Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{(1+n+r)\,b_{n-2}}{2\,(4n+4r-1)} \tag{4}$$

Which for the root $r=-1$ becomes

$$b_n = -\frac{nb_{n-2}}{8n-10} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r=-1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n=2$, using the above recursive equation gives

$$b_2 = \frac{-3-r}{14+8r}$$

Which for the root $r=-1$ becomes

$$b_2 = -\frac{1}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-3-r}{14+8r}$	$-\frac{1}{3}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-3-r}{14+8r}$	$-\frac{1}{3}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^2 + 8r + 15}{64r^2 + 352r + 420}$$

Which for the root $r = -1$ becomes

$$b_4 = \frac{2}{33}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-3-r}{14+8r}$	$-\frac{1}{3}$
b_3	0	0
b_4	$\frac{r^2+8r+15}{64r^2+352r+420}$	$\frac{2}{33}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-3-r}{14+8r}$	$-\frac{1}{3}$
b_3	0	0
b_4	$\frac{r^2+8r+15}{64r^2+352r+420}$	$\frac{2}{33}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned}
y_2(x) &= x^{\frac{1}{4}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= \frac{1 - \frac{x^2}{3} + \frac{2x^4}{33} + O(x^6)}{x}
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{1}{4}}\left(1 - \frac{13x^2}{64} + \frac{273x^4}{8192} + O(x^6)\right) + \frac{c_2\left(1 - \frac{x^2}{3} + \frac{2x^4}{33} + O(x^6)\right)}{x}
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{1}{4}}\left(1 - \frac{13x^2}{64} + \frac{273x^4}{8192} + O(x^6)\right) + \frac{c_2\left(1 - \frac{x^2}{3} + \frac{2x^4}{33} + O(x^6)\right)}{x}
\end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{4}}\left(1 - \frac{13x^2}{64} + \frac{273x^4}{8192} + O(x^6)\right) + \frac{c_2\left(1 - \frac{x^2}{3} + \frac{2x^4}{33} + O(x^6)\right)}{x} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{4}} \left(1 - \frac{13x^2}{64} + \frac{273x^4}{8192} + O(x^6)\right) + \frac{c_2 \left(1 - \frac{x^2}{3} + \frac{2x^4}{33} + O(x^6)\right)}{x}$$

Verified OK.

14.46.1 Maple step by step solution

Let's solve

$x^2(x^2+8)\, y'' + (7x^3 + 14x)\, y' + (9x^2 - 2)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(9x^2-2)y}{x^2(x^2+8)} - \frac{7(x^2+2)y'}{x(x^2+8)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{7(x^2+2)y'}{x(x^2+8)} + \frac{(9x^2-2)y}{x^2(x^2+8)} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x) = \frac{7(x^2+2)}{x(x^2+8)}, P_3(x) = \frac{9x^2-2}{x^2(x^2+8)}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

    $\left.(x \cdot P_2(x))\right|_{x=0} = \frac{7}{4}$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $\left.(x^2 \cdot P_3(x))\right|_{x=0} = -\frac{1}{4}$

  ◦ $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2(x^2+8)\, y'' + 7x(x^2+2)\, y' + (9x^2-2)\, y = 0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

- □ Rewrite ODE with series expansions
  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

  - Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

  - Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

  - Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

  - Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$$

  - Shift index using $k- >k + 2 - m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$2a_0(1+r)\,(-1+4r)\, x^r + 2a_1(2+r)\,(3+4r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} (2a_k(k+r+1)\,(4k+4r-1) + a_{k-2}(\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$2(1+r)\,(-1+4r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-1, \frac{1}{4}\right\}$$

- Each term must be 0

$$2a_1(2+r)\,(3+4r) = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

$$8\left(\frac{a_{k-2}(k+r+1)}{8}+a_k\left(k+r-\frac{1}{4}\right)\right)(k+r+1)=0$$

- Shift index using $k->k+2$

$$8\left(\frac{a_k(k+r+3)}{8}+a_{k+2}\left(k+\frac{7}{4}+r\right)\right)(k+r+3)=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{a_k(k+r+3)}{2(4k+7+4r)}$$

- Recursion relation for $r=-1$

$$a_{k+2}=-\frac{a_k(k+2)}{2(4k+3)}$$

- Solution for $r=-1$

$$\left[y=\sum_{k=0}^{\infty}a_k x^{k-1}, a_{k+2}=-\frac{a_k(k+2)}{2(4k+3)}, a_1=0\right]$$

- Recursion relation for $r=\frac{1}{4}$

$$a_{k+2}=-\frac{a_k\left(k+\frac{13}{4}\right)}{2(4k+8)}$$

- Solution for $r=\frac{1}{4}$

$$\left[y=\sum_{k=0}^{\infty}a_k x^{k+\frac{1}{4}}, a_{k+2}=-\frac{a_k\left(k+\frac{13}{4}\right)}{2(4k+8)}, a_1=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty}a_k x^{k-1}\right)+\left(\sum_{k=0}^{\infty}b_k x^{k+\frac{1}{4}}\right), a_{k+2}=-\frac{a_k(k+2)}{2(4k+3)}, a_1=0, b_{k+2}=-\frac{b_k\left(k+\frac{13}{4}\right)}{2(4k+8)}, b_1=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 49.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{9x^2(x^2+1)\,y''+3x(13x^2+3)\,y'-(-25x^2+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(9x^4+9x^2)\,y''+(39x^3+9x)\,y'+(25x^2-1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{13x^2+3}{3x\,(x^2+1)}\\ q(x)&=\frac{25x^2-1}{9x^2\,(x^2+1)}\end{aligned}$$

Table 622: Table $p(x), q(x)$ singularites.

$p(x) = \frac{13x^2+3}{3x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{25x^2-1}{9x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$9x^2(x^2+1)\, y'' + (39x^3+9x)\, y' + (25x^2-1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$9x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (39x^3+9x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (25x^2-1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 9x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 39x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 25x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 9x^{n+r+2} a_n (n+r)(n+r-1) &= \sum_{n=2}^{\infty} 9a_{n-2}(n+r-2)(n-3+r)\, x^{n+r} \\
\sum_{n=0}^{\infty} 39x^{n+r+2} a_n (n+r) &= \sum_{n=2}^{\infty} 39a_{n-2}(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 25x^{n+r+2} a_n &= \sum_{n=2}^{\infty} 25a_{n-2} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} 9a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 39a_{n-2}(n+r-2)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 25a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
9x^{n+r} a_n (n+r)(n+r-1) + 9x^{n+r} a_n (n+r) - a_n x^{n+r} = 0
$$

When $n = 0$ the above becomes

$$9x^r a_0 r(-1+r) + 9x^r a_0 r - a_0 x^r = 0$$

Or

$$\left(9x^r r(-1+r) + 9x^r r - x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(9r^2 - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$9r^2 - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = -\frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(9r^2 - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{2}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{3}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$9a_{n-2}(n+r-2)(n-3+r)+9a_n(n+r)(n+r-1) \\ +39a_{n-2}(n+r-2)+9a_n(n+r)+25a_{n-2}-a_n=0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(-1+3n+3r)\, a_{n-2}}{3n+3r+1} \tag{4}$$

Which for the root $r=\frac{1}{3}$ becomes

$$a_n = -\frac{3n a_{n-2}}{3n+2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r=\frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n=2$, using the above recursive equation gives

$$a_2 = \frac{-5-3r}{7+3r}$$

Which for the root $r=\frac{1}{3}$ becomes

$$a_2 = -\frac{3}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-3r}{7+3r}$	$-\frac{3}{4}$

For $n=3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-3r}{7+3r}$	$-\frac{3}{4}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{9r^2 + 48r + 55}{9r^2 + 60r + 91}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{9}{14}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-3r}{7+3r}$	$-\frac{3}{4}$
a_3	0	0
a_4	$\frac{9r^2+48r+55}{9r^2+60r+91}$	$\frac{9}{14}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-3r}{7+3r}$	$-\frac{3}{4}$
a_3	0	0
a_4	$\frac{9r^2+48r+55}{9r^2+60r+91}$	$\frac{9}{14}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^{\frac{1}{3}}\left(1 - \frac{3x^2}{4} + \frac{9x^4}{14} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
b_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&9b_{n-2}(n+r-2)(n-3+r) + 9b_n(n+r)(n+r-1) \\
&+ 39b_{n-2}(n+r-2) + 9b_n(n+r) + 25b_{n-2} - b_n = 0
\end{aligned} \tag{3}
$$

Solving for b_n from recursive equation (4) gives

$$
b_n = -\frac{(-1+3n+3r)\, b_{n-2}}{3n+3r+1} \tag{4}
$$

Which for the root $r = -\frac{1}{3}$ becomes

$$
b_n = -\frac{(-2+3n)\, b_{n-2}}{3n} \tag{5}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$
b_2 = \frac{-5-3r}{7+3r}
$$

Which for the root $r = -\frac{1}{3}$ becomes

$$
b_2 = -\frac{2}{3}
$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-3r}{7+3r}$	$-\frac{2}{3}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-3r}{7+3r}$	$-\frac{2}{3}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{9r^2 + 48r + 55}{9r^2 + 60r + 91}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_4 = \frac{5}{9}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-3r}{7+3r}$	$-\frac{2}{3}$
b_3	0	0
b_4	$\frac{9r^2+48r+55}{9r^2+60r+91}$	$\frac{5}{9}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-3r}{7+3r}$	$-\frac{2}{3}$
b_3	0	0
b_4	$\frac{9r^2+48r+55}{9r^2+60r+91}$	$\frac{5}{9}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{1}{3}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 - \frac{2x^2}{3} + \frac{5x^4}{9} + O(x^6)}{x^{\frac{1}{3}}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{1}{3}}\left(1 - \frac{3x^2}{4} + \frac{9x^4}{14} + O(x^6)\right) + \frac{c_2\left(1 - \frac{2x^2}{3} + \frac{5x^4}{9} + O(x^6)\right)}{x^{\frac{1}{3}}} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{1}{3}}\left(1 - \frac{3x^2}{4} + \frac{9x^4}{14} + O(x^6)\right) + \frac{c_2\left(1 - \frac{2x^2}{3} + \frac{5x^4}{9} + O(x^6)\right)}{x^{\frac{1}{3}}} \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{3}}\left(1 - \frac{3x^2}{4} + \frac{9x^4}{14} + O(x^6)\right) + \frac{c_2\left(1 - \frac{2x^2}{3} + \frac{5x^4}{9} + O(x^6)\right)}{x^{\frac{1}{3}}} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{3}} \left(1 - \frac{3x^2}{4} + \frac{9x^4}{14} + O(x^6)\right) + \frac{c_2 \left(1 - \frac{2x^2}{3} + \frac{5x^4}{9} + O(x^6)\right)}{x^{\frac{1}{3}}}$$

Verified OK.

14.47.1 Maple step by step solution

Let's solve

$9x^2(x^2+1)\,y'' + (39x^3+9x)\,y' + (25x^2-1)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(25x^2-1)y}{9x^2(x^2+1)} - \frac{(13x^2+3)y'}{3x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(13x^2+3)y'}{3x(x^2+1)} + \frac{(25x^2-1)y}{9x^2(x^2+1)} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x) = \frac{13x^2+3}{3x(x^2+1)}, P_3(x) = \frac{25x^2-1}{9x^2(x^2+1)}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x=0$

    $(x \cdot P_2(x))\bigg|_{x=0} = 1$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x=0$

    $(x^2 \cdot P_3(x))\bigg|_{x=0} = -\frac{1}{9}$

  ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $9x^2(x^2+1)\,y'' + 3x(13x^2+3)\,y' + (25x^2-1)\,y = 0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(1+3r)\,(-1+3r)\, x^r + a_1(4+3r)\,(2+3r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(3k+3r+1)\,(3k+3r-1) + a_{k-2}\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1+3r)\,(-1+3r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-\frac{1}{3}, \frac{1}{3}\right\}$$

- Each term must be 0

$$a_1(4+3r)\,(2+3r) = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

$$9\left(\left(k+r-\frac{1}{3}\right) a_{k-2}+a_k\left(k+r+\frac{1}{3}\right)\right)\left(k+r-\frac{1}{3}\right)=0$$

- Shift index using $k->k+2$

$$9\left(\left(k+\frac{5}{3}+r\right) a_k+a_{k+2}\left(k+\frac{7}{3}+r\right)\right)\left(k+\frac{5}{3}+r\right)=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{(3k+3r+5)a_k}{3k+7+3r}$$

- Recursion relation for $r=-\frac{1}{3}$

$$a_{k+2}=-\frac{(3k+4)a_k}{3k+6}$$

- Solution for $r=-\frac{1}{3}$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k-\frac{1}{3}}, a_{k+2}=-\frac{(3k+4)a_k}{3k+6}, a_1=0\right]$$

- Recursion relation for $r=\frac{1}{3}$

$$a_{k+2}=-\frac{(3k+6)a_k}{3k+8}$$

- Solution for $r=\frac{1}{3}$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+2}=-\frac{(3k+6)a_k}{3k+8}, a_1=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k x^{k-\frac{1}{3}}\right)+\left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{3}}\right), a_{k+2}=-\frac{(3k+4)a_k}{3k+6}, a_1=0, b_{k+2}=-\frac{(3k+6)b_k}{3k+8}, b_1=0\right]$$

Problem number: 50.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2(x^2+1)\,y''+4x(6x^2+1)\,y'-(-25x^2+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(4x^4+4x^2)\,y''+(24x^3+4x)\,y'+(25x^2-1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{6x^2+1}{x\,(x^2+1)}$$
$$q(x)=\frac{25x^2-1}{4x^2\,(x^2+1)}$$

Table 624: Table $p(x), q(x)$ singularites.

$p(x) = \frac{6x^2+1}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{25x^2-1}{4x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2(x^2+1)\, y'' + (24x^3+4x)\, y' + (25x^2-1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\begin{aligned} & 4x^2(x^2+1) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) \\ & + (24x^3+4x) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (25x^2-1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \end{aligned} \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 24x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 25x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0
\end{aligned}
\tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r)(n+r-1) &= \sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)(n-3+r)\, x^{n+r} \\
\sum_{n=0}^{\infty} 24x^{n+r+2} a_n (n+r) &= \sum_{n=2}^{\infty} 24a_{n-2}(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 25x^{n+r+2} a_n &= \sum_{n=2}^{\infty} 25a_{n-2} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 24a_{n-2}(n+r-2)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 25a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0
\end{aligned}
\tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
4x^{n+r} a_n (n+r)(n+r-1) + 4x^{n+r} a_n (n+r) - a_n x^{n+r} = 0
$$

When $n=0$ the above becomes

$$4x^r a_0 r(-1+r) + 4x^r a_0 r - a_0 x^r = 0$$

Or

$$\left(4x^r r(-1+r) + 4x^r r - x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2-1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = -\frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2-1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 1$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sqrt{x}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{\sqrt{x}}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} 4a_{n-2}(n+r-2)(n-3+r) + 4a_n(n+r)(n+r-1) \\ + 24a_{n-2}(n+r-2) + 4a_n(n+r) + 25a_{n-2} - a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(1+2n+2r)\, a_{n-2}}{2n+2r-1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{(1+n)\, a_{n-2}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-5-2r}{3+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = -\frac{3}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-2r}{3+2r}$	$-\frac{3}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-2r}{3+2r}$	$-\frac{3}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4r^2 + 28r + 45}{4r^2 + 20r + 21}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{15}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-2r}{3+2r}$	$-\frac{3}{2}$
a_3	0	0
a_4	$\frac{4r^2+28r+45}{4r^2+20r+21}$	$\frac{15}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-2r}{3+2r}$	$-\frac{3}{2}$
a_3	0	0
a_4	$\frac{4r^2+28r+45}{4r^2+20r+21}$	$\frac{15}{8}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= \sqrt{x}\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O\left(x^6\right)\right)
\end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 1$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_1(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned}
a_N &= a_1 \\
&= 0
\end{aligned}$$

Therefore

$$\begin{aligned}
\lim_{r\to r_2} 0 &= \lim_{r\to -\frac{1}{2}} 0 \\
&= 0
\end{aligned}$$

The limit is 0. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned}
y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\
&= \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}
\end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq(3) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &4b_{n-2}(n+r-2)\,(n-3+r) + 4b_n(n+r)\,(n+r-1) \\ &+ 24b_{n-2}(n+r-2) + 4b_n(n+r) + 25b_{n-2} - b_n = 0 \end{aligned} \tag{4}$$

Which for for the root $r = -\frac{1}{2}$ becomes

$$\begin{aligned} &4b_{n-2}\left(n-\frac{5}{2}\right)\left(n-\frac{7}{2}\right) + 4b_n\left(n-\frac{1}{2}\right)\left(n-\frac{3}{2}\right) \\ &+ 24b_{n-2}\left(n-\frac{5}{2}\right) + 4b_n\left(n-\frac{1}{2}\right) + 25b_{n-2} - b_n = 0 \end{aligned} \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{(1+2n+2r)\,b_{n-2}}{2n+2r-1} \tag{5}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_n = -\frac{2nb_{n-2}}{2n-2} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -\frac{5+2r}{3+2r}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_2 = -2$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-2r}{3+2r}$	-2

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-2r}{3+2r}$	-2
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{4r^2 + 28r + 45}{(3 + 2r)(7 + 2r)}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_4 = \frac{8}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-2r}{3+2r}$	-2
b_3	0	0
b_4	$\frac{4r^2+28r+45}{4r^2+20r+21}$	$\frac{8}{3}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-2r}{3+2r}$	-2
b_3	0	0
b_4	$\frac{4r^2+28r+45}{4r^2+20r+21}$	$\frac{8}{3}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= \sqrt{x}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 - 2x^2 + \frac{8x^4}{3} + O(x^6)}{\sqrt{x}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 \sqrt{x}\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)\right) + \frac{c_2\left(1 - 2x^2 + \frac{8x^4}{3} + O(x^6)\right)}{\sqrt{x}} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 \sqrt{x}\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)\right) + \frac{c_2\left(1 - 2x^2 + \frac{8x^4}{3} + O(x^6)\right)}{\sqrt{x}} \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 \sqrt{x}\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)\right) + \frac{c_2\left(1 - 2x^2 + \frac{8x^4}{3} + O(x^6)\right)}{\sqrt{x}} \tag{1}$$

Verification of solutions

$$y = c_1\sqrt{x}\left(1-\frac{3x^2}{2}+\frac{15x^4}{8}+O(x^6)\right)+\frac{c_2\left(1-2x^2+\frac{8x^4}{3}+O(x^6)\right)}{\sqrt{x}}$$

Verified OK.

14.48.1 Maple step by step solution

Let's solve

$4x^2(x^2+1)\,y''+(24x^3+4x)\,y'+(25x^2-1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(25x^2-1)y}{4x^2(x^2+1)}-\frac{(6x^2+1)y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(6x^2+1)y'}{x(x^2+1)}+\frac{(25x^2-1)y}{4x^2(x^2+1)}=0$

☐ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{6x^2+1}{x(x^2+1)}, P_3(x)=\frac{25x^2-1}{4x^2(x^2+1)}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $\left.(x\cdot P_2(x))\right|_{x=0}=1$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $\left.(x^2\cdot P_3(x))\right|_{x=0}=-\frac{1}{4}$

  - $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $4x^2(x^2+1)\,y''+4x(6x^2+1)\,y'+(25x^2-1)\,y=0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

- ☐ Rewrite ODE with series expansions
  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

  - Shift index using $k- >k-m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

  - Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$$

  - Shift index using $k- >k+1-m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

  - Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$$

  - Shift index using $k- >k+2-m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

  Rewrite ODE with series expansions

$$a_0(1+2r)\,(-1+2r)\, x^r + a_1(3+2r)\,(1+2r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(2k+2r+1)\,(2k+2r-1) + a_{k-2}\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1+2r)\,(-1+2r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-\frac{1}{2}, \frac{1}{2}\right\}$$

- Each term must be 0

$$a_1(3+2r)\,(1+2r) = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

$$4\left(k+r+\frac{1}{2}\right)\left(\left(k+r+\frac{1}{2}\right)a_{k-2}+a_k\left(k+r-\frac{1}{2}\right)\right)=0$$

- Shift index using $k->k+2$

$$4\left(k+\frac{5}{2}+r\right)\left(\left(k+\frac{5}{2}+r\right)a_k+a_{k+2}\left(k+\frac{3}{2}+r\right)\right)=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{(2k+2r+5)a_k}{2k+3+2r}$$

- Recursion relation for $r=-\frac{1}{2}$

$$a_{k+2}=-\frac{(2k+4)a_k}{2k+2}$$

- Solution for $r=-\frac{1}{2}$

$$\left[y=\sum_{k=0}^{\infty}a_k x^{k-\frac{1}{2}}, a_{k+2}=-\frac{(2k+4)a_k}{2k+2}, a_1=0\right]$$

- Recursion relation for $r=\frac{1}{2}$

$$a_{k+2}=-\frac{(2k+6)a_k}{2k+4}$$

- Solution for $r=\frac{1}{2}$

$$\left[y=\sum_{k=0}^{\infty}a_k x^{k+\frac{1}{2}}, a_{k+2}=-\frac{(2k+6)a_k}{2k+4}, a_1=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty}a_k x^{k-\frac{1}{2}}\right)+\left(\sum_{k=0}^{\infty}b_k x^{k+\frac{1}{2}}\right), a_{k+2}=-\frac{(2k+4)a_k}{2k+2}, a_1=0, b_{k+2}=-\frac{(2k+6)b_k}{2k+4}, b_1=0\right]$$

Problem number: 51.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{8x^2(2x^2+1)\,y''+2x(34x^2+5)\,y'-(-30x^2+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(16x^4+8x^2)\,y''+(68x^3+10x)\,y'+(30x^2-1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{34x^2+5}{4x\,(2x^2+1)}$$
$$q(x)=\frac{30x^2-1}{8x^2\,(2x^2+1)}$$

Table 626: Table $p(x), q(x)$ singularites.

$p(x) = \frac{34x^2+5}{4x(2x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{2}}{2}$	"regular"
$x = \frac{i\sqrt{2}}{2}$	"regular"

$q(x) = \frac{30x^2-1}{8x^2(2x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{2}}{2}$	"regular"
$x = \frac{i\sqrt{2}}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{i\sqrt{2}}{2}, \frac{i\sqrt{2}}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$8x^2(2x^2+1)\,y'' + (68x^3+10x)\,y' + (30x^2-1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\begin{aligned} &8x^2(2x^2+1)\left(\sum_{n=0}^{\infty}(n+r)(n+r-1)\,a_n x^{n+r-2}\right) \\ &+ (68x^3+10x)\left(\sum_{n=0}^{\infty}(n+r)\,a_n x^{n+r-1}\right) + (30x^2-1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \end{aligned} \tag{1}$$

Which simplifies to

$$\begin{aligned}
&\left(\sum_{n=0}^{\infty} 16x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 68x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 10x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 30x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 16x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} 16a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 68x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 68a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 30x^{n+r+2} a_n = \sum_{n=2}^{\infty} 30a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\begin{aligned}
&\left(\sum_{n=2}^{\infty} 16a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 68a_{n-2}(n+r-2)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} 10x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 30a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0
\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$8x^{n+r} a_n (n+r)(n+r-1) + 10x^{n+r} a_n (n+r) - a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$8x^r a_0 r(-1+r) + 10x^r a_0 r - a_0 x^r = 0$$

Or

$$(8x^r r(-1+r) + 10x^r r - x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(8r^2 + 2r - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$8r^2 + 2r - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{4}$$
$$r_2 = -\frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(8r^2 + 2r - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{3}{4}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{4}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$16a_{n-2}(n+r-2)(n-3+r)+8a_n(n+r)(n+r-1) \\ +68a_{n-2}(n+r-2)+10a_n(n+r)+30a_{n-2}-a_n=0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{2(4n+4r-5)\,a_{n-2}}{4n+4r-1} \tag{4}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_n = -\frac{2(n-1)\,a_{n-2}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-8r-6}{7+4r}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_2 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-8r-6}{7+4r}$	-1

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-8r-6}{7+4r}$	-1
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{64r^2 + 224r + 132}{16r^2 + 88r + 105}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_4 = \frac{3}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-8r-6}{7+4r}$	-1
a_3	0	0
a_4	$\frac{64r^2+224r+132}{16r^2+88r+105}$	$\frac{3}{2}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-8r-6}{7+4r}$	-1
a_3	0	0
a_4	$\frac{64r^2+224r+132}{16r^2+88r+105}$	$\frac{3}{2}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^{\frac{1}{4}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \ldots\right) \\
&= x^{\frac{1}{4}}\left(1 - x^2 + \frac{3x^4}{2} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
b_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&16b_{n-2}(n+r-2)\,(n-3+r) + 8b_n(n+r)\,(n+r-1) \\
&+ 68b_{n-2}(n+r-2) + 10b_n(n+r) + 30b_{n-2} - b_n = 0
\end{aligned} \tag{3}
$$

Solving for b_n from recursive equation (4) gives

$$
b_n = -\frac{2(4n+4r-5)\,b_{n-2}}{4n+4r-1} \tag{4}
$$

Which for the root $r = -\frac{1}{2}$ becomes

$$
b_n = \frac{(-8n+14)\,b_{n-2}}{4n-3} \tag{5}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$
b_2 = \frac{-8r-6}{7+4r}
$$

Which for the root $r = -\frac{1}{2}$ becomes

$$
b_2 = -\frac{2}{5}
$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-8r-6}{7+4r}$	$-\frac{2}{5}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-8r-6}{7+4r}$	$-\frac{2}{5}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{64r^2 + 224r + 132}{16r^2 + 88r + 105}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_4 = \frac{36}{65}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-8r-6}{7+4r}$	$-\frac{2}{5}$
b_3	0	0
b_4	$\frac{64r^2+224r+132}{16r^2+88r+105}$	$\frac{36}{65}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-8r-6}{7+4r}$	$-\frac{2}{5}$
b_3	0	0
b_4	$\frac{64r^2+224r+132}{16r^2+88r+105}$	$\frac{36}{65}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{1}{4}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 - \frac{2x^2}{5} + \frac{36x^4}{65} + O(x^6)}{\sqrt{x}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{1}{4}}\left(1 - x^2 + \frac{3x^4}{2} + O(x^6)\right) + \frac{c_2\left(1 - \frac{2x^2}{5} + \frac{36x^4}{65} + O(x^6)\right)}{\sqrt{x}} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{1}{4}}\left(1 - x^2 + \frac{3x^4}{2} + O(x^6)\right) + \frac{c_2\left(1 - \frac{2x^2}{5} + \frac{36x^4}{65} + O(x^6)\right)}{\sqrt{x}} \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{4}}\left(1 - x^2 + \frac{3x^4}{2} + O(x^6)\right) + \frac{c_2\left(1 - \frac{2x^2}{5} + \frac{36x^4}{65} + O(x^6)\right)}{\sqrt{x}} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{4}} \left(1 - x^2 + \frac{3x^4}{2} + O(x^6)\right) + \frac{c_2 \left(1 - \frac{2x^2}{5} + \frac{36x^4}{65} + O(x^6)\right)}{\sqrt{x}}$$

Verified OK.

