maple

Time used: 0.015 (sec). Leaf size: 35

```

ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= 4y_1(t) - 3y_2(t) \\
y_2'(t) &= 2y_1(t) - y_2(t)
\end{aligned}
$$

21.6.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 4 & -3 \\ 2 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} -2\,\mathrm{e}^{t} + 3\,\mathrm{e}^{2t} & -3\,\mathrm{e}^{2t} + 3\,\mathrm{e}^{t} \\ 2\,\mathrm{e}^{2t} - 2\,\mathrm{e}^{t} & 3\,\mathrm{e}^{t} - 2\,\mathrm{e}^{2t} \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} -2\,e^{t}+3\,e^{2t} & -3\,e^{2t}+3\,e^{t} \\ 2\,e^{2t}-2\,e^{t} & 3\,e^{t}-2\,e^{2t} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} (-2\,e^{t}+3\,e^{2t})\,c_1+(-3\,e^{2t}+3\,e^{t})\,c_2 \\ (2\,e^{2t}-2\,e^{t})\,c_1+(3\,e^{t}-2\,e^{2t})\,c_2 \end{bmatrix} \\
&= \begin{bmatrix} (-3c_2+3c_1)\,e^{2t}-2\left(c_1-\frac{3c_2}{2}\right)e^{t} \\ (2c_1-2c_2)\,e^{2t}-2\left(c_1-\frac{3c_2}{2}\right)e^{t} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.6.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 4 & -3 \\ 2 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$
\det(A-\lambda I) = 0
$$

Expanding gives

$$
\det\left(\begin{bmatrix} 4 & -3 \\ 2 & -1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0
$$

Therefore

$$
\det\left(\begin{bmatrix} 4-\lambda & -3 \\ 2 & -1-\lambda \end{bmatrix}\right) = 0
$$

Which gives the characteristic equation

$$\lambda^2 - 3\lambda + 2 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 2$$
$$\lambda_2 = 1$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
1	1	real eigenvalue
2	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 4 & -3 \\ 2 & -1 \end{bmatrix} - (1) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} 3 & -3 \\ 2 & -2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} 3 & -3 & 0 \\ 2 & -2 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{2R_1}{3} \Longrightarrow \left[\begin{array}{cc|c} 3 & -3 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 3 & -3 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t\}$

Hence the solution is

$$\begin{bmatrix} t \\ t \end{bmatrix} = \begin{bmatrix} t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 4 & -3 \\ 2 & -1 \end{bmatrix} - (2) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 2 & -3 \\ 2 & -3 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} 2 & -3 & 0 \\ 2 & -3 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{cc|c} 2 & -3 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 2 & -3 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \frac{3t}{2}\right\}$

Hence the solution is

$$\begin{bmatrix} \frac{3t}{2} \\ t \end{bmatrix} = \begin{bmatrix} \frac{3t}{2} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \frac{3t}{2} \\ t \end{bmatrix} = t \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \frac{3t}{2} \\ t \end{bmatrix} = \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \frac{3t}{2} \\ t \end{bmatrix} = \begin{bmatrix} 3 \\ 2 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
2	1	1	No	$\begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}$
1	1	1	No	$\begin{bmatrix} 1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue 2 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{2t} \\
&= \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix} e^{2t}
\end{aligned}
$$

Since eigenvalue 1 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_2(t) &= \vec{v}_2 e^{t} \\
&= \begin{bmatrix} 1 \\ 1 \end{bmatrix} e^{t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} \frac{3\,\mathrm{e}^{2t}}{2} \\ \mathrm{e}^{2t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{t} \\ \mathrm{e}^{t} \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \frac{3c_1\mathrm{e}^{2t}}{2} + c_2\mathrm{e}^{t} \\ c_1\mathrm{e}^{2t} + c_2\mathrm{e}^{t} \end{bmatrix}
$$

The following is the phase plot of the system.

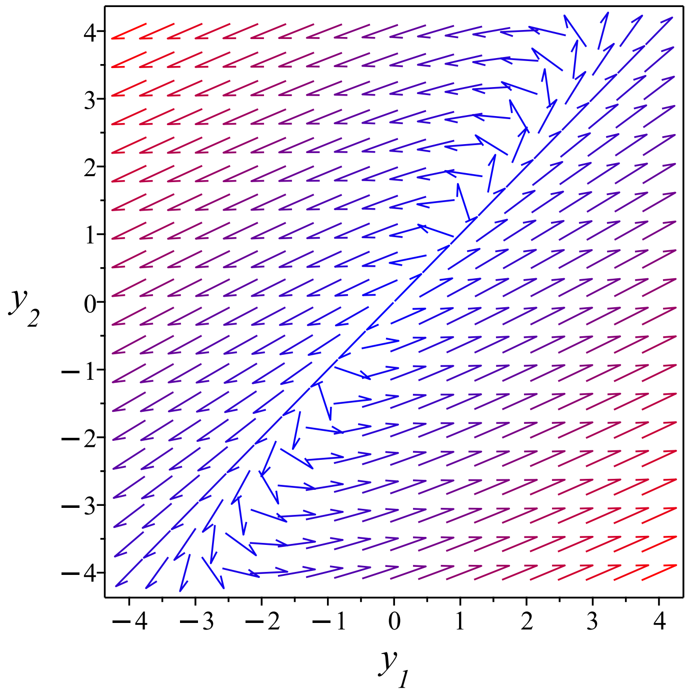

Figure 568: Phase plot

21.6.3 Maple step by step solution

Let's solve

$[y_1'(t) = 4y_1(t) - 3y_2(t), y_2'(t) = 2y_1(t) - y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow}{}'(t) = \begin{bmatrix} 4 & -3 \\ 2 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow}{}'(t) = \begin{bmatrix} 4 & -3 \\ 2 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 4 & -3 \\ 2 & -1 \end{bmatrix}$$

- Rewrite the system as

$$\underline{\vec{y}}'(t) = A \cdot \underline{\vec{y}}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \begin{bmatrix} 1 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_1 = \mathrm{e}^{t} \cdot \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_2 = \mathrm{e}^{2t} \cdot \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_1 + c_2 \underline{\vec{y}}_2$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 \mathrm{e}^{t} \cdot \begin{bmatrix} 1 \\ 1 \end{bmatrix} + c_2 \mathrm{e}^{2t} \cdot \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} c_1 e^t + \frac{3c_2 e^{2t}}{2} \\ c_1 e^t + c_2 e^{2t} \end{bmatrix}$$

- Solution to the system of ODEs

  $$\left\{y_1(t) = c_1 e^t + \frac{3c_2 e^{2t}}{2}, y_2(t) = c_1 e^t + c_2 e^{2t}\right\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -6y_1(t) - 3y_2(t) \\
y_2'(t) &= y_1(t) - 2y_2(t)
\end{aligned}
$$

21.7.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -6 & -3 \\ 1 & -2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{3\,\mathrm{e}^{-5t}}{2} - \frac{\mathrm{e}^{-3t}}{2} & -\frac{3\,\mathrm{e}^{-3t}}{2} + \frac{3\,\mathrm{e}^{-5t}}{2} \\ \frac{\mathrm{e}^{-3t}}{2} - \frac{\mathrm{e}^{-5t}}{2} & -\frac{\mathrm{e}^{-5t}}{2} + \frac{3\,\mathrm{e}^{-3t}}{2} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} \frac{3\,\mathrm{e}^{-5t}}{2}-\frac{\mathrm{e}^{-3t}}{2} & -\frac{3\,\mathrm{e}^{-3t}}{2}+\frac{3\,\mathrm{e}^{-5t}}{2} \\ \frac{\mathrm{e}^{-3t}}{2}-\frac{\mathrm{e}^{-5t}}{2} & -\frac{\mathrm{e}^{-5t}}{2}+\frac{3\,\mathrm{e}^{-3t}}{2} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} \left(\frac{3\,\mathrm{e}^{-5t}}{2}-\frac{\mathrm{e}^{-3t}}{2}\right)c_1+\left(-\frac{3\,\mathrm{e}^{-3t}}{2}+\frac{3\,\mathrm{e}^{-5t}}{2}\right)c_2 \\ \left(\frac{\mathrm{e}^{-3t}}{2}-\frac{\mathrm{e}^{-5t}}{2}\right)c_1+\left(-\frac{\mathrm{e}^{-5t}}{2}+\frac{3\,\mathrm{e}^{-3t}}{2}\right)c_2 \end{bmatrix} \\
&= \begin{bmatrix} \frac{(3c_1+3c_2)\mathrm{e}^{-5t}}{2}-\frac{\mathrm{e}^{-3t}(c_1+3c_2)}{2} \\ \frac{(-c_1-c_2)\mathrm{e}^{-5t}}{2}+\frac{\mathrm{e}^{-3t}(c_1+3c_2)}{2} \end{bmatrix}
\end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.7.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -6 & -3 \\ 1 & -2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A-\lambda I)=0$$

Expanding gives

$$\det\left(\begin{bmatrix} -6 & -3 \\ 1 & -2 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -6-\lambda & -3 \\ 1 & -2-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 + 8\lambda + 15 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -3$$
$$\lambda_2 = -5$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-3	1	real eigenvalue
-5	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -5$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -6 & -3 \\ 1 & -2 \end{bmatrix} - (-5)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} -1 & -3 \\ 1 & 3 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -1 & -3 & 0 \\ 1 & 3 & 0 \end{array}\right]$$

$$R_2 = R_2 + R_1 \Longrightarrow \left[\begin{array}{cc|c} -1 & -3 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -1 & -3 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -3t\}$

Hence the solution is

$$\begin{bmatrix} -3t \\ t \end{bmatrix} = \begin{bmatrix} -3t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -3t \\ t \end{bmatrix} = t \begin{bmatrix} -3 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -3t \\ t \end{bmatrix} = \begin{bmatrix} -3 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = -3$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -6 & -3 \\ 1 & -2 \end{bmatrix} - (-3) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -3 & -3 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -3 & -3 & 0 \\ 1 & 1 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{R_1}{3} \Longrightarrow \left[\begin{array}{cc|c} -3 & -3 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -3 & -3 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-3	1	1	No	$\begin{bmatrix} -1 \\ 1 \end{bmatrix}$
-5	1	1	No	$\begin{bmatrix} -3 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue -3 is real and distinct then the

corresponding eigenvector solution is

$$\vec{x}_1(t) = \vec{v}_1 e^{-3t}$$
$$= \begin{bmatrix} -1 \\ 1 \end{bmatrix} e^{-3t}$$

Since eigenvalue -5 is real and distinct then the corresponding eigenvector solution is

$$\vec{x}_2(t) = \vec{v}_2 e^{-5t}$$
$$= \begin{bmatrix} -3 \\ 1 \end{bmatrix} e^{-5t}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} -\mathrm{e}^{-3t} \\ \mathrm{e}^{-3t} \end{bmatrix} + c_2 \begin{bmatrix} -3\,\mathrm{e}^{-5t} \\ \mathrm{e}^{-5t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} -c_1 \mathrm{e}^{-3t} - 3c_2 \mathrm{e}^{-5t} \\ c_1 \mathrm{e}^{-3t} + c_2 \mathrm{e}^{-5t} \end{bmatrix}$$

The following is the phase plot of the system.

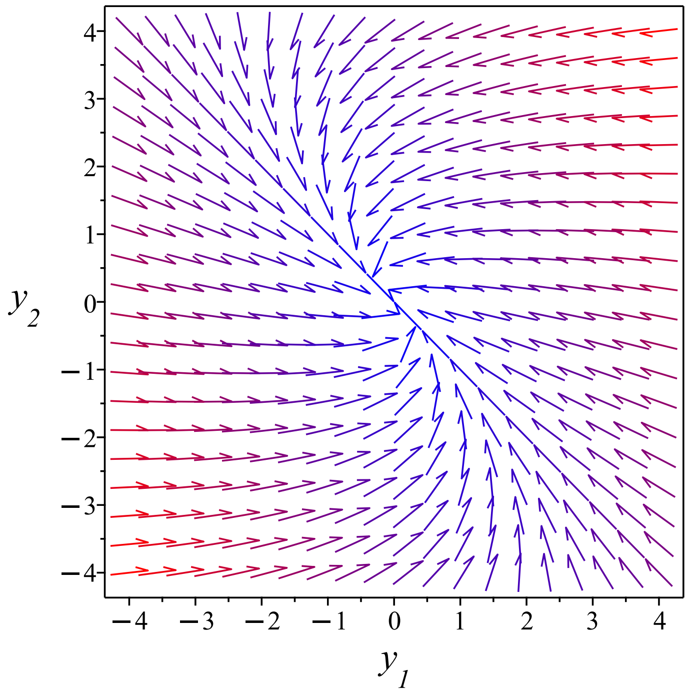

Figure 569: Phase plot

21.7.3 Maple step by step solution

Let's solve

$[y_1'(t) = -6y_1(t) - 3y_2(t), y_2'(t) = y_1(t) - 2y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -6 & -3 \\ 1 & -2 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -6 & -3 \\ 1 & -2 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -6 & -3 \\ 1 & -2 \end{bmatrix}$$

- Rewrite the system as

$$\underline{\vec{y}}'(t) = A \cdot \underline{\vec{y}}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-5, \begin{bmatrix} -3 \\ 1 \end{bmatrix}\right], \left[-3, \begin{bmatrix} -1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-5, \begin{bmatrix} -3 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_1 = e^{-5t} \cdot \begin{bmatrix} -3 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-3, \begin{bmatrix} -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_2 = e^{-3t} \cdot \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_1 + c_2 \underline{\vec{y}}_2$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 e^{-5t} \cdot \begin{bmatrix} -3 \\ 1 \end{bmatrix} + e^{-3t} c_2 \cdot \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} -3c_1 e^{-5t} - e^{-3t} c_2 \\ c_1 e^{-5t} + e^{-3t} c_2 \end{bmatrix}$$

- Solution to the system of ODEs

  $\{y_1(t) = -3c_1 e^{-5t} - e^{-3t} c_2, y_2(t) = c_1 e^{-5t} + e^{-3t} c_2\}$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= y_1(t) - y_2(t) - 2y_3(t)\\
y_2'(t) &= y_1(t) - 2y_2(t) - 3y_3(t)\\
y_3'(t) &= -4y_1(t) + y_2(t) - y_3(t)
\end{aligned}
$$

21.8.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t)\\ y_2'(t)\\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 1 & -1 & -2\\ 1 & -2 & -3\\ -4 & 1 & -1 \end{bmatrix} \begin{bmatrix} y_1(t)\\ y_2(t)\\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} -\frac{(-2\,\mathrm{e}^{5t}+\mathrm{e}^{2t}-1)\,\mathrm{e}^{-3t}}{2} & -\frac{\mathrm{e}^{2t}}{3}+\frac{\mathrm{e}^{-t}}{3} & -\frac{(2\,\mathrm{e}^{5t}+\mathrm{e}^{2t}-3)\,\mathrm{e}^{-3t}}{6} \\ (\mathrm{e}^{5t}-2\,\mathrm{e}^{2t}+1)\,\mathrm{e}^{-3t} & \frac{4\,\mathrm{e}^{-t}}{3}-\frac{\mathrm{e}^{2t}}{3} & -\frac{(\mathrm{e}^{5t}+2\,\mathrm{e}^{2t}-3)\,\mathrm{e}^{-3t}}{3} \\ \frac{(-2\,\mathrm{e}^{5t}+\mathrm{e}^{2t}+1)\,\mathrm{e}^{-3t}}{2} & \frac{\mathrm{e}^{2t}}{3}-\frac{\mathrm{e}^{-t}}{3} & \frac{(2\,\mathrm{e}^{5t}+\mathrm{e}^{2t}+3)\,\mathrm{e}^{-3t}}{6} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} -\frac{(-2\,\mathrm{e}^{5t}+\mathrm{e}^{2t}-1)\,\mathrm{e}^{-3t}}{2} & -\frac{\mathrm{e}^{2t}}{3}+\frac{\mathrm{e}^{-t}}{3} & -\frac{(2\,\mathrm{e}^{5t}+\mathrm{e}^{2t}-3)\,\mathrm{e}^{-3t}}{6} \\ (\mathrm{e}^{5t}-2\,\mathrm{e}^{2t}+1)\,\mathrm{e}^{-3t} & \frac{4\,\mathrm{e}^{-t}}{3}-\frac{\mathrm{e}^{2t}}{3} & -\frac{(\mathrm{e}^{5t}+2\,\mathrm{e}^{2t}-3)\,\mathrm{e}^{-3t}}{3} \\ \frac{(-2\,\mathrm{e}^{5t}+\mathrm{e}^{2t}+1)\,\mathrm{e}^{-3t}}{2} & \frac{\mathrm{e}^{2t}}{3}-\frac{\mathrm{e}^{-t}}{3} & \frac{(2\,\mathrm{e}^{5t}+\mathrm{e}^{2t}+3)\,\mathrm{e}^{-3t}}{6} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} -\frac{(-2\,\mathrm{e}^{5t}+\mathrm{e}^{2t}-1)\,\mathrm{e}^{-3t}c_1}{2} + \left(-\frac{\mathrm{e}^{2t}}{3}+\frac{\mathrm{e}^{-t}}{3}\right)c_2 - \frac{(2\,\mathrm{e}^{5t}+\mathrm{e}^{2t}-3)\,\mathrm{e}^{-3t}c_3}{6} \\ (\mathrm{e}^{5t}-2\,\mathrm{e}^{2t}+1)\,\mathrm{e}^{-3t}c_1 + \left(\frac{4\,\mathrm{e}^{-t}}{3}-\frac{\mathrm{e}^{2t}}{3}\right)c_2 - \frac{(\mathrm{e}^{5t}+2\,\mathrm{e}^{2t}-3)\,\mathrm{e}^{-3t}c_3}{3} \\ \frac{(-2\,\mathrm{e}^{5t}+\mathrm{e}^{2t}+1)\,\mathrm{e}^{-3t}c_1}{2} + \left(\frac{\mathrm{e}^{2t}}{3}-\frac{\mathrm{e}^{-t}}{3}\right)c_2 + \frac{(2\,\mathrm{e}^{5t}+\mathrm{e}^{2t}+3)\,\mathrm{e}^{-3t}c_3}{6} \end{bmatrix} \\
&= \begin{bmatrix} -\frac{\left(\left(c_1-\frac{2c_2}{3}+\frac{c_3}{3}\right)\mathrm{e}^{2t}+\left(-2c_1+\frac{2c_2}{3}+\frac{2c_3}{3}\right)\mathrm{e}^{5t}-c_1-c_3\right)\mathrm{e}^{-3t}}{2} \\ -2\left(\left(c_1-\frac{2c_2}{3}+\frac{c_3}{3}\right)\mathrm{e}^{2t}+\left(-\frac{c_1}{2}+\frac{c_2}{6}+\frac{c_3}{6}\right)\mathrm{e}^{5t}-\frac{c_1}{2}-\frac{c_3}{2}\right)\mathrm{e}^{-3t} \\ \frac{\left(\left(c_1-\frac{2c_2}{3}+\frac{c_3}{3}\right)\mathrm{e}^{2t}+\left(-2c_1+\frac{2c_2}{3}+\frac{2c_3}{3}\right)\mathrm{e}^{5t}+c_1+c_3\right)\mathrm{e}^{-3t}}{2} \end{bmatrix}
\end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.8.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 1 & -1 & -2 \\ 1 & -2 & -3 \\ -4 & 1 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 1 & -1 & -2 \\ 1 & -2 & -3 \\ -4 & 1 & -1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 1-\lambda & -1 & -2 \\ 1 & -2-\lambda & -3 \\ -4 & 1 & -1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + 2\lambda^2 - 5\lambda - 6 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -1$$
$$\lambda_2 = -3$$
$$\lambda_3 = 2$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-1	1	real eigenvalue
-3	1	real eigenvalue
2	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -3$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 1 & -1 & -2 \\ 1 & -2 & -3 \\ -4 & 1 & -1 \end{bmatrix} - (-3)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 4 & -1 & -2 \\ 1 & 1 & -3 \\ -4 & 1 & 2 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 4 & -1 & -2 & 0 \\ 1 & 1 & -3 & 0 \\ -4 & 1 & 2 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{4} \Longrightarrow \left[\begin{array}{ccc|c} 4 & -1 & -2 & 0 \\ 0 & \frac{5}{4} & -\frac{5}{2} & 0 \\ -4 & 1 & 2 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} 4 & -1 & -2 & 0 \\ 0 & \frac{5}{4} & -\frac{5}{2} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 4 & -1 & -2 \\ 0 & \frac{5}{4} & -\frac{5}{2} \\ 0 & 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t, v_2 = 2t\}$

Hence the solution is

$$\begin{bmatrix} t \\ 2t \\ t \end{bmatrix} = \begin{bmatrix} t \\ 2t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ 2t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ 2t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = -1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 1 & -1 & -2 \\ 1 & -2 & -3 \\ -4 & 1 & -1 \end{bmatrix} - (-1) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 2 & -1 & -2 \\ 1 & -1 & -3 \\ -4 & 1 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 2 & -1 & -2 & 0 \\ 1 & -1 & -3 & 0 \\ -4 & 1 & 0 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} 2 & -1 & -2 & 0 \\ 0 & -\frac{1}{2} & -2 & 0 \\ -4 & 1 & 0 & 0 \end{array}\right]$$

$$R_3 = R_3 + 2R_1 \Longrightarrow \left[\begin{array}{ccc|c} 2 & -1 & -2 & 0 \\ 0 & -\frac{1}{2} & -2 & 0 \\ 0 & -1 & -4 & 0 \end{array}\right]$$

$$
R_3 = R_3 - 2R_2 \Longrightarrow \left[\begin{array}{ccc|c} 2 & -1 & -2 & 0 \\ 0 & -\frac{1}{2} & -2 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]
$$

Therefore the system in Echelon form is

$$
\begin{bmatrix} 2 & -1 & -2 \\ 0 & -\frac{1}{2} & -2 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}
$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_2 = -4t\}$

Hence the solution is

$$
\begin{bmatrix} -t \\ -4t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ -4t \\ t \end{bmatrix}
$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$
\begin{bmatrix} -t \\ -4t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ -4 \\ 1 \end{bmatrix}
$$

Let $t = 1$ the eigenvector becomes

$$
\begin{bmatrix} -t \\ -4t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ -4 \\ 1 \end{bmatrix}
$$

Considering the eigenvalue $\lambda_3 = 2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 1 & -1 & -2 \\ 1 & -2 & -3 \\ -4 & 1 & -1 \end{bmatrix} - (2) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -1 & -1 & -2 \\ 1 & -4 & -3 \\ -4 & 1 & -3 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -1 & -1 & -2 & 0 \\ 1 & -4 & -3 & 0 \\ -4 & 1 & -3 & 0 \end{array}\right]$$

$$R_2 = R_2 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} -1 & -1 & -2 & 0 \\ 0 & -5 & -5 & 0 \\ -4 & 1 & -3 & 0 \end{array}\right]$$

$$R_3 = R_3 - 4R_1 \Longrightarrow \left[\begin{array}{ccc|c} -1 & -1 & -2 & 0 \\ 0 & -5 & -5 & 0 \\ 0 & 5 & 5 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_2 \Longrightarrow \left[\begin{array}{ccc|c} -1 & -1 & -2 & 0 \\ 0 & -5 & -5 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -1 & -1 & -2 \\ 0 & -5 & -5 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_2 = -t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ -t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-1	1	1	No	$\begin{bmatrix} -1 \\ -4 \\ 1 \end{bmatrix}$
-3	1	1	No	$\begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$
2	1	1	No	$\begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue -1 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{-t} \\ &= \begin{bmatrix} -1 \\ -4 \\ 1 \end{bmatrix} e^{-t}\end{aligned}$$

Since eigenvalue -3 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned}\vec{x}_2(t) &= \vec{v}_2 e^{-3t} \\ &= \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} e^{-3t}\end{aligned}$$

Since eigenvalue 2 is real and distinct then the corresponding eigenvector solution is

$$\vec{x}_3(t) = \vec{v}_3 e^{2t}$$
$$= \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix} e^{2t}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t) + c_3\vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} -\mathrm{e}^{-t} \\ -4\,\mathrm{e}^{-t} \\ \mathrm{e}^{-t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-3t} \\ 2\,\mathrm{e}^{-3t} \\ \mathrm{e}^{-3t} \end{bmatrix} + c_3 \begin{bmatrix} -\mathrm{e}^{2t} \\ -\mathrm{e}^{2t} \\ \mathrm{e}^{2t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -(c_3\mathrm{e}^{5t} + c_1\mathrm{e}^{2t} - c_2)\,\mathrm{e}^{-3t} \\ (-c_3\mathrm{e}^{5t} - 4c_1\mathrm{e}^{2t} + 2c_2)\,\mathrm{e}^{-3t} \\ (c_3\mathrm{e}^{5t} + c_1\mathrm{e}^{2t} + c_2)\,\mathrm{e}^{-3t} \end{bmatrix}$$

21.8.3 Maple step by step solution

Let's solve

$[y_1'(t) = y_1(t) - y_2(t) - 2y_3(t)\,, y_2'(t) = y_1(t) - 2y_2(t) - 3y_3(t)\,, y_3'(t) = -4y_1(t) + y_2(t) - y_3(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{\vec{y}}'(t) = \begin{bmatrix} 1 & -1 & -2 \\ 1 & -2 & -3 \\ -4 & 1 & -1 \end{bmatrix} \cdot \underline{\vec{y}}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{\vec{y}}'(t) = \begin{bmatrix} 1 & -1 & -2 \\ 1 & -2 & -3 \\ -4 & 1 & -1 \end{bmatrix} \cdot \underline{\vec{y}}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 1 & -1 & -2 \\ 1 & -2 & -3 \\ -4 & 1 & -1 \end{bmatrix}$$

- Rewrite the system as

$\underline{\vec{y}}'(t) = A \cdot \underline{\vec{y}}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-3, \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} -1 \\ -4 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-3, \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_1 = e^{-3t} \cdot \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} -1 \\ -4 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_{2} = \mathrm{e}^{-t} \cdot \begin{bmatrix} -1 \\ -4 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_{3} = \mathrm{e}^{2t} \cdot \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_{1} + c_2 \underline{\vec{y}}_{2} + c_3 \underline{\vec{y}}_{3}$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 \mathrm{e}^{-3t} \cdot \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} + c_2 \mathrm{e}^{-t} \cdot \begin{bmatrix} -1 \\ -4 \\ 1 \end{bmatrix} + c_3 \mathrm{e}^{2t} \cdot \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \left(-c_3 \mathrm{e}^{5t} - c_2 \mathrm{e}^{2t} + c_1\right) \mathrm{e}^{-3t} \\ \left(-c_3 \mathrm{e}^{5t} - 4 c_2 \mathrm{e}^{2t} + 2 c_1\right) \mathrm{e}^{-3t} \\ \left(c_1 + c_2 \mathrm{e}^{2t} + c_3 \mathrm{e}^{5t}\right) \mathrm{e}^{-3t} \end{bmatrix}$$

- Solution to the system of ODEs

$$\{y_1(t) = \left(-c_3 \mathrm{e}^{5t} - c_2 \mathrm{e}^{2t} + c_1\right) \mathrm{e}^{-3t}, y_2(t) = \left(-c_3 \mathrm{e}^{5t} - 4 c_2 \mathrm{e}^{2t} + 2 c_1\right) \mathrm{e}^{-3t}, y_3(t) = \left(c_1 + c_2 \mathrm{e}^{2t} + c_3 \mathrm{e}^{5t}\right)$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -6y_1(t) - 4y_2(t) - 8y_3(t) \\
y_2'(t) &= -4y_1(t) - 4y_3(t) \\
y_3'(t) &= -8y_1(t) - 4y_2(t) - 6y_3(t)
\end{aligned}
$$

21.9.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -6 & -4 & -8 \\ -4 & 0 & -4 \\ -8 & -4 & -6 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{(5\,e^{18t}+4)e^{-16t}}{9} & -\frac{2(e^{18t}-1)e^{-16t}}{9} & -\frac{4(e^{18t}-1)e^{-16t}}{9} \\ -\frac{2(e^{18t}-1)e^{-16t}}{9} & \frac{(8\,e^{18t}+1)e^{-16t}}{9} & -\frac{2(e^{18t}-1)e^{-16t}}{9} \\ -\frac{4(e^{18t}-1)e^{-16t}}{9} & -\frac{2(e^{18t}-1)e^{-16t}}{9} & \frac{(5\,e^{18t}+4)e^{-16t}}{9} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned} \vec{x}_h(t) &= e^{At}\vec{c} \\ &= \begin{bmatrix} \frac{(5\,e^{18t}+4)e^{-16t}}{9} & -\frac{2(e^{18t}-1)e^{-16t}}{9} & -\frac{4(e^{18t}-1)e^{-16t}}{9} \\ -\frac{2(e^{18t}-1)e^{-16t}}{9} & \frac{(8\,e^{18t}+1)e^{-16t}}{9} & -\frac{2(e^{18t}-1)e^{-16t}}{9} \\ -\frac{4(e^{18t}-1)e^{-16t}}{9} & -\frac{2(e^{18t}-1)e^{-16t}}{9} & \frac{(5\,e^{18t}+4)e^{-16t}}{9} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\ &= \begin{bmatrix} \frac{(5\,e^{18t}+4)e^{-16t}c_1}{9} - \frac{2(e^{18t}-1)e^{-16t}c_2}{9} - \frac{4(e^{18t}-1)e^{-16t}c_3}{9} \\ -\frac{2(e^{18t}-1)e^{-16t}c_1}{9} + \frac{(8\,e^{18t}+1)e^{-16t}c_2}{9} - \frac{2(e^{18t}-1)e^{-16t}c_3}{9} \\ -\frac{4(e^{18t}-1)e^{-16t}c_1}{9} - \frac{2(e^{18t}-1)e^{-16t}c_2}{9} + \frac{(5\,e^{18t}+4)e^{-16t}c_3}{9} \end{bmatrix} \\ &= \begin{bmatrix} \frac{e^{-16t}((5c_1-2c_2-4c_3)e^{18t}+4c_1+2c_2+4c_3)}{9} \\ -\frac{2((c_1-4c_2+c_3)e^{18t}-c_1-\frac{c_2}{2}-c_3)e^{-16t}}{9} \\ -\frac{4\left(\left(c_1+\frac{c_2}{2}-\frac{5c_3}{4}\right)e^{18t}-c_1-\frac{c_2}{2}-c_3\right)e^{-16t}}{9} \end{bmatrix} \end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.9.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -6 & -4 & -8 \\ -4 & 0 & -4 \\ -8 & -4 & -6 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -6 & -4 & -8 \\ -4 & 0 & -4 \\ -8 & -4 & -6 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -6-\lambda & -4 & -8 \\ -4 & -\lambda & -4 \\ -8 & -4 & -6-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + 12\lambda^2 - 60\lambda + 64 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -16$$
$$\lambda_2 = 2$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
2	1	real eigenvalue
-16	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -16$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -6 & -4 & -8 \\ -4 & 0 & -4 \\ -8 & -4 & -6 \end{bmatrix} - (-16)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 10 & -4 & -8 \\ -4 & 16 & -4 \\ -8 & -4 & 10 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 10 & -4 & -8 & 0 \\ -4 & 16 & -4 & 0 \\ -8 & -4 & 10 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{2R_1}{5} \Longrightarrow \left[\begin{array}{ccc|c} 10 & -4 & -8 & 0 \\ 0 & \frac{72}{5} & -\frac{36}{5} & 0 \\ -8 & -4 & 10 & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{4R_1}{5} \Longrightarrow \left[\begin{array}{ccc|c} 10 & -4 & -8 & 0 \\ 0 & \frac{72}{5} & -\frac{36}{5} & 0 \\ 0 & -\frac{36}{5} & \frac{18}{5} & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{R_2}{2} \Longrightarrow \left[\begin{array}{ccc|c} 10 & -4 & -8 & 0 \\ 0 & \frac{72}{5} & -\frac{36}{5} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 10 & -4 & -8 \\ 0 & \frac{72}{5} & -\frac{36}{5} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = t, v_2 = \frac{t}{2}\right\}$

Hence the solution is

$$\begin{bmatrix} t \\ \frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} t \\ \frac{t}{2} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ \frac{t}{2} \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ \frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} t \\ \frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \\ 2 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -6 & -4 & -8 \\ -4 & 0 & -4 \\ -8 & -4 & -6 \end{bmatrix} - (2) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -8 & -4 & -8 \\ -4 & -2 & -4 \\ -8 & -4 & -8 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -8 & -4 & -8 & 0 \\ -4 & -2 & -4 & 0 \\ -8 & -4 & -8 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} -8 & -4 & -8 & 0 \\ 0 & 0 & 0 & 0 \\ -8 & -4 & -8 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} -8 & -4 & -8 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -8 & -4 & -8 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2, v_3\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Let $v_3 = s$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = -\frac{t}{2} - s\right\}$

Hence the solution is

$$\begin{bmatrix} -\frac{t}{2} - s \\ t \\ s \end{bmatrix} = \begin{bmatrix} -\frac{t}{2} - s \\ t \\ s \end{bmatrix}$$

Since there are two free Variable, we have found two eigenvectors associated with this eigenvalue. The above can be written as

$$\begin{aligned} \begin{bmatrix} -\frac{t}{2} - s \\ t \\ s \end{bmatrix} &= \begin{bmatrix} -\frac{t}{2} \\ t \\ 0 \end{bmatrix} + \begin{bmatrix} -s \\ 0 \\ s \end{bmatrix} \\ &= t \begin{bmatrix} -\frac{1}{2} \\ 1 \\ 0 \end{bmatrix} + s \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} \end{aligned}$$

By letting $t = 1$ and $s = 1$ then the above becomes

$$\begin{bmatrix} -\frac{t}{2} - s \\ t \\ s \end{bmatrix} = \begin{bmatrix} -\frac{1}{2} \\ 1 \\ 0 \end{bmatrix} + \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$$

Hence the two eigenvectors associated with this eigenvalue are

$$\left(\begin{bmatrix} -\frac{1}{2} \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}\right)$$

Which are normalized to

$$\left(\begin{bmatrix} -1 \\ 2 \\ 0 \end{bmatrix}, \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}\right)$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-16	1	1	No	$\begin{bmatrix} 1 \\ \frac{1}{2} \\ 1 \end{bmatrix}$
2	2	2	No	$\begin{bmatrix} -1 & -\frac{1}{2} \\ 0 & 1 \\ 1 & 0 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue -16 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned} \vec{x}_1(t) &= \vec{v}_1 e^{-16t} \\ &= \begin{bmatrix} 1 \\ \frac{1}{2} \\ 1 \end{bmatrix} e^{-16t} \end{aligned}$$

eigenvalue 2 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

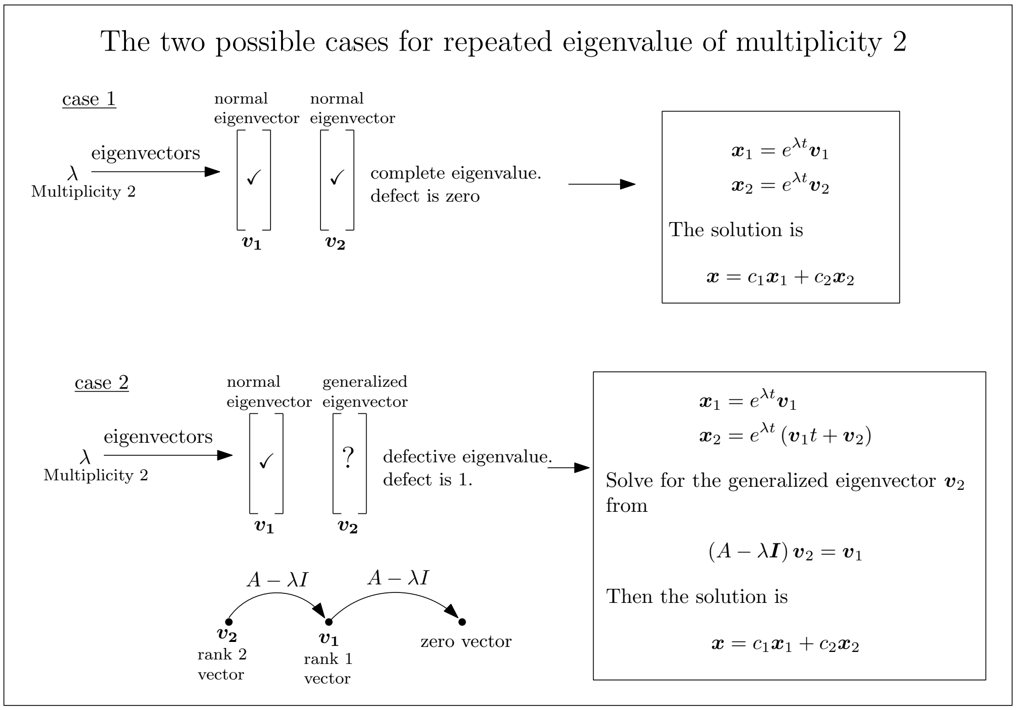

Figure 570: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2 which is the same as its geometric multiplicity 2, then it is complete eigenvalue and this falls into case 1 shown above. Hence the corresponding eigenvector basis are

$$
\begin{aligned}
\vec{x}_2(t) &= \vec{v}_2 e^{2t} \\
&= \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} e^{2t}
\end{aligned}
$$

$$
\begin{aligned}
\vec{x}_3(t) &= \vec{v}_3 e^{2t} \\
&= \begin{bmatrix} -\frac{1}{2} \\ 1 \\ 0 \end{bmatrix} e^{2t}
\end{aligned}
$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t) + c_3\vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} \mathrm{e}^{-16t} \\ \frac{\mathrm{e}^{-16t}}{2} \\ \mathrm{e}^{-16t} \end{bmatrix} + c_2 \begin{bmatrix} -\mathrm{e}^{2t} \\ 0 \\ \mathrm{e}^{2t} \end{bmatrix} + c_3 \begin{bmatrix} -\frac{\mathrm{e}^{2t}}{2} \\ \mathrm{e}^{2t} \\ 0 \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \left(\left(-c_2 - \frac{c_3}{2}\right) \mathrm{e}^{18t} + c_1\right) \mathrm{e}^{-16t} \\ \frac{(2c_3\mathrm{e}^{18t} + c_1)\mathrm{e}^{-16t}}{2} \\ (c_2\mathrm{e}^{18t} + c_1)\,\mathrm{e}^{-16t} \end{bmatrix}$$

21.9.3 Maple step by step solution

Let's solve

$[y_1'(t) = -6y_1(t) - 4y_2(t) - 8y_3(t), y_2'(t) = -4y_1(t) - 4y_3(t), y_3'(t) = -8y_1(t) - 4y_2(t) - 6y_3(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -6 & -4 & -8 \\ -4 & 0 & -4 \\ -8 & -4 & -6 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -6 & -4 & -8 \\ -4 & 0 & -4 \\ -8 & -4 & -6 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -6 & -4 & -8 \\ -4 & 0 & -4 \\ -8 & -4 & -6 \end{bmatrix}$$

- Rewrite the system as

  $\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

  $$\left[\left[-16, \begin{bmatrix} 1 \\ \frac{1}{2} \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} -\frac{1}{2} \\ 1 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair

  $$\left[-16, \begin{bmatrix} 1 \\ \frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

  $$\underline{y}^{\rightarrow}_{1} = e^{-16t} \cdot \begin{bmatrix} 1 \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

  $$\left[2, \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue 2

  $$\underline{y}^{\rightarrow}_{2}(t) = e^{2t} \cdot \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = 2$ is the eigenvalue, and

$\underline{\vec{y}}_3(t) = e^{\lambda t}\left(t\vec{v} + \vec{p}\right)$

- Note that the t multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\underline{\vec{y}}_3(t)$ into the homogeneous system
  $\lambda e^{\lambda t}\left(t\vec{v} + \vec{p}\right) + e^{\lambda t}\vec{v} = \left(e^{\lambda t}A\right) \cdot \left(t\vec{v} + \vec{p}\right)$
- Use the fact that $\vec{v}$ is an eigenvector of A
  $\lambda e^{\lambda t}\left(t\vec{v} + \vec{p}\right) + e^{\lambda t}\vec{v} = e^{\lambda t}\left(\lambda t\vec{v} + A \cdot \vec{p}\right)$
- Simplify equation
  $\lambda\vec{p} + \vec{v} = A \cdot \vec{p}$
- Make use of the identity matrix I
  $(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$
- Condition $\vec{p}$ must meet for $\underline{\vec{y}}_3(t)$ to be a solution to the homogeneous system
  $(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$
- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue 2
  $$\left(\begin{bmatrix} -6 & -4 & -8 \\ -4 & 0 & -4 \\ -8 & -4 & -6 \end{bmatrix} - 2 \cdot \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \cdot \vec{p} = \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$$
- Choice of $\vec{p}$
  $$\vec{p} = \begin{bmatrix} \frac{1}{8} \\ 0 \\ 0 \end{bmatrix}$$
- Second solution from eigenvalue 2
  $$\underline{\vec{y}}_3(t) = e^{2t} \cdot \left(t \cdot \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} + \begin{bmatrix} \frac{1}{8} \\ 0 \\ 0 \end{bmatrix}\right)$$
- General solution to the system of ODEs
  $\underline{\vec{y}} = c_1\underline{\vec{y}}_1 + c_2\underline{\vec{y}}_2(t) + c_3\underline{\vec{y}}_3(t)$
- Substitute solutions into the general solution

$$\underline{\overrightarrow{y}} = c_1 e^{-16t} \cdot \begin{bmatrix} 1 \\ \frac{1}{2} \\ 1 \end{bmatrix} + c_2 e^{2t} \cdot \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} + c_3 e^{2t} \cdot \left(t \cdot \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} + \begin{bmatrix} \frac{1}{8} \\ 0 \\ 0 \end{bmatrix} \right)$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -\left(\left(\left(t - \frac{1}{8}\right) c_3 + c_2\right) e^{18t} - c_1\right) e^{-16t} \\ \frac{c_1 e^{-16t}}{2} \\ \left((c_3 t + c_2) e^{18t} + c_1\right) e^{-16t} \end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{y_1(t) = -\left(\left(\left(t - \frac{1}{8}\right) c_3 + c_2\right) e^{18t} - c_1\right) e^{-16t}, y_2(t) = \frac{c_1 e^{-16t}}{2}, y_3(t) = \left((c_3 t + c_2) e^{18t} + c_1\right) e^{-16t}\right\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= 3y_1(t) + 5y_2(t) + 8y_3(t) \\
y_2'(t) &= y_1(t) - y_2(t) - 2y_3(t) \\
y_3'(t) &= -y_1(t) - y_2(t) - y_3(t)
\end{aligned}
$$

21.10.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 3 & 5 & 8 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{(21\,\mathrm{e}^{4t}-8\,\mathrm{e}^{3t}-1)\mathrm{e}^{-2t}}{12} & \frac{(21\,\mathrm{e}^{4t}-8\,\mathrm{e}^{3t}-13)\mathrm{e}^{-2t}}{12} & \frac{(7\,\mathrm{e}^{4t}-4\,\mathrm{e}^{3t}-3)\mathrm{e}^{-2t}}{2} \\ \frac{(15\,\mathrm{e}^{4t}-16\,\mathrm{e}^{3t}+1)\mathrm{e}^{-2t}}{12} & \frac{(15\,\mathrm{e}^{4t}-16\,\mathrm{e}^{3t}+13)\mathrm{e}^{-2t}}{12} & \frac{(5\,\mathrm{e}^{4t}-8\,\mathrm{e}^{3t}+3)\mathrm{e}^{-2t}}{2} \\ -\mathrm{e}^{2t}+\mathrm{e}^{t} & -\mathrm{e}^{2t}+\mathrm{e}^{t} & 3\,\mathrm{e}^{t}-2\,\mathrm{e}^{2t} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} \frac{(21\,\mathrm{e}^{4t}-8\,\mathrm{e}^{3t}-1)\mathrm{e}^{-2t}}{12} & \frac{(21\,\mathrm{e}^{4t}-8\,\mathrm{e}^{3t}-13)\mathrm{e}^{-2t}}{12} & \frac{(7\,\mathrm{e}^{4t}-4\,\mathrm{e}^{3t}-3)\mathrm{e}^{-2t}}{2} \\ \frac{(15\,\mathrm{e}^{4t}-16\,\mathrm{e}^{3t}+1)\mathrm{e}^{-2t}}{12} & \frac{(15\,\mathrm{e}^{4t}-16\,\mathrm{e}^{3t}+13)\mathrm{e}^{-2t}}{12} & \frac{(5\,\mathrm{e}^{4t}-8\,\mathrm{e}^{3t}+3)\mathrm{e}^{-2t}}{2} \\ -\mathrm{e}^{2t}+\mathrm{e}^{t} & -\mathrm{e}^{2t}+\mathrm{e}^{t} & 3\,\mathrm{e}^{t}-2\,\mathrm{e}^{2t} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} \frac{(21\,\mathrm{e}^{4t}-8\,\mathrm{e}^{3t}-1)\mathrm{e}^{-2t}c_1}{12} + \frac{(21\,\mathrm{e}^{4t}-8\,\mathrm{e}^{3t}-13)\mathrm{e}^{-2t}c_2}{12} + \frac{(7\,\mathrm{e}^{4t}-4\,\mathrm{e}^{3t}-3)\mathrm{e}^{-2t}c_3}{2} \\ \frac{(15\,\mathrm{e}^{4t}-16\,\mathrm{e}^{3t}+1)\mathrm{e}^{-2t}c_1}{12} + \frac{(15\,\mathrm{e}^{4t}-16\,\mathrm{e}^{3t}+13)\mathrm{e}^{-2t}c_2}{12} + \frac{(5\,\mathrm{e}^{4t}-8\,\mathrm{e}^{3t}+3)\mathrm{e}^{-2t}c_3}{2} \\ (-\mathrm{e}^{2t}+\mathrm{e}^{t})\,c_1 + (-\mathrm{e}^{2t}+\mathrm{e}^{t})\,c_2 + (3\,\mathrm{e}^{t}-2\,\mathrm{e}^{2t})\,c_3 \end{bmatrix} \\
&= \begin{bmatrix} -\frac{2\left((c_1+c_2+3c_3)\mathrm{e}^{3t}+\left(-\frac{21c_1}{8}-\frac{21c_2}{8}-\frac{21c_3}{4}\right)\mathrm{e}^{4t}+\frac{c_1}{8}+\frac{13c_2}{8}+\frac{9c_3}{4}\right)\mathrm{e}^{-2t}}{3} \\ -\frac{4\left((c_1+c_2+3c_3)\mathrm{e}^{3t}+\left(-\frac{15c_1}{16}-\frac{15c_2}{16}-\frac{15c_3}{8}\right)\mathrm{e}^{4t}-\frac{c_1}{16}-\frac{13c_2}{16}-\frac{9c_3}{8}\right)\mathrm{e}^{-2t}}{3} \\ (-c_1-c_2-2c_3)\,\mathrm{e}^{2t}+\mathrm{e}^{t}(c_1+c_2+3c_3) \end{bmatrix}
\end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.10.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 3 & 5 & 8 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A-\lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 3 & 5 & 8 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 3-\lambda & 5 & 8 \\ 1 & -1-\lambda & -2 \\ -1 & -1 & -1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - \lambda^2 - 4\lambda + 4 = 0$$

The roots of the above are the eigenvalues.

$$\begin{aligned} \lambda_1 &= -2 \\ \lambda_2 &= 1 \\ \lambda_3 &= 2 \end{aligned}$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-2	1	real eigenvalue
1	1	real eigenvalue
2	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 3 & 5 & 8 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} - (-2) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 5 & 5 & 8 \\ 1 & 1 & -2 \\ -1 & -1 & 1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 5 & 5 & 8 & 0 \\ 1 & 1 & -2 & 0 \\ -1 & -1 & 1 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{5} \Longrightarrow \left[\begin{array}{ccc|c} 5 & 5 & 8 & 0 \\ 0 & 0 & -\frac{18}{5} & 0 \\ -1 & -1 & 1 & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{R_1}{5} \Longrightarrow \left[\begin{array}{ccc|c} 5 & 5 & 8 & 0 \\ 0 & 0 & -\frac{18}{5} & 0 \\ 0 & 0 & \frac{13}{5} & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{13R_2}{18} \Longrightarrow \left[\begin{array}{ccc|c} 5 & 5 & 8 & 0 \\ 0 & 0 & -\frac{18}{5} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 5 & 5 & 8 \\ 0 & 0 & -\frac{18}{5} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1, v_3\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_3 = 0\}$

Hence the solution is

$$\begin{bmatrix} -t \\ t \\ 0 \end{bmatrix} = \begin{bmatrix} -t \\ t \\ 0 \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ t \\ 0 \end{bmatrix} = t \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ t \\ 0 \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 3 & 5 & 8 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} - (1) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 2 & 5 & 8 \\ 1 & -2 & -2 \\ -1 & -1 & -2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 2 & 5 & 8 & 0 \\ 1 & -2 & -2 & 0 \\ -1 & -1 & -2 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{2} \implies \left[\begin{array}{ccc|c} 2 & 5 & 8 & 0 \\ 0 & -\frac{9}{2} & -6 & 0 \\ -1 & -1 & -2 & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{R_1}{2} \implies \left[\begin{array}{ccc|c} 2 & 5 & 8 & 0 \\ 0 & -\frac{9}{2} & -6 & 0 \\ 0 & \frac{3}{2} & 2 & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{R_2}{3} \Longrightarrow \left[\begin{array}{ccc|c} 2 & 5 & 8 & 0 \\ 0 & -\frac{9}{2} & -6 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 2 & 5 & 8 \\ 0 & -\frac{9}{2} & -6 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = -\frac{2t}{3}, v_2 = -\frac{4t}{3}\right\}$

Hence the solution is

$$\begin{bmatrix} -\frac{2t}{3} \\ -\frac{4t}{3} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{2t}{3} \\ -\frac{4t}{3} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -\frac{2t}{3} \\ -\frac{4t}{3} \\ t \end{bmatrix} = t \begin{bmatrix} -\frac{2}{3} \\ -\frac{4}{3} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -\frac{2t}{3} \\ -\frac{4t}{3} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{2}{3} \\ -\frac{4}{3} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} -\frac{2t}{3} \\ -\frac{4t}{3} \\ t \end{bmatrix} = \begin{bmatrix} -2 \\ -4 \\ 3 \end{bmatrix}$$

Considering the eigenvalue $\lambda_3 = 2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 3 & 5 & 8 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} - (2)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 5 & 8 \\ 1 & -3 & -2 \\ -1 & -1 & -3 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 1 & 5 & 8 & 0 \\ 1 & -3 & -2 & 0 \\ -1 & -1 & -3 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} 1 & 5 & 8 & 0 \\ 0 & -8 & -10 & 0 \\ -1 & -1 & -3 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} 1 & 5 & 8 & 0 \\ 0 & -8 & -10 & 0 \\ 0 & 4 & 5 & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{R_2}{2} \Longrightarrow \left[\begin{array}{ccc|c} 1 & 5 & 8 & 0 \\ 0 & -8 & -10 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 1 & 5 & 8 \\ 0 & -8 & -10 \\ 0 & 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = -\frac{7t}{4}, v_2 = -\frac{5t}{4}\right\}$

Hence the solution is

$$\begin{bmatrix} -\frac{7t}{4} \\ -\frac{5t}{4} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{7t}{4} \\ -\frac{5t}{4} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -\frac{7t}{4} \\ -\frac{5t}{4} \\ t \end{bmatrix} = t \begin{bmatrix} -\frac{7}{4} \\ -\frac{5}{4} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -\frac{7t}{4} \\ -\frac{5t}{4} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{7}{4} \\ -\frac{5}{4} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} -\frac{7t}{4} \\ -\frac{5t}{4} \\ t \end{bmatrix} = \begin{bmatrix} -7 \\ -5 \\ 4 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-2	1	1	No	$\begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$
1	1	1	No	$\begin{bmatrix} -\frac{2}{3} \\ -\frac{4}{3} \\ 1 \end{bmatrix}$
2	1	1	No	$\begin{bmatrix} -\frac{7}{4} \\ -\frac{5}{4} \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue -2 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned} \vec{x}_1(t) &= \vec{v}_1 e^{-2t} \\ &= \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix} e^{-2t} \end{aligned}$$

Since eigenvalue 1 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned} \vec{x}_2(t) &= \vec{v}_2 e^{t} \\ &= \begin{bmatrix} -\frac{2}{3} \\ -\frac{4}{3} \\ 1 \end{bmatrix} e^{t} \end{aligned}$$

Since eigenvalue 2 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_3(t) &= \vec{v}_3 e^{2t} \\
&= \begin{bmatrix} -\frac{7}{4} \\ -\frac{5}{4} \\ 1 \end{bmatrix} e^{2t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t) + c_3\vec{x}_3(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} -\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \\ 0 \end{bmatrix} + c_2 \begin{bmatrix} -\frac{2\,\mathrm{e}^{t}}{3} \\ -\frac{4\,\mathrm{e}^{t}}{3} \\ \mathrm{e}^{t} \end{bmatrix} + c_3 \begin{bmatrix} -\frac{7\,\mathrm{e}^{2t}}{4} \\ -\frac{5\,\mathrm{e}^{2t}}{4} \\ \mathrm{e}^{2t} \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -\frac{(21c_3\mathrm{e}^{4t}+8c_2\mathrm{e}^{3t}+12c_1)\mathrm{e}^{-2t}}{12} \\ -\frac{(15c_3\mathrm{e}^{4t}+16c_2\mathrm{e}^{3t}-12c_1)\mathrm{e}^{-2t}}{12} \\ c_2\mathrm{e}^{t} + c_3\mathrm{e}^{2t} \end{bmatrix}
$$

21.10.3 Maple step by step solution

Let's solve

$[y_1'(t) = 3y_1(t) + 5y_2(t) + 8y_3(t)\,, y_2'(t) = y_1(t) - y_2(t) - 2y_3(t)\,, y_3'(t) = -y_1(t) - y_2(t) - y_3(t)]$

- Define vector

$$
\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 3 & 5 & 8 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 3 & 5 & 8 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 3 & 5 & 8 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix}$$

- Rewrite the system as

$\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}\right], \left[1, \begin{bmatrix} -\frac{2}{3} \\ -\frac{4}{3} \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} -\frac{7}{4} \\ -\frac{5}{4} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{y}^{\rightarrow}{}_{1} = \mathrm{e}^{-2t} \cdot \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} -\frac{2}{3} \\ -\frac{4}{3} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{y}^{\rightarrow}{}_{2} = e^{t} \cdot \left[\begin{array}{c} -\frac{2}{3} \\ -\frac{4}{3} \\ 1 \end{array}\right]$$

- Consider eigenpair

$$\left[2, \left[\begin{array}{c} -\frac{7}{4} \\ -\frac{5}{4} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{y}^{\rightarrow}{}_{3} = e^{2t} \cdot \left[\begin{array}{c} -\frac{7}{4} \\ -\frac{5}{4} \\ 1 \end{array}\right]$$

- General solution to the system of ODEs

$$\underline{y}^{\rightarrow} = c_1 \underline{y}^{\rightarrow}{}_{1} + c_2 \underline{y}^{\rightarrow}{}_{2} + c_3 \underline{y}^{\rightarrow}{}_{3}$$

- Substitute solutions into the general solution

$$\underline{y}^{\rightarrow} = c_1 e^{-2t} \cdot \left[\begin{array}{c} -1 \\ 1 \\ 0 \end{array}\right] + c_2 e^{t} \cdot \left[\begin{array}{c} -\frac{2}{3} \\ -\frac{4}{3} \\ 1 \end{array}\right] + c_3 e^{2t} \cdot \left[\begin{array}{c} -\frac{7}{4} \\ -\frac{5}{4} \\ 1 \end{array}\right]$$

- Substitute in vector of dependent variables

$$\left[\begin{array}{c} y_1(t) \\ y_2(t) \\ y_3(t) \end{array}\right] = \left[\begin{array}{c} -\frac{(21c_3 e^{4t} + 8c_2 e^{3t} + 12c_1) e^{-2t}}{12} \\ -\frac{(15c_3 e^{4t} + 16c_2 e^{3t} - 12c_1) e^{-2t}}{12} \\ c_2 e^{t} + c_3 e^{2t} \end{array}\right]$$

- Solution to the system of ODEs

$$\left\{y_1(t) = -\frac{(21c_3 e^{4t} + 8c_2 e^{3t} + 12c_1) e^{-2t}}{12}, y_2(t) = -\frac{(15c_3 e^{4t} + 16c_2 e^{3t} - 12c_1) e^{-2t}}{12}, y_3(t) = c_2 e^{t} + c_3 e^{2t}\right\}$$

ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= y_1(t) - y_2(t) + 2y_3(t) \\
y_2'(t) &= 12y_1(t) - 4y_2(t) + 10y_3(t) \\
y_3'(t) &= -6y_1(t) + y_2(t) - 7y_3(t)
\end{aligned}
$$

21.11.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 1 & -1 & 2 \\ 12 & -4 & 10 \\ -6 & 1 & -7 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} 3\,\mathrm{e}^{-3t} - 2\,\mathrm{e}^{-5t} & -\mathrm{e}^{-2t} + \mathrm{e}^{-3t} & -2\,\mathrm{e}^{-2t} + 4\,\mathrm{e}^{-3t} - 2\,\mathrm{e}^{-5t} \\ 6\,\mathrm{e}^{-3t} - 6\,\mathrm{e}^{-5t} & -\mathrm{e}^{-2t} + 2\,\mathrm{e}^{-3t} & -2\,\mathrm{e}^{-2t} + 8\,\mathrm{e}^{-3t} - 6\,\mathrm{e}^{-5t} \\ -3\,\mathrm{e}^{-3t} + 3\,\mathrm{e}^{-5t} & \mathrm{e}^{-2t} - \mathrm{e}^{-3t} & 3\,\mathrm{e}^{-5t} + 2\,\mathrm{e}^{-2t} - 4\,\mathrm{e}^{-3t} \end{bmatrix}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} 3\,\mathrm{e}^{-3t}-2\,\mathrm{e}^{-5t} & -\mathrm{e}^{-2t}+\mathrm{e}^{-3t} & -2\,\mathrm{e}^{-2t}+4\,\mathrm{e}^{-3t}-2\,\mathrm{e}^{-5t} \\ 6\,\mathrm{e}^{-3t}-6\,\mathrm{e}^{-5t} & -\mathrm{e}^{-2t}+2\,\mathrm{e}^{-3t} & -2\,\mathrm{e}^{-2t}+8\,\mathrm{e}^{-3t}-6\,\mathrm{e}^{-5t} \\ -3\,\mathrm{e}^{-3t}+3\,\mathrm{e}^{-5t} & \mathrm{e}^{-2t}-\mathrm{e}^{-3t} & 3\,\mathrm{e}^{-5t}+2\,\mathrm{e}^{-2t}-4\,\mathrm{e}^{-3t} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} (3\,\mathrm{e}^{-3t}-2\,\mathrm{e}^{-5t})\,c_1+(-\mathrm{e}^{-2t}+\mathrm{e}^{-3t})\,c_2+(-2\,\mathrm{e}^{-2t}+4\,\mathrm{e}^{-3t}-2\,\mathrm{e}^{-5t})\,c_3 \\ (6\,\mathrm{e}^{-3t}-6\,\mathrm{e}^{-5t})\,c_1+(-\mathrm{e}^{-2t}+2\,\mathrm{e}^{-3t})\,c_2+(-2\,\mathrm{e}^{-2t}+8\,\mathrm{e}^{-3t}-6\,\mathrm{e}^{-5t})\,c_3 \\ (-3\,\mathrm{e}^{-3t}+3\,\mathrm{e}^{-5t})\,c_1+(\mathrm{e}^{-2t}-\mathrm{e}^{-3t})\,c_2+(3\,\mathrm{e}^{-5t}+2\,\mathrm{e}^{-2t}-4\,\mathrm{e}^{-3t})\,c_3 \end{bmatrix} \\
&= \begin{bmatrix} (3c_1+c_2+4c_3)\,\mathrm{e}^{-3t}+(-2c_1-2c_3)\,\mathrm{e}^{-5t}-\mathrm{e}^{-2t}(c_2+2c_3) \\ (6c_1+2c_2+8c_3)\,\mathrm{e}^{-3t}+(-6c_1-6c_3)\,\mathrm{e}^{-5t}-\mathrm{e}^{-2t}(c_2+2c_3) \\ (-3c_1-c_2-4c_3)\,\mathrm{e}^{-3t}+(3c_1+3c_3)\,\mathrm{e}^{-5t}+\mathrm{e}^{-2t}(c_2+2c_3) \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.11.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 1 & -1 & 2 \\ 12 & -4 & 10 \\ -6 & 1 & -7 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A-\lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 1 & -1 & 2 \\ 12 & -4 & 10 \\ -6 & 1 & -7 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 1-\lambda & -1 & 2 \\ 12 & -4-\lambda & 10 \\ -6 & 1 & -7-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + 10\lambda^2 + 31\lambda + 30 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -3$$
$$\lambda_2 = -2$$
$$\lambda_3 = -5$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-2	1	real eigenvalue
-3	1	real eigenvalue
-5	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -5$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 1 & -1 & 2 \\ 12 & -4 & 10 \\ -6 & 1 & -7 \end{bmatrix} - (-5)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 6 & -1 & 2 \\ 12 & 1 & 10 \\ -6 & 1 & -2 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 6 & -1 & 2 & 0 \\ 12 & 1 & 10 & 0 \\ -6 & 1 & -2 & 0 \end{array}\right]$$

$$R_2 = R_2 - 2R_1 \Longrightarrow \left[\begin{array}{ccc|c} 6 & -1 & 2 & 0 \\ 0 & 3 & 6 & 0 \\ -6 & 1 & -2 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} 6 & -1 & 2 & 0 \\ 0 & 3 & 6 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 6 & -1 & 2 \\ 0 & 3 & 6 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = -\frac{2t}{3}, v_2 = -2t\right\}$

Hence the solution is

$$\begin{bmatrix} -\frac{2t}{3} \\ -2t \\ t \end{bmatrix} = \begin{bmatrix} -\frac{2t}{3} \\ -2t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -\frac{2t}{3} \\ -2t \\ t \end{bmatrix} = t \begin{bmatrix} -\frac{2}{3} \\ -2 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -\frac{2t}{3} \\ -2t \\ t \end{bmatrix} = \begin{bmatrix} -\frac{2}{3} \\ -2 \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} -\frac{2t}{3} \\ -2t \\ t \end{bmatrix} = \begin{bmatrix} -2 \\ -6 \\ 3 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = -3$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 1 & -1 & 2 \\ 12 & -4 & 10 \\ -6 & 1 & -7 \end{bmatrix} - (-3) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 4 & -1 & 2 \\ 12 & -1 & 10 \\ -6 & 1 & -4 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 4 & -1 & 2 & 0 \\ 12 & -1 & 10 & 0 \\ -6 & 1 & -4 & 0 \end{array}\right]$$

$$R_2 = R_2 - 3R_1 \Longrightarrow \left[\begin{array}{ccc|c} 4 & -1 & 2 & 0 \\ 0 & 2 & 4 & 0 \\ -6 & 1 & -4 & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{3R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} 4 & -1 & 2 & 0 \\ 0 & 2 & 4 & 0 \\ 0 & -\frac{1}{2} & -1 & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{R_2}{4} \Longrightarrow \left[\begin{array}{ccc|c} 4 & -1 & 2 & 0 \\ 0 & 2 & 4 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 4 & -1 & 2 \\ 0 & 2 & 4 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_2 = -2t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ -2t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ -2t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ -2t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ -2 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ -2t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ -2 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_3 = -2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 1 & -1 & 2 \\ 12 & -4 & 10 \\ -6 & 1 & -7 \end{bmatrix} - (-2) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 3 & -1 & 2 \\ 12 & -2 & 10 \\ -6 & 1 & -5 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 3 & -1 & 2 & 0 \\ 12 & -2 & 10 & 0 \\ -6 & 1 & -5 & 0 \end{array}\right]$$

$$R_2 = R_2 - 4R_1 \Longrightarrow \left[\begin{array}{ccc|c} 3 & -1 & 2 & 0 \\ 0 & 2 & 2 & 0 \\ -6 & 1 & -5 & 0 \end{array}\right]$$

$$R_3 = R_3 + 2R_1 \Longrightarrow \left[\begin{array}{ccc|c} 3 & -1 & 2 & 0 \\ 0 & 2 & 2 & 0 \\ 0 & -1 & -1 & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{R_2}{2} \Longrightarrow \left[\begin{array}{ccc|c} 3 & -1 & 2 & 0 \\ 0 & 2 & 2 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 3 & -1 & 2 \\ 0 & 2 & 2 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_2 = -t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ -t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-3	1	1	No	$\begin{bmatrix} -1 \\ -2 \\ 1 \end{bmatrix}$
-2	1	1	No	$\begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$
-5	1	1	No	$\begin{bmatrix} -\frac{2}{3} \\ -2 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue -3 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned} \vec{x}_1(t) &= \vec{v}_1 e^{-3t} \\ &= \begin{bmatrix} -1 \\ -2 \\ 1 \end{bmatrix} e^{-3t} \end{aligned}$$

Since eigenvalue -2 is real and distinct then the corresponding eigenvector solution is

$$\vec{x}_2(t) = \vec{v}_2 e^{-2t}$$
$$= \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix} e^{-2t}$$

Since eigenvalue -5 is real and distinct then the corresponding eigenvector solution is

$$\vec{x}_3(t) = \vec{v}_3 e^{-5t}$$
$$= \begin{bmatrix} -\frac{2}{3} \\ -2 \\ 1 \end{bmatrix} e^{-5t}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t) + c_3\vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} -\mathrm{e}^{-3t} \\ -2\,\mathrm{e}^{-3t} \\ \mathrm{e}^{-3t} \end{bmatrix} + c_2 \begin{bmatrix} -\mathrm{e}^{-2t} \\ -\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \end{bmatrix} + c_3 \begin{bmatrix} -\frac{2\,\mathrm{e}^{-5t}}{3} \\ -2\,\mathrm{e}^{-5t} \\ \mathrm{e}^{-5t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -c_1\mathrm{e}^{-3t} - c_2\mathrm{e}^{-2t} - \frac{2c_3\mathrm{e}^{-5t}}{3} \\ -2c_1\mathrm{e}^{-3t} - c_2\mathrm{e}^{-2t} - 2c_3\mathrm{e}^{-5t} \\ c_1\mathrm{e}^{-3t} + c_2\mathrm{e}^{-2t} + c_3\mathrm{e}^{-5t} \end{bmatrix}$$

21.11.3 Maple step by step solution

Let's solve

$[y_1'(t) = y_1(t) - y_2(t) + 2y_3(t)\,, y_2'(t) = 12y_1(t) - 4y_2(t) + 10y_3(t)\,, y_3'(t) = -6y_1(t) + y_2(t) - 7y_3(t$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 1 & -1 & 2 \\ 12 & -4 & 10 \\ -6 & 1 & -7 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 1 & -1 & 2 \\ 12 & -4 & 10 \\ -6 & 1 & -7 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 1 & -1 & 2 \\ 12 & -4 & 10 \\ -6 & 1 & -7 \end{bmatrix}$$

- Rewrite the system as

$$\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-5, \begin{bmatrix} -\frac{2}{3} \\ -2 \\ 1 \end{bmatrix}\right], \left[-3, \begin{bmatrix} -1 \\ -2 \\ 1 \end{bmatrix}\right], \left[-2, \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-5, \begin{bmatrix} -\frac{2}{3} \\ -2 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_1 = e^{-5t} \cdot \begin{bmatrix} -\frac{2}{3} \\ -2 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\begin{bmatrix} -3, \begin{bmatrix} -1 \\ -2 \\ 1 \end{bmatrix} \end{bmatrix}$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_2 = e^{-3t} \cdot \begin{bmatrix} -1 \\ -2 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\begin{bmatrix} -2, \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix} \end{bmatrix}$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_3 = e^{-2t} \cdot \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_1 + c_2 \underline{\vec{y}}_2 + c_3 \underline{\vec{y}}_3$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 e^{-5t} \cdot \begin{bmatrix} -\frac{2}{3} \\ -2 \\ 1 \end{bmatrix} + e^{-3t} c_2 \cdot \begin{bmatrix} -1 \\ -2 \\ 1 \end{bmatrix} + c_3 e^{-2t} \cdot \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -\frac{2c_1 e^{-5t}}{3} - e^{-3t}c_2 - c_3 e^{-2t} \\ -2c_1 e^{-5t} - 2\,e^{-3t}c_2 - c_3 e^{-2t} \\ c_1 e^{-5t} + e^{-3t}c_2 + c_3 e^{-2t} \end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{y_1(t) = -\frac{2c_1 e^{-5t}}{3} - e^{-3t}c_2 - c_3 e^{-2t}, y_2(t) = -2c_1 e^{-5t} - 2\,e^{-3t}c_2 - c_3 e^{-2t}, y_3(t) = c_1 e^{-5t} + e^{-3t}c_2 +\right.$$

ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= 4y_1(t) - y_2(t) - 4y_3(t) \\
y_2'(t) &= 4y_1(t) - 3y_2(t) - 2y_3(t) \\
y_3'(t) &= y_1(t) - y_2(t) - y_3(t)
\end{aligned}
$$

21.12.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 4 & -1 & -4 \\ 4 & -3 & -2 \\ 1 & -1 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{(11\,e^{5t}+5\,e^{t}-6)e^{-2t}}{10} & -e^{-t}+e^{-2t} & -\frac{(11\,e^{5t}-15\,e^{t}+4)e^{-2t}}{10} \\ \frac{(7\,e^{5t}+5\,e^{t}-12)e^{-2t}}{10} & -e^{-t}+2\,e^{-2t} & -\frac{(7\,e^{5t}-15\,e^{t}+8)e^{-2t}}{10} \\ \frac{(e^{5t}+5\,e^{t}-6)e^{-2t}}{10} & -e^{-t}+e^{-2t} & -\frac{(e^{5t}-15\,e^{t}+4)e^{-2t}}{10} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned} \vec{x}_h(t) &= e^{At}\vec{c} \\ &= \begin{bmatrix} \frac{(11\,e^{5t}+5\,e^{t}-6)e^{-2t}}{10} & -e^{-t}+e^{-2t} & -\frac{(11\,e^{5t}-15\,e^{t}+4)e^{-2t}}{10} \\ \frac{(7\,e^{5t}+5\,e^{t}-12)e^{-2t}}{10} & -e^{-t}+2\,e^{-2t} & -\frac{(7\,e^{5t}-15\,e^{t}+8)e^{-2t}}{10} \\ \frac{(e^{5t}+5\,e^{t}-6)e^{-2t}}{10} & -e^{-t}+e^{-2t} & -\frac{(e^{5t}-15\,e^{t}+4)e^{-2t}}{10} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\ &= \begin{bmatrix} \frac{(11\,e^{5t}+5\,e^{t}-6)e^{-2t}c_1}{10} + \left(-e^{-t}+e^{-2t}\right)c_2 - \frac{(11\,e^{5t}-15\,e^{t}+4)e^{-2t}c_3}{10} \\ \frac{(7\,e^{5t}+5\,e^{t}-12)e^{-2t}c_1}{10} + \left(-e^{-t}+2\,e^{-2t}\right)c_2 - \frac{(7\,e^{5t}-15\,e^{t}+8)e^{-2t}c_3}{10} \\ \frac{(e^{5t}+5\,e^{t}-6)e^{-2t}c_1}{10} + \left(-e^{-t}+e^{-2t}\right)c_2 - \frac{(e^{5t}-15\,e^{t}+4)e^{-2t}c_3}{10} \end{bmatrix} \\ &= \begin{bmatrix} \frac{\left(\frac{11(c_1-c_3)e^{5t}}{5}+(c_1-2c_2+3c_3)e^{t}-\frac{6c_1}{5}+2c_2-\frac{4c_3}{5}\right)e^{-2t}}{2} \\ \frac{\left(\frac{7(c_1-c_3)e^{5t}}{5}+(c_1-2c_2+3c_3)e^{t}-\frac{12c_1}{5}+4c_2-\frac{8c_3}{5}\right)e^{-2t}}{2} \\ \frac{\left(\frac{(c_1-c_3)e^{5t}}{5}+(c_1-2c_2+3c_3)e^{t}-\frac{6c_1}{5}+2c_2-\frac{4c_3}{5}\right)e^{-2t}}{2} \end{bmatrix} \end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.12.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 4 & -1 & -4 \\ 4 & -3 & -2 \\ 1 & -1 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det\left(A - \lambda I\right) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 4 & -1 & -4 \\ 4 & -3 & -2 \\ 1 & -1 & -1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 4-\lambda & -1 & -4 \\ 4 & -3-\lambda & -2 \\ 1 & -1 & -1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 7\lambda - 6 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -1$$
$$\lambda_2 = -2$$
$$\lambda_3 = 3$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-1	1	real eigenvalue
-2	1	real eigenvalue
3	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 4 & -1 & -4 \\ 4 & -3 & -2 \\ 1 & -1 & -1 \end{bmatrix} - (-2) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 6 & -1 & -4 \\ 4 & -1 & -2 \\ 1 & -1 & 1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 6 & -1 & -4 & 0 \\ 4 & -1 & -2 & 0 \\ 1 & -1 & 1 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{2R_1}{3} \implies \left[\begin{array}{ccc|c} 6 & -1 & -4 & 0 \\ 0 & -\frac{1}{3} & \frac{2}{3} & 0 \\ 1 & -1 & 1 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{R_1}{6} \implies \left[\begin{array}{ccc|c} 6 & -1 & -4 & 0 \\ 0 & -\frac{1}{3} & \frac{2}{3} & 0 \\ 0 & -\frac{5}{6} & \frac{5}{3} & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{5R_2}{2} \implies \left[\begin{array}{ccc|c} 6 & -1 & -4 & 0 \\ 0 & -\frac{1}{3} & \frac{2}{3} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 6 & -1 & -4 \\ 0 & -\frac{1}{3} & \frac{2}{3} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t, v_2 = 2t\}$

Hence the solution is

$$\begin{bmatrix} t \\ 2t \\ t \end{bmatrix} = \begin{bmatrix} t \\ 2t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ 2t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ 2t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = -1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 4 & -1 & -4 \\ 4 & -3 & -2 \\ 1 & -1 & -1 \end{bmatrix} - (-1) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 5 & -1 & -4 \\ 4 & -2 & -2 \\ 1 & -1 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 5 & -1 & -4 & 0 \\ 4 & -2 & -2 & 0 \\ 1 & -1 & 0 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{4R_1}{5} \Longrightarrow \left[\begin{array}{ccc|c} 5 & -1 & -4 & 0 \\ 0 & -\frac{6}{5} & \frac{6}{5} & 0 \\ 1 & -1 & 0 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{R_1}{5} \Longrightarrow \left[\begin{array}{ccc|c} 5 & -1 & -4 & 0 \\ 0 & -\frac{6}{5} & \frac{6}{5} & 0 \\ 0 & -\frac{4}{5} & \frac{4}{5} & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{2R_2}{3} \Longrightarrow \left[\begin{array}{ccc|c} 5 & -1 & -4 & 0 \\ 0 & -\frac{6}{5} & \frac{6}{5} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 5 & -1 & -4 \\ 0 & -\frac{6}{5} & \frac{6}{5} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t, v_2 = t\}$

Hence the solution is

$$\begin{bmatrix} t \\ t \\ t \end{bmatrix} = \begin{bmatrix} t \\ t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_3 = 3$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 4 & -1 & -4 \\ 4 & -3 & -2 \\ 1 & -1 & -1 \end{bmatrix} - (3)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & -1 & -4 \\ 4 & -6 & -2 \\ 1 & -1 & -4 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 1 & -1 & -4 & 0 \\ 4 & -6 & -2 & 0 \\ 1 & -1 & -4 & 0 \end{array}\right]$$

$$R_2 = R_2 - 4R_1 \Longrightarrow \left[\begin{array}{ccc|c} 1 & -1 & -4 & 0 \\ 0 & -2 & 14 & 0 \\ 1 & -1 & -4 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} 1 & -1 & -4 & 0 \\ 0 & -2 & 14 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 1 & -1 & -4 \\ 0 & -2 & 14 \\ 0 & 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 11t, v_2 = 7t\}$

Hence the solution is

$$\begin{bmatrix} 11t \\ 7t \\ t \end{bmatrix} = \begin{bmatrix} 11t \\ 7t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} 11t \\ 7t \\ t \end{bmatrix} = t \begin{bmatrix} 11 \\ 7 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} 11t \\ 7t \\ t \end{bmatrix} = \begin{bmatrix} 11 \\ 7 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-1	1	1	No	$\begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$
-2	1	1	No	$\begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$
3	1	1	No	$\begin{bmatrix} 11 \\ 7 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue -1 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{-t} \\ &= \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} e^{-t}\end{aligned}$$

Since eigenvalue -2 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned}\vec{x}_2(t) &= \vec{v}_2 e^{-2t} \\ &= \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} e^{-2t}\end{aligned}$$

Since eigenvalue 3 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned}\vec{x}_3(t) &= \vec{v}_3 e^{3t} \\ &= \begin{bmatrix} 11 \\ 7 \\ 1 \end{bmatrix} e^{3t}\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} \mathrm{e}^{-t} \\ \mathrm{e}^{-t} \\ \mathrm{e}^{-t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-2t} \\ 2\,\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \end{bmatrix} + c_3 \begin{bmatrix} 11\,\mathrm{e}^{3t} \\ 7\,\mathrm{e}^{3t} \\ \mathrm{e}^{3t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} (11c_3\mathrm{e}^{5t} + c_1\mathrm{e}^{t} + c_2)\,\mathrm{e}^{-2t} \\ (7c_3\mathrm{e}^{5t} + c_1\mathrm{e}^{t} + 2c_2)\,\mathrm{e}^{-2t} \\ (c_3\mathrm{e}^{5t} + c_1\mathrm{e}^{t} + c_2)\,\mathrm{e}^{-2t} \end{bmatrix}$$

21.12.3 Maple step by step solution

Let's solve

$[y_1'(t) = 4y_1(t) - y_2(t) - 4y_3(t), y_2'(t) = 4y_1(t) - 3y_2(t) - 2y_3(t), y_3'(t) = y_1(t) - y_2(t) - y_3(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 4 & -1 & -4 \\ 4 & -3 & -2 \\ 1 & -1 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 4 & -1 & -4 \\ 4 & -3 & -2 \\ 1 & -1 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 4 & -1 & -4 \\ 4 & -3 & -2 \\ 1 & -1 & -1 \end{bmatrix}$$

- Rewrite the system as

$$\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[3, \begin{bmatrix} 11 \\ 7 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_1 = e^{-2t} \cdot \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_2 = e^{-t} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider eigenpair

$$\left[3, \begin{bmatrix} 11 \\ 7 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_3 = e^{3t} \cdot \begin{bmatrix} 11 \\ 7 \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_1 + c_2 \underline{\vec{y}}_2 + c_3 \underline{\vec{y}}_3$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 \mathrm{e}^{-2t} \cdot \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} + c_2 \mathrm{e}^{-t} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} + c_3 \mathrm{e}^{3t} \cdot \begin{bmatrix} 11 \\ 7 \\ 1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} (11c_3 \mathrm{e}^{5t} + c_2 \mathrm{e}^{t} + c_1) \mathrm{e}^{-2t} \\ (7c_3 \mathrm{e}^{5t} + c_2 \mathrm{e}^{t} + 2c_1) \mathrm{e}^{-2t} \\ (c_3 \mathrm{e}^{5t} + c_2 \mathrm{e}^{t} + c_1) \mathrm{e}^{-2t} \end{bmatrix}$$

- Solution to the system of ODEs

$$\{y_1(t) = (11c_3 \mathrm{e}^{5t} + c_2 \mathrm{e}^{t} + c_1) \mathrm{e}^{-2t}, y_2(t) = (7c_3 \mathrm{e}^{5t} + c_2 \mathrm{e}^{t} + 2c_1) \mathrm{e}^{-2t}, y_3(t) = (c_3 \mathrm{e}^{5t} + c_2 \mathrm{e}^{t} + c_1) \mathrm{e}^{-2t}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -2y_1(t) + 2y_2(t) - 6y_3(t) \\
y_2'(t) &= 2y_1(t) + 6y_2(t) + 2y_3(t) \\
y_3'(t) &= -2y_1(t) - 2y_2(t) + 2y_3(t)
\end{aligned}
$$

21.13.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -2 & 2 & -6 \\ 2 & 6 & 2 \\ -2 & -2 & 2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{(e^{10t}+4)e^{-4t}}{5} & e^{6t} - e^{4t} & \frac{(e^{10t}-5e^{8t}+4)e^{-4t}}{5} \\ \frac{(e^{10t}-1)e^{-4t}}{5} & e^{6t} & \frac{(e^{10t}-1)e^{-4t}}{5} \\ -\frac{(e^{10t}-1)e^{-4t}}{5} & -e^{6t} + e^{4t} & -\frac{(e^{10t}-5e^{8t}-1)e^{-4t}}{5} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned} \vec{x}_h(t) &= e^{At}\vec{c} \\ &= \begin{bmatrix} \frac{(e^{10t}+4)e^{-4t}}{5} & e^{6t} - e^{4t} & \frac{(e^{10t}-5e^{8t}+4)e^{-4t}}{5} \\ \frac{(e^{10t}-1)e^{-4t}}{5} & e^{6t} & \frac{(e^{10t}-1)e^{-4t}}{5} \\ -\frac{(e^{10t}-1)e^{-4t}}{5} & -e^{6t} + e^{4t} & -\frac{(e^{10t}-5e^{8t}-1)e^{-4t}}{5} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\ &= \begin{bmatrix} \frac{(e^{10t}+4)e^{-4t}c_1}{5} + (e^{6t} - e^{4t})\, c_2 + \frac{(e^{10t}-5e^{8t}+4)e^{-4t}c_3}{5} \\ \frac{(e^{10t}-1)e^{-4t}c_1}{5} + e^{6t}c_2 + \frac{(e^{10t}-1)e^{-4t}c_3}{5} \\ -\frac{(e^{10t}-1)e^{-4t}c_1}{5} + (-e^{6t} + e^{4t})\, c_2 - \frac{(e^{10t}-5e^{8t}-1)e^{-4t}c_3}{5} \end{bmatrix} \\ &= \begin{bmatrix} \frac{((c_1+5c_2+c_3)e^{10t}+(-5c_2-5c_3)e^{8t}+4c_1+4c_3)e^{-4t}}{5} \\ \frac{((c_1+5c_2+c_3)e^{10t}-c_1-c_3)e^{-4t}}{5} \\ -\frac{((c_1+5c_2+c_3)e^{10t}+(-5c_2-5c_3)e^{8t}-c_1-c_3)e^{-4t}}{5} \end{bmatrix} \end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.13.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -2 & 2 & -6 \\ 2 & 6 & 2 \\ -2 & -2 & 2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix}-2 & 2 & -6\\ 2 & 6 & 2\\ -2 & -2 & 2\end{bmatrix} - \lambda\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix}-2-\lambda & 2 & -6\\ 2 & 6-\lambda & 2\\ -2 & -2 & 2-\lambda\end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 6\lambda^2 - 16\lambda + 96 = 0$$

The roots of the above are the eigenvalues.

$$\begin{aligned}\lambda_1 &= -4\\ \lambda_2 &= 4\\ \lambda_3 &= 6\end{aligned}$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-4	1	real eigenvalue
4	1	real eigenvalue
6	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -4$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix}-2 & 2 & -6\\ 2 & 6 & 2\\ -2 & -2 & 2\end{bmatrix} - (-4)\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{bmatrix}\right)\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix} = \begin{bmatrix}0\\ 0\\ 0\end{bmatrix}$$

$$\begin{bmatrix}2 & 2 & -6\\ 2 & 10 & 2\\ -2 & -2 & 6\end{bmatrix}\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix} = \begin{bmatrix}0\\ 0\\ 0\end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 2 & 2 & -6 & 0 \\ 2 & 10 & 2 & 0 \\ -2 & -2 & 6 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} 2 & 2 & -6 & 0 \\ 0 & 8 & 8 & 0 \\ -2 & -2 & 6 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} 2 & 2 & -6 & 0 \\ 0 & 8 & 8 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 2 & 2 & -6 \\ 0 & 8 & 8 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 4t, v_2 = -t\}$

Hence the solution is

$$\begin{bmatrix} 4t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} 4t \\ -t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} 4t \\ -t \\ t \end{bmatrix} = t \begin{bmatrix} 4 \\ -1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} 4t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} 4 \\ -1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 4$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -2 & 2 & -6 \\ 2 & 6 & 2 \\ -2 & -2 & 2 \end{bmatrix} - (4) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -6 & 2 & -6 \\ 2 & 2 & 2 \\ -2 & -2 & -2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -6 & 2 & -6 & 0 \\ 2 & 2 & 2 & 0 \\ -2 & -2 & -2 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{R_1}{3} \implies \left[\begin{array}{ccc|c} -6 & 2 & -6 & 0 \\ 0 & \frac{8}{3} & 0 & 0 \\ -2 & -2 & -2 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{R_1}{3} \implies \left[\begin{array}{ccc|c} -6 & 2 & -6 & 0 \\ 0 & \frac{8}{3} & 0 & 0 \\ 0 & -\frac{8}{3} & 0 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_2 \implies \left[\begin{array}{ccc|c} -6 & 2 & -6 & 0 \\ 0 & \frac{8}{3} & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -6 & 2 & -6 \\ 0 & \frac{8}{3} & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_2 = 0\}$

Hence the solution is

$$\begin{bmatrix} -t \\ 0 \\ t \end{bmatrix} = \begin{bmatrix} -t \\ 0 \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ 0 \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ 0 \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_3 = 6$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -2 & 2 & -6 \\ 2 & 6 & 2 \\ -2 & -2 & 2 \end{bmatrix} - (6) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -8 & 2 & -6 \\ 2 & 0 & 2 \\ -2 & -2 & -4 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -8 & 2 & -6 & 0 \\ 2 & 0 & 2 & 0 \\ -2 & -2 & -4 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{R_1}{4} \implies \left[\begin{array}{ccc|c} -8 & 2 & -6 & 0 \\ 0 & \frac{1}{2} & \frac{1}{2} & 0 \\ -2 & -2 & -4 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{R_1}{4} \implies \left[\begin{array}{ccc|c} -8 & 2 & -6 & 0 \\ 0 & \frac{1}{2} & \frac{1}{2} & 0 \\ 0 & -\frac{5}{2} & -\frac{5}{2} & 0 \end{array}\right]$$

$$R_3 = R_3 + 5R_2 \implies \left[\begin{array}{ccc|c} -8 & 2 & -6 & 0 \\ 0 & \frac{1}{2} & \frac{1}{2} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -8 & 2 & -6 \\ 0 & \frac{1}{2} & \frac{1}{2} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_2 = -t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ -t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-4	1	1	No	$\begin{bmatrix} 4 \\ -1 \\ 1 \end{bmatrix}$
4	1	1	No	$\begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$
6	1	1	No	$\begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue -4 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{-4t} \\ &= \begin{bmatrix} 4 \\ -1 \\ 1 \end{bmatrix} e^{-4t}\end{aligned}$$

Since eigenvalue 4 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned}\vec{x}_2(t) &= \vec{v}_2 e^{4t} \\ &= \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} e^{4t}\end{aligned}$$

Since eigenvalue 6 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned}\vec{x}_3(t) &= \vec{v}_3 e^{6t} \\ &= \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix} e^{6t}\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t) + c_3\vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} 4\,\mathrm{e}^{-4t} \\ -\mathrm{e}^{-4t} \\ \mathrm{e}^{-4t} \end{bmatrix} + c_2 \begin{bmatrix} -\mathrm{e}^{4t} \\ 0 \\ \mathrm{e}^{4t} \end{bmatrix} + c_3 \begin{bmatrix} -\mathrm{e}^{6t} \\ -\mathrm{e}^{6t} \\ \mathrm{e}^{6t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} (-c_3\mathrm{e}^{10t} - c_2\mathrm{e}^{8t} + 4c_1)\,\mathrm{e}^{-4t} \\ -(c_3\mathrm{e}^{10t} + c_1)\,\mathrm{e}^{-4t} \\ (c_3\mathrm{e}^{10t} + c_2\mathrm{e}^{8t} + c_1)\,\mathrm{e}^{-4t} \end{bmatrix}$$

21.13.3 Maple step by step solution

Let's solve

$[y_1'(t) = -2y_1(t) + 2y_2(t) - 6y_3(t), y_2'(t) = 2y_1(t) + 6y_2(t) + 2y_3(t), y_3'(t) = -2y_1(t) - 2y_2(t) + 2y$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -2 & 2 & -6 \\ 2 & 6 & 2 \\ -2 & -2 & 2 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -2 & 2 & -6 \\ 2 & 6 & 2 \\ -2 & -2 & 2 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -2 & 2 & -6 \\ 2 & 6 & 2 \\ -2 & -2 & 2 \end{bmatrix}$$

- Rewrite the system as

$$\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-4, \begin{bmatrix} 4 \\ -1 \\ 1 \end{bmatrix}\right], \left[4, \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}\right], \left[6, \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-4, \left[\begin{array}{c}4 \\ -1 \\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_{1} = e^{-4t} \cdot \left[\begin{array}{c}4 \\ -1 \\ 1\end{array}\right]$$

- Consider eigenpair

$$\left[4, \left[\begin{array}{c}-1 \\ 0 \\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_{2} = e^{4t} \cdot \left[\begin{array}{c}-1 \\ 0 \\ 1\end{array}\right]$$

- Consider eigenpair

$$\left[6, \left[\begin{array}{c}-1 \\ -1 \\ 1\end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_{3} = e^{6t} \cdot \left[\begin{array}{c}-1 \\ -1 \\ 1\end{array}\right]$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_{1} + c_2 \underline{\vec{y}}_{2} + c_3 \underline{\vec{y}}_{3}$$

- Substitute solutions into the general solution

$$\underline{\overrightarrow{y}} = c_1 e^{-4t} \cdot \begin{bmatrix} 4 \\ -1 \\ 1 \end{bmatrix} + c_2 e^{4t} \cdot \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} + c_3 e^{6t} \cdot \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} (-c_3 e^{10t} - c_2 e^{8t} + 4c_1) e^{-4t} \\ -(c_3 e^{10t} + c_1) e^{-4t} \\ (c_3 e^{10t} + c_2 e^{8t} + c_1) e^{-4t} \end{bmatrix}$$

- Solution to the system of ODEs

$$\{y_1(t) = (-c_3 e^{10t} - c_2 e^{8t} + 4c_1) e^{-4t}, y_2(t) = -(c_3 e^{10t} + c_1) e^{-4t}, y_3(t) = (c_3 e^{10t} + c_2 e^{8t} + c_1) e^{-4t}\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= 3y_1(t) + 2y_2(t) - 2y_3(t) \\
y_2'(t) &= -2y_1(t) + 7y_2(t) - 2y_3(t) \\
y_3'(t) &= -10y_1(t) + 10y_2(t) - 5y_3(t)
\end{aligned}
$$

21.14.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 3 & 2 & -2 \\ -2 & 7 & -2 \\ -10 & 10 & -5 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{4\,e^{5t}}{5} + \frac{e^{-5t}}{5} & \frac{e^{5t}}{5} - \frac{e^{-5t}}{5} & -\frac{e^{5t}}{5} + \frac{e^{-5t}}{5} \\ -\frac{e^{5t}}{5} + \frac{e^{-5t}}{5} & \frac{6\,e^{5t}}{5} - \frac{e^{-5t}}{5} & -\frac{e^{5t}}{5} + \frac{e^{-5t}}{5} \\ -e^{5t} + e^{-5t} & e^{5t} - e^{-5t} & e^{-5t} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned} \vec{x}_h(t) &= e^{At}\vec{c} \\ &= \begin{bmatrix} \frac{4\,e^{5t}}{5} + \frac{e^{-5t}}{5} & \frac{e^{5t}}{5} - \frac{e^{-5t}}{5} & -\frac{e^{5t}}{5} + \frac{e^{-5t}}{5} \\ -\frac{e^{5t}}{5} + \frac{e^{-5t}}{5} & \frac{6\,e^{5t}}{5} - \frac{e^{-5t}}{5} & -\frac{e^{5t}}{5} + \frac{e^{-5t}}{5} \\ -e^{5t} + e^{-5t} & e^{5t} - e^{-5t} & e^{-5t} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\ &= \begin{bmatrix} \left(\frac{4\,e^{5t}}{5} + \frac{e^{-5t}}{5}\right) c_1 + \left(\frac{e^{5t}}{5} - \frac{e^{-5t}}{5}\right) c_2 + \left(-\frac{e^{5t}}{5} + \frac{e^{-5t}}{5}\right) c_3 \\ \left(-\frac{e^{5t}}{5} + \frac{e^{-5t}}{5}\right) c_1 + \left(\frac{6\,e^{5t}}{5} - \frac{e^{-5t}}{5}\right) c_2 + \left(-\frac{e^{5t}}{5} + \frac{e^{-5t}}{5}\right) c_3 \\ \left(-e^{5t} + e^{-5t}\right) c_1 + \left(e^{5t} - e^{-5t}\right) c_2 + e^{-5t} c_3 \end{bmatrix} \\ &= \begin{bmatrix} \frac{(c_1 - c_2 + c_3)e^{-5t}}{5} + \frac{4\left(c_1 + \frac{c_2}{4} - \frac{c_3}{4}\right)e^{5t}}{5} \\ \frac{(c_1 - c_2 + c_3)e^{-5t}}{5} - \frac{e^{5t}(c_1 - 6c_2 + c_3)}{5} \\ (c_1 - c_2 + c_3)\,e^{-5t} - e^{5t}(c_1 - c_2) \end{bmatrix} \end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.14.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 3 & 2 & -2 \\ -2 & 7 & -2 \\ -10 & 10 & -5 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 3 & 2 & -2 \\ -2 & 7 & -2 \\ -10 & 10 & -5 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 3-\lambda & 2 & -2 \\ -2 & 7-\lambda & -2 \\ -10 & 10 & -5-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 5\lambda^2 - 25\lambda + 125 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 5$$
$$\lambda_2 = -5$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-5	1	real eigenvalue
5	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -5$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 3 & 2 & -2 \\ -2 & 7 & -2 \\ -10 & 10 & -5 \end{bmatrix} - (-5)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 8 & 2 & -2 \\ -2 & 12 & -2 \\ -10 & 10 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 8 & 2 & -2 & 0 \\ -2 & 12 & -2 & 0 \\ -10 & 10 & 0 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{R_1}{4} \Longrightarrow \left[\begin{array}{ccc|c} 8 & 2 & -2 & 0 \\ 0 & \frac{25}{2} & -\frac{5}{2} & 0 \\ -10 & 10 & 0 & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{5R_1}{4} \Longrightarrow \left[\begin{array}{ccc|c} 8 & 2 & -2 & 0 \\ 0 & \frac{25}{2} & -\frac{5}{2} & 0 \\ 0 & \frac{25}{2} & -\frac{5}{2} & 0 \end{array}\right]$$

$$R_3 = R_3 - R_2 \Longrightarrow \left[\begin{array}{ccc|c} 8 & 2 & -2 & 0 \\ 0 & \frac{25}{2} & -\frac{5}{2} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 8 & 2 & -2 \\ 0 & \frac{25}{2} & -\frac{5}{2} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \frac{t}{5}, v_2 = \frac{t}{5}\right\}$

Hence the solution is

$$\begin{bmatrix} \frac{t}{5} \\ \frac{t}{5} \\ t \end{bmatrix} = \begin{bmatrix} \frac{t}{5} \\ \frac{t}{5} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \frac{t}{5} \\ \frac{t}{5} \\ t \end{bmatrix} = t \begin{bmatrix} \frac{1}{5} \\ \frac{1}{5} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \frac{t}{5} \\ \frac{t}{5} \\ t \end{bmatrix} = \begin{bmatrix} \frac{1}{5} \\ \frac{1}{5} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \frac{t}{5} \\ \frac{t}{5} \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 5 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 5$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 3 & 2 & -2 \\ -2 & 7 & -2 \\ -10 & 10 & -5 \end{bmatrix} - (5) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 2 & -2 \\ -2 & 2 & -2 \\ -10 & 10 & -10 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -2 & 2 & -2 & 0 \\ -2 & 2 & -2 & 0 \\ -10 & 10 & -10 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} -2 & 2 & -2 & 0 \\ 0 & 0 & 0 & 0 \\ -10 & 10 & -10 & 0 \end{array}\right]$$

$$R_3 = R_3 - 5R_1 \Longrightarrow \left[\begin{array}{ccc|c} -2 & 2 & -2 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -2 & 2 & -2 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2, v_3\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Let $v_3 = s$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t - s\}$

Hence the solution is

$$\begin{bmatrix} t - s \\ t \\ s \end{bmatrix} = \begin{bmatrix} t - s \\ t \\ s \end{bmatrix}$$

Since there are two free Variable, we have found two eigenvectors associated with this eigenvalue. The above can be written as

$$\begin{aligned} \begin{bmatrix} t - s \\ t \\ s \end{bmatrix} &= \begin{bmatrix} t \\ t \\ 0 \end{bmatrix} + \begin{bmatrix} -s \\ 0 \\ s \end{bmatrix} \\ &= t \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} + s \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} \end{aligned}$$

By letting $t = 1$ and $s = 1$ then the above becomes

$$\begin{bmatrix} t - s \\ t \\ s \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} + \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$$

Hence the two eigenvectors associated with this eigenvalue are

$$\left(\begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} \right)$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
5	2	2	No	$\begin{bmatrix} -1 & 1 \\ 0 & 1 \\ 1 & 0 \end{bmatrix}$
-5	1	1	No	$\begin{bmatrix} \frac{1}{5} \\ \frac{1}{5} \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue 5 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

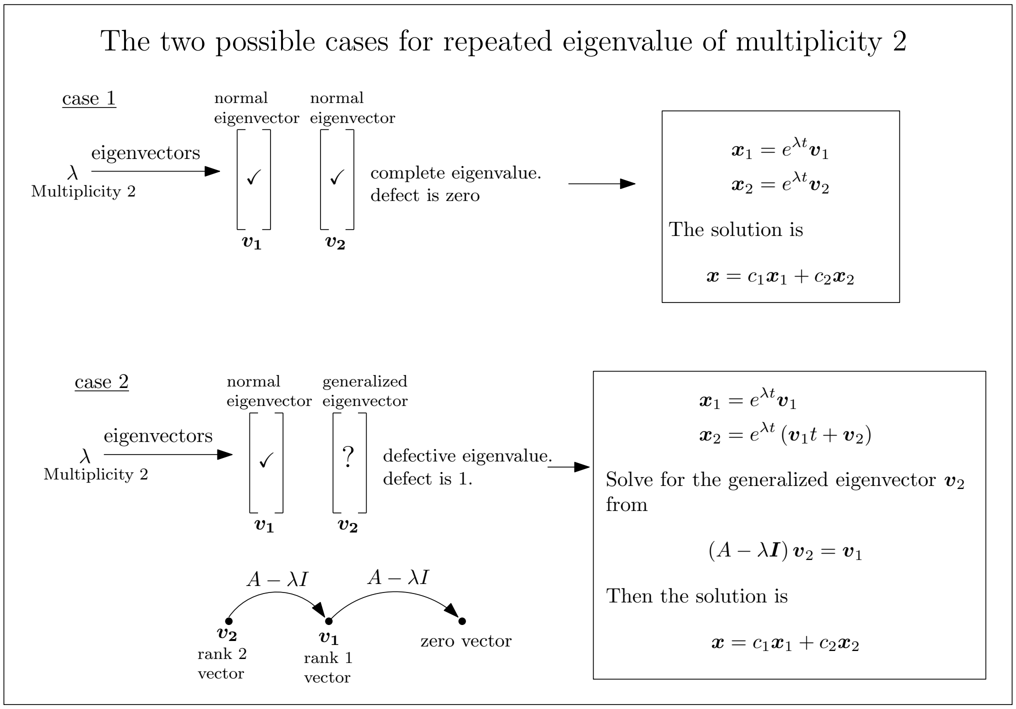

Figure 571: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2 which is the same as its geometric multiplicity 2, then it is complete eigenvalue and this falls into case 1 shown above. Hence the corresponding eigenvector basis are

$$
\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{5t} \\
&= \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} e^{5t}
\end{aligned}
$$

$$
\begin{aligned}
\vec{x}_2(t) &= \vec{v}_2 e^{5t} \\
&= \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} e^{5t}
\end{aligned}
$$

Since eigenvalue -5 is real and distinct then the corresponding eigenvector solution is

$$\vec{x}_3(t) = \vec{v}_3 e^{-5t}$$
$$= \begin{bmatrix} \frac{1}{5} \\ \frac{1}{5} \\ 1 \end{bmatrix} e^{-5t}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t) + c_3\vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} -\mathrm{e}^{5t} \\ 0 \\ \mathrm{e}^{5t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{5t} \\ \mathrm{e}^{5t} \\ 0 \end{bmatrix} + c_3 \begin{bmatrix} \frac{\mathrm{e}^{-5t}}{5} \\ \frac{\mathrm{e}^{-5t}}{5} \\ \mathrm{e}^{-5t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} (-c_1 + c_2)\,\mathrm{e}^{5t} + \frac{c_3\mathrm{e}^{-5t}}{5} \\ c_2\mathrm{e}^{5t} + \frac{c_3\mathrm{e}^{-5t}}{5} \\ c_1\mathrm{e}^{5t} + c_3\mathrm{e}^{-5t} \end{bmatrix}$$

21.14.3 Maple step by step solution

Let's solve

$[y_1'(t) = 3y_1(t) + 2y_2(t) - 2y_3(t)\,, y_2'(t) = -2y_1(t) + 7y_2(t) - 2y_3(t)\,, y_3'(t) = -10y_1(t) + 10y_2(t) -$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow \prime}(t) = \begin{bmatrix} 3 & 2 & -2 \\ -2 & 7 & -2 \\ -10 & 10 & -5 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow \prime}(t) = \begin{bmatrix} 3 & 2 & -2 \\ -2 & 7 & -2 \\ -10 & 10 & -5 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 3 & 2 & -2 \\ -2 & 7 & -2 \\ -10 & 10 & -5 \end{bmatrix}$$

- Rewrite the system as

$\underline{y}^{\rightarrow \prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-5, \begin{bmatrix} \frac{1}{5} \\ \frac{1}{5} \\ 1 \end{bmatrix}\right], \left[5, \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}\right], \left[5, \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-5, \begin{bmatrix} \frac{1}{5} \\ \frac{1}{5} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{y}^{\rightarrow}_{1} = \mathrm{e}^{-5t} \cdot \begin{bmatrix} \frac{1}{5} \\ \frac{1}{5} \\ 1 \end{bmatrix}$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[5, \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue 5

$$\vec{y}_2(t) = e^{5t} \cdot \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = 5$ is the eigenvalue, and

$$\vec{y}_3(t) = e^{\lambda t}\left(t\vec{v} + \vec{p}\right)$$

- Note that the t multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\vec{y}_3(t)$ into the homogeneous system

$$\lambda e^{\lambda t}\left(t\vec{v} + \vec{p}\right) + e^{\lambda t}\vec{v} = \left(e^{\lambda t} A\right) \cdot \left(t\vec{v} + \vec{p}\right)$$

- Use the fact that $\vec{v}$ is an eigenvector of A

$$\lambda e^{\lambda t}\left(t\vec{v} + \vec{p}\right) + e^{\lambda t}\vec{v} = e^{\lambda t}\left(\lambda t\vec{v} + A \cdot \vec{p}\right)$$

- Simplify equation

$$\lambda\vec{p} + \vec{v} = A \cdot \vec{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$$

- Condition $\vec{p}$ must meet for $\vec{y}_3(t)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue 5

$$\left(\begin{bmatrix} 3 & 2 & -2 \\ -2 & 7 & -2 \\ -10 & 10 & -5 \end{bmatrix} - 5 \cdot \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \cdot \vec{p} = \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$$

- Choice of $\vec{p}$

$$\vec{p} = \begin{bmatrix} \frac{1}{2} \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue 5

$$\underline{y}^{\rightarrow}{}_3(t) = \mathrm{e}^{5t} \cdot \left(t \cdot \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} + \begin{bmatrix} \frac{1}{2} \\ 0 \\ 0 \end{bmatrix} \right)$$

- General solution to the system of ODEs

$$\underline{y}^{\rightarrow} = c_1 \underline{y}^{\rightarrow}{}_1 + c_2 \underline{y}^{\rightarrow}{}_2(t) + c_3 \underline{y}^{\rightarrow}{}_3(t)$$

- Substitute solutions into the general solution

$$\underline{y}^{\rightarrow} = c_1 \mathrm{e}^{-5t} \cdot \begin{bmatrix} \frac{1}{5} \\ \frac{1}{5} \\ 1 \end{bmatrix} + c_2 \mathrm{e}^{5t} \cdot \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} + c_3 \mathrm{e}^{5t} \cdot \left(t \cdot \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} + \begin{bmatrix} \frac{1}{2} \\ 0 \\ 0 \end{bmatrix} \right)$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \frac{((1-2t)c_3 - 2c_2)\mathrm{e}^{5t}}{2} + \frac{c_1 \mathrm{e}^{-5t}}{5} \\ \frac{c_1 \mathrm{e}^{-5t}}{5} \\ (c_3 t + c_2)\, \mathrm{e}^{5t} + c_1 \mathrm{e}^{-5t} \end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{ y_1(t) = \frac{((1-2t)c_3 - 2c_2)\mathrm{e}^{5t}}{2} + \frac{c_1 \mathrm{e}^{-5t}}{5}, y_2(t) = \frac{c_1 \mathrm{e}^{-5t}}{5}, y_3(t) = (c_3 t + c_2)\, \mathrm{e}^{5t} + c_1 \mathrm{e}^{-5t} \right\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= 3y_1(t) + y_2(t) - y_3(t) \\
y_2'(t) &= 3y_1(t) + 5y_2(t) + y_3(t) \\
y_3'(t) &= -6y_1(t) + 2y_2(t) + 4y_3(t)
\end{aligned}
$$

21.15.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 3 & 1 & -1 \\ 3 & 5 & 1 \\ -6 & 2 & 4 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{1}{2}+\frac{e^{6t}}{2} & \frac{e^{6t}}{6}-\frac{1}{6} & \frac{1}{6}-\frac{e^{6t}}{6} \\ -\frac{1}{2}+\frac{e^{6t}}{2} & \frac{1}{6}+\frac{5e^{6t}}{6} & \frac{e^{6t}}{6}-\frac{1}{6} \\ 1-e^{6t} & -\frac{1}{3}+\frac{e^{6t}}{3} & \frac{1}{3}+\frac{2e^{6t}}{3} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned} \vec{x}_h(t) &= e^{At}\vec{c} \\ &= \begin{bmatrix} \frac{1}{2}+\frac{e^{6t}}{2} & \frac{e^{6t}}{6}-\frac{1}{6} & \frac{1}{6}-\frac{e^{6t}}{6} \\ -\frac{1}{2}+\frac{e^{6t}}{2} & \frac{1}{6}+\frac{5e^{6t}}{6} & \frac{e^{6t}}{6}-\frac{1}{6} \\ 1-e^{6t} & -\frac{1}{3}+\frac{e^{6t}}{3} & \frac{1}{3}+\frac{2e^{6t}}{3} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\ &= \begin{bmatrix} \left(\frac{1}{2}+\frac{e^{6t}}{2}\right)c_1 + \left(\frac{e^{6t}}{6}-\frac{1}{6}\right)c_2 + \left(\frac{1}{6}-\frac{e^{6t}}{6}\right)c_3 \\ \left(-\frac{1}{2}+\frac{e^{6t}}{2}\right)c_1 + \left(\frac{1}{6}+\frac{5e^{6t}}{6}\right)c_2 + \left(\frac{e^{6t}}{6}-\frac{1}{6}\right)c_3 \\ (1-e^{6t})c_1 + \left(-\frac{1}{3}+\frac{e^{6t}}{3}\right)c_2 + \left(\frac{1}{3}+\frac{2e^{6t}}{3}\right)c_3 \end{bmatrix} \\ &= \begin{bmatrix} \frac{(3c_1+c_2-c_3)e^{6t}}{6} + \frac{c_1}{2} - \frac{c_2}{6} + \frac{c_3}{6} \\ \frac{(3c_1+5c_2+c_3)e^{6t}}{6} - \frac{c_1}{2} + \frac{c_2}{6} - \frac{c_3}{6} \\ \frac{(-3c_1+c_2+2c_3)e^{6t}}{3} + c_1 - \frac{c_2}{3} + \frac{c_3}{3} \end{bmatrix} \end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

21.15.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 3 & 1 & -1 \\ 3 & 5 & 1 \\ -6 & 2 & 4 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 3 & 1 & -1 \\ 3 & 5 & 1 \\ -6 & 2 & 4 \end{bmatrix} - \lambda\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 3-\lambda & 1 & -1 \\ 3 & 5-\lambda & 1 \\ -6 & 2 & 4-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 12\lambda^2 + 36\lambda = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 0$$
$$\lambda_2 = 6$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
0	1	real eigenvalue
6	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 0$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 3 & 1 & -1 \\ 3 & 5 & 1 \\ -6 & 2 & 4 \end{bmatrix} - (0)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} 3 & 1 & -1 \\ 3 & 5 & 1 \\ -6 & 2 & 4 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 3 & 1 & -1 & 0 \\ 3 & 5 & 1 & 0 \\ -6 & 2 & 4 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} 3 & 1 & -1 & 0 \\ 0 & 4 & 2 & 0 \\ -6 & 2 & 4 & 0 \end{array}\right]$$

$$R_3 = R_3 + 2R_1 \Longrightarrow \left[\begin{array}{ccc|c} 3 & 1 & -1 & 0 \\ 0 & 4 & 2 & 0 \\ 0 & 4 & 2 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_2 \Longrightarrow \left[\begin{array}{ccc|c} 3 & 1 & -1 & 0 \\ 0 & 4 & 2 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 3 & 1 & -1 \\ 0 & 4 & 2 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \frac{t}{2}, v_2 = -\frac{t}{2}\right\}$

Hence the solution is

$$\begin{bmatrix} \frac{t}{2} \\ -\frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} \frac{t}{2} \\ -\frac{t}{2} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \frac{t}{2} \\ -\frac{t}{2} \\ t \end{bmatrix} = t \begin{bmatrix} \frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \frac{t}{2} \\ -\frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} \frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \frac{t}{2} \\ -\frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \\ 2 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 6$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 3 & 1 & -1 \\ 3 & 5 & 1 \\ -6 & 2 & 4 \end{bmatrix} - (6) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -3 & 1 & -1 \\ 3 & -1 & 1 \\ -6 & 2 & -2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -3 & 1 & -1 & 0 \\ 3 & -1 & 1 & 0 \\ -6 & 2 & -2 & 0 \end{array}\right]$$

$$R_2 = R_2 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} -3 & 1 & -1 & 0 \\ 0 & 0 & 0 & 0 \\ -6 & 2 & -2 & 0 \end{array}\right]$$

$$
R_3 = R_3 - 2R_1 \Longrightarrow \left[\begin{array}{ccc|c} -3 & 1 & -1 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]
$$

Therefore the system in Echelon form is

$$
\begin{bmatrix} -3 & 1 & -1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}
$$

The free variables are $\{v_2, v_3\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Let $v_3 = s$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \frac{t}{3} - \frac{s}{3}\right\}$

Hence the solution is

$$
\begin{bmatrix} \frac{t}{3} - \frac{s}{3} \\ t \\ s \end{bmatrix} = \begin{bmatrix} \frac{t}{3} - \frac{s}{3} \\ t \\ s \end{bmatrix}
$$

Since there are two free Variable, we have found two eigenvectors associated with this eigenvalue. The above can be written as

$$
\begin{aligned}
\begin{bmatrix} \frac{t}{3} - \frac{s}{3} \\ t \\ s \end{bmatrix} &= \begin{bmatrix} \frac{t}{3} \\ t \\ 0 \end{bmatrix} + \begin{bmatrix} -\frac{s}{3} \\ 0 \\ s \end{bmatrix} \\
&= t \begin{bmatrix} \frac{1}{3} \\ 1 \\ 0 \end{bmatrix} + s \begin{bmatrix} -\frac{1}{3} \\ 0 \\ 1 \end{bmatrix}
\end{aligned}
$$

By letting $t = 1$ and $s = 1$ then the above becomes

$$
\begin{bmatrix} \frac{t}{3} - \frac{s}{3} \\ t \\ s \end{bmatrix} = \begin{bmatrix} \frac{1}{3} \\ 1 \\ 0 \end{bmatrix} + \begin{bmatrix} -\frac{1}{3} \\ 0 \\ 1 \end{bmatrix}
$$

Hence the two eigenvectors associated with this eigenvalue are

$$\left(\begin{bmatrix} \frac{1}{3} \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} -\frac{1}{3} \\ 0 \\ 1 \end{bmatrix} \right)$$

Which are normalized to

$$\left(\begin{bmatrix} 1 \\ 3 \\ 0 \end{bmatrix}, \begin{bmatrix} -1 \\ 0 \\ 3 \end{bmatrix} \right)$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
0	1	1	No	$\begin{bmatrix} \frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$
6	2	2	No	$\begin{bmatrix} \frac{1}{3} & -\frac{1}{3} \\ 1 & 0 \\ 0 & 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue 0 is real and distinct then the

corresponding eigenvector solution is

$$\vec{x}_1(t) = \vec{v}_1 e^{0}$$
$$= \begin{bmatrix} \frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix} e^{0}$$

eigenvalue 6 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

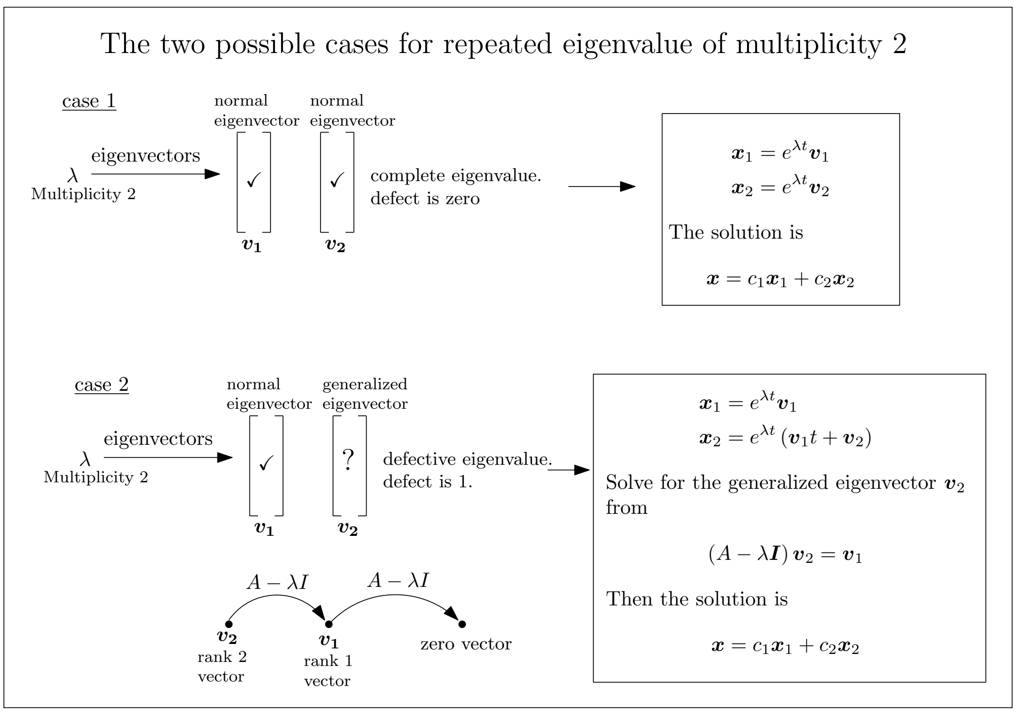

Figure 572: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2 which is the same as its geometric multiplicity 2, then it is complete eigenvalue and this falls into case 1 shown above. Hence the corresponding eigenvector basis are

$$\vec{x}_2(t) = \vec{v}_2 e^{6t}$$
$$= \begin{bmatrix} \frac{1}{3} \\ 1 \\ 0 \end{bmatrix} e^{6t}$$

$$
\begin{aligned}
\vec{x}_3(t) &= \vec{v}_3 e^{6t} \\
&= \begin{bmatrix} -\frac{1}{3} \\ 0 \\ 1 \end{bmatrix} e^{6t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t) + c_3\vec{x}_3(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} \frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix} + c_2 \begin{bmatrix} \frac{e^{6t}}{3} \\ e^{6t} \\ 0 \end{bmatrix} + c_3 \begin{bmatrix} -\frac{e^{6t}}{3} \\ 0 \\ e^{6t} \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \frac{(2c_2-2c_3)e^{6t}}{6} + \frac{c_1}{2} \\ -\frac{c_1}{2} + c_2 e^{6t} \\ c_1 + c_3 e^{6t} \end{bmatrix}
$$

21.15.3 Maple step by step solution

Let's solve

$[y_1'(t) = 3y_1(t) + y_2(t) - y_3(t)\,, y_2'(t) = 3y_1(t) + 5y_2(t) + y_3(t)\,, y_3'(t) = -6y_1(t) + 2y_2(t) + 4y_3(t)]$

- Define vector

$$
\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

- Convert system into a vector equation

$$
\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 3 & 1 & -1 \\ 3 & 5 & 1 \\ -6 & 2 & 4 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}
$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 3 & 1 & -1 \\ 3 & 5 & 1 \\ -6 & 2 & 4 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 3 & 1 & -1 \\ 3 & 5 & 1 \\ -6 & 2 & 4 \end{bmatrix}$$

- Rewrite the system as

$$\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[0, \begin{bmatrix} \frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right], \left[6, \begin{bmatrix} -\frac{1}{3} \\ 0 \\ 1 \end{bmatrix}\right], \left[6, \begin{bmatrix} \frac{1}{3} \\ 1 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[0, \begin{bmatrix} \frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{y}^{\rightarrow}_{1} = \begin{bmatrix} \frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[6, \begin{bmatrix} -\frac{1}{3} \\ 0 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue 6

$$\overrightarrow{y}_2(t) = \mathrm{e}^{6t} \cdot \begin{bmatrix} -\frac{1}{3} \\ 0 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 6$ is the eigenvalue, and

$$\overrightarrow{y}_3(t) = \mathrm{e}^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the t multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\overrightarrow{y}_3(t)$ into the homogeneous system

$$\lambda\,\mathrm{e}^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda t}\overrightarrow{v} = \left(\mathrm{e}^{\lambda t}A\right) \cdot \left(t\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda\,\mathrm{e}^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda t}\overrightarrow{v} = \mathrm{e}^{\lambda t}\left(\lambda t\overrightarrow{v} + A \cdot \overrightarrow{p}\right)$$

- Simplify equation

$$\lambda\overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_3(t)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \overrightarrow{p} = \overrightarrow{v}$$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue 6

$$\left(\begin{bmatrix} 3 & 1 & -1 \\ 3 & 5 & 1 \\ -6 & 2 & 4 \end{bmatrix} - 6 \cdot \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \cdot \overrightarrow{p} = \begin{bmatrix} -\frac{1}{3} \\ 0 \\ 1 \end{bmatrix}$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p} = \begin{bmatrix} \frac{1}{9} \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue 6

$$\vec{y}_3(t) = e^{6t} \cdot \left(t \cdot \begin{bmatrix} -\frac{1}{3} \\ 0 \\ 1 \end{bmatrix} + \begin{bmatrix} \frac{1}{9} \\ 0 \\ 0 \end{bmatrix} \right)$$

- General solution to the system of ODEs

$$\vec{y} = c_1 \vec{y}_1 + c_2 \vec{y}_2(t) + c_3 \vec{y}_3(t)$$

- Substitute solutions into the general solution

$$\vec{y} = c_2 e^{6t} \cdot \begin{bmatrix} -\frac{1}{3} \\ 0 \\ 1 \end{bmatrix} + c_3 e^{6t} \cdot \left(t \cdot \begin{bmatrix} -\frac{1}{3} \\ 0 \\ 1 \end{bmatrix} + \begin{bmatrix} \frac{1}{9} \\ 0 \\ 0 \end{bmatrix} \right) + \begin{bmatrix} \frac{c_1}{2} \\ -\frac{c_1}{2} \\ c_1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \frac{((1-3t)c_3-3c_2)e^{6t}}{9} + \frac{c_1}{2} \\ -\frac{c_1}{2} \\ (c_3 t + c_2)\, e^{6t} + c_1 \end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{ y_1(t) = \frac{((1-3t)c_3-3c_2)e^{6t}}{9} + \frac{c_1}{2}, y_2(t) = -\frac{c_1}{2}, y_3(t) = (c_3 t + c_2)\, e^{6t} + c_1 \right\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$\begin{aligned} y_1'(t) &= 3y_1(t) + 4y_2(t) \\ y_2'(t) &= -y_1(t) + 7y_2(t) \end{aligned}$$

22.1.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 3 & 4 \\ -1 & 7 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} e^{5t}(1-2t) & 4t\,e^{5t} \\ -t\,e^{5t} & e^{5t}(1+2t) \end{bmatrix}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{5t}(1-2t) & 4t\,e^{5t} \\ -t\,e^{5t} & e^{5t}(1+2t) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{5t}(1-2t)\,c_1 + 4t\,e^{5t}c_2 \\ -t\,e^{5t}c_1 + e^{5t}(1+2t)\,c_2 \end{bmatrix} \\
&= \begin{bmatrix} (c_1(1-2t) + 4c_2t)\,e^{5t} \\ e^{5t}(-tc_1 + 2c_2t + c_2) \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.1.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 3 & 4 \\ -1 & 7 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 3 & 4 \\ -1 & 7 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 3-\lambda & 4 \\ -1 & 7-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 - 10\lambda + 25 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 5$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
5	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 5$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 3 & 4 \\ -1 & 7 \end{bmatrix} - (5)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 4 \\ -1 & 2 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -2 & 4 & 0 \\ -1 & 2 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{2} \Longrightarrow \left[\begin{array}{cc|c} -2 & 4 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -2 & 4 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 2t\}$

Hence the solution is

$$\begin{bmatrix} 2t \\ t \end{bmatrix} = \begin{bmatrix} 2t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} 2t \\ t \end{bmatrix} = t \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} 2t \\ t \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
5	2	1	Yes	$\begin{bmatrix} 2 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue 5 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

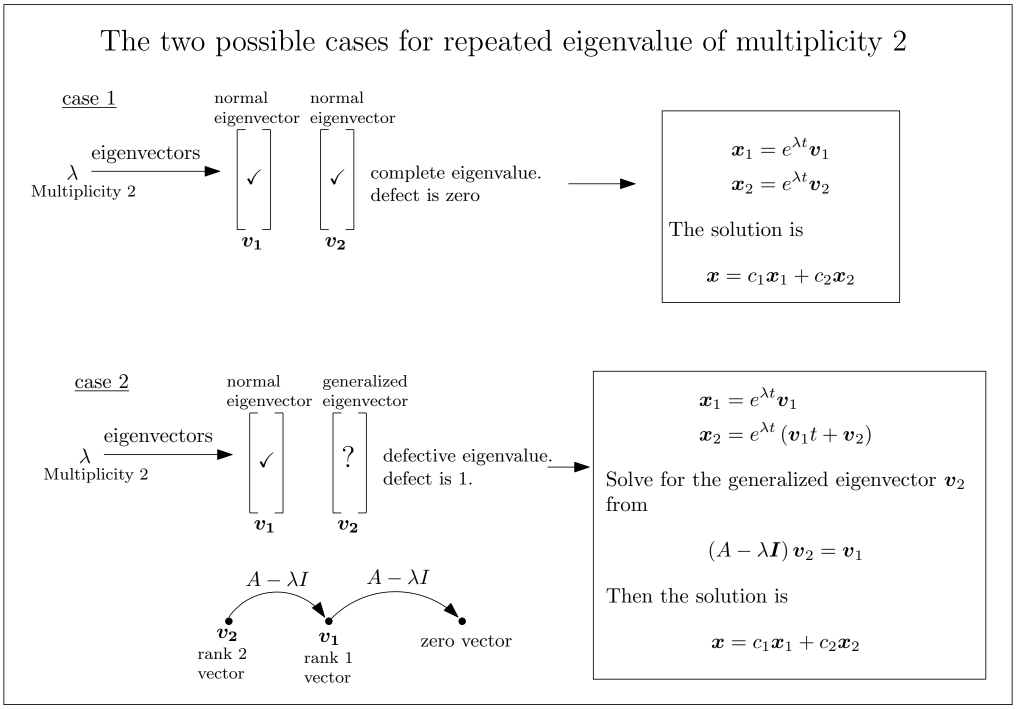

Figure 573: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\, \vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} 3 & 4 \\ -1 & 7 \end{bmatrix} - (5) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 4 \\ -1 & 2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue 5. Therefore the two basis solution associated with this eigenvalue are

$$
\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\
&= \begin{bmatrix} 2 \\ 1 \end{bmatrix} \mathrm{e}^{5t} \\
&= \begin{bmatrix} 2\,\mathrm{e}^{5t} \\ \mathrm{e}^{5t} \end{bmatrix}
\end{aligned}
$$

And

$$
\begin{aligned}
\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\
&= \left(\begin{bmatrix} 2 \\ 1 \end{bmatrix} t + \begin{bmatrix} 1 \\ 1 \end{bmatrix} \right) \mathrm{e}^{5t} \\
&= \begin{bmatrix} \mathrm{e}^{5t}(1+2t) \\ \mathrm{e}^{5t}(t+1) \end{bmatrix}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} 2\,\mathrm{e}^{5t} \\ \mathrm{e}^{5t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{5t}(1+2t) \\ \mathrm{e}^{5t}(t+1) \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \mathrm{e}^{5t}(2c_2 t + 2c_1 + c_2) \\ \mathrm{e}^{5t}(c_2 t + c_1 + c_2) \end{bmatrix}
$$

The following is the phase plot of the system.

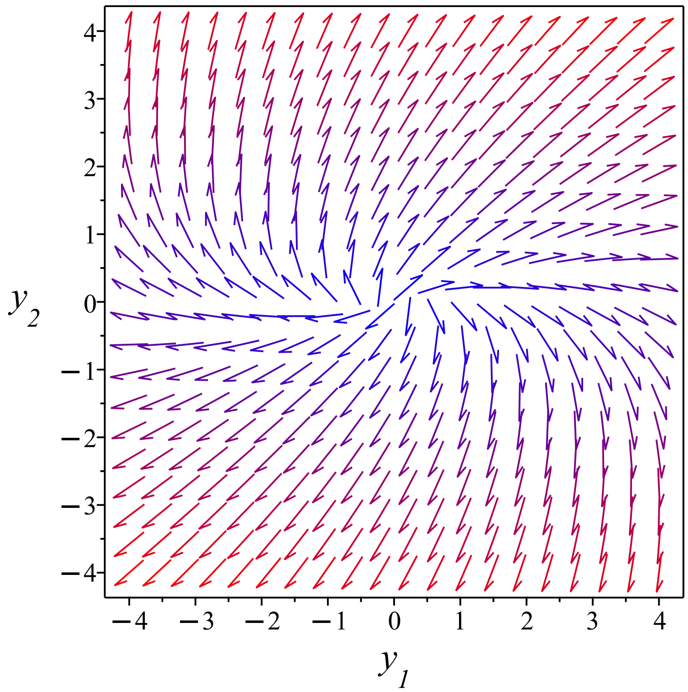

Figure 574: Phase plot

22.1.3 Maple step by step solution

Let's solve

$[y_1'(t) = 3y_1(t) + 4y_2(t), y_2'(t) = -y_1(t) + 7y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow}{}'(t) = \begin{bmatrix} 3 & 4 \\ -1 & 7 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow}{}'(t) = \begin{bmatrix} 3 & 4 \\ -1 & 7 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \left[\begin{array}{cc} 3 & 4 \\ -1 & 7 \end{array}\right]$$

- Rewrite the system as

  $$\underline{y}^{\rightarrow \prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

  $$\left[\left[5, \left[\begin{array}{c} 2 \\ 1 \end{array}\right]\right], \left[5, \left[\begin{array}{c} 0 \\ 0 \end{array}\right]\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

  $$\left[5, \left[\begin{array}{c} 2 \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue 5

  $$\underline{y}^{\rightarrow}_{1}(t) = e^{5t} \cdot \left[\begin{array}{c} 2 \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = 5$ is the eigenvalue, and

  $$\underline{y}^{\rightarrow}_{2}(t) = e^{\lambda t}\left(t\vec{v} + \vec{p}\right)$$

- Note that the t multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\underline{y}^{\rightarrow}_{2}(t)$ into the homogeneous system

  $$\lambda e^{\lambda t}\left(t\vec{v} + \vec{p}\right) + e^{\lambda t}\vec{v} = \left(e^{\lambda t} A\right) \cdot \left(t\vec{v} + \vec{p}\right)$$

- Use the fact that $\vec{v}$ is an eigenvector of A

  $$\lambda e^{\lambda t}\left(t\vec{v} + \vec{p}\right) + e^{\lambda t}\vec{v} = e^{\lambda t}\left(\lambda t\vec{v} + A \cdot \vec{p}\right)$$

- Simplify equation

  $$\lambda \vec{p} + \vec{v} = A \cdot \vec{p}$$

- Make use of the identity matrix I

  $$(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$$

- Condition $\vec{p}$ must meet for $\underline{y}^{\rightarrow}_{2}(t)$ to be a solution to the homogeneous system

  $$(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue 5

$$\left(\left[\begin{array}{cc} 3 & 4 \\ -1 & 7 \end{array}\right]-5\cdot\left[\begin{array}{cc} 1 & 0 \\ 0 & 1 \end{array}\right]\right)\cdot\overrightarrow{p}=\left[\begin{array}{c} 2 \\ 1 \end{array}\right]$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p}=\left[\begin{array}{c} -1 \\ 0 \end{array}\right]$$

- Second solution from eigenvalue 5

$$\overrightarrow{y}_2(t)=\mathrm{e}^{5t}\cdot\left(t\cdot\left[\begin{array}{c} 2 \\ 1 \end{array}\right]+\left[\begin{array}{c} -1 \\ 0 \end{array}\right]\right)$$

- General solution to the system of ODEs

$$\overrightarrow{y}=c_1\overrightarrow{y}_1(t)+c_2\overrightarrow{y}_2(t)$$

- Substitute solutions into the general solution

$$\overrightarrow{y}=c_1\mathrm{e}^{5t}\cdot\left[\begin{array}{c} 2 \\ 1 \end{array}\right]+c_2\mathrm{e}^{5t}\cdot\left(t\cdot\left[\begin{array}{c} 2 \\ 1 \end{array}\right]+\left[\begin{array}{c} -1 \\ 0 \end{array}\right]\right)$$

- Substitute in vector of dependent variables

$$\left[\begin{array}{c} y_1(t) \\ y_2(t) \end{array}\right]=\left[\begin{array}{c} \left(\left(2t-1\right)c_2+2c_1\right)\mathrm{e}^{5t} \\ \mathrm{e}^{5t}\left(c_2t+c_1\right) \end{array}\right]$$

- Solution to the system of ODEs

$$\left\{y_1(t)=\left(\left(2t-1\right)c_2+2c_1\right)\mathrm{e}^{5t}, y_2(t)=\mathrm{e}^{5t}\left(c_2t+c_1\right)\right\}$$

Problem number: section 10.5, problem 2.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -y_2(t) \\
y_2'(t) &= y_1(t) - 2y_2(t)
\end{aligned}
$$

22.2.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 0 & -1 \\ 1 & -2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \mathrm{e}^{-t}(t+1) & -t\,\mathrm{e}^{-t} \\ t\,\mathrm{e}^{-t} & \mathrm{e}^{-t}(1-t) \end{bmatrix}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{-t}(t+1) & -t\,e^{-t} \\ t\,e^{-t} & e^{-t}(1-t) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{-t}(t+1)\,c_1 - t\,e^{-t}c_2 \\ t\,e^{-t}c_1 + e^{-t}(1-t)\,c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{-t}(tc_1 - c_2t + c_1) \\ e^{-t}(tc_1 - c_2t + c_2) \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.2.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 0 & -1 \\ 1 & -2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 0 & -1 \\ 1 & -2 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -\lambda & -1 \\ 1 & -2-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 + 2\lambda + 1 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -1$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-1	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 0 & -1 \\ 1 & -2 \end{bmatrix} - (-1)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} 1 & -1 \\ 1 & -1 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} 1 & -1 & 0 \\ 1 & -1 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{cc|c} 1 & -1 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 1 & -1 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t\}$

Hence the solution is

$$\begin{bmatrix} t \\ t \end{bmatrix} = \begin{bmatrix} t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-1	2	1	Yes	$\begin{bmatrix} 1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -1 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

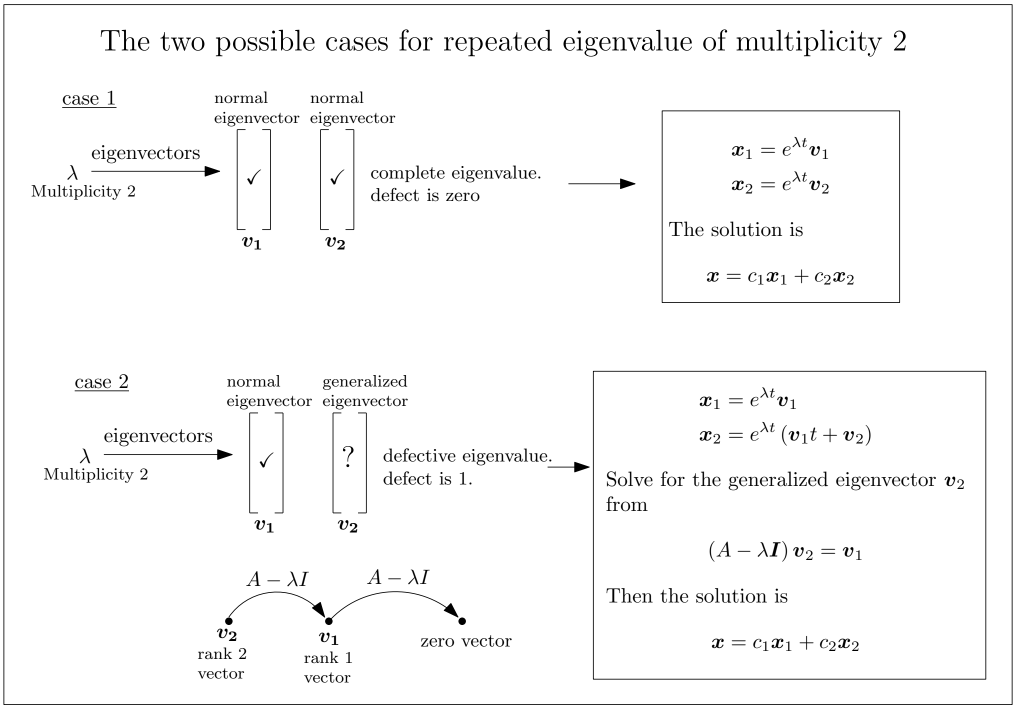

Figure 575: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} 0 & -1 \\ 1 & -2 \end{bmatrix} - (-1)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$
$$\begin{bmatrix} 1 & -1 \\ 1 & -1 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue -1. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} 1 \\ 1 \end{bmatrix} \mathrm{e}^{-t} \\ &= \begin{bmatrix} \mathrm{e}^{-t} \\ \mathrm{e}^{-t} \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\ &= \left(\begin{bmatrix} 1 \\ 1 \end{bmatrix} t + \begin{bmatrix} 2 \\ 1 \end{bmatrix}\right) \mathrm{e}^{-t} \\ &= \begin{bmatrix} \mathrm{e}^{-t}(2+t) \\ \mathrm{e}^{-t}(t+1) \end{bmatrix}\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} \mathrm{e}^{-t} \\ \mathrm{e}^{-t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-t}(2+t) \\ \mathrm{e}^{-t}(t+1) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} ((2+t)\, c_2 + c_1)\, \mathrm{e}^{-t} \\ \mathrm{e}^{-t}(c_2 t + c_1 + c_2) \end{bmatrix}$$

The following is the phase plot of the system.

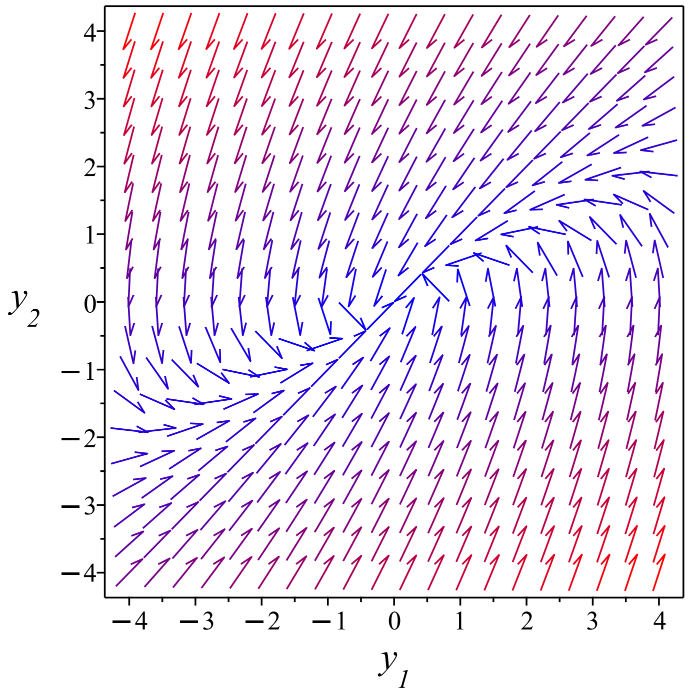

Figure 576: Phase plot

22.2.3 Maple step by step solution

Let's solve

$[y_1'(t) = -y_2(t), y_2'(t) = y_1(t) - 2y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 0 & -1 \\ 1 & -2 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 0 & -1 \\ 1 & -2 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & -1 \\ 1 & -2 \end{bmatrix}$$

- Rewrite the system as

  $$\underline{y}^{\rightarrow \prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

  $$\left[\left[-1, \begin{bmatrix} 1 \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

  $$\left[-1, \begin{bmatrix} 1 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue -1

  $$\underline{y}^{\rightarrow}{}_{1}(t) = \mathrm{e}^{-t} \cdot \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = -1$ is the eigenvalue, an

  $$\underline{y}^{\rightarrow}{}_{2}(t) = \mathrm{e}^{\lambda t}\left(t\vec{v} + \vec{p}\right)$$

- Note that the t multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\underline{y}^{\rightarrow}{}_{2}(t)$ into the homogeneous system

  $$\lambda\,\mathrm{e}^{\lambda t}\left(t\vec{v} + \vec{p}\right) + \mathrm{e}^{\lambda t}\vec{v} = \left(\mathrm{e}^{\lambda t}A\right) \cdot \left(t\vec{v} + \vec{p}\right)$$

- Use the fact that $\vec{v}$ is an eigenvector of A

  $$\lambda\,\mathrm{e}^{\lambda t}\left(t\vec{v} + \vec{p}\right) + \mathrm{e}^{\lambda t}\vec{v} = \mathrm{e}^{\lambda t}\left(\lambda t\vec{v} + A \cdot \vec{p}\right)$$

- Simplify equation

  $$\lambda\vec{p} + \vec{v} = A \cdot \vec{p}$$

- Make use of the identity matrix I

  $$(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$$

- Condition $\vec{p}$ must meet for $\underline{y}^{\rightarrow}{}_{2}(t)$ to be a solution to the homogeneous system

  $$(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue -1

$$\left(\begin{bmatrix} 0 & -1 \\ 1 & -2 \end{bmatrix} - (-1) \cdot \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) \cdot \vec{p} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

- Choice of $\vec{p}$

$$\vec{p} = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue -1

$$\underline{\vec{y}}_2(t) = e^{-t} \cdot \left(t \cdot \begin{bmatrix} 1 \\ 1 \end{bmatrix} + \begin{bmatrix} 1 \\ 0 \end{bmatrix}\right)$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_1(t) + c_2 \underline{\vec{y}}_2(t)$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 e^{-t} \cdot \begin{bmatrix} 1 \\ 1 \end{bmatrix} + c_2 e^{-t} \cdot \left(t \cdot \begin{bmatrix} 1 \\ 1 \end{bmatrix} + \begin{bmatrix} 1 \\ 0 \end{bmatrix}\right)$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} e^{-t}(c_2 t + c_1 + c_2) \\ (c_2 t + c_1)\, e^{-t} \end{bmatrix}$$

- Solution to the system of ODEs

$$\{y_1(t) = e^{-t}(c_2 t + c_1 + c_2)\, , y_2(t) = (c_2 t + c_1)\, e^{-t}\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$y_1'(t) = -7y_1(t) + 4y_2(t)$$
$$y_2'(t) = -y_1(t) - 11y_2(t)$$

22.3.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -7 & 4 \\ -1 & -11 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \mathrm{e}^{-9t}(1+2t) & 4t\,\mathrm{e}^{-9t} \\ -t\,\mathrm{e}^{-9t} & \mathrm{e}^{-9t}(1-2t) \end{bmatrix}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{-9t}(1+2t) & 4t\,e^{-9t} \\ -t\,e^{-9t} & e^{-9t}(1-2t) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{-9t}(1+2t)\,c_1 + 4t\,e^{-9t}c_2 \\ -t\,e^{-9t}c_1 + e^{-9t}(1-2t)\,c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{-9t}(2tc_1 + 4c_2t + c_1) \\ e^{-9t}(-tc_1 - 2c_2t + c_2) \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.3.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -7 & 4 \\ -1 & -11 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -7 & 4 \\ -1 & -11 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -7-\lambda & 4 \\ -1 & -11-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 + 18\lambda + 81 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -9$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-9	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -9$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -7 & 4 \\ -1 & -11 \end{bmatrix} - (-9)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 2 & 4 \\ -1 & -2 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} 2 & 4 & 0 \\ -1 & -2 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{R_1}{2} \Longrightarrow \left[\begin{array}{cc|c} 2 & 4 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 2 & 4 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -2t\}$

Hence the solution is

$$\begin{bmatrix} -2t \\ t \end{bmatrix} = \begin{bmatrix} -2t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -2t \\ t \end{bmatrix} = t \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -2t \\ t \end{bmatrix} = \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-9	2	1	Yes	$\begin{bmatrix} -2 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -9 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

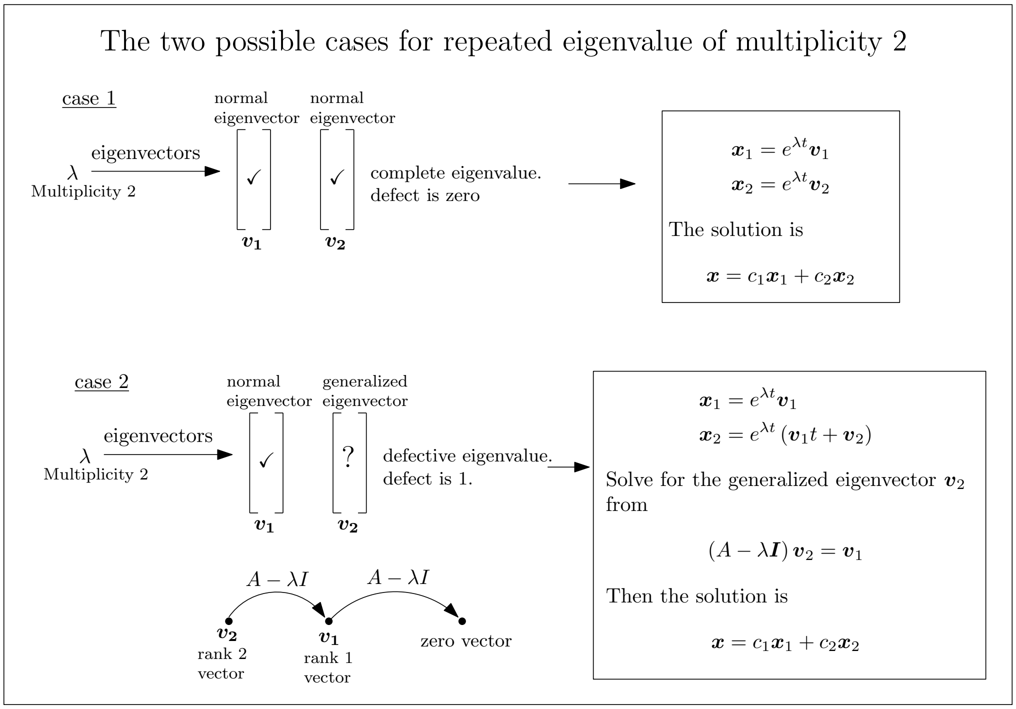

Figure 577: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} -7 & 4 \\ -1 & -11 \end{bmatrix} - (-9)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} 2 & 4 \\ -1 & -2 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} -3 \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue -9. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} -2 \\ 1 \end{bmatrix} \mathrm{e}^{-9t} \\ &= \begin{bmatrix} -2\,\mathrm{e}^{-9t} \\ \mathrm{e}^{-9t} \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\ &= \left(\begin{bmatrix} -2 \\ 1 \end{bmatrix} t + \begin{bmatrix} -3 \\ 1 \end{bmatrix} \right) \mathrm{e}^{-9t} \\ &= \begin{bmatrix} \mathrm{e}^{-9t}(-2t-3) \\ \mathrm{e}^{-9t}(t+1) \end{bmatrix}\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} -2\,\mathrm{e}^{-9t} \\ \mathrm{e}^{-9t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-9t}(-2t-3) \\ \mathrm{e}^{-9t}(t+1) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \mathrm{e}^{-9t}(-2c_2 t - 2c_1 - 3c_2) \\ \mathrm{e}^{-9t}(c_2 t + c_1 + c_2) \end{bmatrix}$$

The following is the phase plot of the system.

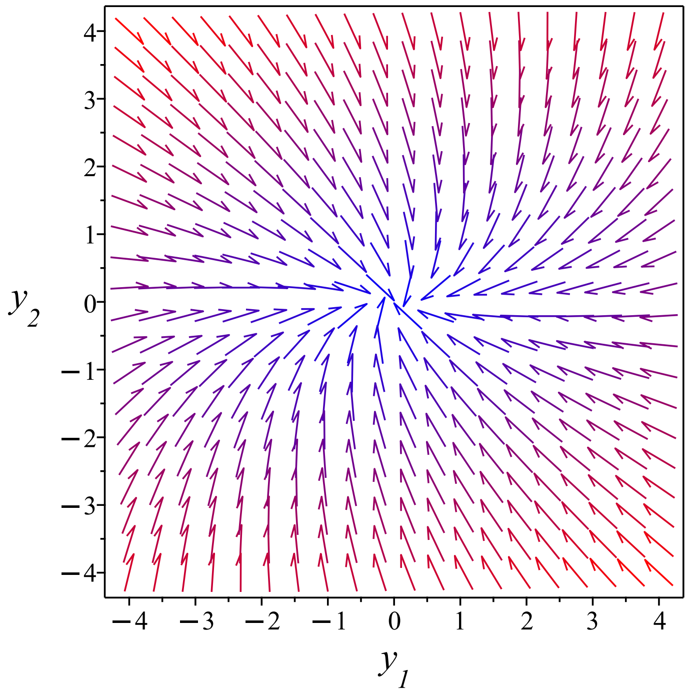

Figure 578: Phase plot

22.3.3 Maple step by step solution

Let's solve

$[y_1'(t) = -7y_1(t) + 4y_2(t), y_2'(t) = -y_1(t) - 11y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -7 & 4 \\ -1 & -11 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -7 & 4 \\ -1 & -11 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -7 & 4 \\ -1 & -11 \end{bmatrix}$$

- Rewrite the system as

  $\underline{y}^{\rightarrow \prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

  $$\left[\left[-9, \begin{bmatrix} -2 \\ 1 \end{bmatrix}\right], \left[-9, \begin{bmatrix} 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

  $$\left[-9, \begin{bmatrix} -2 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue -9

  $$\underline{y}^{\rightarrow}{}_{1}(t) = \mathrm{e}^{-9t} \cdot \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = -9$ is the eigenvalue, an

  $\underline{y}^{\rightarrow}{}_{2}(t) = \mathrm{e}^{\lambda t}\left(t\vec{v} + \vec{p}\right)$

- Note that the t multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\underline{y}^{\rightarrow}{}_{2}(t)$ into the homogeneous system

  $\lambda\,\mathrm{e}^{\lambda t}\left(t\vec{v} + \vec{p}\right) + \mathrm{e}^{\lambda t}\vec{v} = \left(\mathrm{e}^{\lambda t}A\right) \cdot \left(t\vec{v} + \vec{p}\right)$

- Use the fact that $\vec{v}$ is an eigenvector of A

  $\lambda\,\mathrm{e}^{\lambda t}\left(t\vec{v} + \vec{p}\right) + \mathrm{e}^{\lambda t}\vec{v} = \mathrm{e}^{\lambda t}\left(\lambda t\vec{v} + A \cdot \vec{p}\right)$

- Simplify equation

  $\lambda\vec{p} + \vec{v} = A \cdot \vec{p}$

- Make use of the identity matrix I

  $(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$

- Condition $\vec{p}$ must meet for $\underline{y}^{\rightarrow}{}_{2}(t)$ to be a solution to the homogeneous system

  $(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue -9

$$\left(\left[\begin{array}{cc}-7 & 4 \\ -1 & -11\end{array}\right]-(-9)\cdot\left[\begin{array}{cc}1 & 0 \\ 0 & 1\end{array}\right]\right)\cdot\overrightarrow{p}=\left[\begin{array}{c}-2 \\ 1\end{array}\right]$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p}=\left[\begin{array}{c}-1 \\ 0\end{array}\right]$$

- Second solution from eigenvalue -9

$$\overrightarrow{y}_{2}(t)=\mathrm{e}^{-9t}\cdot\left(t\cdot\left[\begin{array}{c}-2 \\ 1\end{array}\right]+\left[\begin{array}{c}-1 \\ 0\end{array}\right]\right)$$

- General solution to the system of ODEs

$$\overrightarrow{y}=c_1\overrightarrow{y}_{1}(t)+c_2\overrightarrow{y}_{2}(t)$$

- Substitute solutions into the general solution

$$\overrightarrow{y}=c_1\mathrm{e}^{-9t}\cdot\left[\begin{array}{c}-2 \\ 1\end{array}\right]+c_2\mathrm{e}^{-9t}\cdot\left(t\cdot\left[\begin{array}{c}-2 \\ 1\end{array}\right]+\left[\begin{array}{c}-1 \\ 0\end{array}\right]\right)$$

- Substitute in vector of dependent variables

$$\left[\begin{array}{c}y_1(t) \\ y_2(t)\end{array}\right]=\left[\begin{array}{c}\mathrm{e}^{-9t}(-2c_2t-2c_1-c_2) \\ \mathrm{e}^{-9t}(c_2t+c_1)\end{array}\right]$$

- Solution to the system of ODEs

$$\{y_1(t)=\mathrm{e}^{-9t}(-2c_2t-2c_1-c_2),y_2(t)=\mathrm{e}^{-9t}(c_2t+c_1)\}$$

✓ Solution by Maple

Time used: 0.016 (sec). Leaf size: 35

```
dsolve([diff(y__1(t),t)=-7*y__1(t)+4*y__2(t),diff(y__2(t),t)=-1*y__1(t)-11*y__2(t)],singsol=
```

$$y_1(t)=\mathrm{e}^{-9t}(c_2t+c_1)$$
$$y_2(t)=-\frac{\mathrm{e}^{-9t}(2c_2t+2c_1-c_2)}{4}$$

✓ Solution by Mathematica

ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$\begin{aligned} y_1'(t) &= 3y_1(t) + y_2(t) \\ y_2'(t) &= -y_1(t) + y_2(t) \end{aligned}$$

22.4.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 3 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} e^{2t}(t+1) & e^{2t}t \\ -e^{2t}t & e^{2t}(1-t) \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{2t}(t+1) & e^{2t}t \\ -e^{2t}t & e^{2t}(1-t) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{2t}(t+1)\, c_1 + e^{2t}tc_2 \\ -e^{2t}tc_1 + e^{2t}(1-t)\, c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{2t}(tc_1 + c_2 t + c_1) \\ -((-1+t)\, c_2 + tc_1)\, e^{2t} \end{bmatrix}
\end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.4.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 3 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det\left(A - \lambda I\right) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 3 & 1 \\ -1 & 1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 3-\lambda & 1 \\ -1 & 1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 - 4\lambda + 4 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 2$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
2	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 3 & 1 \\ -1 & 1 \end{bmatrix} - (2)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} 1 & 1 \\ -1 & -1 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} 1 & 1 & 0 \\ -1 & -1 & 0 \end{array}\right]$$

$$R_2 = R_2 + R_1 \Longrightarrow \left[\begin{array}{cc|c} 1 & 1 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 1 & 1 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
2	2	1	Yes	$\begin{bmatrix} -1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue 2 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

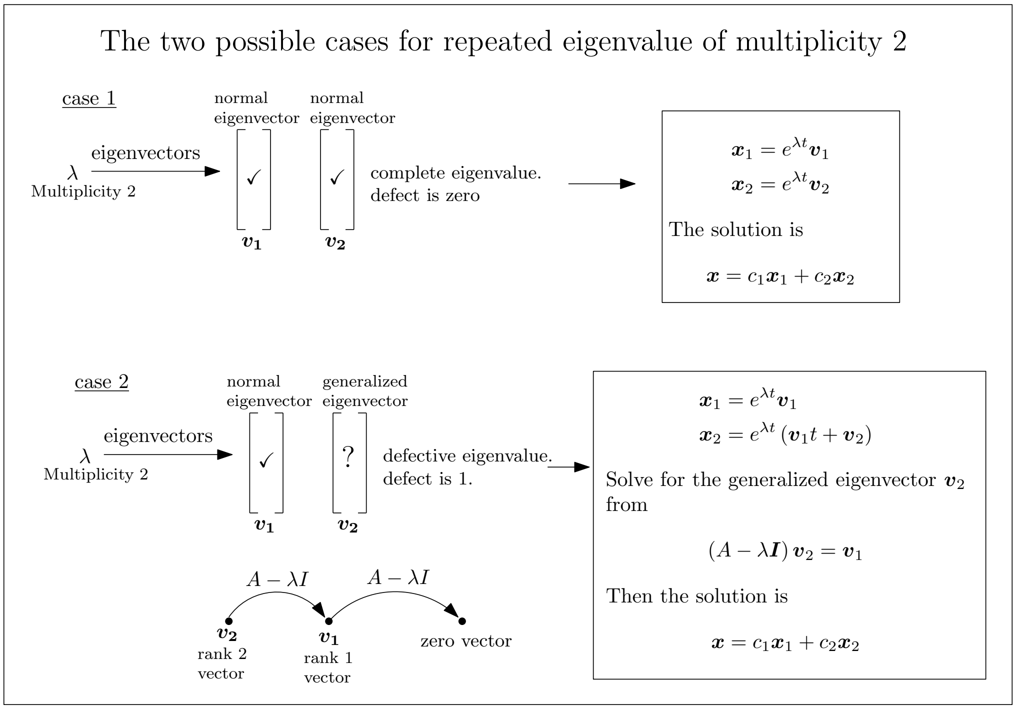

Figure 579: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I) \vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} 3 & 1 \\ -1 & 1 \end{bmatrix} - (2) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$
$$\begin{bmatrix} 1 & 1 \\ -1 & -1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue 2. Therefore the two basis solution associated with this eigenvalue are

$$
\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\
&= \begin{bmatrix} -1 \\ 1 \end{bmatrix} \mathrm{e}^{2t} \\
&= \begin{bmatrix} -\mathrm{e}^{2t} \\ \mathrm{e}^{2t} \end{bmatrix}
\end{aligned}
$$

And

$$
\begin{aligned}
\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\
&= \left(\begin{bmatrix} -1 \\ 1 \end{bmatrix} t + \begin{bmatrix} -2 \\ 1 \end{bmatrix} \right) \mathrm{e}^{2t} \\
&= \begin{bmatrix} -\mathrm{e}^{2t}(2+t) \\ \mathrm{e}^{2t}(t+1) \end{bmatrix}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} -\mathrm{e}^{2t} \\ \mathrm{e}^{2t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{2t}(-t-2) \\ \mathrm{e}^{2t}(t+1) \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} -((2+t)\, c_2 + c_1)\, \mathrm{e}^{2t} \\ \mathrm{e}^{2t}(c_2 t + c_1 + c_2) \end{bmatrix}
$$

The following is the phase plot of the system.