14.49.1 Maple step by step solution

Let's solve

$8x^2(2x^2+1)\, y'' + (68x^3+10x)\, y' + (30x^2-1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(30x^2-1)y}{8x^2(2x^2+1)} - \frac{(34x^2+5)y'}{4x(2x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(34x^2+5)y'}{4x(2x^2+1)} + \frac{(30x^2-1)y}{8x^2(2x^2+1)} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $(x \cdot P_2(x))\Big|_{x=0} = \frac{5}{4}$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\Big|_{x=0} = -\frac{1}{8}$

  ◦ $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $8x^2(2x^2+1)\, y'' + 2x(34x^2+5)\, y' + (30x^2-1)\, y = 0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m} (k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(1+2r)\,(-1+4r)\, x^r + a_1(3+2r)\,(3+4r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(2k+2r+1)\,(4k+4r-1) + 2a_{k-}\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1+2r)\,(-1+4r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-\frac{1}{2}, \frac{1}{4}\right\}$$

- Each term must be 0

$$a_1(3+2r)\,(3+4r) = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

$$8\left(\left(2k+2r-\frac{5}{2}\right)a_{k-2}+a_k\left(k+r-\frac{1}{4}\right)\right)\left(k+r+\frac{1}{2}\right)=0$$

- Shift index using $k->k+2$

$$8\left(\left(2k+\frac{3}{2}+2r\right)a_k+a_{k+2}\left(k+\frac{7}{4}+r\right)\right)\left(k+\frac{5}{2}+r\right)=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{2(4k+4r+3)a_k}{4k+7+4r}$$

- Recursion relation for $r=-\frac{1}{2}$

$$a_{k+2}=-\frac{2(4k+1)a_k}{4k+5}$$

- Solution for $r=-\frac{1}{2}$

$$\left[y=\sum_{k=0}^{\infty}a_k x^{k-\frac{1}{2}}, a_{k+2}=-\frac{2(4k+1)a_k}{4k+5}, a_1=0\right]$$

- Recursion relation for $r=\frac{1}{4}$

$$a_{k+2}=-\frac{2(4k+4)a_k}{4k+8}$$

- Solution for $r=\frac{1}{4}$

$$\left[y=\sum_{k=0}^{\infty}a_k x^{k+\frac{1}{4}}, a_{k+2}=-\frac{2(4k+4)a_k}{4k+8}, a_1=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty}a_k x^{k-\frac{1}{2}}\right)+\left(\sum_{k=0}^{\infty}b_k x^{k+\frac{1}{4}}\right), a_{k+2}=-\frac{2(4k+1)a_k}{4k+5}, a_1=0, b_{k+2}=-\frac{2(4k+4)b_k}{4k+8}, b_1=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 61.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2(x+1)\,y''-x(-3x+1)\,y'+y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(2x^3+2x^2\right)y''+\left(3x^2-x\right)y'+y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{3x-1}{2x\,(x+1)}$$
$$q(x)=\frac{1}{2\,(x+1)\,x^2}$$

Table 628: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3x-1}{2x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = \frac{1}{2(x+1)x^2}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2(x+1)\, y'' + (3x^2 - x)\, y' + y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2(x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (3x^2 - x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r) (n+r-1) = \sum_{n=1}^{\infty} 2a_{n-1} (n+r-1) (n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 3a_{n-1} (n+r-1) x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 2a_{n-1} (n+r-1) (n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=1}^{\infty} 3a_{n-1} (n+r-1) x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$2x^{n+r} a_n (n+r) (n+r-1) - x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$2x^r a_0 r(-1+r) - x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(2x^r r(-1+r) - x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(2r^2 - 3r + 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$2r^2 - 3r + 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 1 \\ r_2 &= \frac{1}{2} \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(2r^2 - 3r + 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{2}$ is not an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right) \\ y_2(x) &= x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{1+n} \\ y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{2}} \end{aligned}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &2a_{n-1}(n + r - 1)(n + r - 2) + 2a_n(n + r)(n + r - 1) \\ &+ 3a_{n-1}(n + r - 1) - a_n(n + r) + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -a_{n-1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -a_{n-1} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -1$$

Which for the root $r = 1$ becomes

$$a_1 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = 1$$

Which for the root $r = 1$ becomes

$$a_2 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	1	1

For $n = 3$, using the above recursive equation gives

$$a_3 = -1$$

Which for the root $r = 1$ becomes

$$a_3 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	1	1
a_3	-1	-1

For $n = 4$, using the above recursive equation gives

$$a_4 = 1$$

Which for the root $r = 1$ becomes

$$a_4 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	1	1
a_3	-1	-1
a_4	1	1

For $n = 5$, using the above recursive equation gives

$$a_5 = -1$$

Which for the root $r = 1$ becomes

$$a_5 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	1	1
a_3	-1	-1
a_4	1	1
a_5	-1	-1

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$
\begin{aligned}
&2b_{n-1}(n+r-1)(n+r-2) + 2b_n(n+r)(n+r-1) \\
&+ 3b_{n-1}(n+r-1) - b_n(n+r) + b_n = 0
\end{aligned}
\tag{3}
$$

Solving for b_n from recursive equation (4) gives

$$
b_n = -b_{n-1} \tag{4}
$$

Which for the root $r = \frac{1}{2}$ becomes

$$
b_n = -b_{n-1} \tag{5}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$
b_1 = -1
$$

Which for the root $r = \frac{1}{2}$ becomes

$$
b_1 = -1
$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-1	-1

For $n = 2$, using the above recursive equation gives

$$
b_2 = 1
$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_2 = 1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-1	-1
b_2	1	1

For $n = 3$, using the above recursive equation gives

$$b_3 = -1$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_3 = -1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-1	-1
b_2	1	1
b_3	-1	-1

For $n = 4$, using the above recursive equation gives

$$b_4 = 1$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_4 = 1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-1	-1
b_2	1	1
b_3	-1	-1
b_4	1	1

For $n = 5$, using the above recursive equation gives

$$b_5 = -1$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_5 = -1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-1	-1
b_2	1	1
b_3	-1	-1
b_4	1	1
b_5	-1	-1

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \ldots\right) \\ &= \sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right) + c_2\sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right) + c_2\sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right) + c_2\sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right) \tag{1}$$

Verification of solutions

$$y = c_1 x\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right) + c_2\sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right)$$

Verified OK.

14.50.1 Maple step by step solution

Let's solve

$2x^2(x+1)\,y''+(3x^2-x)\,y'+y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{y}{2x^2(x+1)}-\frac{(3x-1)y'}{2x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(3x-1)y'}{2x(x+1)}+\frac{y}{2x^2(x+1)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{3x-1}{2x(x+1)},P_3(x)=\frac{1}{2(x+1)x^2}\right]$

  - $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

    $\left((x+1)\cdot P_2(x)\right)\Big|_{x=-1}=2$

  - $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

    $\left((x+1)^2\cdot P_3(x)\right)\Big|_{x=-1}=0$

  - $x=-1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-1$

- Multiply by denominators

  $2x^2(x+1)\,y''+x(3x-1)\,y'+y=0$

- Change variables using $x=u-1$ so that the regular singular point is at $u=0$

  $(2u^3-4u^2+2u)\left(\frac{d^2}{du^2}y(u)\right)+(3u^2-7u+4)\left(\frac{d}{du}y(u)\right)+y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$
- Shift index using $k- >k+1-m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$
- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$
- Shift index using $k- >k+2-m$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$

  Rewrite ODE with series expansions

  $2a_0r(1+r)\, u^{-1+r} + (2a_1(1+r)\,(2+r) - a_0(1+r)\,(-1+4r))\, u^r + \left(\sum_{k=1}^{\infty} (2a_{k+1}(k+r+1)\,(k+\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $2r(1+r) = 0$
- Values of r that satisfy the indicial equation

  $r \in \{-1, 0\}$
- Each term must be 0

  $2a_1(1+r)\,(2+r) - a_0(1+r)\,(-1+4r) = 0$
- Each term in the series must be 0, giving the recursion relation

  $(-4a_k + 2a_{k-1} + 2a_{k+1})\, k^2 + ((-8a_k + 4a_{k-1} + 4a_{k+1})\, r - 3a_k - 3a_{k-1} + 6a_{k+1})\, k + (-4a_k + 2a$
- Shift index using $k- >k+1$

  $(-4a_{k+1} + 2a_k + 2a_{k+2})\,(k+1)^2 + ((-8a_{k+1} + 4a_k + 4a_{k+2})\, r - 3a_{k+1} - 3a_k + 6a_{k+2})\,(k+1) +$
- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{2k^2a_k - 4k^2a_{k+1} + 4kra_k - 8kra_{k+1} + 2r^2a_k - 4r^2a_{k+1} + ka_k - 11ka_{k+1} + ra_k - 11ra_{k+1} - 6a_{k+1}}{2(k^2+2kr+r^2+5k+5r+6)}$
- Recursion relation for $r = -1$

  $a_{k+2} = -\frac{2k^2a_k - 4k^2a_{k+1} - 3ka_k - 3ka_{k+1} + a_k + a_{k+1}}{2(k^2+3k+2)}$
- Solution for $r = -1$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^{k-1}, a_{k+2}=-\frac{2k^2a_k-4k^2a_{k+1}-3ka_k-3ka_{k+1}+a_k+a_{k+1}}{2(k^2+3k+2)}, 0=0\right]$$

- Revert the change of variables $u=x+1$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 62.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{6x^2(2x^2+1)\,y''+x(50x^2+1)\,y'+(30x^2+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(12x^4+6x^2)\,y''+(50x^3+x)\,y'+(30x^2+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{50x^2+1}{6x\,(2x^2+1)}$$
$$q(x)=\frac{30x^2+1}{6x^2\,(2x^2+1)}$$

Table 630: Table $p(x), q(x)$ singularites.

$p(x) = \frac{50x^2+1}{6x(2x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{2}}{2}$	"regular"
$x = \frac{i\sqrt{2}}{2}$	"regular"

$q(x) = \frac{30x^2+1}{6x^2(2x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{2}}{2}$	"regular"
$x = \frac{i\sqrt{2}}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{i\sqrt{2}}{2}, \frac{i\sqrt{2}}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$6x^2(2x^2+1)\,y'' + (50x^3+x)\,y' + (30x^2+1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$6x^2(2x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (50x^3+x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (30x^2+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 12x^{n+r+2} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 6x^{n+r} a_n(n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} 50x^{n+r+2} a_n(n+r)\right)+\left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 30x^{n+r+2} a_n\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 12x^{n+r+2} a_n(n+r)(n+r-1) &= \sum_{n=2}^{\infty} 12a_{n-2}(n+r-2)(n-3+r)\, x^{n+r} \\
\sum_{n=0}^{\infty} 50x^{n+r+2} a_n(n+r) &= \sum_{n=2}^{\infty} 50a_{n-2}(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 30x^{n+r+2} a_n &= \sum_{n=2}^{\infty} 30a_{n-2} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} 12a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 6x^{n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=2}^{\infty} 50a_{n-2}(n+r-2)\, x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)\right)+\left(\sum_{n=2}^{\infty} 30a_{n-2} x^{n+r}\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)=0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
6x^{n+r} a_n(n+r)(n+r-1)+x^{n+r} a_n(n+r)+a_n x^{n+r}=0
$$

When $n = 0$ the above becomes

$$6x^r a_0 r(-1+r) + x^r a_0 r + a_0 x^r = 0$$

Or

$$(6x^r r(-1+r) + x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(6r^2 - 5r + 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$6r^2 - 5r + 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = \frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(6r^2 - 5r + 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{6}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{3}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$12a_{n-2}(n+r-2)(n-3+r)+6a_n(n+r)(n+r-1) \\ +50a_{n-2}(n+r-2)+a_n(n+r)+30a_{n-2}+a_n=0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -2a_{n-2} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -2a_{n-2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -2$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = -2$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	-2	-2

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	-2	-2
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = 4$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = 4$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	-2	-2
a_3	0	0
a_4	4	4

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	-2	-2
a_3	0	0
a_4	4	4
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \sqrt{x}\left(1 - 2x^2 + 4x^4 + O(x^6)\right)\end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned}&12b_{n-2}(n+r-2)(n-3+r) + 6b_n(n+r)(n+r-1) \\ &+ 50b_{n-2}(n+r-2) + b_n(n+r) + 30b_{n-2} + b_n = 0\end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -2b_{n-2} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_n = -2b_{n-2} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -2$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_2 = -2$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	-2	-2

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	-2	-2
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = 4$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_4 = 4$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	-2	-2
b_3	0	0
b_4	4	4

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	-2	-2
b_3	0	0
b_4	4	4
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned}
y_2(x) &= \sqrt{x}(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots) \\
&= x^{\frac{1}{3}}\left(1 - 2x^2 + 4x^4 + O\left(x^6\right)\right)
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 \sqrt{x}\left(1 - 2x^2 + 4x^4 + O\left(x^6\right)\right) + c_2 x^{\frac{1}{3}}\left(1 - 2x^2 + 4x^4 + O\left(x^6\right)\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 \sqrt{x}\left(1 - 2x^2 + 4x^4 + O\left(x^6\right)\right) + c_2 x^{\frac{1}{3}}\left(1 - 2x^2 + 4x^4 + O\left(x^6\right)\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 \sqrt{x}\left(1 - 2x^2 + 4x^4 + O\left(x^6\right)\right) + c_2 x^{\frac{1}{3}}\left(1 - 2x^2 + 4x^4 + O\left(x^6\right)\right) \tag{1}$$

Verification of solutions

$$y = c_1 \sqrt{x}\left(1 - 2x^2 + 4x^4 + O\left(x^6\right)\right) + c_2 x^{\frac{1}{3}}\left(1 - 2x^2 + 4x^4 + O\left(x^6\right)\right)$$

Verified OK.

14.51.1 Maple step by step solution

Let's solve

$6x^2(2x^2+1)\, y''+(50x^3+x)\, y'+(30x^2+1)\, y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(30x^2+1)y}{6x^2(2x^2+1)}-\frac{(50x^2+1)y'}{6x(2x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(50x^2+1)y'}{6x(2x^2+1)}+\frac{(30x^2+1)y}{6x^2(2x^2+1)}=0$

□ Check to see if x_0 is a regular singular point

- ○ Define functions

  $\left[P_2(x)=\frac{50x^2+1}{6x(2x^2+1)}, P_3(x)=\frac{30x^2+1}{6x^2(2x^2+1)}\right]$

- ○ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left(x\cdot P_2(x)\right)\Big|_{x=0}=\frac{1}{6}$

- ○ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left(x^2\cdot P_3(x)\right)\Big|_{x=0}=\frac{1}{6}$

- ○ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $6x^2(2x^2+1)\, y''+x(50x^2+1)\, y'+(30x^2+1)\, y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

- ○ Convert $x^m\cdot y$ to series expansion for $m=0..2$

  $x^m\cdot y=\sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$$

- Shift index using $k->k+1-m$

  $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k->k+2-m$

  $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(-1+3r)\,(-1+2r)\, x^r + a_1(2+3r)\,(1+2r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(3k+3r-1)\,(2k+2r-1) + 2a_{\cdot}\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(-1+3r)\,(-1+2r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{\frac{1}{2}, \frac{1}{3}\right\}$$

- Each term must be 0

  $$a_1(2+3r)\,(1+2r) = 0$$

- Solve for the dependent coefficient(s)

  $$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$(3k+3r-1)\,(2k+2r-1)\,(a_k + 2a_{k-2}) = 0$$

- Shift index using $k->k+2$

  $$(3k+3r+5)\,(2k+2r+3)\,(a_{k+2} + 2a_k) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2} = -2a_k$$

- Recursion relation for $r = \frac{1}{2}$

  $a_{k+2} = -2a_k$
- Solution for $r = \frac{1}{2}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+2} = -2a_k, a_1 = 0\right]$$
- Recursion relation for $r = \frac{1}{3}$

  $a_{k+2} = -2a_k$
- Solution for $r = \frac{1}{3}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+2} = -2a_k, a_1 = 0\right]$$
- Combine solutions and rename parameters

  $$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{3}}\right), a_{k+2} = -2a_k, a_1 = 0, b_{k+2} = -2b_k, b_1 = 0\right]$$

$x = \frac{1}{3}$	"regular"

$q(x) = -\frac{2+9x}{4x^2(3x-1)}$	
singularity	type
$x = 0$	"regular"
$x = \frac{1}{3}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, \frac{1}{3}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-28y''x^2(3x-1) + \left(-63x^2 - 35x\right) y' + (63x + 14)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-28\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) x^2(3x-1) + \left(-63x^2 - 35x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (63x + 14)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=0}^{\infty}\left(-84x^{1+n+r}a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty}28x^{n+r}a_n(n+r)(n+r-1)\right)$$
$$+\sum_{n=0}^{\infty}\left(-63x^{1+n+r}a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-35x^{n+r}a_n(n+r)\right) \tag{2A}$$
$$+\left(\sum_{n=0}^{\infty}63x^{1+n+r}a_n\right)+\left(\sum_{n=0}^{\infty}14a_nx^{n+r}\right)=0$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty}\left(-84x^{1+n+r}a_n(n+r)(n+r-1)\right)=\sum_{n=1}^{\infty}\left(-84a_{n-1}(n+r-1)(n+r-2)\,x^{n+r}\right)$$

$$\sum_{n=0}^{\infty}\left(-63x^{1+n+r}a_n(n+r)\right)=\sum_{n=1}^{\infty}\left(-63a_{n-1}(n+r-1)\,x^{n+r}\right)$$

$$\sum_{n=0}^{\infty}63x^{1+n+r}a_n=\sum_{n=1}^{\infty}63a_{n-1}x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\sum_{n=1}^{\infty}\left(-84a_{n-1}(n+r-1)(n+r-2)\,x^{n+r}\right)$$
$$+\left(\sum_{n=0}^{\infty}28x^{n+r}a_n(n+r)(n+r-1)\right)+\sum_{n=1}^{\infty}\left(-63a_{n-1}(n+r-1)\,x^{n+r}\right) \tag{2B}$$
$$+\sum_{n=0}^{\infty}\left(-35x^{n+r}a_n(n+r)\right)+\left(\sum_{n=1}^{\infty}63a_{n-1}x^{n+r}\right)+\left(\sum_{n=0}^{\infty}14a_nx^{n+r}\right)=0$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$28x^{n+r}a_n(n+r)(n+r-1)-35x^{n+r}a_n(n+r)+14a_nx^{n+r}=0$$

When $n = 0$ the above becomes

$$28x^r a_0 r(-1+r) - 35x^r a_0 r + 14a_0 x^r = 0$$

Or

$$\left(28x^r r(-1+r) - 35x^r r + 14x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(28r^2 - 63r + 14\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$28r^2 - 63r + 14 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 2$$
$$r_2 = \frac{1}{4}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(28r^2 - 63r + 14\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{7}{4}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+2}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{4}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} -84a_{n-1}(n+r-1)(n+r-2) + 28a_n(n+r)(n+r-1) \\ - 63a_{n-1}(n+r-1) - 35a_n(n+r) + 63a_{n-1} + 14a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = 3a_{n-1} \tag{4}$$

Which for the root $r = 2$ becomes

$$a_n = 3a_{n-1} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = 3$$

Which for the root $r = 2$ becomes

$$a_1 = 3$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	3	3

For $n = 2$, using the above recursive equation gives

$$a_2 = 9$$

Which for the root $r = 2$ becomes

$$a_2 = 9$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	3	3
a_2	9	9

For $n = 3$, using the above recursive equation gives

$$a_3 = 27$$

Which for the root $r = 2$ becomes

$$a_3 = 27$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	3	3
a_2	9	9
a_3	27	27

For $n = 4$, using the above recursive equation gives

$$a_4 = 81$$

Which for the root $r = 2$ becomes

$$a_4 = 81$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	3	3
a_2	9	9
a_3	27	27
a_4	81	81

For $n = 5$, using the above recursive equation gives

$$a_5 = 243$$

Which for the root $r = 2$ becomes

$$a_5 = 243$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	3	3
a_2	9	9
a_3	27	27
a_4	81	81
a_5	243	243

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^2\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6\dots\right) \\ &= x^2\left(1 + 3x + 9x^2 + 27x^3 + 81x^4 + 243x^5 + O\left(x^6\right)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &-84b_{n-1}(n+r-1)(n+r-2) + 28b_n(n+r)(n+r-1) \\ &- 63b_{n-1}(n+r-1) - 35b_n(n+r) + 63b_{n-1} + 14b_n = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = 3b_{n-1} \tag{4}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_n = 3b_{n-1} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = 3$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_1 = 3$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	3	3

For $n = 2$, using the above recursive equation gives

$$b_2 = 9$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_2 = 9$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	3	3
b_2	9	9

For $n = 3$, using the above recursive equation gives

$$b_3 = 27$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_3 = 27$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	3	3
b_2	9	9
b_3	27	27

For $n = 4$, using the above recursive equation gives

$$b_4 = 81$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_4 = 81$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	3	3
b_2	9	9
b_3	27	27
b_4	81	81

For $n = 5$, using the above recursive equation gives

$$b_5 = 243$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_5 = 243$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	3	3
b_2	9	9
b_3	27	27
b_4	81	81
b_5	243	243

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^2 \left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= x^{\frac{1}{4}} \left(1 + 3x + 9x^2 + 27x^3 + 81x^4 + 243x^5 + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x) &= c_1y_1(x) + c_2y_2(x)\\ &= c_1x^2\left(1 + 3x + 9x^2 + 27x^3 + 81x^4 + 243x^5 + O(x^6)\right)\\ &\quad + c_2x^{\frac{1}{4}}\left(1 + 3x + 9x^2 + 27x^3 + 81x^4 + 243x^5 + O(x^6)\right)\end{aligned}$$

Hence the final solution is

$$\begin{aligned}y &= y_h\\ &= c_1x^2\left(1 + 3x + 9x^2 + 27x^3 + 81x^4 + 243x^5 + O(x^6)\right)\\ &\quad + c_2x^{\frac{1}{4}}\left(1 + 3x + 9x^2 + 27x^3 + 81x^4 + 243x^5 + O(x^6)\right)\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}y &= c_1x^2\left(1 + 3x + 9x^2 + 27x^3 + 81x^4 + 243x^5 + O(x^6)\right)\\ &\quad + c_2x^{\frac{1}{4}}\left(1 + 3x + 9x^2 + 27x^3 + 81x^4 + 243x^5 + O(x^6)\right)\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}y &= c_1x^2\left(1 + 3x + 9x^2 + 27x^3 + 81x^4 + 243x^5 + O(x^6)\right)\\ &\quad + c_2x^{\frac{1}{4}}\left(1 + 3x + 9x^2 + 27x^3 + 81x^4 + 243x^5 + O(x^6)\right)\end{aligned}$$

Verified OK.

14.52.1 Maple step by step solution

Let's solve

$-28y''x^2(3x-1) + (-63x^2 - 35x)\,y' + (63x+14)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(2+9x)y}{4x^2(3x-1)} - \frac{(5+9x)y'}{4x(3x-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(5+9x)y'}{4x(3x-1)} - \frac{(2+9x)y}{4x^2(3x-1)} = 0$

□ Check to see if x_0 is a regular singular point

- Define functions

  $\left[P_2(x)=\frac{5+9x}{4x(3x-1)}, P_3(x)=-\frac{2+9x}{4x^2(3x-1)}\right]$

- $x\cdot P_2(x)$ is analytic at $x=0$

  $(x\cdot P_2(x))\bigg|_{x=0}=-\frac{5}{4}$

- $x^2\cdot P_3(x)$ is analytic at $x=0$

  $(x^2\cdot P_3(x))\bigg|_{x=0}=\frac{1}{2}$

- $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

• Multiply by denominators

  $4y''x^2(3x-1)+x(5+9x)\,y'+(-9x-2)\,y=0$

• Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_kx^{k+r}$

□ Rewrite ODE with series expansions

- Convert $x^m\cdot y$ to series expansion for $m=0..1$

  $x^m\cdot y=\sum_{k=0}^{\infty}a_kx^{k+r+m}$

- Shift index using $k->k-m$

  $x^m\cdot y=\sum_{k=m}^{\infty}a_{k-m}x^{k+r}$

- Convert $x^m\cdot y'$ to series expansion for $m=1..2$

  $x^m\cdot y'=\sum_{k=0}^{\infty}a_k(k+r)\,x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^m\cdot y'=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,x^{k+r}$

- Convert $x^m\cdot y''$ to series expansion for $m=2..3$

  $x^m\cdot y''=\sum_{k=0}^{\infty}a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $$x^{m}\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$$

  Rewrite ODE with series expansions

  $$-a_{0}(-1+4r)\,(-2+r)\,x^{r}+\left(\sum_{k=1}^{\infty}\left(-a_{k}(4k+4r-1)\,(k+r-2)+3a_{k-1}(4k+4r-1)\,(k+r-\right.\right.$$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $$-(-1+4r)\,(-2+r)=0$$

- Values of r that satisfy the indicial equation

  $$r\in\left\{2,\frac{1}{4}\right\}$$

- Each term in the series must be 0, giving the recursion relation

  $$-4\left(k+r-\frac{1}{4}\right)(a_{k}-3a_{k-1})\,(k+r-2)=0$$

- Shift index using $k->k+1$

  $$-4\left(k+\frac{3}{4}+r\right)(a_{k+1}-3a_{k})\,(k+r-1)=0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+1}=3a_{k}$$

- Recursion relation for $r=2$

  $$a_{k+1}=3a_{k}$$

- Solution for $r=2$

  $$\left[y=\sum_{k=0}^{\infty} a_{k}x^{k+2}, a_{k+1}=3a_{k}\right]$$

- Recursion relation for $r=\frac{1}{4}$

  $$a_{k+1}=3a_{k}$$

- Solution for $r=\frac{1}{4}$

  $$\left[y=\sum_{k=0}^{\infty} a_{k}x^{k+\frac{1}{4}}, a_{k+1}=3a_{k}\right]$$

- Combine solutions and rename parameters

  $$\left[y=\left(\sum_{k=0}^{\infty} a_{k}x^{k+2}\right)+\left(\sum_{k=0}^{\infty} b_{k}x^{k+\frac{1}{4}}\right), a_{1+k}=3a_{k}, b_{1+k}=3b_{k}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 64.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{9x^2(x+5)\,y''+9x(5+9x)\,y'-(5-8x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(9x^3+45x^2\right)y''+\left(81x^2+45x\right)y'+(8x-5)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{5+9x}{x\,(x+5)}\\ q(x)&=\frac{8x-5}{9x^2\,(x+5)}\end{aligned}$$

Table 634: Table $p(x), q(x)$ singularites.

$p(x) = \frac{5+9x}{x(x+5)}$	
singularity	type
$x = -5$	"regular"
$x = 0$	"regular"

$q(x) = \frac{8x-5}{9x^2(x+5)}$	
singularity	type
$x = -5$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-5, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$9x^2(x+5)\,y'' + \left(81x^2+45x\right) y' + (8x-5)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$9x^2(x+5)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + \left(81x^2+45x\right)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (8x-5)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 9 x^{1+n+r} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 45 x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} 81 x^{1+n+r} a_n (n+r)\right)+\left(\sum_{n=0}^{\infty} 45 x^{n+r} a_n (n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 8 x^{1+n+r} a_n\right)+\sum_{n=0}^{\infty}\left(-5 a_n x^{n+r}\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 9 x^{1+n+r} a_n (n+r)(n+r-1) &= \sum_{n=1}^{\infty} 9 a_{n-1} (n+r-1)(n+r-2) x^{n+r} \\
\sum_{n=0}^{\infty} 81 x^{1+n+r} a_n (n+r) &= \sum_{n=1}^{\infty} 81 a_{n-1} (n+r-1) x^{n+r} \\
\sum_{n=0}^{\infty} 8 x^{1+n+r} a_n &= \sum_{n=1}^{\infty} 8 a_{n-1} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=1}^{\infty} 9 a_{n-1} (n+r-1)(n+r-2) x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 45 x^{n+r} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=1}^{\infty} 81 a_{n-1} (n+r-1) x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 45 x^{n+r} a_n (n+r)\right)+\left(\sum_{n=1}^{\infty} 8 a_{n-1} x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-5 a_n x^{n+r}\right)=0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
45 x^{n+r} a_n (n+r)(n+r-1)+45 x^{n+r} a_n (n+r)-5 a_n x^{n+r}=0
$$

When $n = 0$ the above becomes

$$45x^r a_0 r(-1+r) + 45x^r a_0 r - 5a_0 x^r = 0$$

Or

$$(45x^r r(-1+r) + 45x^r r - 5x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(45r^2 - 5\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$45r^2 - 5 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = -\frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(45r^2 - 5\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{2}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{3}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} 9a_{n-1}(n+r-1)\,(n+r-2) + 45a_n(n+r)\,(n+r-1) \\ + 81a_{n-1}(n+r-1) + 45a_n(n+r) + 8a_{n-1} - 5a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(9n^2 + 18nr + 9r^2 + 54n + 54r - 55)}{5\,(9n^2 + 18nr + 9r^2 - 1)} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = -\frac{3a_{n-1}\left(n^2 + \frac{20}{3}n - 4\right)}{15n^2 + 10n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-9r^2 - 72r - 8}{45r^2 + 90r + 40}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_1 = -\frac{11}{25}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-9r^2-72r-8}{45r^2+90r+40}$	$-\frac{11}{25}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{81r^4 + 1458r^3 + 7353r^2 + 7128r + 712}{25\,(9r^2 + 18r + 8)\,(9r^2 + 36r + 35)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = \frac{11}{50}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-9r^2-72r-8}{45r^2+90r+40}$	$-\frac{11}{25}$
a_2	$\frac{81r^4+1458r^3+7353r^2+7128r+712}{25(9r^2+18r+8)(9r^2+36r+35)}$	$\frac{11}{50}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{(9r^2 + 90r + 89)(9r^2 + 72r + 8)(9r^2 + 108r + 188)}{125(9r^2 + 18r + 8)(9r^2 + 36r + 35)(9r^2 + 54r + 80)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = -\frac{1}{10}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-9r^2-72r-8}{45r^2+90r+40}$	$-\frac{11}{25}$
a_2	$\frac{81r^4+1458r^3+7353r^2+7128r+712}{25(9r^2+18r+8)(9r^2+36r+35)}$	$\frac{11}{50}$
a_3	$-\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)}{125(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)}$	$-\frac{1}{10}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(9r^2 + 90r + 89)(9r^2 + 72r + 8)(9r^2 + 108r + 188)(9r^2 + 126r + 305)}{625(9r^2 + 18r + 8)(9r^2 + 36r + 35)(9r^2 + 54r + 80)(9r^2 + 72r + 143)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{29}{700}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-9r^2-72r-8}{45r^2+90r+40}$	$-\frac{11}{25}$
a_2	$\frac{81r^4+1458r^3+7353r^2+7128r+712}{25(9r^2+18r+8)(9r^2+36r+35)}$	$\frac{11}{50}$
a_3	$-\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)}{125(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)}$	$-\frac{1}{10}$
a_4	$\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)(9r^2+126r+305)}{625(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)}$	$\frac{29}{700}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)(9r^2+126r+305)(9r^2+144r+440)}{3125(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)(9r^2+90r+224)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_5 = -\frac{4727}{297500}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-9r^2-72r-8}{45r^2+90r+40}$	$-\frac{11}{25}$
a_2	$\frac{81r^4+1458r^3+7353r^2+7128r+712}{25(9r^2+18r+8)(9r^2+36r+35)}$	$\frac{11}{50}$
a_3	$-\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)}{125(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)}$	$-\frac{1}{10}$
a_4	$\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)(9r^2+126r+305)}{625(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)}$	$\frac{29}{700}$
a_5	$-\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)(9r^2+126r+305)(9r^2+144r+440)}{3125(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)(9r^2+90r+224)}$	$-\frac{4727}{297500}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(1 - \frac{11x}{25} + \frac{11x^2}{50} - \frac{x^3}{10} + \frac{29x^4}{700} - \frac{4727x^5}{297500} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$9b_{n-1}(n+r-1)(n+r-2) + 45b_n(n+r)(n+r-1) + 81b_{n-1}(n+r-1) + 45b_n(n+r) + 8b_{n-1} - 5b_n = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{b_{n-1}(9n^2+18nr+9r^2+54n+54r-55)}{5(9n^2+18nr+9r^2-1)} \tag{4}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_n = -\frac{3\left(n^2+\frac{16}{3}n-8\right)b_{n-1}}{15n^2-10n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{-9r^2-72r-8}{45r^2+90r+40}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_1 = 1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-9r^2-72r-8}{45r^2+90r+40}$	1

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{81r^4+1458r^3+7353r^2+7128r+712}{25(9r^2+18r+8)(9r^2+36r+35)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_2 = -\frac{1}{2}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-9r^2-72r-8}{45r^2+90r+40}$	1
b_2	$\frac{81r^4+1458r^3+7353r^2+7128r+712}{25(9r^2+18r+8)(9r^2+36r+35)}$	$-\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)}{125(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_3 = \frac{17}{70}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-9r^2-72r-8}{45r^2+90r+40}$	1
b_2	$\frac{81r^4+1458r^3+7353r^2+7128r+712}{25(9r^2+18r+8)(9r^2+36r+35)}$	$-\frac{1}{2}$
b_3	$-\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)}{125(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)}$	$\frac{17}{70}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)(9r^2+126r+305)}{625(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_4 = -\frac{187}{1750}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-9r^2-72r-8}{45r^2+90r+40}$	1
b_2	$\frac{81r^4+1458r^3+7353r^2+7128r+712}{25(9r^2+18r+8)(9r^2+36r+35)}$	$-\frac{1}{2}$
b_3	$-\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)}{125(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)}$	$\frac{17}{70}$
b_4	$\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)(9r^2+126r+305)}{625(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)}$	$-\frac{187}{1750}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{(9r^2 + 90r + 89)(9r^2 + 72r + 8)(9r^2 + 108r + 188)(9r^2 + 126r + 305)(9r^2 + 144r + 440)}{3125(9r^2 + 18r + 8)(9r^2 + 36r + 35)(9r^2 + 54r + 80)(9r^2 + 72r + 143)(9r^2 + 90r + 224)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_5 = \frac{24497}{568750}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-9r^2-72r-8}{45r^2+90r+40}$	1
b_2	$\frac{81r^4+1458r^3+7353r^2+7128r+712}{25(9r^2+18r+8)(9r^2+36r+35)}$	$-\frac{1}{2}$
b_3	$-\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)}{125(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)}$	$\frac{17}{70}$
b_4	$\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)(9r^2+126r+305)}{625(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)}$	$-\frac{187}{1750}$
b_5	$-\frac{(9r^2+90r+89)(9r^2+72r+8)(9r^2+108r+188)(9r^2+126r+305)(9r^2+144r+440)}{3125(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)(9r^2+90r+224)}$	$\frac{24497}{568750}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{1}{3}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 + x - \frac{x^2}{2} + \frac{17x^3}{70} - \frac{187x^4}{1750} + \frac{24497x^5}{568750} + O(x^6)}{x^{\frac{1}{3}}} \end{aligned}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{1}{3}} \left(1 - \frac{11x}{25} + \frac{11x^2}{50} - \frac{x^3}{10} + \frac{29x^4}{700} - \frac{4727x^5}{297500} + O(x^6)\right) \\
&+ \frac{c_2 \left(1 + x - \frac{x^2}{2} + \frac{17x^3}{70} - \frac{187x^4}{1750} + \frac{24497x^5}{568750} + O(x^6)\right)}{x^{\frac{1}{3}}}
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{1}{3}} \left(1 - \frac{11x}{25} + \frac{11x^2}{50} - \frac{x^3}{10} + \frac{29x^4}{700} - \frac{4727x^5}{297500} + O(x^6)\right) \\
&+ \frac{c_2 \left(1 + x - \frac{x^2}{2} + \frac{17x^3}{70} - \frac{187x^4}{1750} + \frac{24497x^5}{568750} + O(x^6)\right)}{x^{\frac{1}{3}}}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^{\frac{1}{3}} \left(1 - \frac{11x}{25} + \frac{11x^2}{50} - \frac{x^3}{10} + \frac{29x^4}{700} - \frac{4727x^5}{297500} + O(x^6)\right) \\
&+ \frac{c_2 \left(1 + x - \frac{x^2}{2} + \frac{17x^3}{70} - \frac{187x^4}{1750} + \frac{24497x^5}{568750} + O(x^6)\right)}{x^{\frac{1}{3}}}
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x^{\frac{1}{3}} \left(1 - \frac{11x}{25} + \frac{11x^2}{50} - \frac{x^3}{10} + \frac{29x^4}{700} - \frac{4727x^5}{297500} + O(x^6)\right) \\
&+ \frac{c_2 \left(1 + x - \frac{x^2}{2} + \frac{17x^3}{70} - \frac{187x^4}{1750} + \frac{24497x^5}{568750} + O(x^6)\right)}{x^{\frac{1}{3}}}
\end{aligned}
$$

Verified OK.

14.53.1 Maple step by step solution

Let's solve

$9x^2(x+5)\,y''+(81x^2+45x)\,y'+(8x-5)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(8x-5)y}{9x^2(x+5)}-\frac{(5+9x)y'}{x(x+5)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(5+9x)y'}{x(x+5)}+\frac{(8x-5)y}{9x^2(x+5)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{5+9x}{x(x+5)}, P_3(x)=\frac{8x-5}{9x^2(x+5)}\right]$

  ◦ $(x+5)\cdot P_2(x)$ is analytic at $x=-5$

  $\left((x+5)\cdot P_2(x)\right)\Big|_{x=-5}=8$

  ◦ $(x+5)^2\cdot P_3(x)$ is analytic at $x=-5$

  $\left((x+5)^2\cdot P_3(x)\right)\Big|_{x=-5}=0$

  ◦ $x=-5$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-5$

- Multiply by denominators

  $9x^2(x+5)\,y''+9x(5+9x)\,y'+(8x-5)\,y=0$

- Change variables using $x=u-5$ so that the regular singular point is at $u=0$

  $(9u^3-90u^2+225u)\left(\frac{d^2}{du^2}y(u)\right)+(81u^2-765u+1800)\left(\frac{d}{du}y(u)\right)+(8u-45)\,y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

  $$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

- Shift index using $k- >k - m$

  $$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$225a_0 r(7+r)\, u^{-1+r} + \left(225a_1(1+r)\,(8+r) - 45a_0(2r^2+15r+1)\right) u^r + \left(\sum_{k=1}^{\infty} \left(225a_{k+1}(k+1+\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$225r(7+r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \{-7, 0\}$$

- Each term must be 0

  $$225a_1(1+r)\,(8+r) - 45a_0(2r^2+15r+1) = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$9(-10a_k + a_{k-1} + 25a_{k+1})\, k^2 + 9(2(-10a_k + a_{k-1} + 25a_{k+1})\, r - 75a_k + 6a_{k-1} + 225a_{k+1})\, k + 9($$

- Shift index using $k- >k + 1$

  $$9(-10a_{k+1} + a_k + 25a_{k+2})\,(k+1)^2 + 9(2(-10a_{k+1} + a_k + 25a_{k+2})\, r - 75a_{k+1} + 6a_k + 225a_{k+2})$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{9k^2 a_k - 90k^2 a_{k+1} + 18kra_k - 180kra_{k+1} + 9r^2 a_k - 90r^2 a_{k+1} + 72ka_k - 855ka_{k+1} + 72ra_k - 855ra_{k+1} + 8a_k - 810a_{k+1}}{225(k^2 + 2kr + r^2 + 11k + 11r + 18)}$$

- Recursion relation for $r = -7$

$$a_{k+2} = -\frac{9k^2 a_k - 90k^2 a_{k+1} - 54ka_k + 405ka_{k+1} - 55a_k + 765a_{k+1}}{225(k^2 - 3k - 10)}$$

- Series not valid for $r = -7$, division by 0 in the recursion relation at $k = 5$

$$a_{k+2} = -\frac{9k^2 a_k - 90k^2 a_{k+1} - 54ka_k + 405ka_{k+1} - 55a_k + 765a_{k+1}}{225(k^2 - 3k - 10)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{9k^2 a_k - 90k^2 a_{k+1} + 72ka_k - 855ka_{k+1} + 8a_k - 810a_{k+1}}{225(k^2 + 11k + 18)}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{9k^2 a_k - 90k^2 a_{k+1} + 72ka_k - 855ka_{k+1} + 8a_k - 810a_{k+1}}{225(k^2 + 11k + 18)}, 1800a_1 - 45a_0 = 0\right]$$

- Revert the change of variables $u = x + 5$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+5)^k, a_{k+2} = -\frac{9k^2 a_k - 90k^2 a_{k+1} + 72ka_k - 855ka_{k+1} + 8a_k - 810a_{k+1}}{225(k^2 + 11k + 18)}, 1800a_1 - 45a_0 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 65.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{8x^2\left(-x^2+2\right)y''+2x\left(-21x^2+10\right)y'-\left(35x^2+2\right)y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(-8x^4+16x^2\right)y''+\left(-42x^3+20x\right)y'+\left(-35x^2-2\right)y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{21x^2-10}{4x\left(x^2-2\right)}$$
$$q(x)=\frac{35x^2+2}{8x^2\left(x^2-2\right)}$$

Table 636: Table $p(x), q(x)$ singularites.

$p(x) = \frac{21x^2-10}{4x(x^2-2)}$	
singularity	type
$x = 0$	"regular"
$x = \sqrt{2}$	"regular"
$x = -\sqrt{2}$	"regular"

$q(x) = \frac{35x^2+2}{8x^2(x^2-2)}$	
singularity	type
$x = 0$	"regular"
$x = \sqrt{2}$	"regular"
$x = -\sqrt{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \sqrt{2}, -\sqrt{2}, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-8y''x^2(x^2-2) + (-42x^3+20x)\,y' + (-35x^2-2)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-8\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) x^2(x^2-2) + (-42x^3+20x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (-35x^2-2)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=0}^{\infty}\left(-8x^{n+r+2}a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty}16x^{n+r}a_n(n+r)(n+r-1)\right)+\sum_{n=0}^{\infty}\left(-42x^{n+r+2}a_n(n+r)\right)+\left(\sum_{n=0}^{\infty}20x^{n+r}a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-35x^{n+r+2}a_n\right)+\sum_{n=0}^{\infty}\left(-2a_n x^{n+r}\right)=0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty}\left(-8x^{n+r+2}a_n(n+r)(n+r-1)\right)=\sum_{n=2}^{\infty}\left(-8a_{n-2}(n+r-2)(n-3+r)x^{n+r}\right)$$

$$\sum_{n=0}^{\infty}\left(-42x^{n+r+2}a_n(n+r)\right)=\sum_{n=2}^{\infty}\left(-42a_{n-2}(n+r-2)x^{n+r}\right)$$

$$\sum_{n=0}^{\infty}\left(-35x^{n+r+2}a_n\right)=\sum_{n=2}^{\infty}\left(-35a_{n-2}x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\sum_{n=2}^{\infty}\left(-8a_{n-2}(n+r-2)(n-3+r)x^{n+r}\right)+\left(\sum_{n=0}^{\infty}16x^{n+r}a_n(n+r)(n+r-1)\right)+\sum_{n=2}^{\infty}\left(-42a_{n-2}(n+r-2)x^{n+r}\right)+\left(\sum_{n=0}^{\infty}20x^{n+r}a_n(n+r)\right)+\sum_{n=2}^{\infty}\left(-35a_{n-2}x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-2a_n x^{n+r}\right)=0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$16x^{n+r}a_n(n+r)(n+r-1)+20x^{n+r}a_n(n+r)-2a_n x^{n+r}=0$$

When $n = 0$ the above becomes

$$16x^r a_0 r(-1+r) + 20x^r a_0 r - 2a_0 x^r = 0$$

Or

$$\left(16x^r r(-1+r) + 20x^r r - 2x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(16r^2 + 4r - 2\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$16r^2 + 4r - 2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{4}$$
$$r_2 = -\frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(16r^2 + 4r - 2\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{3}{4}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{4}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$-8a_{n-2}(n+r-2)(n-3+r)+16a_n(n+r)(n+r-1) \\ -42a_{n-2}(n+r-2)+20a_n(n+r)-35a_{n-2}-2a_n=0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{a_{n-2}}{2} \tag{4}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_n = \frac{a_{n-2}}{2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1}{2}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_2 = \frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1}{2}$	$\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1}{2}$	$\frac{1}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{4}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_4 = \frac{1}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1}{2}$	$\frac{1}{2}$
a_3	0	0
a_4	$\frac{1}{4}$	$\frac{1}{4}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1}{2}$	$\frac{1}{2}$
a_3	0	0
a_4	$\frac{1}{4}$	$\frac{1}{4}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^{\frac{1}{4}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \ldots\right) \\
&= x^{\frac{1}{4}}\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
b_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&-8b_{n-2}(n+r-2)(n-3+r) + 16b_n(n+r)(n+r-1) \\
&- 42b_{n-2}(n+r-2) + 20b_n(n+r) - 35b_{n-2} - 2b_n = 0
\end{aligned} \tag{3}
$$

Solving for b_n from recursive equation (4) gives

$$
b_n = \frac{b_{n-2}}{2} \tag{4}
$$

Which for the root $r = -\frac{1}{2}$ becomes

$$
b_n = \frac{b_{n-2}}{2} \tag{5}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$
b_2 = \frac{1}{2}
$$

Which for the root $r = -\frac{1}{2}$ becomes

$$
b_2 = \frac{1}{2}
$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1}{2}$	$\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1}{2}$	$\frac{1}{2}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{1}{4}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_4 = \frac{1}{4}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1}{2}$	$\frac{1}{2}$
b_3	0	0
b_4	$\frac{1}{4}$	$\frac{1}{4}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1}{2}$	$\frac{1}{2}$
b_3	0	0
b_4	$\frac{1}{4}$	$\frac{1}{4}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{1}{4}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)}{\sqrt{x}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{1}{4}}\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right) + \frac{c_2\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right)}{\sqrt{x}} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{1}{4}}\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right) + \frac{c_2\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right)}{\sqrt{x}} \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{4}}\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right) + \frac{c_2\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right)}{\sqrt{x}} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{4}} \left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right) + \frac{c_2 \left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right)}{\sqrt{x}}$$

Verified OK.

14.54.1 Maple step by step solution

Let's solve

$-8y''x^2(x^2-2) + (-42x^3+20x)\,y' + (-35x^2-2)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(35x^2+2)y}{8x^2(x^2-2)} - \frac{(21x^2-10)y'}{4x(x^2-2)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(21x^2-10)y'}{4x(x^2-2)} + \frac{(35x^2+2)y}{8x^2(x^2-2)} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x) = \frac{21x^2-10}{4x(x^2-2)}, P_3(x) = \frac{35x^2+2}{8x^2(x^2-2)}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

    $(x \cdot P_2(x))\Big|_{x=0} = \frac{5}{4}$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $(x^2 \cdot P_3(x))\Big|_{x=0} = -\frac{1}{8}$

  ◦ $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $8y''x^2(x^2-2) + 2x(21x^2-10)\,y' + (35x^2+2)\,y = 0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m} (k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$-2a_0(1+2r)\,(-1+4r)\, x^r - 2a_1(3+2r)\,(3+4r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} (-2a_k(2k+2r+1)\,(4k+4r-1)\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-2(1+2r)\,(-1+4r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-\frac{1}{2}, \frac{1}{4}\right\}$$

- Each term must be 0

$$-2a_1(3+2r)\,(3+4r) = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

$-(2k+2r+1)(4k+4r-1)(2a_k - a_{k-2}) = 0$

- Shift index using $k->k+2$

  $-(2k+2r+5)(4k+4r+7)(2a_{k+2} - a_k) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = \frac{a_k}{2}$

- Recursion relation for $r = -\frac{1}{2}$

  $a_{k+2} = \frac{a_k}{2}$

- Solution for $r = -\frac{1}{2}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{1}{2}}, a_{k+2} = \frac{a_k}{2}, a_1 = 0\right]$

- Recursion relation for $r = \frac{1}{4}$

  $a_{k+2} = \frac{a_k}{2}$

- Solution for $r = \frac{1}{4}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{4}}, a_{k+2} = \frac{a_k}{2}, a_1 = 0\right]$

- Combine solutions and rename parameters

  $\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-\frac{1}{2}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{4}}\right), a_{k+2} = \frac{a_k}{2}, a_1 = 0, b_{k+2} = \frac{b_k}{2}, b_1 = 0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 66.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2(x^2+3x+1)\,y''-4x(-3x^2-3x+1)\,y'+3(x^2-x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(4x^4+12x^3+4x^2)\,y''+(12x^3+12x^2-4x)\,y'+(3x^2-3x+3)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{3x^2+3x-1}{x\,(x^2+3x+1)}\\q(x)&=\frac{\frac{3}{4}x^2-\frac{3}{4}x+\frac{3}{4}}{x^2\,(x^2+3x+1)}\end{aligned}$$

Table 638: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3x^2+3x-1}{x(x^2+3x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{3}{2} - \frac{\sqrt{5}}{2}$	"regular"
$x = \frac{\sqrt{5}}{2} - \frac{3}{2}$	"regular"

$q(x) = \frac{\frac{3}{4}x^2-\frac{3}{4}x+\frac{3}{4}}{x^2(x^2+3x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{3}{2} - \frac{\sqrt{5}}{2}$	"regular"
$x = \frac{\sqrt{5}}{2} - \frac{3}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{3}{2} - \frac{\sqrt{5}}{2}, \frac{\sqrt{5}}{2} - \frac{3}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2\left(x^2 + 3x + 1\right) y'' + \left(12x^3 + 12x^2 - 4x\right) y' + \left(3x^2 - 3x + 3\right) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2\left(x^2 + 3x + 1\right)\left(\sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}\right) + \left(12x^3+12x^2-4x\right)\left(\sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}\right) + \left(3x^2-3x+3\right)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 12x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 12x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 12x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-4x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-3x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} 3a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} 4a_{n-2} (n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 12x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 12a_{n-1} (n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 12x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 12a_{n-2} (n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 12x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 12a_{n-1} (n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{n+r+2} a_n = \sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-3x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-3a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\begin{aligned}
&\left(\sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)\,(n-3+r)\,x^{n+r}\right) \\
&+\left(\sum_{n=1}^{\infty} 12a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 4x^{n+r}a_n(n+r)\,(n+r-1)\right)+\left(\sum_{n=2}^{\infty} 12a_{n-2}(n+r-2)\,x^{n+r}\right) \\
&+\left(\sum_{n=1}^{\infty} 12a_{n-1}(n+r-1)\,x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-4x^{n+r}a_n(n+r)\right) \\
&\quad+\left(\sum_{n=2}^{\infty} 3a_{n-2}x^{n+r}\right)+\sum_{n=1}^{\infty}\left(-3a_{n-1}x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 3a_n x^{n+r}\right)=0
\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r}a_n(n+r)\,(n+r-1)-4x^{n+r}a_n(n+r)+3a_nx^{n+r}=0$$