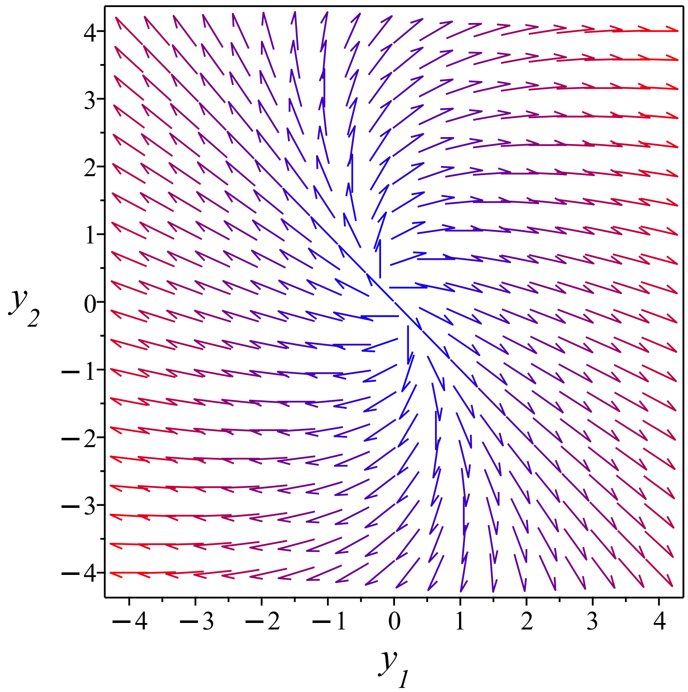

Figure 580: Phase plot

22.4.3 Maple step by step solution

Let's solve

$[y_1'(t) = 3y_1(t) + y_2(t), y_2'(t) = -y_1(t) + y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 3 & 1 \\ -1 & 1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 3 & 1 \\ -1 & 1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 3 & 1 \\ -1 & 1 \end{bmatrix}$$

- Rewrite the system as

  $\underline{\vec{y}}'(t) = A \cdot \underline{\vec{y}}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

  $$\left[\left[2, \begin{bmatrix} -1 \\ 1 \end{bmatrix}\right], \left[2, \begin{bmatrix} 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

  $$\left[2, \begin{bmatrix} -1 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue 2

  $$\underline{\vec{y}}_1(t) = e^{2t} \cdot \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = 2$ is the eigenvalue, and

  $\underline{\vec{y}}_2(t) = e^{\lambda t}\left(t\vec{v} + \vec{p}\right)$

- Note that the t multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\underline{\vec{y}}_2(t)$ into the homogeneous system

  $\lambda\, e^{\lambda t}\left(t\vec{v} + \vec{p}\right) + e^{\lambda t}\vec{v} = \left(e^{\lambda t} A\right) \cdot \left(t\vec{v} + \vec{p}\right)$

- Use the fact that $\vec{v}$ is an eigenvector of A

  $\lambda\, e^{\lambda t}\left(t\vec{v} + \vec{p}\right) + e^{\lambda t}\vec{v} = e^{\lambda t}\left(\lambda t\vec{v} + A \cdot \vec{p}\right)$

- Simplify equation

  $\lambda\vec{p} + \vec{v} = A \cdot \vec{p}$

- Make use of the identity matrix I

  $(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$

- Condition $\vec{p}$ must meet for $\underline{\vec{y}}_2(t)$ to be a solution to the homogeneous system

  $(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue 2

$$\left(\begin{bmatrix} 3 & 1 \\ -1 & 1 \end{bmatrix} - 2 \cdot \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) \cdot \vec{p} = \begin{bmatrix} -1 \\ 1 \end{bmatrix}$$

- Choice of $\vec{p}$

$$\vec{p} = \begin{bmatrix} -1 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue 2

$$\underline{\vec{y}}_2(t) = e^{2t} \cdot \left(t \cdot \begin{bmatrix} -1 \\ 1 \end{bmatrix} + \begin{bmatrix} -1 \\ 0 \end{bmatrix}\right)$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_1(t) + c_2 \underline{\vec{y}}_2(t)$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 e^{2t} \cdot \begin{bmatrix} -1 \\ 1 \end{bmatrix} + c_2 e^{2t} \cdot \left(t \cdot \begin{bmatrix} -1 \\ 1 \end{bmatrix} + \begin{bmatrix} -1 \\ 0 \end{bmatrix}\right)$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} e^{2t}(-c_2 t - c_1 - c_2) \\ e^{2t}(c_2 t + c_1) \end{bmatrix}$$

- Solution to the system of ODEs

$$\{y_1(t) = e^{2t}(-c_2 t - c_1 - c_2), y_2(t) = e^{2t}(c_2 t + c_1)\}$$

✓ Solution by Maple

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= 4y_1(t) + 12y_2(t) \\
y_2'(t) &= -3y_1(t) - 8y_2(t)
\end{aligned}
$$

22.5.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 4 & 12 \\ -3 & -8 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} \mathrm{e}^{-2t}(1+6t) & 12t\,\mathrm{e}^{-2t} \\ -3t\,\mathrm{e}^{-2t} & \mathrm{e}^{-2t}(1-6t) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{-2t}(1+6t) & 12t\,e^{-2t} \\ -3t\,e^{-2t} & e^{-2t}(1-6t) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{-2t}(1+6t)\,c_1 + 12t\,e^{-2t}c_2 \\ -3t\,e^{-2t}c_1 + e^{-2t}(1-6t)\,c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{-2t}(6tc_1 + 12c_2t + c_1) \\ (c_2(1-6t) - 3tc_1)\,e^{-2t} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.5.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 4 & 12 \\ -3 & -8 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 4 & 12 \\ -3 & -8 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 4-\lambda & 12 \\ -3 & -8-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 + 4\lambda + 4 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -2$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-2	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 4 & 12 \\ -3 & -8 \end{bmatrix} - (-2)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 6 & 12 \\ -3 & -6 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} 6 & 12 & 0 \\ -3 & -6 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{R_1}{2} \Longrightarrow \left[\begin{array}{cc|c} 6 & 12 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 6 & 12 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -2t\}$

Hence the solution is

$$\begin{bmatrix} -2t \\ t \end{bmatrix} = \begin{bmatrix} -2t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -2t \\ t \end{bmatrix} = t \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -2t \\ t \end{bmatrix} = \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-2	2	1	Yes	$\begin{bmatrix} -2 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -2 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

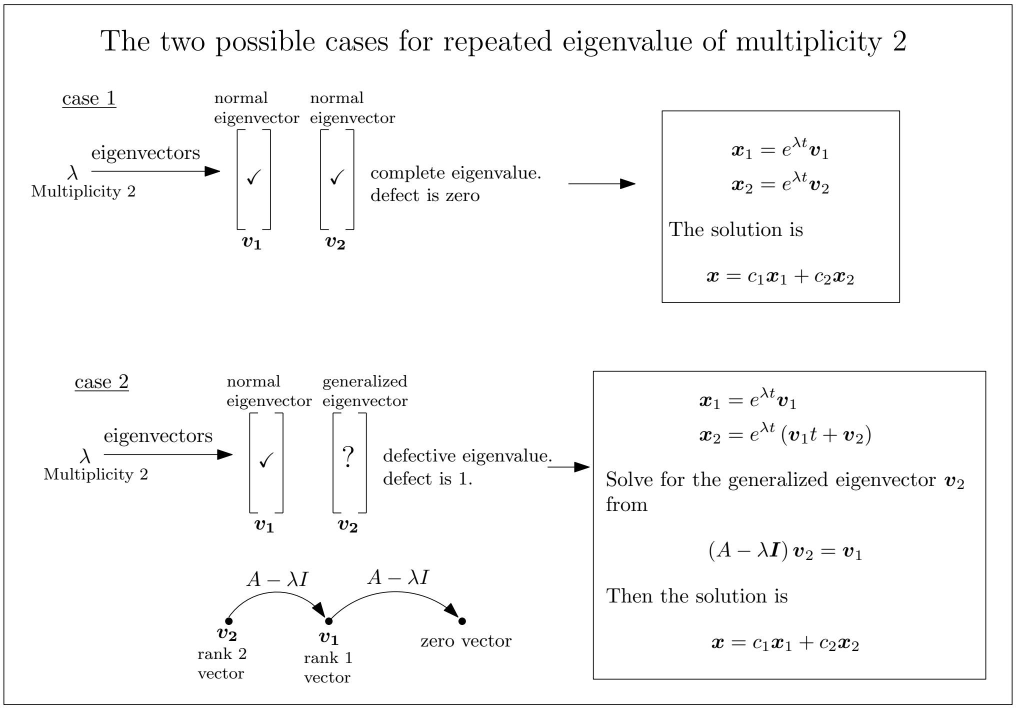

Figure 581: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$
(A-\lambda I)\,\vec{v}_2=\vec{v}_1
$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$
\begin{aligned}
\left(\begin{bmatrix}4 & 12\\ -3 & -8\end{bmatrix}-(-2)\begin{bmatrix}1 & 0\\ 0 & 1\end{bmatrix}\right)\begin{bmatrix}v_1\\ v_2\end{bmatrix} &= \begin{bmatrix}-2\\ 1\end{bmatrix}\\
\begin{bmatrix}6 & 12\\ -3 & -6\end{bmatrix}\begin{bmatrix}v_1\\ v_2\end{bmatrix} &= \begin{bmatrix}-2\\ 1\end{bmatrix}
\end{aligned}
$$

Solving for $\vec{v}_2$ gives

$$
\vec{v}_2=\begin{bmatrix}-\frac{7}{3}\\ 1\end{bmatrix}
$$

We have found two generalized eigenvectors for eigenvalue -2. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} -2 \\ 1 \end{bmatrix} \mathrm{e}^{-2t} \\ &= \begin{bmatrix} -2\,\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\ &= \left(\begin{bmatrix} -2 \\ 1 \end{bmatrix} t + \begin{bmatrix} -\frac{7}{3} \\ 1 \end{bmatrix} \right) \mathrm{e}^{-2t} \\ &= \begin{bmatrix} -\frac{\mathrm{e}^{-2t}(7+6t)}{3} \\ \mathrm{e}^{-2t}(t+1) \end{bmatrix}\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} -2\,\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-2t}\left(-2t - \frac{7}{3}\right) \\ \mathrm{e}^{-2t}(t+1) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \mathrm{e}^{-2t}\left(-2c_1 - 2c_2 t - \frac{7}{3} c_2\right) \\ \mathrm{e}^{-2t}(c_2 t + c_1 + c_2) \end{bmatrix}$$

The following is the phase plot of the system.

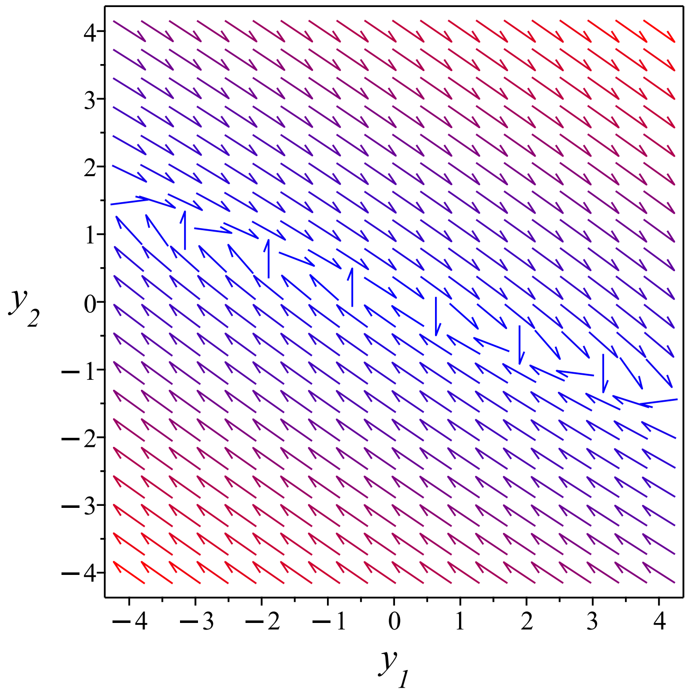

Figure 582: Phase plot

22.5.3 Maple step by step solution

Let's solve

$[y_1'(t) = 4y_1(t) + 12y_2(t), y_2'(t) = -3y_1(t) - 8y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 4 & 12 \\ -3 & -8 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 4 & 12 \\ -3 & -8 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 4 & 12 \\ -3 & -8 \end{bmatrix}$$

- Rewrite the system as

$$\underline{\vec{y}}'(t) = A \cdot \underline{\vec{y}}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} -2 \\ 1 \end{bmatrix}\right], \left[-2, \begin{bmatrix} 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[-2, \begin{bmatrix} -2 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue -2

$$\underline{\vec{y}}_1(t) = \mathrm{e}^{-2t} \cdot \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = -2$ is the eigenvalue, an

$$\underline{\vec{y}}_2(t) = \mathrm{e}^{\lambda t}\left(t\vec{v} + \vec{p}\right)$$

- Note that the t multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\underline{\vec{y}}_2(t)$ into the homogeneous system

$$\lambda \,\mathrm{e}^{\lambda t}\left(t\vec{v} + \vec{p}\right) + \mathrm{e}^{\lambda t}\vec{v} = \left(\mathrm{e}^{\lambda t} A\right) \cdot \left(t\vec{v} + \vec{p}\right)$$

- Use the fact that $\vec{v}$ is an eigenvector of A

$$\lambda \,\mathrm{e}^{\lambda t}\left(t\vec{v} + \vec{p}\right) + \mathrm{e}^{\lambda t}\vec{v} = \mathrm{e}^{\lambda t}\left(\lambda t\vec{v} + A \cdot \vec{p}\right)$$

- Simplify equation

$$\lambda\vec{p} + \vec{v} = A \cdot \vec{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$$

- Condition $\vec{p}$ must meet for $\underline{\vec{y}}_2(t)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue -2

$$\left(\begin{bmatrix} 4 & 12 \\ -3 & -8 \end{bmatrix} - (-2) \cdot \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) \cdot \vec{p} = \begin{bmatrix} -2 \\ 1 \end{bmatrix}$$

- Choice of $\vec{p}$

$$\vec{p} = \begin{bmatrix} -\frac{1}{3} \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue -2

$$\overrightarrow{y\_\_}_2(t) = \mathrm{e}^{-2t} \cdot \left(t \cdot \begin{bmatrix} -2 \\ 1 \end{bmatrix} + \begin{bmatrix} -\frac{1}{3} \\ 0 \end{bmatrix}\right)$$

- General solution to the system of ODEs

$$\overrightarrow{y\_\_} = c_1 \overrightarrow{y\_\_}_1(t) + c_2 \overrightarrow{y\_\_}_2(t)$$

- Substitute solutions into the general solution

$$\overrightarrow{y\_\_} = c_1 \mathrm{e}^{-2t} \cdot \begin{bmatrix} -2 \\ 1 \end{bmatrix} + \mathrm{e}^{-2t} c_2 \cdot \left(t \cdot \begin{bmatrix} -2 \\ 1 \end{bmatrix} + \begin{bmatrix} -\frac{1}{3} \\ 0 \end{bmatrix}\right)$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \mathrm{e}^{-2t}\left(-2c_1 - 2c_2 t - \frac{1}{3}c_2\right) \\ \mathrm{e}^{-2t}(c_2 t + c_1) \end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{y_1(t) = \mathrm{e}^{-2t}\left(-2c_1 - 2c_2 t - \frac{1}{3}c_2\right), y_2(t) = \mathrm{e}^{-2t}(c_2 t + c_1)\right\}$$

✓ Solution by Maple

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 10 Linear system of Differential equations. Section 10.5, constant coefficient homogeneous system II. Page 555
Problem number: section 10.5, problem 6.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -10y_1(t) + 9y_2(t) \\
y_2'(t) &= -4y_1(t) + 2y_2(t)
\end{aligned}
$$

22.6.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -10 & 9 \\ -4 & 2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} \mathrm{e}^{-4t}(1-6t) & 9t\,\mathrm{e}^{-4t} \\ -4t\,\mathrm{e}^{-4t} & \mathrm{e}^{-4t}(1+6t) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{-4t}(1-6t) & 9t\,e^{-4t} \\ -4t\,e^{-4t} & e^{-4t}(1+6t) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{-4t}(1-6t)\,c_1 + 9t\,e^{-4t}c_2 \\ -4t\,e^{-4t}c_1 + e^{-4t}(1+6t)\,c_2 \end{bmatrix} \\
&= \begin{bmatrix} (c_1(1-6t) + 9c_2t)\,e^{-4t} \\ (c_2(1+6t) - 4tc_1)\,e^{-4t} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.6.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -10 & 9 \\ -4 & 2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$
\det(A - \lambda I) = 0
$$

Expanding gives

$$
\det\left(\begin{bmatrix} -10 & 9 \\ -4 & 2 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) = 0
$$

Therefore

$$
\det\left(\begin{bmatrix} -10-\lambda & 9 \\ -4 & 2-\lambda \end{bmatrix} \right) = 0
$$

Which gives the characteristic equation

$$\lambda^2 + 8\lambda + 16 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -4$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-4	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -4$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -10 & 9 \\ -4 & 2 \end{bmatrix} - (-4)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} -6 & 9 \\ -4 & 6 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -6 & 9 & 0 \\ -4 & 6 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{2R_1}{3} \Longrightarrow \left[\begin{array}{cc|c} -6 & 9 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -6 & 9 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \frac{3t}{2}\right\}$

Hence the solution is

$$\begin{bmatrix} \frac{3t}{2} \\ t \end{bmatrix} = \begin{bmatrix} \frac{3t}{2} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \frac{3t}{2} \\ t \end{bmatrix} = t \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \frac{3t}{2} \\ t \end{bmatrix} = \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \frac{3t}{2} \\ t \end{bmatrix} = \begin{bmatrix} 3 \\ 2 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-4	2	1	Yes	$\begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -4 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

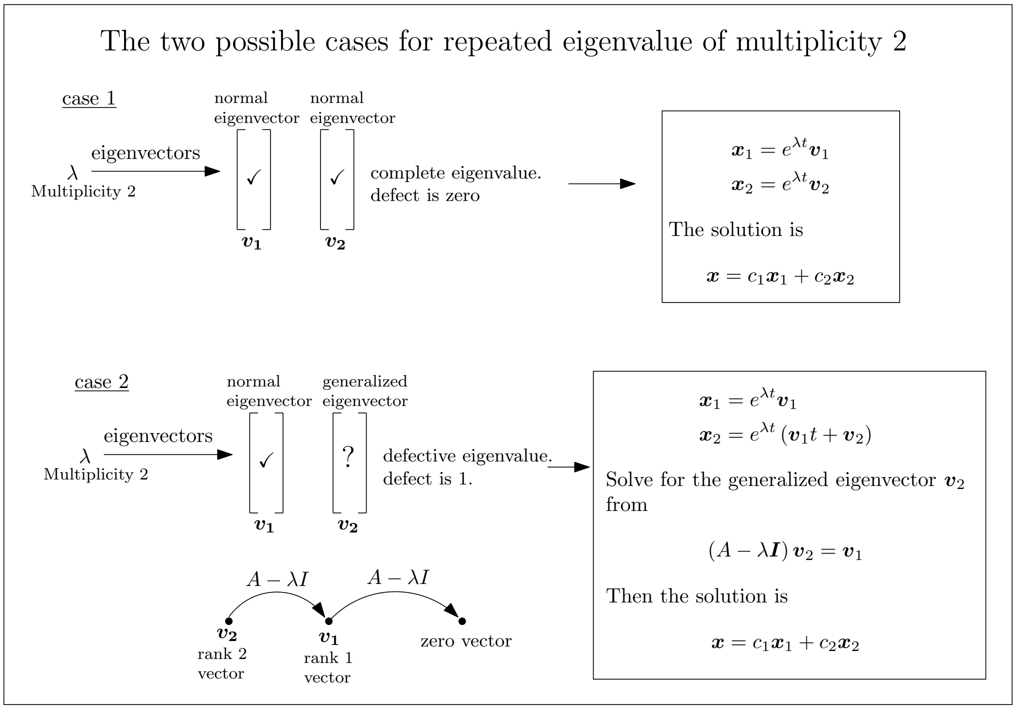

Figure 583: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\begin{aligned}
\left(\begin{bmatrix} -10 & 9 \\ -4 & 2 \end{bmatrix} - (-4) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} &= \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix} \\
\begin{bmatrix} -6 & 9 \\ -4 & 6 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} &= \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}
\end{aligned}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} \frac{5}{4} \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue -4. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\
&= \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix} \mathrm{e}^{-4t} \\
&= \begin{bmatrix} \frac{3\,\mathrm{e}^{-4t}}{2} \\ \mathrm{e}^{-4t} \end{bmatrix}
\end{aligned}$$

And

$$\begin{aligned}
\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\
&= \left(\begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix} t + \begin{bmatrix} \frac{5}{4} \\ 1 \end{bmatrix} \right) \mathrm{e}^{-4t} \\
&= \begin{bmatrix} \frac{\mathrm{e}^{-4t}(6t+5)}{4} \\ \mathrm{e}^{-4t}(t+1) \end{bmatrix}
\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} \frac{3\,\mathrm{e}^{-4t}}{2} \\ \mathrm{e}^{-4t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-4t}\left(\frac{3t}{2} + \frac{5}{4}\right) \\ \mathrm{e}^{-4t}(t+1) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \frac{((6t+5)c_2+6c_1)\mathrm{e}^{-4t}}{4} \\ \mathrm{e}^{-4t}(c_2 t + c_1 + c_2) \end{bmatrix}$$

The following is the phase plot of the system.

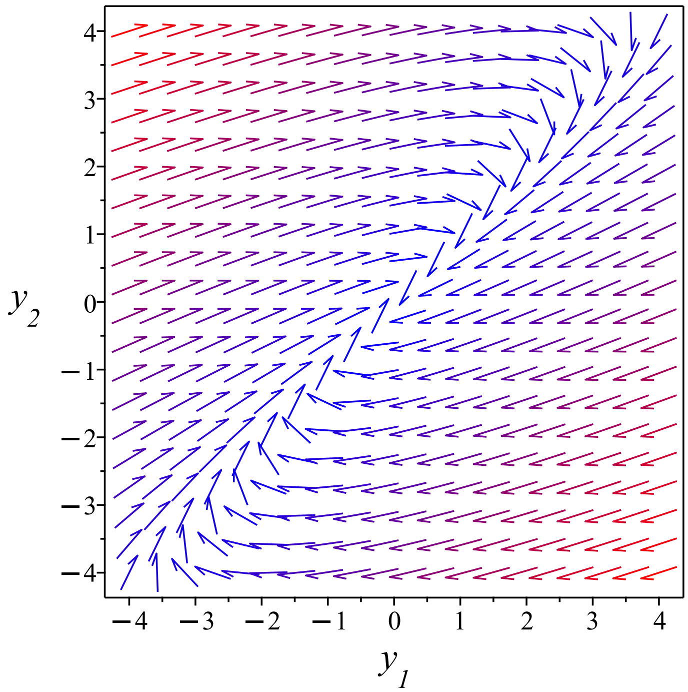

Figure 584: Phase plot

22.6.3 Maple step by step solution

Let's solve

$[y_1'(t) = -10y_1(t) + 9y_2(t), y_2'(t) = -4y_1(t) + 2y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -10 & 9 \\ -4 & 2 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -10 & 9 \\ -4 & 2 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -10 & 9 \\ -4 & 2 \end{bmatrix}$$

- Rewrite the system as

$$\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-4, \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}\right], \left[-4, \begin{bmatrix} 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[-4, \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue -4

$$\underline{y}^{\rightarrow}{}_1(t) = e^{-4t} \cdot \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = -4$ is the eigenvalue, an

$$\underline{y}^{\rightarrow}{}_2(t) = e^{\lambda t}\left(t\vec{v} + \vec{p}\right)$$

- Note that the t multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\underline{y}^{\rightarrow}{}_2(t)$ into the homogeneous system

$$\lambda e^{\lambda t}\left(t\vec{v} + \vec{p}\right) + e^{\lambda t}\vec{v} = \left(e^{\lambda t}A\right) \cdot \left(t\vec{v} + \vec{p}\right)$$

- Use the fact that $\vec{v}$ is an eigenvector of A

$$\lambda e^{\lambda t}\left(t\vec{v} + \vec{p}\right) + e^{\lambda t}\vec{v} = e^{\lambda t}\left(\lambda t\vec{v} + A \cdot \vec{p}\right)$$

- Simplify equation

$$\lambda\vec{p} + \vec{v} = A \cdot \vec{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$$

- Condition $\vec{p}$ must meet for $\underline{y}^{\rightarrow}{}_2(t)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue -4

$$\left(\left[\begin{array}{cc} -10 & 9 \\ -4 & 2 \end{array}\right]-(-4)\cdot\left[\begin{array}{cc} 1 & 0 \\ 0 & 1 \end{array}\right]\right)\cdot\overrightarrow{p}=\left[\begin{array}{c} \frac{3}{2} \\ 1 \end{array}\right]$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p}=\left[\begin{array}{c} -\frac{1}{4} \\ 0 \end{array}\right]$$

- Second solution from eigenvalue -4

$$\overrightarrow{y}_{2}(t)=e^{-4t}\cdot\left(t\cdot\left[\begin{array}{c} \frac{3}{2} \\ 1 \end{array}\right]+\left[\begin{array}{c} -\frac{1}{4} \\ 0 \end{array}\right]\right)$$

- General solution to the system of ODEs

$$\overrightarrow{y}=c_1\overrightarrow{y}_{1}(t)+c_2\overrightarrow{y}_{2}(t)$$

- Substitute solutions into the general solution

$$\overrightarrow{y}=c_1e^{-4t}\cdot\left[\begin{array}{c} \frac{3}{2} \\ 1 \end{array}\right]+c_2e^{-4t}\cdot\left(t\cdot\left[\begin{array}{c} \frac{3}{2} \\ 1 \end{array}\right]+\left[\begin{array}{c} -\frac{1}{4} \\ 0 \end{array}\right]\right)$$

- Substitute in vector of dependent variables

$$\left[\begin{array}{c} y_1(t) \\ y_2(t) \end{array}\right]=\left[\begin{array}{c} \frac{((6t-1)c_2+6c_1)e^{-4t}}{4} \\ e^{-4t}(c_2t+c_1) \end{array}\right]$$

- Solution to the system of ODEs

$$\left\{y_1(t)=\frac{((6t-1)c_2+6c_1)e^{-4t}}{4}, y_2(t)=e^{-4t}(c_2t+c_1)\right\}$$

\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -13 & 16 \\ -9 & 11 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} \mathrm{e}^{-t}(1-12t) & 16t\,\mathrm{e}^{-t} \\ -9t\,\mathrm{e}^{-t} & \mathrm{e}^{-t}(1+12t) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{-t}(1-12t) & 16t\,e^{-t} \\ -9t\,e^{-t} & e^{-t}(1+12t) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{-t}(1-12t)\,c_1 + 16t\,e^{-t}c_2 \\ -9t\,e^{-t}c_1 + e^{-t}(1+12t)\,c_2 \end{bmatrix} \\
&= \begin{bmatrix} (c_1(1-12t) + 16c_2t)\,e^{-t} \\ (c_2(1+12t) - 9tc_1)\,e^{-t} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.7.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -13 & 16 \\ -9 & 11 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$
\det(A - \lambda I) = 0
$$

Expanding gives

$$
\det\left(\begin{bmatrix} -13 & 16 \\ -9 & 11 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0
$$

Therefore

$$
\det\left(\begin{bmatrix} -13-\lambda & 16 \\ -9 & 11-\lambda \end{bmatrix}\right) = 0
$$

Which gives the characteristic equation

$$\lambda^2 + 2\lambda + 1 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -1$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-1	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -13 & 16 \\ -9 & 11 \end{bmatrix} - (-1)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -12 & 16 \\ -9 & 12 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -12 & 16 & 0 \\ -9 & 12 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{3R_1}{4} \Longrightarrow \left[\begin{array}{cc|c} -12 & 16 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -12 & 16 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \frac{4t}{3}\right\}$

Hence the solution is

$$\begin{bmatrix} \frac{4t}{3} \\ t \end{bmatrix} = \begin{bmatrix} \frac{4t}{3} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \frac{4t}{3} \\ t \end{bmatrix} = t \begin{bmatrix} \frac{4}{3} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \frac{4t}{3} \\ t \end{bmatrix} = \begin{bmatrix} \frac{4}{3} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \frac{4t}{3} \\ t \end{bmatrix} = \begin{bmatrix} 4 \\ 3 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-1	2	1	Yes	$\begin{bmatrix} \frac{4}{3} \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -1 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

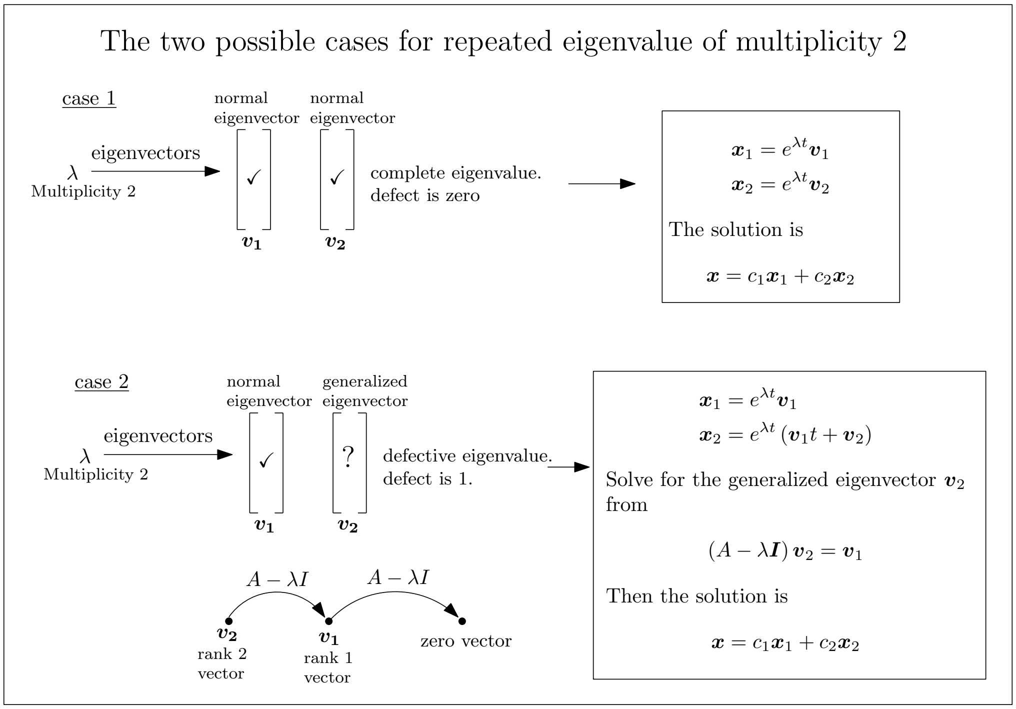

Figure 585: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} -13 & 16 \\ -9 & 11 \end{bmatrix} - (-1)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} \frac{4}{3} \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} -12 & 16 \\ -9 & 12 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} \frac{4}{3} \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} \frac{11}{9} \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue -1. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} \frac{4}{3} \\ 1 \end{bmatrix} \mathrm{e}^{-t} \\ &= \begin{bmatrix} \frac{4\,\mathrm{e}^{-t}}{3} \\ \mathrm{e}^{-t} \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\ &= \left(\begin{bmatrix} \frac{4}{3} \\ 1 \end{bmatrix} t + \begin{bmatrix} \frac{11}{9} \\ 1 \end{bmatrix} \right) \mathrm{e}^{-t} \\ &= \begin{bmatrix} \frac{\mathrm{e}^{-t}(12t+11)}{9} \\ \mathrm{e}^{-t}(t+1) \end{bmatrix}\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} \frac{4\,\mathrm{e}^{-t}}{3} \\ \mathrm{e}^{-t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-t}\left(\frac{4t}{3} + \frac{11}{9}\right) \\ \mathrm{e}^{-t}(t+1) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \frac{((12t+11)c_2+12c_1)\mathrm{e}^{-t}}{9} \\ \mathrm{e}^{-t}(c_2 t + c_1 + c_2) \end{bmatrix}$$

The following is the phase plot of the system.

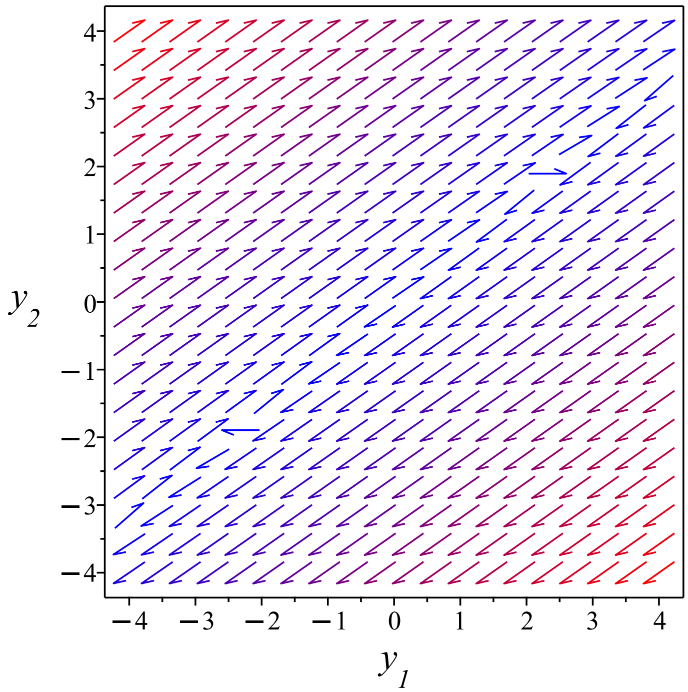

Figure 586: Phase plot

22.7.3 Maple step by step solution

Let's solve

$[y_1'(t) = -13y_1(t) + 16y_2(t), y_2'(t) = -9y_1(t) + 11y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow}{}'(t) = \begin{bmatrix} -13 & 16 \\ -9 & 11 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow}{}'(t) = \begin{bmatrix} -13 & 16 \\ -9 & 11 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -13 & 16 \\ -9 & 11 \end{bmatrix}$$

- Rewrite the system as

  $\underline{\overrightarrow{y}}'(t) = A \cdot \underline{\overrightarrow{y}}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

  $$\left[\left[-1, \begin{bmatrix} \frac{4}{3} \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

  $$\left[-1, \begin{bmatrix} \frac{4}{3} \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue -1

  $$\underline{\overrightarrow{y}}_1(t) = e^{-t} \cdot \begin{bmatrix} \frac{4}{3} \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = -1$ is the eigenvalue, an

  $\underline{\overrightarrow{y}}_2(t) = e^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right)$

- Note that the t multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\underline{\overrightarrow{y}}_2(t)$ into the homogeneous system

  $\lambda e^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right) + e^{\lambda t}\overrightarrow{v} = \left(e^{\lambda t}A\right) \cdot \left(t\overrightarrow{v} + \overrightarrow{p}\right)$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

  $\lambda e^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right) + e^{\lambda t}\overrightarrow{v} = e^{\lambda t}\left(\lambda t\overrightarrow{v} + A \cdot \overrightarrow{p}\right)$

- Simplify equation

  $\lambda\overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$

- Make use of the identity matrix I

  $(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$

- Condition $\overrightarrow{p}$ must meet for $\underline{\overrightarrow{y}}_2(t)$ to be a solution to the homogeneous system

  $(A - \lambda \cdot I) \cdot \overrightarrow{p} = \overrightarrow{v}$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue -1

$$\left(\left[\begin{array}{cc}-13 & 16 \\ -9 & 11\end{array}\right]-(-1)\cdot\left[\begin{array}{cc}1 & 0 \\ 0 & 1\end{array}\right]\right)\cdot\overrightarrow{p}=\left[\begin{array}{c}\frac{4}{3} \\ 1\end{array}\right]$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p}=\left[\begin{array}{c}-\frac{1}{9} \\ 0\end{array}\right]$$

- Second solution from eigenvalue -1

$$\overrightarrow{y}_2(t)=\mathrm{e}^{-t}\cdot\left(t\cdot\left[\begin{array}{c}\frac{4}{3} \\ 1\end{array}\right]+\left[\begin{array}{c}-\frac{1}{9} \\ 0\end{array}\right]\right)$$

- General solution to the system of ODEs

$$\overrightarrow{y}=c_1\overrightarrow{y}_1(t)+c_2\overrightarrow{y}_2(t)$$

- Substitute solutions into the general solution

$$\overrightarrow{y}=c_1\mathrm{e}^{-t}\cdot\left[\begin{array}{c}\frac{4}{3} \\ 1\end{array}\right]+c_2\mathrm{e}^{-t}\cdot\left(t\cdot\left[\begin{array}{c}\frac{4}{3} \\ 1\end{array}\right]+\left[\begin{array}{c}-\frac{1}{9} \\ 0\end{array}\right]\right)$$

- Substitute in vector of dependent variables

$$\left[\begin{array}{c}y_1(t) \\ y_2(t)\end{array}\right]=\left[\begin{array}{c}\frac{((-1+12t)c_2+12c_1)\mathrm{e}^{-t}}{9} \\ (c_2t+c_1)\,\mathrm{e}^{-t}\end{array}\right]$$

- Solution to the system of ODEs

$$\left\{y_1(t)=\frac{((-1+12t)c_2+12c_1)\mathrm{e}^{-t}}{9}, y_2(t)=(c_2t+c_1)\,\mathrm{e}^{-t}\right\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$\begin{aligned} y_1'(t) &= 2y_2(t) + y_3(t) \\ y_2'(t) &= -4y_1(t) + 6y_2(t) + y_3(t) \\ y_3'(t) &= 4y_2(t) + 2y_3(t) \end{aligned}$$

22.8.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 0 & 2 & 1 \\ -4 & 6 & 1 \\ 0 & 4 & 2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{1}{2} - 2t\,\mathrm{e}^{4t} + \frac{\mathrm{e}^{4t}}{2} & 2t\,\mathrm{e}^{4t} & \frac{\mathrm{e}^{4t}}{4} - \frac{1}{4} \\ -\frac{\mathrm{e}^{4t}}{2} + \frac{1}{2} - 2t\,\mathrm{e}^{4t} & \mathrm{e}^{4t}(1+2t) & \frac{\mathrm{e}^{4t}}{4} - \frac{1}{4} \\ -4t\,\mathrm{e}^{4t} + \mathrm{e}^{4t} - 1 & 4t\,\mathrm{e}^{4t} & \frac{1}{2} + \frac{\mathrm{e}^{4t}}{2} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned} \vec{x}_h(t) &= e^{At}\vec{c} \\ &= \begin{bmatrix} \frac{1}{2} - 2t\,\mathrm{e}^{4t} + \frac{\mathrm{e}^{4t}}{2} & 2t\,\mathrm{e}^{4t} & \frac{\mathrm{e}^{4t}}{4} - \frac{1}{4} \\ -\frac{\mathrm{e}^{4t}}{2} + \frac{1}{2} - 2t\,\mathrm{e}^{4t} & \mathrm{e}^{4t}(1+2t) & \frac{\mathrm{e}^{4t}}{4} - \frac{1}{4} \\ -4t\,\mathrm{e}^{4t} + \mathrm{e}^{4t} - 1 & 4t\,\mathrm{e}^{4t} & \frac{1}{2} + \frac{\mathrm{e}^{4t}}{2} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\ &= \begin{bmatrix} \left(\frac{1}{2} - 2t\,\mathrm{e}^{4t} + \frac{\mathrm{e}^{4t}}{2}\right) c_1 + 2t\,\mathrm{e}^{4t} c_2 + \left(\frac{\mathrm{e}^{4t}}{4} - \frac{1}{4}\right) c_3 \\ \left(-\frac{\mathrm{e}^{4t}}{2} + \frac{1}{2} - 2t\,\mathrm{e}^{4t}\right) c_1 + \mathrm{e}^{4t}(1+2t)\, c_2 + \left(\frac{\mathrm{e}^{4t}}{4} - \frac{1}{4}\right) c_3 \\ \left(-4t\,\mathrm{e}^{4t} + \mathrm{e}^{4t} - 1\right) c_1 + 4t\,\mathrm{e}^{4t} c_2 + \left(\frac{1}{2} + \frac{\mathrm{e}^{4t}}{2}\right) c_3 \end{bmatrix} \\ &= \begin{bmatrix} \frac{((2-8t)c_1+8c_2t+c_3)\mathrm{e}^{4t}}{4} + \frac{c_1}{2} - \frac{c_3}{4} \\ \frac{((-8t-2)c_1+(8t+4)c_2+c_3)\mathrm{e}^{4t}}{4} + \frac{c_1}{2} - \frac{c_3}{4} \\ \frac{((2-8t)c_1+8c_2t+c_3)\mathrm{e}^{4t}}{2} - c_1 + \frac{c_3}{2} \end{bmatrix} \end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.8.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 0 & 2 & 1 \\ -4 & 6 & 1 \\ 0 & 4 & 2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 0 & 2 & 1 \\ -4 & 6 & 1 \\ 0 & 4 & 2 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -\lambda & 2 & 1 \\ -4 & 6-\lambda & 1 \\ 0 & 4 & 2-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 8\lambda^2 + 16\lambda = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 0$$
$$\lambda_2 = 4$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
0	1	real eigenvalue
4	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 0$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 0 & 2 & 1 \\ -4 & 6 & 1 \\ 0 & 4 & 2 \end{bmatrix} - (0) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 2 & 1 \\ -4 & 6 & 1 \\ 0 & 4 & 2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 0 & 2 & 1 & 0 \\ -4 & 6 & 1 & 0 \\ 0 & 4 & 2 & 0 \end{array}\right]$$

Since the current pivot $A(1,1)$ is zero, then the current pivot row is replaced with a row with a non-zero pivot. Swapping row 1 and row 2 gives

$$\left[\begin{array}{ccc|c} -4 & 6 & 1 & 0 \\ 0 & 2 & 1 & 0 \\ 0 & 4 & 2 & 0 \end{array}\right]$$

$$R_3 = R_3 - 2R_2 \Longrightarrow \left[\begin{array}{ccc|c} -4 & 6 & 1 & 0 \\ 0 & 2 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -4 & 6 & 1 \\ 0 & 2 & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = -\frac{t}{2}, v_2 = -\frac{t}{2}\right\}$

Hence the solution is

$$\begin{bmatrix} -\frac{t}{2} \\ -\frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{t}{2} \\ -\frac{t}{2} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -\frac{t}{2} \\ -\frac{t}{2} \\ t \end{bmatrix} = t \begin{bmatrix} -\frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

Let $t=1$ the eigenvector becomes

$$\begin{bmatrix} -\frac{t}{2} \\ -\frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} -\frac{t}{2} \\ -\frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ -1 \\ 2 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 4$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 0 & 2 & 1 \\ -4 & 6 & 1 \\ 0 & 4 & 2 \end{bmatrix} - (4) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -4 & 2 & 1 \\ -4 & 2 & 1 \\ 0 & 4 & -2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -4 & 2 & 1 & 0 \\ -4 & 2 & 1 & 0 \\ 0 & 4 & -2 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \implies \left[\begin{array}{ccc|c} -4 & 2 & 1 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 4 & -2 & 0 \end{array}\right]$$

Since the current pivot $A(2,2)$ is zero, then the current pivot row is replaced with a row with a non-zero pivot. Swapping row 2 and row 3 gives

$$\left[\begin{array}{ccc|c} -4 & 2 & 1 & 0 \\ 0 & 4 & -2 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -4 & 2 & 1 \\ 0 & 4 & -2 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \frac{t}{2}, v_2 = \frac{t}{2}\right\}$

Hence the solution is

$$\begin{bmatrix} \frac{t}{2} \\ \frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} \frac{t}{2} \\ \frac{t}{2} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \frac{t}{2} \\ \frac{t}{2} \\ t \end{bmatrix} = t \begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \frac{t}{2} \\ \frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \frac{t}{2} \\ \frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 2 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
0	1	1	No	$\begin{bmatrix} -\frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix}$
4	2	1	Yes	$\begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue 0 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^0 \\
&= \begin{bmatrix} -\frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix} e^0
\end{aligned}
$$

eigenvalue 4 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

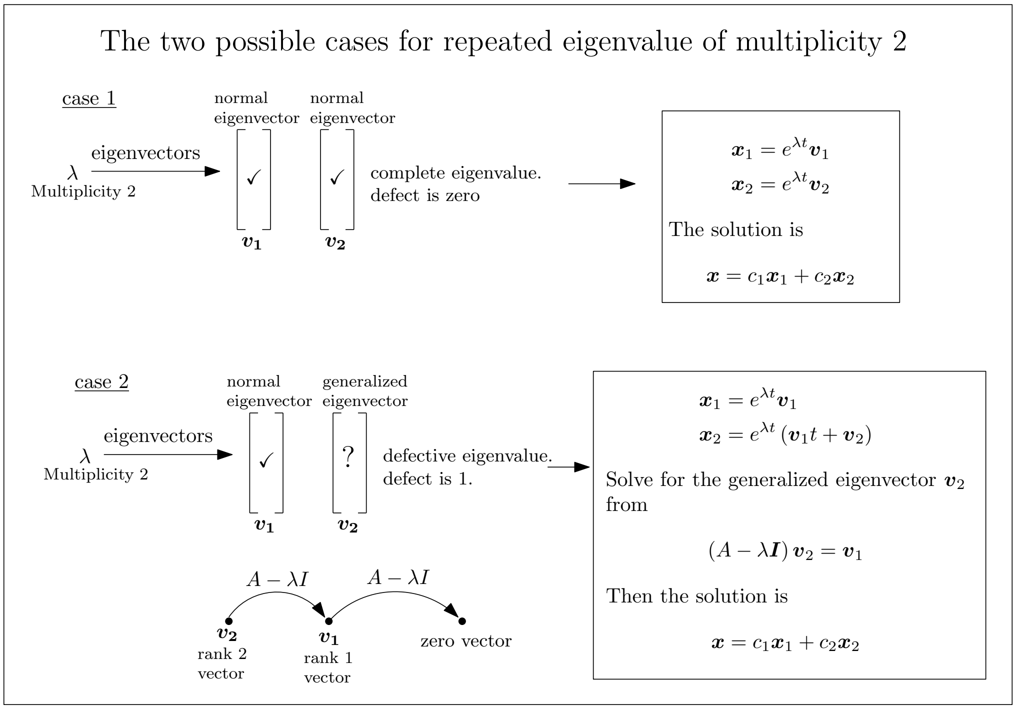

Figure 587: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A-\lambda I)\,\vec{v}_2=\vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix}0 & 2 & 1\\ -4 & 6 & 1\\ 0 & 4 & 2\end{bmatrix}-(4)\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{bmatrix}\right)\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix}=\begin{bmatrix}\frac{1}{2}\\ \frac{1}{2}\\ 1\end{bmatrix}$$

$$\begin{bmatrix}-4 & 2 & 1\\ -4 & 2 & 1\\ 0 & 4 & -2\end{bmatrix}\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix}=\begin{bmatrix}\frac{1}{2}\\ \frac{1}{2}\\ 1\end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} \frac{3}{4} \\ 1 \\ \frac{3}{2} \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue 4. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned}
\vec{x}_2(t) &= \vec{v}_1 e^{\lambda t} \\
&= \begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix} \mathrm{e}^{4t} \\
&= \begin{bmatrix} \frac{\mathrm{e}^{4t}}{2} \\ \frac{\mathrm{e}^{4t}}{2} \\ \mathrm{e}^{4t} \end{bmatrix}
\end{aligned}$$

And

$$\begin{aligned}
\vec{x}_3(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\
&= \left(\begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix} t + \begin{bmatrix} \frac{3}{4} \\ 1 \\ \frac{3}{2} \end{bmatrix} \right) \mathrm{e}^{4t} \\
&= \begin{bmatrix} \frac{\mathrm{e}^{4t}(2t+3)}{4} \\ \frac{\mathrm{e}^{4t}(2+t)}{2} \\ \frac{\mathrm{e}^{4t}(2t+3)}{2} \end{bmatrix}
\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} -\frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{bmatrix} + c_2 \begin{bmatrix} \frac{\mathrm{e}^{4t}}{2} \\ \frac{\mathrm{e}^{4t}}{2} \\ \mathrm{e}^{4t} \end{bmatrix} + c_3 \begin{bmatrix} \mathrm{e}^{4t}\left(\frac{t}{2} + \frac{3}{4}\right) \\ \mathrm{e}^{4t}\left(\frac{t}{2} + 1\right) \\ \mathrm{e}^{4t}\left(t + \frac{3}{2}\right) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \frac{((2t+3)c_3+2c_2)e^{4t}}{4} - \frac{c_1}{2} \\ \frac{((2+t)c_3+c_2)e^{4t}}{2} - \frac{c_1}{2} \\ \frac{((2t+3)c_3+2c_2)e^{4t}}{2} + c_1 \end{bmatrix}$$

22.8.3 Maple step by step solution

Let's solve

$[y_1'(t) = 2y_2(t) + y_3(t), y_2'(t) = -4y_1(t) + 6y_2(t) + y_3(t), y_3'(t) = 4y_2(t) + 2y_3(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 0 & 2 & 1 \\ -4 & 6 & 1 \\ 0 & 4 & 2 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 0 & 2 & 1 \\ -4 & 6 & 1 \\ 0 & 4 & 2 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 0 & 2 & 1 \\ -4 & 6 & 1 \\ 0 & 4 & 2 \end{bmatrix}$$

- Rewrite the system as

$\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[0, \left[\begin{array}{c} -\frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right], \left[4, \left[\begin{array}{c} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{array}\right]\right], \left[4, \left[\begin{array}{c} 0 \\ 0 \\ 0 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[0, \left[\begin{array}{c} -\frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_{1} = \left[\begin{array}{c} -\frac{1}{2} \\ -\frac{1}{2} \\ 1 \end{array}\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[4, \left[\begin{array}{c} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue 4

$$\overrightarrow{y}_{2}(t) = e^{4t} \cdot \left[\begin{array}{c} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 4$ is the eigenvalue, and

$$\overrightarrow{y}_{3}(t) = e^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the t multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\overrightarrow{y}_{3}(t)$ into the homogeneous system

$$\lambda e^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right) + e^{\lambda t}\overrightarrow{v} = \left(e^{\lambda t}A\right) \cdot \left(t\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda e^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right) + e^{\lambda t}\overrightarrow{v} = e^{\lambda t}\left(\lambda t\overrightarrow{v} + A \cdot \overrightarrow{p}\right)$$

- Simplify equation

$\lambda \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$

- Make use of the identity matrix I

$(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$

- Condition $\overrightarrow{p}$ must meet for $\underline{y}^{\rightarrow}{}_{3}(t)$ to be a solution to the homogeneous system

$(A - \lambda \cdot I) \cdot \overrightarrow{p} = \overrightarrow{v}$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue 4

$$\left(\begin{bmatrix} 0 & 2 & 1 \\ -4 & 6 & 1 \\ 0 & 4 & 2 \end{bmatrix} - 4 \cdot \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \cdot \overrightarrow{p} = \begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p} = \begin{bmatrix} -\frac{1}{8} \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue 4

$$\underline{y}^{\rightarrow}{}_{3}(t) = e^{4t} \cdot \left(t \cdot \begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix} + \begin{bmatrix} -\frac{1}{8} \\ 0 \\ 0 \end{bmatrix}\right)$$

- General solution to the system of ODEs

$\underline{y}^{\rightarrow} = c_1 \underline{y}^{\rightarrow}{}_{1} + c_2 \underline{y}^{\rightarrow}{}_{2}(t) + c_3 \underline{y}^{\rightarrow}{}_{3}(t)$

- Substitute solutions into the general solution

$$\underline{y}^{\rightarrow} = c_2 e^{4t} \cdot \begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix} + c_3 e^{4t} \cdot \left(t \cdot \begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix} + \begin{bmatrix} -\frac{1}{8} \\ 0 \\ 0 \end{bmatrix}\right) + \begin{bmatrix} -\frac{c_1}{2} \\ -\frac{c_1}{2} \\ c_1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \frac{((-1+4t)c_3+4c_2)e^{4t}}{8} - \frac{c_1}{2} \\ \frac{(c_3 t+c_2)e^{4t}}{2} - \frac{c_1}{2} \\ (c_3 t + c_2)\, e^{4t} + c_1 \end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{y_1(t)=\frac{((-1+4t)c_3+4c_2)\,\mathrm{e}^{4t}}{8}-\frac{c_1}{2},y_2(t)=\frac{(c_3t+c_2)\,\mathrm{e}^{4t}}{2}-\frac{c_1}{2},y_3(t)=(c_3t+c_2)\,\mathrm{e}^{4t}+c_1\right\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= \frac{y_1(t)}{3} + \frac{y_2(t)}{3} - y_3(t) \\
y_2'(t) &= -\frac{4y_1(t)}{3} - \frac{4y_2(t)}{3} + y_3(t) \\
y_3'(t) &= -\frac{2y_1(t)}{3} + \frac{y_2(t)}{3}
\end{aligned}
$$

22.9.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} \frac{1}{3} & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{4}{3} & 1 \\ -\frac{2}{3} & \frac{1}{3} & 0 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{e^{-t}(2t+3)}{6} + \frac{e^t}{2} & \frac{t\,e^{-t}}{3} & -\frac{e^t}{2} + \frac{e^{-t}}{2} \\ \frac{(-2t+3)e^{-t}}{6} - \frac{e^t}{2} & e^{-t}\left(1 - \frac{t}{3}\right) & \frac{e^t}{2} - \frac{e^{-t}}{2} \\ \frac{e^{-t}(2t+3)}{6} - \frac{e^t}{2} & \frac{t\,e^{-t}}{3} & \frac{e^{-t}}{2} + \frac{e^t}{2} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned} \vec{x}_h(t) &= e^{At}\vec{c} \\ &= \begin{bmatrix} \frac{e^{-t}(2t+3)}{6} + \frac{e^t}{2} & \frac{t\,e^{-t}}{3} & -\frac{e^t}{2} + \frac{e^{-t}}{2} \\ \frac{(-2t+3)e^{-t}}{6} - \frac{e^t}{2} & e^{-t}\left(1 - \frac{t}{3}\right) & \frac{e^t}{2} - \frac{e^{-t}}{2} \\ \frac{e^{-t}(2t+3)}{6} - \frac{e^t}{2} & \frac{t\,e^{-t}}{3} & \frac{e^{-t}}{2} + \frac{e^t}{2} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\ &= \begin{bmatrix} \left(\frac{e^{-t}(2t+3)}{6} + \frac{e^t}{2}\right)c_1 + \frac{t\,e^{-t}c_2}{3} + \left(-\frac{e^t}{2} + \frac{e^{-t}}{2}\right)c_3 \\ \left(\frac{(-2t+3)e^{-t}}{6} - \frac{e^t}{2}\right)c_1 + e^{-t}\left(1 - \frac{t}{3}\right)c_2 + \left(\frac{e^t}{2} - \frac{e^{-t}}{2}\right)c_3 \\ \left(\frac{e^{-t}(2t+3)}{6} - \frac{e^t}{2}\right)c_1 + \frac{t\,e^{-t}c_2}{3} + \left(\frac{e^{-t}}{2} + \frac{e^t}{2}\right)c_3 \end{bmatrix} \\ &= \begin{bmatrix} \frac{(c_1(2t+3)+2c_2t+3c_3)e^{-t}}{6} + \frac{e^t(c_1-c_3)}{2} \\ \frac{((-2t+3)c_1+(6-2t)c_2-3c_3)e^{-t}}{6} - \frac{e^t(c_1-c_3)}{2} \\ \frac{(c_1(2t+3)+2c_2t+3c_3)e^{-t}}{6} - \frac{e^t(c_1-c_3)}{2} \end{bmatrix} \end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.9.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} \frac{1}{3} & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{4}{3} & 1 \\ -\frac{2}{3} & \frac{1}{3} & 0 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} \frac{1}{3} & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{4}{3} & 1 \\ -\frac{2}{3} & \frac{1}{3} & 0 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} \frac{1}{3} - \lambda & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{4}{3} - \lambda & 1 \\ -\frac{2}{3} & \frac{1}{3} & -\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + \lambda^2 - \lambda - 1 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -1$$
$$\lambda_2 = 1$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-1	1	real eigenvalue
1	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} \frac{1}{3} & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{4}{3} & 1 \\ -\frac{2}{3} & \frac{1}{3} & 0 \end{bmatrix} - (-1) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} \frac{4}{3} & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{1}{3} & 1 \\ -\frac{2}{3} & \frac{1}{3} & 1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} \frac{4}{3} & \frac{1}{3} & -1 & 0 \\ -\frac{4}{3} & -\frac{1}{3} & 1 & 0 \\ -\frac{2}{3} & \frac{1}{3} & 1 & 0 \end{array}\right]$$

$$R_2 = R_2 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} \frac{4}{3} & \frac{1}{3} & -1 & 0 \\ 0 & 0 & 0 & 0 \\ -\frac{2}{3} & \frac{1}{3} & 1 & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} \frac{4}{3} & \frac{1}{3} & -1 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & \frac{1}{2} & \frac{1}{2} & 0 \end{array}\right]$$

Since the current pivot $A(2,2)$ is zero, then the current pivot row is replaced with a row with a non-zero pivot. Swapping row 2 and row 3 gives

$$\left[\begin{array}{ccc|c} \frac{4}{3} & \frac{1}{3} & -1 & 0 \\ 0 & \frac{1}{2} & \frac{1}{2} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} \frac{4}{3} & \frac{1}{3} & -1 \\ 0 & \frac{1}{2} & \frac{1}{2} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t, v_2 = -t\}$

Hence the solution is

$$\begin{bmatrix} t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} t \\ -t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ -t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} \frac{1}{3} & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{4}{3} & 1 \\ -\frac{2}{3} & \frac{1}{3} & 0 \end{bmatrix} - (1) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -\frac{2}{3} & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{7}{3} & 1 \\ -\frac{2}{3} & \frac{1}{3} & -1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -\frac{2}{3} & \frac{1}{3} & -1 & 0 \\ -\frac{4}{3} & -\frac{7}{3} & 1 & 0 \\ -\frac{2}{3} & \frac{1}{3} & -1 & 0 \end{array}\right]$$

$$R_2 = R_2 - 2R_1 \Longrightarrow \left[\begin{array}{ccc|c} -\frac{2}{3} & \frac{1}{3} & -1 & 0 \\ 0 & -3 & 3 & 0 \\ -\frac{2}{3} & \frac{1}{3} & -1 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} -\frac{2}{3} & \frac{1}{3} & -1 & 0 \\ 0 & -3 & 3 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -\frac{2}{3} & \frac{1}{3} & -1 \\ 0 & -3 & 3 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_2 = t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
-1	2	1	Yes	$\begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$
1	1	1	No	$\begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -1 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

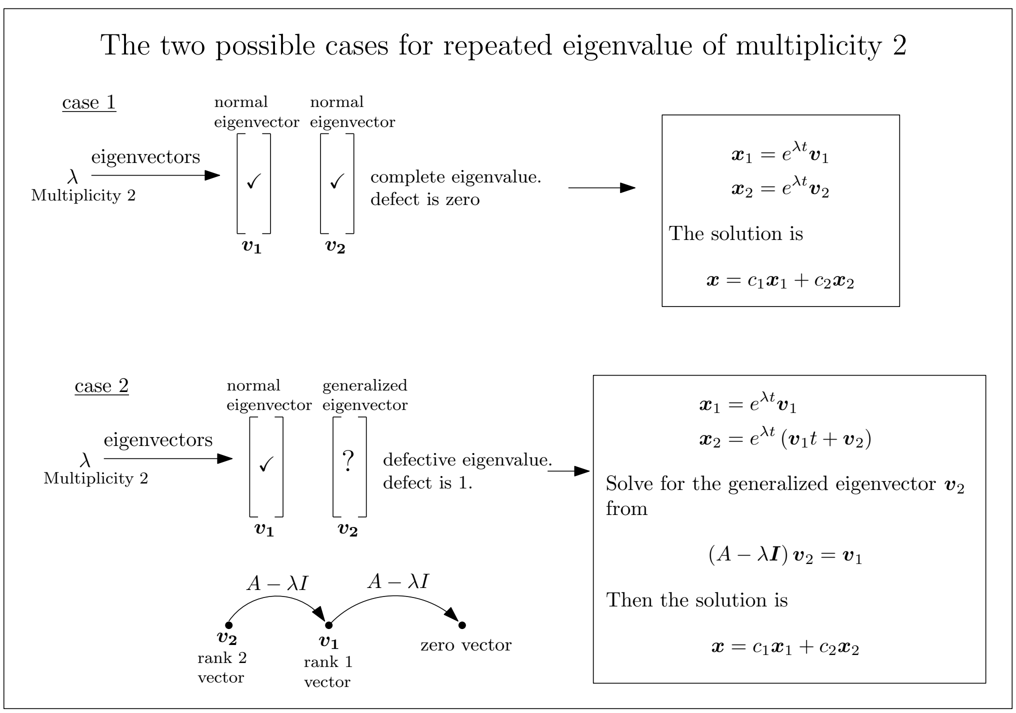

Figure 588: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore

this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} \frac{1}{3} & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{4}{3} & 1 \\ -\frac{2}{3} & \frac{1}{3} & 0 \end{bmatrix} - (-1)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} \frac{4}{3} & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{1}{3} & 1 \\ -\frac{2}{3} & \frac{1}{3} & 1 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue -1. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned} \vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} \mathrm{e}^{-t} \\ &= \begin{bmatrix} \mathrm{e}^{-t} \\ -\mathrm{e}^{-t} \\ \mathrm{e}^{-t} \end{bmatrix} \end{aligned}$$

And

$$
\begin{aligned}
\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\
&= \left(\begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} t + \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} \right) \mathrm{e}^{-t} \\
&= \begin{bmatrix} \mathrm{e}^{-t}(t+1) \\ -\mathrm{e}^{-t}(t-2) \\ \mathrm{e}^{-t}(t+1) \end{bmatrix}
\end{aligned}
$$

Since eigenvalue 1 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_3(t) &= \vec{v}_3 e^{t} \\
&= \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix} e^{t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} \mathrm{e}^{-t} \\ -\mathrm{e}^{-t} \\ \mathrm{e}^{-t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-t}(t+1) \\ \mathrm{e}^{-t}(-t+2) \\ \mathrm{e}^{-t}(t+1) \end{bmatrix} + c_3 \begin{bmatrix} -\mathrm{e}^{t} \\ \mathrm{e}^{t} \\ \mathrm{e}^{t} \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} ((t+1)\, c_2 + c_1)\, \mathrm{e}^{-t} - c_3 \mathrm{e}^{t} \\ ((-t+2)\, c_2 - c_1)\, \mathrm{e}^{-t} + c_3 \mathrm{e}^{t} \\ ((t+1)\, c_2 + c_1)\, \mathrm{e}^{-t} + c_3 \mathrm{e}^{t} \end{bmatrix}
$$

22.9.3 Maple step by step solution

Let's solve

$$\left[y_1'(t)=\frac{y_1(t)}{3}+\frac{y_2(t)}{3}-y_3(t), y_2'(t)=-\frac{4y_1(t)}{3}-\frac{4y_2(t)}{3}+y_3(t), y_3'(t)=-\frac{2y_1(t)}{3}+\frac{y_2(t)}{3}\right]$$

- Define vector

$$\underline{y}^{\rightarrow}(t)=\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t)=\begin{bmatrix} \frac{1}{3} & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{4}{3} & 1 \\ -\frac{2}{3} & \frac{1}{3} & 0 \end{bmatrix}\cdot \underline{y}^{\rightarrow}(t)+\begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t)=\begin{bmatrix} \frac{1}{3} & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{4}{3} & 1 \\ -\frac{2}{3} & \frac{1}{3} & 0 \end{bmatrix}\cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A=\begin{bmatrix} \frac{1}{3} & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{4}{3} & 1 \\ -\frac{2}{3} & \frac{1}{3} & 0 \end{bmatrix}$$

- Rewrite the system as

$$\underline{y}^{\rightarrow\prime}(t)=A\cdot \underline{y}^{\rightarrow}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}\right], \left[-1, \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right], \left[1, \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[-1, \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue -1

$$\underline{y}_1(t) = \mathrm{e}^{-t} \cdot \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = -1$ is the eigenvalue, an

$$\underline{y}_2(t) = \mathrm{e}^{\lambda t}\left(t\vec{v} + \vec{p}\right)$$

- Note that the t multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\underline{y}_2(t)$ into the homogeneous system

$$\lambda\,\mathrm{e}^{\lambda t}\left(t\vec{v} + \vec{p}\right) + \mathrm{e}^{\lambda t}\vec{v} = \left(\mathrm{e}^{\lambda t} A\right) \cdot \left(t\vec{v} + \vec{p}\right)$$

- Use the fact that $\vec{v}$ is an eigenvector of A

$$\lambda\,\mathrm{e}^{\lambda t}\left(t\vec{v} + \vec{p}\right) + \mathrm{e}^{\lambda t}\vec{v} = \mathrm{e}^{\lambda t}\left(\lambda t\vec{v} + A \cdot \vec{p}\right)$$

- Simplify equation

$$\lambda\vec{p} + \vec{v} = A \cdot \vec{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$$

- Condition $\vec{p}$ must meet for $\underline{y}_2(t)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue -1

$$\left(\left[\begin{array}{ccc} \frac{1}{3} & \frac{1}{3} & -1 \\ -\frac{4}{3} & -\frac{4}{3} & 1 \\ -\frac{2}{3} & \frac{1}{3} & 0 \end{array}\right] - (-1) \cdot \left[\begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{array}\right]\right) \cdot \vec{p} = \left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$$

- Choice of $\vec{p}$

$$\vec{p} = \begin{bmatrix} \frac{3}{4} \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue -1

$$\vec{y}_2(t) = \mathrm{e}^{-t} \cdot \left(t \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} + \begin{bmatrix} \frac{3}{4} \\ 0 \\ 0 \end{bmatrix} \right)$$

- Consider eigenpair

$$\left[1, \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\vec{y}_3 = \mathrm{e}^{t} \cdot \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\vec{y} = c_1 \vec{y}_1(t) + c_2 \vec{y}_2(t) + c_3 \vec{y}_3$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 \mathrm{e}^{-t} \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} + c_2 \mathrm{e}^{-t} \cdot \left(t \cdot \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} + \begin{bmatrix} \frac{3}{4} \\ 0 \\ 0 \end{bmatrix} \right) + c_3 \mathrm{e}^{t} \cdot \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \frac{(c_2(4t+3)+4c_1)\mathrm{e}^{-t}}{4} - c_3 \mathrm{e}^{t} \\ (-c_2 t - c_1)\,\mathrm{e}^{-t} + c_3 \mathrm{e}^{t} \\ (c_2 t + c_1)\,\mathrm{e}^{-t} + c_3 \mathrm{e}^{t} \end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{y_1(t) = \frac{(c_2(4t+3)+4c_1)\mathrm{e}^{-t}}{4} - c_3 \mathrm{e}^{t}, y_2(t) = (-c_2 t - c_1)\,\mathrm{e}^{-t} + c_3 \mathrm{e}^{t}, y_3(t) = (c_2 t + c_1)\,\mathrm{e}^{-t} + c_3 \mathrm{e}^{t}\right\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -y_1(t) + y_2(t) - y_3(t) \\
y_2'(t) &= -2y_1(t) + 2y_3(t) \\
y_3'(t) &= -y_1(t) + 3y_2(t) - y_3(t)
\end{aligned}
$$

22.10.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -1 & 1 & -1 \\ -2 & 0 & 2 \\ -1 & 3 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} e^{-2t}(t+1) & t\,e^{-2t} & -t\,e^{-2t} \\ \frac{e^{-2t}}{2} - \frac{e^{2t}}{2} & \frac{e^{-2t}}{2} + \frac{e^{2t}}{2} & -\frac{e^{-2t}}{2} + \frac{e^{2t}}{2} \\ t\,e^{-2t} + \frac{e^{-2t}}{2} - \frac{e^{2t}}{2} & t\,e^{-2t} - \frac{e^{-2t}}{2} + \frac{e^{2t}}{2} & \frac{e^{-2t}}{2} - t\,e^{-2t} + \frac{e^{2t}}{2} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{-2t}(t+1) & t\,e^{-2t} & -t\,e^{-2t} \\ \frac{e^{-2t}}{2} - \frac{e^{2t}}{2} & \frac{e^{-2t}}{2} + \frac{e^{2t}}{2} & -\frac{e^{-2t}}{2} + \frac{e^{2t}}{2} \\ t\,e^{-2t} + \frac{e^{-2t}}{2} - \frac{e^{2t}}{2} & t\,e^{-2t} - \frac{e^{-2t}}{2} + \frac{e^{2t}}{2} & \frac{e^{-2t}}{2} - t\,e^{-2t} + \frac{e^{2t}}{2} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} e^{-2t}(t+1)\,c_1 + t\,e^{-2t}c_2 - t\,e^{-2t}c_3 \\ \left(\frac{e^{-2t}}{2} - \frac{e^{2t}}{2}\right)c_1 + \left(\frac{e^{-2t}}{2} + \frac{e^{2t}}{2}\right)c_2 + \left(-\frac{e^{-2t}}{2} + \frac{e^{2t}}{2}\right)c_3 \\ \left(t\,e^{-2t} + \frac{e^{-2t}}{2} - \frac{e^{2t}}{2}\right)c_1 + \left(t\,e^{-2t} - \frac{e^{-2t}}{2} + \frac{e^{2t}}{2}\right)c_2 + \left(\frac{e^{-2t}}{2} - t\,e^{-2t} + \frac{e^{2t}}{2}\right)c_3 \end{bmatrix} \\
&= \begin{bmatrix} ((c_1 + c_2 - c_3)\,t + c_1)\,e^{-2t} \\ \frac{(c_1+c_2-c_3)e^{-2t}}{2} - \frac{e^{2t}(c_1-c_2-c_3)}{2} \\ \frac{(c_1(1+2t)+2\left(t-\frac{1}{2}\right)(c_2-c_3))e^{-2t}}{2} - \frac{e^{2t}(c_1-c_2-c_3)}{2} \end{bmatrix}
\end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.10.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -1 & 1 & -1 \\ -2 & 0 & 2 \\ -1 & 3 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -1 & 1 & -1 \\ -2 & 0 & 2 \\ -1 & 3 & -1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -1-\lambda & 1 & -1 \\ -2 & -\lambda & 2 \\ -1 & 3 & -1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + 2\lambda^2 - 4\lambda - 8 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -2$$
$$\lambda_2 = 2$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-2	1	real eigenvalue
2	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -1 & 1 & -1 \\ -2 & 0 & 2 \\ -1 & 3 & -1 \end{bmatrix} - (-2) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 1 & -1 \\ -2 & 2 & 2 \\ -1 & 3 & 1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 1 & 1 & -1 & 0 \\ -2 & 2 & 2 & 0 \\ -1 & 3 & 1 & 0 \end{array}\right]$$

$$R_2 = R_2 + 2R_1 \implies \left[\begin{array}{ccc|c} 1 & 1 & -1 & 0 \\ 0 & 4 & 0 & 0 \\ -1 & 3 & 1 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_1 \implies \left[\begin{array}{ccc|c} 1 & 1 & -1 & 0 \\ 0 & 4 & 0 & 0 \\ 0 & 4 & 0 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_2 \implies \left[\begin{array}{ccc|c} 1 & 1 & -1 & 0 \\ 0 & 4 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 1 & 1 & -1 \\ 0 & 4 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t, v_2 = 0\}$

Hence the solution is

$$\begin{bmatrix} t \\ 0 \\ t \end{bmatrix} = \begin{bmatrix} t \\ 0 \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ 0 \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}$$

Let $t=1$ the eigenvector becomes