When $n=0$ the above becomes

$$4x^r a_0 r(-1+r)-4x^r a_0 r+3a_0x^r=0$$

Or

$$(4x^r r(-1+r)-4x^r r+3x^r)\,a_0=0$$

Since $a_0\neq 0$ then the above simplifies to

$$\left(4r^2-8r+3\right)x^r=0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2-8r+3=0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned}
r_1&=\frac{3}{2}\\
r_2&=\frac{1}{2}
\end{aligned}$$

Since $a_0\neq 0$ then the indicial equation becomes

$$\left(4r^2-8r+3\right)x^r=0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 1$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = Cy_1(x)\ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^{\frac{3}{2}}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = Cy_1(x)\ln(x) + \sqrt{x}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{3}{2}}$$
$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+\frac{1}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -3$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &4a_{n-2}(n+r-2)(n-3+r)+12a_{n-1}(n+r-1)(n+r-2)+4a_n(n+r)(n+r-1) \\ &+12a_{n-2}(n+r-2)+12a_{n-1}(n+r-1)-4a_n(n+r)+3a_{n-2}-3a_{n-1}+3a_n=0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -a_{n-2} - 3a_{n-1} \tag{4}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_n = -a_{n-2} - 3a_{n-1} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{3}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-3	-3

For $n = 2$, using the above recursive equation gives

$$a_2 = 8$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_2 = 8$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-3	-3
a_2	8	8

For $n = 3$, using the above recursive equation gives

$$a_3 = -21$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_3 = -21$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-3	-3
a_2	8	8
a_3	-21	-21

For $n = 4$, using the above recursive equation gives

$$a_4 = 55$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_4 = 55$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-3	-3
a_2	8	8
a_3	-21	-21
a_4	55	55

For $n = 5$, using the above recursive equation gives

$$a_5 = -144$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_5 = -144$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-3	-3
a_2	8	8
a_3	-21	-21
a_4	55	55
a_5	-144	-144

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{3}{2}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{3}{2}}\left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 1$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\rightarrow r_2} a_1(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_1 \\ &= -3 \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\rightarrow r_2} -3 &= \lim_{r\rightarrow \frac{1}{2}} -3 \\ &= -3 \end{aligned}$$

The limit is -3. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{2}} \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq(3) gives

$$b_1 = -3$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &4b_{n-2}(n+r-2)(n-3+r)+12b_{n-1}(n+r-1)(n+r-2)+4b_n(n+r)(n+r-1) \\ &+12b_{n-2}(n+r-2)+12b_{n-1}(n+r-1)-4b_n(n+r)+3b_{n-2}-3b_{n-1}+3b_n=0 \end{aligned} \tag{4}$$

Which for for the root $r = \frac{1}{2}$ becomes

$$\begin{aligned} &4b_{n-2}\left(n-\frac{3}{2}\right)\left(n-\frac{5}{2}\right)+12b_{n-1}\left(n-\frac{1}{2}\right)\left(n-\frac{3}{2}\right)+4b_n\left(n+\frac{1}{2}\right)\left(n-\frac{1}{2}\right) \\ &+12b_{n-2}\left(n-\frac{3}{2}\right)+12b_{n-1}\left(n-\frac{1}{2}\right)-4b_n\left(n+\frac{1}{2}\right)+3b_{n-2}-3b_{n-1}+3b_n=0 \end{aligned} \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -b_{n-2} - 3b_{n-1} \tag{5}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_n = -b_{n-2} - 3b_{n-1} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-3	-3

For $n = 2$, using the above recursive equation gives

$$b_2 = 8$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_2 = 8$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-3	-3
b_2	8	8

For $n = 3$, using the above recursive equation gives

$$b_3 = -21$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_3 = -21$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-3	-3
b_2	8	8
b_3	-21	-21

For $n = 4$, using the above recursive equation gives

$$b_4 = 55$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_4 = 55$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-3	-3
b_2	8	8
b_3	-21	-21
b_4	55	55

For $n = 5$, using the above recursive equation gives

$$b_5 = -144$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_5 = -144$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-3	-3
b_2	8	8
b_3	-21	-21
b_4	55	55
b_5	-144	-144

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{3}{2}}\left(b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6 \dots\right) \\ &= \sqrt{x}\left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{3}{2}} \left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right) \\
&\quad + c_2 \sqrt{x}\, \left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{3}{2}} \left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right) \\
&\quad + c_2 \sqrt{x}\, \left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^{\frac{3}{2}} \left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right) \\
&\quad + c_2 \sqrt{x}\, \left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x^{\frac{3}{2}} \left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right) \\
&\quad + c_2 \sqrt{x}\, \left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right)
\end{aligned}
$$

Verified OK.

14.55.1 Maple step by step solution

Let's solve

$4x^2(x^2 + 3x + 1)\, y'' + (12x^3 + 12x^2 - 4x)\, y' + (3x^2 - 3x + 3)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{3(x^2-x+1)y}{4x^2(x^2+3x+1)} - \frac{(3x^2+3x-1)y'}{x(x^2+3x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(3x^2+3x-1)y'}{x(x^2+3x+1)} + \frac{3(x^2-x+1)y}{4x^2(x^2+3x+1)} = 0$

□ Check to see if x_0 is a regular singular point

- Define functions

  $\left[P_2(x)=\frac{3x^2+3x-1}{x(x^2+3x+1)}, P_3(x)=\frac{3(x^2-x+1)}{4x^2(x^2+3x+1)}\right]$

- $x\cdot P_2(x)$ is analytic at $x=0$

  $(x\cdot P_2(x))\bigg|_{x=0}=-1$

- $x^2\cdot P_3(x)$ is analytic at $x=0$

  $(x^2\cdot P_3(x))\bigg|_{x=0}=\frac{3}{4}$

- $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $4x^2(x^2+3x+1)\,y''+4x(3x^2+3x-1)\,y'+(3x^2-3x+3)\,y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $x^m\cdot y$ to series expansion for $m=0..2$

  $x^m\cdot y=\sum_{k=0}^{\infty}a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^m\cdot y=\sum_{k=m}^{\infty}a_{k-m}x^{k+r}$

- Convert $x^m\cdot y'$ to series expansion for $m=1..3$

  $x^m\cdot y'=\sum_{k=0}^{\infty}a_k(k+r)\,x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^m\cdot y'=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,x^{k+r}$

- Convert $x^m\cdot y''$ to series expansion for $m=2..4$

  $x^m\cdot y''=\sum_{k=0}^{\infty}a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\,x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(-1+2r)(-3+2r)\,x^r + (a_1(1+2r)(-1+2r) + 3a_0(1+2r)(-1+2r))\,x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(2k\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(-1+2r)(-3+2r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{\frac{1}{2}, \frac{3}{2}\right\}$$

- Each term must be 0

  $$a_1(1+2r)(-1+2r) + 3a_0(1+2r)(-1+2r) = 0$$

- Solve for the dependent coefficient(s)

  $$a_1 = -3a_0$$

- Each term in the series must be 0, giving the recursion relation

  $$(2k+2r-1)(2k+2r-3)(a_k + 3a_{k-1} + a_{k-2}) = 0$$

- Shift index using $k->k+2$

  $$(2k+2r+3)(2k+2r+1)(a_{k+2} + 3a_{k+1} + a_k) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2} = -3a_{k+1} - a_k$$

- Recursion relation for $r = \frac{1}{2}$

  $$a_{k+2} = -3a_{k+1} - a_k$$

- Solution for $r = \frac{1}{2}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+2} = -3a_{k+1} - a_k, a_1 = -3a_0\right]$$

- Recursion relation for $r = \frac{3}{2}$

  $$a_{k+2} = -3a_{k+1} - a_k$$

- Solution for $r = \frac{3}{2}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{3}{2}}, a_{k+2} = -3a_{k+1} - a_k, a_1 = -3a_0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{3}{2}}\right), a_{k+2} = -3a_{1+k} - a_k, a_1 = -3a_0, b_{k+2} = -3b_{1+k} - b_k, b_1 =\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 67.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{3x^2(x+1)^2 y'' - x\left(-11x^2 - 10x + 1\right) y' + \left(5x^2 + 1\right) y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(3x^4 + 6x^3 + 3x^2\right) y'' + \left(11x^3 + 10x^2 - x\right) y' + \left(5x^2 + 1\right) y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{11x - 1}{3x\,(x + 1)}$$
$$q(x) = \frac{5x^2 + 1}{3x^2\,(x + 1)^2}$$

Table 640: Table $p(x), q(x)$ singularites.

$p(x) = \frac{11x-1}{3x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = \frac{5x^2+1}{3x^2(x+1)^2}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$3x^2(x^2+2x+1)\,y'' + (11x^3+10x^2-x)\,y' + (5x^2+1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$3x^2(x^2+2x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (11x^3+10x^2-x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (5x^2+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 6x^{1+n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 11x^{n+r+2} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 10x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 5x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r)(n+r-1) &= \sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)(n-3+r)\, x^{n+r} \\
\sum_{n=0}^{\infty} 6x^{1+n+r} a_n (n+r)(n+r-1) &= \sum_{n=1}^{\infty} 6a_{n-1}(n+r-1)(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 11x^{n+r+2} a_n (n+r) &= \sum_{n=2}^{\infty} 11a_{n-2}(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 10x^{1+n+r} a_n (n+r) &= \sum_{n=1}^{\infty} 10a_{n-1}(n+r-1)\, x^{n+r} \\
\sum_{n=0}^{\infty} 5x^{n+r+2} a_n &= \sum_{n=2}^{\infty} 5a_{n-2} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right)+\left(\sum_{n=1}^{\infty} 6a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=2}^{\infty} 11a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 10a_{n-1}(n+r-1)\, x^{n+r}\right)+\sum_{n=0}^{\infty} \left(-x^{n+r} a_n(n+r)\right) + \left(\sum_{n=2}^{\infty} 5a_{n-2}x^{n+r}\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$3x^{n+r} a_n(n+r)(n+r-1) - x^{n+r} a_n(n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$3x^r a_0 r(-1+r) - x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(3x^r r(-1+r) - x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(3r^2-4r+1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$3r^2-4r+1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = \frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(3r^2-4r+1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{2}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{1+n}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{3}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -2$$

For $2 \leq n$ the recursive equation is

$$3a_{n-2}(n+r-2)(n-3+r)+6a_{n-1}(n+r-1)(n+r-2)+3a_n(n+r)(n+r-1) + 11a_{n-2}(n+r-2)+10a_{n-1}(n+r-1)-a_n(n+r)+5a_{n-2}+a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -a_{n-2} - 2a_{n-1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -a_{n-2} - 2a_{n-1} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-2	-2

For $n = 2$, using the above recursive equation gives

$$a_2 = 3$$

Which for the root $r = 1$ becomes

$$a_2 = 3$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-2	-2
a_2	3	3

For $n = 3$, using the above recursive equation gives

$$a_3 = -4$$

Which for the root $r = 1$ becomes

$$a_3 = -4$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-2	-2
a_2	3	3
a_3	-4	-4

For $n = 4$, using the above recursive equation gives

$$a_4 = 5$$

Which for the root $r = 1$ becomes

$$a_4 = 5$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-2	-2
a_2	3	3
a_3	-4	-4
a_4	5	5

For $n = 5$, using the above recursive equation gives

$$a_5 = -6$$

Which for the root $r = 1$ becomes

$$a_5 = -6$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-2	-2
a_2	3	3
a_3	-4	-4
a_4	5	5
a_5	-6	-6

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x\left(1 - 2x + 3x^2 - 4x^3 + 5x^4 - 6x^5 + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = -2$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &3b_{n-2}(n+r-2)(n-3+r) + 6b_{n-1}(n+r-1)(n+r-2) + 3b_n(n+r)(n+r-1) \\ &+ 11b_{n-2}(n+r-2) + 10b_{n-1}(n+r-1) - b_n(n+r) + 5b_{n-2} + b_n = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -b_{n-2} - 2b_{n-1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_n = -b_{n-2} - 2b_{n-1} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-2	-2

For $n = 2$, using the above recursive equation gives

$$b_2 = 3$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_2 = 3$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-2	-2
b_2	3	3

For $n = 3$, using the above recursive equation gives

$$b_3 = -4$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_3 = -4$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-2	-2
b_2	3	3
b_3	-4	-4

For $n = 4$, using the above recursive equation gives

$$b_4 = 5$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_4 = 5$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-2	-2
b_2	3	3
b_3	-4	-4
b_4	5	5

For $n = 5$, using the above recursive equation gives

$$b_5 = -6$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_5 = -6$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-2	-2
b_2	3	3
b_3	-4	-4
b_4	5	5
b_5	-6	-6

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(1 - 2x + 3x^2 - 4x^3 + 5x^4 - 6x^5 + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x\left(1-2x+3x^2-4x^3+5x^4-6x^5+O(x^6)\right) \\
&\quad + c_2 x^{\frac{1}{3}}\left(1-2x+3x^2-4x^3+5x^4-6x^5+O(x^6)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x\left(1-2x+3x^2-4x^3+5x^4-6x^5+O(x^6)\right) \\
&\quad + c_2 x^{\frac{1}{3}}\left(1-2x+3x^2-4x^3+5x^4-6x^5+O(x^6)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x\left(1-2x+3x^2-4x^3+5x^4-6x^5+O(x^6)\right) \\
&\quad + c_2 x^{\frac{1}{3}}\left(1-2x+3x^2-4x^3+5x^4-6x^5+O(x^6)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x\left(1-2x+3x^2-4x^3+5x^4-6x^5+O(x^6)\right) \\
&\quad + c_2 x^{\frac{1}{3}}\left(1-2x+3x^2-4x^3+5x^4-6x^5+O(x^6)\right)
\end{aligned}
$$

Verified OK.

14.56.1 Maple step by step solution

Let's solve

$3x^2(x^2+2x+1)\, y'' + (11x^3+10x^2-x)\, y' + (5x^2+1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(5x^2+1)y}{3x^2(x^2+2x+1)} - \frac{y'(11x-1)}{3x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{y'(11x-1)}{3x(x+1)} + \frac{(5x^2+1)y}{3x^2(x^2+2x+1)} = 0$

☐ Check to see if x_0 is a regular singular point

- Define functions

  $\left[P_2(x) = \frac{11x-1}{3x(x+1)}, P_3(x) = \frac{5x^2+1}{3x^2(x^2+2x+1)}\right]$
- $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

  $((x+1)\cdot P_2(x))\Big|_{x=-1} = 4$
- $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

  $((x+1)^2\cdot P_3(x))\Big|_{x=-1} = 2$
- $x=-1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = -1$

- Multiply by denominators

  $3x^2(x+1)(x^2+2x+1)y'' + (11x-1)x(x^2+2x+1)y' + (5x^2+1)(x+1)y = 0$
- Change variables using $x = u-1$ so that the regular singular point is at $u=0$

  $(3u^5-6u^4+3u^3)\left(\frac{d^2}{du^2}y(u)\right) + (11u^4-23u^3+12u^2)\left(\frac{d}{du}y(u)\right) + (5u^3-10u^2+6u)y(u) = 0$
- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m\cdot y(u)$ to series expansion for $m = 1..3$

  $u^m\cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$
- Shift index using $k->k-m$

  $u^m\cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$
- Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 2..4$

  $u^m\cdot\left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$
- Shift index using $k->k+1-m$

  $u^m\cdot\left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,u^{k+r}$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 3..5$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\,u^{k+r-2+m}$$

- Shift index using $k- >k+2-m$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\,u^{k+r}$$

  Rewrite ODE with series expansions

  $$3a_0(2+r)(1+r)\,u^{1+r} + (3a_1(3+r)(2+r) - a_0(2+r)(5+6r))\,u^{2+r} + \left(\sum_{k=3}^{\infty} (3a_{k-1}(k+r+1)\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$3(2+r)(1+r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \{-2, -1\}$$

- Each term must be 0

  $$3a_1(3+r)(2+r) - a_0(2+r)(5+6r) = 0$$

- Solve for the dependent coefficient(s)

  $$a_1 = \frac{a_0(5+6r)}{3(3+r)}$$

- Each term in the series must be 0, giving the recursion relation

  $$3a_{k-1}(k+r+1)(k+r) - 6(k+r)\,a_{k-2}\left(k-\frac{7}{6}+r\right) + a_{k-3}(3k-4+3r)(k-2+r) = 0$$

- Shift index using $k- >k+3$

  $$3a_{k+2}(k+4+r)(k+3+r) - 6(k+3+r)\,a_{k+1}\left(k+\frac{11}{6}+r\right) + a_k(3k+3r+5)(k+r+1) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2} = -\frac{3k^2a_k - 6k^2a_{k+1} + 6kra_k - 12kra_{k+1} + 3r^2a_k - 6r^2a_{k+1} + 8ka_k - 29ka_{k+1} + 8ra_k - 29ra_{k+1} + 5a_k - 33a_{k+1}}{3(k+4+r)(k+3+r)}$$

- Recursion relation for $r = -2$

  $$a_{k+2} = -\frac{3k^2a_k - 6k^2a_{k+1} - 4ka_k - 5ka_{k+1} + a_k + a_{k+1}}{3(k+2)(k+1)}$$

- Solution for $r = -2$

  $$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-2}, a_{k+2} = -\frac{3k^2a_k - 6k^2a_{k+1} - 4ka_k - 5ka_{k+1} + a_k + a_{k+1}}{3(k+2)(k+1)}, a_1 = -\frac{7a_0}{3}\right]$$

- Revert the change of variables $u = x+1$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^{k-2}, a_{k+2} = -\frac{3k^2 a_k - 6k^2 a_{k+1} - 4k a_k - 5k a_{k+1} + a_k + a_{k+1}}{3(k+2)(k+1)}, a_1 = -\frac{7a_0}{3}\right]$$

- Recursion relation for $r = -1$

$$a_{k+2} = -\frac{3k^2 a_k - 6k^2 a_{k+1} + 2k a_k - 17k a_{k+1} - 10a_{k+1}}{3(k+3)(k+2)}$$

- Solution for $r = -1$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-1}, a_{k+2} = -\frac{3k^2 a_k - 6k^2 a_{k+1} + 2k a_k - 17k a_{k+1} - 10a_{k+1}}{3(k+3)(k+2)}, a_1 = -\frac{a_0}{6}\right]$$

- Revert the change of variables $u = x + 1$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^{k-1}, a_{k+2} = -\frac{3k^2 a_k - 6k^2 a_{k+1} + 2k a_k - 17k a_{k+1} - 10a_{k+1}}{3(k+3)(k+2)}, a_1 = -\frac{a_0}{6}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k (x+1)^{k-2}\right) + \left(\sum_{k=0}^{\infty} b_k (x+1)^{k-1}\right), a_{k+2} = -\frac{3k^2 a_k - 6k^2 a_{1+k} - 4k a_k - 5k a_{1+k} + a_k + a_{1+k}}{3(k+2)(1+k)}, a_1 =\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 68.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2\left(x^2+2x+3\right)y''-x\left(-15x^2-14x+3\right)y'+\left(7x^2+3\right)y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(4x^4+8x^3+12x^2\right)y''+\left(15x^3+14x^2-3x\right)y'+\left(7x^2+3\right)y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned} p(x) &= \frac{15x^2+14x-3}{4x\left(x^2+2x+3\right)} \\ q(x) &= \frac{7x^2+3}{4x^2\left(x^2+2x+3\right)} \end{aligned}$$

Table 642: Table $p(x), q(x)$ singularites.

$p(x) = \frac{15x^2+14x-3}{4x(x^2+2x+3)}$	
singularity	type
$x = 0$	"regular"
$x = -1 - i\sqrt{2}$	"regular"
$x = -1 + i\sqrt{2}$	"regular"

$q(x) = \frac{7x^2+3}{4x^2(x^2+2x+3)}$	
singularity	type
$x = 0$	"regular"
$x = -1 - i\sqrt{2}$	"regular"
$x = -1 + i\sqrt{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -1 - i\sqrt{2}, -1 + i\sqrt{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2\left(x^2 + 2x + 3\right) y'' + \left(15x^3 + 14x^2 - 3x\right) y' + \left(7x^2 + 3\right) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2\left(x^2 + 2x + 3\right) \left(\sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}\right) + \left(15x^3 + 14x^2 - 3x\right) \left(\sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}\right) + \left(7x^2 + 3\right) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n(n+r)\,(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 8x^{1+n+r} a_n(n+r)\,(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 12x^{n+r} a_n(n+r)\,(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 15x^{n+r+2} a_n(n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 14x^{1+n+r} a_n(n+r)\right) + \sum_{n=0}^{\infty} \left(-3x^{n+r} a_n(n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 7x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 3a_n x^{n+r}\right) = 0
\end{aligned}
\tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 4x^{n+r+2} a_n(n+r)\,(n+r-1) &= \sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)\,(n-3+r)\,x^{n+r} \\
\sum_{n=0}^{\infty} 8x^{1+n+r} a_n(n+r)\,(n+r-1) &= \sum_{n=1}^{\infty} 8a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r} \\
\sum_{n=0}^{\infty} 15x^{n+r+2} a_n(n+r) &= \sum_{n=2}^{\infty} 15a_{n-2}(n+r-2)\,x^{n+r} \\
\sum_{n=0}^{\infty} 14x^{1+n+r} a_n(n+r) &= \sum_{n=1}^{\infty} 14a_{n-1}(n+r-1)\,x^{n+r} \\
\sum_{n=0}^{\infty} 7x^{n+r+2} a_n &= \sum_{n=2}^{\infty} 7a_{n-2} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)(n-3+r)\,x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 8a_{n-1}(n+r-1)(n+r-2)\,x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 12x^{n+r}a_n(n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 15a_{n-2}(n+r-2)\,x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 14a_{n-1}(n+r-1)\,x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-3x^{n+r}a_n(n+r)\right) + \left(\sum_{n=2}^{\infty} 7a_{n-2}x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$12x^{n+r}a_n(n+r)(n+r-1) - 3x^{n+r}a_n(n+r) + 3a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$12x^r a_0 r(-1+r) - 3x^r a_0 r + 3a_0 x^r = 0$$

Or

$$(12x^r r(-1+r) - 3x^r r + 3x^r)\,a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(12r^2 - 15r + 3\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$12r^2 - 15r + 3 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = \frac{1}{4}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(12r^2 - 15r + 3\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{3}{4}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{1+n}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{4}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -\frac{2}{3}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &4a_{n-2}(n+r-2)(n-3+r)+8a_{n-1}(n+r-1)(n+r-2)+12a_n(n+r)(n+r-1) \\ &+15a_{n-2}(n+r-2)+14a_{n-1}(n+r-1)-3a_n(n+r)+7a_{n-2}+3a_n=0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}}{3} - \frac{2a_{n-1}}{3} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{a_{n-2}}{3} - \frac{2a_{n-1}}{3} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{3}$	$-\frac{2}{3}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1}{9}$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{1}{9}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{3}$	$-\frac{2}{3}$
a_2	$\frac{1}{9}$	$\frac{1}{9}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{4}{27}$$

Which for the root $r = 1$ becomes

$$a_3 = \frac{4}{27}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{3}$	$-\frac{2}{3}$
a_2	$\frac{1}{9}$	$\frac{1}{9}$
a_3	$\frac{4}{27}$	$\frac{4}{27}$

For $n = 4$, using the above recursive equation gives

$$a_4 = -\frac{11}{81}$$

Which for the root $r = 1$ becomes

$$a_4 = -\frac{11}{81}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{3}$	$-\frac{2}{3}$
a_2	$\frac{1}{9}$	$\frac{1}{9}$
a_3	$\frac{4}{27}$	$\frac{4}{27}$
a_4	$-\frac{11}{81}$	$-\frac{11}{81}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{10}{243}$$

Which for the root $r = 1$ becomes

$$a_5 = \frac{10}{243}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{3}$	$-\frac{2}{3}$
a_2	$\frac{1}{9}$	$\frac{1}{9}$
a_3	$\frac{4}{27}$	$\frac{4}{27}$
a_4	$-\frac{11}{81}$	$-\frac{11}{81}$
a_5	$\frac{10}{243}$	$\frac{10}{243}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= x\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x\left(1 - \frac{2x}{3} + \frac{x^2}{9} + \frac{4x^3}{27} - \frac{11x^4}{81} + \frac{10x^5}{243} + O(x^6)\right)
\end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = -\frac{2}{3}$$

For $2 \leq n$ the recursive equation is

$$4b_{n-2}(n+r-2)(n-3+r)+8b_{n-1}(n+r-1)(n+r-2)+12b_n(n+r)(n+r-1) \\ +15b_{n-2}(n+r-2)+14b_{n-1}(n+r-1)-3b_n(n+r)+7b_{n-2}+3b_n = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{b_{n-2}}{3} - \frac{2b_{n-1}}{3} \tag{4}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_n = -\frac{b_{n-2}}{3} - \frac{2b_{n-1}}{3} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{3}$	$-\frac{2}{3}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{1}{9}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_2 = \frac{1}{9}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{3}$	$-\frac{2}{3}$
b_2	$\frac{1}{9}$	$\frac{1}{9}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{4}{27}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_3 = \frac{4}{27}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{3}$	$-\frac{2}{3}$
b_2	$\frac{1}{9}$	$\frac{1}{9}$
b_3	$\frac{4}{27}$	$\frac{4}{27}$

For $n = 4$, using the above recursive equation gives

$$b_4 = -\frac{11}{81}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_4 = -\frac{11}{81}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{3}$	$-\frac{2}{3}$
b_2	$\frac{1}{9}$	$\frac{1}{9}$
b_3	$\frac{4}{27}$	$\frac{4}{27}$
b_4	$-\frac{11}{81}$	$-\frac{11}{81}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{10}{243}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_5 = \frac{10}{243}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{3}$	$-\frac{2}{3}$
b_2	$\frac{1}{9}$	$\frac{1}{9}$
b_3	$\frac{4}{27}$	$\frac{4}{27}$
b_4	$-\frac{11}{81}$	$-\frac{11}{81}$
b_5	$\frac{10}{243}$	$\frac{10}{243}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= x^{\frac{1}{4}}\left(1 - \frac{2x}{3} + \frac{x^2}{9} + \frac{4x^3}{27} - \frac{11x^4}{81} + \frac{10x^5}{243} + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x\left(1 - \frac{2x}{3} + \frac{x^2}{9} + \frac{4x^3}{27} - \frac{11x^4}{81} + \frac{10x^5}{243} + O(x^6)\right) \\ &+ c_2 x^{\frac{1}{4}}\left(1 - \frac{2x}{3} + \frac{x^2}{9} + \frac{4x^3}{27} - \frac{11x^4}{81} + \frac{10x^5}{243} + O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x\left(1 - \frac{2x}{3} + \frac{x^2}{9} + \frac{4x^3}{27} - \frac{11x^4}{81} + \frac{10x^5}{243} + O(x^6)\right) \\ &+ c_2 x^{\frac{1}{4}}\left(1 - \frac{2x}{3} + \frac{x^2}{9} + \frac{4x^3}{27} - \frac{11x^4}{81} + \frac{10x^5}{243} + O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = c_1 x\left(1 - \frac{2x}{3} + \frac{x^2}{9} + \frac{4x^3}{27} - \frac{11x^4}{81} + \frac{10x^5}{243} + O(x^6)\right) \\ + c_2 x^{\frac{1}{4}}\left(1 - \frac{2x}{3} + \frac{x^2}{9} + \frac{4x^3}{27} - \frac{11x^4}{81} + \frac{10x^5}{243} + O(x^6)\right) \end{aligned} \tag{1}$$

Verification of solutions

$$y = c_1 x \left(1 - \frac{2x}{3} + \frac{x^2}{9} + \frac{4x^3}{27} - \frac{11x^4}{81} + \frac{10x^5}{243} + O(x^6)\right) + c_2 x^{\frac{1}{4}} \left(1 - \frac{2x}{3} + \frac{x^2}{9} + \frac{4x^3}{27} - \frac{11x^4}{81} + \frac{10x^5}{243} + O(x^6)\right)$$

Verified OK.

14.57.1 Maple step by step solution

Let's solve

$4x^2(x^2 + 2x + 3) y'' + (15x^3 + 14x^2 - 3x) y' + (7x^2 + 3) y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(7x^2+3)y}{4x^2(x^2+2x+3)} - \frac{(15x^2+14x-3)y'}{4x(x^2+2x+3)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(15x^2+14x-3)y'}{4x(x^2+2x+3)} + \frac{(7x^2+3)y}{4x^2(x^2+2x+3)} = 0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{15x^2+14x-3}{4x(x^2+2x+3)}, P_3(x) = \frac{7x^2+3}{4x^2(x^2+2x+3)}\right]$

  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $(x \cdot P_2(x))\bigg|_{x=0} = -\frac{1}{4}$

  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $(x^2 \cdot P_3(x))\bigg|_{x=0} = \frac{1}{4}$

  - $x = 0$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = 0$

- Multiply by denominators

  $4x^2(x^2 + 2x + 3) y'' + x(15x^2 + 14x - 3) y' + (7x^2 + 3) y = 0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

  ◦ Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

  ◦ Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

  ◦ Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$$

  ◦ Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$$

  ◦ Shift index using $k- >k + 2 - m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m} (k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$3a_0(-1+4r)\,(-1+r)\, x^r + (3a_1(3+4r)\, r + 2a_0 r(3+4r))\, x^{1+r} + \left(\sum_{k=2}^{\infty} (3a_k(4k+4r-1)\,(k+r\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$3(-1+4r)\,(-1+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{1, \frac{1}{4}\right\}$$

- Each term must be 0

$$3a_1(3+4r)\, r + 2a_0 r(3+4r) = 0$$

- Solve for the dependent coefficient(s)

$a_1 = -\frac{2a_0}{3}$

- Each term in the series must be 0, giving the recursion relation

  $(4k+4r-1)(k+r-1)(3a_k+2a_{k-1}+a_{k-2}) = 0$

- Shift index using $k- > k+2$

  $(4k+4r+7)(k+r+1)(3a_{k+2}+2a_{k+1}+a_k) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{2a_{k+1}}{3} - \frac{a_k}{3}$

- Recursion relation for $r = 1$

  $a_{k+2} = -\frac{2a_{k+1}}{3} - \frac{a_k}{3}$

- Solution for $r = 1$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+2} = -\frac{2a_{k+1}}{3} - \frac{a_k}{3}, a_1 = -\frac{2a_0}{3}\right]$

Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: Example 7.6.1 page 367.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2-2x+1)\,y''-x(x+3)\,y'+(x+4)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4-2x^3+x^2)\,y''+(-x^2-3x)\,y'+(x+4)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{x+3}{x\,(x-1)^2}$$
$$q(x)=\frac{x+4}{x^2\,(x-1)^2}$$

Table 644: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{x+3}{x(x-1)^2}$	
singularity	type
$x = 0$	"regular"
$x = 1$	"irregular"

$q(x) = \frac{x+4}{x^2(x-1)^2}$	
singularity	type
$x = 0$	"regular"
$x = 1$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty]$

Irregular singular points : $[1]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2 (x^2 - 2x + 1) y'' + (-x^2 - 3x) y' + (x + 4) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 (x^2 - 2x + 1) \left(\sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}\right) + (-x^2 - 3x) \left(\sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}\right) + (x + 4) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-2x^{1+n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n (n+r)\right) \\
&+ \sum_{n=0}^{\infty} \left(-3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}
$$

$$
\sum_{n=0}^{\infty} \left(-2x^{1+n+r} a_n (n+r)(n+r-1)\right) = \sum_{n=1}^{\infty} \left(-2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right)
$$

$$
\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n (n+r)\right) = \sum_{n=1}^{\infty} \left(-a_{n-1}(n+r-1)\, x^{n+r}\right)
$$

$$
\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) \\
&+ \sum_{n=1}^{\infty} \left(-2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=1}^{\infty} \left(-a_{n-1}(n+r-1)\, x^{n+r}\right) \\
&+ \sum_{n=0}^{\infty} \left(-3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - 3x^{n+r} a_n (n+r) + 4a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - 3x^r a_0 r + 4a_0 x^r = 0$$

Or

$$(x^r r(-1+r) - 3x^r r + 4x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r-2)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r-2)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 2$$
$$r_2 = 2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r-2)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 2$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+2}$$

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+2}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = \frac{2r+1}{-1+r}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &a_{n-2}(n+r-2)(n-3+r) - 2a_{n-1}(n+r-1)(n+r-2) \\ &+ a_n(n+r)(n+r-1) - a_{n-1}(n+r-1) - 3a_n(n+r) + a_{n-1} + 4a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{na_{n-2} - 2na_{n-1} + ra_{n-2} - 2ra_{n-1} - 3a_{n-2} + a_{n-1}}{n+r-2} \tag{4}$$

Which for the root $r = 2$ becomes

$$a_n = \frac{(-a_{n-2} + 2a_{n-1})\,n + a_{n-2} + 3a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r+1}{-1+r}$	5

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{3r^2 + 10r + 2}{r(-1+r)}$$

Which for the root $r = 2$ becomes

$$a_2 = 17$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r+1}{-1+r}$	5
a_2	$\frac{3r^2+10r+2}{r(-1+r)}$	17

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{4r^3 + 34r^2 + 54r + 10}{r^3 - r}$$

Which for the root $r = 2$ becomes

$$a_3 = \frac{143}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r+1}{-1+r}$	5
a_2	$\frac{3r^2+10r+2}{r(-1+r)}$	17
a_3	$\frac{4r^3+34r^2+54r+10}{r^3-r}$	$\frac{143}{3}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{5r^4 + 80r^3 + 321r^2 + 384r + 68}{(2 + r) r (r^2 - 1)}$$

Which for the root $r = 2$ becomes

$$a_4 = \frac{355}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r+1}{-1+r}$	5
a_2	$\frac{3r^2+10r+2}{r(-1+r)}$	17
a_3	$\frac{4r^3+34r^2+54r+10}{r^3-r}$	$\frac{143}{3}$
a_4	$\frac{5r^4+80r^3+321r^2+384r+68}{(2+r)r(r^2-1)}$	$\frac{355}{3}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{6r^5 + 155r^4 + 1156r^3 + 3295r^2 + 3336r + 572}{r^5 + 5r^4 + 5r^3 - 5r^2 - 6r}$$

Which for the root $r = 2$ becomes

$$a_5 = \frac{4043}{15}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r+1}{-1+r}$	5
a_2	$\frac{3r^2+10r+2}{r(-1+r)}$	17
a_3	$\frac{4r^3+34r^2+54r+10}{r^3-r}$	$\frac{143}{3}$
a_4	$\frac{5r^4+80r^3+321r^2+384r+68}{(2+r)r(r^2-1)}$	$\frac{355}{3}$
a_5	$\frac{6r^5+155r^4+1156r^3+3295r^2+3336r+572}{r^5+5r^4+5r^3-5r^2-6r}$	$\frac{4043}{15}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^2\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^2\left(17x^2 + 5x + 1 + \frac{143x^3}{3} + \frac{355x^4}{3} + \frac{4043x^5}{15} + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 2$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{2r+1}{-1+r}$	5	$-\frac{3}{(-1+r)^2}$
b_2	$\frac{3r^2+10r+2}{r(-1+r)}$	17	$\frac{-13r^2-4r+2}{r^2(-1+r)^2}$
b_3	$\frac{4r^3+34r^2+54r+10}{r^3-r}$	$\frac{143}{3}$	$\frac{-34r^4-116r^3-64r^2+10}{r^2(r^2-1)^2}$
b_4	$\frac{5r^4+80r^3+321r^2+384r+68}{(2+r)r(r^2-1)}$	$\frac{355}{3}$	$\frac{-70r^6-652r^5-1904r^4-2128r^3-666r^2+136r+136}{(2+r)^2r^2(r^2-1)^2}$
b_5	$\frac{6r^5+155r^4+1156r^3+3295r^2+3336r+572}{r^5+5r^4+5r^3-5r^2-6r}$	$\frac{4043}{15}$	$\frac{-125r^8-2252r^7-14980r^6-47988r^5-77945r^4-58672r^3-11670r^2+5720r+3432}{r^2(r^4+5r^3+5r^2-5r-6)^2}$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6 \ldots \\
&= x^2\left(17x^2 + 5x + 1 + \frac{143x^3}{3} + \frac{355x^4}{3} + \frac{4043x^5}{15} + O(x^6)\right)\ln(x) \\
&\quad + x^2\left(-3x - \frac{29x^2}{2} - \frac{859x^3}{18} - \frac{4693x^4}{36} - \frac{285181x^5}{900} + O(x^6)\right)
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1y_1(x) + c_2y_2(x) \\
&= c_1x^2\left(17x^2 + 5x + 1 + \frac{143x^3}{3} + \frac{355x^4}{3} + \frac{4043x^5}{15} + O(x^6)\right) \\
&\quad + c_2\left(x^2\left(17x^2 + 5x + 1 + \frac{143x^3}{3} + \frac{355x^4}{3} + \frac{4043x^5}{15} + O(x^6)\right)\ln(x)\right. \\
&\quad \left. + x^2\left(-3x - \frac{29x^2}{2} - \frac{859x^3}{18} - \frac{4693x^4}{36} - \frac{285181x^5}{900} + O(x^6)\right)\right)
\end{aligned}$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^2 \left(17x^2 + 5x + 1 + \frac{143x^3}{3} + \frac{355x^4}{3} + \frac{4043x^5}{15} + O(x^6)\right) \\
&\quad + c_2 \left(x^2 \left(17x^2 + 5x + 1 + \frac{143x^3}{3} + \frac{355x^4}{3} + \frac{4043x^5}{15} + O(x^6)\right) \ln(x) \right. \\
&\quad \left. + x^2 \left(-3x - \frac{29x^2}{2} - \frac{859x^3}{18} - \frac{4693x^4}{36} - \frac{285181x^5}{900} + O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^2 \left(17x^2 + 5x + 1 + \frac{143x^3}{3} + \frac{355x^4}{3} + \frac{4043x^5}{15} + O(x^6)\right) \\
&\quad + c_2 \left(x^2 \left(17x^2 + 5x + 1 + \frac{143x^3}{3} + \frac{355x^4}{3} + \frac{4043x^5}{15} + O(x^6)\right) \ln(x) \right. \\
&\quad \left. + x^2 \left(-3x - \frac{29x^2}{2} - \frac{859x^3}{18} - \frac{4693x^4}{36} - \frac{285181x^5}{900} + O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x^2 \left(17x^2 + 5x + 1 + \frac{143x^3}{3} + \frac{355x^4}{3} + \frac{4043x^5}{15} + O(x^6)\right) \\
&\quad + c_2 \left(x^2 \left(17x^2 + 5x + 1 + \frac{143x^3}{3} + \frac{355x^4}{3} + \frac{4043x^5}{15} + O(x^6)\right) \ln(x) \right. \\
&\quad \left. + x^2 \left(-3x - \frac{29x^2}{2} - \frac{859x^3}{18} - \frac{4693x^4}{36} - \frac{285181x^5}{900} + O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.1.1 Maple step by step solution

Let's solve

$x^2(x^2 - 2x + 1)\, y'' + (-x^2 - 3x)\, y' + (x + 4)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(x+4)y}{x^2(x^2-2x+1)} + \frac{(x+3)y'}{x(x^2-2x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{(x+3)y'}{x(x^2-2x+1)} + \frac{(x+4)y}{x^2(x^2-2x+1)} = 0$

- ☐ Check to see if x_0 is a regular singular point
  - Define functions

    $\left[P_2(x) = -\frac{x+3}{x(x^2-2x+1)}, P_3(x) = \frac{x+4}{x^2(x^2-2x+1)}\right]$
  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $(x \cdot P_2(x))\bigg|_{x=0} = -3$
  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $(x^2 \cdot P_3(x))\bigg|_{x=0} = 4$
  - $x = 0$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = 0$

- Multiply by denominators

  $x^2(x^2-2x+1)\,y'' - x(x+3)\,y' + (x+4)\,y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

- ☐ Rewrite ODE with series expansions
  - Convert $x^m \cdot y$ to series expansion for $m = 0..1$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$
  - Shift index using $k->k-m$

    $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$
  - Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$
  - Shift index using $k->k+1-m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k->k+2-m$

  $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(-2+r)^2 x^r + \left(a_1(-1+r)^2 - a_0(1+2r)(-1+r)\right) x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(k+r-2)^2 - a_{k-1}(2k - \right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(-2+r)^2 = 0$$

- Values of r that satisfy the indicial equation

  $$r = 2$$

- Each term must be 0

  $$a_1(-1+r)^2 - a_0(1+2r)(-1+r) = 0$$

- Solve for the dependent coefficient(s)

  $$a_1 = \frac{a_0(1+2r)}{-1+r}$$

- Each term in the series must be 0, giving the recursion relation

  $$(k+r-2)\left((a_k + a_{k-2} - 2a_{k-1})\, k + (a_k + a_{k-2} - 2a_{k-1})\, r - 2a_k - 3a_{k-2} + a_{k-1}\right) = 0$$

- Shift index using $k->k+2$

  $$(k+r)\left((a_{k+2} + a_k - 2a_{k+1})(k+2) + (a_{k+2} + a_k - 2a_{k+1})\, r - 2a_{k+2} - 3a_k + a_{k+1}\right) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2} = -\frac{k a_k - 2k a_{k+1} + r a_k - 2r a_{k+1} - a_k - 3a_{k+1}}{k+r}$$

- Recursion relation for $r = 2$

  $$a_{k+2} = -\frac{k a_k - 2k a_{k+1} + a_k - 7a_{k+1}}{k+2}$$

- Solution for $r = 2$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+2}, a_{k+2} = -\frac{k a_k - 2k a_{k+1} + a_k - 7a_{k+1}}{k+2}, a_1 = 5a_0\right]$$

ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2(2+x)\,y''+5y'x^2+(x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(2x^3+4x^2\right)y''+5y'x^2+(x+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{5}{2\,(2+x)}$$
$$q(x)=\frac{x+1}{2x^2\,(2+x)}$$

Table 646: Table $p(x), q(x)$ singularites.

$p(x) = \frac{5}{2(2+x)}$	
singularity	type
$x = -2$	"regular"

$q(x) = \frac{x+1}{2x^2(2+x)}$	
singularity	type
$x = -2$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-2, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2(2+x)\,y'' + 5y'x^2 + (x+1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2(2+x)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + 5\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) x^2 + (x+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 5x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 5x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 5a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 5a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r)(n+r-1) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$4x^r a_0 r(-1+r) + a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^r (2r-1)^2 = 0$$

Since the above is true for all x then the indicial equation becomes

$$(2r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= \frac{1}{2} \\ r_2 &= \frac{1}{2} \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^r (2r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{2}$, Eqs (1A,1B) become

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}} \\ y_2(x) &= y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{2}}\right) \end{aligned}$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$2a_{n-1}(n+r-1)(n+r-2)+4a_n(n+r)(n+r-1)+5a_{n-1}(n+r-1)+a_{n-1}+a_n=0 \quad (3)$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r)\,a_{n-1}}{-1+2n+2r} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{(2n+1)\,a_{n-1}}{4n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-1-r}{1+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = -\frac{3}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{1+2r}$	$-\frac{3}{4}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{r^2+3r+2}{4r^2+8r+3}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = \frac{15}{32}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{1+2r}$	$-\frac{3}{4}$
a_2	$\frac{r^2+3r+2}{4r^2+8r+3}$	$\frac{15}{32}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-r^3 - 6r^2 - 11r - 6}{8r^3 + 36r^2 + 46r + 15}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = -\frac{35}{128}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{1+2r}$	$-\frac{3}{4}$
a_2	$\frac{r^2+3r+2}{4r^2+8r+3}$	$\frac{15}{32}$
a_3	$\frac{-r^3-6r^2-11r-6}{8r^3+36r^2+46r+15}$	$-\frac{35}{128}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^4 + 10r^3 + 35r^2 + 50r + 24}{16r^4 + 128r^3 + 344r^2 + 352r + 105}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{315}{2048}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{1+2r}$	$-\frac{3}{4}$
a_2	$\frac{r^2+3r+2}{4r^2+8r+3}$	$\frac{15}{32}$
a_3	$\frac{-r^3-6r^2-11r-6}{8r^3+36r^2+46r+15}$	$-\frac{35}{128}$
a_4	$\frac{r^4+10r^3+35r^2+50r+24}{16r^4+128r^3+344r^2+352r+105}$	$\frac{315}{2048}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-r^5 - 15r^4 - 85r^3 - 225r^2 - 274r - 120}{32r^5 + 400r^4 + 1840r^3 + 3800r^2 + 3378r + 945}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = -\frac{693}{8192}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{1+2r}$	$-\frac{3}{4}$
a_2	$\frac{r^2+3r+2}{4r^2+8r+3}$	$\frac{15}{32}$
a_3	$\frac{-r^3-6r^2-11r-6}{8r^3+36r^2+46r+15}$	$-\frac{35}{128}$
a_4	$\frac{r^4+10r^3+35r^2+50r+24}{16r^4+128r^3+344r^2+352r+105}$	$\frac{315}{2048}$
a_5	$\frac{-r^5-15r^4-85r^3-225r^2-274r-120}{32r^5+400r^4+1840r^3+3800r^2+3378r+945}$	$-\frac{693}{8192}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \sqrt{x}\left(1 - \frac{3x}{4} + \frac{15x^2}{32} - \frac{35x^3}{128} + \frac{315x^4}{2048} - \frac{693x^5}{8192} + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{2}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{-1-r}{1+2r}$	$-\frac{3}{4}$	$\frac{1}{(1+2r)^2}$
b_2	$\frac{r^2+3r+2}{4r^2+8r+3}$	$\frac{15}{32}$	$\frac{-4r^2-10r-7}{(4r^2+8r+3)^2}$
b_3	$\frac{-r^3-6r^2-11r-6}{8r^3+36r^2+46r+15}$	$-\frac{35}{128}$	$\frac{12r^4+84r^3+219r^2+252r+111}{(8r^3+36r^2+46r+15)^2}$
b_4	$\frac{r^4+10r^3+35r^2+50r+24}{16r^4+128r^3+344r^2+352r+105}$	$\frac{315}{2048}$	$\frac{-32r^6-432r^5-2384r^4-6876r^3-10946r^2-9162r-3198}{(16r^4+128r^3+344r^2+352r+105)^2}$
b_5	$\frac{-r^5-15r^4-85r^3-225r^2-274r-120}{32r^5+400r^4+1840r^3+3800r^2+3378r+945}$	$-\frac{693}{8192}$	$\frac{80r^8+1760r^7+16600r^6+87560r^5+282265r^4+569360r^3+702575r^2+486750r+1}{(32r^5+400r^4+1840r^3+3800r^2+3378r+945)^2}$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= \sqrt{x}\left(1 - \frac{3x}{4} + \frac{15x^2}{32} - \frac{35x^3}{128} + \frac{315x^4}{2048} - \frac{693x^5}{8192} + O(x^6)\right)\ln(x) \\
&\quad + \sqrt{x}\left(\frac{x}{4} - \frac{13x^2}{64} + \frac{101x^3}{768} - \frac{641x^4}{8192} + \frac{7303x^5}{163840} + O(x^6)\right)
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1\sqrt{x}\left(1 - \frac{3x}{4} + \frac{15x^2}{32} - \frac{35x^3}{128} + \frac{315x^4}{2048} - \frac{693x^5}{8192} + O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1 - \frac{3x}{4} + \frac{15x^2}{32} - \frac{35x^3}{128} + \frac{315x^4}{2048} - \frac{693x^5}{8192} + O(x^6)\right)\ln(x)\right. \\
&\qquad \left. + \sqrt{x}\left(\frac{x}{4} - \frac{13x^2}{64} + \frac{101x^3}{768} - \frac{641x^4}{8192} + \frac{7303x^5}{163840} + O(x^6)\right)\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1\sqrt{x}\left(1-\frac{3x}{4}+\frac{15x^2}{32}-\frac{35x^3}{128}+\frac{315x^4}{2048}-\frac{693x^5}{8192}+O\left(x^6\right)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1-\frac{3x}{4}+\frac{15x^2}{32}-\frac{35x^3}{128}+\frac{315x^4}{2048}-\frac{693x^5}{8192}+O\left(x^6\right)\right)\ln\left(x\right)\right. \\ &\quad \left. + \sqrt{x}\left(\frac{x}{4}-\frac{13x^2}{64}+\frac{101x^3}{768}-\frac{641x^4}{8192}+\frac{7303x^5}{163840}+O\left(x^6\right)\right)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y &= c_1\sqrt{x}\left(1-\frac{3x}{4}+\frac{15x^2}{32}-\frac{35x^3}{128}+\frac{315x^4}{2048}-\frac{693x^5}{8192}+O\left(x^6\right)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1-\frac{3x}{4}+\frac{15x^2}{32}-\frac{35x^3}{128}+\frac{315x^4}{2048}-\frac{693x^5}{8192}+O\left(x^6\right)\right)\ln\left(x\right)\right. \\ &\quad \left. + \sqrt{x}\left(\frac{x}{4}-\frac{13x^2}{64}+\frac{101x^3}{768}-\frac{641x^4}{8192}+\frac{7303x^5}{163840}+O\left(x^6\right)\right)\right) \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y &= c_1\sqrt{x}\left(1-\frac{3x}{4}+\frac{15x^2}{32}-\frac{35x^3}{128}+\frac{315x^4}{2048}-\frac{693x^5}{8192}+O\left(x^6\right)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1-\frac{3x}{4}+\frac{15x^2}{32}-\frac{35x^3}{128}+\frac{315x^4}{2048}-\frac{693x^5}{8192}+O\left(x^6\right)\right)\ln\left(x\right)\right. \\ &\quad \left. + \sqrt{x}\left(\frac{x}{4}-\frac{13x^2}{64}+\frac{101x^3}{768}-\frac{641x^4}{8192}+\frac{7303x^5}{163840}+O\left(x^6\right)\right)\right) \end{aligned}$$

Verified OK.