$$\begin{bmatrix} t \\ 0 \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -1 & 1 & -1 \\ -2 & 0 & 2 \\ -1 & 3 & -1 \end{bmatrix} - (2) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -3 & 1 & -1 \\ -2 & -2 & 2 \\ -1 & 3 & -3 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -3 & 1 & -1 & 0 \\ -2 & -2 & 2 & 0 \\ -1 & 3 & -3 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{2R_1}{3} \Longrightarrow \left[\begin{array}{ccc|c} -3 & 1 & -1 & 0 \\ 0 & -\frac{8}{3} & \frac{8}{3} & 0 \\ -1 & 3 & -3 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{R_1}{3} \Longrightarrow \left[\begin{array}{ccc|c} -3 & 1 & -1 & 0 \\ 0 & -\frac{8}{3} & \frac{8}{3} & 0 \\ 0 & \frac{8}{3} & -\frac{8}{3} & 0 \end{array}\right]$$

$$R_3 = R_3 + R_2 \Longrightarrow \left[\begin{array}{ccc|c} -3 & 1 & -1 & 0 \\ 0 & -\frac{8}{3} & \frac{8}{3} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -3 & 1 & -1 \\ 0 & -\frac{8}{3} & \frac{8}{3} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 0, v_2 = t\}$

Hence the solution is

$$\begin{bmatrix} 0 \\ t \\ t \end{bmatrix} = \begin{bmatrix} 0 \\ t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} 0 \\ t \\ t \end{bmatrix} = t \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} 0 \\ t \\ t \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
-2	2	1	Yes	$\begin{bmatrix}1\\0\\1\end{bmatrix}$
2	1	1	No	$\begin{bmatrix}0\\1\\1\end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -2 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

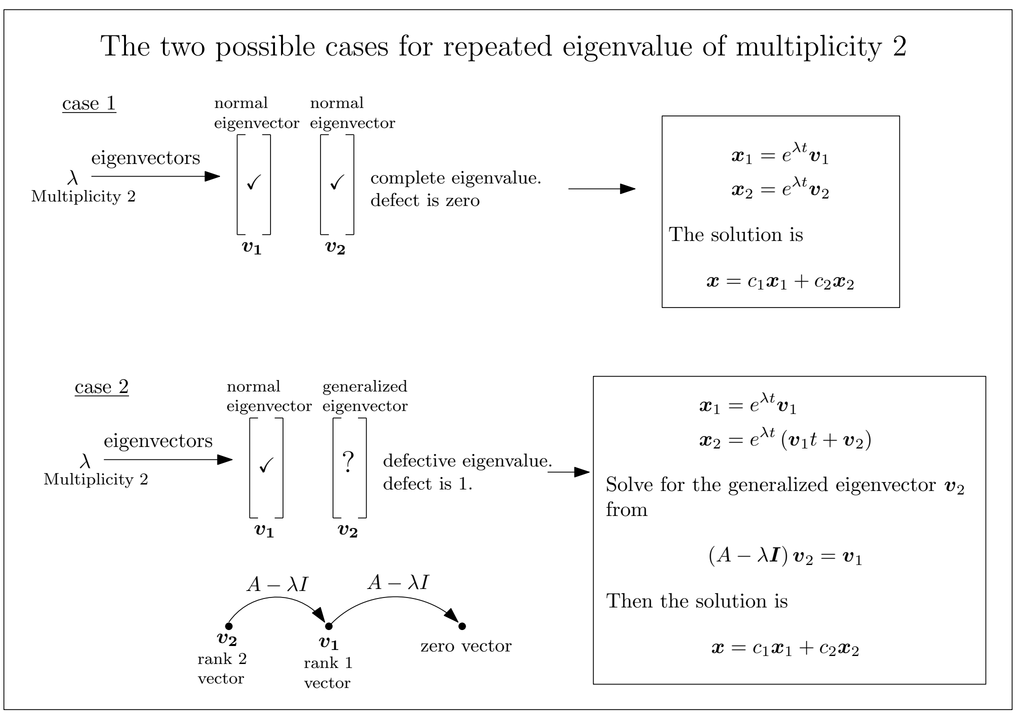

Figure 589: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore

this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} -1 & 1 & -1 \\ -2 & 0 & 2 \\ -1 & 3 & -1 \end{bmatrix} - (-2)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}$$
$$\begin{bmatrix} 1 & 1 & -1 \\ -2 & 2 & 2 \\ -1 & 3 & 1 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} \frac{3}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue -2. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned} \vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} \mathrm{e}^{-2t} \\ &= \begin{bmatrix} \mathrm{e}^{-2t} \\ 0 \\ \mathrm{e}^{-2t} \end{bmatrix} \end{aligned}$$

And

$$
\begin{aligned}
\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\
&= \left(\begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} t + \begin{bmatrix} \frac{3}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix} \right) \mathrm{e}^{-2t} \\
&= \begin{bmatrix} \frac{\mathrm{e}^{-2t}(2t+3)}{2} \\ \frac{\mathrm{e}^{-2t}}{2} \\ \mathrm{e}^{-2t}(t+1) \end{bmatrix}
\end{aligned}
$$

Since eigenvalue 2 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_3(t) &= \vec{v}_3 e^{2t} \\
&= \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} e^{2t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} \mathrm{e}^{-2t} \\ 0 \\ \mathrm{e}^{-2t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-2t}\left(t + \frac{3}{2}\right) \\ \frac{\mathrm{e}^{-2t}}{2} \\ \mathrm{e}^{-2t}(t+1) \end{bmatrix} + c_3 \begin{bmatrix} 0 \\ \mathrm{e}^{2t} \\ \mathrm{e}^{2t} \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \mathrm{e}^{-2t}\left(c_1 + c_2 t + \frac{3}{2} c_2\right) \\ \frac{c_2 \mathrm{e}^{-2t}}{2} + c_3 \mathrm{e}^{2t} \\ \left((t+1)\, c_2 + c_1\right) \mathrm{e}^{-2t} + c_3 \mathrm{e}^{2t} \end{bmatrix}
$$

22.10.3 Maple step by step solution

Let's solve

$[y_1'(t) = -y_1(t) + y_2(t) - y_3(t), y_2'(t) = -2y_1(t) + 2y_3(t), y_3'(t) = -y_1(t) + 3y_2(t) - y_3(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -1 & 1 & -1 \\ -2 & 0 & 2 \\ -1 & 3 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -1 & 1 & -1 \\ -2 & 0 & 2 \\ -1 & 3 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -1 & 1 & -1 \\ -2 & 0 & 2 \\ -1 & 3 & -1 \end{bmatrix}$$

- Rewrite the system as

$\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}\right], \left[-2, \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right], \left[2, \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[-2, \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue -2

$$\vec{y}_1(t) = e^{-2t} \cdot \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\vec{p}$ is to be solved for, $\lambda = -2$ is the eigenvalue, an

$$\vec{y}_2(t) = e^{\lambda t}\left(t\vec{v} + \vec{p}\right)$$

- Note that the t multiplying $\vec{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\vec{y}_2(t)$ into the homogeneous system

$$\lambda e^{\lambda t}\left(t\vec{v} + \vec{p}\right) + e^{\lambda t}\vec{v} = \left(e^{\lambda t} A\right) \cdot \left(t\vec{v} + \vec{p}\right)$$

- Use the fact that $\vec{v}$ is an eigenvector of A

$$\lambda e^{\lambda t}\left(t\vec{v} + \vec{p}\right) + e^{\lambda t}\vec{v} = e^{\lambda t}\left(\lambda t\vec{v} + A \cdot \vec{p}\right)$$

- Simplify equation

$$\lambda\vec{p} + \vec{v} = A \cdot \vec{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \vec{p} + \vec{v} = A \cdot \vec{p}$$

- Condition $\vec{p}$ must meet for $\vec{y}_2(t)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \vec{p} = \vec{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue -2

$$\left(\begin{bmatrix} -1 & 1 & -1 \\ -2 & 0 & 2 \\ -1 & 3 & -1 \end{bmatrix} - (-2) \cdot \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \cdot \vec{p} = \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}$$

- Choice of $\vec{p}$

$$\vec{p} = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue -2

$$\underline{y^{\rightarrow}}_2(t) = e^{-2t} \cdot \left(t \cdot \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} + \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right)$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} \right]$$

- Solution to homogeneous system from eigenpair

$$\underline{y^{\rightarrow}}_3 = e^{2t} \cdot \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

- General solution to the system of ODEs

$$\underline{y^{\rightarrow}} = c_1 \underline{y^{\rightarrow}}_1(t) + c_2 \underline{y^{\rightarrow}}_2(t) + c_3 \underline{y^{\rightarrow}}_3$$

- Substitute solutions into the general solution

$$\underline{y^{\rightarrow}} = c_1 e^{-2t} \cdot \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} + e^{-2t} c_2 \cdot \left(t \cdot \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix} + \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} \right) + c_3 e^{2t} \cdot \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} e^{-2t}(c_2 t + c_1 + c_2) \\ c_3 e^{2t} \\ e^{-2t}(c_2 t + c_1) + c_3 e^{2t} \end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{ y_1(t) = e^{-2t}(c_2 t + c_1 + c_2), y_2(t) = c_3 e^{2t}, y_3(t) = e^{-2t}(c_2 t + c_1) + c_3 e^{2t} \right\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= 4y_1(t) - 2y_2(t) - 2y_3(t) \\
y_2'(t) &= -2y_1(t) + 3y_2(t) - y_3(t) \\
y_3'(t) &= 2y_1(t) - y_2(t) + 3y_3(t)
\end{aligned}
$$

22.11.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 4 & -2 & -2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} e^{4t} & -e^{4t} + e^{2t} & -e^{4t} + e^{2t} \\ -2t\, e^{4t} & \frac{3\, e^{2t}}{2} + 2t\, e^{4t} - \frac{e^{4t}}{2} & 2t\, e^{4t} - \frac{3\, e^{4t}}{2} + \frac{3\, e^{2t}}{2} \\ 2t\, e^{4t} & -2t\, e^{4t} + \frac{e^{4t}}{2} - \frac{e^{2t}}{2} & -2t\, e^{4t} + \frac{3\, e^{4t}}{2} - \frac{e^{2t}}{2} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{4t} & -e^{4t} + e^{2t} & -e^{4t} + e^{2t} \\ -2t\, e^{4t} & \frac{3\, e^{2t}}{2} + 2t\, e^{4t} - \frac{e^{4t}}{2} & 2t\, e^{4t} - \frac{3\, e^{4t}}{2} + \frac{3\, e^{2t}}{2} \\ 2t\, e^{4t} & -2t\, e^{4t} + \frac{e^{4t}}{2} - \frac{e^{2t}}{2} & -2t\, e^{4t} + \frac{3\, e^{4t}}{2} - \frac{e^{2t}}{2} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} e^{4t} c_1 + \left(-e^{4t} + e^{2t}\right) c_2 + \left(-e^{4t} + e^{2t}\right) c_3 \\ -2t\, e^{4t} c_1 + \left(\frac{3\, e^{2t}}{2} + 2t\, e^{4t} - \frac{e^{4t}}{2}\right) c_2 + \left(2t\, e^{4t} - \frac{3\, e^{4t}}{2} + \frac{3\, e^{2t}}{2}\right) c_3 \\ 2t\, e^{4t} c_1 + \left(-2t\, e^{4t} + \frac{e^{4t}}{2} - \frac{e^{2t}}{2}\right) c_2 + \left(-2t\, e^{4t} + \frac{3\, e^{4t}}{2} - \frac{e^{2t}}{2}\right) c_3 \end{bmatrix} \\
&= \begin{bmatrix} e^{4t}(c_1 - c_2 - c_3) + e^{2t}(c_2 + c_3) \\ \frac{((-1+4t)c_2 + (-3+4t)c_3 - 4c_1 t)e^{4t}}{2} + \frac{3\, e^{2t}(c_2+c_3)}{2} \\ \frac{((1-4t)c_2 + (-4t+3)c_3 + 4c_1 t)e^{4t}}{2} - \frac{e^{2t}(c_2+c_3)}{2} \end{bmatrix}
\end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.11.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\, \vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 4 & -2 & -2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix}4 & -2 & -2\\ -2 & 3 & -1\\ 2 & -1 & 3\end{bmatrix} - \lambda\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix}4-\lambda & -2 & -2\\ -2 & 3-\lambda & -1\\ 2 & -1 & 3-\lambda\end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 10\lambda^2 + 32\lambda - 32 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 4$$
$$\lambda_2 = 2$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
2	1	real eigenvalue
4	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix}4 & -2 & -2\\ -2 & 3 & -1\\ 2 & -1 & 3\end{bmatrix} - (2)\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{bmatrix}\right)\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix} = \begin{bmatrix}0\\ 0\\ 0\end{bmatrix}$$

$$\begin{bmatrix}2 & -2 & -2\\ -2 & 1 & -1\\ 2 & -1 & 1\end{bmatrix}\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix} = \begin{bmatrix}0\\ 0\\ 0\end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 2 & -2 & -2 & 0 \\ -2 & 1 & -1 & 0 \\ 2 & -1 & 1 & 0 \end{array}\right]$$

$$R_2 = R_2 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} 2 & -2 & -2 & 0 \\ 0 & -1 & -3 & 0 \\ 2 & -1 & 1 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} 2 & -2 & -2 & 0 \\ 0 & -1 & -3 & 0 \\ 0 & 1 & 3 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_2 \Longrightarrow \left[\begin{array}{ccc|c} 2 & -2 & -2 & 0 \\ 0 & -1 & -3 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 2 & -2 & -2 \\ 0 & -1 & -3 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -2t, v_2 = -3t\}$

Hence the solution is

$$\begin{bmatrix} -2t \\ -3t \\ t \end{bmatrix} = \begin{bmatrix} -2t \\ -3t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -2t \\ -3t \\ t \end{bmatrix} = t \begin{bmatrix} -2 \\ -3 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -2t \\ -3t \\ t \end{bmatrix} = \begin{bmatrix} -2 \\ -3 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 4$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 4 & -2 & -2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix} - (4) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 & -2 & -2 \\ -2 & -1 & -1 \\ 2 & -1 & -1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 0 & -2 & -2 & 0 \\ -2 & -1 & -1 & 0 \\ 2 & -1 & -1 & 0 \end{array}\right]$$

Since the current pivot $A(1,1)$ is zero, then the current pivot row is replaced with a row with a non-zero pivot. Swapping row 1 and row 2 gives

$$\left[\begin{array}{ccc|c} -2 & -1 & -1 & 0 \\ 0 & -2 & -2 & 0 \\ 2 & -1 & -1 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} -2 & -1 & -1 & 0 \\ 0 & -2 & -2 & 0 \\ 0 & -2 & -2 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_2 \Longrightarrow \left[\begin{array}{ccc|c} -2 & -1 & -1 & 0 \\ 0 & -2 & -2 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$
\begin{bmatrix} -2 & -1 & -1 \\ 0 & -2 & -2 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}
$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 0, v_2 = -t\}$

Hence the solution is

$$
\begin{bmatrix} 0 \\ -t \\ t \end{bmatrix} = \begin{bmatrix} 0 \\ -t \\ t \end{bmatrix}
$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$
\begin{bmatrix} 0 \\ -t \\ t \end{bmatrix} = t \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}
$$

Let $t = 1$ the eigenvector becomes

$$
\begin{bmatrix} 0 \\ -t \\ t \end{bmatrix} = \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}
$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity algebraic m	multiplicity geometric k	defective?	eigenvectors
4	2	1	Yes	$\begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}$
2	1	1	No	$\begin{bmatrix} -2 \\ -3 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue 4 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

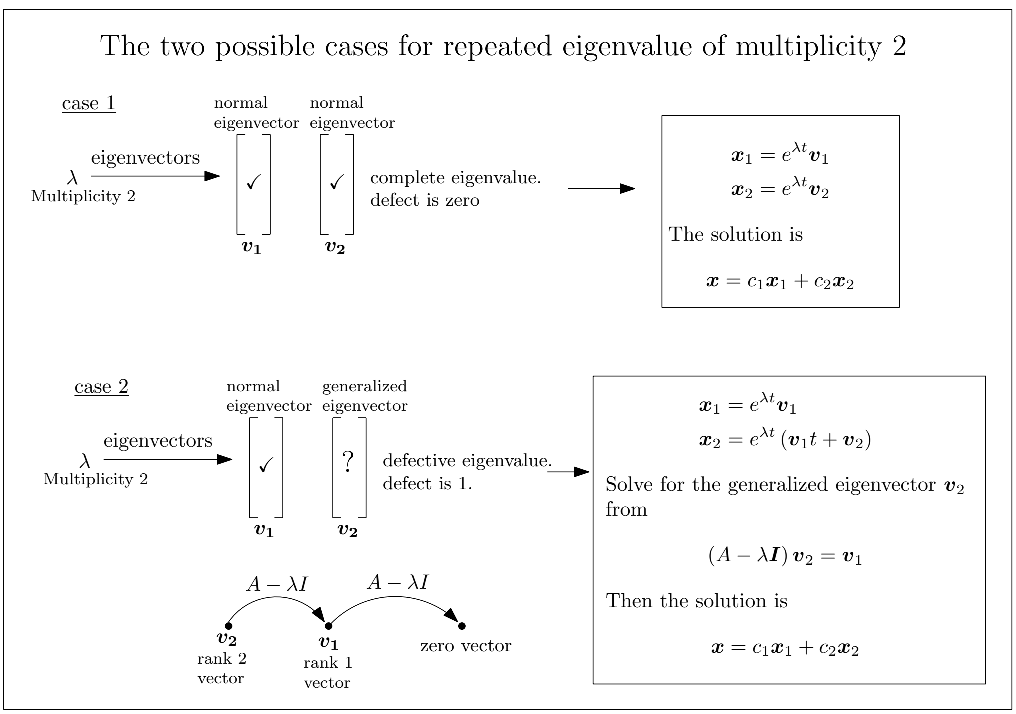

Figure 590: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore

this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} 4 & -2 & -2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix} - (4)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} 0 & -2 & -2 \\ -2 & -1 & -1 \\ 2 & -1 & -1 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} \frac{1}{2} \\ -1 \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue 4. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned} \vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix} \mathrm{e}^{4t} \\ &= \begin{bmatrix} 0 \\ -\mathrm{e}^{4t} \\ \mathrm{e}^{4t} \end{bmatrix} \end{aligned}$$

And

$$
\begin{aligned}
\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\
&= \left(\begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix} t + \begin{bmatrix} \frac{1}{2} \\ -1 \\ 1 \end{bmatrix} \right) \mathrm{e}^{4t} \\
&= \begin{bmatrix} \frac{\mathrm{e}^{4t}}{2} \\ -\mathrm{e}^{4t}(t+1) \\ \mathrm{e}^{4t}(t+1) \end{bmatrix}
\end{aligned}
$$

Since eigenvalue 2 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_3(t) &= \vec{v}_3 e^{2t} \\
&= \begin{bmatrix} -2 \\ -3 \\ 1 \end{bmatrix} e^{2t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} 0 \\ -\mathrm{e}^{4t} \\ \mathrm{e}^{4t} \end{bmatrix} + c_2 \begin{bmatrix} \frac{\mathrm{e}^{4t}}{2} \\ \mathrm{e}^{4t}(-t-1) \\ \mathrm{e}^{4t}(t+1) \end{bmatrix} + c_3 \begin{bmatrix} -2\,\mathrm{e}^{2t} \\ -3\,\mathrm{e}^{2t} \\ \mathrm{e}^{2t} \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \frac{c_2 \mathrm{e}^{4t}}{2} - 2c_3 \mathrm{e}^{2t} \\ ((-t-1)\, c_2 - c_1)\, \mathrm{e}^{4t} - 3c_3 \mathrm{e}^{2t} \\ ((t+1)\, c_2 + c_1)\, \mathrm{e}^{4t} + c_3 \mathrm{e}^{2t} \end{bmatrix}
$$

22.11.3 Maple step by step solution

Let's solve

$[y_1'(t) = 4y_1(t) - 2y_2(t) - 2y_3(t), y_2'(t) = -2y_1(t) + 3y_2(t) - y_3(t), y_3'(t) = 2y_1(t) - y_2(t) + 3y_3(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 4 & -2 & -2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 4 & -2 & -2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 4 & -2 & -2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix}$$

- Rewrite the system as

$\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[2, \begin{bmatrix} -2 \\ -3 \\ 1 \end{bmatrix}\right], \left[4, \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}\right], \left[4, \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[2, \left[\begin{array}{c} -2 \\ -3 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\overrightarrow{y}_{1} = \mathrm{e}^{2t} \cdot \left[\begin{array}{c} -2 \\ -3 \\ 1 \end{array}\right]$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[4, \left[\begin{array}{c} 0 \\ -1 \\ 1 \end{array}\right]\right]$$

- First solution from eigenvalue 4

$$\overrightarrow{y}_{2}(t) = \mathrm{e}^{4t} \cdot \left[\begin{array}{c} 0 \\ -1 \\ 1 \end{array}\right]$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 4$ is the eigenvalue, and

$$\overrightarrow{y}_{3}(t) = \mathrm{e}^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the t multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\overrightarrow{y}_{3}(t)$ into the homogeneous system

$$\lambda\,\mathrm{e}^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda t}\overrightarrow{v} = \left(\mathrm{e}^{\lambda t}A\right) \cdot \left(t\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda\,\mathrm{e}^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda t}\overrightarrow{v} = \mathrm{e}^{\lambda t}\left(\lambda t\overrightarrow{v} + A \cdot \overrightarrow{p}\right)$$

- Simplify equation

$$\lambda\overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Condition $\overrightarrow{p}$ must meet for $\overrightarrow{y}_{3}(t)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \overrightarrow{p} = \overrightarrow{v}$$

- Choose $\overrightarrow{p}$ to use in the second solution to the homogeneous system from eigenvalue 4

$$\left(\begin{bmatrix} 4 & -2 & -2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix} - 4 \cdot \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \cdot \overrightarrow{p} = \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}$$

- Choice of $\overrightarrow{p}$

$$\overrightarrow{p} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- Second solution from eigenvalue 4

$$\underline{\overrightarrow{y}}_3(t) = \mathrm{e}^{4t} \cdot \left(t \cdot \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right)$$

- General solution to the system of ODEs

$\underline{\overrightarrow{y}} = c_1 \underline{\overrightarrow{y}}_1 + c_2 \underline{\overrightarrow{y}}_2(t) + c_3 \underline{\overrightarrow{y}}_3(t)$

- Substitute solutions into the general solution

$$\underline{\overrightarrow{y}} = c_1 \mathrm{e}^{2t} \cdot \begin{bmatrix} -2 \\ -3 \\ 1 \end{bmatrix} + c_2 \mathrm{e}^{4t} \cdot \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix} + c_3 \mathrm{e}^{4t} \cdot \left(t \cdot \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right)$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -2c_1 \mathrm{e}^{2t} \\ (-c_3 t - c_2)\,\mathrm{e}^{4t} - 3c_1 \mathrm{e}^{2t} \\ (c_3 t + c_2)\,\mathrm{e}^{4t} + c_1 \mathrm{e}^{2t} \end{bmatrix}$$

- Solution to the system of ODEs

$\{y_1(t) = -2c_1 \mathrm{e}^{2t}, y_2(t) = (-c_3 t - c_2)\,\mathrm{e}^{4t} - 3c_1 \mathrm{e}^{2t}, y_3(t) = (c_3 t + c_2)\,\mathrm{e}^{4t} + c_1 \mathrm{e}^{2t}\}$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= 6y_1(t) - 5y_2(t) + 3y_3(t)\\
y_2'(t) &= 2y_1(t) - y_2(t) + 3y_3(t)\\
y_3'(t) &= 2y_1(t) + y_2(t) + y_3(t)
\end{aligned}
$$

22.12.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 6 & -5 & 3 \\ 2 & -1 & 3 \\ 2 & 1 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} e^{4t}(1+2t) & -2t\,e^{4t} - \frac{e^{4t}}{2} + \frac{e^{-2t}}{2} & \frac{e^{4t}}{2} - \frac{e^{-2t}}{2} \\ 2t\,e^{4t} & \frac{e^{-2t}}{2} - 2t\,e^{4t} + \frac{e^{4t}}{2} & \frac{e^{4t}}{2} - \frac{e^{-2t}}{2} \\ 2t\,e^{4t} & -2t\,e^{4t} + \frac{e^{4t}}{2} - \frac{e^{-2t}}{2} & \frac{e^{-2t}}{2} + \frac{e^{4t}}{2} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned} \vec{x}_h(t) &= e^{At}\vec{c} \\ &= \begin{bmatrix} e^{4t}(1+2t) & -2t\,e^{4t} - \frac{e^{4t}}{2} + \frac{e^{-2t}}{2} & \frac{e^{4t}}{2} - \frac{e^{-2t}}{2} \\ 2t\,e^{4t} & \frac{e^{-2t}}{2} - 2t\,e^{4t} + \frac{e^{4t}}{2} & \frac{e^{4t}}{2} - \frac{e^{-2t}}{2} \\ 2t\,e^{4t} & -2t\,e^{4t} + \frac{e^{4t}}{2} - \frac{e^{-2t}}{2} & \frac{e^{-2t}}{2} + \frac{e^{4t}}{2} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\ &= \begin{bmatrix} e^{4t}(1+2t)\,c_1 + \left(-2t\,e^{4t} - \frac{e^{4t}}{2} + \frac{e^{-2t}}{2}\right) c_2 + \left(\frac{e^{4t}}{2} - \frac{e^{-2t}}{2}\right) c_3 \\ 2t\,e^{4t} c_1 + \left(\frac{e^{-2t}}{2} - 2t\,e^{4t} + \frac{e^{4t}}{2}\right) c_2 + \left(\frac{e^{4t}}{2} - \frac{e^{-2t}}{2}\right) c_3 \\ 2t\,e^{4t} c_1 + \left(-2t\,e^{4t} + \frac{e^{4t}}{2} - \frac{e^{-2t}}{2}\right) c_2 + \left(\frac{e^{-2t}}{2} + \frac{e^{4t}}{2}\right) c_3 \end{bmatrix} \\ &= \begin{bmatrix} \frac{((-4t-1)c_2+(4t+2)c_1+c_3)e^{4t}}{2} + \frac{e^{-2t}(c_2-c_3)}{2} \\ \frac{((1-4t)c_2+4c_1t+c_3)e^{4t}}{2} + \frac{e^{-2t}(c_2-c_3)}{2} \\ \frac{((1-4t)c_2+4c_1t+c_3)e^{4t}}{2} - \frac{e^{-2t}(c_2-c_3)}{2} \end{bmatrix} \end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.12.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 6 & -5 & 3 \\ 2 & -1 & 3 \\ 2 & 1 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 6 & -5 & 3 \\ 2 & -1 & 3 \\ 2 & 1 & 1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 6-\lambda & -5 & 3 \\ 2 & -1-\lambda & 3 \\ 2 & 1 & 1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 6\lambda^2 + 32 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 4$$
$$\lambda_2 = -2$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-2	1	real eigenvalue
4	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 6 & -5 & 3 \\ 2 & -1 & 3 \\ 2 & 1 & 1 \end{bmatrix} - (-2) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 8 & -5 & 3 \\ 2 & 1 & 3 \\ 2 & 1 & 3 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 8 & -5 & 3 & 0 \\ 2 & 1 & 3 & 0 \\ 2 & 1 & 3 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{4} \Longrightarrow \left[\begin{array}{ccc|c} 8 & -5 & 3 & 0 \\ 0 & \frac{9}{4} & \frac{9}{4} & 0 \\ 2 & 1 & 3 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{R_1}{4} \Longrightarrow \left[\begin{array}{ccc|c} 8 & -5 & 3 & 0 \\ 0 & \frac{9}{4} & \frac{9}{4} & 0 \\ 0 & \frac{9}{4} & \frac{9}{4} & 0 \end{array}\right]$$

$$R_3 = R_3 - R_2 \Longrightarrow \left[\begin{array}{ccc|c} 8 & -5 & 3 & 0 \\ 0 & \frac{9}{4} & \frac{9}{4} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 8 & -5 & 3 \\ 0 & \frac{9}{4} & \frac{9}{4} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_2 = -t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ -t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 4$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 6 & -5 & 3 \\ 2 & -1 & 3 \\ 2 & 1 & 1 \end{bmatrix} - (4) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 2 & -5 & 3 \\ 2 & -5 & 3 \\ 2 & 1 & -3 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 2 & -5 & 3 & 0 \\ 2 & -5 & 3 & 0 \\ 2 & 1 & -3 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} 2 & -5 & 3 & 0 \\ 0 & 0 & 0 & 0 \\ 2 & 1 & -3 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} 2 & -5 & 3 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 6 & -6 & 0 \end{array}\right]$$

Since the current pivot $A(2,2)$ is zero, then the current pivot row is replaced with a row with a non-zero pivot. Swapping row 2 and row 3 gives

$$\left[\begin{array}{ccc|c} 2 & -5 & 3 & 0 \\ 0 & 6 & -6 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 2 & -5 & 3 \\ 0 & 6 & -6 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t, v_2 = t\}$

Hence the solution is

$$\begin{bmatrix} t \\ t \\ t \end{bmatrix} = \begin{bmatrix} t \\ t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
4	2	1	Yes	$\begin{bmatrix}1\\1\\1\end{bmatrix}$
-2	1	1	No	$\begin{bmatrix}-1\\-1\\1\end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue 4 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

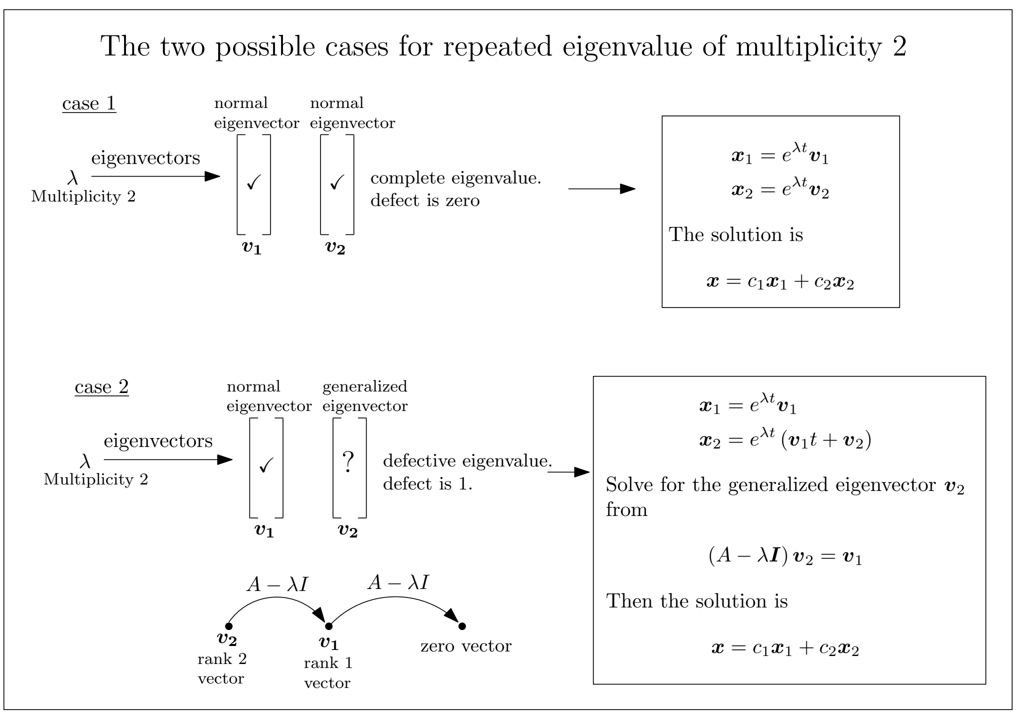

Figure 591: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore

this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} 6 & -5 & 3 \\ 2 & -1 & 3 \\ 2 & 1 & 1 \end{bmatrix} - (4)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} 2 & -5 & 3 \\ 2 & -5 & 3 \\ 2 & 1 & -3 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} \frac{3}{2} \\ 1 \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue 4. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned} \vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} \mathrm{e}^{4t} \\ &= \begin{bmatrix} \mathrm{e}^{4t} \\ \mathrm{e}^{4t} \\ \mathrm{e}^{4t} \end{bmatrix} \end{aligned}$$

And

$$
\begin{aligned}
\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\
&= \left(\begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} t + \begin{bmatrix} \frac{3}{2} \\ 1 \\ 1 \end{bmatrix} \right) \mathrm{e}^{4t} \\
&= \begin{bmatrix} \frac{\mathrm{e}^{4t}(2t+3)}{2} \\ \mathrm{e}^{4t}(t+1) \\ \mathrm{e}^{4t}(t+1) \end{bmatrix}
\end{aligned}
$$

Since eigenvalue -2 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_3(t) &= \vec{v}_3 e^{-2t} \\
&= \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix} e^{-2t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} \mathrm{e}^{4t} \\ \mathrm{e}^{4t} \\ \mathrm{e}^{4t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{4t}\left(t+\frac{3}{2}\right) \\ \mathrm{e}^{4t}(t+1) \\ \mathrm{e}^{4t}(t+1) \end{bmatrix} + c_3 \begin{bmatrix} -\mathrm{e}^{-2t} \\ -\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \frac{((2t+3)c_2+2c_1)\mathrm{e}^{4t}}{2} - c_3 \mathrm{e}^{-2t} \\ ((t+1)\, c_2 + c_1)\, \mathrm{e}^{4t} - c_3 \mathrm{e}^{-2t} \\ ((t+1)\, c_2 + c_1)\, \mathrm{e}^{4t} + c_3 \mathrm{e}^{-2t} \end{bmatrix}
$$

22.12.3 Maple step by step solution

Let's solve

$[y_1'(t) = 6y_1(t) - 5y_2(t) + 3y_3(t), y_2'(t) = 2y_1(t) - y_2(t) + 3y_3(t), y_3'(t) = 2y_1(t) + y_2(t) + y_3(t)]$

- Define vector

$$\underline{\vec{y}}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{\vec{y}}'(t) = \begin{bmatrix} 6 & -5 & 3 \\ 2 & -1 & 3 \\ 2 & 1 & 1 \end{bmatrix} \cdot \underline{\vec{y}}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{\vec{y}}'(t) = \begin{bmatrix} 6 & -5 & 3 \\ 2 & -1 & 3 \\ 2 & 1 & 1 \end{bmatrix} \cdot \underline{\vec{y}}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 6 & -5 & 3 \\ 2 & -1 & 3 \\ 2 & 1 & 1 \end{bmatrix}$$

- Rewrite the system as

$\underline{\vec{y}}'(t) = A \cdot \underline{\vec{y}}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-2, \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}\right], \left[4, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[4, \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-2, \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\overrightarrow{y}}_1 = \mathrm{e}^{-2t} \cdot \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider eigenpair, with eigenvalue of algebraic multiplicity 2

$$\left[4, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- First solution from eigenvalue 4

$$\underline{\overrightarrow{y}}_2(t) = \mathrm{e}^{4t} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- Form of the 2nd homogeneous solution where $\overrightarrow{p}$ is to be solved for, $\lambda = 4$ is the eigenvalue, and

$$\underline{\overrightarrow{y}}_3(t) = \mathrm{e}^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right)$$

- Note that the t multiplying $\overrightarrow{v}$ makes this solution linearly independent to the 1st solution obtai
- Substitute $\underline{\overrightarrow{y}}_3(t)$ into the homogeneous system

$$\lambda\,\mathrm{e}^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda t}\overrightarrow{v} = \left(\mathrm{e}^{\lambda t}A\right) \cdot \left(t\overrightarrow{v} + \overrightarrow{p}\right)$$

- Use the fact that $\overrightarrow{v}$ is an eigenvector of A

$$\lambda\,\mathrm{e}^{\lambda t}\left(t\overrightarrow{v} + \overrightarrow{p}\right) + \mathrm{e}^{\lambda t}\overrightarrow{v} = \mathrm{e}^{\lambda t}\left(\lambda t\overrightarrow{v} + A \cdot \overrightarrow{p}\right)$$

- Simplify equation

$$\lambda\overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Make use of the identity matrix I

$$(\lambda \cdot I) \cdot \overrightarrow{p} + \overrightarrow{v} = A \cdot \overrightarrow{p}$$

- Condition $\overrightarrow{p}$ must meet for $\underline{\overrightarrow{y}}_3(t)$ to be a solution to the homogeneous system

$$(A - \lambda \cdot I) \cdot \overrightarrow{p} = \overrightarrow{v}$$

- Choose $\vec{p}$ to use in the second solution to the homogeneous system from eigenvalue 4

$$\left(\left[\begin{array}{ccc} 6 & -5 & 3 \\ 2 & -1 & 3 \\ 2 & 1 & 1 \end{array}\right]-4\cdot\left[\begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{array}\right]\right)\cdot\vec{p}=\left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]$$

- Choice of $\vec{p}$

$$\vec{p}=\left[\begin{array}{c} \frac{1}{2} \\ 0 \\ 0 \end{array}\right]$$

- Second solution from eigenvalue 4

$$\vec{y}_3(t)=\mathrm{e}^{4t}\cdot\left(t\cdot\left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]+\left[\begin{array}{c} \frac{1}{2} \\ 0 \\ 0 \end{array}\right]\right)$$

- General solution to the system of ODEs

$$\vec{y}=c_1\vec{y}_1+c_2\vec{y}_2(t)+c_3\vec{y}_3(t)$$

- Substitute solutions into the general solution

$$\vec{y}=c_1\mathrm{e}^{-2t}\cdot\left[\begin{array}{c} -1 \\ -1 \\ 1 \end{array}\right]+c_2\mathrm{e}^{4t}\cdot\left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]+c_3\mathrm{e}^{4t}\cdot\left(t\cdot\left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right]+\left[\begin{array}{c} \frac{1}{2} \\ 0 \\ 0 \end{array}\right]\right)$$

- Substitute in vector of dependent variables

$$\left[\begin{array}{c} y_1(t) \\ y_2(t) \\ y_3(t) \end{array}\right]=\left[\begin{array}{c} \frac{((1+2t)c_3+2c_2)\mathrm{e}^{4t}}{2}-c_1\mathrm{e}^{-2t} \\ (c_3t+c_2)\,\mathrm{e}^{4t}-c_1\mathrm{e}^{-2t} \\ (c_3t+c_2)\,\mathrm{e}^{4t}+c_1\mathrm{e}^{-2t} \end{array}\right]$$

- Solution to the system of ODEs

$$\left\{y_1(t)=\frac{((1+2t)c_3+2c_2)\mathrm{e}^{4t}}{2}-c_1\mathrm{e}^{-2t}, y_2(t)=(c_3t+c_2)\,\mathrm{e}^{4t}-c_1\mathrm{e}^{-2t}, y_3(t)=(c_3t+c_2)\,\mathrm{e}^{4t}+c_1\mathrm{e}^{-2t}\right\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -11y_1(t) + 8y_2(t)\\
y_2'(t) &= -2y_1(t) - 3y_2(t)
\end{aligned}
$$

With initial conditions

$$
[y_1(0) = 6, y_2(0) = 2]
$$

22.13.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -11 & 8 \\ -2 & -3 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} \mathrm{e}^{-7t}(1-4t) & 8t\,\mathrm{e}^{-7t} \\ -2t\,\mathrm{e}^{-7t} & \mathrm{e}^{-7t}(4t+1) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$\begin{aligned}\vec{x}_h(t) &= e^{At}\vec{x}_0 \\ &= \begin{bmatrix} e^{-7t}(1-4t) & 8t\,e^{-7t} \\ -2t\,e^{-7t} & e^{-7t}(4t+1) \end{bmatrix} \begin{bmatrix} 6 \\ 2 \end{bmatrix} \\ &= \begin{bmatrix} 6\,e^{-7t}(1-4t)+16t\,e^{-7t} \\ -12t\,e^{-7t}+2\,e^{-7t}(4t+1) \end{bmatrix} \\ &= \begin{bmatrix} (-8t+6)\,e^{-7t} \\ (-4t+2)\,e^{-7t} \end{bmatrix}\end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.13.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -11 & 8 \\ -2 & -3 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -11 & 8 \\ -2 & -3 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -11-\lambda & 8 \\ -2 & -3-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 + 14\lambda + 49 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -7$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-7	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -7$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -11 & 8 \\ -2 & -3 \end{bmatrix} - (-7)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} -4 & 8 \\ -2 & 4 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -4 & 8 & 0 \\ -2 & 4 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{2} \Longrightarrow \left[\begin{array}{cc|c} -4 & 8 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -4 & 8 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 2t\}$

Hence the solution is

$$\begin{bmatrix} 2t \\ t \end{bmatrix} = \begin{bmatrix} 2t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} 2t \\ t \end{bmatrix} = t \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} 2t \\ t \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-7	2	1	Yes	$\begin{bmatrix} 2 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -7 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

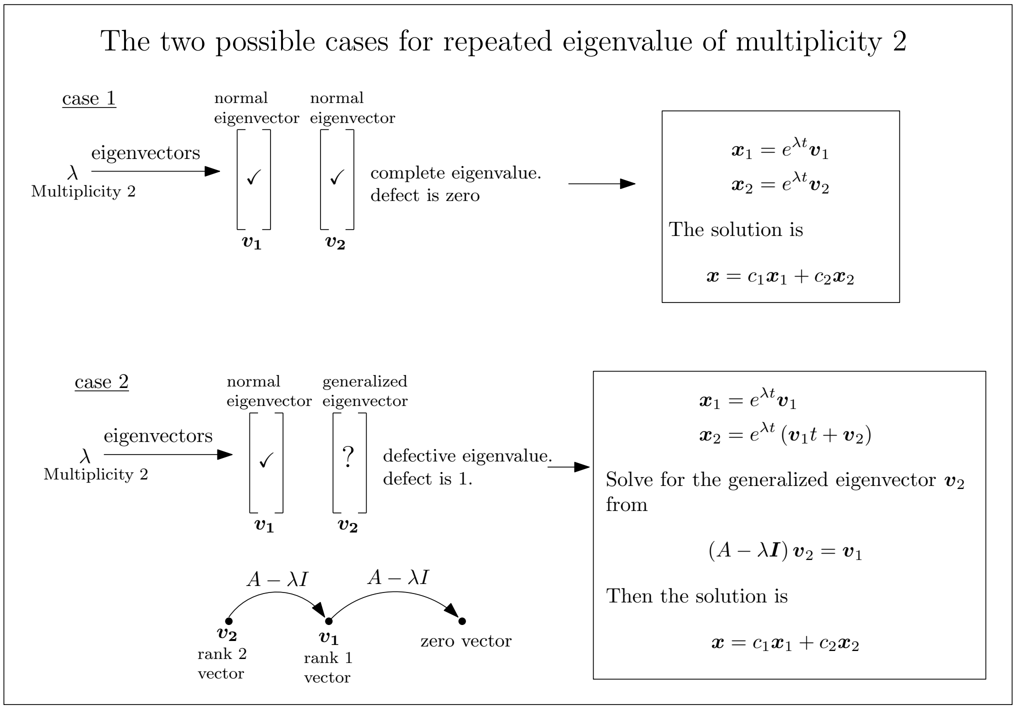

Figure 592: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} -11 & 8 \\ -2 & -3 \end{bmatrix} - (-7)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$
$$\begin{bmatrix} -4 & 8 \\ -2 & 4 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue -7. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t}\\ &= \begin{bmatrix} 2 \\ 1 \end{bmatrix} \mathrm{e}^{-7t}\\ &= \begin{bmatrix} 2\,\mathrm{e}^{-7t} \\ \mathrm{e}^{-7t} \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t}\\ &= \left(\begin{bmatrix} 2 \\ 1 \end{bmatrix} t + \begin{bmatrix} \frac{3}{2} \\ 1 \end{bmatrix}\right) \mathrm{e}^{-7t}\\ &= \begin{bmatrix} \frac{\mathrm{e}^{-7t}(4t+3)}{2} \\ \mathrm{e}^{-7t}(t+1) \end{bmatrix}\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} 2\,\mathrm{e}^{-7t} \\ \mathrm{e}^{-7t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-7t}\left(2t + \frac{3}{2}\right) \\ \mathrm{e}^{-7t}(t+1) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \mathrm{e}^{-7t}\left(2c_1 + 2c_2 t + \frac{3}{2}c_2\right) \\ \mathrm{e}^{-7t}(c_2 t + c_1 + c_2) \end{bmatrix}$$

Since initial conditions are given, the solution above needs to be updated by solving for the constants of integrations using the given initial conditions

$$\begin{bmatrix} y_1(0) = 6 \\ y_2(0) = 2 \end{bmatrix} \tag{1}$$

Substituting initial conditions into the above solution at $t = 0$ gives

$$\begin{bmatrix} 6 \\ 2 \end{bmatrix} = \begin{bmatrix} 2c_1 + \frac{3c_2}{2} \\ c_1 + c_2 \end{bmatrix}$$

Solving for the constants of integrations gives

$$\begin{bmatrix} c_1 = 6 \\ c_2 = -4 \end{bmatrix}$$

Substituting these constants back in original solution in Eq. (1) gives

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} (-8t + 6)\,\mathrm{e}^{-7t} \\ (-4t + 2)\,\mathrm{e}^{-7t} \end{bmatrix}$$

The following is the phase plot of the system.

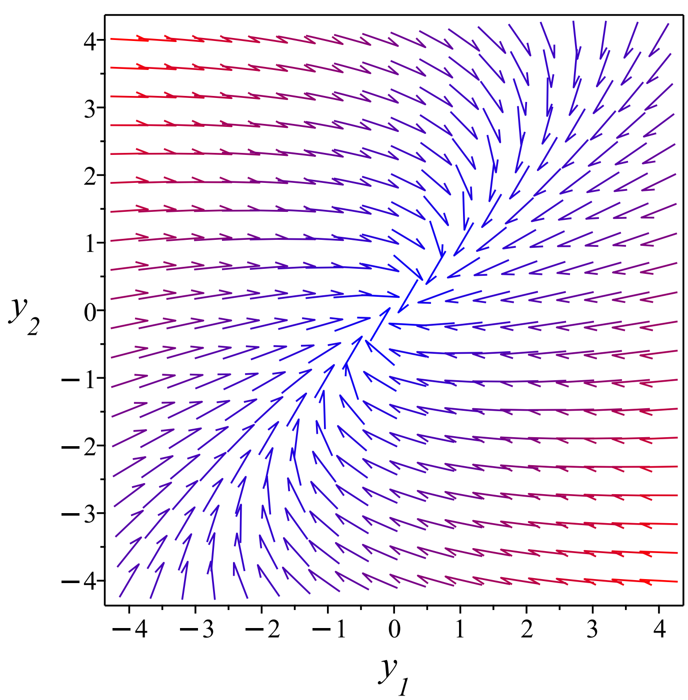

Figure 593: Phase plot

Section: Chapter 10 Linear system of Differential equations. Section 10.5, constant coefficient homogeneous system II. Page 555

Problem number: section 10.5, problem 14.

ODE order: 1.

ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= 15y_1(t) - 9y_2(t) \\
y_2'(t) &= 16y_1(t) - 9y_2(t)
\end{aligned}
$$

With initial conditions

$$
[y_1(0) = 5, y_2(0) = 8]
$$

22.14.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 15 & -9 \\ 16 & -9 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} \mathrm{e}^{3t}(1+12t) & -9\,\mathrm{e}^{3t}t \\ 16\,\mathrm{e}^{3t}t & \mathrm{e}^{3t}(1-12t) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{x}_0 \\
&= \begin{bmatrix} e^{3t}(1+12t) & -9\,e^{3t}t \\ 16\,e^{3t}t & e^{3t}(1-12t) \end{bmatrix} \begin{bmatrix} 5 \\ 8 \end{bmatrix} \\
&= \begin{bmatrix} 5\,e^{3t}(1+12t) - 72\,e^{3t}t \\ 80\,e^{3t}t + 8\,e^{3t}(1-12t) \end{bmatrix} \\
&= \begin{bmatrix} e^{3t}(-12t+5) \\ (-16t+8)\,e^{3t} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.14.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 15 & -9 \\ 16 & -9 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 15 & -9 \\ 16 & -9 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 15-\lambda & -9 \\ 16 & -9-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 - 6\lambda + 9 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 3$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
3	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 3$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 15 & -9 \\ 16 & -9 \end{bmatrix} - (3)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} 12 & -9 \\ 16 & -12 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} 12 & -9 & 0 \\ 16 & -12 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{4R_1}{3} \Longrightarrow \left[\begin{array}{cc|c} 12 & -9 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 12 & -9 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = \frac{3t}{4}\}$

Hence the solution is

$$\begin{bmatrix}\frac{3t}{4}\\ t\end{bmatrix}=\begin{bmatrix}\frac{3t}{4}\\ t\end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix}\frac{3t}{4}\\ t\end{bmatrix}=t\begin{bmatrix}\frac{3}{4}\\ 1\end{bmatrix}$$

Let $t=1$ the eigenvector becomes

$$\begin{bmatrix}\frac{3t}{4}\\ t\end{bmatrix}=\begin{bmatrix}\frac{3}{4}\\ 1\end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix}\frac{3t}{4}\\ t\end{bmatrix}=\begin{bmatrix}3\\ 4\end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m>k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m-k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
3	2	1	Yes	$\begin{bmatrix}\frac{3}{4}\\ 1\end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue 3 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

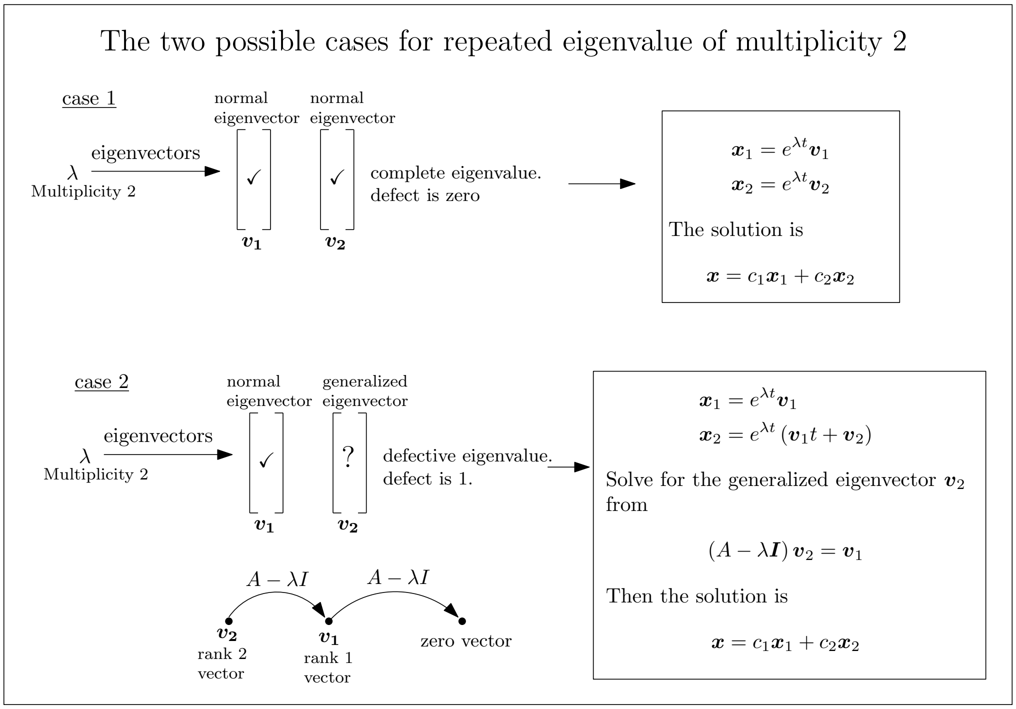

Figure 594: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} 15 & -9 \\ 16 & -9 \end{bmatrix} - (3) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} \frac{3}{4} \\ 1 \end{bmatrix}$$
$$\begin{bmatrix} 12 & -9 \\ 16 & -12 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} \frac{3}{4} \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} 1 \\ \frac{5}{4} \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue 3. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t}\\ &= \left[\begin{array}{c}\frac{3}{4}\\ 1\end{array}\right] e^{3t}\\ &= \left[\begin{array}{c}\frac{3\,e^{3t}}{4}\\ e^{3t}\end{array}\right]\end{aligned}$$

And

$$\begin{aligned}\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t}\\ &= \left(\left[\begin{array}{c}\frac{3}{4}\\ 1\end{array}\right] t + \left[\begin{array}{c}1\\ \frac{5}{4}\end{array}\right]\right) e^{3t}\\ &= \left[\begin{array}{c}\frac{e^{3t}(3t+4)}{4}\\ \frac{e^{3t}(4t+5)}{4}\end{array}\right]\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t)$$

Which is written as

$$\left[\begin{array}{c}y_1(t)\\ y_2(t)\end{array}\right] = c_1\left[\begin{array}{c}\frac{3\,e^{3t}}{4}\\ e^{3t}\end{array}\right] + c_2\left[\begin{array}{c}e^{3t}\left(\frac{3t}{4}+1\right)\\ e^{3t}\left(t+\frac{5}{4}\right)\end{array}\right]$$

Which becomes

$$\left[\begin{array}{c}y_1(t)\\ y_2(t)\end{array}\right] = \left[\begin{array}{c}\frac{((3t+4)c_2+3c_1)e^{3t}}{4}\\ e^{3t}\left(c_1+c_2t+\frac{5}{4}c_2\right)\end{array}\right]$$

Since initial conditions are given, the solution above needs to be updated by solving for the constants of integrations using the given initial conditions

$$\left[\begin{array}{c}y_1(0) = 5\\ y_2(0) = 8\end{array}\right] \tag{1}$$

Substituting initial conditions into the above solution at $t = 0$ gives

$$\begin{bmatrix} 5 \\ 8 \end{bmatrix} = \begin{bmatrix} c_2 + \frac{3c_1}{4} \\ c_1 + \frac{5c_2}{4} \end{bmatrix}$$

Solving for the constants of integrations gives

$$\begin{bmatrix} c_1 = 28 \\ c_2 = -16 \end{bmatrix}$$

Substituting these constants back in original solution in Eq. (1) gives

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \frac{(-48t+20)\,\mathrm{e}^{3t}}{4} \\ (-16t + 8)\,\mathrm{e}^{3t} \end{bmatrix}$$

The following is the phase plot of the system.

Problem number: section 10.5, problem 15.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -3y_1(t) - 4y_2(t) \\
y_2'(t) &= y_1(t) - 7y_2(t)
\end{aligned}
$$

With initial conditions

$$
[y_1(0) = 2, y_2(0) = 3]
$$

22.15.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -3 & -4 \\ 1 & -7 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} e^{-5t}(1+2t) & -4t\,e^{-5t} \\ t\,e^{-5t} & e^{-5t}(1-2t) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{x}_0 \\
&= \begin{bmatrix} e^{-5t}(1+2t) & -4t\,e^{-5t} \\ t\,e^{-5t} & e^{-5t}(1-2t) \end{bmatrix} \begin{bmatrix} 2 \\ 3 \end{bmatrix} \\
&= \begin{bmatrix} 2\,e^{-5t}(1+2t) - 12t\,e^{-5t} \\ 2t\,e^{-5t} + 3\,e^{-5t}(1-2t) \end{bmatrix} \\
&= \begin{bmatrix} (2-8t)\,e^{-5t} \\ e^{-5t}(-4t+3) \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.15.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -3 & -4 \\ 1 & -7 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$
\det(A - \lambda I) = 0
$$

Expanding gives

$$
\det\left(\begin{bmatrix} -3 & -4 \\ 1 & -7 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) = 0
$$

Therefore

$$
\det\left(\begin{bmatrix} -3-\lambda & -4 \\ 1 & -7-\lambda \end{bmatrix} \right) = 0
$$

Which gives the characteristic equation

$$\lambda^2 + 10\lambda + 25 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -5$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-5	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -5$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -3 & -4 \\ 1 & -7 \end{bmatrix} - (-5)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 2 & -4 \\ 1 & -2 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} 2 & -4 & 0 \\ 1 & -2 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{2} \Longrightarrow \left[\begin{array}{cc|c} 2 & -4 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 2 & -4 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 2t\}$

Hence the solution is

$$
\begin{bmatrix} 2t \\ t \end{bmatrix} = \begin{bmatrix} 2t \\ t \end{bmatrix}
$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$
\begin{bmatrix} 2t \\ t \end{bmatrix} = t \begin{bmatrix} 2 \\ 1 \end{bmatrix}
$$

Let $t = 1$ the eigenvector becomes

$$
\begin{bmatrix} 2t \\ t \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}
$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-5	2	1	Yes	$\begin{bmatrix} 2 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -5 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

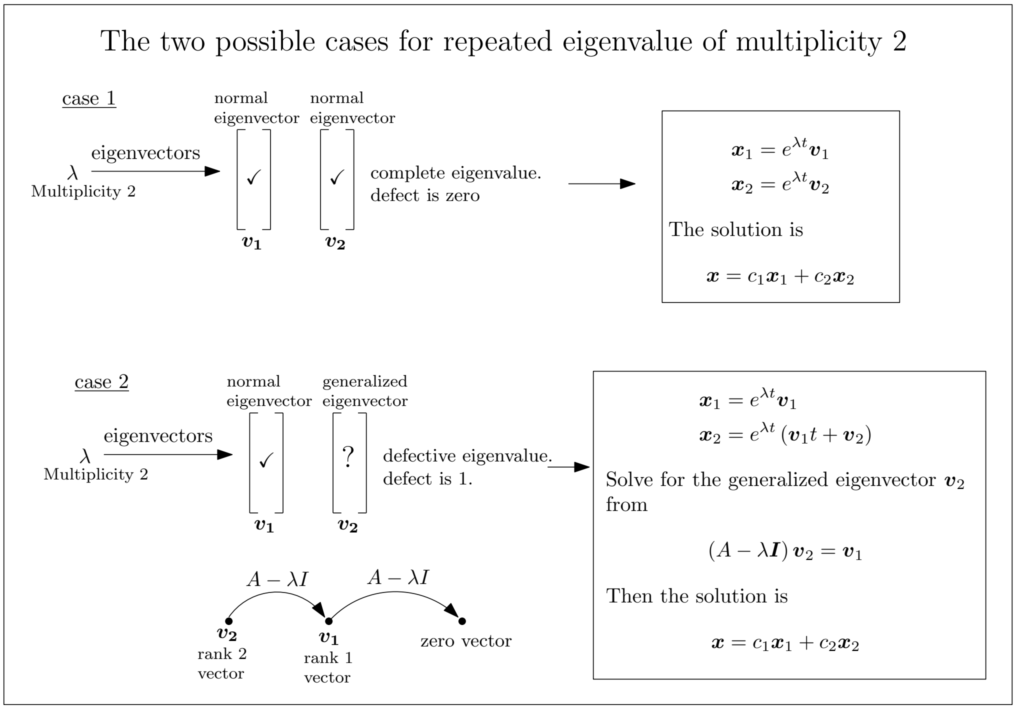

Figure 596: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} -3 & -4 \\ 1 & -7 \end{bmatrix} - (-5)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$
$$\begin{bmatrix} 2 & -4 \\ 1 & -2 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} 3 \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue -5. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\
&= \begin{bmatrix} 2 \\ 1 \end{bmatrix} \mathrm{e}^{-5t} \\
&= \begin{bmatrix} 2\,\mathrm{e}^{-5t} \\ \mathrm{e}^{-5t} \end{bmatrix}
\end{aligned}$$

And

$$\begin{aligned}
\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\
&= \left(\begin{bmatrix} 2 \\ 1 \end{bmatrix} t + \begin{bmatrix} 3 \\ 1 \end{bmatrix} \right) \mathrm{e}^{-5t} \\
&= \begin{bmatrix} \mathrm{e}^{-5t}(2t+3) \\ \mathrm{e}^{-5t}(t+1) \end{bmatrix}
\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} 2\,\mathrm{e}^{-5t} \\ \mathrm{e}^{-5t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-5t}(2t+3) \\ \mathrm{e}^{-5t}(t+1) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} ((2t+3)\, c_2 + 2c_1)\,\mathrm{e}^{-5t} \\ \mathrm{e}^{-5t}(c_2 t + c_1 + c_2) \end{bmatrix}$$

Since initial conditions are given, the solution above needs to be updated by solving for the constants of integrations using the given initial conditions

$$\begin{bmatrix} y_1(0) = 2 \\ y_2(0) = 3 \end{bmatrix} \tag{1}$$

Substituting initial conditions into the above solution at $t = 0$ gives

$$\begin{bmatrix} 2 \\ 3 \end{bmatrix} = \begin{bmatrix} 3c_2 + 2c_1 \\ c_1 + c_2 \end{bmatrix}$$

Solving for the constants of integrations gives

$$\begin{bmatrix} c_1 = 7 \\ c_2 = -4 \end{bmatrix}$$

Substituting these constants back in original solution in Eq. (1) gives

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} (2 - 8t)\,\mathrm{e}^{-5t} \\ \mathrm{e}^{-5t}(-4t + 3) \end{bmatrix}$$

The following is the phase plot of the system.

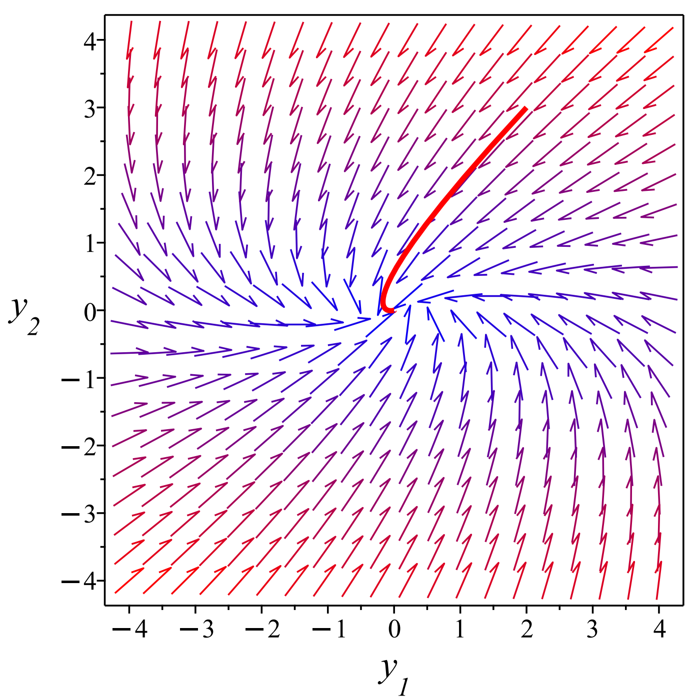

Figure 597: Phase plot

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -7y_1(t) + 24y_2(t) \\
y_2'(t) &= -6y_1(t) + 17y_2(t)
\end{aligned}
$$

With initial conditions

$$
[y_1(0) = 3, y_2(0) = 1]
$$

22.16.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -7 & 24 \\ -6 & 17 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} e^{5t}(1-12t) & 24t\,e^{5t} \\ -6t\,e^{5t} & e^{5t}(1+12t) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{x}_0 \\
&= \begin{bmatrix} e^{5t}(1-12t) & 24t\,e^{5t} \\ -6t\,e^{5t} & e^{5t}(1+12t) \end{bmatrix} \begin{bmatrix} 3 \\ 1 \end{bmatrix} \\
&= \begin{bmatrix} 3\,e^{5t}(1-12t) + 24t\,e^{5t} \\ -18t\,e^{5t} + e^{5t}(1+12t) \end{bmatrix} \\
&= \begin{bmatrix} (-12t+3)\,e^{5t} \\ e^{5t}(1-6t) \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.16.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -7 & 24 \\ -6 & 17 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$
\det(A - \lambda I) = 0
$$

Expanding gives

$$
\det\left(\begin{bmatrix} -7 & 24 \\ -6 & 17 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0
$$

Therefore

$$
\det\left(\begin{bmatrix} -7-\lambda & 24 \\ -6 & 17-\lambda \end{bmatrix}\right) = 0
$$

Which gives the characteristic equation

$$\lambda^2 - 10\lambda + 25 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 5$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
5	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 5$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -7 & 24 \\ -6 & 17 \end{bmatrix} - (5)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -12 & 24 \\ -6 & 12 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -12 & 24 & 0 \\ -6 & 12 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{2} \Longrightarrow \left[\begin{array}{cc|c} -12 & 24 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -12 & 24 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 2t\}$

Hence the solution is

$$\begin{bmatrix} 2t \\ t \end{bmatrix} = \begin{bmatrix} 2t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} 2t \\ t \end{bmatrix} = t \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} 2t \\ t \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
5	2	1	Yes	$\begin{bmatrix} 2 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue 5 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

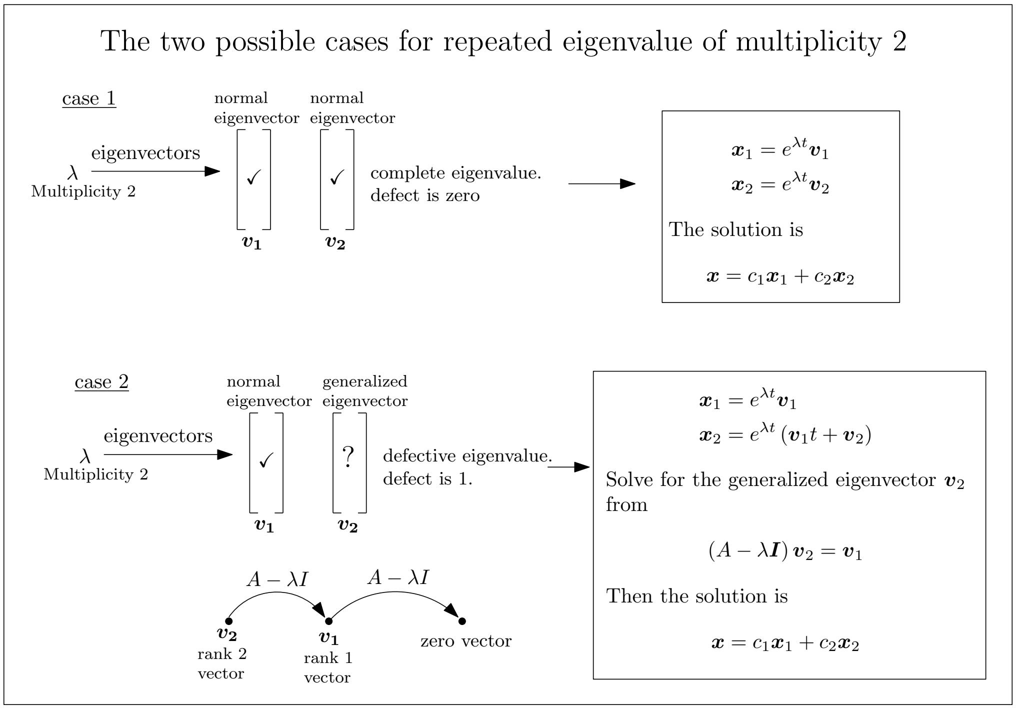

Figure 598: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} -7 & 24 \\ -6 & 17 \end{bmatrix} - (5)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} -12 & 24 \\ -6 & 12 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} \frac{11}{6} \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue 5. Therefore the two basis solution associated with this eigenvalue are

$$
\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\
&= \begin{bmatrix} 2 \\ 1 \end{bmatrix} e^{5t} \\
&= \begin{bmatrix} 2\,e^{5t} \\ e^{5t} \end{bmatrix}
\end{aligned}
$$

And

$$
\begin{aligned}
\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\
&= \left(\begin{bmatrix} 2 \\ 1 \end{bmatrix} t + \begin{bmatrix} \frac{11}{6} \\ 1 \end{bmatrix} \right) e^{5t} \\
&= \begin{bmatrix} \frac{e^{5t}(12t+11)}{6} \\ e^{5t}(t+1) \end{bmatrix}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} 2\,e^{5t} \\ e^{5t} \end{bmatrix} + c_2 \begin{bmatrix} e^{5t}\left(2t + \frac{11}{6}\right) \\ e^{5t}(t+1) \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} e^{5t}\left(2c_1 + 2c_2 t + \frac{11}{6} c_2\right) \\ e^{5t}(c_2 t + c_1 + c_2) \end{bmatrix}
$$

Since initial conditions are given, the solution above needs to be updated by solving for the constants of integrations using the given initial conditions

$$
\begin{bmatrix} y_1(0) = 3 \\ y_2(0) = 1 \end{bmatrix} \tag{1}
$$

Substituting initial conditions into the above solution at $t = 0$ gives

$$\begin{bmatrix} 3 \\ 1 \end{bmatrix} = \begin{bmatrix} 2c_1 + \frac{11c_2}{6} \\ c_1 + c_2 \end{bmatrix}$$

Solving for the constants of integrations gives

$$\begin{bmatrix} c_1 = 7 \\ c_2 = -6 \end{bmatrix}$$

Substituting these constants back in original solution in Eq. (1) gives

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} (-12t + 3)\,\mathrm{e}^{5t} \\ \mathrm{e}^{5t}(1 - 6t) \end{bmatrix}$$

The following is the phase plot of the system.

ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -7y_1(t) + 3y_2(t) \\
y_2'(t) &= -3y_1(t) - y_2(t)
\end{aligned}
$$

With initial conditions

$$
[y_1(0) = 0, y_2(0) = 2]
$$

22.17.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -7 & 3 \\ -3 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} \mathrm{e}^{-4t}(1-3t) & 3t\,\mathrm{e}^{-4t} \\ -3t\,\mathrm{e}^{-4t} & \mathrm{e}^{-4t}(1+3t) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{x}_0 \\
&= \begin{bmatrix} e^{-4t}(1-3t) & 3t\,e^{-4t} \\ -3t\,e^{-4t} & e^{-4t}(1+3t) \end{bmatrix} \begin{bmatrix} 0 \\ 2 \end{bmatrix} \\
&= \begin{bmatrix} 6t\,e^{-4t} \\ 2\,e^{-4t}(1+3t) \end{bmatrix} \\
&= \begin{bmatrix} 6t\,e^{-4t} \\ (6t+2)\,e^{-4t} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.17.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -7 & 3 \\ -3 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -7 & 3 \\ -3 & -1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -7-\lambda & 3 \\ -3 & -1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 + 8\lambda + 16 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -4$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-4	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -4$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -7 & 3 \\ -3 & -1 \end{bmatrix} - (-4)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -3 & 3 \\ -3 & 3 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -3 & 3 & 0 \\ -3 & 3 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{cc|c} -3 & 3 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -3 & 3 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t\}$

Hence the solution is

$$\begin{bmatrix} t \\ t \end{bmatrix} = \begin{bmatrix} t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-4	2	1	Yes	$\begin{bmatrix} 1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -4 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

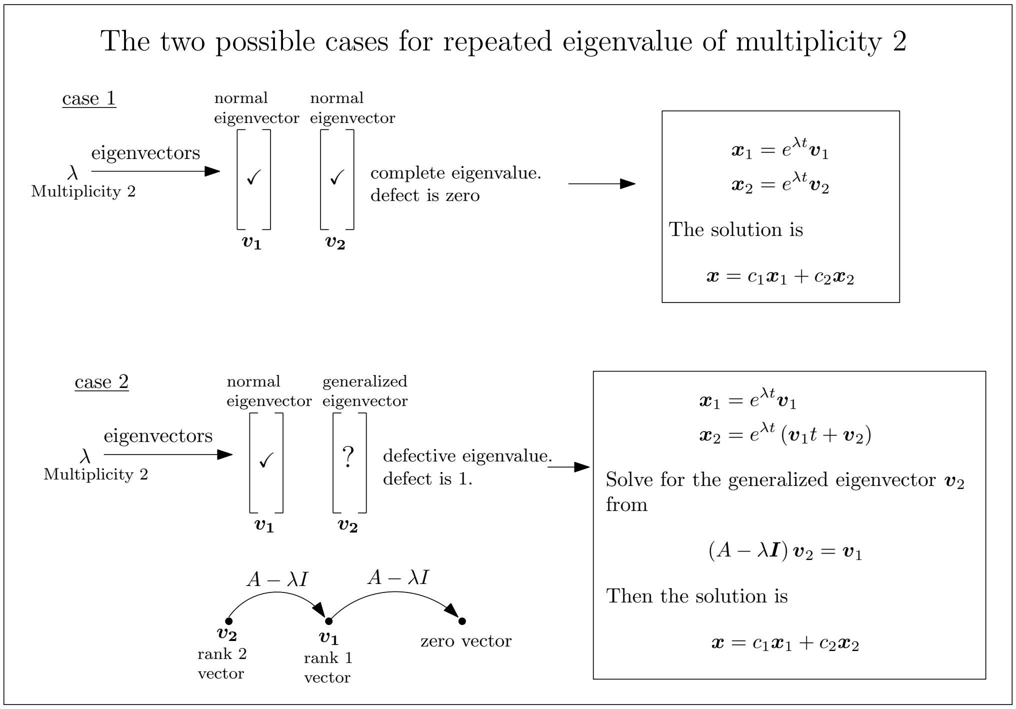

Figure 600: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} -7 & 3 \\ -3 & -1 \end{bmatrix} - (-4)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$
$$\begin{bmatrix} -3 & 3 \\ -3 & 3 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} \frac{2}{3} \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue -4. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} 1 \\ 1 \end{bmatrix} \mathrm{e}^{-4t} \\ &= \begin{bmatrix} \mathrm{e}^{-4t} \\ \mathrm{e}^{-4t} \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\ &= \left(\begin{bmatrix} 1 \\ 1 \end{bmatrix} t + \begin{bmatrix} \frac{2}{3} \\ 1 \end{bmatrix}\right) \mathrm{e}^{-4t} \\ &= \begin{bmatrix} \frac{\mathrm{e}^{-4t}(3t+2)}{3} \\ \mathrm{e}^{-4t}(t+1) \end{bmatrix}\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} \mathrm{e}^{-4t} \\ \mathrm{e}^{-4t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-4t}\left(t + \frac{2}{3}\right) \\ \mathrm{e}^{-4t}(t+1) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \mathrm{e}^{-4t}\left(c_1 + c_2 t + \frac{2}{3} c_2\right) \\ \mathrm{e}^{-4t}(c_2 t + c_1 + c_2) \end{bmatrix}$$

Since initial conditions are given, the solution above needs to be updated by solving for the constants of integrations using the given initial conditions

$$\begin{bmatrix} y_1(0) = 0 \\ y_2(0) = 2 \end{bmatrix} \tag{1}$$

Substituting initial conditions into the above solution at $t = 0$ gives

$$\begin{bmatrix} 0 \\ 2 \end{bmatrix} = \begin{bmatrix} c_1 + \frac{2c_2}{3} \\ c_1 + c_2 \end{bmatrix}$$

Solving for the constants of integrations gives

$$\begin{bmatrix} c_1 = -4 \\ c_2 = 6 \end{bmatrix}$$

Substituting these constants back in original solution in Eq. (1) gives

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} 6t\,\mathrm{e}^{-4t} \\ (6t + 2)\,\mathrm{e}^{-4t} \end{bmatrix}$$

The following is the phase plot of the system.

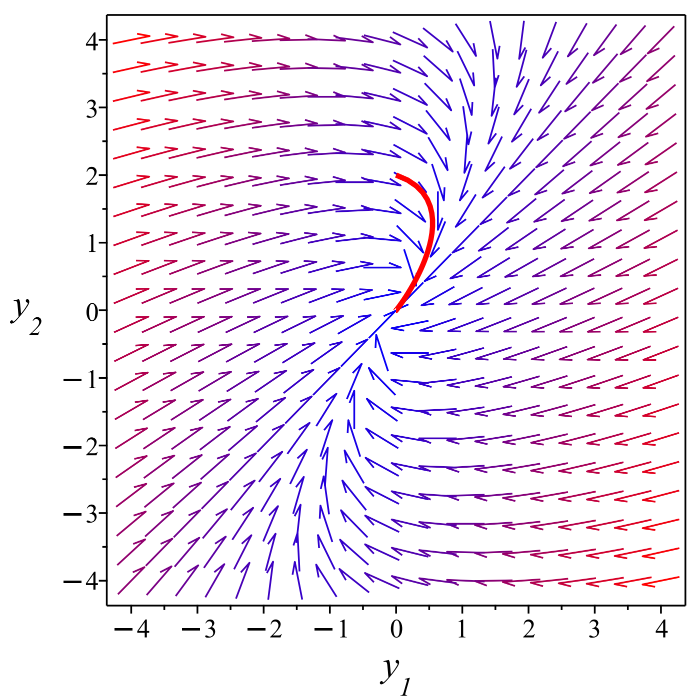

Figure 601: Phase plot

The following are plots of each solution.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -y_1(t) + y_2(t) \\
y_2'(t) &= y_1(t) - y_2(t) - 2y_3(t) \\
y_3'(t) &= -y_1(t) - y_2(t) - y_3(t)
\end{aligned}
$$

With initial conditions

$$[y_1(0) = 6, y_2(0) = 5, y_3(0) = -7]$$

22.18.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -1 & 1 & 0 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{(2\,\mathrm{e}^{3t}+3t+7)\,\mathrm{e}^{-2t}}{9} & \frac{(2\,\mathrm{e}^{3t}+3t-2)\,\mathrm{e}^{-2t}}{9} & -\frac{2(\mathrm{e}^{3t}-3t-1)\,\mathrm{e}^{-2t}}{9} \\ \frac{(4\,\mathrm{e}^{3t}-3t-4)\,\mathrm{e}^{-2t}}{9} & \frac{(4\,\mathrm{e}^{3t}-3t+5)\,\mathrm{e}^{-2t}}{9} & -\frac{2(2\,\mathrm{e}^{3t}+3t-2)\,\mathrm{e}^{-2t}}{9} \\ -\frac{(\mathrm{e}^{3t}-1)\,\mathrm{e}^{-2t}}{3} & -\frac{(\mathrm{e}^{3t}-1)\,\mathrm{e}^{-2t}}{3} & \frac{(\mathrm{e}^{3t}+2)\,\mathrm{e}^{-2t}}{3} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned} \vec{x}_h(t) &= e^{At}\vec{x}_0 \\ &= \begin{bmatrix} \frac{(2\,\mathrm{e}^{3t}+3t+7)\,\mathrm{e}^{-2t}}{9} & \frac{(2\,\mathrm{e}^{3t}+3t-2)\,\mathrm{e}^{-2t}}{9} & -\frac{2(\mathrm{e}^{3t}-3t-1)\,\mathrm{e}^{-2t}}{9} \\ \frac{(4\,\mathrm{e}^{3t}-3t-4)\,\mathrm{e}^{-2t}}{9} & \frac{(4\,\mathrm{e}^{3t}-3t+5)\,\mathrm{e}^{-2t}}{9} & -\frac{2(2\,\mathrm{e}^{3t}+3t-2)\,\mathrm{e}^{-2t}}{9} \\ -\frac{(\mathrm{e}^{3t}-1)\,\mathrm{e}^{-2t}}{3} & -\frac{(\mathrm{e}^{3t}-1)\,\mathrm{e}^{-2t}}{3} & \frac{(\mathrm{e}^{3t}+2)\,\mathrm{e}^{-2t}}{3} \end{bmatrix} \begin{bmatrix} 6 \\ 5 \\ -7 \end{bmatrix} \\ &= \begin{bmatrix} \frac{2(2\,\mathrm{e}^{3t}+3t+7)\,\mathrm{e}^{-2t}}{3} + \frac{5(2\,\mathrm{e}^{3t}+3t-2)\,\mathrm{e}^{-2t}}{9} + \frac{14(\mathrm{e}^{3t}-3t-1)\,\mathrm{e}^{-2t}}{9} \\ \frac{2(4\,\mathrm{e}^{3t}-3t-4)\,\mathrm{e}^{-2t}}{3} + \frac{5(4\,\mathrm{e}^{3t}-3t+5)\,\mathrm{e}^{-2t}}{9} + \frac{14(2\,\mathrm{e}^{3t}+3t-2)\,\mathrm{e}^{-2t}}{9} \\ -\frac{11(\mathrm{e}^{3t}-1)\,\mathrm{e}^{-2t}}{3} - \frac{7(\mathrm{e}^{3t}+2)\,\mathrm{e}^{-2t}}{3} \end{bmatrix} \\ &= \begin{bmatrix} -(-4\,\mathrm{e}^{3t}+t-2)\,\mathrm{e}^{-2t} \\ (8\,\mathrm{e}^{3t}+t-3)\,\mathrm{e}^{-2t} \\ (-6\,\mathrm{e}^{3t}-1)\,\mathrm{e}^{-2t} \end{bmatrix} \end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.18.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -1 & 1 & 0 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -1 & 1 & 0 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -1-\lambda & 1 & 0 \\ 1 & -1-\lambda & -2 \\ -1 & -1 & -1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + 3\lambda^2 - 4 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -2$$
$$\lambda_2 = 1$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-2	1	real eigenvalue
1	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -1 & 1 & 0 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} - (-2) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} 1 & 1 & 0 \\ 1 & 1 & -2 \\ -1 & -1 & 1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 1 & 1 & 0 & 0 \\ 1 & 1 & -2 & 0 \\ -1 & -1 & 1 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} 1 & 1 & 0 & 0 \\ 0 & 0 & -2 & 0 \\ -1 & -1 & 1 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} 1 & 1 & 0 & 0 \\ 0 & 0 & -2 & 0 \\ 0 & 0 & 1 & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{R_2}{2} \Longrightarrow \left[\begin{array}{ccc|c} 1 & 1 & 0 & 0 \\ 0 & 0 & -2 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 1 & 1 & 0 \\ 0 & 0 & -2 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1, v_3\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_3 = 0\}$

Hence the solution is

$$\begin{bmatrix} -t \\ t \\ 0 \end{bmatrix} = \begin{bmatrix} -t \\ t \\ 0 \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ t \\ 0 \end{bmatrix} = t \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$$

Let $t=1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ t \\ 0 \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A-\lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -1 & 1 & 0 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} - (1) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 1 & 0 \\ 1 & -2 & -2 \\ -1 & -1 & -2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -2 & 1 & 0 & 0 \\ 1 & -2 & -2 & 0 \\ -1 & -1 & -2 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} -2 & 1 & 0 & 0 \\ 0 & -\frac{3}{2} & -2 & 0 \\ -1 & -1 & -2 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} -2 & 1 & 0 & 0 \\ 0 & -\frac{3}{2} & -2 & 0 \\ 0 & -\frac{3}{2} & -2 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_2 \Longrightarrow \left[\begin{array}{ccc|c} -2 & 1 & 0 & 0 \\ 0 & -\frac{3}{2} & -2 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -2 & 1 & 0 \\ 0 & -\frac{3}{2} & -2 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = -\frac{2t}{3}, v_2 = -\frac{4t}{3}\right\}$

Hence the solution is

$$\begin{bmatrix} -\frac{2t}{3} \\ -\frac{4t}{3} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{2t}{3} \\ -\frac{4t}{3} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -\frac{2t}{3} \\ -\frac{4t}{3} \\ t \end{bmatrix} = t \begin{bmatrix} -\frac{2}{3} \\ -\frac{4}{3} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -\frac{2t}{3} \\ -\frac{4t}{3} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{2}{3} \\ -\frac{4}{3} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} -\frac{2t}{3} \\ -\frac{4t}{3} \\ t \end{bmatrix} = \begin{bmatrix} -2 \\ -4 \\ 3 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
-2	2	1	Yes	$\begin{bmatrix}-1\\1\\0\end{bmatrix}$
1	1	1	No	$\begin{bmatrix}-\frac{2}{3}\\-\frac{4}{3}\\1\end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -2 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

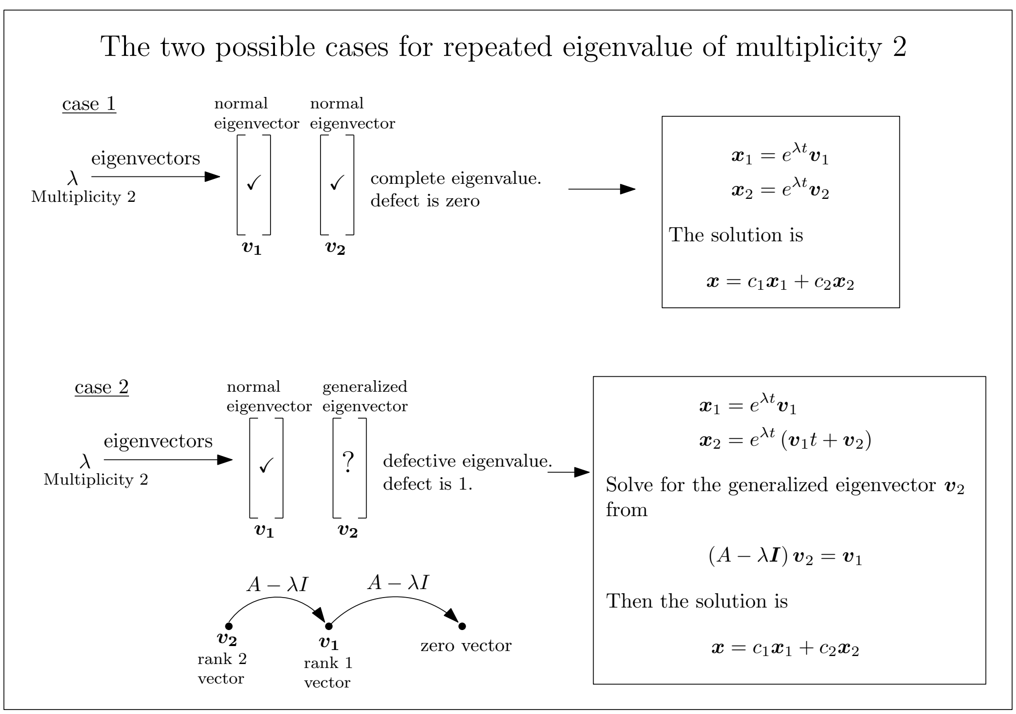

Figure 602: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore

this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} -1 & 1 & 0 \\ 1 & -1 & -2 \\ -1 & -1 & -1 \end{bmatrix} - (-2)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} 1 & 1 & 0 \\ 1 & 1 & -2 \\ -1 & -1 & 1 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} -2 \\ 1 \\ -1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue -2. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned} \vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix} \mathrm{e}^{-2t} \\ &= \begin{bmatrix} -\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \\ 0 \end{bmatrix} \end{aligned}$$

And

$$
\begin{aligned}
\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\
&= \left(\left[\begin{array}{c} -1 \\ 1 \\ 0 \end{array}\right] t + \left[\begin{array}{c} -2 \\ 1 \\ -1 \end{array}\right] \right) \mathrm{e}^{-2t} \\
&= \left[\begin{array}{c} -\mathrm{e}^{-2t}(2+t) \\ \mathrm{e}^{-2t}(t+1) \\ -\mathrm{e}^{-2t} \end{array}\right]
\end{aligned}
$$

Since eigenvalue 1 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_3(t) &= \vec{v}_3 e^{t} \\
&= \left[\begin{array}{c} -\frac{2}{3} \\ -\frac{4}{3} \\ 1 \end{array}\right] e^{t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)
$$

Which is written as

$$
\left[\begin{array}{c} y_1(t) \\ y_2(t) \\ y_3(t) \end{array}\right] = c_1 \left[\begin{array}{c} -\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \\ 0 \end{array}\right] + c_2 \left[\begin{array}{c} \mathrm{e}^{-2t}(-t-2) \\ \mathrm{e}^{-2t}(t+1) \\ -\mathrm{e}^{-2t} \end{array}\right] + c_3 \left[\begin{array}{c} -\frac{2\,\mathrm{e}^{t}}{3} \\ -\frac{4\,\mathrm{e}^{t}}{3} \\ \mathrm{e}^{t} \end{array}\right]
$$

Which becomes

$$
\left[\begin{array}{c} y_1(t) \\ y_2(t) \\ y_3(t) \end{array}\right] = \left[\begin{array}{c} \frac{(-2c_3\mathrm{e}^{3t} + (-3t-6)c_2 - 3c_1)\mathrm{e}^{-2t}}{3} \\ \frac{(-4c_3\mathrm{e}^{3t} + (3t+3)c_2 + 3c_1)\mathrm{e}^{-2t}}{3} \\ -(-c_3\mathrm{e}^{3t} + c_2)\,\mathrm{e}^{-2t} \end{array}\right]
$$

Since initial conditions are given, the solution above needs to be updated by solving for the constants of integrations using the given initial conditions

$$
\left[\begin{array}{c} y_1(0) = 6 \\ y_2(0) = 5 \\ y_3(0) = -7 \end{array}\right] \tag{1}
$$

Substituting initial conditions into the above solution at $t = 0$ gives

$$\begin{bmatrix} 6 \\ 5 \\ -7 \end{bmatrix} = \begin{bmatrix} -\frac{2c_3}{3} - 2c_2 - c_1 \\ -\frac{4c_3}{3} + c_2 + c_1 \\ c_3 - c_2 \end{bmatrix}$$

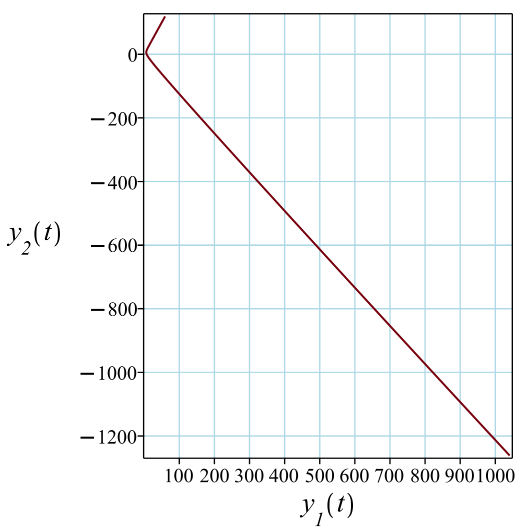
Solving for the constants of integrations gives

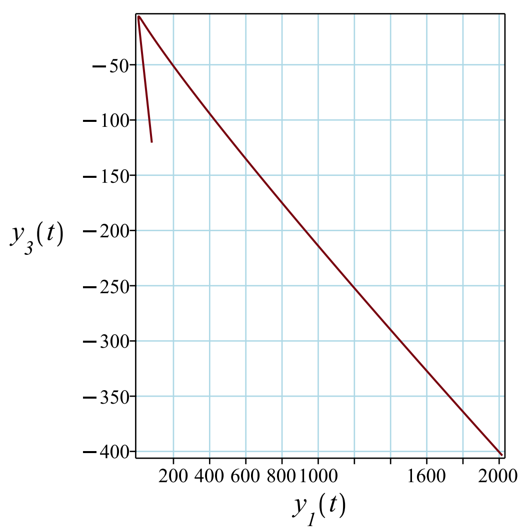
$$\begin{bmatrix} c_1 = -4 \\ c_2 = 1 \\ c_3 = -6 \end{bmatrix}$$

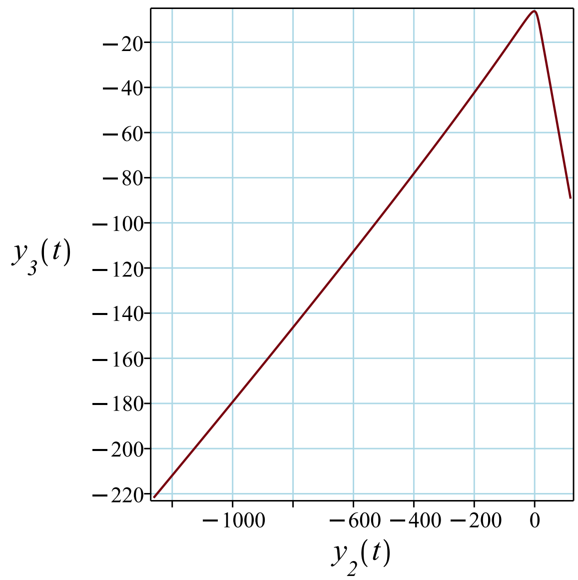
Substituting these constants back in original solution in Eq. (1) gives

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \frac{(12\,e^{3t}-3t+6)\,e^{-2t}}{3} \\ \frac{(24\,e^{3t}+3t-9)\,e^{-2t}}{3} \\ -(6\,e^{3t}+1)\,e^{-2t} \end{bmatrix}$$

The following are plots of each solution against another.







The following are plots of each solution.

Problem number: section 10.5, problem 19.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -2y_1(t) + 2y_2(t) + y_3(t)\\
y_2'(t) &= -2y_1(t) + 2y_2(t) + y_3(t)\\
y_3'(t) &= -3y_1(t) + 3y_2(t) + 2y_3(t)
\end{aligned}
$$

With initial conditions

$$[y_1(0) = -6, y_2(0) = -2, y_3(0) = 0]$$

22.19.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -2 & 2 & 1 \\ -2 & 2 & 1 \\ -3 & 3 & 2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{7}{4}-\frac{t}{2}-\frac{3\,\mathrm{e}^{2t}}{4} & \frac{t}{2}+\frac{3\,\mathrm{e}^{2t}}{4}-\frac{3}{4} & \frac{\mathrm{e}^{2t}}{2}-\frac{1}{2} \\ -\frac{t}{2}-\frac{3\,\mathrm{e}^{2t}}{4}+\frac{3}{4} & \frac{1}{4}+\frac{t}{2}+\frac{3\,\mathrm{e}^{2t}}{4} & \frac{\mathrm{e}^{2t}}{2}-\frac{1}{2} \\ -\frac{3\,\mathrm{e}^{2t}}{2}+\frac{3}{2} & \frac{3\,\mathrm{e}^{2t}}{2}-\frac{3}{2} & \mathrm{e}^{2t} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned} \vec{x}_h(t) &= e^{At}\vec{x}_0 \\ &= \begin{bmatrix} \frac{7}{4}-\frac{t}{2}-\frac{3\,\mathrm{e}^{2t}}{4} & \frac{t}{2}+\frac{3\,\mathrm{e}^{2t}}{4}-\frac{3}{4} & \frac{\mathrm{e}^{2t}}{2}-\frac{1}{2} \\ -\frac{t}{2}-\frac{3\,\mathrm{e}^{2t}}{4}+\frac{3}{4} & \frac{1}{4}+\frac{t}{2}+\frac{3\,\mathrm{e}^{2t}}{4} & \frac{\mathrm{e}^{2t}}{2}-\frac{1}{2} \\ -\frac{3\,\mathrm{e}^{2t}}{2}+\frac{3}{2} & \frac{3\,\mathrm{e}^{2t}}{2}-\frac{3}{2} & \mathrm{e}^{2t} \end{bmatrix} \begin{bmatrix} -6 \\ -2 \\ 0 \end{bmatrix} \\ &= \begin{bmatrix} -9+2t+3\,\mathrm{e}^{2t} \\ 2t+3\,\mathrm{e}^{2t}-5 \\ 6\,\mathrm{e}^{2t}-6 \end{bmatrix} \end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.19.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -2 & 2 & 1 \\ -2 & 2 & 1 \\ -3 & 3 & 2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A-\lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -2 & 2 & 1 \\ -2 & 2 & 1 \\ -3 & 3 & 2 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -2-\lambda & 2 & 1 \\ -2 & 2-\lambda & 1 \\ -3 & 3 & 2-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 2\lambda^2 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 0$$
$$\lambda_2 = 2$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
0	1	real eigenvalue
2	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 0$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -2 & 2 & 1 \\ -2 & 2 & 1 \\ -3 & 3 & 2 \end{bmatrix} - (0)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 2 & 1 \\ -2 & 2 & 1 \\ -3 & 3 & 2 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -2 & 2 & 1 & 0 \\ -2 & 2 & 1 & 0 \\ -3 & 3 & 2 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} -2 & 2 & 1 & 0 \\ 0 & 0 & 0 & 0 \\ -3 & 3 & 2 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{3R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} -2 & 2 & 1 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & \frac{1}{2} & 0 \end{array}\right]$$

Since the current pivot $A(2,3)$ is zero, then the current pivot row is replaced with a row with a non-zero pivot. Swapping row 2 and row 3 gives

$$\left[\begin{array}{ccc|c} -2 & 2 & 1 & 0 \\ 0 & 0 & \frac{1}{2} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -2 & 2 & 1 \\ 0 & 0 & \frac{1}{2} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1, v_3\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t, v_3 = 0\}$

Hence the solution is

$$\begin{bmatrix} t \\ t \\ 0 \end{bmatrix} = \begin{bmatrix} t \\ t \\ 0 \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ t \\ 0 \end{bmatrix} = t \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ t \\ 0 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -2 & 2 & 1 \\ -2 & 2 & 1 \\ -3 & 3 & 2 \end{bmatrix} - (2) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -4 & 2 & 1 \\ -2 & 0 & 1 \\ -3 & 3 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -4 & 2 & 1 & 0 \\ -2 & 0 & 1 & 0 \\ -3 & 3 & 0 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{2} \implies \left[\begin{array}{ccc|c} -4 & 2 & 1 & 0 \\ 0 & -1 & \frac{1}{2} & 0 \\ -3 & 3 & 0 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{3R_1}{4} \implies \left[\begin{array}{ccc|c} -4 & 2 & 1 & 0 \\ 0 & -1 & \frac{1}{2} & 0 \\ 0 & \frac{3}{2} & -\frac{3}{4} & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{3R_2}{2} \implies \left[\begin{array}{ccc|c} -4 & 2 & 1 & 0 \\ 0 & -1 & \frac{1}{2} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -4 & 2 & 1 \\ 0 & -1 & \frac{1}{2} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = \frac{t}{2}, v_2 = \frac{t}{2}\}$

Hence the solution is

$$\begin{bmatrix} \frac{t}{2} \\ \frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} \frac{t}{2} \\ \frac{t}{2} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \frac{t}{2} \\ \frac{t}{2} \\ t \end{bmatrix} = t \begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \frac{t}{2} \\ \frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \frac{t}{2} \\ \frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 2 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
0	2	1	Yes	$\begin{bmatrix}1\\1\\0\end{bmatrix}$
2	1	1	No	$\begin{bmatrix}\frac{1}{2}\\\frac{1}{2}\\1\end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue 0 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

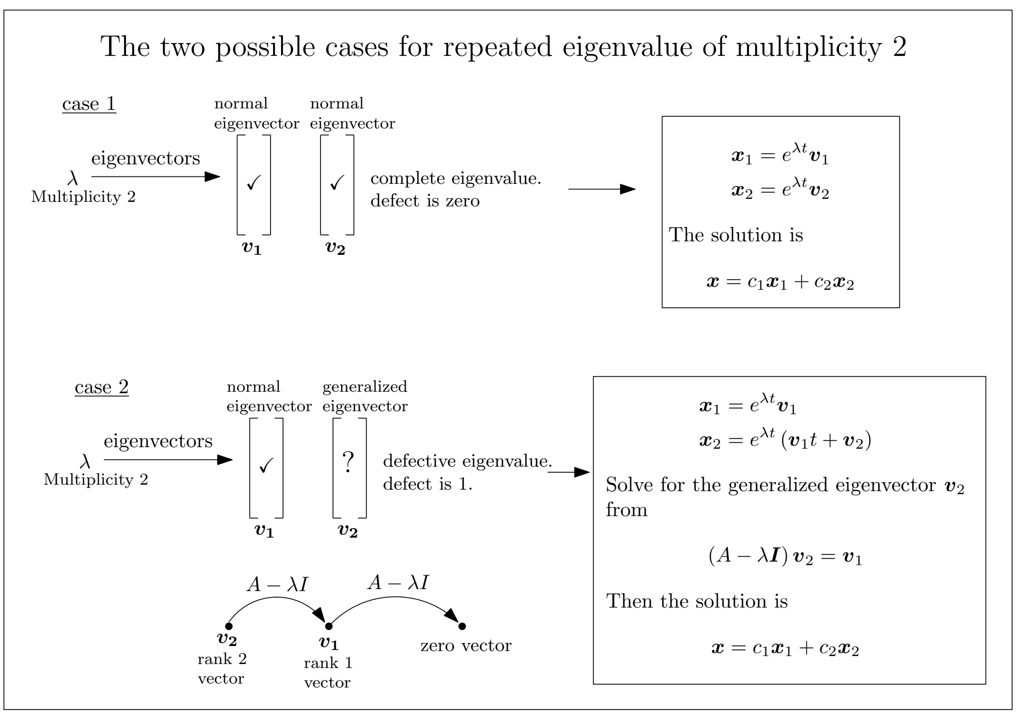

Figure 603: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore

this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} -2 & 2 & 1 \\ -2 & 2 & 1 \\ -3 & 3 & 2 \end{bmatrix} - (0)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} -2 & 2 & 1 \\ -2 & 2 & 1 \\ -3 & 3 & 2 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} -1 \\ 1 \\ -3 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue 0. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned} \vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} 1 \\ &= \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} \end{aligned}$$

And

$$
\begin{aligned}
\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\
&= \left(\begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} t + \begin{bmatrix} -1 \\ 1 \\ -3 \end{bmatrix} \right) 1 \\
&= \begin{bmatrix} -1+t \\ t+1 \\ -3 \end{bmatrix}
\end{aligned}
$$

Since eigenvalue 2 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_3(t) &= \vec{v}_3 e^{2t} \\
&= \begin{bmatrix} \frac{1}{2} \\ \frac{1}{2} \\ 1 \end{bmatrix} e^{2t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} + c_2 \begin{bmatrix} -1+t \\ t+1 \\ -3 \end{bmatrix} + c_3 \begin{bmatrix} \frac{e^{2t}}{2} \\ \frac{e^{2t}}{2} \\ e^{2t} \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} c_1 + c_2(-1+t) + \frac{c_3 e^{2t}}{2} \\ c_1 + c_2 t + c_2 + \frac{c_3 e^{2t}}{2} \\ -3c_2 + c_3 e^{2t} \end{bmatrix}
$$

Since initial conditions are given, the solution above needs to be updated by solving for the constants of integrations using the given initial conditions

$$
\begin{bmatrix} y_1(0) = -6 \\ y_2(0) = -2 \\ y_3(0) = 0 \end{bmatrix} \tag{1}
$$

Substituting initial conditions into the above solution at $t = 0$ gives

$$\begin{bmatrix} -6 \\ -2 \\ 0 \end{bmatrix} = \begin{bmatrix} c_1 - c_2 + \frac{c_3}{2} \\ c_1 + c_2 + \frac{c_3}{2} \\ -3c_2 + c_3 \end{bmatrix}$$

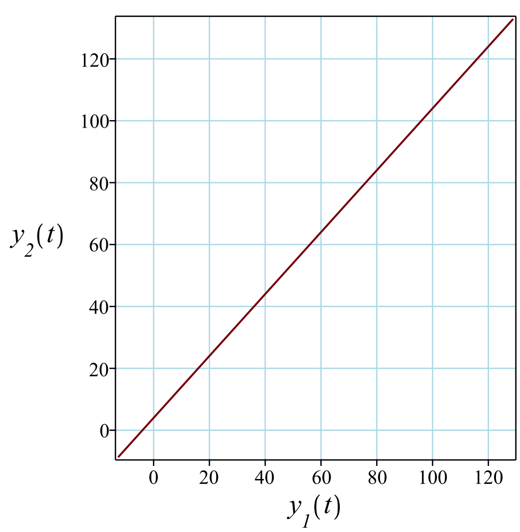
Solving for the constants of integrations gives

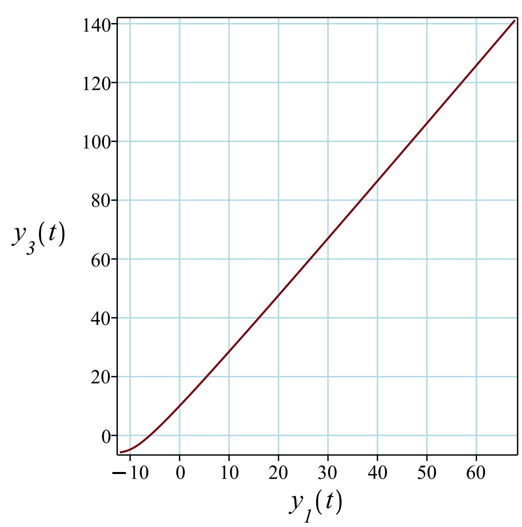
$$\begin{bmatrix} c_1 = -7 \\ c_2 = 2 \\ c_3 = 6 \end{bmatrix}$$

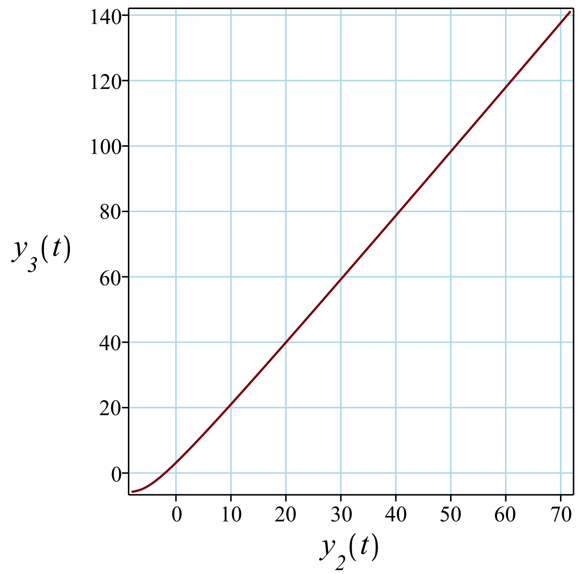
Substituting these constants back in original solution in Eq. (1) gives

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -9 + 2t + 3\,\mathrm{e}^{2t} \\ 2t + 3\,\mathrm{e}^{2t} - 5 \\ 6\,\mathrm{e}^{2t} - 6 \end{bmatrix}$$

The following are plots of each solution against another.







The following are plots of each solution.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -7y_1(t) - 4y_2(t) + 4y_3(t) \\
y_2'(t) &= y_1(t) + y_3(t) \\
y_3'(t) &= -9y_1(t) - 5y_2(t) + 6y_3(t)
\end{aligned}
$$

With initial conditions

$$
[y_1(0) = -6, y_2(0) = 9, y_3(0) = -1]
$$

22.20.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -7 & -4 & 4 \\ 1 & 0 & 1 \\ -9 & -5 & 6 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} e^{-t}\cos(2t) - 3e^{-t}\sin(2t) & -2e^{-t}\sin(2t) & 2e^{-t}\sin(2t) \\ \frac{7e^{-t}\cos(2t)}{4} + \frac{9e^{-t}\sin(2t)}{4} - \frac{7e^{t}}{4} & -\frac{e^{t}}{2} + \frac{3e^{-t}\cos(2t)}{2} + e^{-t}\sin(2t) & -\frac{3e^{-t}\cos(2t)}{2} - e^{-t}\sin(2t) + \frac{3e^{t}}{2} \\ \frac{7e^{-t}\cos(2t)}{4} - \frac{11e^{-t}\sin(2t)}{4} - \frac{7e^{t}}{4} & \frac{e^{-t}\cos(2t)}{2} - 2e^{-t}\sin(2t) - \frac{e^{t}}{2} & \frac{3e^{t}}{2} - \frac{e^{-t}\cos(2t)}{2} + 2e^{-t}\sin(2t) \end{bmatrix}$$

$$= \begin{bmatrix} e^{-t}(\cos(2t) - 3\sin(2t)) & -2e^{-t}\sin(2t) & 2e^{-t}\sin(2t) \\ \frac{(7\cos(2t)+9\sin(2t))e^{-t}}{4} - \frac{7e^{t}}{4} & \frac{(3\cos(2t)+2\sin(2t))e^{-t}}{2} - \frac{e^{t}}{2} & \frac{(-3\cos(2t)-2\sin(2t))e^{-t}}{2} + \frac{3e^{t}}{2} \\ \frac{(7\cos(2t)-11\sin(2t))e^{-t}}{4} - \frac{7e^{t}}{4} & \frac{(\cos(2t)-4\sin(2t))e^{-t}}{2} - \frac{e^{t}}{2} & \frac{(-\cos(2t)+4\sin(2t))e^{-t}}{2} + \frac{3e^{t}}{2} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\vec{x}_h(t) = e^{At}\vec{x}_0$$

$$= \begin{bmatrix} e^{-t}(\cos(2t) - 3\sin(2t)) & -2e^{-t}\sin(2t) & 2e^{-t}\sin(2t) \\ \frac{(7\cos(2t)+9\sin(2t))e^{-t}}{4} - \frac{7e^{t}}{4} & \frac{(3\cos(2t)+2\sin(2t))e^{-t}}{2} - \frac{e^{t}}{2} & \frac{(-3\cos(2t)-2\sin(2t))e^{-t}}{2} + \frac{3e^{t}}{2} \\ \frac{(7\cos(2t)-11\sin(2t))e^{-t}}{4} - \frac{7e^{t}}{4} & \frac{(\cos(2t)-4\sin(2t))e^{-t}}{2} - \frac{e^{t}}{2} & \frac{(-\cos(2t)+4\sin(2t))e^{-t}}{2} + \frac{3e^{t}}{2} \end{bmatrix} \begin{bmatrix} -6 \\ 9 \\ -1 \end{bmatrix}$$

$$= \begin{bmatrix} -6e^{-t}(\cos(2t) - 3\sin(2t)) - 20e^{-t}\sin(2t) \\ -\frac{3(7\cos(2t)+9\sin(2t))e^{-t}}{2} + \frac{9e^{t}}{2} + \frac{9(3\cos(2t)+2\sin(2t))e^{-t}}{2} - \frac{(-3\cos(2t)-2\sin(2t))e^{-t}}{2} \\ -\frac{3(7\cos(2t)-11\sin(2t))e^{-t}}{2} + \frac{9e^{t}}{2} + \frac{9(\cos(2t)-4\sin(2t))e^{-t}}{2} - \frac{(-\cos(2t)+4\sin(2t))e^{-t}}{2} \end{bmatrix}$$

$$= \begin{bmatrix} -2e^{-t}(3\cos(2t) + \sin(2t)) \\ \frac{(9\cos(2t)-7\sin(2t))e^{-t}}{2} + \frac{9e^{t}}{2} \\ \frac{(-11\cos(2t)-7\sin(2t))e^{-t}}{2} + \frac{9e^{t}}{2} \end{bmatrix}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.20.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -7 & -4 & 4 \\ 1 & 0 & 1 \\ -9 & -5 & 6 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -7 & -4 & 4 \\ 1 & 0 & 1 \\ -9 & -5 & 6 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -7-\lambda & -4 & 4 \\ 1 & -\lambda & 1 \\ -9 & -5 & 6-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + \lambda^2 + 3\lambda - 5 = 0$$

The roots of the above are the eigenvalues.

$$\begin{aligned} \lambda_1 &= 1 \\ \lambda_2 &= -1 + 2i \\ \lambda_3 &= -1 - 2i \end{aligned}$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
$-1 - 2i$	1	complex eigenvalue
1	1	real eigenvalue
$-1 + 2i$	1	complex eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -7 & -4 & 4 \\ 1 & 0 & 1 \\ -9 & -5 & 6 \end{bmatrix} - (1)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -8 & -4 & 4 \\ 1 & -1 & 1 \\ -9 & -5 & 5 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -8 & -4 & 4 & 0 \\ 1 & -1 & 1 & 0 \\ -9 & -5 & 5 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{R_1}{8} \Longrightarrow \left[\begin{array}{ccc|c} -8 & -4 & 4 & 0 \\ 0 & -\frac{3}{2} & \frac{3}{2} & 0 \\ -9 & -5 & 5 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{9R_1}{8} \Longrightarrow \left[\begin{array}{ccc|c} -8 & -4 & 4 & 0 \\ 0 & -\frac{3}{2} & \frac{3}{2} & 0 \\ 0 & -\frac{1}{2} & \frac{1}{2} & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{R_2}{3} \Longrightarrow \left[\begin{array}{ccc|c} -8 & -4 & 4 & 0 \\ 0 & -\frac{3}{2} & \frac{3}{2} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -8 & -4 & 4 \\ 0 & -\frac{3}{2} & \frac{3}{2} \\ 0 & 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 0, v_2 = t\}$

Hence the solution is

$$\begin{bmatrix} 0 \\ t \\ t \end{bmatrix} = \begin{bmatrix} 0 \\ t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} 0 \\ t \\ t \end{bmatrix} = t \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} 0 \\ t \\ t \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = -1 - 2i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -7 & -4 & 4 \\ 1 & 0 & 1 \\ -9 & -5 & 6 \end{bmatrix} - (-1 - 2i) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -6 + 2i & -4 & 4 \\ 1 & 1 + 2i & 1 \\ -9 & -5 & 7 + 2i \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -6 + 2i & -4 & 4 & 0 \\ 1 & 1 + 2i & 1 & 0 \\ -9 & -5 & 7 + 2i & 0 \end{array}\right]$$

$$R_2 = R_2 + \left(\frac{3}{20} + \frac{i}{20}\right) R_1 \Longrightarrow \left[\begin{array}{ccc|c} -6+2i & -4 & 4 & 0 \\ 0 & \frac{2}{5}+\frac{9i}{5} & \frac{8}{5}+\frac{i}{5} & 0 \\ -9 & -5 & 7+2i & 0 \end{array}\right]$$

$$R_3 = R_3 + \left(-\frac{27}{20} - \frac{9i}{20}\right) R_1 \Longrightarrow \left[\begin{array}{ccc|c} -6+2i & -4 & 4 & 0 \\ 0 & \frac{2}{5}+\frac{9i}{5} & \frac{8}{5}+\frac{i}{5} & 0 \\ 0 & \frac{2}{5}+\frac{9i}{5} & \frac{8}{5}+\frac{i}{5} & 0 \end{array}\right]$$

$$R_3 = R_3 - R_2 \Longrightarrow \left[\begin{array}{ccc|c} -6+2i & -4 & 4 & 0 \\ 0 & \frac{2}{5}+\frac{9i}{5} & \frac{8}{5}+\frac{i}{5} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -6+2i & -4 & 4 \\ 0 & \frac{2}{5}+\frac{9i}{5} & \frac{8}{5}+\frac{i}{5} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \left(\frac{16}{17} - \frac{4i}{17}\right) t, v_2 = -\frac{5}{17}t + \frac{14}{17}it\right\}$

Hence the solution is

$$\begin{bmatrix} \left(\frac{16}{17} - \frac{4\,\mathrm{I}}{17}\right) t \\ -\frac{5t}{17} + \frac{14\,\mathrm{I}\,t}{17} \\ t \end{bmatrix} = \begin{bmatrix} \left(\frac{16}{17} - \frac{4i}{17}\right) t \\ -\frac{5}{17}t + \frac{14}{17}it \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \left(\frac{16}{17} - \frac{4\,\mathrm{I}}{17}\right) t \\ -\frac{5t}{17} + \frac{14\,\mathrm{I}\,t}{17} \\ t \end{bmatrix} = t \begin{bmatrix} \frac{16}{17} - \frac{4i}{17} \\ \frac{-\frac{5}{17}t+\frac{14}{17}it}{t} \\ 1 \end{bmatrix}$$

Let $t=1$ the eigenvector becomes

$$\begin{bmatrix} \left(\frac{16}{17}-\frac{4\,\mathrm{I}}{17}\right)t \\ -\frac{5t}{17}+\frac{14\,\mathrm{I}\,t}{17} \\ t \end{bmatrix} = \begin{bmatrix} \frac{16}{17}-\frac{4i}{17} \\ -\frac{5}{17}+\frac{14i}{17} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \left(\frac{16}{17}-\frac{4\,\mathrm{I}}{17}\right)t \\ -\frac{5t}{17}+\frac{14\,\mathrm{I}\,t}{17} \\ t \end{bmatrix} = \begin{bmatrix} 16-4i \\ -5+14i \\ 17 \end{bmatrix}$$

Considering the eigenvalue $\lambda_3=-1+2i$

We need to solve $A\vec{v}=\lambda\vec{v}$ or $(A-\lambda I)\vec{v}=\vec{0}$ which becomes

$$\left(\begin{bmatrix} -7 & -4 & 4 \\ 1 & 0 & 1 \\ -9 & -5 & 6 \end{bmatrix} - (-1+2i)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -6-2i & -4 & 4 \\ 1 & 1-2i & 1 \\ -9 & -5 & 7-2i \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -6-2i & -4 & 4 & 0 \\ 1 & 1-2i & 1 & 0 \\ -9 & -5 & 7-2i & 0 \end{array}\right]$$

$$R_2 = R_2 + \left(\frac{3}{20}-\frac{i}{20}\right)R_1 \Longrightarrow \left[\begin{array}{ccc|c} -6-2i & -4 & 4 & 0 \\ 0 & \frac{2}{5}-\frac{9i}{5} & \frac{8}{5}-\frac{i}{5} & 0 \\ -9 & -5 & 7-2i & 0 \end{array}\right]$$

$$R_3 = R_3 + \left(-\frac{27}{20}+\frac{9i}{20}\right)R_1 \Longrightarrow \left[\begin{array}{ccc|c} -6-2i & -4 & 4 & 0 \\ 0 & \frac{2}{5}-\frac{9i}{5} & \frac{8}{5}-\frac{i}{5} & 0 \\ 0 & \frac{2}{5}-\frac{9i}{5} & \frac{8}{5}-\frac{i}{5} & 0 \end{array}\right]$$

$$R_3 = R_3 - R_2 \Longrightarrow \left[\begin{array}{ccc|c} -6-2i & -4 & 4 & 0 \\ 0 & \frac{2}{5}-\frac{9i}{5} & \frac{8}{5}-\frac{i}{5} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -6-2i & -4 & 4 \\ 0 & \frac{2}{5}-\frac{9i}{5} & \frac{8}{5}-\frac{i}{5} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \left(\frac{16}{17} + \frac{4i}{17}\right)t, v_2 = -\frac{5}{17}t - \frac{14}{17}it\right\}$

Hence the solution is

$$\begin{bmatrix} \left(\frac{16}{17} + \frac{4\,\mathrm{I}}{17}\right)t \\ -\frac{5t}{17} - \frac{14\,\mathrm{I}\,t}{17} \\ t \end{bmatrix} = \begin{bmatrix} \left(\frac{16}{17} + \frac{4i}{17}\right)t \\ -\frac{5}{17}t - \frac{14}{17}it \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \left(\frac{16}{17} + \frac{4\,\mathrm{I}}{17}\right)t \\ -\frac{5t}{17} - \frac{14\,\mathrm{I}\,t}{17} \\ t \end{bmatrix} = t \begin{bmatrix} \frac{16}{17} + \frac{4i}{17} \\ \frac{-\frac{5}{17}t - \frac{14}{17}it}{t} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \left(\frac{16}{17} + \frac{4\,\mathrm{I}}{17}\right)t \\ -\frac{5t}{17} - \frac{14\,\mathrm{I}\,t}{17} \\ t \end{bmatrix} = \begin{bmatrix} \frac{16}{17} + \frac{4i}{17} \\ -\frac{5}{17} - \frac{14i}{17} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \left(\frac{16}{17} + \frac{4\,\mathrm{I}}{17}\right)t \\ -\frac{5t}{17} - \frac{14\,\mathrm{I}\,t}{17} \\ t \end{bmatrix} = \begin{bmatrix} 16+4i \\ -5-14i \\ 17 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
1	1	1	No	$\begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$
$-1+2i$	1	1	No	$\begin{bmatrix} \frac{16}{17}+\frac{4i}{17} \\ -\frac{5}{17}-\frac{14i}{17} \\ 1 \end{bmatrix}$
$-1-2i$	1	1	No	$\begin{bmatrix} \frac{16}{17}-\frac{4i}{17} \\ -\frac{5}{17}+\frac{14i}{17} \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue 1 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned} \vec{x}_1(t) &= \vec{v}_1 e^{t} \\ &= \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} e^{t} \end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t) + c_3\vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} 0 \\ e^t \\ e^t \end{bmatrix} + c_2 \begin{bmatrix} \left(\frac{16}{17} + \frac{4i}{17}\right) e^{(-1+2i)t} \\ \left(-\frac{5}{17} - \frac{14i}{17}\right) e^{(-1+2i)t} \\ e^{(-1+2i)t} \end{bmatrix} + c_3 \begin{bmatrix} \left(\frac{16}{17} - \frac{4i}{17}\right) e^{(-1-2i)t} \\ \left(-\frac{5}{17} + \frac{14i}{17}\right) e^{(-1-2i)t} \\ e^{(-1-2i)t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \left(\frac{16}{17} + \frac{4i}{17}\right) c_2 e^{(-1+2i)t} + \left(\frac{16}{17} - \frac{4i}{17}\right) c_3 e^{(-1-2i)t} \\ c_1 e^t + \left(-\frac{5}{17} - \frac{14i}{17}\right) c_2 e^{(-1+2i)t} + \left(-\frac{5}{17} + \frac{14i}{17}\right) c_3 e^{(-1-2i)t} \\ c_1 e^t + c_2 e^{(-1+2i)t} + c_3 e^{(-1-2i)t} \end{bmatrix}$$

Since initial conditions are given, the solution above needs to be updated by solving for the constants of integrations using the given initial conditions

$$\begin{bmatrix} y_1(0) = -6 \\ y_2(0) = 9 \\ y_3(0) = -1 \end{bmatrix} \tag{1}$$

Substituting initial conditions into the above solution at $t = 0$ gives

$$\begin{bmatrix} -6 \\ 9 \\ -1 \end{bmatrix} = \begin{bmatrix} \left(\frac{16}{17} + \frac{4i}{17}\right) c_2 + \left(\frac{16}{17} - \frac{4i}{17}\right) c_3 \\ \left(-\frac{5}{17} - \frac{14i}{17}\right) c_2 + \left(-\frac{5}{17} + \frac{14i}{17}\right) c_3 + c_1 \\ c_1 + c_2 + c_3 \end{bmatrix}$$

Solving for the constants of integrations gives

$$\begin{bmatrix} c_1 = \frac{9}{2} \\ c_2 = -\frac{11}{4} + \frac{7i}{4} \\ c_3 = -\frac{11}{4} - \frac{7i}{4} \end{bmatrix}$$

Substituting these constants back in original solution in Eq. (1) gives

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} (-3+i) e^{(-1+2i)t} + (-3-i) e^{(-1-2i)t} \\ \frac{9 e^t}{2} + \left(\frac{9}{4} + \frac{7i}{4}\right) e^{(-1+2i)t} + \left(\frac{9}{4} - \frac{7i}{4}\right) e^{(-1-2i)t} \\ \frac{9 e^t}{2} + \left(-\frac{11}{4} + \frac{7i}{4}\right) e^{(-1+2i)t} + \left(-\frac{11}{4} - \frac{7i}{4}\right) e^{(-1-2i)t} \end{bmatrix}$$

The following are plots of each solution against another.

ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -y_1(t) - 4y_2(t) - y_3(t) \\
y_2'(t) &= 3y_1(t) + 6y_2(t) + y_3(t) \\
y_3'(t) &= -3y_1(t) - 2y_2(t) + 3y_3(t)
\end{aligned}
$$

With initial conditions

$$
[y_1(0) = -2, y_2(0) = 1, y_3(0) = 3]
$$

22.21.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -1 & -4 & -1 \\ 3 & 6 & 1 \\ -3 & -2 & 3 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} e^{2t}(1-3t) & -3\,e^{2t}t + \frac{e^{2t}}{2} - \frac{e^{4t}}{2} & -\frac{e^{4t}}{2} + \frac{e^{2t}}{2} \\ 3\,e^{2t}t & \frac{e^{2t}}{2} + 3\,e^{2t}t + \frac{e^{4t}}{2} & \frac{e^{4t}}{2} - \frac{e^{2t}}{2} \\ -3\,e^{2t}t & -3\,e^{2t}t - \frac{e^{2t}}{2} + \frac{e^{4t}}{2} & \frac{e^{2t}}{2} + \frac{e^{4t}}{2} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned} \vec{x}_h(t) &= e^{At}\vec{x}_0 \\ &= \begin{bmatrix} e^{2t}(1-3t) & -3\,e^{2t}t + \frac{e^{2t}}{2} - \frac{e^{4t}}{2} & -\frac{e^{4t}}{2} + \frac{e^{2t}}{2} \\ 3\,e^{2t}t & \frac{e^{2t}}{2} + 3\,e^{2t}t + \frac{e^{4t}}{2} & \frac{e^{4t}}{2} - \frac{e^{2t}}{2} \\ -3\,e^{2t}t & -3\,e^{2t}t - \frac{e^{2t}}{2} + \frac{e^{4t}}{2} & \frac{e^{2t}}{2} + \frac{e^{4t}}{2} \end{bmatrix} \begin{bmatrix} -2 \\ 1 \\ 3 \end{bmatrix} \\ &= \begin{bmatrix} -2\,e^{2t}(1-3t) - 3\,e^{2t}t + 2\,e^{2t} - 2\,e^{4t} \\ -3\,e^{2t}t - e^{2t} + 2\,e^{4t} \\ 3\,e^{2t}t + e^{2t} + 2\,e^{4t} \end{bmatrix} \\ &= \begin{bmatrix} 3\,e^{2t}t - 2\,e^{4t} \\ (-3t-1)\,e^{2t} + 2\,e^{4t} \\ 3\,e^{2t}t + e^{2t} + 2\,e^{4t} \end{bmatrix} \end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.21.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -1 & -4 & -1 \\ 3 & 6 & 1 \\ -3 & -2 & 3 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -1 & -4 & -1 \\ 3 & 6 & 1 \\ -3 & -2 & 3 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -1-\lambda & -4 & -1 \\ 3 & 6-\lambda & 1 \\ -3 & -2 & 3-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 8\lambda^2 + 20\lambda - 16 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 2$$
$$\lambda_2 = 4$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
2	1	real eigenvalue
4	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -1 & -4 & -1 \\ 3 & 6 & 1 \\ -3 & -2 & 3 \end{bmatrix} - (2) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -3 & -4 & -1 \\ 3 & 4 & 1 \\ -3 & -2 & 1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -3 & -4 & -1 & 0 \\ 3 & 4 & 1 & 0 \\ -3 & -2 & 1 & 0 \end{array}\right]$$

$$R_2 = R_2 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} -3 & -4 & -1 & 0 \\ 0 & 0 & 0 & 0 \\ -3 & -2 & 1 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} -3 & -4 & -1 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 2 & 2 & 0 \end{array}\right]$$

Since the current pivot $A(2,2)$ is zero, then the current pivot row is replaced with a row with a non-zero pivot. Swapping row 2 and row 3 gives

$$\left[\begin{array}{ccc|c} -3 & -4 & -1 & 0 \\ 0 & 2 & 2 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -3 & -4 & -1 \\ 0 & 2 & 2 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t, v_2 = -t\}$

Hence the solution is

$$\begin{bmatrix} t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} t \\ -t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ -t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 4$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -1 & -4 & -1 \\ 3 & 6 & 1 \\ -3 & -2 & 3 \end{bmatrix} - (4) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -5 & -4 & -1 \\ 3 & 2 & 1 \\ -3 & -2 & -1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -5 & -4 & -1 & 0 \\ 3 & 2 & 1 & 0 \\ -3 & -2 & -1 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{3R_1}{5} \Longrightarrow \left[\begin{array}{ccc|c} -5 & -4 & -1 & 0 \\ 0 & -\frac{2}{5} & \frac{2}{5} & 0 \\ -3 & -2 & -1 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{3R_1}{5} \Longrightarrow \left[\begin{array}{ccc|c} -5 & -4 & -1 & 0 \\ 0 & -\frac{2}{5} & \frac{2}{5} & 0 \\ 0 & \frac{2}{5} & -\frac{2}{5} & 0 \end{array}\right]$$

$$R_3 = R_3 + R_2 \Longrightarrow \left[\begin{array}{ccc|c} -5 & -4 & -1 & 0 \\ 0 & -\frac{2}{5} & \frac{2}{5} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -5 & -4 & -1 \\ 0 & -\frac{2}{5} & \frac{2}{5} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_2 = t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
2	2	1	Yes	$\left[\begin{array}{c} 1 \\ -1 \\ 1 \end{array}\right]$
4	1	1	No	$\left[\begin{array}{c} -1 \\ 1 \\ 1 \end{array}\right]$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue 2 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

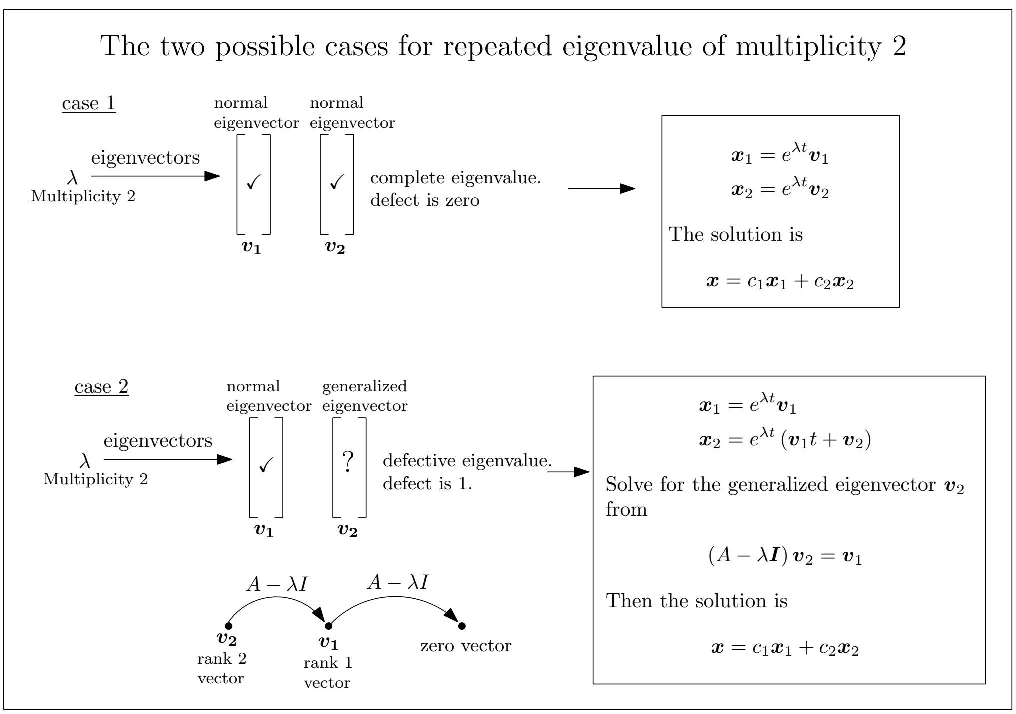

Figure 604: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore

this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} -1 & -4 & -1 \\ 3 & 6 & 1 \\ -3 & -2 & 3 \end{bmatrix} - (2)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$
$$\begin{bmatrix} -3 & -4 & -1 \\ 3 & 4 & 1 \\ -3 & -2 & 1 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} -\frac{4}{3} \\ 1 \\ -1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue 2. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned} \vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} \mathrm{e}^{2t} \\ &= \begin{bmatrix} \mathrm{e}^{2t} \\ -\mathrm{e}^{2t} \\ \mathrm{e}^{2t} \end{bmatrix} \end{aligned}$$

And

$$
\begin{aligned}
\vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\
&= \left(\begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} t + \begin{bmatrix} -\frac{4}{3} \\ 1 \\ -1 \end{bmatrix} \right) \mathrm{e}^{2t} \\
&= \begin{bmatrix} \frac{\mathrm{e}^{2t}(3t-4)}{3} \\ -\mathrm{e}^{2t}(-1+t) \\ \mathrm{e}^{2t}(-1+t) \end{bmatrix}
\end{aligned}
$$

Since eigenvalue 4 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_3(t) &= \vec{v}_3 e^{4t} \\
&= \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix} e^{4t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} \mathrm{e}^{2t} \\ -\mathrm{e}^{2t} \\ \mathrm{e}^{2t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{2t}\left(t - \frac{4}{3}\right) \\ \mathrm{e}^{2t}(1-t) \\ \mathrm{e}^{2t}(-1+t) \end{bmatrix} + c_3 \begin{bmatrix} -\mathrm{e}^{4t} \\ \mathrm{e}^{4t} \\ \mathrm{e}^{4t} \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \frac{((3t-4)c_2 + 3c_1)\mathrm{e}^{2t}}{3} - c_3 \mathrm{e}^{4t} \\ ((1-t)\, c_2 - c_1)\, \mathrm{e}^{2t} + c_3 \mathrm{e}^{4t} \\ ((-1+t)\, c_2 + c_1)\, \mathrm{e}^{2t} + c_3 \mathrm{e}^{4t} \end{bmatrix}
$$

Since initial conditions are given, the solution above needs to be updated by solving for the constants of integrations using the given initial conditions

$$
\begin{bmatrix} y_1(0) = -2 \\ y_2(0) = 1 \\ y_3(0) = 3 \end{bmatrix} \tag{1}
$$

Substituting initial conditions into the above solution at $t = 0$ gives

$$\begin{bmatrix} -2 \\ 1 \\ 3 \end{bmatrix} = \begin{bmatrix} -\frac{4c_2}{3} + c_1 - c_3 \\ c_2 - c_1 + c_3 \\ -c_2 + c_1 + c_3 \end{bmatrix}$$

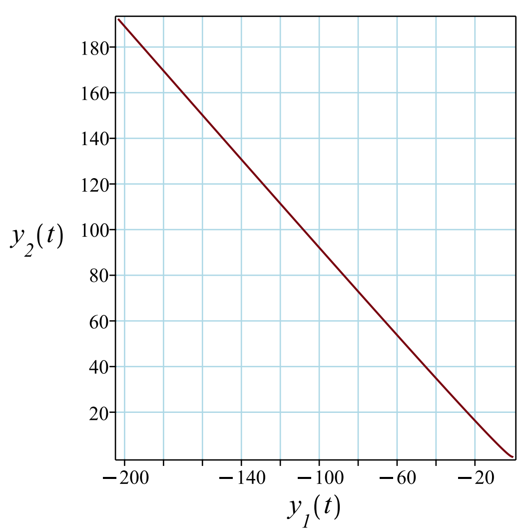
Solving for the constants of integrations gives

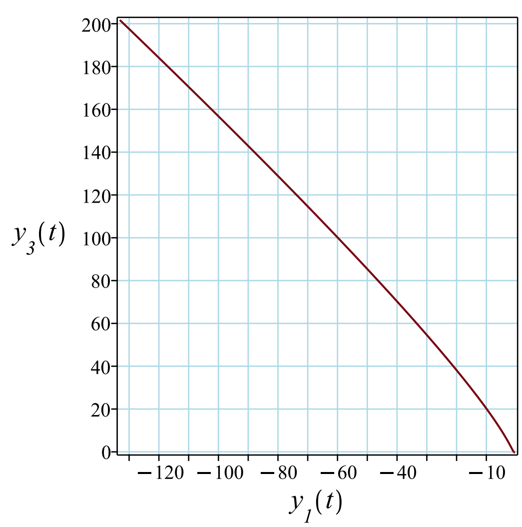
$$\begin{bmatrix} c_1 = 4 \\ c_2 = 3 \\ c_3 = 2 \end{bmatrix}$$

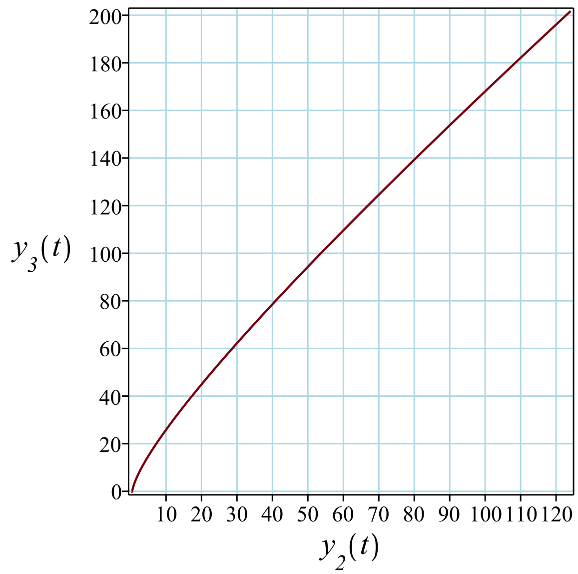
Substituting these constants back in original solution in Eq. (1) gives

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} 3\,e^{2t}t - 2\,e^{4t} \\ (-3t-1)\,e^{2t} + 2\,e^{4t} \\ e^{2t}(1+3t) + 2\,e^{4t} \end{bmatrix}$$

The following are plots of each solution against another.







The following are plots of each solution.

ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= 4y_1(t) - 8y_2(t) - 4y_3(t) \\
y_2'(t) &= -3y_1(t) - y_2(t) - 4y_3(t) \\
y_3'(t) &= y_1(t) - y_2(t) + 9y_3(t)
\end{aligned}
$$

With initial conditions

$$
[y_1(0) = -4, y_2(0) = 1, y_3(0) = -3]
$$

22.22.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 4 & -8 & -4 \\ -3 & -1 & -4 \\ 1 & -1 & 9 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} -\frac{(22\,e^{13t}-130\,e^{11t}-35)e^{-4t}}{143} & \frac{2(11\,e^{13t}-65\,e^{11t}+54)e^{-4t}}{143} & -\frac{4(e^{13t}-1)e^{-4t}}{13} \\ -\frac{(22\,e^{13t}+13\,e^{11t}-35)e^{-4t}}{143} & \frac{(22\,e^{13t}+13\,e^{11t}+108)e^{-4t}}{143} & -\frac{4(e^{13t}-1)e^{-4t}}{13} \\ \frac{e^{9t}}{2}-\frac{e^{7t}}{2} & -\frac{e^{9t}}{2}+\frac{e^{7t}}{2} & e^{9t} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned} \vec{x}_h(t) &= e^{At}\vec{x}_0 \\ &= \begin{bmatrix} -\frac{(22\,e^{13t}-130\,e^{11t}-35)e^{-4t}}{143} & \frac{2(11\,e^{13t}-65\,e^{11t}+54)e^{-4t}}{143} & -\frac{4(e^{13t}-1)e^{-4t}}{13} \\ -\frac{(22\,e^{13t}+13\,e^{11t}-35)e^{-4t}}{143} & \frac{(22\,e^{13t}+13\,e^{11t}+108)e^{-4t}}{143} & -\frac{4(e^{13t}-1)e^{-4t}}{13} \\ \frac{e^{9t}}{2}-\frac{e^{7t}}{2} & -\frac{e^{9t}}{2}+\frac{e^{7t}}{2} & e^{9t} \end{bmatrix} \begin{bmatrix} -4 \\ 1 \\ -3 \end{bmatrix} \\ &= \begin{bmatrix} \frac{4(22\,e^{13t}-130\,e^{11t}-35)e^{-4t}}{143} + \frac{2(11\,e^{13t}-65\,e^{11t}+54)e^{-4t}}{143} + \frac{12(e^{13t}-1)e^{-4t}}{13} \\ \frac{4(22\,e^{13t}+13\,e^{11t}-35)e^{-4t}}{143} + \frac{(22\,e^{13t}+13\,e^{11t}+108)e^{-4t}}{143} + \frac{12(e^{13t}-1)e^{-4t}}{13} \\ -\frac{11\,e^{9t}}{2}+\frac{5\,e^{7t}}{2} \end{bmatrix} \\ &= \begin{bmatrix} \frac{2(121\,e^{13t}-325\,e^{11t}-82)e^{-4t}}{143} \\ \frac{(242\,e^{13t}+65\,e^{11t}-164)e^{-4t}}{143} \\ -\frac{11\,e^{9t}}{2}+\frac{5\,e^{7t}}{2} \end{bmatrix} \end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.22.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 4 & -8 & -4 \\ -3 & -1 & -4 \\ 1 & -1 & 9 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 4 & -8 & -4 \\ -3 & -1 & -4 \\ 1 & -1 & 9 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 4-\lambda & -8 & -4 \\ -3 & -1-\lambda & -4 \\ 1 & -1 & 9-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 12\lambda^2 - \lambda + 252 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 7$$
$$\lambda_2 = -4$$
$$\lambda_3 = 9$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-4	1	real eigenvalue
7	1	real eigenvalue
9	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -4$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 4 & -8 & -4 \\ -3 & -1 & -4 \\ 1 & -1 & 9 \end{bmatrix} - (-4)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 8 & -8 & -4 \\ -3 & 3 & -4 \\ 1 & -1 & 13 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 8 & -8 & -4 & 0 \\ -3 & 3 & -4 & 0 \\ 1 & -1 & 13 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{3R_1}{8} \Longrightarrow \left[\begin{array}{ccc|c} 8 & -8 & -4 & 0 \\ 0 & 0 & -\frac{11}{2} & 0 \\ 1 & -1 & 13 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{R_1}{8} \Longrightarrow \left[\begin{array}{ccc|c} 8 & -8 & -4 & 0 \\ 0 & 0 & -\frac{11}{2} & 0 \\ 0 & 0 & \frac{27}{2} & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{27R_2}{11} \Longrightarrow \left[\begin{array}{ccc|c} 8 & -8 & -4 & 0 \\ 0 & 0 & -\frac{11}{2} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 8 & -8 & -4 \\ 0 & 0 & -\frac{11}{2} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1, v_3\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t, v_3 = 0\}$

Hence the solution is

$$\begin{bmatrix} t \\ t \\ 0 \end{bmatrix} = \begin{bmatrix} t \\ t \\ 0 \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ t \\ 0 \end{bmatrix} = t \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ t \\ 0 \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 7$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 4 & -8 & -4 \\ -3 & -1 & -4 \\ 1 & -1 & 9 \end{bmatrix} - (7) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -3 & -8 & -4 \\ -3 & -8 & -4 \\ 1 & -1 & 2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -3 & -8 & -4 & 0 \\ -3 & -8 & -4 & 0 \\ 1 & -1 & 2 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} -3 & -8 & -4 & 0 \\ 0 & 0 & 0 & 0 \\ 1 & -1 & 2 & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{R_1}{3} \Longrightarrow \left[\begin{array}{ccc|c} -3 & -8 & -4 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & -\frac{11}{3} & \frac{2}{3} & 0 \end{array}\right]$$

Since the current pivot $A(2,2)$ is zero, then the current pivot row is replaced with a row with a non-zero pivot. Swapping row 2 and row 3 gives

$$\left[\begin{array}{ccc|c} -3 & -8 & -4 & 0 \\ 0 & -\frac{11}{3} & \frac{2}{3} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -3 & -8 & -4 \\ 0 & -\frac{11}{3} & \frac{2}{3} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = -\frac{20t}{11}, v_2 = \frac{2t}{11}\right\}$

Hence the solution is

$$\begin{bmatrix} -\frac{20t}{11} \\ \frac{2t}{11} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{20t}{11} \\ \frac{2t}{11} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -\frac{20t}{11} \\ \frac{2t}{11} \\ t \end{bmatrix} = t \begin{bmatrix} -\frac{20}{11} \\ \frac{2}{11} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -\frac{20t}{11} \\ \frac{2t}{11} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{20}{11} \\ \frac{2}{11} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} -\frac{20t}{11} \\ \frac{2t}{11} \\ t \end{bmatrix} = \begin{bmatrix} -20 \\ 2 \\ 11 \end{bmatrix}$$

Considering the eigenvalue $\lambda_3 = 9$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 4 & -8 & -4 \\ -3 & -1 & -4 \\ 1 & -1 & 9 \end{bmatrix} - (9)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -5 & -8 & -4 \\ -3 & -10 & -4 \\ 1 & -1 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -5 & -8 & -4 & 0 \\ -3 & -10 & -4 & 0 \\ 1 & -1 & 0 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{3R_1}{5} \implies \left[\begin{array}{ccc|c} -5 & -8 & -4 & 0 \\ 0 & -\frac{26}{5} & -\frac{8}{5} & 0 \\ 1 & -1 & 0 & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{R_1}{5} \implies \left[\begin{array}{ccc|c} -5 & -8 & -4 & 0 \\ 0 & -\frac{26}{5} & -\frac{8}{5} & 0 \\ 0 & -\frac{13}{5} & -\frac{4}{5} & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{R_2}{2} \implies \left[\begin{array}{ccc|c} -5 & -8 & -4 & 0 \\ 0 & -\frac{26}{5} & -\frac{8}{5} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -5 & -8 & -4 \\ 0 & -\frac{26}{5} & -\frac{8}{5} \\ 0 & 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = -\frac{4t}{13}, v_2 = -\frac{4t}{13}\right\}$

Hence the solution is

$$\begin{bmatrix} -\frac{4t}{13} \\ -\frac{4t}{13} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{4t}{13} \\ -\frac{4t}{13} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -\frac{4t}{13} \\ -\frac{4t}{13} \\ t \end{bmatrix} = t \begin{bmatrix} -\frac{4}{13} \\ -\frac{4}{13} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -\frac{4t}{13} \\ -\frac{4t}{13} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{4}{13} \\ -\frac{4}{13} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} -\frac{4t}{13} \\ -\frac{4t}{13} \\ t \end{bmatrix} = \begin{bmatrix} -4 \\ -4 \\ 13 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
7	1	1	No	$\begin{bmatrix} -\frac{20}{11} \\ \frac{2}{11} \\ 1 \end{bmatrix}$
-4	1	1	No	$\begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}$
9	1	1	No	$\begin{bmatrix} -\frac{4}{13} \\ -\frac{4}{13} \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue 7 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{7t} \\
&= \begin{bmatrix} -\frac{20}{11} \\ \frac{2}{11} \\ 1 \end{bmatrix} e^{7t}
\end{aligned}$$

Since eigenvalue -4 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned}
\vec{x}_2(t) &= \vec{v}_2 e^{-4t} \\
&= \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} e^{-4t}
\end{aligned}$$

Since eigenvalue 9 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_3(t) &= \vec{v}_3 e^{9t} \\
&= \begin{bmatrix} -\frac{4}{13} \\ -\frac{4}{13} \\ 1 \end{bmatrix} e^{9t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} -\frac{20\,\mathrm{e}^{7t}}{11} \\ \frac{2\,\mathrm{e}^{7t}}{11} \\ \mathrm{e}^{7t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{-4t} \\ \mathrm{e}^{-4t} \\ 0 \end{bmatrix} + c_3 \begin{bmatrix} -\frac{4\,\mathrm{e}^{9t}}{13} \\ -\frac{4\,\mathrm{e}^{9t}}{13} \\ \mathrm{e}^{9t} \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -\frac{(44c_3\mathrm{e}^{13t}+260c_1\mathrm{e}^{11t}-143c_2)\mathrm{e}^{-4t}}{143} \\ -\frac{(44c_3\mathrm{e}^{13t}-26c_1\mathrm{e}^{11t}-143c_2)\mathrm{e}^{-4t}}{143} \\ c_1\mathrm{e}^{7t}+c_3\mathrm{e}^{9t} \end{bmatrix}
$$

Since initial conditions are given, the solution above needs to be updated by solving for the constants of integrations using the given initial conditions

$$
\begin{bmatrix} y_1(0) = -4 \\ y_2(0) = 1 \\ y_3(0) = -3 \end{bmatrix} \tag{1}
$$

Substituting initial conditions into the above solution at $t = 0$ gives

$$
\begin{bmatrix} -4 \\ 1 \\ -3 \end{bmatrix} = \begin{bmatrix} -\frac{4c_3}{13} - \frac{20c_1}{11} + c_2 \\ -\frac{4c_3}{13} + \frac{2c_1}{11} + c_2 \\ c_1 + c_3 \end{bmatrix}
$$

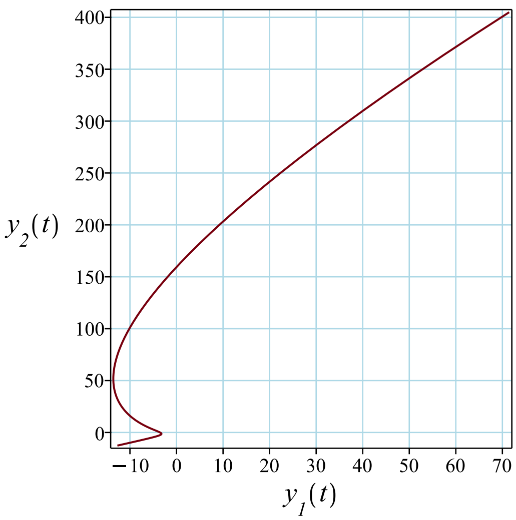
Solving for the constants of integrations gives

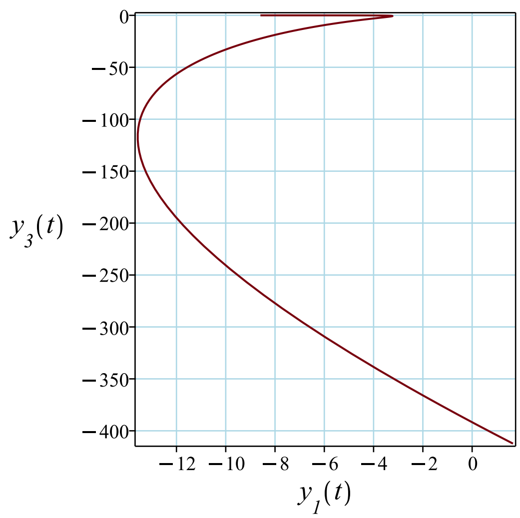
$$
\begin{bmatrix} c_1 = \frac{5}{2} \\ c_2 = -\frac{164}{143} \\ c_3 = -\frac{11}{2} \end{bmatrix}
$$

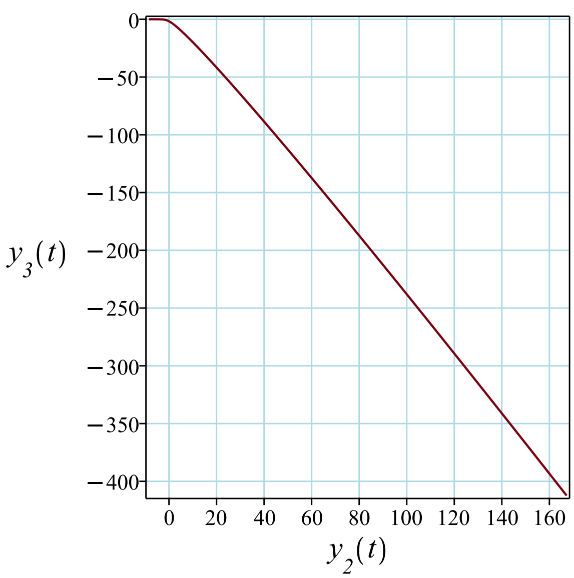
Substituting these constants back in original solution in Eq. (1) gives

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -\frac{\left(-242\,e^{13t}+650\,e^{11t}+164\right)e^{-4t}}{143} \\ -\frac{\left(-242\,e^{13t}-65\,e^{11t}+164\right)e^{-4t}}{143} \\ -\frac{11\,e^{9t}}{2}+\frac{5\,e^{7t}}{2} \end{bmatrix}$$

The following are plots of each solution against another.