15.2.1 Maple step by step solution

Let's solve

$2x^2(2+x)\,y''+5y'x^2+(x+1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(x+1)y}{2x^2(2+x)}-\frac{5y'}{2(2+x)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{5y'}{2(2+x)}+\frac{(x+1)y}{2x^2(2+x)}=0$

☐ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{5}{2(2+x)}, P_3(x)=\frac{x+1}{2x^2(2+x)}\right]$

  - $(2+x)\cdot P_2(x)$ is analytic at $x=-2$

    $\left((2+x)\cdot P_2(x)\right)\bigg|_{x=-2}=\frac{5}{2}$

  - $(2+x)^2\cdot P_3(x)$ is analytic at $x=-2$

    $\left((2+x)^2\cdot P_3(x)\right)\bigg|_{x=-2}=0$

  - $x=-2$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0=-2$

- Multiply by denominators

  $2x^2(2+x)\,y''+5y'x^2+(x+1)\,y=0$

- Change variables using $x=u-2$ so that the regular singular point is at $u=0$

  $(2u^3-8u^2+8u)\left(\frac{d^2}{du^2}y(u)\right)+(5u^2-20u+20)\left(\frac{d}{du}y(u)\right)+(u-1)\,y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

☐ Rewrite ODE with series expansions

  - Convert $u^m\cdot y(u)$ to series expansion for $m=0..1$

    $u^m\cdot y(u)=\sum_{k=0}^{\infty}a_k u^{k+r+m}$

  - Shift index using $k->k-m$

    $u^m\cdot y(u)=\sum_{k=m}^{\infty}a_{k-m}u^{k+r}$

  - Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..2$

    $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,u^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $$u^{m}\cdot \left(\frac{d}{du}y \left(u \right)\right)=\sum_{k =-1+m}^{\infty}a_{k +1-m} \left(k +1-m +r \right) u^{k +r}$$

- Convert $u^{m}\cdot \left(\frac{d^{2}}{d u^{2}}y \left(u \right)\right)$ to series expansion for $m =1..3$

  $$u^{m}\cdot \left(\frac{d^{2}}{d u^{2}}y \left(u \right)\right)=\sum_{k =0}^{\infty}a_{k} \left(k +r \right) \left(k +r -1\right) u^{k +r -2+m}$$

- Shift index using $k->k+2-m$

  $$u^{m}\cdot \left(\frac{d^{2}}{d u^{2}}y \left(u \right)\right)=\sum_{k =-2+m}^{\infty}a_{k +2-m} \left(k +2-m +r \right) \left(k +1-m +r \right) u^{k +r}$$

  Rewrite ODE with series expansions

  $$4 a_{0} r \left(3+2 r \right) u^{-1+r}+\left(4 a_{1} \left(1+r \right) \left(5+2 r \right)-a_{0} \left(8 r^{2}+12 r +1\right)\right) u^{r}+\left(\sum_{k =1}^{\infty}\left(4 a_{k +1} \left(k +r +1\right) \left(2 k \right.\right.\right.$$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $$4 r \left(3+2 r \right)=0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{0, -\frac{3}{2}\right\}$$

- Each term must be 0

  $$4 a_{1} \left(1+r \right) \left(5+2 r \right)-a_{0} \left(8 r^{2}+12 r +1\right)=0$$

- Each term in the series must be 0, giving the recursion relation

  $$2 \left(-4 a_{k}+a_{k -1}+4 a_{k +1}\right) k^{2}+\left(4 \left(-4 a_{k}+a_{k -1}+4 a_{k +1}\right) r -12 a_{k}-a_{k -1}+28 a_{k +1}\right) k +2 \left(-4 a_{k}+\right.$$

- Shift index using $k->k+1$

  $$2 \left(-4 a_{k +1}+a_{k}+4 a_{k +2}\right) \left(k +1\right)^{2}+\left(4 \left(-4 a_{k +1}+a_{k}+4 a_{k +2}\right) r -12 a_{k +1}-a_{k}+28 a_{k +2}\right) \left(k +1\right)$$

- Recursion relation that defines series solution to ODE

  $$a_{k +2}=-\frac{2 k^{2} a_{k}-8 k^{2} a_{k +1}+4 k r a_{k}-16 k r a_{k +1}+2 r^{2} a_{k}-8 r^{2} a_{k +1}+3 k a_{k}-28 k a_{k +1}+3 r a_{k}-28 r a_{k +1}+a_{k}-21 a_{k +1}}{4 \left(2 k^{2}+4 k r +2 r^{2}+11 k +11 r +14\right)}$$

- Recursion relation for $r =0$

  $$a_{k +2}=-\frac{2 k^{2} a_{k}-8 k^{2} a_{k +1}+3 k a_{k}-28 k a_{k +1}+a_{k}-21 a_{k +1}}{4 \left(2 k^{2}+11 k +14\right)}$$

- Solution for $r =0$

  $$\left[y \left(u \right)=\sum_{k =0}^{\infty}a_{k} u^{k}, a_{k +2}=-\frac{2 k^{2} a_{k}-8 k^{2} a_{k +1}+3 k a_{k}-28 k a_{k +1}+a_{k}-21 a_{k +1}}{4 \left(2 k^{2}+11 k +14\right)}, 20 a_{1}-a_{0}=0\right]$$

- Revert the change of variables $u =2+x$

$$\left[y = \sum_{k=0}^{\infty} a_k (2+x)^k, a_{k+2} = -\frac{2k^2 a_k - 8k^2 a_{k+1} + 3k a_k - 28k a_{k+1} + a_k - 21 a_{k+1}}{4(2k^2+11k+14)}, 20a_1 - a_0 = 0\right]$$

- Recursion relation for $r = -\frac{3}{2}$

$$a_{k+2} = -\frac{2k^2 a_k - 8k^2 a_{k+1} - 3k a_k - 4k a_{k+1} + a_k + 3a_{k+1}}{4(2k^2+5k+2)}$$

- Solution for $r = -\frac{3}{2}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{3}{2}}, a_{k+2} = -\frac{2k^2 a_k - 8k^2 a_{k+1} - 3k a_k - 4k a_{k+1} + a_k + 3a_{k+1}}{4(2k^2+5k+2)}, -4a_1 - a_0 = 0\right]$$

- Revert the change of variables $u = 2 + x$

$$\left[y = \sum_{k=0}^{\infty} a_k (2+x)^{k-\frac{3}{2}}, a_{k+2} = -\frac{2k^2 a_k - 8k^2 a_{k+1} - 3k a_k - 4k a_{k+1} + a_k + 3a_{k+1}}{4(2k^2+5k+2)}, -4a_1 - a_0 = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k (2+x)^k\right) + \left(\sum_{k=0}^{\infty} b_k (2+x)^{k-\frac{3}{2}}\right), a_{k+2} = -\frac{2k^2 a_k - 8k^2 a_{1+k} + 3k a_k - 28k a_{1+k} + a_k - 21 a_{1+k}}{4(2k^2+11k+14)}, 20a\right.$$

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2\left(-x^2+2\right)y''-2x\left(2x^2+1\right)y'+\left(-2x^2+2\right)y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(-x^4+2x^2\right)y''+\left(-4x^3-2x\right)y'+\left(-2x^2+2\right)y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{4x^2+2}{x\left(x^2-2\right)}$$
$$q(x)=\frac{2x^2-2}{x^2\left(x^2-2\right)}$$

Table 648: Table $p(x), q(x)$ singularites.

$p(x) = \frac{4x^2+2}{x(x^2-2)}$	
singularity	type
$x = 0$	"regular"
$x = \sqrt{2}$	"regular"
$x = -\sqrt{2}$	"regular"

$q(x) = \frac{2x^2-2}{x^2(x^2-2)}$	
singularity	type
$x = 0$	"regular"
$x = \sqrt{2}$	"regular"
$x = -\sqrt{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \sqrt{2}, -\sqrt{2}, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-y''x^2(x^2-2) + (-4x^3-2x)\, y' + (-2x^2+2)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) x^2 (x^2-2) + (-4x^3-2x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (-2x^2+2)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=0}^{\infty}\left(-x^{n+r+2} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty}\left(-4x^{n+r+2} a_n (n+r)\right)+\sum_{n=0}^{\infty}\left(-2x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty}\left(-2x^{n+r+2} a_n\right)+\left(\sum_{n=0}^{\infty} 2a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty}\left(-x^{n+r+2} a_n (n+r)(n+r-1)\right) = \sum_{n=2}^{\infty}\left(-a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty}\left(-4x^{n+r+2} a_n (n+r)\right) = \sum_{n=2}^{\infty}\left(-4a_{n-2}(n+r-2)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty}\left(-2x^{n+r+2} a_n\right) = \sum_{n=2}^{\infty}\left(-2a_{n-2} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\sum_{n=2}^{\infty}\left(-a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=2}^{\infty}\left(-4a_{n-2}(n+r-2)\, x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-2x^{n+r} a_n (n+r)\right) + \sum_{n=2}^{\infty}\left(-2a_{n-2} x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 2a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$2x^{n+r} a_n (n+r)(n+r-1) - 2x^{n+r} a_n (n+r) + 2a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$2x^r a_0 r(-1+r) - 2x^r a_0 r + 2a_0 x^r = 0$$

Or

$$(2x^r r(-1+r) - 2x^r r + 2x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$2x^r (-1+r)^2 = 0$$

Since the above is true for all x then the indicial equation becomes

$$2(-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$2x^r (-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+1}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+1}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &-a_{n-2}(n+r-2)(n-3+r) + 2a_n(n+r)(n+r-1) \\ &- 4a_{n-2}(n+r-2) - 2a_n(n+r) - 2a_{n-2} + 2a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{(n+r)\, a_{n-2}}{2n+2r-2} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = \frac{(n+1)\, a_{n-2}}{2n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{2+r}{2+2r}$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{3}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2+r}{2+2r}$	$\frac{3}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2+r}{2+2r}$	$\frac{3}{4}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 + 6r + 8}{4\left(3 + r\right)\left(1 + r\right)}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{15}{32}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2+r}{2+2r}$	$\frac{3}{4}$
a_3	0	0
a_4	$\frac{r^2+6r+8}{4(3+r)(1+r)}$	$\frac{15}{32}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2+r}{2+2r}$	$\frac{3}{4}$
a_3	0	0
a_4	$\frac{r^2+6r+8}{4(3+r)(1+r)}$	$\frac{15}{32}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= x\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x\left(1 + \frac{3x^2}{4} + \frac{15x^4}{32} + O(x^6)\right)
\end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r = 1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{2+r}{2+2r}$	$\frac{3}{4}$	$-\frac{1}{2(1+r)^2}$	$-\frac{1}{8}$
b_3	0	0	0	0
b_4	$\frac{r^2+6r+8}{4(3+r)(1+r)}$	$\frac{15}{32}$	$\frac{-r^2-5r-7}{2(1+r)^2(3+r)^2}$	$-\frac{13}{128}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= x\left(1+\frac{3x^2}{4}+\frac{15x^4}{32}+O(x^6)\right)\ln(x) + x\left(-\frac{x^2}{8}-\frac{13x^4}{128}+O(x^6)\right)
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x\left(1+\frac{3x^2}{4}+\frac{15x^4}{32}+O(x^6)\right) \\
&\quad + c_2\left(x\left(1+\frac{3x^2}{4}+\frac{15x^4}{32}+O(x^6)\right)\ln(x) + x\left(-\frac{x^2}{8}-\frac{13x^4}{128}+O(x^6)\right)\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x\left(1+\frac{3x^2}{4}+\frac{15x^4}{32}+O(x^6)\right) \\
&\quad + c_2\left(x\left(1+\frac{3x^2}{4}+\frac{15x^4}{32}+O(x^6)\right)\ln(x) + x\left(-\frac{x^2}{8}-\frac{13x^4}{128}+O(x^6)\right)\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y &= c_1 x\left(1+\frac{3x^2}{4}+\frac{15x^4}{32}+O(x^6)\right) \\
&\quad + c_2\left(x\left(1+\frac{3x^2}{4}+\frac{15x^4}{32}+O(x^6)\right)\ln(x) + x\left(-\frac{x^2}{8}-\frac{13x^4}{128}+O(x^6)\right)\right)
\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}
y &= c_1 x\left(1+\frac{3x^2}{4}+\frac{15x^4}{32}+O(x^6)\right) \\
&\quad + c_2\left(x\left(1+\frac{3x^2}{4}+\frac{15x^4}{32}+O(x^6)\right)\ln(x) + x\left(-\frac{x^2}{8}-\frac{13x^4}{128}+O(x^6)\right)\right)
\end{aligned}$$

Verified OK.

15.3.1 Maple step by step solution

Let's solve

$-y''x^2(x^2-2)+(-4x^3-2x)\,y'+(-2x^2+2)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{2(x^2-1)y}{x^2(x^2-2)}-\frac{2(2x^2+1)y'}{x(x^2-2)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{2(2x^2+1)y'}{x(x^2-2)}+\frac{2(x^2-1)y}{x^2(x^2-2)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{2(2x^2+1)}{x(x^2-2)},P_3(x)=\frac{2(x^2-1)}{x^2(x^2-2)}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $\left(x\cdot P_2(x)\right)\bigg|_{x=0}=-1$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $\left(x^2\cdot P_3(x)\right)\bigg|_{x=0}=1$

  - $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $y''x^2(x^2-2)+2x(2x^2+1)\,y'+(2x^2-2)\,y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m\cdot y$ to series expansion for $m=0..2$

    $x^m\cdot y=\sum_{k=0}^{\infty}a_k x^{k+r+m}$

- ◦ Shift index using $k->k-m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- ◦ Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$

- ◦ Shift index using $k->k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- ◦ Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$

- ◦ Shift index using $k->k+2-m$

  $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $-2a_0(-1+r)^2 x^r - 2a_1 r^2 x^{1+r} + \left(\sum_{k=2}^{\infty} \left(-2a_k(k+r-1)^2 + a_{k-2}(k+r)\,(k+r-1)\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-2(-1+r)^2 = 0$

- Values of r that satisfy the indicial equation

  $r = 1$

- Each term must be 0

  $-2a_1 r^2 = 0$

- Solve for the dependent coefficient(s)

  $a_1 = 0$

- Each term in the series must be 0, giving the recursion relation

  $-2a_k(k+r-1)^2 + a_{k-2}(k+r)\,(k+r-1) = 0$

- Shift index using $k->k+2$

  $-2a_{k+2}(k+r+1)^2 + a_k(k+r+2)\,(k+r+1) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = \frac{a_k(k+r+2)}{2(k+r+1)}$

- Recursion relation for $r = 1$

  $a_{k+2} = \frac{a_k(k+3)}{2(k+2)}$

- Solution for $r = 1$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+2} = \frac{a_k(k+3)}{2(k+2)}, a_1 = 0\right]$

Problem number: Example 7.6.4 page 372.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' - x(5-x)\,y' + (9-4x)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + \left(x^2 - 5x\right)y' + (9-4x)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{x-5}{x}$$
$$q(x) = -\frac{4x-9}{x^2}$$

Table 650: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x-5}{x}$	
singularity	type
$x = 0$	"regular"

$q(x) = -\frac{4x-9}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2y'' + (x^2 - 5x)\, y' + (9 - 4x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (x^2 - 5x) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (9 - 4x) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 9a_n x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-4x^{1+n+r} a_n\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-4x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-4a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 9a_n x^{n+r}\right) + \sum_{n=1}^{\infty} \left(-4a_{n-1} x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - 5x^{n+r} a_n (n+r) + 9a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - 5x^r a_0 r + 9a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - 5x^r r + 9x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r-3)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r - 3)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 3$$
$$r_2 = 3$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r - 3)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 3$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+3}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+3}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$a_n(n + r)(n + r - 1) + a_{n-1}(n + r - 1) - 5a_n(n + r) + 9a_n - 4a_{n-1} = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n+r-5)}{n^2+2nr+r^2-6n-6r+9} \tag{4}$$

Which for the root $r = 3$ becomes

$$a_n = -\frac{a_{n-1}(n-2)}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 3$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{4-r}{(r-2)^2}$$

Which for the root $r = 3$ becomes

$$a_1 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{4-r}{(r-2)^2}$	1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(-4+r)(r-3)}{(r-2)^2(-1+r)^2}$$

Which for the root $r = 3$ becomes

$$a_2 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{4-r}{(r-2)^2}$	1
a_2	$\frac{(-4+r)(r-3)}{(r-2)^2(-1+r)^2}$	0

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{(-4+r)(r-3)}{(r-2)(-1+r)^2 r^2}$$

Which for the root $r = 3$ becomes

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{4-r}{(r-2)^2}$	1
a_2	$\frac{(-4+r)(r-3)}{(r-2)^2(-1+r)^2}$	0
a_3	$-\frac{(-4+r)(r-3)}{(r-2)(-1+r)^2r^2}$	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(-4+r)(r-3)}{(-1+r)(r-2)r^2(r+1)^2}$$

Which for the root $r = 3$ becomes

$$a_4 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{4-r}{(r-2)^2}$	1
a_2	$\frac{(-4+r)(r-3)}{(r-2)^2(-1+r)^2}$	0
a_3	$-\frac{(-4+r)(r-3)}{(r-2)(-1+r)^2r^2}$	0
a_4	$\frac{(-4+r)(r-3)}{(-1+r)(r-2)r^2(r+1)^2}$	0

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(-4+r)(r-3)}{(-1+r)(r-2)r(r+1)^2(r+2)^2}$$

Which for the root $r = 3$ becomes

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{4-r}{(r-2)^2}$	1
a_2	$\frac{(-4+r)(r-3)}{(r-2)^2(-1+r)^2}$	0
a_3	$-\frac{(-4+r)(r-3)}{(r-2)(-1+r)^2 r^2}$	0
a_4	$\frac{(-4+r)(r-3)}{(-1+r)(r-2)r^2(r+1)^2}$	0
a_5	$-\frac{(-4+r)(r-3)}{(-1+r)(r-2)r(r+1)^2(r+2)^2}$	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= x^3\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^3\left(x + 1 + O(x^6)\right)
\end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 3$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$	$b_n(r=3)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	$\frac{4-r}{(r-2)^2}$	1	$\frac{r-6}{(r-2)^3}$	-3
b_2	$\frac{(-4+r)(r-3)}{(r-2)^2(-1+r)^2}$	0	$\frac{-2r^3+21r^2-65r+58}{(r-2)^3(-1+r)^3}$	$-\frac{1}{4}$
b_3	$-\frac{(-4+r)(r-3)}{(r-2)(-1+r)^2r^2}$	0	$\frac{3r^4-33r^3+116r^2-146r+48}{(r-2)^2(-1+r)^3r^3}$	$\frac{1}{36}$
b_4	$\frac{(-4+r)(r-3)}{(-1+r)(r-2)r^2(r+1)^2}$	0	$\frac{-4r^5+42r^4-136r^3+132r^2+26r-48}{(-1+r)^2(r-2)^2r^3(r+1)^3}$	$-\frac{1}{288}$
b_5	$-\frac{(-4+r)(r-3)}{(-1+r)(r-2)r(r+1)^2(r+2)^2}$	0	$\frac{5r^6-45r^5+95r^4+75r^3-286r^2+72r+48}{(-1+r)^2(r-2)^2r^2(r+1)^3(r+2)^3}$	$\frac{1}{2400}$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6\dots \\
&= x^3(x+1+O(x^6))\ln(x) + x^3\left(-3x - \frac{x^2}{4} + \frac{x^3}{36} - \frac{x^4}{288} + \frac{x^5}{2400} + O(x^6)\right)
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1y_1(x) + c_2y_2(x) \\
&= c_1x^3(x+1+O(x^6)) \\
&\quad + c_2\left(x^3(x+1+O(x^6))\ln(x) + x^3\left(-3x - \frac{x^2}{4} + \frac{x^3}{36} - \frac{x^4}{288} + \frac{x^5}{2400} + O(x^6)\right)\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1x^3(x+1+O(x^6)) \\
&\quad + c_2\left(x^3(x+1+O(x^6))\ln(x) + x^3\left(-3x - \frac{x^2}{4} + \frac{x^3}{36} - \frac{x^4}{288} + \frac{x^5}{2400} + O(x^6)\right)\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y &= c_1x^3(x+1+O(x^6)) \\
&\quad + c_2\left(x^3(x+1+O(x^6))\ln(x) + x^3\left(-3x - \frac{x^2}{4} + \frac{x^3}{36} - \frac{x^4}{288} + \frac{x^5}{2400} + O(x^6)\right)\right)
\end{aligned} \tag{1}$$

Verification of solutions

$$y = c_1 x^3 \left(x + 1 + O(x^6)\right) + c_2 \left(x^3 \left(x + 1 + O(x^6)\right) \ln(x) + x^3 \left(-3x - \frac{x^2}{4} + \frac{x^3}{36} - \frac{x^4}{288} + \frac{x^5}{2400} + O(x^6)\right)\right)$$

Verified OK.

15.4.1 Maple step by step solution

Let's solve

$x^2 y'' + (x^2 - 5x) y' + (9 - 4x) y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(4x-9)y}{x^2} - \frac{(x-5)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x-5)y'}{x} - \frac{(4x-9)y}{x^2} = 0$

☐ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{x-5}{x}, P_3(x) = -\frac{4x-9}{x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\Big|_{x=0} = -5$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\Big|_{x=0} = 9$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2 y'' + x(x - 5) y' + (9 - 4x) y = 0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k->k-m$

  $$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

  $$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- Shift index using $k->k+1-m$

  $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

  $$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(-3+r)^2\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(k+r-3)^2 + a_{k-1}(k-5+r)\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(-3+r)^2 = 0$$

- Values of r that satisfy the indicial equation

  $$r = 3$$

- Each term in the series must be 0, giving the recursion relation

  $$a_k(k+r-3)^2 + a_{k-1}(k-5+r) = 0$$

- Shift index using $k->k+1$

  $$a_{k+1}(k-2+r)^2 + a_k(k+r-4) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+1} = -\frac{a_k(k+r-4)}{(k-2+r)^2}$$

- Recursion relation for $r = 3$; series terminates at $k = 1$

$a_{k+1} = -\frac{a_k(k-1)}{(k+1)^2}$

- Apply recursion relation for $k = 0$

  $a_1 = a_0$

- Terminating series solution of the ODE for $r = 3$. Use reduction of order to find the second li

  $y = a_0 \cdot (x+1)$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + \left(x^2 - x\right)y' + \left(-x^2+1\right)y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{x-1}{x}$$
$$q(x) = -\frac{x^2-1}{x^2}$$

Table 652: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x-1}{x}$	
singularity	type
$x = 0$	"regular"

$q(x) = -\frac{x^2-1}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2y'' + (x^2 - x)\, y' + (-x^2 + 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}\right) + (x^2 - x) \left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) + (-x^2 + 1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} a_{n-1} (n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-x^{n+r+2} a_n\right) = \sum_{n=2}^{\infty} \left(-a_{n-2} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} a_{n-1} (n+r-1)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \sum_{n=2}^{\infty} \left(-a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^r (-1+r)^2 = 0$$

Since the above is true for all x then the indicial equation becomes

$$(-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^r (-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{1+n}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{1+n}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -\frac{1}{r}$$

For $2 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) + a_{n-1}(n+r-1) - a_n(n+r) - a_{n-2} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{n a_{n-1} + r a_{n-1} - a_{n-2} - a_{n-1}}{n^2 + 2nr + r^2 - 2n - 2r + 1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = \frac{-n a_{n-1} + a_{n-2}}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r}$	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{2r+1}{r(1+r)^2}$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{3}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r}$	-1
a_2	$\frac{2r+1}{r(1+r)^2}$	$\frac{3}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-3r^2 - 7r - 3}{r(1+r)^2(r+2)^2}$$

Which for the root $r = 1$ becomes

$$a_3 = -\frac{13}{36}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r}$	-1
a_2	$\frac{2r+1}{r(1+r)^2}$	$\frac{3}{4}$
a_3	$\frac{-3r^2-7r-3}{r(1+r)^2(r+2)^2}$	$-\frac{13}{36}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{5r^3 + 25r^2 + 36r + 13}{r(1+r)^2 (r+2)^2 (r+3)^2}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{79}{576}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r}$	-1
a_2	$\frac{2r+1}{r(1+r)^2}$	$\frac{3}{4}$
a_3	$\frac{-3r^2-7r-3}{r(1+r)^2(r+2)^2}$	$-\frac{13}{36}$
a_4	$\frac{5r^3+25r^2+36r+13}{r(1+r)^2(r+2)^2(r+3)^2}$	$\frac{79}{576}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-8r^4 - 70r^3 - 208r^2 - 238r - 79}{r(1+r)^2 (r+2)^2 (r+3)^2 (r+4)^2}$$

Which for the root $r = 1$ becomes

$$a_5 = -\frac{67}{1600}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r}$	-1
a_2	$\frac{2r+1}{r(1+r)^2}$	$\frac{3}{4}$
a_3	$\frac{-3r^2-7r-3}{r(1+r)^2(r+2)^2}$	$-\frac{13}{36}$
a_4	$\frac{5r^3+25r^2+36r+13}{r(1+r)^2(r+2)^2(r+3)^2}$	$\frac{79}{576}$
a_5	$\frac{-8r^4-70r^3-208r^2-238r-79}{r(1+r)^2(r+2)^2(r+3)^2(r+4)^2}$	$-\frac{67}{1600}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{13r^5 + 175r^4 + 874r^3 + 1979r^2 + 1949r + 603}{r(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$$

Which for the root $r = 1$ becomes

$$a_6 = \frac{5593}{518400}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r}$	-1
a_2	$\frac{2r+1}{r(1+r)^2}$	$\frac{3}{4}$
a_3	$\frac{-3r^2-7r-3}{r(1+r)^2(r+2)^2}$	$-\frac{13}{36}$
a_4	$\frac{5r^3+25r^2+36r+13}{r(1+r)^2(r+2)^2(r+3)^2}$	$\frac{79}{576}$
a_5	$\frac{-8r^4-70r^3-208r^2-238r-79}{r(1+r)^2(r+2)^2(r+3)^2(r+4)^2}$	$-\frac{67}{1600}$
a_6	$\frac{13r^5+175r^4+874r^3+1979r^2+1949r+603}{r(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$\frac{5593}{518400}$

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{-21r^6 - 403r^5 - 3032r^4 - 11291r^3 - 21482r^2 - 19037r - 5593}{r(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(r+6)^2}$$

Which for the root $r = 1$ becomes

$$a_7 = -\frac{60859}{25401600}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r}$	-1
a_2	$\frac{2r+1}{r(1+r)^2}$	$\frac{3}{4}$
a_3	$\frac{-3r^2-7r-3}{r(1+r)^2(r+2)^2}$	$-\frac{13}{36}$
a_4	$\frac{5r^3+25r^2+36r+13}{r(1+r)^2(r+2)^2(r+3)^2}$	$\frac{79}{576}$
a_5	$\frac{-8r^4-70r^3-208r^2-238r-79}{r(1+r)^2(r+2)^2(r+3)^2(r+4)^2}$	$-\frac{67}{1600}$
a_6	$\frac{13r^5+175r^4+874r^3+1979r^2+1949r+603}{r(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$\frac{5593}{518400}$
a_7	$\frac{-21r^6-403r^5-3032r^4-11291r^3-21482r^2-19037r-5593}{r(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(r+6)^2}$	$-\frac{60859}{25401600}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned}y_1(x) &= x\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 + a_7x^7 + a_8x^8 \dots\right)\\ &= x\left(1 - x + \frac{3x^2}{4} - \frac{13x^3}{36} + \frac{79x^4}{576} - \frac{67x^5}{1600} + \frac{5593x^6}{518400} - \frac{60859x^7}{25401600} + O(x^8)\right)\end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr}a_{n,r}$$