The following are plots of each solution.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -5y_1(t) - y_2(t) + 11y_3(t) \\
y_2'(t) &= -7y_1(t) + y_2(t) + 13y_3(t) \\
y_3'(t) &= -4y_1(t) + 8y_3(t)
\end{aligned}
$$

With initial conditions

$$[y_1(0) = 0, y_2(0) = 2, y_3(0) = 2]$$

22.23.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -5 & -1 & 11 \\ -7 & 1 & 13 \\ -4 & 0 & 8 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{7}{4} - 2t - \frac{3\,e^{4t}}{4} & \frac{e^{4t}}{4} - \frac{1}{4} - 2t & \frac{5\,e^{4t}}{4} - \frac{5}{4} + 6t \\ -t - \frac{3\,e^{4t}}{2} + \frac{3}{2} & \frac{1}{2} + \frac{e^{4t}}{2} - t & \frac{5\,e^{4t}}{2} - \frac{5}{2} + 3t \\ -t - \frac{3\,e^{4t}}{4} + \frac{3}{4} & \frac{e^{4t}}{4} - \frac{1}{4} - t & -\frac{1}{4} + \frac{5\,e^{4t}}{4} + 3t \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned} \vec{x}_h(t) &= e^{At}\vec{x}_0 \\ &= \begin{bmatrix} \frac{7}{4} - 2t - \frac{3\,e^{4t}}{4} & \frac{e^{4t}}{4} - \frac{1}{4} - 2t & \frac{5\,e^{4t}}{4} - \frac{5}{4} + 6t \\ -t - \frac{3\,e^{4t}}{2} + \frac{3}{2} & \frac{1}{2} + \frac{e^{4t}}{2} - t & \frac{5\,e^{4t}}{2} - \frac{5}{2} + 3t \\ -t - \frac{3\,e^{4t}}{4} + \frac{3}{4} & \frac{e^{4t}}{4} - \frac{1}{4} - t & -\frac{1}{4} + \frac{5\,e^{4t}}{4} + 3t \end{bmatrix} \begin{bmatrix} 0 \\ 2 \\ 2 \end{bmatrix} \\ &= \begin{bmatrix} -3 + 3\,e^{4t} + 8t \\ -4 + 6\,e^{4t} + 4t \\ -1 + 3\,e^{4t} + 4t \end{bmatrix} \end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.23.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -5 & -1 & 11 \\ -7 & 1 & 13 \\ -4 & 0 & 8 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -5 & -1 & 11 \\ -7 & 1 & 13 \\ -4 & 0 & 8 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -5-\lambda & -1 & 11 \\ -7 & 1-\lambda & 13 \\ -4 & 0 & 8-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 4\lambda^2 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 0$$
$$\lambda_2 = 4$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
0	1	real eigenvalue
4	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 0$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -5 & -1 & 11 \\ -7 & 1 & 13 \\ -4 & 0 & 8 \end{bmatrix} - (0)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} -5 & -1 & 11 \\ -7 & 1 & 13 \\ -4 & 0 & 8 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -5 & -1 & 11 & 0 \\ -7 & 1 & 13 & 0 \\ -4 & 0 & 8 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{7R_1}{5} \Longrightarrow \left[\begin{array}{ccc|c} -5 & -1 & 11 & 0 \\ 0 & \frac{12}{5} & -\frac{12}{5} & 0 \\ -4 & 0 & 8 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{4R_1}{5} \Longrightarrow \left[\begin{array}{ccc|c} -5 & -1 & 11 & 0 \\ 0 & \frac{12}{5} & -\frac{12}{5} & 0 \\ 0 & \frac{4}{5} & -\frac{4}{5} & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{R_2}{3} \Longrightarrow \left[\begin{array}{ccc|c} -5 & -1 & 11 & 0 \\ 0 & \frac{12}{5} & -\frac{12}{5} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -5 & -1 & 11 \\ 0 & \frac{12}{5} & -\frac{12}{5} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 2t, v_2 = t\}$

Hence the solution is

$$\begin{bmatrix} 2t \\ t \\ t \end{bmatrix} = \begin{bmatrix} 2t \\ t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} 2t \\ t \\ t \end{bmatrix} = t \begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} 2t \\ t \\ t \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 4$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -5 & -1 & 11 \\ -7 & 1 & 13 \\ -4 & 0 & 8 \end{bmatrix} - (4)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -9 & -1 & 11 \\ -7 & -3 & 13 \\ -4 & 0 & 4 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -9 & -1 & 11 & 0 \\ -7 & -3 & 13 & 0 \\ -4 & 0 & 4 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{7R_1}{9} \Longrightarrow \left[\begin{array}{ccc|c} -9 & -1 & 11 & 0 \\ 0 & -\frac{20}{9} & \frac{40}{9} & 0 \\ -4 & 0 & 4 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{4R_1}{9} \Longrightarrow \left[\begin{array}{ccc|c} -9 & -1 & 11 & 0 \\ 0 & -\frac{20}{9} & \frac{40}{9} & 0 \\ 0 & \frac{4}{9} & -\frac{8}{9} & 0 \end{array}\right]$$

$$R_3 = R_3 + \frac{R_2}{5} \Longrightarrow \left[\begin{array}{ccc|c} -9 & -1 & 11 & 0 \\ 0 & -\frac{20}{9} & \frac{40}{9} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -9 & -1 & 11 \\ 0 & -\frac{20}{9} & \frac{40}{9} \\ 0 & 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t, v_2 = 2t\}$

Hence the solution is

$$\begin{bmatrix} t \\ 2t \\ t \end{bmatrix} = \begin{bmatrix} t \\ 2t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ 2t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ 2t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
0	2	1	Yes	$\begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix}$
4	1	1	No	$\begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue 0 is real and repated eigenvalue of multiplicity 2.There are two possible cases that can happen. This is illustrated in this diagram

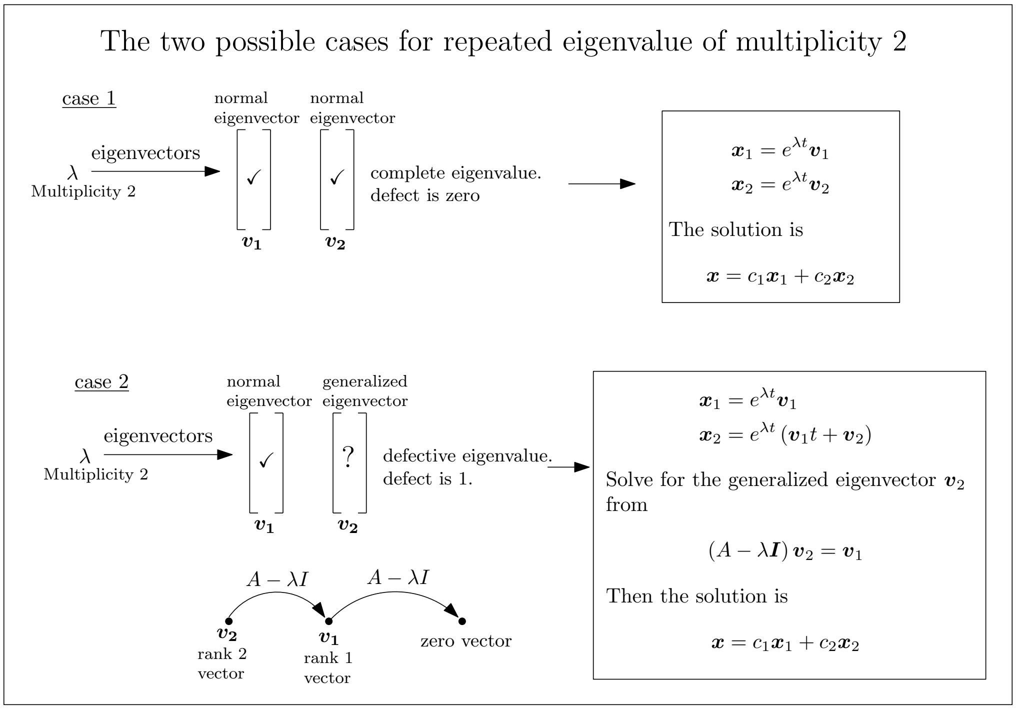

Figure 605: Possible case for repeated λ of multiplicity 2

This eigenvalue has algebraic multiplicity of 2, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to generate the missing additonal generalized eigevector $\vec{v}_2$ by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence we need to solve

$$\left(\begin{bmatrix} -5 & -1 & 11 \\ -7 & 1 & 13 \\ -4 & 0 & 8 \end{bmatrix} - (0)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} -5 & -1 & 11 \\ -7 & 1 & 13 \\ -4 & 0 & 8 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} \frac{7}{4} \\ \frac{1}{4} \\ 1 \end{bmatrix}$$

We have found two generalized eigenvectors for eigenvalue 0. Therefore the two basis solution associated with this eigenvalue are

$$\begin{aligned} \vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix} 1 \\ &= \begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix} \end{aligned}$$

And

$$\begin{aligned} \vec{x}_2(t) &= (\vec{v}_1 t + \vec{v}_2)\, e^{\lambda t} \\ &= \left(\begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix} t + \begin{bmatrix} \frac{7}{4} \\ \frac{1}{4} \\ 1 \end{bmatrix}\right) 1 \\ &= \begin{bmatrix} 2t + \frac{7}{4} \\ t + \frac{1}{4} \\ t + 1 \end{bmatrix} \end{aligned}$$

Since eigenvalue 4 is real and distinct then the corresponding eigenvector solution is

$$\vec{x}_3(t) = \vec{v}_3 e^{4t}$$
$$= \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix} e^{4t}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t) + c_3\vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix} + c_2 \begin{bmatrix} 2t + \frac{7}{4} \\ t + \frac{1}{4} \\ t + 1 \end{bmatrix} + c_3 \begin{bmatrix} \mathrm{e}^{4t} \\ 2\,\mathrm{e}^{4t} \\ \mathrm{e}^{4t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} 2c_1 + 2c_2 t + \frac{7c_2}{4} + c_3 \mathrm{e}^{4t} \\ c_1 + c_2 t + \frac{c_2}{4} + 2c_3 \mathrm{e}^{4t} \\ c_3 \mathrm{e}^{4t} + c_2 t + c_1 + c_2 \end{bmatrix}$$

Since initial conditions are given, the solution above needs to be updated by solving for the constants of integrations using the given initial conditions

$$\begin{bmatrix} y_1(0) = 0 \\ y_2(0) = 2 \\ y_3(0) = 2 \end{bmatrix} \tag{1}$$

Substituting initial conditions into the above solution at $t = 0$ gives

$$\begin{bmatrix} 0 \\ 2 \\ 2 \end{bmatrix} = \begin{bmatrix} 2c_1 + \frac{7c_2}{4} + c_3 \\ c_1 + \frac{c_2}{4} + 2c_3 \\ c_3 + c_1 + c_2 \end{bmatrix}$$

Solving for the constants of integrations gives

$$\begin{bmatrix} c_1 = -5 \\ c_2 = 4 \\ c_3 = 3 \end{bmatrix}$$

Substituting these constants back in original solution in Eq. (1) gives

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -3 + 3\,\mathrm{e}^{4t} + 8t \\ -4 + 6\,\mathrm{e}^{4t} + 4t \\ -1 + 3\,\mathrm{e}^{4t} + 4t \end{bmatrix}$$

The following are plots of each solution against another.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= 5y_1(t) - y_2(t) + y_3(t) \\
y_2'(t) &= -y_1(t) + 9y_2(t) - 3y_3(t) \\
y_3'(t) &= -2y_1(t) + 2y_2(t) + 4y_3(t)
\end{aligned}
$$

22.24.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 5 & -1 & 1 \\ -1 & 9 & -3 \\ -2 & 2 & 4 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} \mathrm{e}^{6t}(1-t) & -t\,\mathrm{e}^{6t} & t\,\mathrm{e}^{6t} \\ \mathrm{e}^{6t}t(2t-1) & \mathrm{e}^{6t}(2t^2+3t+1) & \mathrm{e}^{6t}(-2t^2-3t) \\ 2\,\mathrm{e}^{6t}t(-1+t) & 2\,\mathrm{e}^{6t}t(t+1) & \mathrm{e}^{6t}(-2t^2-2t+1) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{6t}(1-t) & -t\,e^{6t} & t\,e^{6t} \\ e^{6t}t(2t-1) & e^{6t}(2t^2+3t+1) & e^{6t}(-2t^2-3t) \\ 2\,e^{6t}t(-1+t) & 2\,e^{6t}t(t+1) & e^{6t}(-2t^2-2t+1) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} e^{6t}(1-t)\,c_1 - t\,e^{6t}c_2 + t\,e^{6t}c_3 \\ e^{6t}t(2t-1)\,c_1 + e^{6t}(2t^2+3t+1)\,c_2 + e^{6t}(-2t^2-3t)\,c_3 \\ 2\,e^{6t}t(-1+t)\,c_1 + 2\,e^{6t}t(t+1)\,c_2 + e^{6t}(-2t^2-2t+1)\,c_3 \end{bmatrix} \\
&= \begin{bmatrix} -((c_1+c_2-c_3)\,t - c_1)\,e^{6t} \\ 2\left((c_1+c_2-c_3)\,t^2 + \frac{(-c_1+3c_2-3c_3)t}{2} + \frac{c_2}{2}\right)e^{6t} \\ 2\left((c_1+c_2-c_3)\,t^2 + (-c_1+c_2-c_3)\,t + \frac{c_3}{2}\right)e^{6t} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.24.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 5 & -1 & 1 \\ -1 & 9 & -3 \\ -2 & 2 & 4 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 5 & -1 & 1 \\ -1 & 9 & -3 \\ -2 & 2 & 4 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 5-\lambda & -1 & 1 \\ -1 & 9-\lambda & -3 \\ -2 & 2 & 4-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 18\lambda^2 + 108\lambda - 216 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 6$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
6	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 6$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 5 & -1 & 1 \\ -1 & 9 & -3 \\ -2 & 2 & 4 \end{bmatrix} - (6)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -1 & -1 & 1 \\ -1 & 3 & -3 \\ -2 & 2 & -2 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -1 & -1 & 1 & 0 \\ -1 & 3 & -3 & 0 \\ -2 & 2 & -2 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} -1 & -1 & 1 & 0 \\ 0 & 4 & -4 & 0 \\ -2 & 2 & -2 & 0 \end{array}\right]$$

$$R_3 = R_3 - 2R_1 \Longrightarrow \left[\begin{array}{ccc|c} -1 & -1 & 1 & 0 \\ 0 & 4 & -4 & 0 \\ 0 & 4 & -4 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_2 \Longrightarrow \left[\begin{array}{ccc|c} -1 & -1 & 1 & 0 \\ 0 & 4 & -4 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -1 & -1 & 1 \\ 0 & 4 & -4 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 0, v_2 = t\}$

Hence the solution is

$$\begin{bmatrix} 0 \\ t \\ t \end{bmatrix} = \begin{bmatrix} 0 \\ t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} 0 \\ t \\ t \end{bmatrix} = t \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} 0 \\ t \\ t \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated

with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
6	3	1	Yes	$\begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue 6 is real and repated eigenvalue of multiplicity 3.There are three possible cases that can happen. This is illustrated in this diagram

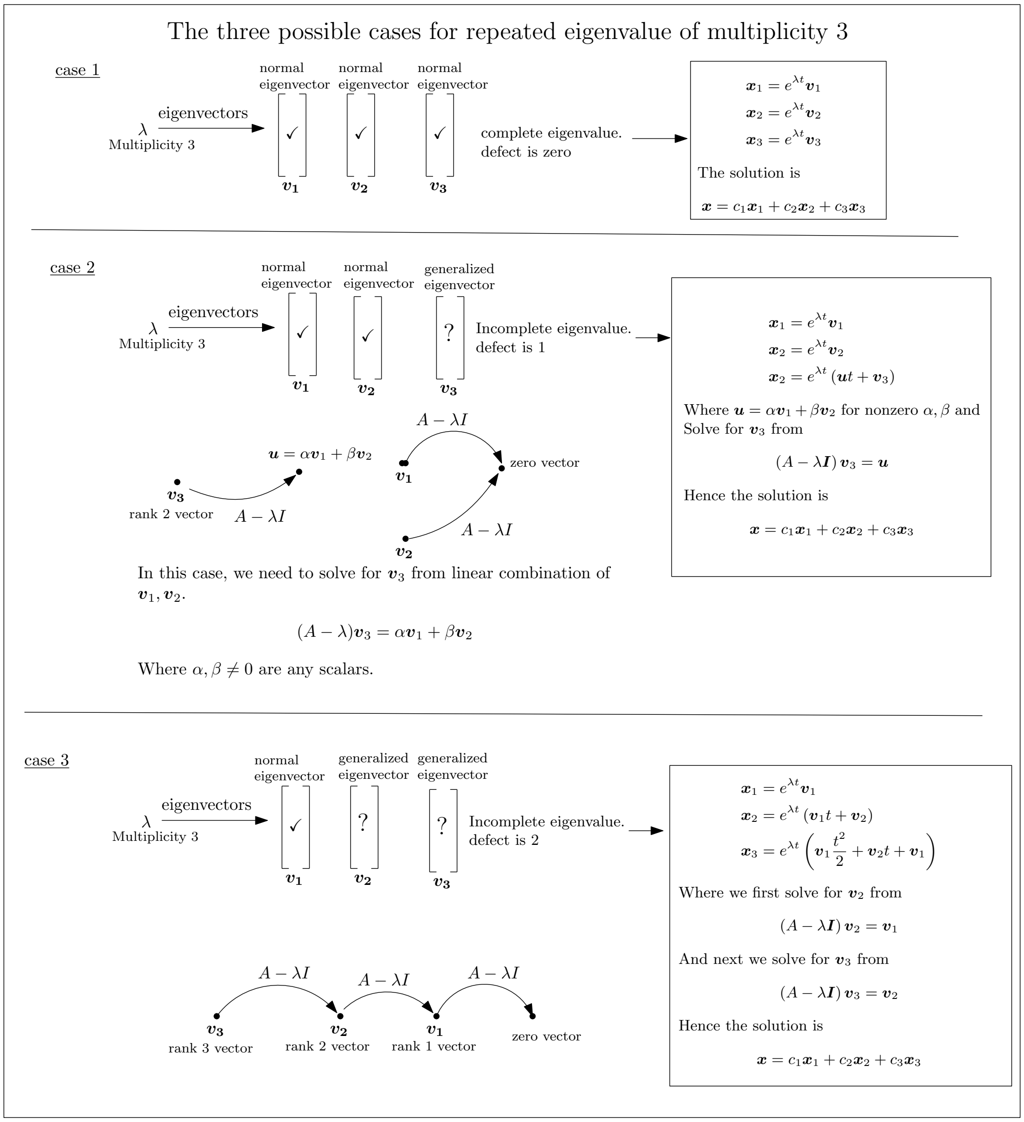

Figure 606: Possible case for repeated λ of multiplicity 3

This eigenvalue has algebraic multiplicity of 3, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 2. This falls into case 3 shown above. First we find generalized eigenvector $\vec{v}_2$ of rank 2 and then use this to find generalized eigenvector $\vec{v}_3$ of rank 3.$\vec{v}_2$ is found by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence

$$\left(\begin{bmatrix} 5 & -1 & 1 \\ -1 & 9 & -3 \\ -2 & 2 & 4 \end{bmatrix} - (6) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} -1 & -1 & 1 \\ -1 & 3 & -3 \\ -2 & 2 & -2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} -\frac{1}{4} \\ \frac{5}{4} \\ 1 \end{bmatrix}$$

Now $\vec{v}_3$ is found by solving

$$(A - \lambda I)\,\vec{v}_3 = \vec{v}_2$$

Where $\vec{v}_2$ is the (rank 2) generalized eigenvector found above. Hence

$$\left(\begin{bmatrix} 5 & -1 & 1 \\ -1 & 9 & -3 \\ -2 & 2 & 4 \end{bmatrix} - (6) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} -\frac{1}{4} \\ \frac{5}{4} \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} -1 & -1 & 1 \\ -1 & 3 & -3 \\ -2 & 2 & -2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} -\frac{1}{4} \\ \frac{5}{4} \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_3$ gives

$$\vec{v}_3 = \begin{bmatrix} -\frac{1}{8} \\ \frac{11}{8} \\ 1 \end{bmatrix}$$

We have found three generalized eigenvectors for eigenvalue 6. Therefore the three basis

solutions associated with this eigenvalue are

$$
\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\
&= \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} \mathrm{e}^{6t} \\
&= \begin{bmatrix} 0 \\ \mathrm{e}^{6t} \\ \mathrm{e}^{6t} \end{bmatrix}
\end{aligned}
$$

And

$$
\begin{aligned}
\vec{x}_2(t) &= e^{\lambda t}(\vec{v}_1 t + \vec{v}_2) \\
&= \mathrm{e}^{6t}\left(\begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} t + \begin{bmatrix} -\frac{1}{4} \\ \frac{5}{4} \\ 1 \end{bmatrix}\right) \\
&= \begin{bmatrix} -\frac{\mathrm{e}^{6t}}{4} \\ \frac{\mathrm{e}^{6t}(4t+5)}{4} \\ \mathrm{e}^{6t}(t+1) \end{bmatrix}
\end{aligned}
$$

And

$$
\begin{aligned}
\vec{x}_3(t) &= \left(\vec{v}_1 \frac{t^2}{2} + \vec{v}_2 t + \vec{v}_3\right) e^{\lambda t} \\
&= \left(\begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} \frac{t^2}{2} + \begin{bmatrix} -\frac{1}{4} \\ \frac{5}{4} \\ 1 \end{bmatrix} t + \begin{bmatrix} -\frac{1}{8} \\ \frac{11}{8} \\ 1 \end{bmatrix}\right) \mathrm{e}^{6t} \\
&= \begin{bmatrix} -\frac{\mathrm{e}^{6t}(1+2t)}{8} \\ \frac{\mathrm{e}^{6t}(4t^2+10t+11)}{8} \\ \frac{\mathrm{e}^{6t}(t^2+2t+2)}{2} \end{bmatrix}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)
$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} 0 \\ e^{6t} \\ e^{6t} \end{bmatrix} + c_2 \begin{bmatrix} -\frac{e^{6t}}{4} \\ e^{6t}\left(t+\frac{5}{4}\right) \\ e^{6t}(t+1) \end{bmatrix} + c_3 \begin{bmatrix} e^{6t}\left(-\frac{t}{4}-\frac{1}{8}\right) \\ e^{6t}\left(\frac{1}{2}t^2+\frac{5}{4}t+\frac{11}{8}\right) \\ e^{6t}\left(t+\frac{1}{2}t^2+1\right) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -\frac{e^{6t}(2c_3t+2c_2+c_3)}{8} \\ \frac{((4t^2+10t+11)c_3+8c_2t+8c_1+10c_2)e^{6t}}{8} \\ \frac{((t^2+2t+2)c_3+2c_2t+2c_1+2c_2)e^{6t}}{2} \end{bmatrix}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= y_1(t) + 10y_2(t) - 12y_3(t)\\
y_2'(t) &= 2y_1(t) + 2y_2(t) + 3y_3(t)\\
y_3'(t) &= 2y_1(t) - y_2(t) + 6y_3(t)
\end{aligned}
$$

22.25.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 1 & 10 & -12 \\ 2 & 2 & 3 \\ 2 & -1 & 6 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} e^{3t}(1-2t) & e^{3t}(-9t^2+10t) & (9t^2-12t)\,e^{3t} \\ 2\,e^{3t}t & e^{3t}(9t^2-t+1) & (-9t^2+3t)\,e^{3t} \\ 2\,e^{3t}t & e^{3t}t(9t-1) & e^{3t}(-9t^2+3t+1) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{3t}(1-2t) & e^{3t}(-9t^2+10t) & (9t^2-12t)\,e^{3t} \\ 2\,e^{3t}t & e^{3t}(9t^2-t+1) & (-9t^2+3t)\,e^{3t} \\ 2\,e^{3t}t & e^{3t}t(9t-1) & e^{3t}(-9t^2+3t+1) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} e^{3t}(1-2t)\,c_1 + e^{3t}(-9t^2+10t)\,c_2 + (9t^2-12t)\,e^{3t}c_3 \\ 2\,e^{3t}tc_1 + e^{3t}(9t^2-t+1)\,c_2 + (-9t^2+3t)\,e^{3t}c_3 \\ 2\,e^{3t}tc_1 + e^{3t}t(9t-1)\,c_2 + e^{3t}(-9t^2+3t+1)\,c_3 \end{bmatrix} \\
&= \begin{bmatrix} -9\,e^{3t}\left((c_2-c_3)\,t^2 + \left(\frac{2c_1}{9} - \frac{10c_2}{9} + \frac{4c_3}{3}\right)t - \frac{c_1}{9}\right) \\ 9\left((c_2-c_3)\,t^2 + \left(\frac{2c_1}{9} - \frac{c_2}{9} + \frac{c_3}{3}\right)t + \frac{c_2}{9}\right)e^{3t} \\ 9\,e^{3t}\left((c_2-c_3)\,t^2 + \left(\frac{2c_1}{9} - \frac{c_2}{9} + \frac{c_3}{3}\right)t + \frac{c_3}{9}\right) \end{bmatrix}
\end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.25.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 1 & 10 & -12 \\ 2 & 2 & 3 \\ 2 & -1 & 6 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 1 & 10 & -12 \\ 2 & 2 & 3 \\ 2 & -1 & 6 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 1-\lambda & 10 & -12 \\ 2 & 2-\lambda & 3 \\ 2 & -1 & 6-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 9\lambda^2 + 27\lambda - 27 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 3$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
3	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 3$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 1 & 10 & -12 \\ 2 & 2 & 3 \\ 2 & -1 & 6 \end{bmatrix} - (3)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 10 & -12 \\ 2 & -1 & 3 \\ 2 & -1 & 3 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -2 & 10 & -12 & 0 \\ 2 & -1 & 3 & 0 \\ 2 & -1 & 3 & 0 \end{array}\right]$$

$$R_2 = R_2 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} -2 & 10 & -12 & 0 \\ 0 & 9 & -9 & 0 \\ 2 & -1 & 3 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} -2 & 10 & -12 & 0 \\ 0 & 9 & -9 & 0 \\ 0 & 9 & -9 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_2 \Longrightarrow \left[\begin{array}{ccc|c} -2 & 10 & -12 & 0 \\ 0 & 9 & -9 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -2 & 10 & -12 \\ 0 & 9 & -9 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_2 = t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated

with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
3	3	1	Yes	$\begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue 3 is real and repated eigenvalue of multiplicity 3.There are three possible cases that can happen. This is illustrated in this diagram

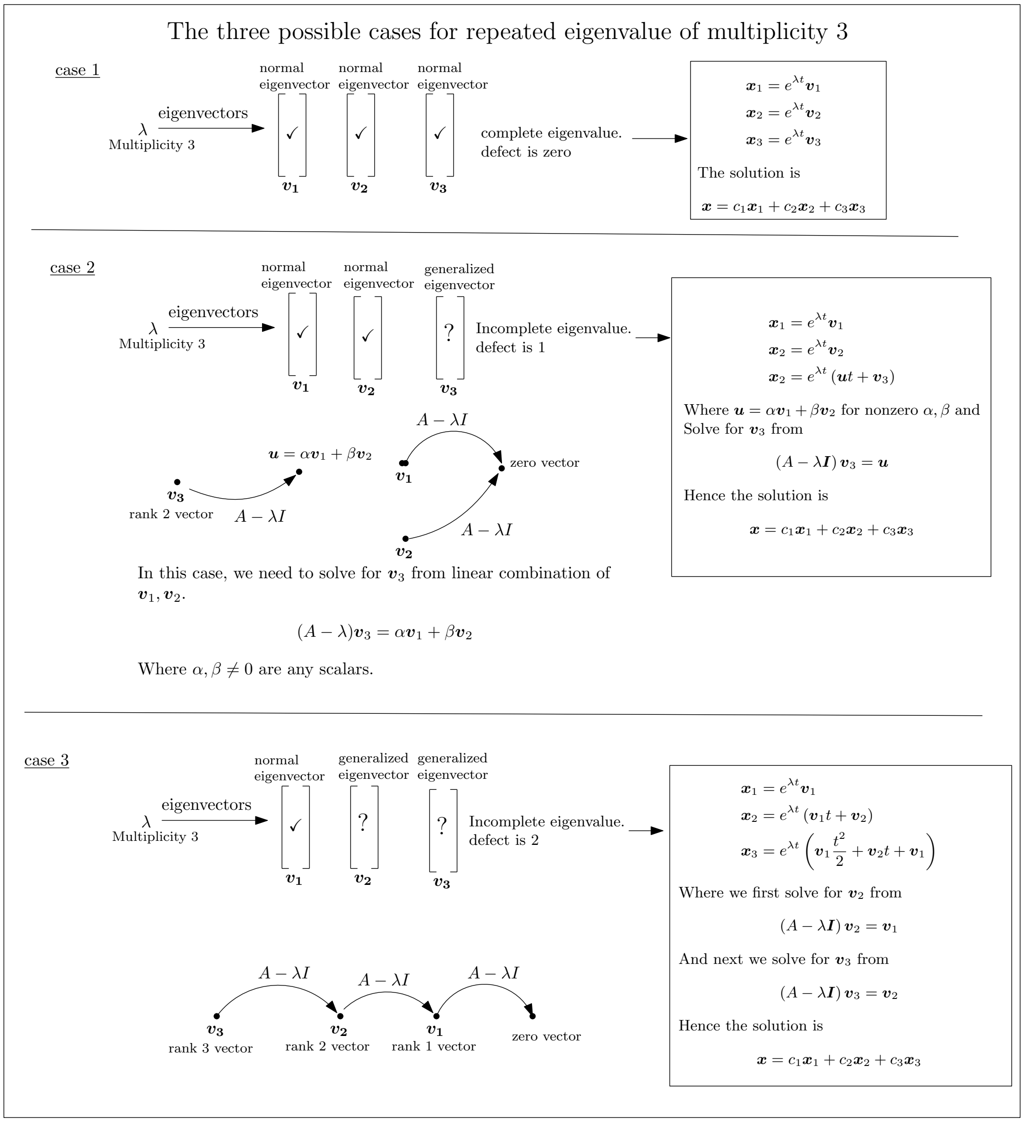

Figure 607: Possible case for repeated λ of multiplicity 3

This eigenvalue has algebraic multiplicity of 3, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 2. This falls into case 3 shown above. First we find generalized eigenvector $\vec{v}_2$ of rank 2 and then use this to find generalized eigenvector $\vec{v}_3$ of rank 3.$\vec{v}_2$ is found by solving

$$(A - \lambda I)\, \vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence

$$\left(\begin{bmatrix} 1 & 10 & -12 \\ 2 & 2 & 3 \\ 2 & -1 & 6 \end{bmatrix} - (3)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 10 & -12 \\ 2 & -1 & 3 \\ 2 & -1 & 3 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} -\frac{1}{2} \\ 1 \\ 1 \end{bmatrix}$$

Now $\vec{v}_3$ is found by solving

$$(A - \lambda I)\,\vec{v}_3 = \vec{v}_2$$

Where $\vec{v}_2$ is the (rank 2) generalized eigenvector found above. Hence

$$\left(\begin{bmatrix} 1 & 10 & -12 \\ 2 & 2 & 3 \\ 2 & -1 & 6 \end{bmatrix} - (3)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} -\frac{1}{2} \\ 1 \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 10 & -12 \\ 2 & -1 & 3 \\ 2 & -1 & 3 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} -\frac{1}{2} \\ 1 \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_3$ gives

$$\vec{v}_3 = \begin{bmatrix} -\frac{17}{36} \\ \frac{19}{18} \\ 1 \end{bmatrix}$$

We have found three generalized eigenvectors for eigenvalue 3. Therefore the three basis

solutions associated with this eigenvalue are

$$
\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\
&= \begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix} \mathrm{e}^{3t} \\
&= \begin{bmatrix} -\mathrm{e}^{3t} \\ \mathrm{e}^{3t} \\ \mathrm{e}^{3t} \end{bmatrix}
\end{aligned}
$$

And

$$
\begin{aligned}
\vec{x}_2(t) &= e^{\lambda t}(\vec{v}_1 t + \vec{v}_2) \\
&= \mathrm{e}^{3t}\left(\begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix} t + \begin{bmatrix} -\frac{1}{2} \\ 1 \\ 1 \end{bmatrix}\right) \\
&= \begin{bmatrix} -\frac{\mathrm{e}^{3t}(1+2t)}{2} \\ \mathrm{e}^{3t}(t+1) \\ \mathrm{e}^{3t}(t+1) \end{bmatrix}
\end{aligned}
$$

And

$$
\begin{aligned}
\vec{x}_3(t) &= \left(\vec{v}_1 \frac{t^2}{2} + \vec{v}_2 t + \vec{v}_3\right) e^{\lambda t} \\
&= \left(\begin{bmatrix} -1 \\ 1 \\ 1 \end{bmatrix} \frac{t^2}{2} + \begin{bmatrix} -\frac{1}{2} \\ 1 \\ 1 \end{bmatrix} t + \begin{bmatrix} -\frac{17}{36} \\ \frac{19}{18} \\ 1 \end{bmatrix}\right) \mathrm{e}^{3t} \\
&= \begin{bmatrix} -\frac{\mathrm{e}^{3t}(18t^2+18t+17)}{36} \\ \frac{\mathrm{e}^{3t}(9t^2+18t+19)}{18} \\ \frac{\mathrm{e}^{3t}(t^2+2t+2)}{2} \end{bmatrix}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)
$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} -\mathrm{e}^{3t} \\ \mathrm{e}^{3t} \\ \mathrm{e}^{3t} \end{bmatrix} + c_2 \begin{bmatrix} \mathrm{e}^{3t}\left(-t-\frac{1}{2}\right) \\ \mathrm{e}^{3t}(t+1) \\ \mathrm{e}^{3t}(t+1) \end{bmatrix} + c_3 \begin{bmatrix} \mathrm{e}^{3t}\left(-\frac{1}{2}t^2-\frac{1}{2}t-\frac{17}{36}\right) \\ \mathrm{e}^{3t}\left(\frac{1}{2}t^2+t+\frac{19}{18}\right) \\ \mathrm{e}^{3t}\left(t+\frac{1}{2}t^2+1\right) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -\frac{\left(\left(t^2+t+\frac{17}{18}\right)c_3+2c_2t+2c_1+c_2\right)\mathrm{e}^{3t}}{2} \\ \frac{\mathrm{e}^{3t}\left(\left(t^2+2t+\frac{19}{9}\right)c_3+2c_2t+2c_1+2c_2\right)}{2} \\ \frac{\left((t^2+2t+2)c_3+2c_2t+2c_1+2c_2\right)\mathrm{e}^{3t}}{2} \end{bmatrix}$$

ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$\begin{aligned} y_1'(t) &= -6y_1(t) - 4y_2(t) - 4y_3(t) \\ y_2'(t) &= 2y_1(t) - y_2(t) + y_3(t) \\ y_3'(t) &= 2y_1(t) + 3y_2(t) + y_3(t) \end{aligned}$$

22.26.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -6 & -4 & -4 \\ 2 & -1 & 1 \\ 2 & 3 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} e^{-2t}(1-4t) & -4t\,e^{-2t} & -4t\,e^{-2t} \\ -2\,e^{-2t}t(-1+t) & e^{-2t}(-2t^2+t+1) & e^{-2t}(-2t^2+t) \\ 2\,e^{-2t}t(t+1) & e^{-2t}t(2t+3) & e^{-2t}(2t^2+3t+1) \end{bmatrix}$$

Therefore the homogeneous solution is

$$\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{-2t}(1-4t) & -4t\,e^{-2t} & -4t\,e^{-2t} \\ -2\,e^{-2t}t(-1+t) & e^{-2t}(-2t^2+t+1) & e^{-2t}(-2t^2+t) \\ 2\,e^{-2t}t(t+1) & e^{-2t}t(2t+3) & e^{-2t}(2t^2+3t+1) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} e^{-2t}(1-4t)\,c_1 - 4t\,e^{-2t}c_2 - 4t\,e^{-2t}c_3 \\ -2\,e^{-2t}t(-1+t)\,c_1 + e^{-2t}(-2t^2+t+1)\,c_2 + e^{-2t}(-2t^2+t)\,c_3 \\ 2\,e^{-2t}t(t+1)\,c_1 + e^{-2t}t(2t+3)\,c_2 + e^{-2t}(2t^2+3t+1)\,c_3 \end{bmatrix} \\
&= \begin{bmatrix} -4\left((c_1+c_2+c_3)\,t - \frac{c_1}{4}\right)e^{-2t} \\ -2\left((c_1+c_2+c_3)\,t^2 + \left(-c_1 - \frac{c_2}{2} - \frac{c_3}{2}\right)t - \frac{c_2}{2}\right)e^{-2t} \\ 2\left((c_1+c_2+c_3)\,t^2 + \left(c_1 + \frac{3c_2}{2} + \frac{3c_3}{2}\right)t + \frac{c_3}{2}\right)e^{-2t} \end{bmatrix}
\end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.26.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -6 & -4 & -4 \\ 2 & -1 & 1 \\ 2 & 3 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -6 & -4 & -4 \\ 2 & -1 & 1 \\ 2 & 3 & 1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix}-6-\lambda & -4 & -4\\ 2 & -1-\lambda & 1\\ 2 & 3 & 1-\lambda\end{bmatrix}\right)=0$$

Which gives the characteristic equation

$$\lambda^3+6\lambda^2+12\lambda+8=0$$

The roots of the above are the eigenvalues.

$$\lambda_1=-2$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-2	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1=-2$

We need to solve $A\vec{v}=\lambda\vec{v}$ or $(A-\lambda I)\vec{v}=\vec{0}$ which becomes

$$\left(\begin{bmatrix}-6 & -4 & -4\\ 2 & -1 & 1\\ 2 & 3 & 1\end{bmatrix}-(-2)\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{bmatrix}\right)\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix}=\begin{bmatrix}0\\ 0\\ 0\end{bmatrix}$$

$$\begin{bmatrix}-4 & -4 & -4\\ 2 & 1 & 1\\ 2 & 3 & 3\end{bmatrix}\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix}=\begin{bmatrix}0\\ 0\\ 0\end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c}-4 & -4 & -4 & 0\\ 2 & 1 & 1 & 0\\ 2 & 3 & 3 & 0\end{array}\right]$$

$$R_2=R_2+\frac{R_1}{2}\Longrightarrow\left[\begin{array}{ccc|c}-4 & -4 & -4 & 0\\ 0 & -1 & -1 & 0\\ 2 & 3 & 3 & 0\end{array}\right]$$

$$
R_3 = R_3 + \frac{R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} -4 & -4 & -4 & 0 \\ 0 & -1 & -1 & 0 \\ 0 & 1 & 1 & 0 \end{array}\right]
$$

$$
R_3 = R_3 + R_2 \Longrightarrow \left[\begin{array}{ccc|c} -4 & -4 & -4 & 0 \\ 0 & -1 & -1 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]
$$

Therefore the system in Echelon form is

$$
\begin{bmatrix} -4 & -4 & -4 \\ 0 & -1 & -1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}
$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 0, v_2 = -t\}$

Hence the solution is

$$
\begin{bmatrix} 0 \\ -t \\ t \end{bmatrix} = \begin{bmatrix} 0 \\ -t \\ t \end{bmatrix}
$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$
\begin{bmatrix} 0 \\ -t \\ t \end{bmatrix} = t \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}
$$

Let $t = 1$ the eigenvector becomes

$$
\begin{bmatrix} 0 \\ -t \\ t \end{bmatrix} = \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}
$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated

with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m-k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
-2	3	1	Yes	$\begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -2 is real and repated eigenvalue of multiplicity 3.There are three possible cases that can happen. This is illustrated in this diagram

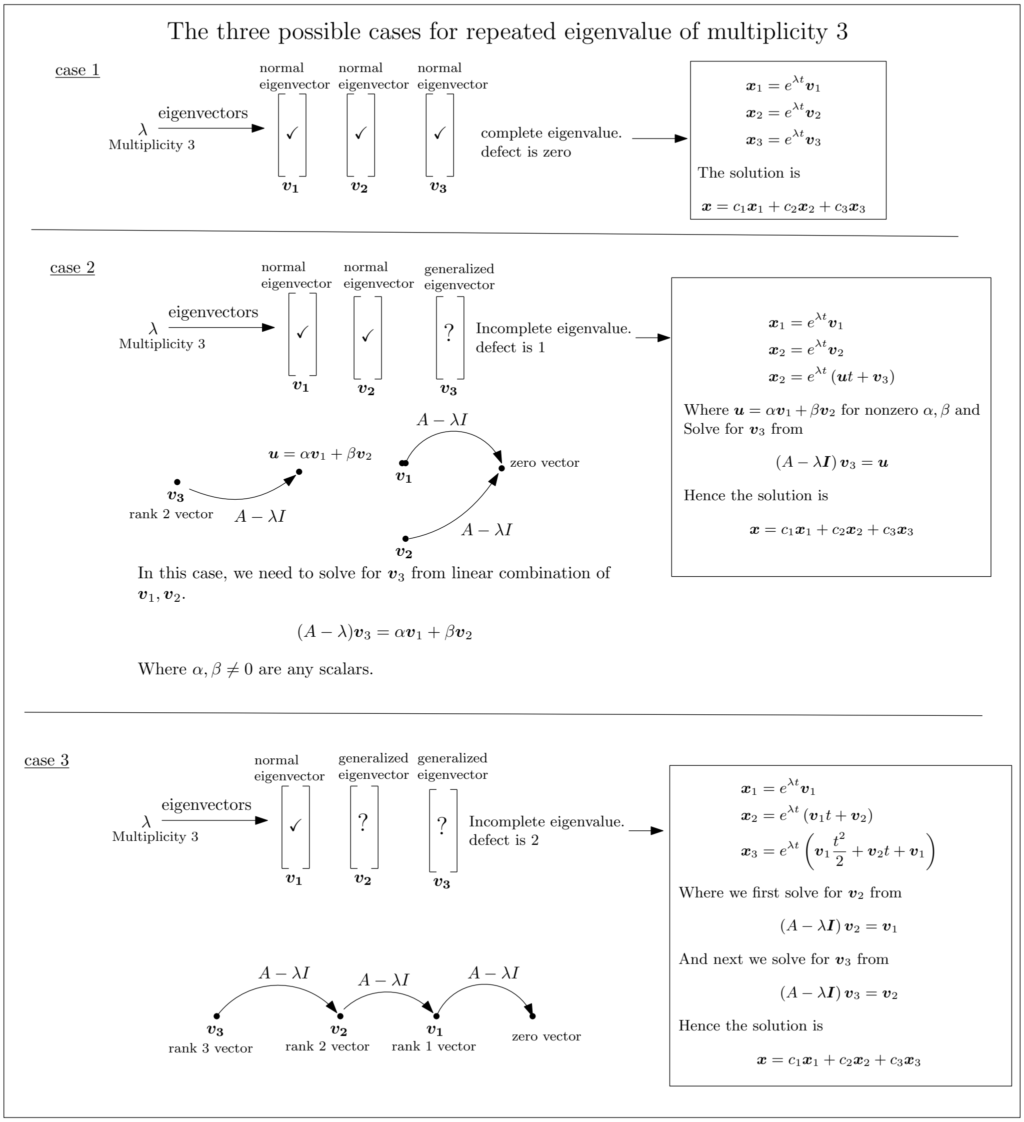

Figure 608: Possible case for repeated λ of multiplicity 3

This eigenvalue has algebraic multiplicity of 3, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 2. This falls into case 3 shown above. First we find generalized eigenvector $\vec{v}_2$ of rank 2 and then use this to find generalized eigenvector $\vec{v}_3$ of rank 3.$\vec{v}_2$ is found by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence

$$\left(\begin{bmatrix}-6 & -4 & -4\\ 2 & -1 & 1\\ 2 & 3 & 1\end{bmatrix} - (-2)\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{bmatrix}\right)\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix} = \begin{bmatrix}0\\ -1\\ 1\end{bmatrix}$$

$$\begin{bmatrix}-4 & -4 & -4\\ 2 & 1 & 1\\ 2 & 3 & 3\end{bmatrix}\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix} = \begin{bmatrix}0\\ -1\\ 1\end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix}-1\\ 0\\ 1\end{bmatrix}$$

Now $\vec{v}_3$ is found by solving

$$(A - \lambda I)\,\vec{v}_3 = \vec{v}_2$$

Where $\vec{v}_2$ is the (rank 2) generalized eigenvector found above. Hence

$$\left(\begin{bmatrix}-6 & -4 & -4\\ 2 & -1 & 1\\ 2 & 3 & 1\end{bmatrix} - (-2)\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{bmatrix}\right)\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix} = \begin{bmatrix}-1\\ 0\\ 1\end{bmatrix}$$

$$\begin{bmatrix}-4 & -4 & -4\\ 2 & 1 & 1\\ 2 & 3 & 3\end{bmatrix}\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix} = \begin{bmatrix}-1\\ 0\\ 1\end{bmatrix}$$

Solving for $\vec{v}_3$ gives

$$\vec{v}_3 = \begin{bmatrix}-\frac{1}{4}\\ -\frac{1}{2}\\ 1\end{bmatrix}$$

We have found three generalized eigenvectors for eigenvalue -2. Therefore the three basis solutions associated with this eigenvalue are

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t}\\ &= \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix} \mathrm{e}^{-2t}\\ &= \begin{bmatrix} 0 \\ -\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_2(t) &= e^{\lambda t}(\vec{v}_1 t + \vec{v}_2)\\ &= \mathrm{e}^{-2t}\left(\begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix} t + \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}\right)\\ &= \begin{bmatrix} -\mathrm{e}^{-2t} \\ -t\,\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t}(t+1) \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_3(t) &= \left(\vec{v}_1 \frac{t^2}{2} + \vec{v}_2 t + \vec{v}_3\right) e^{\lambda t}\\ &= \left(\begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix} \frac{t^2}{2} + \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} t + \begin{bmatrix} -\frac{1}{4} \\ -\frac{1}{2} \\ 1 \end{bmatrix}\right) \mathrm{e}^{-2t}\\ &= \begin{bmatrix} -\frac{\mathrm{e}^{-2t}(4t+1)}{4} \\ -\frac{\mathrm{e}^{-2t}(t^2+1)}{2} \\ \frac{\mathrm{e}^{-2t}(t^2+2t+2)}{2} \end{bmatrix}\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t) + c_3\vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} 0 \\ -\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \end{bmatrix} + c_2 \begin{bmatrix} -\mathrm{e}^{-2t} \\ -t\,\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t}(t+1) \end{bmatrix} + c_3 \begin{bmatrix} \mathrm{e}^{-2t}\left(-t-\frac{1}{4}\right) \\ \mathrm{e}^{-2t}\left(-\frac{t^2}{2}-\frac{1}{2}\right) \\ \mathrm{e}^{-2t}\left(t+\frac{1}{2}t^2+1\right) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \mathrm{e}^{-2t}\left(-c_2-c_3t-\frac{1}{4}c_3\right) \\ -\frac{\mathrm{e}^{-2t}(c_3t^2+2tc_2+2c_1+c_3)}{2} \\ \frac{((t^2+2t+2)c_3+2tc_2+2c_1+2c_2)\mathrm{e}^{-2t}}{2} \end{bmatrix}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= 2y_2(t) - 2y_3(t)\\
y_2'(t) &= -y_1(t) + 5y_2(t) - 3y_3(t)\\
y_3'(t) &= y_1(t) + y_2(t) + y_3(t)
\end{aligned}
$$

22.27.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 0 & 2 & -2 \\ -1 & 5 & -3 \\ 1 & 1 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} (1-2t)\,\mathrm{e}^{2t} & 2\,\mathrm{e}^{2t}t & -2\,\mathrm{e}^{2t}t \\ \mathrm{e}^{2t}(-2t^2-t) & \mathrm{e}^{2t}(2t^2+3t+1) & \mathrm{e}^{2t}(-2t^2-3t) \\ \mathrm{e}^{2t}(-2t^2+t) & \mathrm{e}^{2t}(2t^2+t) & \mathrm{e}^{2t}(-2t^2-t+1) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} (1-2t)\,\mathrm{e}^{2t} & 2\,\mathrm{e}^{2t}t & -2\,\mathrm{e}^{2t}t \\ \mathrm{e}^{2t}(-2t^2-t) & \mathrm{e}^{2t}(2t^2+3t+1) & \mathrm{e}^{2t}(-2t^2-3t) \\ \mathrm{e}^{2t}(-2t^2+t) & \mathrm{e}^{2t}(2t^2+t) & \mathrm{e}^{2t}(-2t^2-t+1) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} (1-2t)\,\mathrm{e}^{2t}c_1 + 2\,\mathrm{e}^{2t}tc_2 - 2\,\mathrm{e}^{2t}tc_3 \\ \mathrm{e}^{2t}(-2t^2-t)\,c_1 + \mathrm{e}^{2t}(2t^2+3t+1)\,c_2 + \mathrm{e}^{2t}(-2t^2-3t)\,c_3 \\ \mathrm{e}^{2t}(-2t^2+t)\,c_1 + \mathrm{e}^{2t}(2t^2+t)\,c_2 + \mathrm{e}^{2t}(-2t^2-t+1)\,c_3 \end{bmatrix} \\
&= \begin{bmatrix} -2\left((c_1-c_2+c_3)\,t - \frac{c_1}{2}\right)\mathrm{e}^{2t} \\ -2\left((c_1-c_2+c_3)\,t^2 + \frac{(c_1-3c_2+3c_3)t}{2} - \frac{c_2}{2}\right)\mathrm{e}^{2t} \\ -2\,\mathrm{e}^{2t}\left((c_1-c_2+c_3)\,t^2 + \frac{(-c_1-c_2+c_3)t}{2} - \frac{c_3}{2}\right) \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.27.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 0 & 2 & -2 \\ -1 & 5 & -3 \\ 1 & 1 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$
\det(A - \lambda I) = 0
$$

Expanding gives

$$
\det\left(\begin{bmatrix} 0 & 2 & -2 \\ -1 & 5 & -3 \\ 1 & 1 & 1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0
$$

Therefore

$$\det\left(\begin{bmatrix} -\lambda & 2 & -2 \\ -1 & 5-\lambda & -3 \\ 1 & 1 & 1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 6\lambda^2 + 12\lambda - 8 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 2$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
2	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 0 & 2 & -2 \\ -1 & 5 & -3 \\ 1 & 1 & 1 \end{bmatrix} - (2)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 2 & -2 \\ -1 & 3 & -3 \\ 1 & 1 & -1 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -2 & 2 & -2 & 0 \\ -1 & 3 & -3 & 0 \\ 1 & 1 & -1 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} -2 & 2 & -2 & 0 \\ 0 & 2 & -2 & 0 \\ 1 & 1 & -1 & 0 \end{array}\right]$$

$$
R_3 = R_3 + \frac{R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} -2 & 2 & -2 & 0 \\ 0 & 2 & -2 & 0 \\ 0 & 2 & -2 & 0 \end{array}\right]
$$

$$
R_3 = R_3 - R_2 \Longrightarrow \left[\begin{array}{ccc|c} -2 & 2 & -2 & 0 \\ 0 & 2 & -2 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]
$$

Therefore the system in Echelon form is

$$
\begin{bmatrix} -2 & 2 & -2 \\ 0 & 2 & -2 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}
$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 0, v_2 = t\}$

Hence the solution is

$$
\begin{bmatrix} 0 \\ t \\ t \end{bmatrix} = \begin{bmatrix} 0 \\ t \\ t \end{bmatrix}
$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$
\begin{bmatrix} 0 \\ t \\ t \end{bmatrix} = t \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}
$$

Let $t = 1$ the eigenvector becomes

$$
\begin{bmatrix} 0 \\ t \\ t \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}
$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated

with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
2	3	1	Yes	$\begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue 2 is real and repated eigenvalue of multiplicity 3.There are three possible cases that can happen. This is illustrated in this diagram

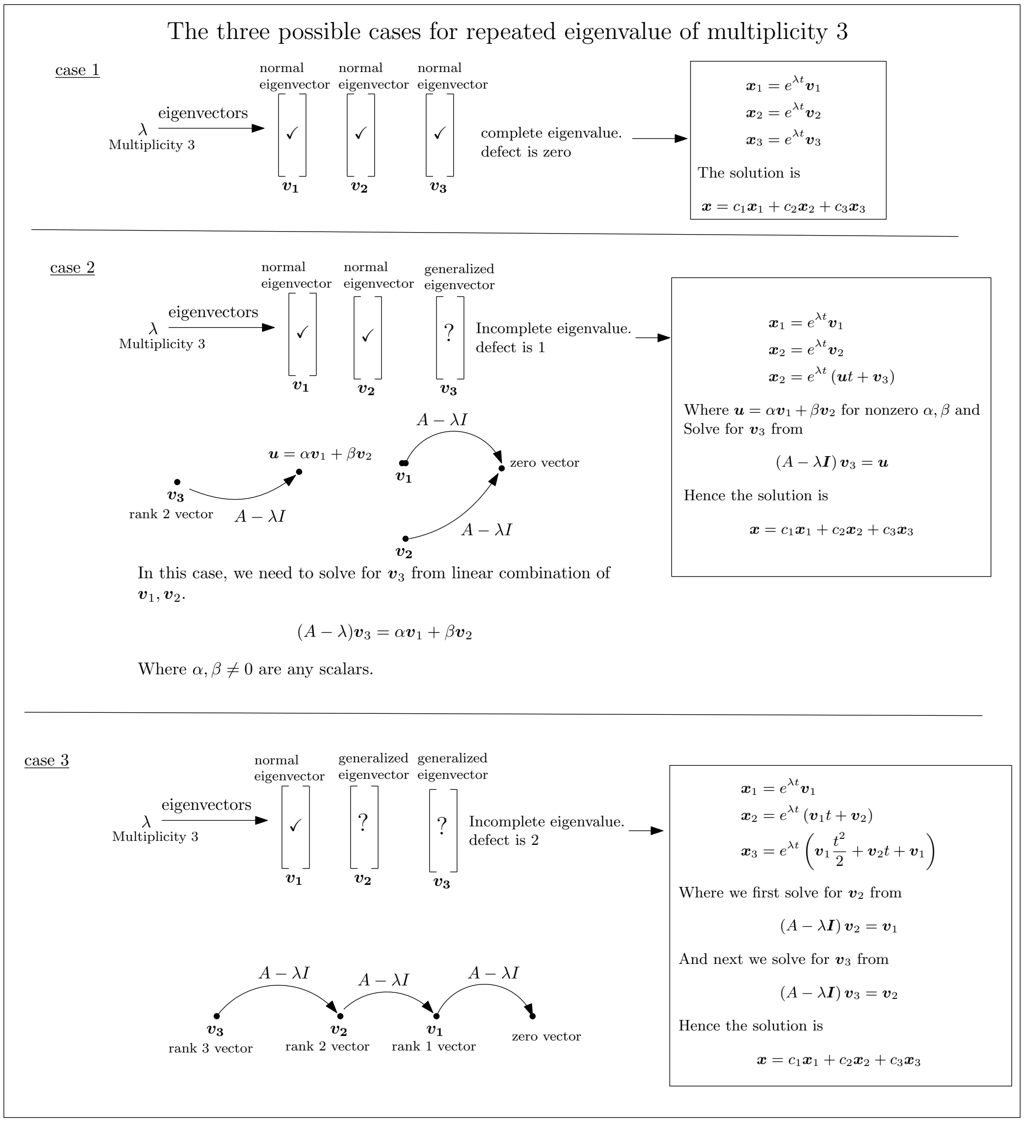

Figure 609: Possible case for repeated λ of multiplicity 3

This eigenvalue has algebraic multiplicity of 3, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 2. This falls into case 3 shown above. First we find generalized eigenvector $\vec{v}_2$ of rank 2 and then use this to find generalized eigenvector $\vec{v}_3$ of rank 3.$\vec{v}_2$ is found by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence

$$\left(\begin{bmatrix}0 & 2 & -2\\ -1 & 5 & -3\\ 1 & 1 & 1\end{bmatrix} - (2)\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{bmatrix}\right)\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix} = \begin{bmatrix}0\\ 1\\ 1\end{bmatrix}$$

$$\begin{bmatrix}-2 & 2 & -2\\ -1 & 3 & -3\\ 1 & 1 & -1\end{bmatrix}\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix} = \begin{bmatrix}0\\ 1\\ 1\end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix}\frac{1}{2}\\ \frac{3}{2}\\ 1\end{bmatrix}$$

Now $\vec{v}_3$ is found by solving

$$(A - \lambda I)\,\vec{v}_3 = \vec{v}_2$$

Where $\vec{v}_2$ is the (rank 2) generalized eigenvector found above. Hence

$$\left(\begin{bmatrix}0 & 2 & -2\\ -1 & 5 & -3\\ 1 & 1 & 1\end{bmatrix} - (2)\begin{bmatrix}1 & 0 & 0\\ 0 & 1 & 0\\ 0 & 0 & 1\end{bmatrix}\right)\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix} = \begin{bmatrix}\frac{1}{2}\\ \frac{3}{2}\\ 1\end{bmatrix}$$

$$\begin{bmatrix}-2 & 2 & -2\\ -1 & 3 & -3\\ 1 & 1 & -1\end{bmatrix}\begin{bmatrix}v_1\\ v_2\\ v_3\end{bmatrix} = \begin{bmatrix}\frac{1}{2}\\ \frac{3}{2}\\ 1\end{bmatrix}$$

Solving for $\vec{v}_3$ gives

$$\vec{v}_3 = \begin{bmatrix}\frac{3}{8}\\ \frac{13}{8}\\ 1\end{bmatrix}$$

We have found three generalized eigenvectors for eigenvalue 2. Therefore the three basis

solutions associated with this eigenvalue are

$$\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\
&= \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} \mathrm{e}^{2t} \\
&= \begin{bmatrix} 0 \\ \mathrm{e}^{2t} \\ \mathrm{e}^{2t} \end{bmatrix}
\end{aligned}$$

And

$$\begin{aligned}
\vec{x}_2(t) &= e^{\lambda t}(\vec{v}_1 t + \vec{v}_2) \\
&= \mathrm{e}^{2t} \left(\begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} t + \begin{bmatrix} \frac{1}{2} \\ \frac{3}{2} \\ 1 \end{bmatrix} \right) \\
&= \begin{bmatrix} \frac{\mathrm{e}^{2t}}{2} \\ \frac{\mathrm{e}^{2t}(2t+3)}{2} \\ \mathrm{e}^{2t}(t+1) \end{bmatrix}
\end{aligned}$$

And

$$\begin{aligned}
\vec{x}_3(t) &= \left(\vec{v}_1 \frac{t^2}{2} + \vec{v}_2 t + \vec{v}_3 \right) e^{\lambda t} \\
&= \left(\begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix} \frac{t^2}{2} + \begin{bmatrix} \frac{1}{2} \\ \frac{3}{2} \\ 1 \end{bmatrix} t + \begin{bmatrix} \frac{3}{8} \\ \frac{13}{8} \\ 1 \end{bmatrix} \right) \mathrm{e}^{2t} \\
&= \begin{bmatrix} \frac{\mathrm{e}^{2t}(4t+3)}{8} \\ \frac{\mathrm{e}^{2t}(4t^2+12t+13)}{8} \\ \frac{\mathrm{e}^{2t}(t^2+2t+2)}{2} \end{bmatrix}
\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} 0 \\ e^{2t} \\ e^{2t} \end{bmatrix} + c_2 \begin{bmatrix} \frac{e^{2t}}{2} \\ e^{2t}\left(t+\frac{3}{2}\right) \\ e^{2t}(t+1) \end{bmatrix} + c_3 \begin{bmatrix} e^{2t}\left(\frac{t}{2}+\frac{3}{8}\right) \\ e^{2t}\left(\frac{1}{2}t^2+\frac{3}{2}t+\frac{13}{8}\right) \\ e^{2t}\left(t+\frac{1}{2}t^2+1\right) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \frac{((4t+3)c_3+4c_2)e^{2t}}{8} \\ \frac{\left(\left(t^2+3t+\frac{13}{4}\right)c_3+2c_2t+2c_1+3c_2\right)e^{2t}}{2} \\ \frac{\left((t^2+2t+2)c_3+2c_2t+2c_1+2c_2\right)e^{2t}}{2} \end{bmatrix}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -2y_1(t) - 12y_2(t) + 10y_3(t) \\
y_2'(t) &= 2y_1(t) - 24y_2(t) + 11y_3(t) \\
y_3'(t) &= 2y_1(t) - 24y_2(t) + 8y_3(t)
\end{aligned}
$$

22.28.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -2 & -12 & 10 \\ 2 & -24 & 11 \\ 2 & -24 & 8 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} e^{-6t}(6t^2+4t+1) & (-36t^2-12t)\,e^{-6t} & (24t^2+10t)\,e^{-6t} \\ e^{-6t}(-3t^2+2t) & e^{-6t}(18t^2-18t+1) & e^{-6t}(-12t^2+11t) \\ (-6t^2+2t)\,e^{-6t} & (36t^2-24t)\,e^{-6t} & e^{-6t}(-24t^2+14t+1) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{-6t}(6t^2+4t+1) & (-36t^2-12t)\,e^{-6t} & (24t^2+10t)\,e^{-6t} \\ e^{-6t}(-3t^2+2t) & e^{-6t}(18t^2-18t+1) & e^{-6t}(-12t^2+11t) \\ (-6t^2+2t)\,e^{-6t} & (36t^2-24t)\,e^{-6t} & e^{-6t}(-24t^2+14t+1) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} e^{-6t}(6t^2+4t+1)\,c_1 + (-36t^2-12t)\,e^{-6t}c_2 + (24t^2+10t)\,e^{-6t}c_3 \\ e^{-6t}(-3t^2+2t)\,c_1 + e^{-6t}(18t^2-18t+1)\,c_2 + e^{-6t}(-12t^2+11t)\,c_3 \\ (-6t^2+2t)\,e^{-6t}c_1 + (36t^2-24t)\,e^{-6t}c_2 + e^{-6t}(-24t^2+14t+1)\,c_3 \end{bmatrix} \\
&= \begin{bmatrix} 6\left((c_1-6c_2+4c_3)\,t^2 + \left(\frac{2c_1}{3} - 2c_2 + \frac{5c_3}{3}\right)t + \frac{c_1}{6}\right)e^{-6t} \\ -3\left((c_1-6c_2+4c_3)\,t^2 + \left(-\frac{2c_1}{3} + 6c_2 - \frac{11c_3}{3}\right)t - \frac{c_2}{3}\right)e^{-6t} \\ -6\left((c_1-6c_2+4c_3)\,t^2 + \left(-\frac{c_1}{3} + 4c_2 - \frac{7c_3}{3}\right)t - \frac{c_3}{6}\right)e^{-6t} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.28.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -2 & -12 & 10 \\ 2 & -24 & 11 \\ 2 & -24 & 8 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -2 & -12 & 10 \\ 2 & -24 & 11 \\ 2 & -24 & 8 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -2-\lambda & -12 & 10 \\ 2 & -24-\lambda & 11 \\ 2 & -24 & 8-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + 18\lambda^2 + 108\lambda + 216 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -6$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-6	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -6$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -2 & -12 & 10 \\ 2 & -24 & 11 \\ 2 & -24 & 8 \end{bmatrix} - (-6)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 4 & -12 & 10 \\ 2 & -18 & 11 \\ 2 & -24 & 14 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 4 & -12 & 10 & 0 \\ 2 & -18 & 11 & 0 \\ 2 & -24 & 14 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{2} \implies \left[\begin{array}{ccc|c} 4 & -12 & 10 & 0 \\ 0 & -12 & 6 & 0 \\ 2 & -24 & 14 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} 4 & -12 & 10 & 0 \\ 0 & -12 & 6 & 0 \\ 0 & -18 & 9 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{3R_2}{2} \Longrightarrow \left[\begin{array}{ccc|c} 4 & -12 & 10 & 0 \\ 0 & -12 & 6 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 4 & -12 & 10 \\ 0 & -12 & 6 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = -t, v_2 = \frac{t}{2}\right\}$

Hence the solution is

$$\begin{bmatrix} -t \\ \frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} -t \\ \frac{t}{2} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ \frac{t}{2} \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ \frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

Which is normalized to

$$
\begin{bmatrix} -t \\ \frac{t}{2} \\ t \end{bmatrix} = \begin{bmatrix} -2 \\ 1 \\ 2 \end{bmatrix}
$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-6	3	1	Yes	$\begin{bmatrix} -1 \\ \frac{1}{2} \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -6 is real and repated eigenvalue of multiplicity 3.There are three possible cases that can happen. This is illustrated in this diagram

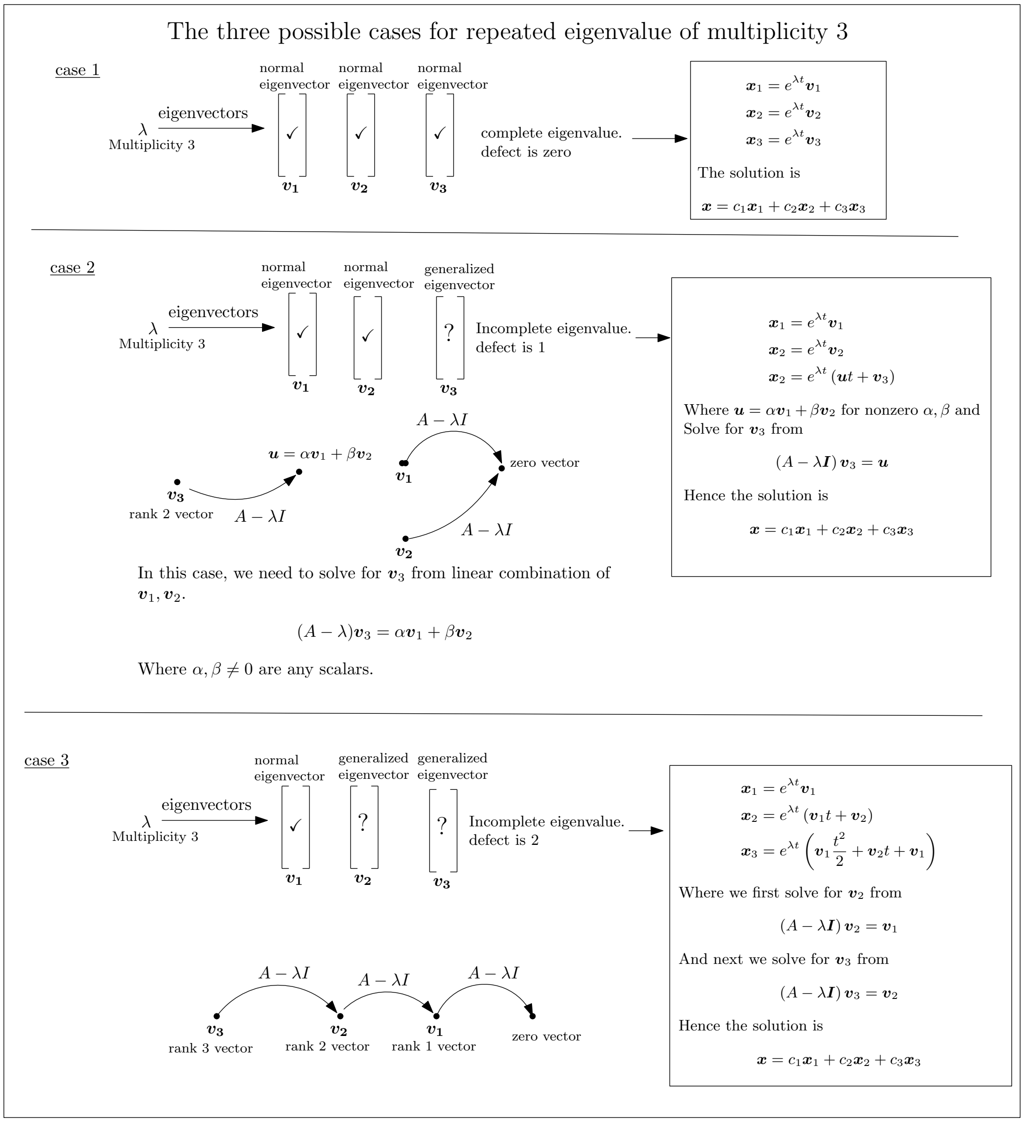

Figure 610: Possible case for repeated λ of multiplicity 3

This eigenvalue has algebraic multiplicity of 3, and geometric multiplicity 1, therefore this is defective eigenvalue. The defect is 2. This falls into case 3 shown above. First we find generalized eigenvector $\vec{v}_2$ of rank 2 and then use this to find generalized eigenvector $\vec{v}_3$ of rank 3.$\vec{v}_2$ is found by solving

$$(A - \lambda I)\,\vec{v}_2 = \vec{v}_1$$

Where $\vec{v}_1$ is the normal (rank 1) eigenvector found above. Hence

$$\left(\begin{bmatrix} -2 & -12 & 10 \\ 2 & -24 & 11 \\ 2 & -24 & 8 \end{bmatrix} - (-6)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} -1 \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

$$\begin{bmatrix} 4 & -12 & 10 \\ 2 & -18 & 11 \\ 2 & -24 & 14 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} -1 \\ \frac{1}{2} \\ 1 \end{bmatrix}$$

Solving for $\vec{v}_2$ gives

$$\vec{v}_2 = \begin{bmatrix} -\frac{8}{3} \\ 1 \\ \frac{13}{6} \end{bmatrix}$$

Now $\vec{v}_3$ is found by solving

$$(A - \lambda I)\,\vec{v}_3 = \vec{v}_2$$

Where $\vec{v}_2$ is the (rank 2) generalized eigenvector found above. Hence

$$\left(\begin{bmatrix} -2 & -12 & 10 \\ 2 & -24 & 11 \\ 2 & -24 & 8 \end{bmatrix} - (-6)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} -\frac{8}{3} \\ 1 \\ \frac{13}{6} \end{bmatrix}$$

$$\begin{bmatrix} 4 & -12 & 10 \\ 2 & -18 & 11 \\ 2 & -24 & 14 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} -\frac{8}{3} \\ 1 \\ \frac{13}{6} \end{bmatrix}$$

Solving for $\vec{v}_3$ gives

$$\vec{v}_3 = \begin{bmatrix} -\frac{131}{36} \\ 1 \\ \frac{43}{18} \end{bmatrix}$$

We have found three generalized eigenvectors for eigenvalue -6. Therefore the three basis solutions associated with this eigenvalue are

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t}\\ &= \begin{bmatrix} -1 \\ \frac{1}{2} \\ 1 \end{bmatrix} \mathrm{e}^{-6t}\\ &= \begin{bmatrix} -\mathrm{e}^{-6t} \\ \frac{\mathrm{e}^{-6t}}{2} \\ \mathrm{e}^{-6t} \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_2(t) &= e^{\lambda t}(\vec{v}_1 t + \vec{v}_2)\\ &= \mathrm{e}^{-6t}\left(\begin{bmatrix} -1 \\ \frac{1}{2} \\ 1 \end{bmatrix} t + \begin{bmatrix} -\frac{8}{3} \\ 1 \\ \frac{13}{6} \end{bmatrix}\right)\\ &= \begin{bmatrix} -\frac{\mathrm{e}^{-6t}(3t+8)}{3} \\ \frac{\mathrm{e}^{-6t}(2+t)}{2} \\ \frac{\mathrm{e}^{-6t}(6t+13)}{6} \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_3(t) &= \left(\vec{v}_1 \frac{t^2}{2} + \vec{v}_2 t + \vec{v}_3\right) e^{\lambda t}\\ &= \left(\begin{bmatrix} -1 \\ \frac{1}{2} \\ 1 \end{bmatrix} \frac{t^2}{2} + \begin{bmatrix} -\frac{8}{3} \\ 1 \\ \frac{13}{6} \end{bmatrix} t + \begin{bmatrix} -\frac{131}{36} \\ 1 \\ \frac{43}{18} \end{bmatrix}\right) \mathrm{e}^{-6t}\\ &= \begin{bmatrix} -\frac{\mathrm{e}^{-6t}(18t^2+96t+131)}{36} \\ \frac{\mathrm{e}^{-6t}(2+t)^2}{4} \\ \frac{\mathrm{e}^{-6t}(9t^2+39t+43)}{18} \end{bmatrix}\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} -e^{-6t} \\ \frac{e^{-6t}}{2} \\ e^{-6t} \end{bmatrix} + c_2 \begin{bmatrix} e^{-6t}\left(-t-\frac{8}{3}\right) \\ e^{-6t}\left(\frac{t}{2}+1\right) \\ e^{-6t}\left(t+\frac{13}{6}\right) \end{bmatrix} + c_3 \begin{bmatrix} e^{-6t}\left(-\frac{1}{2}t^2-\frac{8}{3}t-\frac{131}{36}\right) \\ e^{-6t}\left(\frac{1}{4}t^2+t+1\right) \\ e^{-6t}\left(\frac{1}{2}t^2+\frac{13}{6}t+\frac{43}{18}\right) \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -\frac{\left(\left(t^2+\frac{16}{3}t+\frac{131}{18}\right)c_3+2c_2t+2c_1+\frac{16c_2}{3}\right)e^{-6t}}{2} \\ \frac{\left((2+t)^2c_3+2c_2t+2c_1+4c_2\right)e^{-6t}}{4} \\ \frac{\left((9t^2+39t+43)c_3+18c_2t+18c_1+39c_2\right)e^{-6t}}{18} \end{bmatrix}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -y_1(t) - 12y_2(t) + 8y_3(t)\\
y_2'(t) &= y_1(t) - 9y_2(t) + 4y_3(t)\\
y_3'(t) &= y_1(t) - 6y_2(t) + y_3(t)
\end{aligned}
$$

22.29.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -1 & -12 & 8 \\ 1 & -9 & 4 \\ 1 & -6 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \mathrm{e}^{-3t}(1+2t) & -12t\,\mathrm{e}^{-3t} & 8t\,\mathrm{e}^{-3t} \\ t\,\mathrm{e}^{-3t} & \mathrm{e}^{-3t}(1-6t) & 4t\,\mathrm{e}^{-3t} \\ t\,\mathrm{e}^{-3t} & -6t\,\mathrm{e}^{-3t} & \mathrm{e}^{-3t}(4t+1) \end{bmatrix}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{-3t}(1+2t) & -12t\,e^{-3t} & 8t\,e^{-3t} \\ t\,e^{-3t} & e^{-3t}(1-6t) & 4t\,e^{-3t} \\ t\,e^{-3t} & -6t\,e^{-3t} & e^{-3t}(4t+1) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} e^{-3t}(1+2t)\,c_1 - 12t\,e^{-3t}c_2 + 8t\,e^{-3t}c_3 \\ t\,e^{-3t}c_1 + e^{-3t}(1-6t)\,c_2 + 4t\,e^{-3t}c_3 \\ t\,e^{-3t}c_1 - 6t\,e^{-3t}c_2 + e^{-3t}(4t+1)\,c_3 \end{bmatrix} \\
&= \begin{bmatrix} 2\left((c_1 - 6c_2 + 4c_3)\,t + \frac{c_1}{2}\right)e^{-3t} \\ ((c_1 - 6c_2 + 4c_3)\,t + c_2)\,e^{-3t} \\ ((c_1 - 6c_2 + 4c_3)\,t + c_3)\,e^{-3t} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.29.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -1 & -12 & 8 \\ 1 & -9 & 4 \\ 1 & -6 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -1 & -12 & 8 \\ 1 & -9 & 4 \\ 1 & -6 & 1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -1-\lambda & -12 & 8 \\ 1 & -9-\lambda & 4 \\ 1 & -6 & 1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + 9\lambda^2 + 27\lambda + 27 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -3$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-3	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -3$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -1 & -12 & 8 \\ 1 & -9 & 4 \\ 1 & -6 & 1 \end{bmatrix} - (-3)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 2 & -12 & 8 \\ 1 & -6 & 4 \\ 1 & -6 & 4 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 2 & -12 & 8 & 0 \\ 1 & -6 & 4 & 0 \\ 1 & -6 & 4 & 0 \end{array}\right]$$

$$R_2 = R_2 - \frac{R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} 2 & -12 & 8 & 0 \\ 0 & 0 & 0 & 0 \\ 1 & -6 & 4 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} 2 & -12 & 8 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 2 & -12 & 8 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2, v_3\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Let $v_3 = s$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = 6t - 4s\}$

Hence the solution is

$$\begin{bmatrix} 6t - 4s \\ t \\ s \end{bmatrix} = \begin{bmatrix} 6t - 4s \\ t \\ s \end{bmatrix}$$

Since there are two free Variable, we have found two eigenvectors associated with this eigenvalue. The above can be written as

$$\begin{aligned} \begin{bmatrix} 6t - 4s \\ t \\ s \end{bmatrix} &= \begin{bmatrix} 6t \\ t \\ 0 \end{bmatrix} + \begin{bmatrix} -4s \\ 0 \\ s \end{bmatrix} \\ &= t \begin{bmatrix} 6 \\ 1 \\ 0 \end{bmatrix} + s \begin{bmatrix} -4 \\ 0 \\ 1 \end{bmatrix} \end{aligned}$$

By letting $t = 1$ and $s = 1$ then the above becomes

$$\begin{bmatrix} 6t - 4s \\ t \\ s \end{bmatrix} = \begin{bmatrix} 6 \\ 1 \\ 0 \end{bmatrix} + \begin{bmatrix} -4 \\ 0 \\ 1 \end{bmatrix}$$

Hence the two eigenvectors associated with this eigenvalue are

$$\left(\begin{bmatrix} 6 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} -4 \\ 0 \\ 1 \end{bmatrix} \right)$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-3	3	2	Yes	$\begin{bmatrix} -4 & 6 \\ 0 & 1 \\ 1 & 0 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -3 is real and repated eigenvalue of multiplicity 3.There are three possible cases that can happen. This is illustrated in this diagram

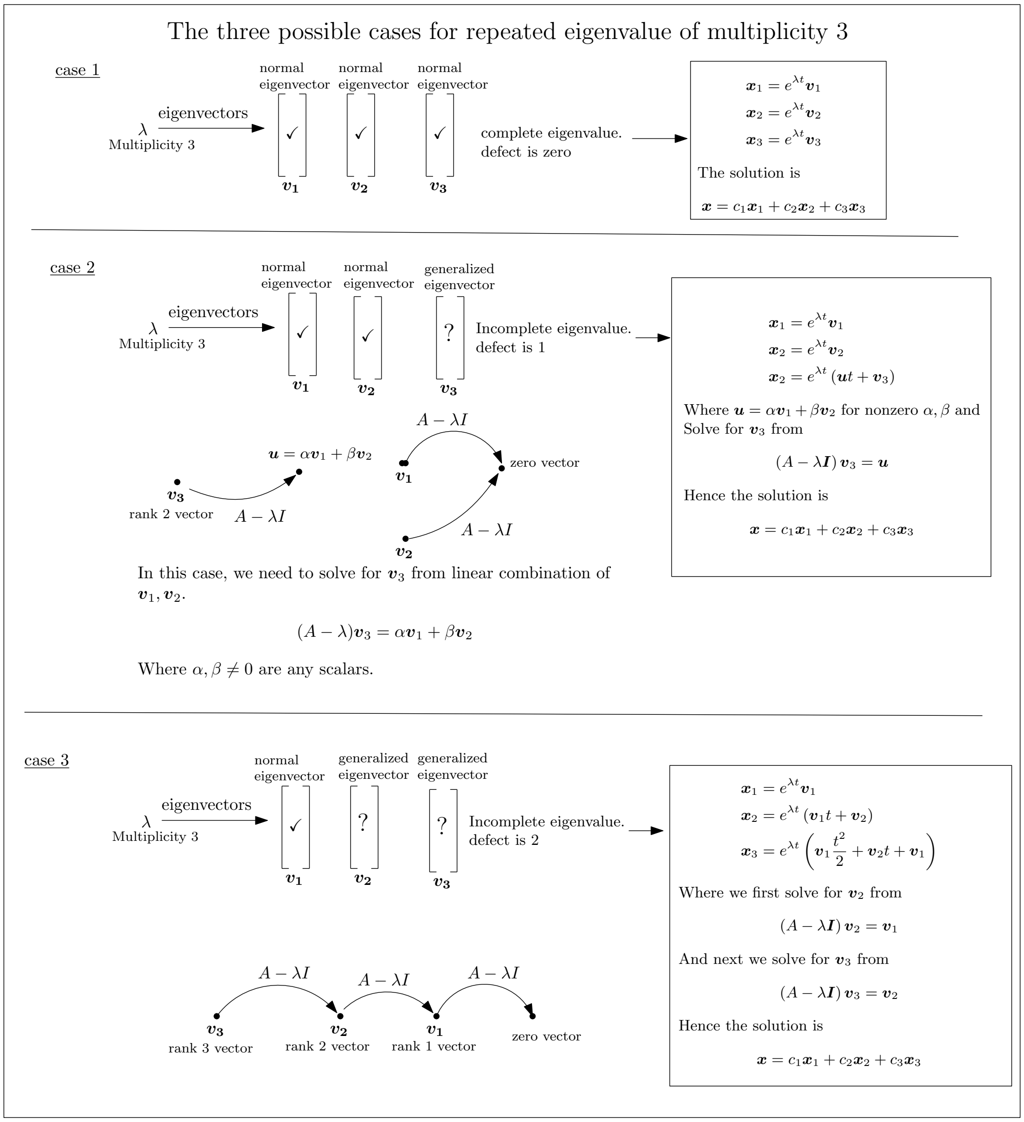

Figure 611: Possible case for repeated λ of multiplicity 3

This eigenvalue has algebraic multiplicity of 3, and geometric multiplicity 2, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to find rank-2 eigenvector $\vec{v}_3$. This eigenvector must therefore satisfy $(A - \lambda I)^2 \vec{v}_3 = \vec{0}$.

But

$$
\begin{aligned}
(A-\lambda I)^2 &= \left(\begin{bmatrix} -1 & -12 & 8 \\ 1 & -9 & 4 \\ 1 & -6 & 1 \end{bmatrix} - -3 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right)^2 \\
&= \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}
\end{aligned}
$$

Therefore $\vec{v}_3$ could be any eigenvector vector we want (but not the zero vector). Let

$$
\vec{v}_3 = \begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \end{bmatrix}
$$

To determine the actual $\vec{v}_3$ we need now to enforce the condition that $\vec{v}_3$ satisfies

$$
(A-\lambda I)\,\vec{v}_3 = \vec{u} \tag{1}
$$

Where $\vec{u}$ is linear combination of $\vec{v}_1, \vec{v}_2$. Hence

$$
\vec{u} = \alpha \vec{v}_1 + \beta \vec{v}_2
$$

Where α, β are arbitrary constants (not both zero). Eq. (1) becomes

$$
\begin{aligned}
(A-\lambda I) \begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \end{bmatrix} &= \alpha \begin{bmatrix} -4 \\ 0 \\ 1 \end{bmatrix} + \beta \begin{bmatrix} 6 \\ 1 \\ 0 \end{bmatrix} \\
\begin{bmatrix} 2 & -12 & 8 \\ 1 & -6 & 4 \\ 1 & -6 & 4 \end{bmatrix} \begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \end{bmatrix} &= \alpha \begin{bmatrix} -4 \\ 0 \\ 1 \end{bmatrix} + \beta \begin{bmatrix} 6 \\ 1 \\ 0 \end{bmatrix} \\
\begin{bmatrix} 2\eta_1 - 12\eta_2 + 8\eta_3 \\ \eta_1 - 6\eta_2 + 4\eta_3 \\ \eta_1 - 6\eta_2 + 4\eta_3 \end{bmatrix} &= \begin{bmatrix} -4\alpha + 6\beta \\ \beta \\ \alpha \end{bmatrix}
\end{aligned}
$$

Expanding the above gives the following equations equations

$$\begin{aligned}2\eta_1 - 12\eta_2 + 8\eta_3 &= -4\alpha + 6\beta \\ \eta_1 - 6\eta_2 + 4\eta_3 &= \beta \\ \eta_1 - 6\eta_2 + 4\eta_3 &= \alpha\end{aligned}$$

solving for α, β from the above gives

$$\begin{aligned}2\eta_1 - 12\eta_2 + 8\eta_3 &= -4\alpha + 6\beta \\ \eta_1 - 6\eta_2 + 4\eta_3 &= \beta\end{aligned}$$

Since α, β are not both zero, then we just need to determine η_i values, not all zero, which satisfy the above equations for α, β not both zero. By inspection we see that the following values satisfy this condition

$$[\eta_1 = 0, \eta_2 = 1, \eta_3 = 0]$$

Hence we found the missing generalized eigenvector

$$\vec{v}_3 = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$$

Which implies that

$$\begin{aligned}\alpha &= -6 \\ \beta &= -6\end{aligned}$$

Therefore

$$\begin{aligned}\vec{u} &= \alpha\vec{v}_1 + \beta\vec{v}_2 \\ &= -6\begin{bmatrix} -4 \\ 0 \\ 1 \end{bmatrix} + (-6)\begin{bmatrix} 6 \\ 1 \\ 0 \end{bmatrix} \\ &= \begin{bmatrix} -12 \\ -6 \\ -6 \end{bmatrix}\end{aligned}$$

Therefore the missing generalized eigenvector is now found. We have found three generalized eigenvectors for eigenvalue -3. Therefore the three basis solutions associated with this eigenvalue are

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t}\\ &= \left[\begin{array}{c}-4\\ 0\\ 1\end{array}\right] \mathrm{e}^{-3t}\\ &= \left[\begin{array}{c}-4\,\mathrm{e}^{-3t}\\ 0\\ \mathrm{e}^{-3t}\end{array}\right]\end{aligned}$$

And

$$\begin{aligned}\vec{x}_2(t) &= \vec{v}_2 e^{\lambda t}\\ &= \left[\begin{array}{c}6\\ 1\\ 0\end{array}\right] \mathrm{e}^{-3t}\\ &= \left[\begin{array}{c}6\,\mathrm{e}^{-3t}\\ \mathrm{e}^{-3t}\\ 0\end{array}\right]\end{aligned}$$

And

$$\begin{aligned}\vec{x}_3(t) &= (\vec{u}t + \vec{v}_3)\, e^{\lambda t}\\ &= \left(\left[\begin{array}{c}-12\\ -6\\ -6\end{array}\right] t + \left[\begin{array}{c}0\\ 1\\ 0\end{array}\right]\right) \mathrm{e}^{-3t}\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)$$

Which is written as

$$\left[\begin{array}{c}y_1(t)\\ y_2(t)\\ y_3(t)\end{array}\right] = c_1 \left[\begin{array}{c}-4\,\mathrm{e}^{-3t}\\ 0\\ \mathrm{e}^{-3t}\end{array}\right] + c_2 \left[\begin{array}{c}6\,\mathrm{e}^{-3t}\\ \mathrm{e}^{-3t}\\ 0\end{array}\right] + c_3 \left[\begin{array}{c}-12t\,\mathrm{e}^{-3t}\\ \mathrm{e}^{-3t}(1-6t)\\ -6t\,\mathrm{e}^{-3t}\end{array}\right]$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} (-12tc_3 - 4c_1 + 6c_2)\,\mathrm{e}^{-3t} \\ \mathrm{e}^{-3t}(-6tc_3 + c_2 + c_3) \\ \mathrm{e}^{-3t}(-6tc_3 + c_1) \end{bmatrix}$$

Problem number: section 10.5, problem 30.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -4y_1(t) - y_3(t) \\
y_2'(t) &= -y_1(t) - 3y_2(t) - y_3(t) \\
y_3'(t) &= y_1(t) - 2y_3(t)
\end{aligned}
$$

22.30.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -4 & 0 & -1 \\ -1 & -3 & -1 \\ 1 & 0 & -2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} \mathrm{e}^{-3t}(1-t) & 0 & -t\,\mathrm{e}^{-3t} \\ -t\,\mathrm{e}^{-3t} & \mathrm{e}^{-3t} & -t\,\mathrm{e}^{-3t} \\ t\,\mathrm{e}^{-3t} & 0 & \mathrm{e}^{-3t}(t+1) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{-3t}(1-t) & 0 & -t\,e^{-3t} \\ -t\,e^{-3t} & e^{-3t} & -t\,e^{-3t} \\ t\,e^{-3t} & 0 & e^{-3t}(t+1) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} e^{-3t}(1-t)\,c_1 - t\,e^{-3t}c_3 \\ -t\,e^{-3t}c_1 + e^{-3t}c_2 - t\,e^{-3t}c_3 \\ t\,e^{-3t}c_1 + e^{-3t}(t+1)\,c_3 \end{bmatrix} \\
&= \begin{bmatrix} -(c_1(-1+t) + c_3 t)\,e^{-3t} \\ -((c_1+c_3)\,t - c_2)\,e^{-3t} \\ e^{-3t}(tc_1 + c_3 t + c_3) \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.30.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -4 & 0 & -1 \\ -1 & -3 & -1 \\ 1 & 0 & -2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -4 & 0 & -1 \\ -1 & -3 & -1 \\ 1 & 0 & -2 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -4-\lambda & 0 & -1 \\ -1 & -3-\lambda & -1 \\ 1 & 0 & -2-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + 9\lambda^2 + 27\lambda + 27 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -3$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-3	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -3$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -4 & 0 & -1 \\ -1 & -3 & -1 \\ 1 & 0 & -2 \end{bmatrix} - (-3)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -1 & 0 & -1 \\ -1 & 0 & -1 \\ 1 & 0 & 1 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -1 & 0 & -1 & 0 \\ -1 & 0 & -1 & 0 \\ 1 & 0 & 1 & 0 \end{array}\right]$$

$$R_2 = R_2 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} -1 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 \\ 1 & 0 & 1 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} -1 & 0 & -1 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -1 & 0 & -1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2, v_3\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Let $v_3 = s$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -s\}$

Hence the solution is

$$\begin{bmatrix} -s \\ t \\ s \end{bmatrix} = \begin{bmatrix} -s \\ t \\ s \end{bmatrix}$$

Since there are two free Variable, we have found two eigenvectors associated with this eigenvalue. The above can be written as

$$\begin{aligned} \begin{bmatrix} -s \\ t \\ s \end{bmatrix} &= \begin{bmatrix} 0 \\ t \\ 0 \end{bmatrix} + \begin{bmatrix} -s \\ 0 \\ s \end{bmatrix} \\ &= t \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} + s \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} \end{aligned}$$

By letting $t = 1$ and $s = 1$ then the above becomes

$$\begin{bmatrix} -s \\ t \\ s \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} + \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix}$$

Hence the two eigenvectors associated with this eigenvalue are

$$\left(\begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} \right)$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
-3	3	2	Yes	$\begin{bmatrix} -1 & 0 \\ 0 & 1 \\ 1 & 0 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -3 is real and repated eigenvalue of multiplicity 3.There are three possible cases that can happen. This is illustrated in this diagram

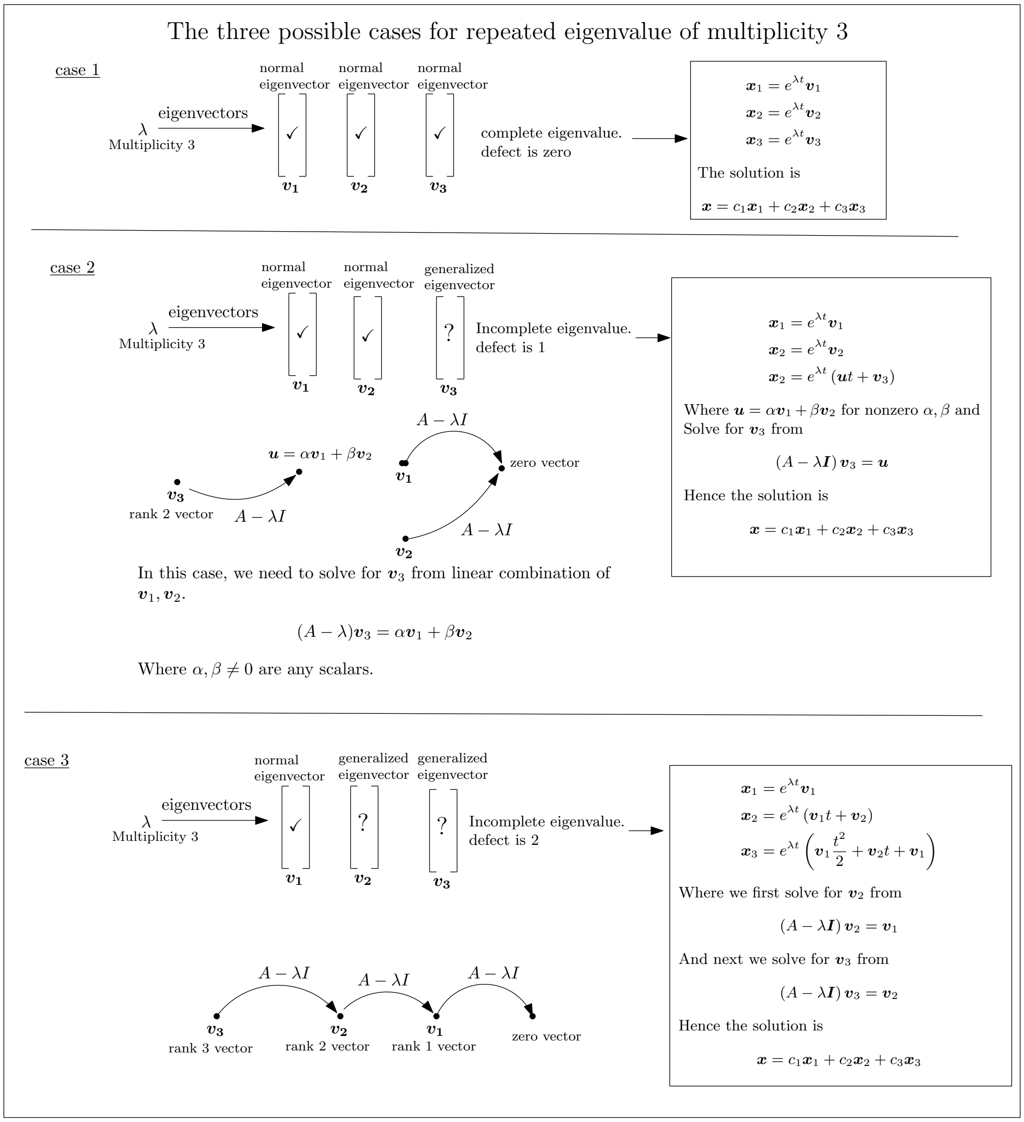

Figure 612: Possible case for repeated λ of multiplicity 3

This eigenvalue has algebraic multiplicity of 3, and geometric multiplicity 2, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to find rank-2 eigenvector $\vec{v}_3$. This eigenvector must therefore satisfy $(A - \lambda I)^2 \vec{v}_3 = \vec{0}$.