And the above is then evaluated at $r = 1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$-\frac{1}{r}$	-1	$\frac{1}{r^2}$
b_2	$\frac{2r+1}{r(1+r)^2}$	$\frac{3}{4}$	$\frac{-4r^2-3r-1}{r^2(1+r)^3}$
b_3	$\frac{-3r^2-7r-3}{r(1+r)^2(r+2)^2}$	$-\frac{13}{36}$	$\frac{9r^4+37r^3+51r^2+27r+6}{r^2(1+r)^3(r+2)^3}$
b_4	$\frac{5r^3+25r^2+36r+13}{r(1+r)^2(r+2)^2(r+3)^2}$	$\frac{79}{576}$	$\frac{-20r^6-185r^5-666r^4-1170r^3-1032r^2-429r-78}{r^2(1+r)^3(r+2)^3(r+3)^3}$
b_5	$\frac{-8r^4-70r^3-208r^2-238r-79}{r(1+r)^2(r+2)^2(r+3)^2(r+4)^2}$	$-\frac{67}{1600}$	$\frac{40r^8+660r^7+4536r^6+16804r^5+36255r^4+45890r^3+32633r}{r^2(1+r)^3(r+2)^3(r+3)^3(r+4)^3}$
b_6	$\frac{13r^5+175r^4+874r^3+1979r^2+1949r+603}{r(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$\frac{5593}{518400}$	$\frac{-78r^{10}-2005r^9-22327r^8-141096r^7-556696r^6-1420698r}{r^2(1+r)^3(r+2)^3(r+}$
b_7	$\frac{-21r^6-403r^5-3032r^4-11291r^3-21482r^2-19037r-5593}{r(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(r+6)^2}$	$-\frac{60859}{25401600}$	$\frac{147r^{12}+5429r^{11}+89091r^{10}+856149r^9+5344496r^8+227185}{r^2(}$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \ldots \\
&= x\left(1 - x + \frac{3x^2}{4} - \frac{13x^3}{36} + \frac{79x^4}{576} - \frac{67x^5}{1600} + \frac{5593x^6}{518400} - \frac{60859x^7}{25401600} + O(x^8)\right)\ln(x) \\
&\quad + x\left(-x^2 + x + \frac{65x^3}{108} - \frac{895x^4}{3456} + \frac{12547x^5}{144000} - \frac{41729x^6}{1728000} + \frac{10121677x^7}{1778112000} + O(x^8)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x\left(1 - x + \frac{3x^2}{4} - \frac{13x^3}{36} + \frac{79x^4}{576} - \frac{67x^5}{1600} + \frac{5593x^6}{518400} - \frac{60859x^7}{25401600} + O(x^8)\right) \\
&\quad + c_2\left(x\left(1 - x + \frac{3x^2}{4} - \frac{13x^3}{36} + \frac{79x^4}{576} - \frac{67x^5}{1600} + \frac{5593x^6}{518400} - \frac{60859x^7}{25401600} + O(x^8)\right)\ln(x)\right. \\
&\quad \left. + x\left(-x^2 + x + \frac{65x^3}{108} - \frac{895x^4}{3456} + \frac{12547x^5}{144000} - \frac{41729x^6}{1728000} + \frac{10121677x^7}{1778112000} + O(x^8)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
y = y_h
$$

$$= c_1 x \left(1 - x + \frac{3x^2}{4} - \frac{13x^3}{36} + \frac{79x^4}{576} - \frac{67x^5}{1600} + \frac{5593x^6}{518400} - \frac{60859x^7}{25401600} + O(x^8)\right)$$
$$+ c_2 \left(x \left(1 - x + \frac{3x^2}{4} - \frac{13x^3}{36} + \frac{79x^4}{576} - \frac{67x^5}{1600} + \frac{5593x^6}{518400} - \frac{60859x^7}{25401600} + O(x^8)\right) \ln(x)\right.$$
$$\left. + x \left(-x^2 + x + \frac{65x^3}{108} - \frac{895x^4}{3456} + \frac{12547x^5}{144000} - \frac{41729x^6}{1728000} + \frac{10121677x^7}{1778112000} + O(x^8)\right)\right)$$

Summary

The solution(s) found are the following

$$y = c_1 x \left(1 - x + \frac{3x^2}{4} - \frac{13x^3}{36} + \frac{79x^4}{576} - \frac{67x^5}{1600} + \frac{5593x^6}{518400} - \frac{60859x^7}{25401600} + O(x^8)\right)$$
$$+ c_2 \left(x \left(1 - x + \frac{3x^2}{4} - \frac{13x^3}{36} + \frac{79x^4}{576} - \frac{67x^5}{1600} + \frac{5593x^6}{518400} - \frac{60859x^7}{25401600} + O(x^8)\right) \ln(x)\right.$$
$$\left. + x \left(-x^2 + x + \frac{65x^3}{108} - \frac{895x^4}{3456} + \frac{12547x^5}{144000} - \frac{41729x^6}{1728000} + \frac{10121677x^7}{1778112000} + O(x^8)\right)\right) \tag{1}$$

Verification of solutions

$$y = c_1 x \left(1 - x + \frac{3x^2}{4} - \frac{13x^3}{36} + \frac{79x^4}{576} - \frac{67x^5}{1600} + \frac{5593x^6}{518400} - \frac{60859x^7}{25401600} + O(x^8)\right)$$
$$+ c_2 \left(x \left(1 - x + \frac{3x^2}{4} - \frac{13x^3}{36} + \frac{79x^4}{576} - \frac{67x^5}{1600} + \frac{5593x^6}{518400} - \frac{60859x^7}{25401600} + O(x^8)\right) \ln(x)\right.$$
$$\left. + x \left(-x^2 + x + \frac{65x^3}{108} - \frac{895x^4}{3456} + \frac{12547x^5}{144000} - \frac{41729x^6}{1728000} + \frac{10121677x^7}{1778112000} + O(x^8)\right)\right)$$

Verified OK.

15.5.1 Maple step by step solution

Let's solve

$x^2 y'' + (x^2 - x) y' + (-x^2 + 1) y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(x^2-1)y}{x^2} - \frac{(x-1)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x-1)y'}{x} - \frac{(x^2-1)y}{x^2} = 0$

- ☐ Check to see if $x_0 = 0$ is a regular singular point
  - Define functions

    $\left[P_2(x) = \frac{x-1}{x}, P_3(x) = -\frac{x^2-1}{x^2}\right]$
  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $\left(x \cdot P_2(x)\right)\bigg|_{x=0} = -1$
  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = 1$
  - $x = 0$is a regular singular point

    Check to see if $x_0 = 0$ is a regular singular point

    $x_0 = 0$
- Multiply by denominators

  $x^2 y'' + x(x-1)\, y' + (-x^2+1)\, y = 0$
- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$
- ☐ Rewrite ODE with series expansions
  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$
  - Shift index using $k- >k-m$

    $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$
  - Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$
  - Shift index using $k- >k+1-m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$
  - Convert $x^2 \cdot y''$ to series expansion

$$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)(k+r-1) x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(-1+r)^2 x^r + (a_1 r^2 + a_0 r) x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k (k+r-1)^2 + a_{k-1}(k+r-1) - a_{k-2}\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(-1+r)^2 = 0$$

- Values of r that satisfy the indicial equation

$$r = 1$$

- Each term must be 0

$$a_1 r^2 + a_0 r = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = -\frac{a_0}{r}$$

- Each term in the series must be 0, giving the recursion relation

$$a_k (k+r-1)^2 + a_{k-1}(k+r-1) - a_{k-2} = 0$$

- Shift index using $k- >k+2$

$$a_{k+2}(k+1+r)^2 + a_{k+1}(k+1+r) - a_k = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{k a_{k+1} + r a_{k+1} - a_k + a_{k+1}}{(k+1+r)^2}$$

- Recursion relation for $r = 1$

$$a_{k+2} = -\frac{k a_{k+1} - a_k + 2 a_{k+1}}{(k+2)^2}$$

- Solution for $r = 1$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+2} = -\frac{k a_{k+1} - a_k + 2 a_{k+1}}{(k+2)^2}, a_1 = -a_0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 2.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x^2(2x^2+x+1)\,y''+x(7x^2+6x+3)\,y'+(-3x^2+6x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(2x^4+x^3+x^2)\,y''+(7x^3+6x^2+3x)\,y'+(-3x^2+6x+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{7x^2+6x+3}{x\,(2x^2+x+1)}$$
$$q(x)=-\frac{3x^2-6x-1}{x^2\,(2x^2+x+1)}$$

Table 654: Table $p(x), q(x)$ singularites.

$p(x) = \frac{7x^2+6x+3}{x(2x^2+x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{7}}{4} - \frac{1}{4}$	"regular"
$x = \frac{i\sqrt{7}}{4} - \frac{1}{4}$	"regular"

$q(x) = -\frac{3x^2-6x-1}{x^2(2x^2+x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{7}}{4} - \frac{1}{4}$	"regular"
$x = \frac{i\sqrt{7}}{4} - \frac{1}{4}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{i\sqrt{7}}{4} - \frac{1}{4}, \frac{i\sqrt{7}}{4} - \frac{1}{4}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(2x^2 + x + 1)\, y'' + (7x^3 + 6x^2 + 3x)\, y' + (-3x^2 + 6x + 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(2x^2 + x + 1)\left(\sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}\right) + (7x^3+6x^2+3x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (-3x^2+6x+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}&\left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r)(n+r-1)\right)\\&+\left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 7x^{n+r+2} a_n(n+r)\right)\\&+\left(\sum_{n=0}^{\infty} 6x^{1+n+r} a_n(n+r)\right)+\left(\sum_{n=0}^{\infty} 3x^{n+r} a_n(n+r)\right)\\&+\sum_{n=0}^{\infty}\left(-3x^{n+r+2} a_n\right)+\left(\sum_{n=0}^{\infty} 6x^{1+n+r} a_n\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)=0\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n(n+r)(n+r-1)=\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r)(n+r-1)=\sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 7x^{n+r+2} a_n(n+r)=\sum_{n=2}^{\infty} 7a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 6x^{1+n+r} a_n(n+r)=\sum_{n=1}^{\infty} 6a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty}\left(-3x^{n+r+2} a_n\right)=\sum_{n=2}^{\infty}\left(-3a_{n-2} x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} 6x^{1+n+r} a_n=\sum_{n=1}^{\infty} 6a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\,(n-3+r)\,x^{n+r}\right) + \left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r}a_n(n+r)\,(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 7a_{n-2}(n+r-2)\,x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 6a_{n-1}(n+r-1)\,x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r}a_n(n+r)\right) + \sum_{n=2}^{\infty}\left(-3a_{n-2}x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 6a_{n-1}x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r}a_n(n+r)\,(n+r-1) + 3x^{n+r}a_n(n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) + 3x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + 3x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r+1)^2\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r+1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -1$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r+1)^2\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-1}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-1}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = \frac{-r-3}{r+2}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} 2a_{n-2}(n+r-2)(n-3+r) + a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ + 7a_{n-2}(n+r-2) + 6a_{n-1}(n+r-1) + 3a_n(n+r) - 3a_{n-2} + 6a_{n-1} + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{2na_{n-2} + na_{n-1} + 2ra_{n-2} + ra_{n-1} - 5a_{n-2} + 2a_{n-1}}{1+n+r} \tag{4}$$

Which for the root $r = -1$ becomes

$$a_n = \frac{(-2a_{n-2} - a_{n-1})\, n + 7a_{n-2} - a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r+2}$	-2

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-r^2 + 4r + 14}{(r+2)(r+3)}$$

Which for the root $r = -1$ becomes

$$a_2 = \frac{9}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r+2}$	-2
a_2	$\frac{-r^2+4r+14}{(r+2)(r+3)}$	$\frac{9}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{3r^3 + 14r^2 - 10r - 61}{(4+r)(r+2)(r+3)}$$

Which for the root $r = -1$ becomes

$$a_3 = -\frac{20}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r+2}$	-2
a_2	$\frac{-r^2+4r+14}{(r+2)(r+3)}$	$\frac{9}{2}$
a_3	$\frac{3r^3+14r^2-10r-61}{(4+r)(r+2)(r+3)}$	$-\frac{20}{3}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{-r^4 - 29r^3 - 134r^2 - 81r + 198}{(r+2)(r+3)(4+r)(5+r)}$$

Which for the root $r = -1$ becomes

$$a_4 = \frac{173}{24}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r+2}$	-2
a_2	$\frac{-r^2+4r+14}{(r+2)(r+3)}$	$\frac{9}{2}$
a_3	$\frac{3r^3+14r^2-10r-61}{(4+r)(r+2)(r+3)}$	$-\frac{20}{3}$
a_4	$\frac{-r^4-29r^3-134r^2-81r+198}{(r+2)(r+3)(4+r)(5+r)}$	$\frac{173}{24}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-5r^5 - 37r^4 + 72r^3 + 941r^2 + 1534r + 139}{(r+2)(r+3)(4+r)(5+r)(6+r)}$$

Which for the root $r = -1$ becomes

$$a_5 = -\frac{93}{20}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r+2}$	-2
a_2	$\frac{-r^2+4r+14}{(r+2)(r+3)}$	$\frac{9}{2}$
a_3	$\frac{3r^3+14r^2-10r-61}{(4+r)(r+2)(r+3)}$	$-\frac{20}{3}$
a_4	$\frac{-r^4-29r^3-134r^2-81r+198}{(r+2)(r+3)(4+r)(5+r)}$	$\frac{173}{24}$
a_5	$\frac{-5r^5-37r^4+72r^3+941r^2+1534r+139}{(r+2)(r+3)(4+r)(5+r)(6+r)}$	$-\frac{93}{20}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{7r^6 + 154r^5 + 1085r^4 + 2409r^3 - 2291r^2 - 12771r - 9428}{(7 + r)(r + 2)(r + 3)(4 + r)(5 + r)(6 + r)}$$

Which for the root $r = -1$ becomes

$$a_6 = -\frac{419}{720}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r+2}$	-2
a_2	$\frac{-r^2+4r+14}{(r+2)(r+3)}$	$\frac{9}{2}$
a_3	$\frac{3r^3+14r^2-10r-61}{(4+r)(r+2)(r+3)}$	$-\frac{20}{3}$
a_4	$\frac{-r^4-29r^3-134r^2-81r+198}{(r+2)(r+3)(4+r)(5+r)}$	$\frac{173}{24}$
a_5	$\frac{-5r^5-37r^4+72r^3+941r^2+1534r+139}{(r+2)(r+3)(4+r)(5+r)(6+r)}$	$-\frac{93}{20}$
a_6	$\frac{7r^6+154r^5+1085r^4+2409r^3-2291r^2-12771r-9428}{(7+r)(r+2)(r+3)(4+r)(5+r)(6+r)}$	$-\frac{419}{720}$

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{3r^7 - 28r^6 - 1449r^5 - 13381r^4 - 48637r^3 - 61453r^2 + 24528r + 76095}{(8 + r)(r + 2)(r + 3)(4 + r)(5 + r)(6 + r)(7 + r)}$$

Which for the root $r = -1$ becomes

$$a_7 = \frac{6697}{1260}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r+2}$	-2
a_2	$\frac{-r^2+4r+14}{(r+2)(r+3)}$	$\frac{9}{2}$
a_3	$\frac{3r^3+14r^2-10r-61}{(4+r)(r+2)(r+3)}$	$-\frac{20}{3}$
a_4	$\frac{-r^4-29r^3-134r^2-81r+198}{(r+2)(r+3)(4+r)(5+r)}$	$\frac{173}{24}$
a_5	$\frac{-5r^5-37r^4+72r^3+941r^2+1534r+139}{(r+2)(r+3)(4+r)(5+r)(6+r)}$	$-\frac{93}{20}$
a_6	$\frac{7r^6+154r^5+1085r^4+2409r^3-2291r^2-12771r-9428}{(7+r)(r+2)(r+3)(4+r)(5+r)(6+r)}$	$-\frac{419}{720}$
a_7	$\frac{3r^7-28r^6-1449r^5-13381r^4-48637r^3-61453r^2+24528r+76095}{(8+r)(r+2)(r+3)(4+r)(5+r)(6+r)(7+r)}$	$\frac{6697}{1260}$

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \frac{1}{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 \dots\right) \\
&= \frac{1 - 2x + \frac{9x^2}{2} - \frac{20x^3}{3} + \frac{173x^4}{24} - \frac{93x^5}{20} - \frac{419x^6}{720} + \frac{6697x^7}{1260} + O(x^8)}{x}
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = -1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{-r-3}{r+2}$	-2	$\frac{1}{(r+2)^{2}}$
b_2	$\frac{-r^{2}+4r+14}{(r+2)(r+3)}$	$\frac{9}{2}$	$\frac{-9r^{2}-40r-46}{(r+2)^{2}(r+3)^{2}}$
b_3	$\frac{3r^{3}+14r^{2}-10r-61}{(4+r)(r+2)(r+3)}$	$-\frac{20}{3}$	$\frac{13r^{4}+176r^{3}+853r^{2}+1770r+1346}{(r+2)^{2}(r+3)^{2}(4+r)^{2}}$
b_4	$\frac{-r^{4}-29r^{3}-134r^{2}-81r+198}{(r+2)(r+3)(4+r)(5+r)}$	$\frac{173}{24}$	$\frac{15r^{6}+126r^{5}-402r^{4}-7936r^{3}-33641r^{2}-60276r-40212}{(r+2)^{2}(r+3)^{2}(4+r)^{2}(5+r)^{2}}$
b_5	$\frac{-5r^{5}-37r^{4}+72r^{3}+941r^{2}+1534r+139}{(r+2)(r+3)(4+r)(5+r)(6+r)}$	$-\frac{93}{20}$	$\frac{-63r^{8}-1694r^{7}-18698r^{6}-107576r^{5}-330714r^{4}-442884r^{3}}{(r+2)^{2}(r+3)^{2}(4+r)^{2}(5+r)^{2}(6}$
b_6	$\frac{7r^{6}+154r^{5}+1085r^{4}+2409r^{3}-2291r^{2}-12771r-9428}{(7+r)(r+2)(r+3)(4+r)(5+r)(6+r)}$	$-\frac{419}{720}$	$\frac{35r^{10}+1960r^{9}+43873r^{8}+534810r^{7}+3984324r^{6}+1902013}{(7+r)^{2}(r+2)^{2}(}$
b_7	$\frac{3r^{7}-28r^{6}-1449r^{5}-13381r^{4}-48637r^{3}-61453r^{2}+24528r+76095}{(8+r)(r+2)(r+3)(4+r)(5+r)(6+r)(7+r)}$	$\frac{6697}{1260}$	$\frac{133r^{12}+5964r^{11}+112775r^{10}+1126906r^{9}+5604900r^{8}+544}{}$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \dots \\
&= \frac{\left(1-2x+\frac{9x^2}{2}-\frac{20x^3}{3}+\frac{173x^4}{24}-\frac{93x^5}{20}-\frac{419x^6}{720}+\frac{6697x^7}{1260}+O(x^8)\right)\ln(x)}{x} \\
&+ \frac{x-\frac{15x^2}{4}+\frac{133x^3}{18}-\frac{3077x^4}{288}+\frac{4217x^5}{400}-\frac{70949x^6}{14400}-\frac{125221x^7}{29400}+O(x^8)}{x}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= \frac{c_1\left(1-2x+\frac{9x^2}{2}-\frac{20x^3}{3}+\frac{173x^4}{24}-\frac{93x^5}{20}-\frac{419x^6}{720}+\frac{6697x^7}{1260}+O(x^8)\right)}{x} \\
&+ c_2\left(\frac{\left(1-2x+\frac{9x^2}{2}-\frac{20x^3}{3}+\frac{173x^4}{24}-\frac{93x^5}{20}-\frac{419x^6}{720}+\frac{6697x^7}{1260}+O(x^8)\right)\ln(x)}{x}\right. \\
&\left. + \frac{x-\frac{15x^2}{4}+\frac{133x^3}{18}-\frac{3077x^4}{288}+\frac{4217x^5}{400}-\frac{70949x^6}{14400}-\frac{125221x^7}{29400}+O(x^8)}{x}\right)
\end{aligned}
$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= \frac{c_1\left(1-2x+\frac{9x^2}{2}-\frac{20x^3}{3}+\frac{173x^4}{24}-\frac{93x^5}{20}-\frac{419x^6}{720}+\frac{6697x^7}{1260}+O(x^8)\right)}{x} \\ &\quad + c_2\left(\frac{\left(1-2x+\frac{9x^2}{2}-\frac{20x^3}{3}+\frac{173x^4}{24}-\frac{93x^5}{20}-\frac{419x^6}{720}+\frac{6697x^7}{1260}+O(x^8)\right)\ln(x)}{x}\right. \\ &\quad \left.+\frac{x-\frac{15x^2}{4}+\frac{133x^3}{18}-\frac{3077x^4}{288}+\frac{4217x^5}{400}-\frac{70949x^6}{14400}-\frac{125221x^7}{29400}+O(x^8)}{x}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y &= \frac{c_1\left(1-2x+\frac{9x^2}{2}-\frac{20x^3}{3}+\frac{173x^4}{24}-\frac{93x^5}{20}-\frac{419x^6}{720}+\frac{6697x^7}{1260}+O(x^8)\right)}{x} \\ &\quad + c_2\left(\frac{\left(1-2x+\frac{9x^2}{2}-\frac{20x^3}{3}+\frac{173x^4}{24}-\frac{93x^5}{20}-\frac{419x^6}{720}+\frac{6697x^7}{1260}+O(x^8)\right)\ln(x)}{x}\right. \\ &\quad \left.+\frac{x-\frac{15x^2}{4}+\frac{133x^3}{18}-\frac{3077x^4}{288}+\frac{4217x^5}{400}-\frac{70949x^6}{14400}-\frac{125221x^7}{29400}+O(x^8)}{x}\right) \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y &= \frac{c_1\left(1-2x+\frac{9x^2}{2}-\frac{20x^3}{3}+\frac{173x^4}{24}-\frac{93x^5}{20}-\frac{419x^6}{720}+\frac{6697x^7}{1260}+O(x^8)\right)}{x} \\ &\quad + c_2\left(\frac{\left(1-2x+\frac{9x^2}{2}-\frac{20x^3}{3}+\frac{173x^4}{24}-\frac{93x^5}{20}-\frac{419x^6}{720}+\frac{6697x^7}{1260}+O(x^8)\right)\ln(x)}{x}\right. \\ &\quad \left.+\frac{x-\frac{15x^2}{4}+\frac{133x^3}{18}-\frac{3077x^4}{288}+\frac{4217x^5}{400}-\frac{70949x^6}{14400}-\frac{125221x^7}{29400}+O(x^8)}{x}\right) \end{aligned}$$

Verified OK.