But

$$
(A-\lambda I)^2 = \left(\begin{bmatrix} -4 & 0 & -1 \\ -1 & -3 & -1 \\ 1 & 0 & -2 \end{bmatrix} - -3 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right)^2
$$
$$
= \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}
$$

Therefore $\vec{v}_3$ could be any eigenvector vector we want (but not the zero vector). Let

$$
\vec{v}_3 = \begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \end{bmatrix}
$$

To determine the actual $\vec{v}_3$ we need now to enforce the condition that $\vec{v}_3$ satisfies

$$
(A-\lambda I)\,\vec{v}_3 = \vec{u} \tag{1}
$$

Where $\vec{u}$ is linear combination of $\vec{v}_1, \vec{v}_2$. Hence

$$
\vec{u} = \alpha\vec{v}_1 + \beta\vec{v}_2
$$

Where α, β are arbitrary constants (not both zero). Eq. (1) becomes

$$
(A-\lambda I) \begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \end{bmatrix} = \alpha \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} + \beta \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}
$$
$$
\begin{bmatrix} -1 & 0 & -1 \\ -1 & 0 & -1 \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \end{bmatrix} = \alpha \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} + \beta \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}
$$
$$
\begin{bmatrix} -\eta_1 - \eta_3 \\ -\eta_1 - \eta_3 \\ \eta_1 + \eta_3 \end{bmatrix} = \begin{bmatrix} -\alpha \\ \beta \\ \alpha \end{bmatrix}
$$

Expanding the above gives the following equations equations

$$
\begin{aligned}
-\eta_1 - \eta_3 &= -\alpha \\
-\eta_1 - \eta_3 &= \beta \\
\eta_1 + \eta_3 &= \alpha
\end{aligned}
$$

solving for α, β from the above gives

$$
\begin{aligned}
-\eta_1 - \eta_3 &= -\alpha \\
-\eta_1 - \eta_3 &= \beta
\end{aligned}
$$

Since α, β are not both zero, then we just need to determine η_i values, not all zero, which satisfy the above equations for α, β not both zero. By inspection we see that the following values satisfy this condition

$$[\eta_1 = -1, \eta_3 = 0]$$

Hence we found the missing generalized eigenvector

$$\vec{v}_3 = \begin{bmatrix} -1 \\ 0 \\ 0 \end{bmatrix}$$

Which implies that

$$
\begin{aligned}
\alpha &= -1 \\
\beta &= 1
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\vec{u} &= \alpha \vec{v}_1 + \beta \vec{v}_2 \\
&= -1 \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} + (1) \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} \\
&= \begin{bmatrix} 1 \\ 1 \\ -1 \end{bmatrix}
\end{aligned}
$$

Therefore the missing generalized eigenvector is now found. We have found three generalized eigenvectors for eigenvalue -3. Therefore the three basis solutions associated with this eigenvalue are

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\ &= \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} \mathrm{e}^{-3t} \\ &= \begin{bmatrix} -\mathrm{e}^{-3t} \\ 0 \\ \mathrm{e}^{-3t} \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_2(t) &= \vec{v}_2 e^{\lambda t} \\ &= \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} \mathrm{e}^{-3t} \\ &= \begin{bmatrix} 0 \\ \mathrm{e}^{-3t} \\ 0 \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_3(t) &= (\vec{u}t + \vec{v}_3)\, e^{\lambda t} \\ &= \left(\begin{bmatrix} 1 \\ 1 \\ -1 \end{bmatrix} t + \begin{bmatrix} -1 \\ 0 \\ 0 \end{bmatrix}\right) \mathrm{e}^{-3t}\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} -\mathrm{e}^{-3t} \\ 0 \\ \mathrm{e}^{-3t} \end{bmatrix} + c_2 \begin{bmatrix} 0 \\ \mathrm{e}^{-3t} \\ 0 \end{bmatrix} + c_3 \begin{bmatrix} \mathrm{e}^{-3t}(-1+t) \\ t\,\mathrm{e}^{-3t} \\ -t\,\mathrm{e}^{-3t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} ((-1+t)\,c_3 - c_1)\,e^{-3t} \\ e^{-3t}(c_3 t + c_2) \\ e^{-3t}(-c_3 t + c_1) \end{bmatrix}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -3y_1(t) - 3y_2(t) + 4y_3(t) \\
y_2'(t) &= 4y_1(t) + 5y_2(t) - 8y_3(t) \\
y_3'(t) &= 2y_1(t) + 3y_2(t) - 5y_3(t)
\end{aligned}
$$

22.31.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -3 & -3 & 4 \\ 4 & 5 & -8 \\ 2 & 3 & -5 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
e^{At} = \begin{bmatrix} \mathrm{e}^{-t}(1-2t) & -3t\,\mathrm{e}^{-t} & 4t\,\mathrm{e}^{-t} \\ 4t\,\mathrm{e}^{-t} & \mathrm{e}^{-t}(1+6t) & -8t\,\mathrm{e}^{-t} \\ 2t\,\mathrm{e}^{-t} & 3t\,\mathrm{e}^{-t} & \mathrm{e}^{-t}(1-4t) \end{bmatrix}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{-t}(1-2t) & -3t\,e^{-t} & 4t\,e^{-t} \\ 4t\,e^{-t} & e^{-t}(1+6t) & -8t\,e^{-t} \\ 2t\,e^{-t} & 3t\,e^{-t} & e^{-t}(1-4t) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} e^{-t}(1-2t)\,c_1 - 3t\,e^{-t}c_2 + 4t\,e^{-t}c_3 \\ 4t\,e^{-t}c_1 + e^{-t}(1+6t)\,c_2 - 8t\,e^{-t}c_3 \\ 2t\,e^{-t}c_1 + 3t\,e^{-t}c_2 + e^{-t}(1-4t)\,c_3 \end{bmatrix} \\
&= \begin{bmatrix} -2\left(\left(c_1 + \frac{3c_2}{2} - 2c_3\right)t - \frac{c_1}{2}\right)e^{-t} \\ 4\left(\left(c_1 + \frac{3c_2}{2} - 2c_3\right)t + \frac{c_2}{4}\right)e^{-t} \\ 2\left(\left(c_1 + \frac{3c_2}{2} - 2c_3\right)t + \frac{c_3}{2}\right)e^{-t} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.31.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -3 & -3 & 4 \\ 4 & 5 & -8 \\ 2 & 3 & -5 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -3 & -3 & 4 \\ 4 & 5 & -8 \\ 2 & 3 & -5 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -3-\lambda & -3 & 4 \\ 4 & 5-\lambda & -8 \\ 2 & 3 & -5-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + 3\lambda^2 + 3\lambda + 1 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -1$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-1	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -3 & -3 & 4 \\ 4 & 5 & -8 \\ 2 & 3 & -5 \end{bmatrix} - (-1)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 & -3 & 4 \\ 4 & 6 & -8 \\ 2 & 3 & -4 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -2 & -3 & 4 & 0 \\ 4 & 6 & -8 & 0 \\ 2 & 3 & -4 & 0 \end{array}\right]$$

$$R_2 = R_2 + 2R_1 \Longrightarrow \left[\begin{array}{ccc|c} -2 & -3 & 4 & 0 \\ 0 & 0 & 0 & 0 \\ 2 & 3 & -4 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_1 \implies \left[\begin{array}{ccc|c} -2 & -3 & 4 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -2 & -3 & 4 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2, v_3\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Let $v_3 = s$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = -\frac{3t}{2} + 2s\right\}$

Hence the solution is

$$\begin{bmatrix} -\frac{3t}{2} + 2s \\ t \\ s \end{bmatrix} = \begin{bmatrix} -\frac{3t}{2} + 2s \\ t \\ s \end{bmatrix}$$

Since there are two free Variable, we have found two eigenvectors associated with this eigenvalue. The above can be written as

$$\begin{aligned} \begin{bmatrix} -\frac{3t}{2} + 2s \\ t \\ s \end{bmatrix} &= \begin{bmatrix} -\frac{3t}{2} \\ t \\ 0 \end{bmatrix} + \begin{bmatrix} 2s \\ 0 \\ s \end{bmatrix} \\ &= t \begin{bmatrix} -\frac{3}{2} \\ 1 \\ 0 \end{bmatrix} + s \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix} \end{aligned}$$

By letting $t = 1$ and $s = 1$ then the above becomes

$$\begin{bmatrix} -\frac{3t}{2} + 2s \\ t \\ s \end{bmatrix} = \begin{bmatrix} -\frac{3}{2} \\ 1 \\ 0 \end{bmatrix} + \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix}$$

Hence the two eigenvectors associated with this eigenvalue are

$$\left(\begin{bmatrix} -\frac{3}{2} \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix} \right)$$

Which are normalized to

$$\left(\begin{bmatrix} -3 \\ 2 \\ 0 \end{bmatrix}, \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix} \right)$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-1	3	2	Yes	$\begin{bmatrix} 2 & -\frac{3}{2} \\ 0 & 1 \\ 1 & 0 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -1 is real and repated eigenvalue of multiplicity 3.There are three possible cases that can happen. This is illustrated in this diagram

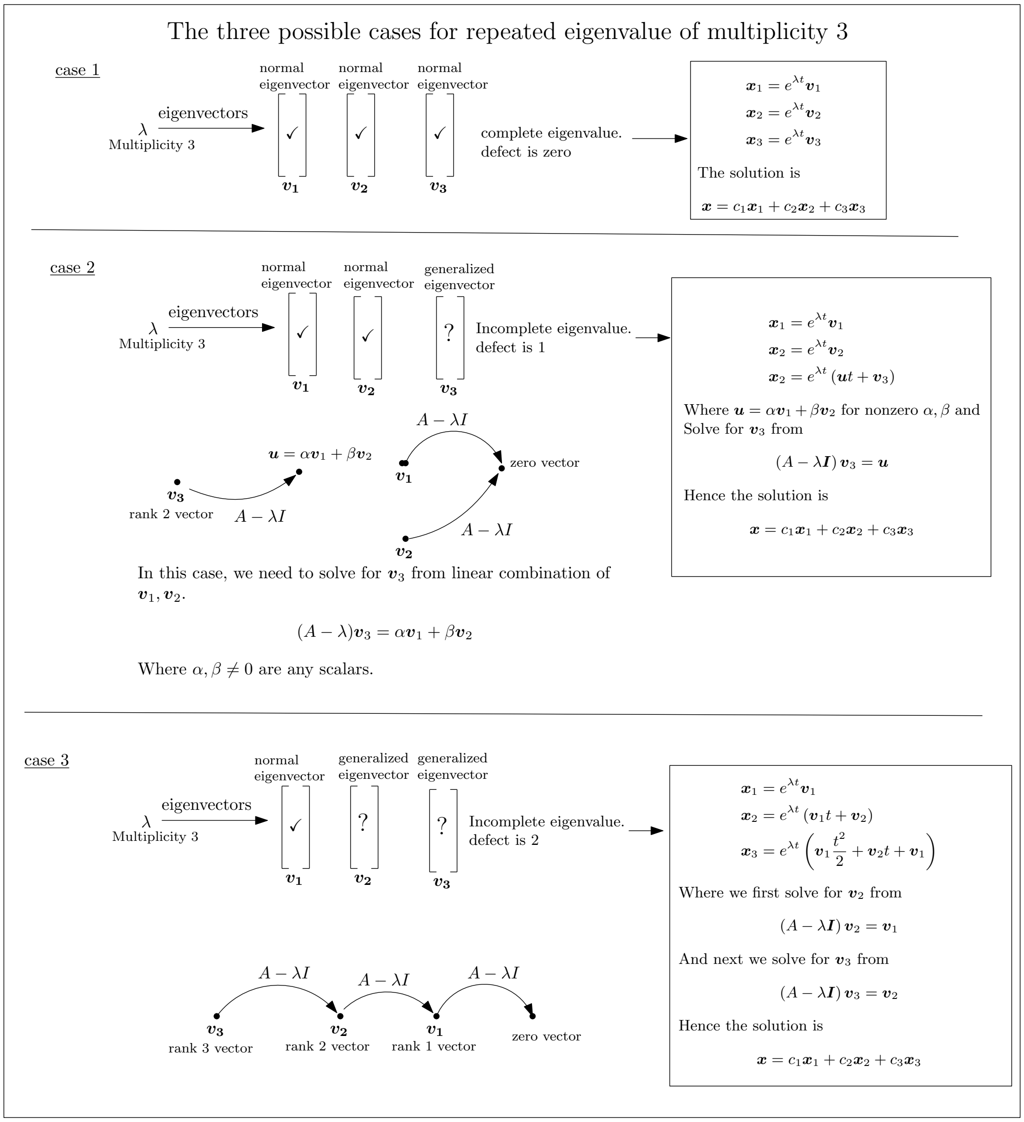

Figure 613: Possible case for repeated λ of multiplicity 3

This eigenvalue has algebraic multiplicity of 3, and geometric multiplicity 2, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to find rank-2 eigenvector $\vec{v}_3$. This eigenvector must therefore satisfy $(A - \lambda I)^2 \vec{v}_3 = \vec{0}$.

But

$$
(A-\lambda I)^2 = \left(\begin{bmatrix} -3 & -3 & 4 \\ 4 & 5 & -8 \\ 2 & 3 & -5 \end{bmatrix} - -1 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right)^2
$$

$$
= \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}
$$

Therefore $\vec{v}_3$ could be any eigenvector vector we want (but not the zero vector). Let

$$
\vec{v}_3 = \begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \end{bmatrix}
$$

To determine the actual $\vec{v}_3$ we need now to enforce the condition that $\vec{v}_3$ satisfies

$$
(A-\lambda I)\,\vec{v}_3 = \vec{u} \tag{1}
$$

Where $\vec{u}$ is linear combination of $\vec{v}_1, \vec{v}_2$. Hence

$$
\vec{u} = \alpha \vec{v}_1 + \beta \vec{v}_2
$$

Where α, β are arbitrary constants (not both zero). Eq. (1) becomes

$$
(A-\lambda I) \begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \end{bmatrix} = \alpha \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix} + \beta \begin{bmatrix} -\frac{3}{2} \\ 1 \\ 0 \end{bmatrix}
$$

$$
\begin{bmatrix} -2 & -3 & 4 \\ 4 & 6 & -8 \\ 2 & 3 & -4 \end{bmatrix} \begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \end{bmatrix} = \alpha \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix} + \beta \begin{bmatrix} -\frac{3}{2} \\ 1 \\ 0 \end{bmatrix}
$$

$$
\begin{bmatrix} -2\eta_1 - 3\eta_2 + 4\eta_3 \\ 4\eta_1 + 6\eta_2 - 8\eta_3 \\ 2\eta_1 + 3\eta_2 - 4\eta_3 \end{bmatrix} = \begin{bmatrix} 2\alpha - \frac{3\beta}{2} \\ \beta \\ \alpha \end{bmatrix}
$$

Expanding the above gives the following equations equations

$$
\begin{aligned}
-2\eta_1 - 3\eta_2 + 4\eta_3 &= 2\alpha - \frac{3\beta}{2} \\
4\eta_1 + 6\eta_2 - 8\eta_3 &= \beta \\
2\eta_1 + 3\eta_2 - 4\eta_3 &= \alpha
\end{aligned}
$$

solving for α, β from the above gives

$$
\begin{aligned}
-2\eta_1 - 3\eta_2 + 4\eta_3 &= 2\alpha - \frac{3\beta}{2} \\
4\eta_1 + 6\eta_2 - 8\eta_3 &= \beta
\end{aligned}
$$

Since α, β are not both zero, then we just need to determine η_i values, not all zero, which satisfy the above equations for α, β not both zero. By inspection we see that the following values satisfy this condition

$$
[\eta_1 = 0, \eta_2 = 0, \eta_3 = 1]
$$

Hence we found the missing generalized eigenvector

$$
\vec{v}_3 = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}
$$

Which implies that

$$
\begin{aligned}
\alpha &= -4 \\
\beta &= -8
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\vec{u} &= \alpha \vec{v}_1 + \beta \vec{v}_2 \\
&= -4 \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix} + (-8) \begin{bmatrix} -\frac{3}{2} \\ 1 \\ 0 \end{bmatrix} \\
&= \begin{bmatrix} 4 \\ -8 \\ -4 \end{bmatrix}
\end{aligned}
$$

Therefore the missing generalized eigenvector is now found. We have found three generalized eigenvectors for eigenvalue -1. Therefore the three basis solutions associated with this eigenvalue are

$$
\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t} \\
&= \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix} \mathrm{e}^{-t} \\
&= \begin{bmatrix} 2\,\mathrm{e}^{-t} \\ 0 \\ \mathrm{e}^{-t} \end{bmatrix}
\end{aligned}
$$

And

$$
\begin{aligned}
\vec{x}_2(t) &= \vec{v}_2 e^{\lambda t} \\
&= \begin{bmatrix} -\frac{3}{2} \\ 1 \\ 0 \end{bmatrix} \mathrm{e}^{-t} \\
&= \begin{bmatrix} -\frac{3\,\mathrm{e}^{-t}}{2} \\ \mathrm{e}^{-t} \\ 0 \end{bmatrix}
\end{aligned}
$$

And

$$
\begin{aligned}
\vec{x}_3(t) &= (\vec{u}t + \vec{v}_3)\, e^{\lambda t} \\
&= \left(\begin{bmatrix} 4 \\ -8 \\ -4 \end{bmatrix} t + \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} \right) \mathrm{e}^{-t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} 2\,\mathrm{e}^{-t} \\ 0 \\ \mathrm{e}^{-t} \end{bmatrix} + c_2 \begin{bmatrix} -\frac{3\,\mathrm{e}^{-t}}{2} \\ \mathrm{e}^{-t} \\ 0 \end{bmatrix} + c_3 \begin{bmatrix} 4t\,\mathrm{e}^{-t} \\ -8t\,\mathrm{e}^{-t} \\ \mathrm{e}^{-t}(1-4t) \end{bmatrix}
$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} e^{-t}\left(2c_1 - \frac{3c_2}{2} + 4tc_3\right) \\ e^{-t}(-8tc_3 + c_2) \\ e^{-t}(-4tc_3 + c_1 + c_3) \end{bmatrix}$$

ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -3y_1(t) - y_2(t) \\
y_2'(t) &= y_1(t) - y_2(t) \\
y_3'(t) &= -y_1(t) - y_2(t) - 2y_3(t)
\end{aligned}
$$

22.32.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -3 & -1 & 0 \\ 1 & -1 & 0 \\ -1 & -1 & -2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \mathrm{e}^{-2t}(1-t) & -t\,\mathrm{e}^{-2t} & 0 \\ t\,\mathrm{e}^{-2t} & \mathrm{e}^{-2t}(t+1) & 0 \\ -t\,\mathrm{e}^{-2t} & -t\,\mathrm{e}^{-2t} & \mathrm{e}^{-2t} \end{bmatrix}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{-2t}(1-t) & -t\,e^{-2t} & 0 \\ t\,e^{-2t} & e^{-2t}(t+1) & 0 \\ -t\,e^{-2t} & -t\,e^{-2t} & e^{-2t} \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\
&= \begin{bmatrix} e^{-2t}(1-t)\,c_1 - t\,e^{-2t}c_2 \\ t\,e^{-2t}c_1 + e^{-2t}(t+1)\,c_2 \\ -t\,e^{-2t}c_1 - t\,e^{-2t}c_2 + e^{-2t}c_3 \end{bmatrix} \\
&= \begin{bmatrix} -(c_1(-1+t) + c_2 t)\,e^{-2t} \\ e^{-2t}(tc_1 + c_2 t + c_2) \\ -((c_1+c_2)\,t - c_3)\,e^{-2t} \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

22.32.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -3 & -1 & 0 \\ 1 & -1 & 0 \\ -1 & -1 & -2 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$
\det(A - \lambda I) = 0
$$

Expanding gives

$$
\det\left(\begin{bmatrix} -3 & -1 & 0 \\ 1 & -1 & 0 \\ -1 & -1 & -2 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0
$$

Therefore

$$\det\left(\begin{bmatrix} -3-\lambda & -1 & 0 \\ 1 & -1-\lambda & 0 \\ -1 & -1 & -2-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + 6\lambda^2 + 12\lambda + 8 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -2$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-2	1	real eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -3 & -1 & 0 \\ 1 & -1 & 0 \\ -1 & -1 & -2 \end{bmatrix} - (-2)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -1 & -1 & 0 \\ 1 & 1 & 0 \\ -1 & -1 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -1 & -1 & 0 & 0 \\ 1 & 1 & 0 & 0 \\ -1 & -1 & 0 & 0 \end{array}\right]$$

$$R_2 = R_2 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} -1 & -1 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ -1 & -1 & 0 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_1 \Longrightarrow \left[\begin{array}{ccc|c} -1 & -1 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -1 & -1 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2, v_3\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Let $v_3 = s$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ t \\ s \end{bmatrix} = \begin{bmatrix} -t \\ t \\ s \end{bmatrix}$$

Since there are two free Variable, we have found two eigenvectors associated with this eigenvalue. The above can be written as

$$\begin{aligned} \begin{bmatrix} -t \\ t \\ s \end{bmatrix} &= \begin{bmatrix} -t \\ t \\ 0 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ s \end{bmatrix} \\ &= t \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix} + s \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} \end{aligned}$$

By letting $t = 1$ and $s = 1$ then the above becomes

$$\begin{bmatrix} -t \\ t \\ s \end{bmatrix} = \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$$

Hence the two eigenvectors associated with this eigenvalue are

$$\left(\begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} \right)$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
-2	3	2	Yes	$\begin{bmatrix} 0 & -1 \\ 0 & 1 \\ 1 & 0 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. eigenvalue -2 is real and repated eigenvalue of multiplicity 3.There are three possible cases that can happen. This is illustrated in this diagram

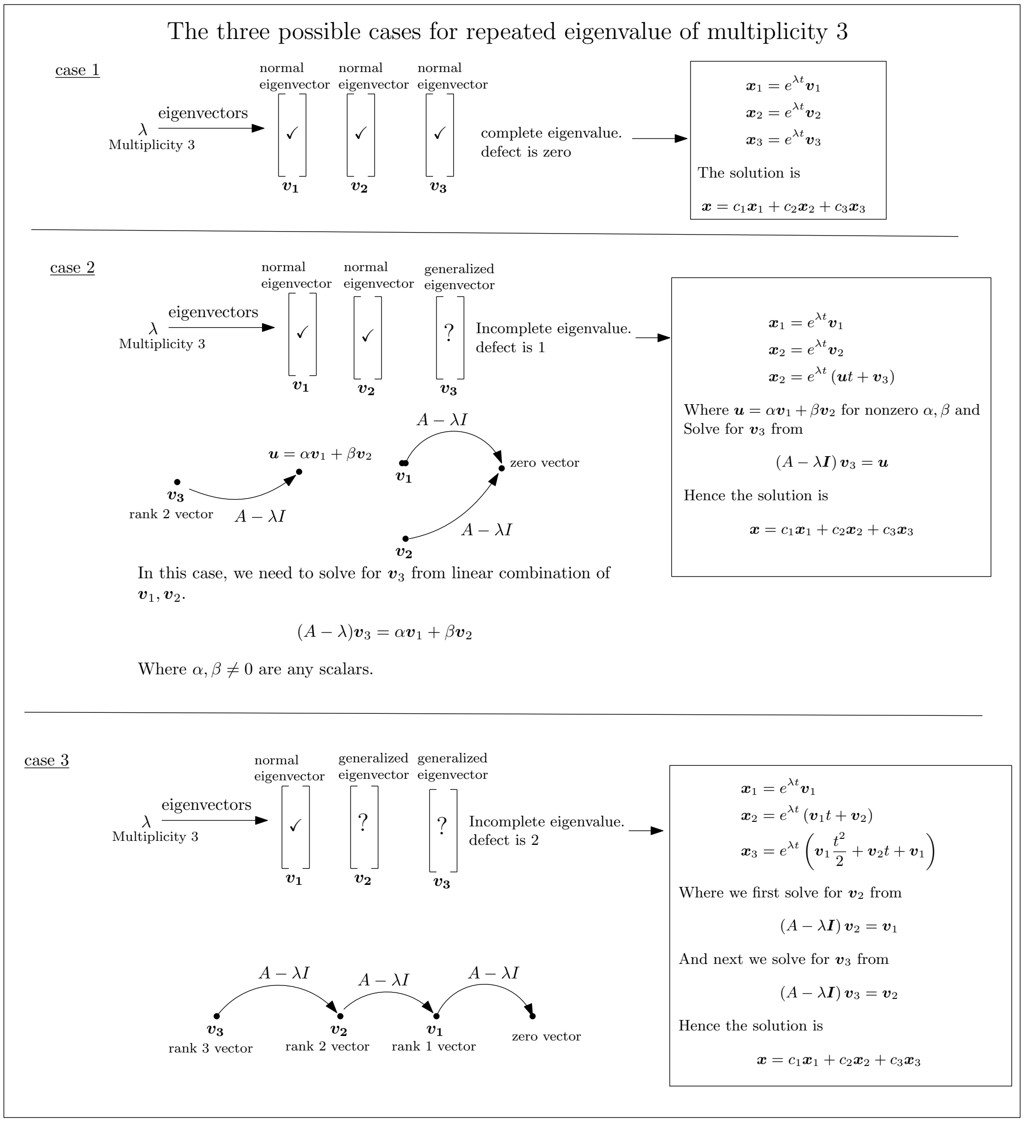

Figure 614: Possible case for repeated λ of multiplicity 3

This eigenvalue has algebraic multiplicity of 3, and geometric multiplicity 2, therefore this is defective eigenvalue. The defect is 1. This falls into case 2 shown above. We need to find rank-2 eigenvector $\vec{v}_3$. This eigenvector must therefore satisfy $(A - \lambda I)^2 \vec{v}_3 = \vec{0}$.

But

$$(A-\lambda I)^2 = \left(\begin{bmatrix} -3 & -1 & 0 \\ 1 & -1 & 0 \\ -1 & -1 & -2 \end{bmatrix} - -2\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)^2$$

$$= \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

Therefore $\vec{v}_3$ could be any eigenvector vector we want (but not the zero vector). Let

$$\vec{v}_3 = \begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \end{bmatrix}$$

To determine the actual $\vec{v}_3$ we need now to enforce the condition that $\vec{v}_3$ satisfies

$$(A-\lambda I)\,\vec{v}_3 = \vec{u} \tag{1}$$

Where $\vec{u}$ is linear combination of $\vec{v}_1, \vec{v}_2$. Hence

$$\vec{u} = \alpha\vec{v}_1 + \beta\vec{v}_2$$

Where α, β are arbitrary constants (not both zero). Eq. (1) becomes

$$(A-\lambda I)\begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \end{bmatrix} = \alpha\begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} + \beta\begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -1 & -1 & 0 \\ 1 & 1 & 0 \\ -1 & -1 & 0 \end{bmatrix}\begin{bmatrix} \eta_1 \\ \eta_2 \\ \eta_3 \end{bmatrix} = \alpha\begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} + \beta\begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -\eta_1 - \eta_2 \\ \eta_1 + \eta_2 \\ -\eta_1 - \eta_2 \end{bmatrix} = \begin{bmatrix} -\beta \\ \beta \\ \alpha \end{bmatrix}$$

Expanding the above gives the following equations equations

$$
\begin{aligned}
-\eta_1 - \eta_2 &= -\beta \\
\eta_1 + \eta_2 &= \beta \\
-\eta_1 - \eta_2 &= \alpha
\end{aligned}
$$

solving for α, β from the above gives

$$
\begin{aligned}
-\eta_1 - \eta_2 &= -\beta \\
\eta_1 + \eta_2 &= \beta
\end{aligned}
$$

Since α, β are not both zero, then we just need to determine η_i values, not all zero, which satisfy the above equations for α, β not both zero. By inspection we see that the following values satisfy this condition

$$
[\eta_1 = -1, \eta_2 = 0]
$$

Hence we found the missing generalized eigenvector

$$
\vec{v}_3 = \begin{bmatrix} -1 \\ 0 \\ 0 \end{bmatrix}
$$

Which implies that

$$
\begin{aligned}
\alpha &= 1 \\
\beta &= -1
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\vec{u} &= \alpha \vec{v}_1 + \beta \vec{v}_2 \\
&= 1 \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} + (-1) \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix} \\
&= \begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix}
\end{aligned}
$$

Therefore the missing generalized eigenvector is now found. We have found three generalized eigenvectors for eigenvalue -2. Therefore the three basis solutions associated with this eigenvalue are

$$\begin{aligned}\vec{x}_1(t) &= \vec{v}_1 e^{\lambda t}\\ &= \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} \mathrm{e}^{-2t}\\ &= \begin{bmatrix} 0 \\ 0 \\ \mathrm{e}^{-2t} \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_2(t) &= \vec{v}_2 e^{\lambda t}\\ &= \begin{bmatrix} -1 \\ 1 \\ 0 \end{bmatrix} \mathrm{e}^{-2t}\\ &= \begin{bmatrix} -\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \\ 0 \end{bmatrix}\end{aligned}$$

And

$$\begin{aligned}\vec{x}_3(t) &= (\vec{u}t + \vec{v}_3)\, e^{\lambda t}\\ &= \left(\begin{bmatrix} 1 \\ -1 \\ 1 \end{bmatrix} t + \begin{bmatrix} -1 \\ 0 \\ 0 \end{bmatrix}\right) \mathrm{e}^{-2t}\end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} 0 \\ 0 \\ \mathrm{e}^{-2t} \end{bmatrix} + c_2 \begin{bmatrix} -\mathrm{e}^{-2t} \\ \mathrm{e}^{-2t} \\ 0 \end{bmatrix} + c_3 \begin{bmatrix} \mathrm{e}^{-2t}(-1+t) \\ -t\,\mathrm{e}^{-2t} \\ t\,\mathrm{e}^{-2t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} ((-1+t)\,c_3 - c_2)\,e^{-2t} \\ e^{-2t}(-c_3 t + c_2) \\ e^{-2t}(c_3 t + c_1) \end{bmatrix}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -y_1(t) + 2y_2(t) \\
y_2'(t) &= -5y_1(t) + 5y_2(t)
\end{aligned}
$$

23.1.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -1 & 2 \\ -5 & 5 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$
\begin{aligned}
e^{At} &= \begin{bmatrix} e^{2t}\cos(t) - 3\,e^{2t}\sin(t) & 2\,e^{2t}\sin(t) \\ -5\,e^{2t}\sin(t) & e^{2t}\cos(t) + 3\,e^{2t}\sin(t) \end{bmatrix} \\
&= \begin{bmatrix} e^{2t}(-3\sin(t) + \cos(t)) & 2\,e^{2t}\sin(t) \\ -5\,e^{2t}\sin(t) & e^{2t}(\cos(t) + 3\sin(t)) \end{bmatrix}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{2t}(-3\sin(t)+\cos(t)) & 2\,e^{2t}\sin(t) \\ -5\,e^{2t}\sin(t) & e^{2t}(\cos(t)+3\sin(t)) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{2t}(-3\sin(t)+\cos(t))\,c_1 + 2\,e^{2t}\sin(t)\,c_2 \\ -5\,e^{2t}\sin(t)\,c_1 + e^{2t}(\cos(t)+3\sin(t))\,c_2 \end{bmatrix} \\
&= \begin{bmatrix} ((-3c_1+2c_2)\sin(t)+c_1\cos(t))\,e^{2t} \\ e^{2t}(c_2\cos(t)-5c_1\sin(t)+3\sin(t)\,c_2) \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

23.1.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -1 & 2 \\ -5 & 5 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -1 & 2 \\ -5 & 5 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -1-\lambda & 2 \\ -5 & 5-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 - 4\lambda + 5 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 2 + i$$
$$\lambda_2 = 2 - i$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
$2 + i$	1	complex eigenvalue
$2 - i$	1	complex eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 2 - i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -1 & 2 \\ -5 & 5 \end{bmatrix} - (2 - i)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} -3 + i & 2 \\ -5 & 3 + i \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -3 + i & 2 & 0 \\ -5 & 3 + i & 0 \end{array}\right]$$

$$R_2 = R_2 + \left(-\frac{3}{2} - \frac{i}{2}\right) R_1 \Longrightarrow \left[\begin{array}{cc|c} -3 + i & 2 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -3 + i & 2 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \left(\frac{3}{5} + \frac{i}{5}\right) t\right\}$

Hence the solution is

$$\begin{bmatrix} \left(\frac{3}{5} + \frac{I}{5}\right) t \\ t \end{bmatrix} = \begin{bmatrix} \left(\frac{3}{5} + \frac{i}{5}\right) t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \left(\frac{3}{5} + \frac{I}{5}\right) t \\ t \end{bmatrix} = t \begin{bmatrix} \frac{3}{5} + \frac{i}{5} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \left(\frac{3}{5} + \frac{I}{5}\right) t \\ t \end{bmatrix} = \begin{bmatrix} \frac{3}{5} + \frac{i}{5} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \left(\frac{3}{5} + \frac{I}{5}\right) t \\ t \end{bmatrix} = \begin{bmatrix} 3 + i \\ 5 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 2 + i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -1 & 2 \\ -5 & 5 \end{bmatrix} - (2+i) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -3 - i & 2 \\ -5 & 3 - i \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -3 - i & 2 & 0 \\ -5 & 3 - i & 0 \end{array}\right]$$

$$R_2 = R_2 + \left(-\frac{3}{2} + \frac{i}{2}\right) R_1 \Longrightarrow \left[\begin{array}{cc|c} -3 - i & 2 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -3-i & 2 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \left(\frac{3}{5} - \frac{i}{5}\right) t\right\}$

Hence the solution is

$$\begin{bmatrix} \left(\frac{3}{5} - \frac{I}{5}\right) t \\ t \end{bmatrix} = \begin{bmatrix} \left(\frac{3}{5} - \frac{i}{5}\right) t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \left(\frac{3}{5} - \frac{I}{5}\right) t \\ t \end{bmatrix} = t \begin{bmatrix} \frac{3}{5} - \frac{i}{5} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \left(\frac{3}{5} - \frac{I}{5}\right) t \\ t \end{bmatrix} = \begin{bmatrix} \frac{3}{5} - \frac{i}{5} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \left(\frac{3}{5} - \frac{I}{5}\right) t \\ t \end{bmatrix} = \begin{bmatrix} 3-i \\ 5 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
$2+i$	1	1	No	$\left[\begin{array}{c}\frac{3}{5}-\frac{i}{5} \\ 1\end{array}\right]$
$2-i$	1	1	No	$\left[\begin{array}{c}\frac{3}{5}+\frac{i}{5} \\ 1\end{array}\right]$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t)$$

Which is written as

$$\left[\begin{array}{c}y_1(t) \\ y_2(t)\end{array}\right] = c_1\left[\begin{array}{c}\left(\frac{3}{5}-\frac{i}{5}\right)\mathrm{e}^{(2+i)t} \\ \mathrm{e}^{(2+i)t}\end{array}\right] + c_2\left[\begin{array}{c}\left(\frac{3}{5}+\frac{i}{5}\right)\mathrm{e}^{(2-i)t} \\ \mathrm{e}^{(2-i)t}\end{array}\right]$$

Which becomes

$$\left[\begin{array}{c}y_1(t) \\ y_2(t)\end{array}\right] = \left[\begin{array}{c}\left(\frac{3}{5}-\frac{i}{5}\right)c_1\mathrm{e}^{(2+i)t} + \left(\frac{3}{5}+\frac{i}{5}\right)c_2\mathrm{e}^{(2-i)t} \\ c_1\mathrm{e}^{(2+i)t} + c_2\mathrm{e}^{(2-i)t}\end{array}\right]$$

The following is the phase plot of the system.

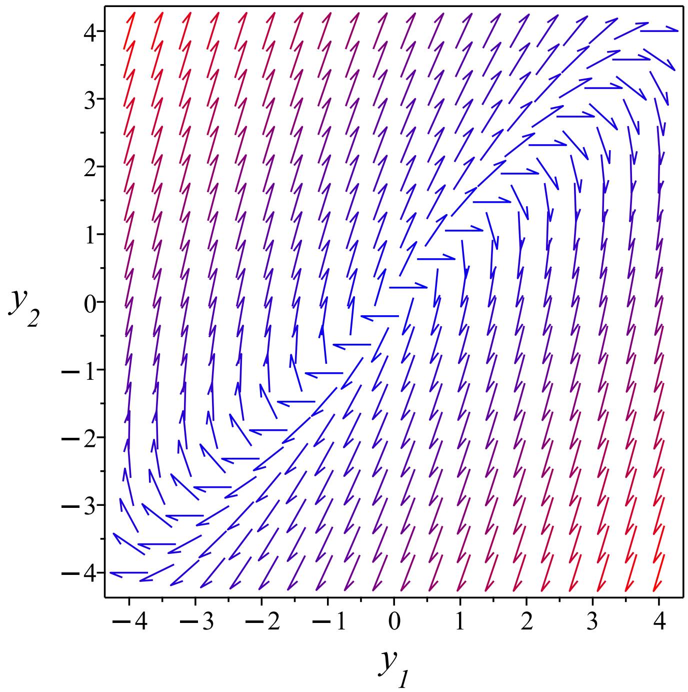

Figure 615: Phase plot

23.1.3 Maple step by step solution

Let's solve

$[y_1'(t) = -y_1(t) + 2y_2(t), y_2'(t) = -5y_1(t) + 5y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -1 & 2 \\ -5 & 5 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -1 & 2 \\ -5 & 5 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -1 & 2 \\ -5 & 5 \end{bmatrix}$$

- Rewrite the system as

  $\underline{y}^{\rightarrow}{}'(t) = A \cdot \underline{y}^{\rightarrow}(t)$
- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

  $$\left[\left[2 - \mathrm{I}, \begin{bmatrix} \frac{3}{5} + \frac{\mathrm{I}}{5} \\ 1 \end{bmatrix}\right], \left[2 + \mathrm{I}, \begin{bmatrix} \frac{3}{5} - \frac{\mathrm{I}}{5} \\ 1 \end{bmatrix}\right]\right]$$
- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

  $$\left[2 - \mathrm{I}, \begin{bmatrix} \frac{3}{5} + \frac{\mathrm{I}}{5} \\ 1 \end{bmatrix}\right]$$
- Solution from eigenpair

  $$\mathrm{e}^{(2-\mathrm{I})t} \cdot \begin{bmatrix} \frac{3}{5} + \frac{\mathrm{I}}{5} \\ 1 \end{bmatrix}$$
- Use Euler identity to write solution in terms of $\sin$ and $\cos$

  $$\mathrm{e}^{2t} \cdot (\cos(t) - \mathrm{I}\sin(t)) \cdot \begin{bmatrix} \frac{3}{5} + \frac{\mathrm{I}}{5} \\ 1 \end{bmatrix}$$
- Simplify expression

  $$\mathrm{e}^{2t} \cdot \begin{bmatrix} \left(\frac{3}{5} + \frac{\mathrm{I}}{5}\right)(\cos(t) - \mathrm{I}\sin(t)) \\ \cos(t) - \mathrm{I}\sin(t) \end{bmatrix}$$
- Both real and imaginary parts are solutions to the homogeneous system

  $$\left[\underline{y}^{\rightarrow}{}_{1}(t) = \mathrm{e}^{2t} \cdot \begin{bmatrix} \frac{3\cos(t)}{5} + \frac{\sin(t)}{5} \\ \cos(t) \end{bmatrix}, \underline{y}^{\rightarrow}{}_{2}(t) = \mathrm{e}^{2t} \cdot \begin{bmatrix} -\frac{3\sin(t)}{5} + \frac{\cos(t)}{5} \\ -\sin(t) \end{bmatrix}\right]$$
- General solution to the system of ODEs

  $\underline{y}^{\rightarrow} = c_1 \underline{y}^{\rightarrow}{}_{1}(t) + c_2 \underline{y}^{\rightarrow}{}_{2}(t)$
- Substitute solutions into the general solution

$$\underline{y}^{\rightarrow} = c_1 e^{2t} \cdot \begin{bmatrix} \frac{3\cos(t)}{5} + \frac{\sin(t)}{5} \\ \cos(t) \end{bmatrix} + c_2 e^{2t} \cdot \begin{bmatrix} -\frac{3\sin(t)}{5} + \frac{\cos(t)}{5} \\ -\sin(t) \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \frac{3\left(\left(c_1+\frac{c_2}{3}\right)\cos(t)+\frac{\sin(t)(c_1-3c_2)}{3}\right)e^{2t}}{5} \\ e^{2t}(-c_2\sin(t)+c_1\cos(t)) \end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{ y_1(t) = \frac{3\left(\left(c_1+\frac{c_2}{3}\right)\cos(t)+\frac{\sin(t)(c_1-3c_2)}{3}\right)e^{2t}}{5}, y_2(t) = e^{2t}(-c_2\sin(t)+c_1\cos(t)) \right\}$$

✓ Solution by Maple

Time used: 0.015 (sec). Leaf size: 48

```
dsolve([diff(y__1(t),t)=-1*y__1(t)+2*y__2(t),diff(y__2(t),t)=-5*y__1(t)+5*y__2(t)],singsol=a
```

$$y_1(t) = e^{2t}(c_1\sin(t) + c_2\cos(t))$$
$$y_2(t) = \frac{e^{2t}(3c_1\sin(t) - c_2\sin(t) + c_1\cos(t) + 3c_2\cos(t))}{2}$$

✓ Solution by Mathematica

Time used: 0.008 (sec). Leaf size: 55

```
DSolve[{y1'[t]==-1*y1[t]+2*y2[t],y2'[t]==-5*y1[t]+5*y2[t]},{y1[t],y2[t]},t,IncludeSingularSo
```

$$\text{y1}(t) \rightarrow e^{2t}(c_1\cos(t) + (2c_2 - 3c_1)\sin(t))$$
$$\text{y2}(t) \rightarrow e^{2t}(c_2(3\sin(t) + \cos(t)) - 5c_1\sin(t))$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -11y_1(t) + 4y_2(t) \\
y_2'(t) &= -26y_1(t) + 9y_2(t)
\end{aligned}
$$

23.2.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -11 & 4 \\ -26 & 9 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$
\begin{aligned}
e^{At} &= \begin{bmatrix} \mathrm{e}^{-t}\cos(2t) - 5\,\mathrm{e}^{-t}\sin(2t) & 2\,\mathrm{e}^{-t}\sin(2t) \\ -13\,\mathrm{e}^{-t}\sin(2t) & \mathrm{e}^{-t}\cos(2t) + 5\,\mathrm{e}^{-t}\sin(2t) \end{bmatrix} \\
&= \begin{bmatrix} \mathrm{e}^{-t}(\cos(2t) - 5\sin(2t)) & 2\,\mathrm{e}^{-t}\sin(2t) \\ -13\,\mathrm{e}^{-t}\sin(2t) & \mathrm{e}^{-t}(\cos(2t) + 5\sin(2t)) \end{bmatrix}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{-t}(\cos(2t) - 5\sin(2t)) & 2\,e^{-t}\sin(2t) \\ -13\,e^{-t}\sin(2t) & e^{-t}(\cos(2t) + 5\sin(2t)) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{-t}(\cos(2t) - 5\sin(2t))\,c_1 + 2\,e^{-t}\sin(2t)\,c_2 \\ -13\,e^{-t}\sin(2t)\,c_1 + e^{-t}(\cos(2t) + 5\sin(2t))\,c_2 \end{bmatrix} \\
&= \begin{bmatrix} ((-5c_1 + 2c_2)\sin(2t) + c_1\cos(2t))\,e^{-t} \\ e^{-t}(c_2\cos(2t) - 13c_1\sin(2t) + 5\sin(2t)\,c_2) \end{bmatrix}
\end{aligned}
$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

23.2.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} -11 & 4 \\ -26 & 9 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -11 & 4 \\ -26 & 9 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -11 - \lambda & 4 \\ -26 & 9 - \lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 + 2\lambda + 5 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -1 + 2i$$
$$\lambda_2 = -1 - 2i$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
$-1-2i$	1	complex eigenvalue
$-1+2i$	1	complex eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -1 - 2i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -11 & 4 \\ -26 & 9 \end{bmatrix} - (-1-2i)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} -10+2i & 4 \\ -26 & 10+2i \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -10+2i & 4 & 0 \\ -26 & 10+2i & 0 \end{array}\right]$$

$$R_2 = R_2 + \left(-\frac{5}{2} - \frac{i}{2}\right)R_1 \Longrightarrow \left[\begin{array}{cc|c} -10+2i & 4 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -10+2i & 4 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = \left(\frac{5}{13} + \frac{i}{13}\right) t\}$

Hence the solution is

$$\begin{bmatrix} \left(\frac{5}{13} + \frac{I}{13}\right) t \\ t \end{bmatrix} = \begin{bmatrix} \left(\frac{5}{13} + \frac{i}{13}\right) t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \left(\frac{5}{13} + \frac{I}{13}\right) t \\ t \end{bmatrix} = t \begin{bmatrix} \frac{5}{13} + \frac{i}{13} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \left(\frac{5}{13} + \frac{I}{13}\right) t \\ t \end{bmatrix} = \begin{bmatrix} \frac{5}{13} + \frac{i}{13} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \left(\frac{5}{13} + \frac{I}{13}\right) t \\ t \end{bmatrix} = \begin{bmatrix} 5 + i \\ 13 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = -1 + 2i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -11 & 4 \\ -26 & 9 \end{bmatrix} - (-1 + 2i) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -10 - 2i & 4 \\ -26 & 10 - 2i \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -10 - 2i & 4 & 0 \\ -26 & 10 - 2i & 0 \end{array}\right]$$

$$R_2 = R_2 + \left(-\frac{5}{2} + \frac{i}{2}\right) R_1 \implies \left[\begin{array}{cc|c} -10 - 2i & 4 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -10-2i & 4 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \left(\frac{5}{13} - \frac{i}{13}\right) t\right\}$

Hence the solution is

$$\begin{bmatrix} \left(\frac{5}{13} - \frac{I}{13}\right) t \\ t \end{bmatrix} = \begin{bmatrix} \left(\frac{5}{13} - \frac{i}{13}\right) t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \left(\frac{5}{13} - \frac{I}{13}\right) t \\ t \end{bmatrix} = t \begin{bmatrix} \frac{5}{13} - \frac{i}{13} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \left(\frac{5}{13} - \frac{I}{13}\right) t \\ t \end{bmatrix} = \begin{bmatrix} \frac{5}{13} - \frac{i}{13} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \left(\frac{5}{13} - \frac{I}{13}\right) t \\ t \end{bmatrix} = \begin{bmatrix} 5-i \\ 13 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity: algebraic m	multiplicity: geometric k	defective?	eigenvectors
$-1+2i$	1	1	No	$\left[\begin{array}{c} \frac{5}{13}-\frac{i}{13} \\ 1 \end{array}\right]$
$-1-2i$	1	1	No	$\left[\begin{array}{c} \frac{5}{13}+\frac{i}{13} \\ 1 \end{array}\right]$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t)$$

Which is written as

$$\left[\begin{array}{c} y_1(t) \\ y_2(t) \end{array}\right] = c_1 \left[\begin{array}{c} \left(\frac{5}{13}-\frac{i}{13}\right) e^{(-1+2i)t} \\ e^{(-1+2i)t} \end{array}\right] + c_2 \left[\begin{array}{c} \left(\frac{5}{13}+\frac{i}{13}\right) e^{(-1-2i)t} \\ e^{(-1-2i)t} \end{array}\right]$$

Which becomes

$$\left[\begin{array}{c} y_1(t) \\ y_2(t) \end{array}\right] = \left[\begin{array}{c} \left(\frac{5}{13}-\frac{i}{13}\right) c_1 e^{(-1+2i)t} + \left(\frac{5}{13}+\frac{i}{13}\right) c_2 e^{(-1-2i)t} \\ c_1 e^{(-1+2i)t} + c_2 e^{(-1-2i)t} \end{array}\right]$$

The following is the phase plot of the system.

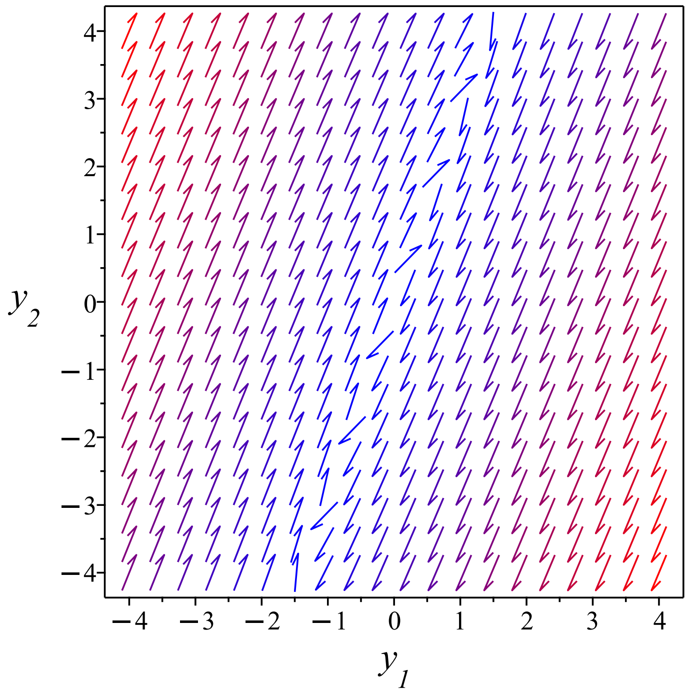

Figure 616: Phase plot

23.2.3 Maple step by step solution

Let's solve

$[y_1'(t) = -11y_1(t) + 4y_2(t), y_2'(t) = -26y_1(t) + 9y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -11 & 4 \\ -26 & 9 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -11 & 4 \\ -26 & 9 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -11 & 4 \\ -26 & 9 \end{bmatrix}$$

- Rewrite the system as

$$\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1-2\,\mathrm{I}, \begin{bmatrix} \frac{5}{13}+\frac{\mathrm{I}}{13} \\ 1 \end{bmatrix}\right], \left[-1+2\,\mathrm{I}, \begin{bmatrix} \frac{5}{13}-\frac{\mathrm{I}}{13} \\ 1 \end{bmatrix}\right]\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-1-2\,\mathrm{I}, \begin{bmatrix} \frac{5}{13}+\frac{\mathrm{I}}{13} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(-1-2\,\mathrm{I})t} \cdot \begin{bmatrix} \frac{5}{13}+\frac{\mathrm{I}}{13} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{-t} \cdot (\cos(2t) - \mathrm{I}\sin(2t)) \cdot \begin{bmatrix} \frac{5}{13}+\frac{\mathrm{I}}{13} \\ 1 \end{bmatrix}$$

- Simplify expression

$$\mathrm{e}^{-t} \cdot \begin{bmatrix} \left(\frac{5}{13}+\frac{\mathrm{I}}{13}\right)(\cos(2t) - \mathrm{I}\sin(2t)) \\ \cos(2t) - \mathrm{I}\sin(2t) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\underline{y}^{\rightarrow}{}_{1}(t) = \mathrm{e}^{-t} \cdot \begin{bmatrix} \frac{5\cos(2t)}{13}+\frac{\sin(2t)}{13} \\ \cos(2t) \end{bmatrix}, \underline{y}^{\rightarrow}{}_{2}(t) = \mathrm{e}^{-t} \cdot \begin{bmatrix} -\frac{5\sin(2t)}{13}+\frac{\cos(2t)}{13} \\ -\sin(2t) \end{bmatrix}\right]$$

- General solution to the system of ODEs

$$\underline{y}^{\rightarrow} = c_1 \underline{y}^{\rightarrow}{}_{1}(t) + c_2 \underline{y}^{\rightarrow}{}_{2}(t)$$

- Substitute solutions into the general solution

$$\underline{y}^{\rightarrow} = c_1 e^{-t} \cdot \begin{bmatrix} \frac{5\cos(2t)}{13} + \frac{\sin(2t)}{13} \\ \cos(2t) \end{bmatrix} + c_2 e^{-t} \cdot \begin{bmatrix} -\frac{5\sin(2t)}{13} + \frac{\cos(2t)}{13} \\ -\sin(2t) \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \frac{5\left(\left(c_1+\frac{c_2}{5}\right)\cos(2t)+\frac{\sin(2t)(c_1-5c_2)}{5}\right)e^{-t}}{13} \\ e^{-t}(-c_2\sin(2t)+c_1\cos(2t)) \end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{y_1(t) = \frac{5\left(\left(c_1+\frac{c_2}{5}\right)\cos(2t)+\frac{\sin(2t)(c_1-5c_2)}{5}\right)e^{-t}}{13}, y_2(t) = e^{-t}(-c_2\sin(2t)+c_1\cos(2t))\right\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= y_1(t) + 2y_2(t) \\
y_2'(t) &= -4y_1(t) + 5y_2(t)
\end{aligned}
$$

23.3.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 1 & 2 \\ -4 & 5 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$
\begin{aligned}
e^{At} &= \begin{bmatrix} e^{3t}\cos(2t) - e^{3t}\sin(2t) & e^{3t}\sin(2t) \\ -2\,e^{3t}\sin(2t) & e^{3t}\cos(2t) + e^{3t}\sin(2t) \end{bmatrix} \\
&= \begin{bmatrix} e^{3t}(\cos(2t) - \sin(2t)) & e^{3t}\sin(2t) \\ -2\,e^{3t}\sin(2t) & e^{3t}(\cos(2t) + \sin(2t)) \end{bmatrix}
\end{aligned}
$$

Therefore the homogeneous solution is

$$\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{3t}(\cos(2t) - \sin(2t)) & e^{3t}\sin(2t) \\ -2\,e^{3t}\sin(2t) & e^{3t}(\cos(2t) + \sin(2t)) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{3t}(\cos(2t) - \sin(2t))\,c_1 + e^{3t}\sin(2t)\,c_2 \\ -2\,e^{3t}\sin(2t)\,c_1 + e^{3t}(\cos(2t) + \sin(2t))\,c_2 \end{bmatrix} \\
&= \begin{bmatrix} ((c_2 - c_1)\sin(2t) + c_1\cos(2t))\,e^{3t} \\ e^{3t}(c_2\cos(2t) - 2c_1\sin(2t) + \sin(2t)\,c_2) \end{bmatrix}
\end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

23.3.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 1 & 2 \\ -4 & 5 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 1 & 2 \\ -4 & 5 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 1-\lambda & 2 \\ -4 & 5-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 - 6\lambda + 13 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 3 + 2i$$
$$\lambda_2 = 3 - 2i$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
$3 - 2i$	1	complex eigenvalue
$3 + 2i$	1	complex eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 3 - 2i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 1 & 2 \\ -4 & 5 \end{bmatrix} - (3 - 2i)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} -2 + 2i & 2 \\ -4 & 2 + 2i \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -2 + 2i & 2 & 0 \\ -4 & 2 + 2i & 0 \end{array}\right]$$

$$R_2 = R_2 + (-1 - i)\, R_1 \Longrightarrow \left[\begin{array}{cc|c} -2 + 2i & 2 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -2 + 2i & 2 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \left(\frac{1}{2} + \frac{i}{2}\right) t\right\}$

Hence the solution is

$$\begin{bmatrix} \left(\frac{1}{2} + \frac{I}{2}\right) t \\ t \end{bmatrix} = \begin{bmatrix} \left(\frac{1}{2} + \frac{i}{2}\right) t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \left(\frac{1}{2} + \frac{I}{2}\right) t \\ t \end{bmatrix} = t \begin{bmatrix} \frac{1}{2} + \frac{i}{2} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \left(\frac{1}{2} + \frac{I}{2}\right) t \\ t \end{bmatrix} = \begin{bmatrix} \frac{1}{2} + \frac{i}{2} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \left(\frac{1}{2} + \frac{I}{2}\right) t \\ t \end{bmatrix} = \begin{bmatrix} 1 + i \\ 2 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 3 + 2i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 1 & 2 \\ -4 & 5 \end{bmatrix} - (3 + 2i) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 - 2i & 2 \\ -4 & 2 - 2i \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} -2 - 2i & 2 & 0 \\ -4 & 2 - 2i & 0 \end{array}\right]$$

$$R_2 = R_2 + (-1 + i) R_1 \Longrightarrow \left[\begin{array}{cc|c} -2 - 2i & 2 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -2-2i & 2 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \left(\frac{1}{2} - \frac{i}{2}\right) t\right\}$

Hence the solution is

$$\begin{bmatrix} \left(\frac{1}{2} - \frac{I}{2}\right) t \\ t \end{bmatrix} = \begin{bmatrix} \left(\frac{1}{2} - \frac{i}{2}\right) t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \left(\frac{1}{2} - \frac{I}{2}\right) t \\ t \end{bmatrix} = t \begin{bmatrix} \frac{1}{2} - \frac{i}{2} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \left(\frac{1}{2} - \frac{I}{2}\right) t \\ t \end{bmatrix} = \begin{bmatrix} \frac{1}{2} - \frac{i}{2} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \left(\frac{1}{2} - \frac{I}{2}\right) t \\ t \end{bmatrix} = \begin{bmatrix} 1-i \\ 2 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
$3+2i$	1	1	No	$\begin{bmatrix} \frac{1}{2}-\frac{i}{2} \\ 1 \end{bmatrix}$
$3-2i$	1	1	No	$\begin{bmatrix} \frac{1}{2}+\frac{i}{2} \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} \left(\frac{1}{2}-\frac{i}{2}\right) e^{(3+2i)t} \\ e^{(3+2i)t} \end{bmatrix} + c_2 \begin{bmatrix} \left(\frac{1}{2}+\frac{i}{2}\right) e^{(3-2i)t} \\ e^{(3-2i)t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \left(\frac{1}{2}-\frac{i}{2}\right) c_1 e^{(3+2i)t} + \left(\frac{1}{2}+\frac{i}{2}\right) c_2 e^{(3-2i)t} \\ c_1 e^{(3+2i)t} + c_2 e^{(3-2i)t} \end{bmatrix}$$

The following is the phase plot of the system.

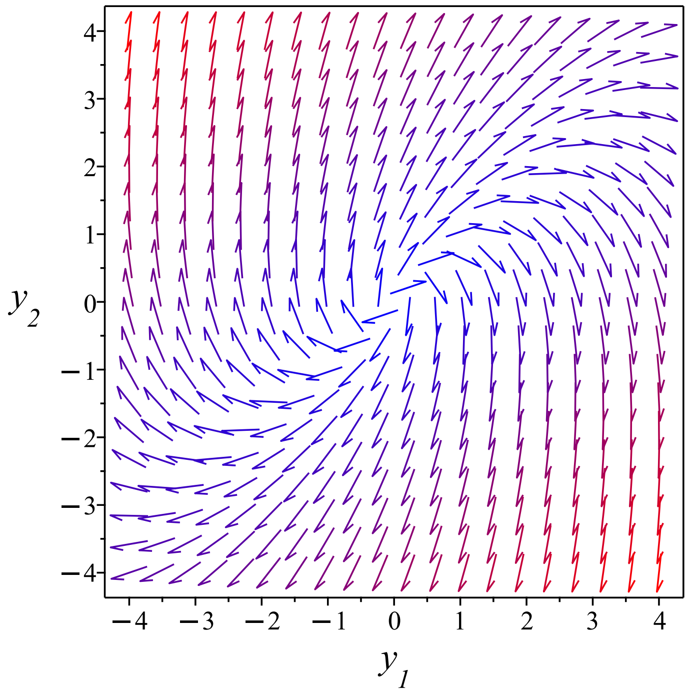

Figure 617: Phase plot

23.3.3 Maple step by step solution

Let's solve

$[y_1'(t) = y_1(t) + 2y_2(t), y_2'(t) = -4y_1(t) + 5y_2(t)]$

- Define vector

$$\underline{y^{\rightarrow}}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y^{\rightarrow}}'(t) = \begin{bmatrix} 1 & 2 \\ -4 & 5 \end{bmatrix} \cdot \underline{y^{\rightarrow}}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y^{\rightarrow}}'(t) = \begin{bmatrix} 1 & 2 \\ -4 & 5 \end{bmatrix} \cdot \underline{y^{\rightarrow}}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 1 & 2 \\ -4 & 5 \end{bmatrix}$$

- Rewrite the system as

$$\underline{\vec{y}}'(t) = A \cdot \underline{\vec{y}}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[3-2\,\mathrm{I}, \begin{bmatrix} \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[3+2\,\mathrm{I}, \begin{bmatrix} \frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[3-2\,\mathrm{I}, \begin{bmatrix} \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(3-2\,\mathrm{I})t} \cdot \begin{bmatrix} \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{3t} \cdot (\cos(2t) - \mathrm{I}\sin(2t)) \cdot \begin{bmatrix} \frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}$$

- Simplify expression

$$\mathrm{e}^{3t} \cdot \begin{bmatrix} \left(\frac{1}{2}+\frac{\mathrm{I}}{2}\right)(\cos(2t) - \mathrm{I}\sin(2t)) \\ \cos(2t) - \mathrm{I}\sin(2t) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\underline{\vec{y}}_1(t) = \mathrm{e}^{3t} \cdot \begin{bmatrix} \frac{\cos(2t)}{2}+\frac{\sin(2t)}{2} \\ \cos(2t) \end{bmatrix}, \underline{\vec{y}}_2(t) = \mathrm{e}^{3t} \cdot \begin{bmatrix} \frac{\cos(2t)}{2}-\frac{\sin(2t)}{2} \\ -\sin(2t) \end{bmatrix}\right]$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_1(t) + c_2 \underline{\vec{y}}_2(t)$$

- Substitute solutions into the general solution

$$\vec{y} = c_1 e^{3t} \cdot \begin{bmatrix} \frac{\cos(2t)}{2} + \frac{\sin(2t)}{2} \\ \cos(2t) \end{bmatrix} + c_2 e^{3t} \cdot \begin{bmatrix} \frac{\cos(2t)}{2} - \frac{\sin(2t)}{2} \\ -\sin(2t) \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} \frac{((c_1+c_2)\cos(2t)+\sin(2t)(c_1-c_2))e^{3t}}{2} \\ e^{3t}(-c_2 \sin(2t) + c_1 \cos(2t)) \end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{y_1(t) = \frac{((c_1+c_2)\cos(2t)+\sin(2t)(c_1-c_2))e^{3t}}{2}, y_2(t) = e^{3t}(-c_2 \sin(2t) + c_1 \cos(2t))\right\}$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$\begin{aligned} y_1'(t) &= 5y_1(t) - 6y_2(t) \\ y_2'(t) &= 3y_1(t) - y_2(t) \end{aligned}$$

23.4.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 5 & -6 \\ 3 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

For the above matrix A, the matrix exponential can be found to be

$$\begin{aligned} e^{At} &= \begin{bmatrix} e^{2t}\cos(3t) + e^{2t}\sin(3t) & -2\,e^{2t}\sin(3t) \\ e^{2t}\sin(3t) & e^{2t}\cos(3t) - e^{2t}\sin(3t) \end{bmatrix} \\ &= \begin{bmatrix} e^{2t}(\sin(3t) + \cos(3t)) & -2\,e^{2t}\sin(3t) \\ e^{2t}\sin(3t) & e^{2t}(\cos(3t) - \sin(3t)) \end{bmatrix} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
\vec{x}_h(t) &= e^{At}\vec{c} \\
&= \begin{bmatrix} e^{2t}(\sin(3t)+\cos(3t)) & -2\,e^{2t}\sin(3t) \\ e^{2t}\sin(3t) & e^{2t}(\cos(3t)-\sin(3t)) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \end{bmatrix} \\
&= \begin{bmatrix} e^{2t}(\sin(3t)+\cos(3t))\,c_1 - 2\,e^{2t}\sin(3t)\,c_2 \\ e^{2t}\sin(3t)\,c_1 + e^{2t}(\cos(3t)-\sin(3t))\,c_2 \end{bmatrix} \\
&= \begin{bmatrix} ((c_1-2c_2)\sin(3t)+c_1\cos(3t))\,e^{2t} \\ (\sin(3t)(-c_2+c_1)+c_2\cos(3t))\,e^{2t} \end{bmatrix}
\end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

23.4.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \end{bmatrix} = \begin{bmatrix} 5 & -6 \\ 3 & -1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 5 & -6 \\ 3 & -1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 5-\lambda & -6 \\ 3 & -1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^2 - 4\lambda + 13 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 2 + 3i$$
$$\lambda_2 = 2 - 3i$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
$2+3i$	1	complex eigenvalue
$2-3i$	1	complex eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 2 - 3i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 5 & -6 \\ 3 & -1 \end{bmatrix} - (2-3i)\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$
$$\begin{bmatrix} 3+3i & -6 \\ 3 & -3+3i \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} 3+3i & -6 & 0 \\ 3 & -3+3i & 0 \end{array}\right]$$

$$R_2 = R_2 + \left(-\frac{1}{2} + \frac{i}{2}\right) R_1 \Longrightarrow \left[\begin{array}{cc|c} 3+3i & -6 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 3+3i & -6 \\ 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = (1-i)\,t\}$

Hence the solution is

$$\begin{bmatrix} (1-\mathrm{I})\,t \\ t \end{bmatrix} = \begin{bmatrix} (1-i)\,t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} (1-\mathrm{I})\,t \\ t \end{bmatrix} = t \begin{bmatrix} 1-i \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} (1-\mathrm{I})\,t \\ t \end{bmatrix} = \begin{bmatrix} 1-i \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 2+3i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A-\lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 5 & -6 \\ 3 & -1 \end{bmatrix} - (2+3i) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 3-3i & -6 \\ 3 & -3-3i \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{cc|c} 3-3i & -6 & 0 \\ 3 & -3-3i & 0 \end{array}\right]$$

$$R_2 = R_2 + \left(-\frac{1}{2} - \frac{i}{2}\right) R_1 \Longrightarrow \left[\begin{array}{cc|c} 3-3i & -6 & 0 \\ 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 3-3i & -6 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_2\}$ and the leading variables are $\{v_1\}$. Let $v_2 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = (1+i)\,t\}$

Hence the solution is

$$\begin{bmatrix} (1+\mathrm{I})\,t \\ t \end{bmatrix} = \begin{bmatrix} (1+i)\,t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} (1+\mathrm{I})\,t \\ t \end{bmatrix} = t \begin{bmatrix} 1+i \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} (1+\mathrm{I})\,t \\ t \end{bmatrix} = \begin{bmatrix} 1+i \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
$2+3i$	1	1	No	$\begin{bmatrix} 1+i \\ 1 \end{bmatrix}$
$2-3i$	1	1	No	$\begin{bmatrix} 1-i \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = c_1 \begin{bmatrix} (1+i)\,\mathrm{e}^{(2+3i)t} \\ \mathrm{e}^{(2+3i)t} \end{bmatrix} + c_2 \begin{bmatrix} (1-i)\,\mathrm{e}^{(2-3i)t} \\ \mathrm{e}^{(2-3i)t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} (1+i)\,c_1\mathrm{e}^{(2+3i)t} + (1-i)\,c_2\mathrm{e}^{(2-3i)t} \\ c_1\mathrm{e}^{(2+3i)t} + c_2\mathrm{e}^{(2-3i)t} \end{bmatrix}$$

The following is the phase plot of the system.

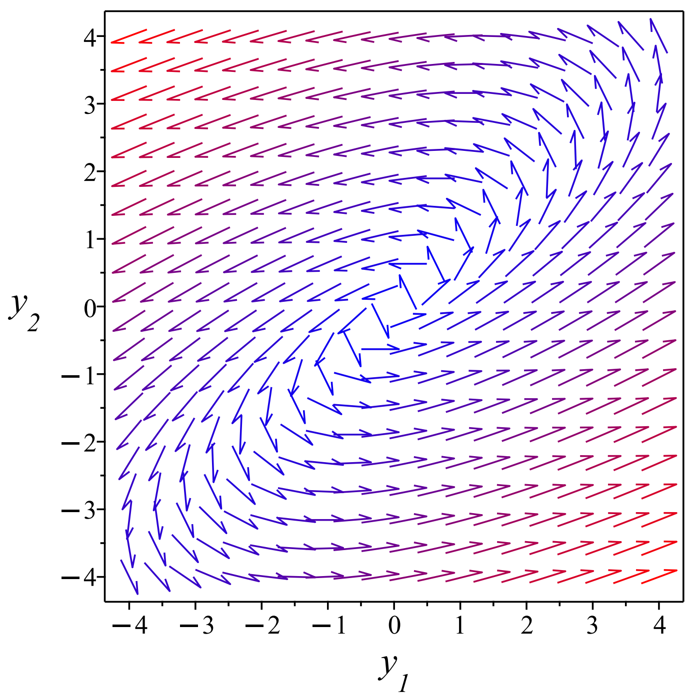

Figure 618: Phase plot

23.4.3 Maple step by step solution

Let's solve

$[y_1'(t) = 5y_1(t) - 6y_2(t)\,, y_2'(t) = 3y_1(t) - y_2(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 5 & -6 \\ 3 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} 5 & -6 \\ 3 & -1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 5 & -6 \\ 3 & -1 \end{bmatrix}$$

- Rewrite the system as

$$\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[2-3\,\mathrm{I}, \begin{bmatrix} 1-\mathrm{I} \\ 1 \end{bmatrix}\right], \left[2+3\,\mathrm{I}, \begin{bmatrix} 1+\mathrm{I} \\ 1 \end{bmatrix}\right]\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[2-3\,\mathrm{I}, \begin{bmatrix} 1-\mathrm{I} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(2-3\,\mathrm{I})t} \cdot \begin{bmatrix} 1-\mathrm{I} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{2t} \cdot (\cos(3t) - \mathrm{I}\sin(3t)) \cdot \begin{bmatrix} 1-\mathrm{I} \\ 1 \end{bmatrix}$$

- Simplify expression

$$e^{2t} \cdot \begin{bmatrix} (1-I)(\cos(3t) - I\sin(3t)) \\ \cos(3t) - I\sin(3t) \end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\underline{y}^{\rightarrow}{}_{1}(t) = e^{2t} \cdot \begin{bmatrix} \cos(3t) - \sin(3t) \\ \cos(3t) \end{bmatrix}, \underline{y}^{\rightarrow}{}_{2}(t) = e^{2t} \cdot \begin{bmatrix} -\sin(3t) - \cos(3t) \\ -\sin(3t) \end{bmatrix}\right]$$

- General solution to the system of ODEs

$$\underline{y}^{\rightarrow} = c_1 \underline{y}^{\rightarrow}{}_{1}(t) + c_2 \underline{y}^{\rightarrow}{}_{2}(t)$$

- Substitute solutions into the general solution

$$\underline{y}^{\rightarrow} = c_1 e^{2t} \cdot \begin{bmatrix} \cos(3t) - \sin(3t) \\ \cos(3t) \end{bmatrix} + c_2 e^{2t} \cdot \begin{bmatrix} -\sin(3t) - \cos(3t) \\ -\sin(3t) \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \end{bmatrix} = \begin{bmatrix} e^{2t}((c_1 - c_2)\cos(3t) - \sin(3t)(c_1 + c_2)) \\ e^{2t}(-c_2\sin(3t) + c_1\cos(3t)) \end{bmatrix}$$

- Solution to the system of ODEs

$$\{y_1(t) = e^{2t}((c_1 - c_2)\cos(3t) - \sin(3t)(c_1 + c_2)), y_2(t) = e^{2t}(-c_2\sin(3t) + c_1\cos(3t))\}$$

Problem number: section 10.6, problem 5.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -3y_1(t) - 3y_2(t) + y_3(t)\\
y_2'(t) &= 2y_2(t) + 2y_3(t)\\
y_3'(t) &= 5y_1(t) + y_2(t) + y_3(t)
\end{aligned}
$$

23.5.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -3 & -3 & 1 \\ 0 & 2 & 2 \\ 5 & 1 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$
\begin{aligned}
e^{At} &= \text{Expression too large to display}\\
&= \text{Expression too large to display}
\end{aligned}
$$

Therefore the homogeneous solution is

$$\begin{aligned}\vec{x}_h(t) &= e^{At}\vec{c} \\ &= \text{Expression too large to display} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix} \\ &= \text{Expression too large to display} \\ &= \text{Expression too large to display}\end{aligned}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

23.5.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -3 & -3 & 1 \\ 0 & 2 & 2 \\ 5 & 1 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -3 & -3 & 1 \\ 0 & 2 & 2 \\ 5 & 1 & 1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -3-\lambda & -3 & 1 \\ 0 & 2-\lambda & 2 \\ 5 & 1 & 1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 14\lambda + 40 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3} - \frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}$$

$$\lambda_2 = \frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6} + \frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} + \frac{i\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3} + \frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2}$$

$$\lambda_3 = \frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6} + \frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} - \frac{i\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3} + \frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2}$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eiger
$\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6} + \frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} - \frac{i\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3} + \frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2}$	1	complex eige
$-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3} - \frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}$	1	real eigenval
$\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6} + \frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} + \frac{i\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3} + \frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2}$	1	complex eige

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3} - \frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -3 & -3 & 1 \\ 0 & 2 & 2 \\ 5 & 1 & 1 \end{bmatrix} - \left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3} - \frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) [$$

$$\begin{bmatrix} \frac{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}-9\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+42}{3\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} & -3 & 1 \\ 0 & \frac{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+6\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+42}{3\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} & 2 \\ 5 & 1 & \frac{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+3\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+42}{3\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} \end{bmatrix} [$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\begin{bmatrix} -3+\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} & -3 & 1 \\ 0 & 2+\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} & 2 \\ 5 & 1 & 1+\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{604\ldots}\right.} \end{bmatrix}$$

$$R_3 = R_3 - \frac{5R_1}{-3+\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}} \Longrightarrow \begin{bmatrix} \frac{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}-9\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+42}{3\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} & -\ldots \\ 0 & \frac{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+6\left(\ldots\right.}{3\left(540+6\sqrt{\ldots}\right.} \\ 0 & \frac{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+36\left(\ldots\right.}{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}-9\left(\ldots\right.} \end{bmatrix}$$

$$R_3 = R_3 - \frac{3\left(\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+36\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+42\right)\left(540+6\sqrt{6042}\right)^{\frac{1}{3}} R_2}{\left(\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}-9\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+42\right)\left(\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+6\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+4\right.}$$

Therefore the system in Echelon form is

$$\begin{bmatrix} \frac{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}-9\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+42}{3\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} & -3 & 1 \\ 0 & \frac{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+6\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+42}{3\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} & 2 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = -\frac{3t\left(4\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}+7\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+90\right)}{5\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+69\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}-3\sqrt{6042}+24}, v_2 = -\right.$

Hence the solution is

$$\begin{bmatrix} -\frac{3t\left(4\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}+7\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+90\right)}{5\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+69\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}-3\sqrt{6042}+24} \\ -\frac{6t\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+6\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+42} \\ t \end{bmatrix} = \begin{bmatrix} -\frac{3t\left(4\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}\right.}{5\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}\left(540+6\sqrt{6042}\right.} \\ -\frac{6t\left(540+6\sqrt{\right.}}{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+6\left(5\right.} \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -\frac{3t\left(4\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}+7\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+90\right)}{5\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+69\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}-3\sqrt{6042}+24} \\ -\frac{6t\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+6\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+42} \\ t \end{bmatrix} = t \begin{bmatrix} -\frac{3\left(4\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{604\right.}}{5\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}\left(540+6\sqrt{604\right.}} \\ -\frac{6\left(540+6\sqrt{\right.}}{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+6\left(\right.} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\left[\begin{array}{c} -\frac{3t\left(4\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}+7\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+90\right)}{5\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+69\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}-3\sqrt{6042}+24} \\ -\frac{6t\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+6\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+42} \\ t \end{array}\right] = \left[\begin{array}{c} -\frac{3\left(4\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}\cdots\right.}{5\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}\left(540+6\sqrt{6042}\right)\cdots} \\ -\frac{6\left(540+6\sqrt{6\cdots}\right.}{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+6\left(5\cdots\right.} \\ 1 \end{array}\right.$$

Which is normalized to

$$\left[\begin{array}{c} -\frac{3t\left(4\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}+7\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+90\right)}{5\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+69\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}-3\sqrt{6042}+24} \\ -\frac{6t\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+6\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}+42} \\ t \end{array}\right] = \left[\begin{array}{c} -\frac{3\left(4\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}\cdots\right.}{5\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+\sqrt{6042}\left(540+6\sqrt{6042}\right)\cdots} \\ -\frac{6\left(540+6\sqrt{6\cdots}\right.}{\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+6\left(5\cdots\right.} \\ 1 \end{array}\right.$$

Considering the eigenvalue $\lambda_2 = \frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6} + \frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} - \frac{i\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2}$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\left[\begin{array}{ccc} -3 & -3 & 1 \\ 0 & 2 & 2 \\ 5 & 1 & 1 \end{array}\right] - \left(\frac{(540\cdots}{\cdots}\right.\right.$$

$$\left[\begin{array}{cc} -\frac{42+18\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}+i\left(\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}}-42\right)\sqrt{3}+\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}}}{6\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}} & -3 \\ 0 & \frac{-42+12\left(540+6\sqrt{3}\sqrt{20\cdots}\right)^{\frac{1}{3}}-i\left(\left(540+6\sqrt{3}\sqrt{20\cdots}\right.\right.}{6\left(540+6\sqrt{3}\sqrt{20\cdots}\right.} \\ 5 & 1 \end{array}\right.$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\begin{bmatrix} -3 - \frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6} - \frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} + \frac{i\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2} & \\ 0 & 2 - \frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6} - \frac{7}{\left(540+6\sqrt{6042}\right.} \\ 5 & \end{bmatrix}$$

$$R_3 = R_3 - \frac{5R_1}{-3 - \frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6} - \frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} + \frac{i\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2}} \implies \begin{bmatrix} -\frac{42+18\left(540+6\sqrt{3}\right.}{} \\ \\ \\ \end{bmatrix}$$

$$R_3 = R_3 - \frac{6\left(i\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}}\sqrt{3} + \left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}} - 42i\right.}{\left(i\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}}\sqrt{3} + \left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}} - 42i\sqrt{3} + 18\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}} + 42\right.}$$

Therefore the system in Echelon form is

$$\left[\begin{array}{cc} -\frac{42+18\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+i\left(\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}-42\right)\sqrt{3}+\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}}{6\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}} & -3 \\ 0 & \frac{-42+12\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}-i\left(\left(540+6\sqrt{3}\,\sqrt{20\ldots}\right.\right.}{6\left(540+6\sqrt{3}\,\sqrt{20\ldots}\right.} \\ 0 & 0 \end{array}\right.$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{ v_1 = \frac{3t\left(3i\sqrt{2014}-7i\sqrt{3}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+90i\sqrt{3}+\sqrt{3}\,\sqrt{2014}-8\ldots\right.}{3i\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{2014}-\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}\,\sqrt{2014}+69i\sqrt{3}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+9\ldots} \right.$

Hence the solution is

$$\left[\begin{array}{c} \frac{3t\left(3\,I\sqrt{2014}-7\,I\sqrt{3}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+90\,I\sqrt{3}+\sqrt{3}\,\sqrt{2014}-8\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}+7\left(540+6\sqrt{3}\,\sqrt{201\ldots}\right.\right.}{3\,I\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{2014}-\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}\,\sqrt{2014}+69\,I\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}+9\,I\sqrt{2014}+3\sqrt{3}\,\sqrt{2014}+10\left(540+6\sqrt{3}\,\sqrt{2014}\right.\ldots} \\ \frac{12t\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}}{I\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}\sqrt{3}+\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}-42\,I\sqrt{3}-12\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+42} \\ t \end{array}\right.$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\left[\begin{array}{c} \frac{3t\left(3\,I\sqrt{2014}-7\,I\sqrt{3}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+90\,I\sqrt{3}+\sqrt{3}\,\sqrt{2014}-8\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}+7\left(540+6\sqrt{3}\,\sqrt{201\ldots}\right.\right.}{3\,I\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{2014}-\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}\,\sqrt{2014}+69\,I\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}+9\,I\sqrt{2014}+3\sqrt{3}\,\sqrt{2014}+10\left(540+6\sqrt{3}\,\sqrt{2014}\right.\ldots} \\ \frac{12t\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}}{I\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}\sqrt{3}+\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}-42\,I\sqrt{3}-12\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+42} \\ t \end{array}\right.$$

Let $t = 1$ the eigenvector becomes

$$\left[\begin{array}{c} \frac{3t\left(3\,\mathrm{I}\sqrt{2014}-7\,\mathrm{I}\sqrt{3}\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}+90\,\mathrm{I}\sqrt{3}+\sqrt{3}\sqrt{2014}-8\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}}+7\left(540+6\sqrt{3}\sqrt{2014}\right.\right.}{3\,\mathrm{I}\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{2014}-\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}\sqrt{2014}+69\,\mathrm{I}\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}+9\,\mathrm{I}\sqrt{2014}+3\sqrt{3}\sqrt{2014}+10\left(540+6\sqrt{3}\sqrt{2014}\right.} \\ \frac{12t\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}}{\mathrm{I}\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}}\sqrt{3}+\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}}-42\,\mathrm{I}\sqrt{3}-12\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}+42} \\ t \end{array}\right.$$

Which is normalized to

$$\left[\begin{array}{c} \frac{3t\left(3\,\mathrm{I}\sqrt{2014}-7\,\mathrm{I}\sqrt{3}\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}+90\,\mathrm{I}\sqrt{3}+\sqrt{3}\sqrt{2014}-8\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}}+7\left(540+6\sqrt{3}\sqrt{2014}\right.\right.}{3\,\mathrm{I}\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{2014}-\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}\sqrt{2014}+69\,\mathrm{I}\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}+9\,\mathrm{I}\sqrt{2014}+3\sqrt{3}\sqrt{2014}+10\left(540+6\sqrt{3}\sqrt{2014}\right.} \\ \frac{12t\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}}{\mathrm{I}\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}}\sqrt{3}+\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}}-42\,\mathrm{I}\sqrt{3}-12\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}+42} \\ t \end{array}\right.$$

Considering the eigenvalue $\lambda_3 = \frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6} + \frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} + \frac{i\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3} + \frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2}$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\left[\begin{array}{ccc} -3 & -3 & 1 \\ 0 & 2 & 2 \\ 5 & 1 & 1 \end{array}\right] - \left(\frac{(540}{}\right.\right.$$

$$\left[\begin{array}{cc} \frac{-42-18\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}+i\left(\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}}-42\right)\sqrt{3}-\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{2}{3}}}{6\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}} & -3 \\ 0 & \frac{-42+12\left(540+6\sqrt{3}\sqrt{2014}\right)^{\frac{1}{3}}+i\left(\left(540+6\sqrt{3}\sqrt{201\right.\right.}{6\left(540+6\sqrt{3}\sqrt{201\right.} \\ 5 & 1 \end{array}\right.$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc} -3-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}-\frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-\frac{i\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2} & & \\ 0 & & 2-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}-\frac{7}{\left(540+6\sqrt{6042}\right. } \\ 5 & & \end{array}\right.$$

$$R_3 = R_3 - \frac{5R_1}{-3-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}-\frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-\frac{i\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2}} \implies \left[\begin{array}{c} \frac{-42-18\left(540+6\sqrt{3}\right.}{} \\ \\ \end{array}\right.$$

$$R_3 = R_3 - \frac{6\left(i\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}\sqrt{3}-\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}-42i\sqrt{3}+7\right.}{\left(i\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}\sqrt{3}-\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}-42i\sqrt{3}-18\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}-42\right)\left(-42+1\right.}$$

Therefore the system in Echelon form is

$$\left[\begin{array}{cc} \frac{-42-18\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+i\left(\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}-42\right)\sqrt{3}-\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}}{6\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}} & -3 \\ 0 & \frac{-42+12\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+i\left(\left(540+6\sqrt{3}\,\sqrt{201\right.\right.}{6\left(540+6\sqrt{3}\,\sqrt{201\right.}} \\ 0 & 0 \end{array}\right.$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{ v_1 = \frac{3t\left(3i\sqrt{2014}-7i\sqrt{3}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+90i\sqrt{3}-\sqrt{3}\,\sqrt{2014}+8\right.}{3i\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{2014}+\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}\,\sqrt{2014}+69i\sqrt{3}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+9} \right.$

Hence the solution is

$$\left[\begin{array}{c} \frac{3t\left(3\,\mathrm{I}\sqrt{2014}-7\,\mathrm{I}\sqrt{3}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+90\,\mathrm{I}\sqrt{3}-\sqrt{3}\,\sqrt{2014}+8\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}-7\left(540+6\sqrt{3}\,\sqrt{2014\right.\right.}}{3\,\mathrm{I}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{2014}+\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}\,\sqrt{2014}+69\,\mathrm{I}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}+9\,\mathrm{I}\sqrt{2014}-3\sqrt{3}\,\sqrt{2014}-10\left(540+6\sqrt{3}\,\sqrt{2014}\right.} \\ -\frac{12t\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{\mathrm{I}\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}\sqrt{3}-\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}-42\,\mathrm{I}\sqrt{3}+12\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}-42} \\ t \end{array}\right.$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\left[\begin{array}{c} \frac{3t\left(3\,\mathrm{I}\sqrt{2014}-7\,\mathrm{I}\sqrt{3}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+90\,\mathrm{I}\sqrt{3}-\sqrt{3}\,\sqrt{2014}+8\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}-7\left(540+6\sqrt{3}\,\sqrt{2014\right.\right.}}{3\,\mathrm{I}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{2014}+\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}\,\sqrt{2014}+69\,\mathrm{I}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}+9\,\mathrm{I}\sqrt{2014}-3\sqrt{3}\,\sqrt{2014}-10\left(540+6\sqrt{3}\,\sqrt{2014}\right.} \\ -\frac{12t\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{\mathrm{I}\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}\sqrt{3}-\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}-42\,\mathrm{I}\sqrt{3}+12\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}-42} \\ t \end{array}\right.$$

Let $t = 1$ the eigenvector becomes

$$\left[\begin{array}{c} \frac{3t\left(3\,\mathrm{I}\,\sqrt{2014}-7\,\mathrm{I}\,\sqrt{3}\,\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+90\,\mathrm{I}\,\sqrt{3}-\sqrt{3}\,\sqrt{2014}+8\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}-7\left(540+6\sqrt{3}\,\sqrt{2014}\right.\right.}{3\,\mathrm{I}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{2014}+\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}\,\sqrt{2014}+69\,\mathrm{I}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}+9\,\mathrm{I}\,\sqrt{2014}-3\sqrt{3}\,\sqrt{2014}-10\left(540+6\sqrt{3}\,\sqrt{2014}\right)} \\ -\frac{12t\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{\mathrm{I}\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}\sqrt{3}-\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}-42\,\mathrm{I}\,\sqrt{3}+12\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}-42} \\ t \end{array}\right.$$

Which is normalized to

$$\left[\begin{array}{c} \frac{3t\left(3\,\mathrm{I}\,\sqrt{2014}-7\,\mathrm{I}\,\sqrt{3}\,\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+90\,\mathrm{I}\,\sqrt{3}-\sqrt{3}\,\sqrt{2014}+8\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{2}{3}}-7\left(540+6\sqrt{3}\,\sqrt{2014}\right.\right.}{3\,\mathrm{I}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{2014}+\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}\,\sqrt{2014}+69\,\mathrm{I}\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}\sqrt{3}+9\,\mathrm{I}\,\sqrt{2014}-3\sqrt{3}\,\sqrt{2014}-10\left(540+6\sqrt{3}\,\sqrt{2014}\right)} \\ -\frac{12t\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{\mathrm{I}\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}\sqrt{3}-\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}-42\,\mathrm{I}\,\sqrt{3}+12\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}-42} \\ t \end{array}\right.$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defectiv
	algebraic m	geometric k	
$-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}$	1	1	No
$\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}+\frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}+\frac{i\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2}$	1	1	No
$\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}+\frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-\frac{i\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2}$	1	1	No

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue $-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}$ is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)t} \\
&= \left[\begin{array}{c} \frac{-8-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}}{\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-2\right)\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}+3\right)} \\ \frac{2}{-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-2} \\ 1 \end{array}\right] e^{\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right.}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t) + c_3\vec{x}_3(t)
$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} \frac{e^{\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)t}\left(-8-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-2\right)\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}+3\right)} \\ \frac{2\,e^{\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)t}}{-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-2} \\ e^{\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)t} \end{bmatrix} + c_2 \begin{bmatrix} \frac{e^{\left(\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}+\cdots\right.}}{\left(\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}+\cdots\right.} \\ \\ \\ \end{bmatrix}$$

Which becomes

Expression too large to display

23.5.3 Maple step by step solution

Let's solve

$[y_1'(t) = -3y_1(t) - 3y_2(t) + y_3(t)\,, y_2'(t) = 2y_2(t) + 2y_3(t)\,, y_3'(t) = 5y_1(t) + y_2(t) + y_3(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -3 & -3 & 1 \\ 0 & 2 & 2 \\ 5 & 1 & 1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -3 & -3 & 1 \\ 0 & 2 & 2 \\ 5 & 1 & 1 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -3 & -3 & 1 \\ 0 & 2 & 2 \\ 5 & 1 & 1 \end{bmatrix}$$

- Rewrite the system as

$$\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3} - \frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}, \left[\begin{array}{c} \frac{-8-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}}{\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-2\right)\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}+\right.} \\ \frac{2}{-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-2} \\ 1 \end{array}\right.\right.\right.$$

- Consider eigenpair

$$\left[-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}, \left[\begin{array}{c} \frac{-8-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}}{\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-2\right)\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}+3\right)} \\ \frac{2}{-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-2} \\ 1 \end{array}\right.\right.$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_{1} = \mathrm{e}^{\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)t} \cdot \left[\begin{array}{c} \frac{-8-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}}{\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-2\right)\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}} \cdots\right)} \\ \frac{2}{-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-2} \\ 1 \end{array}\right.$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}+\frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-\frac{\mathrm{I}\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2}, \left[\frac{\cdots}{\left(\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}+\frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-\cdots\right.}\right.\right.$$

- Solution from eigenpair

$$e^{\left(\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}+\frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-\frac{I\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)}{2}\right)t} \cdot \left[\frac{}{\left(\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}+\frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-\frac{I\sqrt{3}\left(\cdot\right.}{}\right.}\right.$$

- Use Euler identity to write solution in terms of sin and cos

$$e^{\left(\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}+\frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)t} \cdot \left(\cos\left(\frac{\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)t}{2}\right)-I\sin\left(\frac{\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right.}{3}\right.}{}\right.\right.$$

- Simplify expression

$$\mathrm{e}^{\left(\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}+\frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)t} \cdot \left[\frac{\left(\cos\left(\frac{\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)t}{2}\right) - \mathrm{I}\sin\left(\frac{\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{\cdots}{\left(540\cdots\right.}\cdots\right.}{2}\cdots\right.\right.}{\left(\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}+\frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-\frac{\mathrm{I}\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)\cdots}\cdots\right.}{2}\cdots\right.} \cdots \right.$$

$$\frac{2\left(\cos\left(\frac{\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\cdots\right.}\cdots\right.}{2}\cdots\right.\right.}{\cdots}$$

$$\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}+\frac{7}{\left(540+6\sqrt{6042}\right)\cdots}\cdots$$

$$\cos\left(\frac{\sqrt{3}\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}+\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\cdots\right.}{2}\cdots\right.$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\overrightarrow{y}_{2}(t) = \mathrm{e}^{\left(\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{6}+\frac{7}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)t} \cdot \left[-\frac{9\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}\left(4\sqrt{3}\left(540+6\sqrt{6042}\right)^{\frac{5}{3}}\sin\left(\frac{\sqrt{3}\left(\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}\cdots\right.}{6\left(540+6\sqrt{6042}\right)\cdots}\cdots\right.\right.}{\cdots}\cdots\right]\right]$$

- General solution to the system of ODEs
  $\overrightarrow{y} = c_1\overrightarrow{y}_1 + c_2\overrightarrow{y}_2(t) + c_3\overrightarrow{y}_3(t)$
- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 \mathrm{e}^{\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}\right)t} \cdot \left[\begin{array}{c} \frac{-8-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}}{\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-2\right)\left(-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{\cdots}\right.}\right.} \\ \frac{2}{-\frac{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}{3}-\frac{14}{\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}-2} \\ 1 \end{array}\right.$$

- Substitute in vector of dependent variables

$$\left[\begin{array}{c} y_1(t) \\ y_2(t) \\ y_3(t) \end{array}\right] = \left[\begin{array}{c} \frac{1031\left(\left(\left(\left(\sqrt{3}\,c_2+3c_3\right)\sqrt{2014}+\frac{80442c_3\sqrt{3}}{1031}+\frac{80442c_2}{1031}\right)\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+\frac{\left(12\left(\sqrt{3}\,c_2-3c_3\right)\sqrt{2014}-1423c_3\sqrt{3}+1423\cdots\right.}{1031}\right.\right.}{\left(\mathrm{e}^{\frac{\left(\left(540+6\sqrt{6042}\right)^{\frac{2}{3}}+42\right)t}{2\left(540+6\sqrt{6042}\right)^{\frac{1}{3}}}}\left(\left(\left(\sqrt{3}\,c_2-3c_3\right)\sqrt{2014}-48c_3\sqrt{3}+48c_2\right)\left(540+6\sqrt{3}\,\sqrt{20\cdots}\right.\right.\right.} \end{array}\right.$$

- Solution to the system of ODEs

$$\left\{ y_1(t) = \frac{1031\left(\left(\left(\left(\sqrt{3}\,c_2+3c_3\right)\sqrt{2014}+\frac{80442c_3\sqrt{3}}{1031}+\frac{80442c_2}{1031}\right)\left(540+6\sqrt{3}\,\sqrt{2014}\right)^{\frac{1}{3}}+\frac{\left(12\left(\sqrt{3}\,c_2-3c_3\right)\sqrt{2014}-1423c_3\sqrt{3}+1423c_2\right)\left(540\right.}{1031}\right.\right.}{}\right.$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -3y_1(t) + 3y_2(t) + y_3(t) \\
y_2'(t) &= y_1(t) - 5y_2(t) - 3y_3(t) \\
y_3'(t) &= -3y_1(t) + 7y_2(t) + 3y_3(t)
\end{aligned}
$$

23.6.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -3 & 3 & 1 \\ 1 & -5 & -3 \\ -3 & 7 & 3 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \mathrm{e}^{-t} - \mathrm{e}^{-2t} \sin(2t) & \mathrm{e}^{-2t} \cos(2t) + 2\,\mathrm{e}^{-2t} \sin(2t) - \mathrm{e}^{-t} & \mathrm{e}^{-2t} \cos(2t) + \mathrm{e}^{-2t} \sin(2t \\ -\mathrm{e}^{-2t} \cos(2t) + \mathrm{e}^{-t} & -\mathrm{e}^{-t} + 2\,\mathrm{e}^{-2t} \cos(2t) - \mathrm{e}^{-2t} \sin(2t) & \mathrm{e}^{-2t} \cos(2t) - \mathrm{e}^{-2t} \sin(2t \\ \mathrm{e}^{-2t} \cos(2t) - \mathrm{e}^{-2t} \sin(2t) - \mathrm{e}^{-t} & -\mathrm{e}^{-2t} \cos(2t) + 3\,\mathrm{e}^{-2t} \sin(2t) + \mathrm{e}^{-t} & \mathrm{e}^{-t} + 2\,\mathrm{e}^{-2t} \sin(2t \end{bmatrix}$$

$$= \begin{bmatrix} \mathrm{e}^{-t} - \mathrm{e}^{-2t} \sin(2t) & -\mathrm{e}^{-t} + (\cos(2t) + 2\sin(2t))\,\mathrm{e}^{-2t} & -\mathrm{e}^{-t} + (\cos(2t) + \sin(2t)) \\ -\mathrm{e}^{-2t} \cos(2t) + \mathrm{e}^{-t} & -\mathrm{e}^{-t} + (2\cos(2t) - \sin(2t))\,\mathrm{e}^{-2t} & -\mathrm{e}^{-t} + (\cos(2t) - \sin(2t)) \\ -\mathrm{e}^{-t} + (\cos(2t) - \sin(2t))\,\mathrm{e}^{-2t} & \mathrm{e}^{-t} + (-\cos(2t) + 3\sin(2t))\,\mathrm{e}^{-2t} & \mathrm{e}^{-t} + 2\,\mathrm{e}^{-2t} \sin(2t) \end{bmatrix}$$

Therefore the homogeneous solution is

$$\vec{x}_h(t) = e^{At}\vec{c}$$

$$= \begin{bmatrix} \mathrm{e}^{-t} - \mathrm{e}^{-2t} \sin(2t) & -\mathrm{e}^{-t} + (\cos(2t) + 2\sin(2t))\,\mathrm{e}^{-2t} & -\mathrm{e}^{-t} + (\cos(2t) + \sin(2t \\ -\mathrm{e}^{-2t} \cos(2t) + \mathrm{e}^{-t} & -\mathrm{e}^{-t} + (2\cos(2t) - \sin(2t))\,\mathrm{e}^{-2t} & -\mathrm{e}^{-t} + (\cos(2t) - \sin(2t \\ -\mathrm{e}^{-t} + (\cos(2t) - \sin(2t))\,\mathrm{e}^{-2t} & \mathrm{e}^{-t} + (-\cos(2t) + 3\sin(2t))\,\mathrm{e}^{-2t} & \mathrm{e}^{-t} + 2\,\mathrm{e}^{-2t} \sin(2t) \end{bmatrix}$$

$$= \begin{bmatrix} (\mathrm{e}^{-t} - \mathrm{e}^{-2t} \sin(2t))\, c_1 + (-\mathrm{e}^{-t} + (\cos(2t) + 2\sin(2t))\,\mathrm{e}^{-2t})\, c_2 + (-\mathrm{e}^{-t} + (\cos(2t) + \sin(2t))\,\mathrm{e} \\ (-\mathrm{e}^{-2t} \cos(2t) + \mathrm{e}^{-t})\, c_1 + (-\mathrm{e}^{-t} + (2\cos(2t) - \sin(2t))\,\mathrm{e}^{-2t})\, c_2 + (-\mathrm{e}^{-t} + (\cos(2t) - \sin(2t)) \\ (-\mathrm{e}^{-t} + (\cos(2t) - \sin(2t))\,\mathrm{e}^{-2t})\, c_1 + (\mathrm{e}^{-t} + (-\cos(2t) + 3\sin(2t))\,\mathrm{e}^{-2t})\, c_2 + (\mathrm{e}^{-t} + 2\,\mathrm{e}^{-2t} \sin \end{bmatrix}$$

$$= \begin{bmatrix} ((-c_1 + 2c_2 + c_3)\sin(2t) + \cos(2t)(c_2 + c_3))\,\mathrm{e}^{-2t} + \mathrm{e}^{-t}(c_1 - c_2 - c_3) \\ ((-c_1 + 2c_2 + c_3)\cos(2t) - \sin(2t)(c_2 + c_3))\,\mathrm{e}^{-2t} + \mathrm{e}^{-t}(c_1 - c_2 - c_3) \\ ((-c_1 + 3c_2 + 2c_3)\sin(2t) + \cos(2t)(-c_2 + c_1))\,\mathrm{e}^{-2t} - \mathrm{e}^{-t}(c_1 - c_2 - c_3) \end{bmatrix}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

23.6.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -3 & 3 & 1 \\ 1 & -5 & -3 \\ -3 & 7 & 3 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -3 & 3 & 1 \\ 1 & -5 & -3 \\ -3 & 7 & 3 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -3-\lambda & 3 & 1 \\ 1 & -5-\lambda & -3 \\ -3 & 7 & 3-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + 5\lambda^2 + 12\lambda + 8 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = -2 + 2i$$
$$\lambda_2 = -2 - 2i$$
$$\lambda_3 = -1$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
-1	1	real eigenvalue
$-2+2i$	1	complex eigenvalue
$-2-2i$	1	complex eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = -1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -3 & 3 & 1 \\ 1 & -5 & -3 \\ -3 & 7 & 3 \end{bmatrix} - (-1)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 & 3 & 1 \\ 1 & -4 & -3 \\ -3 & 7 & 4 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -2 & 3 & 1 & 0 \\ 1 & -4 & -3 & 0 \\ -3 & 7 & 4 & 0 \end{array}\right]$$

$$R_2 = R_2 + \frac{R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} -2 & 3 & 1 & 0 \\ 0 & -\frac{5}{2} & -\frac{5}{2} & 0 \\ -3 & 7 & 4 & 0 \end{array}\right]$$

$$R_3 = R_3 - \frac{3R_1}{2} \Longrightarrow \left[\begin{array}{ccc|c} -2 & 3 & 1 & 0 \\ 0 & -\frac{5}{2} & -\frac{5}{2} & 0 \\ 0 & \frac{5}{2} & \frac{5}{2} & 0 \end{array}\right]$$

$$R_3 = R_3 + R_2 \Longrightarrow \left[\begin{array}{ccc|c} -2 & 3 & 1 & 0 \\ 0 & -\frac{5}{2} & -\frac{5}{2} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -2 & 3 & 1 \\ 0 & -\frac{5}{2} & -\frac{5}{2} \\ 0 & 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_2 = -t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ -t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = -2 - 2i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -3 & 3 & 1 \\ 1 & -5 & -3 \\ -3 & 7 & 3 \end{bmatrix} - (-2 - 2i) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -1 + 2i & 3 & 1 \\ 1 & -3 + 2i & -3 \\ -3 & 7 & 5 + 2i \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -1 + 2i & 3 & 1 & 0 \\ 1 & -3 + 2i & -3 & 0 \\ -3 & 7 & 5 + 2i & 0 \end{array}\right]$$

$$R_2 = R_2 + \left(\frac{1}{5} + \frac{2i}{5}\right) R_1 \Longrightarrow \left[\begin{array}{ccc|c} -1+2i & 3 & 1 & 0 \\ 0 & -\frac{12}{5} + \frac{16i}{5} & -\frac{14}{5} + \frac{2i}{5} & 0 \\ -3 & 7 & 5+2i & 0 \end{array}\right]$$

$$R_3 = R_3 + \left(-\frac{3}{5} - \frac{6i}{5}\right) R_1 \Longrightarrow \left[\begin{array}{ccc|c} -1+2i & 3 & 1 & 0 \\ 0 & -\frac{12}{5} + \frac{16i}{5} & -\frac{14}{5} + \frac{2i}{5} & 0 \\ 0 & \frac{26}{5} - \frac{18i}{5} & \frac{22}{5} + \frac{4i}{5} & 0 \end{array}\right]$$

$$R_3 = R_3 + \left(\frac{3}{2} + \frac{i}{2}\right) R_2 \Longrightarrow \left[\begin{array}{ccc|c} -1+2i & 3 & 1 & 0 \\ 0 & -\frac{12}{5} + \frac{16i}{5} & -\frac{14}{5} + \frac{2i}{5} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -1+2i & 3 & 1 \\ 0 & -\frac{12}{5} + \frac{16i}{5} & -\frac{14}{5} + \frac{2i}{5} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \left(\frac{1}{2} - \frac{i}{2}\right) t, v_2 = -\frac{1}{2}t - \frac{1}{2}it\right\}$

Hence the solution is

$$\begin{bmatrix} \left(\frac{1}{2} - \frac{I}{2}\right) t \\ -\frac{t}{2} - \frac{It}{2} \\ t \end{bmatrix} = \begin{bmatrix} \left(\frac{1}{2} - \frac{i}{2}\right) t \\ -\frac{1}{2}t - \frac{1}{2}it \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \left(\frac{1}{2} - \frac{I}{2}\right) t \\ -\frac{t}{2} - \frac{It}{2} \\ t \end{bmatrix} = t \begin{bmatrix} \frac{1}{2} - \frac{i}{2} \\ \frac{-\frac{1}{2}t - \frac{1}{2}it}{t} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \left(\frac{1}{2} - \frac{I}{2}\right) t \\ -\frac{t}{2} - \frac{It}{2} \\ t \end{bmatrix} = \begin{bmatrix} \frac{1}{2} - \frac{i}{2} \\ -\frac{1}{2} - \frac{i}{2} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \left(\frac{1}{2} - \frac{I}{2}\right) t \\ -\frac{t}{2} - \frac{It}{2} \\ t \end{bmatrix} = \begin{bmatrix} 1 - i \\ -1 - i \\ 2 \end{bmatrix}$$

Considering the eigenvalue $\lambda_3 = -2 + 2i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -3 & 3 & 1 \\ 1 & -5 & -3 \\ -3 & 7 & 3 \end{bmatrix} - (-2 + 2i) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -1 - 2i & 3 & 1 \\ 1 & -3 - 2i & -3 \\ -3 & 7 & 5 - 2i \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -1 - 2i & 3 & 1 & 0 \\ 1 & -3 - 2i & -3 & 0 \\ -3 & 7 & 5 - 2i & 0 \end{array}\right]$$

$$R_2 = R_2 + \left(\frac{1}{5} - \frac{2i}{5}\right) R_1 \Longrightarrow \left[\begin{array}{ccc|c} -1 - 2i & 3 & 1 & 0 \\ 0 & -\frac{12}{5} - \frac{16i}{5} & -\frac{14}{5} - \frac{2i}{5} & 0 \\ -3 & 7 & 5 - 2i & 0 \end{array}\right]$$

$$R_3 = R_3 + \left(-\frac{3}{5} + \frac{6i}{5}\right) R_1 \Longrightarrow \left[\begin{array}{ccc|c} -1 - 2i & 3 & 1 & 0 \\ 0 & -\frac{12}{5} - \frac{16i}{5} & -\frac{14}{5} - \frac{2i}{5} & 0 \\ 0 & \frac{26}{5} + \frac{18i}{5} & \frac{22}{5} - \frac{4i}{5} & 0 \end{array}\right]$$

$$R_3 = R_3 + \left(\frac{3}{2} - \frac{i}{2}\right) R_2 \Longrightarrow \left[\begin{array}{ccc|c} -1-2i & 3 & 1 & 0 \\ 0 & -\frac{12}{5} - \frac{16i}{5} & -\frac{14}{5} - \frac{2i}{5} & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -1-2i & 3 & 1 \\ 0 & -\frac{12}{5} - \frac{16i}{5} & -\frac{14}{5} - \frac{2i}{5} \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \left(\frac{1}{2} + \frac{i}{2}\right) t, v_2 = -\frac{1}{2}t + \frac{1}{2}it\right\}$

Hence the solution is

$$\begin{bmatrix} \left(\frac{1}{2} + \frac{I}{2}\right) t \\ -\frac{t}{2} + \frac{It}{2} \\ t \end{bmatrix} = \begin{bmatrix} \left(\frac{1}{2} + \frac{i}{2}\right) t \\ -\frac{1}{2}t + \frac{1}{2}it \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \left(\frac{1}{2} + \frac{I}{2}\right) t \\ -\frac{t}{2} + \frac{It}{2} \\ t \end{bmatrix} = t \begin{bmatrix} \frac{1}{2} + \frac{i}{2} \\ \frac{-\frac{1}{2}t + \frac{1}{2}it}{t} \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \left(\frac{1}{2} + \frac{I}{2}\right) t \\ -\frac{t}{2} + \frac{It}{2} \\ t \end{bmatrix} = \begin{bmatrix} \frac{1}{2} + \frac{i}{2} \\ -\frac{1}{2} + \frac{i}{2} \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \left(\frac{1}{2} + \frac{I}{2}\right) t \\ -\frac{t}{2} + \frac{It}{2} \\ t \end{bmatrix} = \begin{bmatrix} 1+i \\ -1+i \\ 2 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated

with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
$-2+2i$	1	1	No	$\begin{bmatrix} \frac{1}{2}+\frac{i}{2} \\ -\frac{1}{2}+\frac{i}{2} \\ 1 \end{bmatrix}$
$-2-2i$	1	1	No	$\begin{bmatrix} \frac{1}{2}-\frac{i}{2} \\ -\frac{1}{2}-\frac{i}{2} \\ 1 \end{bmatrix}$
-1	1	1	No	$\begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue -1 is real and distinct then the corresponding eigenvector solution is

$$\begin{aligned} \vec{x}_1(t) &= \vec{v}_1 e^{-t} \\ &= \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix} e^{-t} \end{aligned}$$

Therefore the final solution is

$$\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t) + c_3\vec{x}_3(t)$$

Which is written as

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} \left(\frac{1}{2}+\frac{i}{2}\right) e^{(-2+2i)t} \\ \left(-\frac{1}{2}+\frac{i}{2}\right) e^{(-2+2i)t} \\ e^{(-2+2i)t} \end{bmatrix} + c_2 \begin{bmatrix} \left(\frac{1}{2}-\frac{i}{2}\right) e^{(-2-2i)t} \\ \left(-\frac{1}{2}-\frac{i}{2}\right) e^{(-2-2i)t} \\ e^{(-2-2i)t} \end{bmatrix} + c_3 \begin{bmatrix} -e^{-t} \\ -e^{-t} \\ e^{-t} \end{bmatrix}$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \left(\frac{1}{2}+\frac{i}{2}\right) c_1 e^{(-2+2i)t} + \left(\frac{1}{2}-\frac{i}{2}\right) c_2 e^{(-2-2i)t} - c_3 e^{-t} \\ \left(-\frac{1}{2}+\frac{i}{2}\right) c_1 e^{(-2+2i)t} + \left(-\frac{1}{2}-\frac{i}{2}\right) c_2 e^{(-2-2i)t} - c_3 e^{-t} \\ c_1 e^{(-2+2i)t} + c_2 e^{(-2-2i)t} + c_3 e^{-t} \end{bmatrix}$$

23.6.3 Maple step by step solution

Let's solve

$[y_1'(t) = -3y_1(t) + 3y_2(t) + y_3(t), y_2'(t) = y_1(t) - 5y_2(t) - 3y_3(t), y_3'(t) = -3y_1(t) + 7y_2(t) + 3y_3($

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow}{}'(t) = \begin{bmatrix} -3 & 3 & 1 \\ 1 & -5 & -3 \\ -3 & 7 & 3 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow}{}'(t) = \begin{bmatrix} -3 & 3 & 1 \\ 1 & -5 & -3 \\ -3 & 7 & 3 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -3 & 3 & 1 \\ 1 & -5 & -3 \\ -3 & 7 & 3 \end{bmatrix}$$

- Rewrite the system as

$$\underline{y}^{\rightarrow}{}'(t) = A \cdot \underline{y}^{\rightarrow}(t)$$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[-1, \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}\right], \left[-2-2\,\mathrm{I}, \begin{bmatrix} \frac{1}{2}-\frac{\mathrm{I}}{2} \\ -\frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right], \left[-2+2\,\mathrm{I}, \begin{bmatrix} \frac{1}{2}+\frac{\mathrm{I}}{2} \\ -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[-1, \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{y}^{\rightarrow}_{1} = \mathrm{e}^{-t} \cdot \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-2-2\,\mathrm{I}, \begin{bmatrix} \frac{1}{2}-\frac{\mathrm{I}}{2} \\ -\frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(-2-2\,\mathrm{I})t} \cdot \begin{bmatrix} \frac{1}{2}-\frac{\mathrm{I}}{2} \\ -\frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \end{bmatrix}$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$e^{-2t}\cdot(\cos(2t)-\mathrm{I}\sin(2t))\cdot\begin{bmatrix}\frac{1}{2}-\frac{\mathrm{I}}{2}\\ -\frac{1}{2}-\frac{\mathrm{I}}{2}\\ 1\end{bmatrix}$$

- Simplify expression

$$e^{-2t}\cdot\begin{bmatrix}\left(\frac{1}{2}-\frac{\mathrm{I}}{2}\right)(\cos(2t)-\mathrm{I}\sin(2t))\\ \left(-\frac{1}{2}-\frac{\mathrm{I}}{2}\right)(\cos(2t)-\mathrm{I}\sin(2t))\\ \cos(2t)-\mathrm{I}\sin(2t)\end{bmatrix}$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\underline{\vec{y}}_{2}(t)=e^{-2t}\cdot\begin{bmatrix}\frac{\cos(2t)}{2}-\frac{\sin(2t)}{2}\\ -\frac{\sin(2t)}{2}-\frac{\cos(2t)}{2}\\ \cos(2t)\end{bmatrix},\underline{\vec{y}}_{3}(t)=e^{-2t}\cdot\begin{bmatrix}-\frac{\sin(2t)}{2}-\frac{\cos(2t)}{2}\\ -\frac{\cos(2t)}{2}+\frac{\sin(2t)}{2}\\ -\sin(2t)\end{bmatrix}\right]$$

- General solution to the system of ODEs

$$\underline{\vec{y}}=c_1\underline{\vec{y}}_{1}+c_2\underline{\vec{y}}_{2}(t)+c_3\underline{\vec{y}}_{3}(t)$$

- Substitute solutions into the general solution

$$\underline{\vec{y}}=c_1e^{-t}\cdot\begin{bmatrix}-1\\ -1\\ 1\end{bmatrix}+e^{-2t}c_2\cdot\begin{bmatrix}\frac{\cos(2t)}{2}-\frac{\sin(2t)}{2}\\ -\frac{\sin(2t)}{2}-\frac{\cos(2t)}{2}\\ \cos(2t)\end{bmatrix}+c_3e^{-2t}\cdot\begin{bmatrix}-\frac{\sin(2t)}{2}-\frac{\cos(2t)}{2}\\ -\frac{\cos(2t)}{2}+\frac{\sin(2t)}{2}\\ -\sin(2t)\end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix}y_1(t)\\ y_2(t)\\ y_3(t)\end{bmatrix}=\begin{bmatrix}\frac{((c_2-c_3)\cos(2t)-\sin(2t)(c_2+c_3))e^{-2t}}{2}-c_1e^{-t}\\ \frac{((-c_2-c_3)\cos(2t)-\sin(2t)(c_2-c_3))e^{-2t}}{2}-c_1e^{-t}\\ c_1e^{-t}+e^{-2t}c_2\cos(2t)-c_3e^{-2t}\sin(2t)\end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{y_1(t)=\frac{((c_2-c_3)\cos(2t)-\sin(2t)(c_2+c_3))e^{-2t}}{2}-c_1e^{-t},y_2(t)=\frac{((-c_2-c_3)\cos(2t)-\sin(2t)(c_2-c_3))e^{-2t}}{2}-c_1e^{-t},y_3(t)\right.$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= 2y_1(t) + y_2(t) - y_3(t) \\
y_2'(t) &= y_2(t) + y_3(t) \\
y_3'(t) &= y_1(t) + y_3(t)
\end{aligned}
$$

23.7.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 2 & 1 & -1 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At} = \begin{bmatrix} \frac{e^{2t}}{2} + \frac{e^t\cos(t)}{2} + \frac{\sin(t)e^t}{2} & -\frac{e^t\cos(t)}{2} + \frac{\sin(t)e^t}{2} + \frac{e^{2t}}{2} & -\sin(t)e^t \\ -\frac{e^t\cos(t)}{2} - \frac{\sin(t)e^t}{2} + \frac{e^{2t}}{2} & \frac{e^{2t}}{2} + \frac{e^t\cos(t)}{2} - \frac{\sin(t)e^t}{2} & \sin(t)e^t \\ -\frac{e^t\cos(t)}{2} + \frac{\sin(t)e^t}{2} + \frac{e^{2t}}{2} & -\frac{e^t\cos(t)}{2} - \frac{\sin(t)e^t}{2} + \frac{e^{2t}}{2} & e^t\cos(t) \end{bmatrix}$$

$$= \begin{bmatrix} \frac{e^{2t}}{2} + \frac{(\cos(t)+\sin(t))e^t}{2} & \frac{e^{2t}}{2} + \frac{(\sin(t)-\cos(t))e^t}{2} & -\sin(t)e^t \\ \frac{e^{2t}}{2} + \frac{(-\cos(t)-\sin(t))e^t}{2} & \frac{e^{2t}}{2} + \frac{(-\sin(t)+\cos(t))e^t}{2} & \sin(t)e^t \\ \frac{e^{2t}}{2} + \frac{(\sin(t)-\cos(t))e^t}{2} & \frac{e^{2t}}{2} + \frac{(-\cos(t)-\sin(t))e^t}{2} & e^t\cos(t) \end{bmatrix}$$

Therefore the homogeneous solution is

$$\vec{x}_h(t) = e^{At}\vec{c}$$

$$= \begin{bmatrix} \frac{e^{2t}}{2} + \frac{(\cos(t)+\sin(t))e^t}{2} & \frac{e^{2t}}{2} + \frac{(\sin(t)-\cos(t))e^t}{2} & -\sin(t)e^t \\ \frac{e^{2t}}{2} + \frac{(-\cos(t)-\sin(t))e^t}{2} & \frac{e^{2t}}{2} + \frac{(-\sin(t)+\cos(t))e^t}{2} & \sin(t)e^t \\ \frac{e^{2t}}{2} + \frac{(\sin(t)-\cos(t))e^t}{2} & \frac{e^{2t}}{2} + \frac{(-\cos(t)-\sin(t))e^t}{2} & e^t\cos(t) \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix}$$

$$= \begin{bmatrix} \left(\frac{e^{2t}}{2} + \frac{(\cos(t)+\sin(t))e^t}{2}\right)c_1 + \left(\frac{e^{2t}}{2} + \frac{(\sin(t)-\cos(t))e^t}{2}\right)c_2 - \sin(t)e^t c_3 \\ \left(\frac{e^{2t}}{2} + \frac{(-\cos(t)-\sin(t))e^t}{2}\right)c_1 + \left(\frac{e^{2t}}{2} + \frac{(-\sin(t)+\cos(t))e^t}{2}\right)c_2 + \sin(t)e^t c_3 \\ \left(\frac{e^{2t}}{2} + \frac{(\sin(t)-\cos(t))e^t}{2}\right)c_1 + \left(\frac{e^{2t}}{2} + \frac{(-\cos(t)-\sin(t))e^t}{2}\right)c_2 + e^t\cos(t)c_3 \end{bmatrix}$$

$$= \begin{bmatrix} \frac{(c_1+c_2)e^{2t}}{2} + \frac{((c_1+c_2-2c_3)\sin(t)+\cos(t)(-c_2+c_1))e^t}{2} \\ \frac{(c_1+c_2)e^{2t}}{2} - \frac{((c_1+c_2-2c_3)\sin(t)+\cos(t)(-c_2+c_1))e^t}{2} \\ \frac{(c_1+c_2)e^{2t}}{2} - \frac{((c_1+c_2-2c_3)\cos(t)-\sin(t)(-c_2+c_1))e^t}{2} \end{bmatrix}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

23.7.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t) = A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} 2 & 1 & -1 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} 2 & 1 & -1 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} 2-\lambda & 1 & -1 \\ 0 & 1-\lambda & 1 \\ 1 & 0 & 1-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 - 4\lambda^2 + 6\lambda - 4 = 0$$

The roots of the above are the eigenvalues.

$$\begin{aligned} \lambda_1 &= 2 \\ \lambda_2 &= 1 + i \\ \lambda_3 &= 1 - i \end{aligned}$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
2	1	real eigenvalue
$1 - i$	1	complex eigenvalue
$1 + i$	1	complex eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 2$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 2 & 1 & -1 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} - (2) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 1 & -1 \\ 0 & -1 & 1 \\ 1 & 0 & -1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 0 & 1 & -1 & 0 \\ 0 & -1 & 1 & 0 \\ 1 & 0 & -1 & 0 \end{array}\right]$$

Since the current pivot $A(1,1)$ is zero, then the current pivot row is replaced with a row with a non-zero pivot. Swapping row 1 and row 3 gives

$$\left[\begin{array}{ccc|c} 1 & 0 & -1 & 0 \\ 0 & -1 & 1 & 0 \\ 0 & 1 & -1 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_2 \Longrightarrow \left[\begin{array}{ccc|c} 1 & 0 & -1 & 0 \\ 0 & -1 & 1 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 1 & 0 & -1 \\ 0 & -1 & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = t, v_2 = t\}$

Hence the solution is

$$\begin{bmatrix} t \\ t \\ t \end{bmatrix} = \begin{bmatrix} t \\ t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} t \\ t \\ t \end{bmatrix} = t \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} t \\ t \\ t \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = 1 - i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 2 & 1 & -1 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} - (1 - i) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 1+i & 1 & -1 \\ 0 & i & 1 \\ 1 & 0 & i \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 1+i & 1 & -1 & 0 \\ 0 & i & 1 & 0 \\ 1 & 0 & i & 0 \end{array}\right]$$

$$R_3 = R_3 + \left(-\frac{1}{2} + \frac{i}{2}\right) R_1 \Longrightarrow \left[\begin{array}{ccc|c} 1+i & 1 & -1 & 0 \\ 0 & i & 1 & 0 \\ 0 & -\frac{1}{2} + \frac{i}{2} & \frac{1}{2} + \frac{i}{2} & 0 \end{array}\right]$$

$$R_3 = R_3 + \left(-\frac{1}{2} - \frac{i}{2}\right) R_2 \Longrightarrow \left[\begin{array}{ccc|c} 1+i & 1 & -1 & 0 \\ 0 & i & 1 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 1+i & 1 & -1 \\ 0 & i & 1 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -it, v_2 = it\}$

Hence the solution is

$$\begin{bmatrix} \text{-I}t \\ \text{I}t \\ t \end{bmatrix} = \begin{bmatrix} -it \\ it \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \text{-I}t \\ \text{I}t \\ t \end{bmatrix} = t \begin{bmatrix} -i \\ i \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \text{-I}t \\ \text{I}t \\ t \end{bmatrix} = \begin{bmatrix} -i \\ i \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_3 = 1 + i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} 2 & 1 & -1 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} - (1+i)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} 1-i & 1 & -1 \\ 0 & -i & 1 \\ 1 & 0 & -i \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} 1-i & 1 & -1 & 0 \\ 0 & -i & 1 & 0 \\ 1 & 0 & -i & 0 \end{array}\right]$$

$$R_3 = R_3 + \left(-\frac{1}{2} - \frac{i}{2}\right)R_1 \Longrightarrow \left[\begin{array}{ccc|c} 1-i & 1 & -1 & 0 \\ 0 & -i & 1 & 0 \\ 0 & -\frac{1}{2} - \frac{i}{2} & \frac{1}{2} - \frac{i}{2} & 0 \end{array}\right]$$

$$R_3 = R_3 + \left(-\frac{1}{2} + \frac{i}{2}\right)R_2 \Longrightarrow \left[\begin{array}{ccc|c} 1-i & 1 & -1 & 0 \\ 0 & -i & 1 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} 1-i & 1 & -1 \\ 0 & -i & 1 \\ 0 & 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = it, v_2 = -it\}$

Hence the solution is

$$\begin{bmatrix} \mathrm{I}t \\ \text{-I}t \\ t \end{bmatrix} = \begin{bmatrix} it \\ -it \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \mathrm{I}t \\ \text{-}\mathrm{I}t \\ t \end{bmatrix} = t \begin{bmatrix} i \\ -i \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \mathrm{I}t \\ \text{-}\mathrm{I}t \\ t \end{bmatrix} = \begin{bmatrix} i \\ -i \\ 1 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

	multiplicity			
eigenvalue	algebraic m	geometric k	defective?	eigenvectors
2	1	1	No	$\begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$
$1 + i$	1	1	No	$\begin{bmatrix} i \\ -i \\ 1 \end{bmatrix}$
$1 - i$	1	1	No	$\begin{bmatrix} -i \\ i \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue 2 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^{2t} \\
&= \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} e^{2t}
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1\vec{x}_1(t) + c_2\vec{x}_2(t) + c_3\vec{x}_3(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} e^{2t} \\ e^{2t} \\ e^{2t} \end{bmatrix} + c_2 \begin{bmatrix} i e^{(1+i)t} \\ -i e^{(1+i)t} \\ e^{(1+i)t} \end{bmatrix} + c_3 \begin{bmatrix} -i e^{(1-i)t} \\ i e^{(1-i)t} \\ e^{(1-i)t} \end{bmatrix}
$$

Which becomes

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} c_1 e^{2t} + i c_2 e^{(1+i)t} - i c_3 e^{(1-i)t} \\ c_1 e^{2t} - i c_2 e^{(1+i)t} + i c_3 e^{(1-i)t} \\ c_1 e^{2t} + c_2 e^{(1+i)t} + c_3 e^{(1-i)t} \end{bmatrix}
$$

23.7.3 Maple step by step solution

Let's solve

$[y_1'(t) = 2y_1(t) + y_2(t) - y_3(t), y_2'(t) = y_2(t) + y_3(t), y_3'(t) = y_1(t) + y_3(t)]$

- Define vector

$$
\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

- Convert system into a vector equation

$$\underline{\vec{y}}'(t) = \begin{bmatrix} 2 & 1 & -1 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} \cdot \underline{\vec{y}}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{\vec{y}}'(t) = \begin{bmatrix} 2 & 1 & -1 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix} \cdot \underline{\vec{y}}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} 2 & 1 & -1 \\ 0 & 1 & 1 \\ 1 & 0 & 1 \end{bmatrix}$$

- Rewrite the system as

$\underline{\vec{y}}'(t) = A \cdot \underline{\vec{y}}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[2, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right], \left[1 - \mathrm{I}, \begin{bmatrix} -\mathrm{I} \\ \mathrm{I} \\ 1 \end{bmatrix}\right], \left[1 + \mathrm{I}, \begin{bmatrix} \mathrm{I} \\ -\mathrm{I} \\ 1 \end{bmatrix}\right]\right]$$

- Consider eigenpair

$$\left[2, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\vec{y}}_1 = \mathrm{e}^{2t} \cdot \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix}$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[1-\mathrm{I}, \left[\begin{array}{c} -\mathrm{I} \\ \mathrm{I} \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(1-\mathrm{I})t} \cdot \left[\begin{array}{c} -\mathrm{I} \\ \mathrm{I} \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of sin and cos

$$\mathrm{e}^{t} \cdot (\cos(t) - \mathrm{I}\sin(t)) \cdot \left[\begin{array}{c} -\mathrm{I} \\ \mathrm{I} \\ 1 \end{array}\right]$$

- Simplify expression

$$\mathrm{e}^{t} \cdot \left[\begin{array}{c} -\mathrm{I}(\cos(t) - \mathrm{I}\sin(t)) \\ \mathrm{I}(\cos(t) - \mathrm{I}\sin(t)) \\ \cos(t) - \mathrm{I}\sin(t) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\underline{\vec{y}}_{2}(t) = \mathrm{e}^{t} \cdot \left[\begin{array}{c} -\sin(t) \\ \sin(t) \\ \cos(t) \end{array}\right], \underline{\vec{y}}_{3}(t) = \mathrm{e}^{t} \cdot \left[\begin{array}{c} -\cos(t) \\ \cos(t) \\ -\sin(t) \end{array}\right]\right]$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_{1} + c_2 \underline{\vec{y}}_{2}(t) + c_3 \underline{\vec{y}}_{3}(t)$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 \mathrm{e}^{2t} \cdot \left[\begin{array}{c} 1 \\ 1 \\ 1 \end{array}\right] + c_2 \mathrm{e}^{t} \cdot \left[\begin{array}{c} -\sin(t) \\ \sin(t) \\ \cos(t) \end{array}\right] + c_3 \mathrm{e}^{t} \cdot \left[\begin{array}{c} -\cos(t) \\ \cos(t) \\ -\sin(t) \end{array}\right]$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} c_1 e^{2t} - c_2 e^t \sin(t) - c_3 e^t \cos(t) \\ c_1 e^{2t} + c_2 e^t \sin(t) + c_3 e^t \cos(t) \\ c_1 e^{2t} + c_2 e^t \cos(t) - c_3 e^t \sin(t) \end{bmatrix}$$

- Solution to the system of ODEs

$$\{y_1(t) = c_1 e^{2t} - c_2 e^t \sin(t) - c_3 e^t \cos(t), y_2(t) = c_1 e^{2t} + c_2 e^t \sin(t) + c_3 e^t \cos(t), y_3(t) = c_1 e^{2t} + c_$$

The type(s) of ODE detected by this program : **"system of linear ODEs"**

Solve

$$
\begin{aligned}
y_1'(t) &= -3y_1(t) + y_2(t) - 3y_3(t) \\
y_2'(t) &= 4y_1(t) - y_2(t) + 2y_3(t) \\
y_3'(t) &= 4y_1(t) - 2y_2(t) + 3y_3(t)
\end{aligned}
$$

23.8.1 Solution using Matrix exponential method

In this method, we will assume we have found the matrix exponential e^{At} allready. There are different methods to determine this but will not be shown here. This is a system of linear ODE's given as

$$
\vec{x}'(t) = A\,\vec{x}(t)
$$

Or

$$
\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix} = \begin{bmatrix} -3 & 1 & -3 \\ 4 & -1 & 2 \\ 4 & -2 & 3 \end{bmatrix} \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}
$$

For the above matrix A, the matrix exponential can be found to be

$$e^{At}=\begin{bmatrix} e^{-t}\cos(2t)-e^{-t}\sin(2t) & -\frac{e^{-t}\cos(2t)}{2}+\frac{e^t}{2} & \frac{e^{-t}\cos(2t)}{2}-e^{-t}\sin(2t)-\frac{e^t}{2} \\ 2e^{-t}\sin(2t) & \frac{e^t}{2}+\frac{e^{-t}\cos(2t)}{2}-\frac{e^{-t}\sin(2t)}{2} & \frac{e^{-t}\cos(2t)}{2}+\frac{3e^{-t}\sin(2t)}{2}-\frac{e^t}{2} \\ 2e^{-t}\sin(2t) & \frac{e^{-t}\cos(2t)}{2}-\frac{e^{-t}\sin(2t)}{2}-\frac{e^t}{2} & \frac{e^t}{2}+\frac{e^{-t}\cos(2t)}{2}+\frac{3e^{-t}\sin(2t)}{2} \end{bmatrix}$$

$$=\begin{bmatrix} e^{-t}(\cos(2t)-\sin(2t)) & -\frac{e^{-t}\cos(2t)}{2}+\frac{e^t}{2} & \frac{(\cos(2t)-2\sin(2t))e^{-t}}{2}-\frac{e^t}{2} \\ 2e^{-t}\sin(2t) & \frac{e^{-t}(\cos(2t)-\sin(2t))}{2}+\frac{e^t}{2} & \frac{(\cos(2t)+3\sin(2t))e^{-t}}{2}-\frac{e^t}{2} \\ 2e^{-t}\sin(2t) & \frac{e^{-t}(\cos(2t)-\sin(2t))}{2}-\frac{e^t}{2} & \frac{(\cos(2t)+3\sin(2t))e^{-t}}{2}+\frac{e^t}{2} \end{bmatrix}$$

Therefore the homogeneous solution is

$$\vec{x}_h(t)=e^{At}\vec{c}$$

$$=\begin{bmatrix} e^{-t}(\cos(2t)-\sin(2t)) & -\frac{e^{-t}\cos(2t)}{2}+\frac{e^t}{2} & \frac{(\cos(2t)-2\sin(2t))e^{-t}}{2}-\frac{e^t}{2} \\ 2e^{-t}\sin(2t) & \frac{e^{-t}(\cos(2t)-\sin(2t))}{2}+\frac{e^t}{2} & \frac{(\cos(2t)+3\sin(2t))e^{-t}}{2}-\frac{e^t}{2} \\ 2e^{-t}\sin(2t) & \frac{e^{-t}(\cos(2t)-\sin(2t))}{2}-\frac{e^t}{2} & \frac{(\cos(2t)+3\sin(2t))e^{-t}}{2}+\frac{e^t}{2} \end{bmatrix}\begin{bmatrix} c_1 \\ c_2 \\ c_3 \end{bmatrix}$$

$$=\begin{bmatrix} e^{-t}(\cos(2t)-\sin(2t))\,c_1+\left(-\frac{e^{-t}\cos(2t)}{2}+\frac{e^t}{2}\right)c_2+\left(\frac{(\cos(2t)-2\sin(2t))e^{-t}}{2}-\frac{e^t}{2}\right)c_3 \\ 2e^{-t}\sin(2t)\,c_1+\left(\frac{e^{-t}(\cos(2t)-\sin(2t))}{2}+\frac{e^t}{2}\right)c_2+\left(\frac{(\cos(2t)+3\sin(2t))e^{-t}}{2}-\frac{e^t}{2}\right)c_3 \\ 2e^{-t}\sin(2t)\,c_1+\left(\frac{e^{-t}(\cos(2t)-\sin(2t))}{2}-\frac{e^t}{2}\right)c_2+\left(\frac{(\cos(2t)+3\sin(2t))e^{-t}}{2}+\frac{e^t}{2}\right)c_3 \end{bmatrix}$$

$$=\begin{bmatrix} \frac{((2c_1-c_2+c_3)\cos(2t)-2\sin(2t)(c_1+c_3))e^{-t}}{2}+\frac{(c_2-c_3)e^t}{2} \\ \frac{((4c_1-c_2+3c_3)\sin(2t)+\cos(2t)(c_2+c_3))e^{-t}}{2}+\frac{(c_2-c_3)e^t}{2} \\ \frac{((4c_1-c_2+3c_3)\sin(2t)+\cos(2t)(c_2+c_3))e^{-t}}{2}-\frac{(c_2-c_3)e^t}{2} \end{bmatrix}$$

Since no forcing function is given, then the final solution is $\vec{x}_h(t)$ above.

23.8.2 Solution using explicit Eigenvalue and Eigenvector method

This is a system of linear ODE's given as

$$\vec{x}'(t)=A\,\vec{x}(t)$$

Or

$$\begin{bmatrix} y_1'(t) \\ y_2'(t) \\ y_3'(t) \end{bmatrix}=\begin{bmatrix} -3 & 1 & -3 \\ 4 & -1 & 2 \\ 4 & -2 & 3 \end{bmatrix}\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

The first step is find the homogeneous solution. We start by finding the eigenvalues of A. This is done by solving the following equation for the eigenvalues λ

$$\det(A - \lambda I) = 0$$

Expanding gives

$$\det\left(\begin{bmatrix} -3 & 1 & -3 \\ 4 & -1 & 2 \\ 4 & -2 & 3 \end{bmatrix} - \lambda \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right) = 0$$

Therefore

$$\det\left(\begin{bmatrix} -3-\lambda & 1 & -3 \\ 4 & -1-\lambda & 2 \\ 4 & -2 & 3-\lambda \end{bmatrix}\right) = 0$$

Which gives the characteristic equation

$$\lambda^3 + \lambda^2 + 3\lambda - 5 = 0$$

The roots of the above are the eigenvalues.

$$\lambda_1 = 1$$
$$\lambda_2 = -1 + 2i$$
$$\lambda_3 = -1 - 2i$$

This table summarises the above result

eigenvalue	algebraic multiplicity	type of eigenvalue
$-1-2i$	1	complex eigenvalue
1	1	real eigenvalue
$-1+2i$	1	complex eigenvalue

Now the eigenvector for each eigenvalue are found.

Considering the eigenvalue $\lambda_1 = 1$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -3 & 1 & -3 \\ 4 & -1 & 2 \\ 4 & -2 & 3 \end{bmatrix} - (1)\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}\right)\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -4 & 1 & -3 \\ 4 & -2 & 2 \\ 4 & -2 & 2 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -4 & 1 & -3 & 0 \\ 4 & -2 & 2 & 0 \\ 4 & -2 & 2 & 0 \end{array}\right]$$

$$R_2 = R_2 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} -4 & 1 & -3 & 0 \\ 0 & -1 & -1 & 0 \\ 4 & -2 & 2 & 0 \end{array}\right]$$

$$R_3 = R_3 + R_1 \Longrightarrow \left[\begin{array}{ccc|c} -4 & 1 & -3 & 0 \\ 0 & -1 & -1 & 0 \\ 0 & -1 & -1 & 0 \end{array}\right]$$

$$R_3 = R_3 - R_2 \Longrightarrow \left[\begin{array}{ccc|c} -4 & 1 & -3 & 0 \\ 0 & -1 & -1 & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -4 & 1 & -3 \\ 0 & -1 & -1 \\ 0 & 0 & 0 \end{bmatrix}\begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\{v_1 = -t, v_2 = -t\}$

Hence the solution is

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} -t \\ -t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = t \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} -t \\ -t \\ t \end{bmatrix} = \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$$

Considering the eigenvalue $\lambda_2 = -1 - 2i$

We need to solve $A\vec{v} = \lambda \vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -3 & 1 & -3 \\ 4 & -1 & 2 \\ 4 & -2 & 3 \end{bmatrix} - (-1 - 2i) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 + 2i & 1 & -3 \\ 4 & 2i & 2 \\ 4 & -2 & 4 + 2i \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -2 + 2i & 1 & -3 & 0 \\ 4 & 2i & 2 & 0 \\ 4 & -2 & 4 + 2i & 0 \end{array}\right]$$

$$R_2 = R_2 + (1+i)\,R_1 \Longrightarrow \left[\begin{array}{ccc|c} -2+2i & 1 & -3 & 0 \\ 0 & 1+3i & -1-3i & 0 \\ 4 & -2 & 4+2i & 0 \end{array}\right]$$

$$R_3 = R_3 + (1+i)\,R_1 \Longrightarrow \left[\begin{array}{ccc|c} -2+2i & 1 & -3 & 0 \\ 0 & 1+3i & -1-3i & 0 \\ 0 & -1+i & 1-i & 0 \end{array}\right]$$

$$R_3 = R_3 + \left(-\frac{1}{5} - \frac{2i}{5}\right) R_2 \Longrightarrow \left[\begin{array}{ccc|c} -2+2i & 1 & -3 & 0 \\ 0 & 1+3i & -1-3i & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -2+2i & 1 & -3 \\ 0 & 1+3i & -1-3i \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \left(-\frac{1}{2} - \frac{i}{2}\right) t, v_2 = t\right\}$

Hence the solution is

$$\begin{bmatrix} \left(-\frac{1}{2} - \frac{I}{2}\right) t \\ t \\ t \end{bmatrix} = \begin{bmatrix} \left(-\frac{1}{2} - \frac{i}{2}\right) t \\ t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \left(-\frac{1}{2} - \frac{I}{2}\right) t \\ t \\ t \end{bmatrix} = t \begin{bmatrix} -\frac{1}{2} - \frac{i}{2} \\ 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \left(-\frac{1}{2} - \frac{I}{2}\right) t \\ t \\ t \end{bmatrix} = \begin{bmatrix} -\frac{1}{2} - \frac{i}{2} \\ 1 \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \left(-\frac{1}{2} - \frac{I}{2}\right) t \\ t \\ t \end{bmatrix} = \begin{bmatrix} -1 - i \\ 2 \\ 2 \end{bmatrix}$$

Considering the eigenvalue $\lambda_3 = -1 + 2i$

We need to solve $A\vec{v} = \lambda\vec{v}$ or $(A - \lambda I)\vec{v} = \vec{0}$ which becomes

$$\left(\begin{bmatrix} -3 & 1 & -3 \\ 4 & -1 & 2 \\ 4 & -2 & 3 \end{bmatrix} - (-1 + 2i) \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \right) \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$$\begin{bmatrix} -2 - 2i & 1 & -3 \\ 4 & -2i & 2 \\ 4 & -2 & 4 - 2i \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

Now forward elimination is applied to solve for the eigenvector $\vec{v}$. The augmented matrix is

$$\left[\begin{array}{ccc|c} -2 - 2i & 1 & -3 & 0 \\ 4 & -2i & 2 & 0 \\ 4 & -2 & 4 - 2i & 0 \end{array}\right]$$

$$R_2 = R_2 + (1 - i) R_1 \implies \left[\begin{array}{ccc|c} -2 - 2i & 1 & -3 & 0 \\ 0 & 1 - 3i & -1 + 3i & 0 \\ 4 & -2 & 4 - 2i & 0 \end{array}\right]$$

$$R_3 = R_3 + (1 - i) R_1 \implies \left[\begin{array}{ccc|c} -2 - 2i & 1 & -3 & 0 \\ 0 & 1 - 3i & -1 + 3i & 0 \\ 0 & -1 - i & 1 + i & 0 \end{array}\right]$$

$$R_3 = R_3 + \left(-\frac{1}{5} + \frac{2i}{5}\right) R_2 \implies \left[\begin{array}{ccc|c} -2 - 2i & 1 & -3 & 0 \\ 0 & 1 - 3i & -1 + 3i & 0 \\ 0 & 0 & 0 & 0 \end{array}\right]$$

Therefore the system in Echelon form is

$$\begin{bmatrix} -2-2i & 1 & -3 \\ 0 & 1-3i & -1+3i \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

The free variables are $\{v_3\}$ and the leading variables are $\{v_1, v_2\}$. Let $v_3 = t$. Now we start back substitution. Solving the above equation for the leading variables in terms of free variables gives equation $\left\{v_1 = \left(-\frac{1}{2} + \frac{i}{2}\right) t, v_2 = t\right\}$

Hence the solution is

$$\begin{bmatrix} \left(-\frac{1}{2} + \frac{I}{2}\right) t \\ t \\ t \end{bmatrix} = \begin{bmatrix} \left(-\frac{1}{2} + \frac{i}{2}\right) t \\ t \\ t \end{bmatrix}$$

Since there is one free Variable, we have found one eigenvector associated with this eigenvalue. The above can be written as

$$\begin{bmatrix} \left(-\frac{1}{2} + \frac{I}{2}\right) t \\ t \\ t \end{bmatrix} = t \begin{bmatrix} -\frac{1}{2} + \frac{i}{2} \\ 1 \\ 1 \end{bmatrix}$$

Let $t = 1$ the eigenvector becomes

$$\begin{bmatrix} \left(-\frac{1}{2} + \frac{I}{2}\right) t \\ t \\ t \end{bmatrix} = \begin{bmatrix} -\frac{1}{2} + \frac{i}{2} \\ 1 \\ 1 \end{bmatrix}$$

Which is normalized to

$$\begin{bmatrix} \left(-\frac{1}{2} + \frac{I}{2}\right) t \\ t \\ t \end{bmatrix} = \begin{bmatrix} -1+i \\ 2 \\ 2 \end{bmatrix}$$

The following table gives a summary of this result. It shows for each eigenvalue the algebraic multiplicity m, and its geometric multiplicity k and the eigenvectors associated with the eigenvalue. If $m > k$ then the eigenvalue is defective which means the number of normal linearly independent eigenvectors associated with this eigenvalue (called the geometric multiplicity k) does not equal the algebraic multiplicity m, and we need to determine an additional $m - k$ generalized eigenvectors for this eigenvalue.

eigenvalue	multiplicity		defective?	eigenvectors
	algebraic m	geometric k		
1	1	1	No	$\begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$
$-1+2i$	1	1	No	$\begin{bmatrix} -\frac{1}{2}+\frac{i}{2} \\ 1 \\ 1 \end{bmatrix}$
$-1-2i$	1	1	No	$\begin{bmatrix} -\frac{1}{2}-\frac{i}{2} \\ 1 \\ 1 \end{bmatrix}$

Now that we found the eigenvalues and associated eigenvectors, we will go over each eigenvalue and generate the solution basis. The only problem we need to take care of is if the eigenvalue is defective. Since eigenvalue 1 is real and distinct then the corresponding eigenvector solution is

$$
\begin{aligned}
\vec{x}_1(t) &= \vec{v}_1 e^t \\
&= \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix} e^t
\end{aligned}
$$

Therefore the final solution is

$$
\vec{x}_h(t) = c_1 \vec{x}_1(t) + c_2 \vec{x}_2(t) + c_3 \vec{x}_3(t)
$$

Which is written as

$$
\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = c_1 \begin{bmatrix} -\mathrm{e}^t \\ -\mathrm{e}^t \\ \mathrm{e}^t \end{bmatrix} + c_2 \begin{bmatrix} \left(-\frac{1}{2}+\frac{i}{2}\right) \mathrm{e}^{(-1+2i)t} \\ \mathrm{e}^{(-1+2i)t} \\ \mathrm{e}^{(-1+2i)t} \end{bmatrix} + c_3 \begin{bmatrix} \left(-\frac{1}{2}-\frac{i}{2}\right) \mathrm{e}^{(-1-2i)t} \\ \mathrm{e}^{(-1-2i)t} \\ \mathrm{e}^{(-1-2i)t} \end{bmatrix}
$$

Which becomes

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} -c_1 e^t + \left(-\frac{1}{2}+\frac{i}{2}\right) c_2 e^{(-1+2i)t} + \left(-\frac{1}{2}-\frac{i}{2}\right) c_3 e^{(-1-2i)t} \\ -c_1 e^t + c_2 e^{(-1+2i)t} + c_3 e^{(-1-2i)t} \\ c_1 e^t + c_2 e^{(-1+2i)t} + c_3 e^{(-1-2i)t} \end{bmatrix}$$

23.8.3 Maple step by step solution

Let's solve

$[y_1'(t) = -3y_1(t) + y_2(t) - 3y_3(t), y_2'(t) = 4y_1(t) - y_2(t) + 2y_3(t), y_3'(t) = 4y_1(t) - 2y_2(t) + 3y_3(t)]$

- Define vector

$$\underline{y}^{\rightarrow}(t) = \begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix}$$

- Convert system into a vector equation

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -3 & 1 & -3 \\ 4 & -1 & 2 \\ 4 & -2 & 3 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t) + \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

- System to solve

$$\underline{y}^{\rightarrow\prime}(t) = \begin{bmatrix} -3 & 1 & -3 \\ 4 & -1 & 2 \\ 4 & -2 & 3 \end{bmatrix} \cdot \underline{y}^{\rightarrow}(t)$$

- Define the coefficient matrix

$$A = \begin{bmatrix} -3 & 1 & -3 \\ 4 & -1 & 2 \\ 4 & -2 & 3 \end{bmatrix}$$

- Rewrite the system as

$\underline{y}^{\rightarrow\prime}(t) = A \cdot \underline{y}^{\rightarrow}(t)$

- To solve the system, find the eigenvalues and eigenvectors of A
- Eigenpairs of A

$$\left[\left[1, \left[\begin{array}{c} -1 \\ -1 \\ 1 \end{array}\right]\right], \left[-1-2\,\mathrm{I}, \left[\begin{array}{c} -\frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \\ 1 \end{array}\right]\right], \left[-1+2\,\mathrm{I}, \left[\begin{array}{c} -\frac{1}{2}+\frac{\mathrm{I}}{2} \\ 1 \\ 1 \end{array}\right]\right]\right]$$

- Consider eigenpair

$$\left[1, \left[\begin{array}{c} -1 \\ -1 \\ 1 \end{array}\right]\right]$$

- Solution to homogeneous system from eigenpair

$$\underline{\overrightarrow{y}}_{1} = \mathrm{e}^{t} \cdot \left[\begin{array}{c} -1 \\ -1 \\ 1 \end{array}\right]$$

- Consider complex eigenpair, complex conjugate eigenvalue can be ignored

$$\left[-1-2\,\mathrm{I}, \left[\begin{array}{c} -\frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \\ 1 \end{array}\right]\right]$$

- Solution from eigenpair

$$\mathrm{e}^{(-1-2\,\mathrm{I})t} \cdot \left[\begin{array}{c} -\frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \\ 1 \end{array}\right]$$

- Use Euler identity to write solution in terms of $\sin$ and $\cos$

$$\mathrm{e}^{-t} \cdot (\cos(2t) - \mathrm{I}\sin(2t)) \cdot \left[\begin{array}{c} -\frac{1}{2}-\frac{\mathrm{I}}{2} \\ 1 \\ 1 \end{array}\right]$$

- Simplify expression

$$\mathrm{e}^{-t} \cdot \left[\begin{array}{c} \left(-\frac{1}{2}-\frac{\mathrm{I}}{2}\right)(\cos(2t) - \mathrm{I}\sin(2t)) \\ \cos(2t) - \mathrm{I}\sin(2t) \\ \cos(2t) - \mathrm{I}\sin(2t) \end{array}\right]$$

- Both real and imaginary parts are solutions to the homogeneous system

$$\left[\underline{\vec{y}}_2(t) = e^{-t} \cdot \begin{bmatrix} -\frac{\sin(2t)}{2} - \frac{\cos(2t)}{2} \\ \cos(2t) \\ \cos(2t) \end{bmatrix}, \underline{\vec{y}}_3(t) = e^{-t} \cdot \begin{bmatrix} -\frac{\cos(2t)}{2} + \frac{\sin(2t)}{2} \\ -\sin(2t) \\ -\sin(2t) \end{bmatrix}\right]$$

- General solution to the system of ODEs

$$\underline{\vec{y}} = c_1 \underline{\vec{y}}_1 + c_2 \underline{\vec{y}}_2(t) + c_3 \underline{\vec{y}}_3(t)$$

- Substitute solutions into the general solution

$$\underline{\vec{y}} = c_1 e^t \cdot \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix} + c_2 e^{-t} \cdot \begin{bmatrix} -\frac{\sin(2t)}{2} - \frac{\cos(2t)}{2} \\ \cos(2t) \\ \cos(2t) \end{bmatrix} + c_3 e^{-t} \cdot \begin{bmatrix} -\frac{\cos(2t)}{2} + \frac{\sin(2t)}{2} \\ -\sin(2t) \\ -\sin(2t) \end{bmatrix}$$

- Substitute in vector of dependent variables

$$\begin{bmatrix} y_1(t) \\ y_2(t) \\ y_3(t) \end{bmatrix} = \begin{bmatrix} \frac{((-c_2-c_3)\cos(2t)-\sin(2t)(c_2-c_3))e^{-t}}{2} - c_1 e^t \\ -c_1 e^t + c_2 e^{-t}\cos(2t) - c_3 e^{-t}\sin(2t) \\ c_1 e^t + c_2 e^{-t}\cos(2t) - c_3 e^{-t}\sin(2t) \end{bmatrix}$$

- Solution to the system of ODEs

$$\left\{y_1(t) = \frac{((-c_2-c_3)\cos(2t)-\sin(2t)(c_2-c_3))e^{-t}}{2} - c_1 e^t, y_2(t) = -c_1 e^t + c_2 e^{-t}\cos(2t) - c_3 e^{-t}\sin(2t), y_3(t) =\right.$$