15.6.1 Maple step by step solution

Let's solve

$x^2(2x^2+x+1)\,y''+(7x^3+6x^2+3x)\,y'+(-3x^2+6x+1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{(3x^2-6x-1)y}{x^2(2x^2+x+1)}-\frac{(7x^2+6x+3)y'}{x(2x^2+x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(7x^2+6x+3)y'}{x(2x^2+x+1)}-\frac{(3x^2-6x-1)y}{x^2(2x^2+x+1)}=0$

☐ Check to see if x_0 is a regular singular point

- ○ Define functions

  $\left[P_2(x)=\frac{7x^2+6x+3}{x(2x^2+x+1)}, P_3(x)=-\frac{3x^2-6x-1}{x^2(2x^2+x+1)}\right]$

- ○ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left.(x\cdot P_2(x))\right|_{x=0}=3$

- ○ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left.(x^2\cdot P_3(x))\right|_{x=0}=1$

- ○ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $x^2(2x^2+x+1)\,y''+x(7x^2+6x+3)\,y'+(-3x^2+6x+1)\,y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- ○ Convert $x^m\cdot y$ to series expansion for $m=0..2$

  $x^m\cdot y=\sum_{k=0}^{\infty}a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m}x^{k+r}$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..3$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^{m}\cdot y''$ to series expansion for $m=2..4$

  $x^{m}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m}\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}(1+r)^{2} x^{r}+\left(a_{1}(2+r)^{2}+a_{0}(3+r)\,(2+r)\right) x^{1+r}+\left(\sum_{k=2}^{\infty} \left(a_{k}(k+r+1)^{2}+a_{k-1}(k+r+2)\,(k\right.\right.$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $(1+r)^{2}=0$

- Values of r that satisfy the indicial equation

  $r=-1$

- Each term must be 0

  $a_{1}(2+r)^{2}+a_{0}(3+r)\,(2+r)=0$

- Solve for the dependent coefficient(s)

  $a_{1}=-\frac{(3+r)a_{0}}{2+r}$

- Each term in the series must be 0, giving the recursion relation

  $(k+r+1)\left(\left(a_{k}+2a_{k-2}+a_{k-1}\right) k+\left(a_{k}+2a_{k-2}+a_{k-1}\right) r+a_{k}-5a_{k-2}+2a_{k-1}\right)=0$

- Shift index using $k->k+2$

  $(k+r+3)\left(\left(a_{k+2}+2a_{k}+a_{k+1}\right) (k+2)+\left(a_{k+2}+2a_{k}+a_{k+1}\right) r+a_{k+2}-5a_{k}+2a_{k+1}\right)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{2ka_{k}+ka_{k+1}+2ra_{k}+ra_{k+1}-a_{k}+4a_{k+1}}{k+r+3}$

- Recursion relation for $r = -1$

$$a_{k+2} = -\frac{2ka_k + ka_{k+1} - 3a_k + 3a_{k+1}}{k+2}$$

- Solution for $r = -1$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+2} = -\frac{2ka_k + ka_{k+1} - 3a_k + 3a_{k+1}}{k+2}, a_1 = -2a_0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 3.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries], [_2nd_order, _linear, `
   _with_symmetry_[0,F(x)]`]]
```

$$\boxed{x^2(x^2+2x+1)\,y''+x(4x^2+3x+1)\,y'-x(1-2x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The ODE is

$$x^2(x+1)^2\,y''+\left(4x^3+3x^2+x\right)y'+\left(2x^2-x\right)y=0$$

Or

$$x\left(y''x^3+4y'x^2+2x^2y''+2yx+3y'x+y''x-y+y'\right)=0$$

For $x\neq 0$ the above simplifies to

$$y(2x-1)+\left(4x^2+3x+1\right)y'+x(x+1)^2\,y''=0$$

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^4+2x^3+x^2\right)y''+\left(4x^3+3x^2+x\right)y'+\left(2x^2-x\right)y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{4x^2 + 3x + 1}{x (x + 1)^2}$$
$$q(x) = \frac{2x - 1}{x (x + 1)^2}$$

Table 656: Table $p(x), q(x)$ singularites.

$p(x) = \frac{4x^2+3x+1}{x(x+1)^2}$	
singularity	type
$x = -1$	"irregular"
$x = 0$	"regular"

$q(x) = \frac{2x-1}{x(x+1)^2}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty]$

Irregular singular points : $[-1]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2 (x^2 + 2x + 1) y'' + (4x^3 + 3x^2 + x) y' + (2x^2 - x) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$
\begin{aligned}
&x^2\left(x^2+2x+1\right)\left(\sum_{n=0}^{\infty}(n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) \\
&+\left(4x^3+3x^2+x\right)\left(\sum_{n=0}^{\infty}(n+r)\,a_n x^{n+r-1}\right)+\left(2x^2-x\right)\left(\sum_{n=0}^{\infty}a_n x^{n+r}\right)=0
\end{aligned}
\tag{1}
$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty}x^{n+r+2}a_n(n+r)\,(n+r-1)\right)+\left(\sum_{n=0}^{\infty}2x^{1+n+r}a_n(n+r)\,(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)\,(n+r-1)\right)+\left(\sum_{n=0}^{\infty}4x^{n+r+2}a_n(n+r)\right) \\
&+\left(\sum_{n=0}^{\infty}3x^{1+n+r}a_n(n+r)\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)\right) \\
&+\left(\sum_{n=0}^{\infty}2x^{n+r+2}a_n\right)+\sum_{n=0}^{\infty}\left(-x^{1+n+r}a_n\right)=0
\end{aligned}
\tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty}x^{n+r+2}a_n(n+r)\,(n+r-1)=\sum_{n=2}^{\infty}a_{n-2}(n+r-2)\,(n-3+r)\,x^{n+r}
$$

$$
\sum_{n=0}^{\infty}2x^{1+n+r}a_n(n+r)\,(n+r-1)=\sum_{n=1}^{\infty}2a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}
$$

$$
\sum_{n=0}^{\infty}4x^{n+r+2}a_n(n+r)=\sum_{n=2}^{\infty}4a_{n-2}(n+r-2)\,x^{n+r}
$$

$$
\sum_{n=0}^{\infty}3x^{1+n+r}a_n(n+r)=\sum_{n=1}^{\infty}3a_{n-1}(n+r-1)\,x^{n+r}
$$

$$
\sum_{n=0}^{\infty}2x^{n+r+2}a_n=\sum_{n=2}^{\infty}2a_{n-2}x^{n+r}
$$

$$\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 3a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2} x^{n+r}\right) + \sum_{n=1}^{\infty} \left(-a_{n-1} x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r} a_n(n+r)(n+r-1) + x^{n+r} a_n(n+r) = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + x^r a_0 r = 0$$

Or

$$\left(x^r r(-1+r) + x^r r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^r r^2 = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 0$$
$$r_2 = 0$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^r r^2 = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = \frac{-2r+1}{1+r}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-2}(n+r-2)(n-3+r) + 2a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ + 4a_{n-2}(n+r-2) + 3a_{n-1}(n+r-1) + a_n(n+r) + 2a_{n-2} - a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{n a_{n-2} + 2n a_{n-1} + r a_{n-2} + 2r a_{n-1} - a_{n-2} - 3a_{n-1}}{n+r} \tag{4}$$

Which for the root $r = 0$ becomes

$$a_n = \frac{(-a_{n-2} - 2a_{n-1}) n + a_{n-2} + 3a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 0$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{1+r}$	1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{3r^2 - 2r - 2}{(2+r)(1+r)}$$

Which for the root $r = 0$ becomes

$$a_2 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{1+r}$	1
a_2	$\frac{3r^2-2r-2}{(2+r)(1+r)}$	-1

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-4r^3 + 2r^2 + 14r + 2}{(1+r)(2+r)(3+r)}$$

Which for the root $r = 0$ becomes

$$a_3 = \frac{1}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{1+r}$	1
a_2	$\frac{3r^2-2r-2}{(2+r)(1+r)}$	-1
a_3	$\frac{-4r^3+2r^2+14r+2}{(1+r)(2+r)(3+r)}$	$\frac{1}{3}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{5r^4 - 51r^2 - 44r + 8}{(4+r)(1+r)(2+r)(3+r)}$$

Which for the root $r = 0$ becomes

$$a_4 = \frac{1}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{1+r}$	1
a_2	$\frac{3r^2-2r-2}{(2+r)(1+r)}$	-1
a_3	$\frac{-4r^3+2r^2+14r+2}{(1+r)(2+r)(3+r)}$	$\frac{1}{3}$
a_4	$\frac{5r^4-51r^2-44r+8}{(4+r)(1+r)(2+r)(3+r)}$	$\frac{1}{3}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-6r^5 - 5r^4 + 136r^3 + 299r^2 + 52r - 88}{(1+r)(2+r)(3+r)(4+r)(5+r)}$$

Which for the root $r = 0$ becomes

$$a_5 = -\frac{11}{15}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{1+r}$	1
a_2	$\frac{3r^2-2r-2}{(2+r)(1+r)}$	-1
a_3	$\frac{-4r^3+2r^2+14r+2}{(1+r)(2+r)(3+r)}$	$\frac{1}{3}$
a_4	$\frac{5r^4-51r^2-44r+8}{(4+r)(1+r)(2+r)(3+r)}$	$\frac{1}{3}$
a_5	$\frac{-6r^5-5r^4+136r^3+299r^2+52r-88}{(1+r)(2+r)(3+r)(4+r)(5+r)}$	$-\frac{11}{15}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{7r^6 + 14r^5 - 301r^4 - 1268r^3 - 1088r^2 + 728r + 592}{(6+r)(1+r)(2+r)(3+r)(4+r)(5+r)}$$

Which for the root $r = 0$ becomes

$$a_6 = \frac{37}{45}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{1+r}$	1
a_2	$\frac{3r^2-2r-2}{(2+r)(1+r)}$	-1
a_3	$\frac{-4r^3+2r^2+14r+2}{(1+r)(2+r)(3+r)}$	$\frac{1}{3}$
a_4	$\frac{5r^4-51r^2-44r+8}{(4+r)(1+r)(2+r)(3+r)}$	$\frac{1}{3}$
a_5	$\frac{-6r^5-5r^4+136r^3+299r^2+52r-88}{(1+r)(2+r)(3+r)(4+r)(5+r)}$	$-\frac{11}{15}$
a_6	$\frac{7r^6+14r^5-301r^4-1268r^3-1088r^2+728r+592}{(6+r)(1+r)(2+r)(3+r)(4+r)(5+r)}$	$\frac{37}{45}$

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{-8r^7 - 28r^6 + 588r^5 + 4096r^4 + 7588r^3 - 788r^2 - 10008r - 3344}{(1+r)(2+r)(3+r)(4+r)(5+r)(6+r)(7+r)}$$

Which for the root $r = 0$ becomes

$$a_7 = -\frac{209}{315}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{1+r}$	1
a_2	$\frac{3r^2-2r-2}{(2+r)(1+r)}$	-1
a_3	$\frac{-4r^3+2r^2+14r+2}{(1+r)(2+r)(3+r)}$	$\frac{1}{3}$
a_4	$\frac{5r^4-51r^2-44r+8}{(4+r)(1+r)(2+r)(3+r)}$	$\frac{1}{3}$
a_5	$\frac{-6r^5-5r^4+136r^3+299r^2+52r-88}{(1+r)(2+r)(3+r)(4+r)(5+r)}$	$-\frac{11}{15}$
a_6	$\frac{7r^6+14r^5-301r^4-1268r^3-1088r^2+728r+592}{(6+r)(1+r)(2+r)(3+r)(4+r)(5+r)}$	$\frac{37}{45}$
a_7	$\frac{-8r^7-28r^6+588r^5+4096r^4+7588r^3-788r^2-10008r-3344}{(1+r)(2+r)(3+r)(4+r)(5+r)(6+r)(7+r)}$	$-\frac{209}{315}$

Using the above table, then the first solution $y_1(x)$ becomes

$$
\begin{aligned}
y_1(x) &= a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 \dots \\
&= -x^2 + x + 1 + \frac{x^3}{3} + \frac{x^4}{3} - \frac{11x^5}{15} + \frac{37x^6}{45} - \frac{209x^7}{315} + O(x^8)
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = 0$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{-2r+1}{1+r}$	1	$-\frac{3}{(1+r)^2}$
b_2	$\frac{3r^2-2r-2}{(2+r)(1+r)}$	-1	$\frac{11r^2+16r+2}{(2+r)^2(1+r)^2}$
b_3	$\frac{-4r^3+2r^2+14r+2}{(1+r)(2+r)(3+r)}$	$\frac{1}{3}$	$\frac{-26r^4-116r^3-140r^2+62}{(1+r)^2(2+r)^2(3+r)^2}$
b_4	$\frac{5r^4-51r^2-44r+8}{(4+r)(1+r)(2+r)(3+r)}$	$\frac{1}{3}$	$\frac{50r^6+452r^5+1392r^4+1328r^3-1250r^2-3008r-1456}{(1+r)^2(2+r)^2(3+r)^2(4+r)^2}$
b_5	$\frac{-6r^5-5r^4+136r^3+299r^2+52r-88}{(1+r)(2+r)(3+r)(4+r)(5+r)}$	$-\frac{11}{15}$	$\frac{-85r^8-1292r^7-7412r^6-18004r^5-4425r^4+68568r^3+141626r^2 \ldots}{(1+r)^2(2+r)^2(3+r)^2(4+r)^2(5+r)^2 \ldots}$
b_6	$\frac{7r^6+14r^5-301r^4-1268r^3-1088r^2+728r+592}{(6+r)(1+r)(2+r)(3+r)(4+r)(5+r)}$	$\frac{37}{45}$	$\frac{133r^{10}+3052r^9+28010r^8+123660r^7+195517r^6-532528r^5-32 \ldots}{(1+r)^2(2+r)^2(3+r)^2(4+r) \ldots}$
b_7	$\frac{-8r^7-28r^6+588r^5+4096r^4+7588r^3-788r^2-10008r-3344}{(1+r)(2+r)(3+r)(4+r)(5+r)(6+r)(7+r)}$	$-\frac{209}{315}$	$-\frac{4(49r^{12}+1582r^{11}+21202r^{10}+146524r^9+473440r^8-280982r \ldots}{(1+r)^2(2 \ldots}$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \ldots \\
&= \left(-x^2 + x + 1 + \frac{x^3}{3} + \frac{x^4}{3} - \frac{11x^5}{15} + \frac{37x^6}{45} - \frac{209x^7}{315} + O(x^8)\right)\ln(x) \\
&\quad - 3x + \frac{x^2}{2} + \frac{31x^3}{18} - \frac{91x^4}{36} + \frac{1897x^5}{900} - \frac{301x^6}{300} - \frac{3901x^7}{14700} + O(x^8)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1\left(-x^2 + x + 1 + \frac{x^3}{3} + \frac{x^4}{3} - \frac{11x^5}{15} + \frac{37x^6}{45} - \frac{209x^7}{315} + O(x^8)\right) \\
&\quad + c_2\left(\left(-x^2 + x + 1 + \frac{x^3}{3} + \frac{x^4}{3} - \frac{11x^5}{15} + \frac{37x^6}{45} - \frac{209x^7}{315} + O(x^8)\right)\ln(x) - 3x\right. \\
&\qquad \left. + \frac{x^2}{2} + \frac{31x^3}{18} - \frac{91x^4}{36} + \frac{1897x^5}{900} - \frac{301x^6}{300} - \frac{3901x^7}{14700} + O(x^8)\right)
\end{aligned}
$$

Hence the final solution is

$$
y = y_h
$$

$$= c_1\left(-x^2+x+1+\frac{x^3}{3}+\frac{x^4}{3}-\frac{11x^5}{15}+\frac{37x^6}{45}-\frac{209x^7}{315}+O(x^8)\right) + c_2\left(\left(-x^2+x+1+\frac{x^3}{3}+\frac{x^4}{3}-\frac{11x^5}{15}+\frac{37x^6}{45}-\frac{209x^7}{315}+O(x^8)\right)\ln(x)-3x+\frac{x^2}{2} + \frac{31x^3}{18}-\frac{91x^4}{36}+\frac{1897x^5}{900}-\frac{301x^6}{300}-\frac{3901x^7}{14700}+O(x^8)\right)$$

Summary

The solution(s) found are the following

$$y = c_1\left(-x^2+x+1+\frac{x^3}{3}+\frac{x^4}{3}-\frac{11x^5}{15}+\frac{37x^6}{45}-\frac{209x^7}{315}+O(x^8)\right) + c_2\left(\left(-x^2+x+1+\frac{x^3}{3}+\frac{x^4}{3}-\frac{11x^5}{15}+\frac{37x^6}{45}-\frac{209x^7}{315}+O(x^8)\right)\ln(x)-3x + \frac{x^2}{2}+\frac{31x^3}{18}-\frac{91x^4}{36}+\frac{1897x^5}{900}-\frac{301x^6}{300}-\frac{3901x^7}{14700}+O(x^8)\right) \tag{1}$$

Verification of solutions

$$y = c_1\left(-x^2+x+1+\frac{x^3}{3}+\frac{x^4}{3}-\frac{11x^5}{15}+\frac{37x^6}{45}-\frac{209x^7}{315}+O(x^8)\right) + c_2\left(\left(-x^2+x+1+\frac{x^3}{3}+\frac{x^4}{3}-\frac{11x^5}{15}+\frac{37x^6}{45}-\frac{209x^7}{315}+O(x^8)\right)\ln(x)-3x+\frac{x^2}{2} + \frac{31x^3}{18}-\frac{91x^4}{36}+\frac{1897x^5}{900}-\frac{301x^6}{300}-\frac{3901x^7}{14700}+O(x^8)\right)$$

Verified OK.

15.7.1 Maple step by step solution

Let's solve

$x^2(x^2+2x+1)\,y''+(4x^3+3x^2+x)\,y'+(2x^2-x)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(2x-1)y}{x(x^2+2x+1)}-\frac{(4x^2+3x+1)y'}{x(x^2+2x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(4x^2+3x+1)y'}{x(x^2+2x+1)}+\frac{(2x-1)y}{x(x^2+2x+1)}=0$

- ☐ Check to see if x_0 is a regular singular point
  - Define functions

    $\left[P_2(x)=\frac{4x^2+3x+1}{x(x^2+2x+1)}, P_3(x)=\frac{2x-1}{x(x^2+2x+1)}\right]$
  - $x\cdot P_2(x)$ is analytic at $x=0$

    $\left(x\cdot P_2(x)\right)\Big|_{x=0}=1$
  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $\left(x^2\cdot P_3(x)\right)\Big|_{x=0}=0$
  - $x=0$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0=0$
- Multiply by denominators

  $(x^2+2x+1)\,y''x+(4x^2+3x+1)\,y'+y(2x-1)=0$
- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$
- ☐ Rewrite ODE with series expansions
  - Convert $x^m\cdot y$ to series expansion for $m=0..1$

    $x^m\cdot y=\sum_{k=0}^{\infty} a_k x^{k+r+m}$
  - Shift index using $k->k-m$

    $x^m\cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$
  - Convert $x^m\cdot y'$ to series expansion for $m=0..2$

    $x^m\cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$
  - Shift index using $k->k+1-m$

    $x^m\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$
  - Convert $x^m\cdot y''$ to series expansion for $m=1..3$

$$x^{m}\cdot y''=\sum_{k=0}^{\infty}a_{k}(k+r)\,(k+r-1)\,x^{k+r-2+m}$$

- Shift index using $k->k+2-m$

$$x^{m}\cdot y''=\sum_{k=-2+m}^{\infty}a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$$

Rewrite ODE with series expansions

$$a_{0}r^{2}x^{-1+r}+\left(a_{1}(1+r)^{2}+a_{0}(1+r)\,(-1+2r)\right)x^{r}+\left(\sum_{k=1}^{\infty}\left(a_{k+1}(k+r+1)^{2}+a_{k}(k+r+1)\,(2k\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$r^{2}=0$$

- Values of r that satisfy the indicial equation

$$r=0$$

- Each term must be 0

$$a_{1}(1+r)^{2}+a_{0}(1+r)\,(-1+2r)=0$$

- Each term in the series must be 0, giving the recursion relation

$$(k+1)\,(2ka_{k}+a_{k-1}k+ka_{k+1}-a_{k}+a_{k+1})=0$$

- Shift index using $k->k+1$

$$(k+2)\,(2a_{k+1}(k+1)+a_{k}(k+1)+(k+1)\,a_{k+2}-a_{k+1}+a_{k+2})=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{ka_{k}+2ka_{k+1}+a_{k}+a_{k+1}}{k+2}$$

- Recursion relation for $r=0$

$$a_{k+2}=-\frac{ka_{k}+2ka_{k+1}+a_{k}+a_{k+1}}{k+2}$$

- Solution for $r=0$

$$\left[y=\sum_{k=0}^{\infty}a_{k}x^{k},a_{k+2}=-\frac{ka_{k}+2ka_{k+1}+a_{k}+a_{k+1}}{k+2},a_{1}-a_{0}=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 4.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2(x^2+x+1)\,y''+12x^2(x+1)\,y'+(3x^2+3x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(4x^4+4x^3+4x^2)\,y''+(12x^3+12x^2)\,y'+(3x^2+3x+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{3+3x}{x^2+x+1}$$
$$q(x)=\frac{3x^2+3x+1}{4x^2\,(x^2+x+1)}$$

Table 658: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3+3x}{x^2+x+1}$	
singularity	type
$x = -\frac{1}{2} - \frac{i\sqrt{3}}{2}$	"regular"
$x = -\frac{1}{2} + \frac{i\sqrt{3}}{2}$	"regular"

$q(x) = \frac{3x^2+3x+1}{4x^2(x^2+x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2} - \frac{i\sqrt{3}}{2}$	"regular"
$x = -\frac{1}{2} + \frac{i\sqrt{3}}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[-\frac{1}{2} - \frac{i\sqrt{3}}{2}, -\frac{1}{2} + \frac{i\sqrt{3}}{2}, 0, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2\left(x^2+x+1\right)y'' + \left(12x^3+12x^2\right)y' + \left(3x^2+3x+1\right)y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2\left(x^2+x+1\right)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(12x^3+12x^2\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(3x^2+3x+1\right)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 12x^{n+r+2} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 12x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n\right) \\
&+ \left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r)(n+r-1) &= \sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)(n-3+r)\, x^{n+r} \\
\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1) &= \sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 12x^{n+r+2} a_n (n+r) &= \sum_{n=2}^{\infty} 12a_{n-2}(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 12x^{1+n+r} a_n (n+r) &= \sum_{n=1}^{\infty} 12a_{n-1}(n+r-1)\, x^{n+r} \\
\sum_{n=0}^{\infty} 3x^{n+r+2} a_n &= \sum_{n=2}^{\infty} 3a_{n-2} x^{n+r} \\
\sum_{n=0}^{\infty} 3x^{1+n+r} a_n &= \sum_{n=1}^{\infty} 3a_{n-1} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)\,(n-3+r)\,x^{n+r}\right)+\left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}\right)$$
$$+\left(\sum_{n=0}^{\infty} 4x^{n+r}a_n(n+r)\,(n+r-1)\right)+\left(\sum_{n=2}^{\infty} 12a_{n-2}(n+r-2)\,x^{n+r}\right)$$
$$+\left(\sum_{n=1}^{\infty} 12a_{n-1}(n+r-1)\,x^{n+r}\right)+\left(\sum_{n=2}^{\infty} 3a_{n-2}x^{n+r}\right)+\left(\sum_{n=1}^{\infty} 3a_{n-1}x^{n+r}\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)$$
$$=0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r}a_n(n+r)\,(n+r-1)+a_n x^{n+r}=0$$

When $n=0$ the above becomes

$$4x^r a_0 r(-1+r)+a_0 x^r=0$$

Or

$$(4x^r r(-1+r)+x^r)\,a_0=0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(2r-1)^2\,x^r=0$$

Since the above is true for all x then the indicial equation becomes

$$(2r-1)^2=0$$

Solving for r gives the roots of the indicial equation as

$$r_1=\frac{1}{2}$$
$$r_2=\frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(2r-1)^2\,x^r=0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{2}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{2}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = \frac{-3 - 2r}{2r + 1}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} 4a_{n-2}(n+r-2)(n-3+r) + 4a_{n-1}(n+r-1)(n+r-2) + 4a_n(n+r)(n+r-1) \\ + 12a_{n-2}(n+r-2) + 12a_{n-1}(n+r-1) + 3a_{n-2} + 3a_{n-1} + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{2na_{n-2} + 2na_{n-1} + 2ra_{n-2} + 2ra_{n-1} - 3a_{n-2} + a_{n-1}}{-1 + 2n + 2r} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = \frac{(-a_{n-2} - a_{n-1})\, n + a_{n-2} - a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-2r}{2r+1}$	-2

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{12r + 14}{4r^2 + 8r + 3}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = \frac{5}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-2r}{2r+1}$	-2
a_2	$\frac{12r+14}{4r^2+8r+3}$	$\frac{5}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{8r^3 + 12r^2 - 58r - 71}{8r^3 + 36r^2 + 46r + 15}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = -2$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-2r}{2r+1}$	-2
a_2	$\frac{12r+14}{4r^2+8r+3}$	$\frac{5}{2}$
a_3	$\frac{8r^3+12r^2-58r-71}{8r^3+36r^2+46r+15}$	-2

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{-16r^4 - 144r^3 - 288r^2 + 84r + 289}{16r^4 + 128r^3 + 344r^2 + 352r + 105}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{5}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-2r}{2r+1}$	-2
a_2	$\frac{12r+14}{4r^2+8r+3}$	$\frac{5}{2}$
a_3	$\frac{8r^3+12r^2-58r-71}{8r^3+36r^2+46r+15}$	-2
a_4	$\frac{-16r^4-144r^3-288r^2+84r+289}{16r^4+128r^3+344r^2+352r+105}$	$\frac{5}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{192r^4 + 1664r^3 + 4320r^2 + 3328r + 300}{32r^5 + 400r^4 + 1840r^3 + 3800r^2 + 3378r + 945}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = \frac{17}{20}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-2r}{2r+1}$	-2
a_2	$\frac{12r+14}{4r^2+8r+3}$	$\frac{5}{2}$
a_3	$\frac{8r^3+12r^2-58r-71}{8r^3+36r^2+46r+15}$	-2
a_4	$\frac{-16r^4-144r^3-288r^2+84r+289}{16r^4+128r^3+344r^2+352r+105}$	$\frac{5}{8}$
a_5	$\frac{192r^4+1664r^3+4320r^2+3328r+300}{32r^5+400r^4+1840r^3+3800r^2+3378r+945}$	$\frac{17}{20}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{64r^6 + 768r^5 + 1808r^4 - 8576r^3 - 43668r^2 - 61072r - 27309}{64r^6 + 1152r^5 + 8080r^4 + 27840r^3 + 48556r^2 + 39048r + 10395}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_6 = -\frac{121}{80}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-2r}{2r+1}$	-2
a_2	$\frac{12r+14}{4r^2+8r+3}$	$\frac{5}{2}$
a_3	$\frac{8r^3+12r^2-58r-71}{8r^3+36r^2+46r+15}$	-2
a_4	$\frac{-16r^4-144r^3-288r^2+84r+289}{16r^4+128r^3+344r^2+352r+105}$	$\frac{5}{8}$
a_5	$\frac{192r^4+1664r^3+4320r^2+3328r+300}{32r^5+400r^4+1840r^3+3800r^2+3378r+945}$	$\frac{17}{20}$
a_6	$\frac{64r^6+768r^5+1808r^4-8576r^3-43668r^2-61072r-27309}{64r^6+1152r^5+8080r^4+27840r^3+48556r^2+39048r+10395}$	$-\frac{121}{80}$

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{-128r^7 - 3264r^6 - 30240r^5 - 123696r^4 - 188760r^3 + 106812r^2 + 554810r + 373335}{128r^7 + 3136r^6 + 31136r^5 + 160720r^4 + 459032r^3 + 709324r^2 + 528414r + 135135}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_7 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-2r}{2r+1}$	-2
a_2	$\frac{12r+14}{4r^2+8r+3}$	$\frac{5}{2}$
a_3	$\frac{8r^3+12r^2-58r-71}{8r^3+36r^2+46r+15}$	-2
a_4	$\frac{-16r^4-144r^3-288r^2+84r+289}{16r^4+128r^3+344r^2+352r+105}$	$\frac{5}{8}$
a_5	$\frac{192r^4+1664r^3+4320r^2+3328r+300}{32r^5+400r^4+1840r^3+3800r^2+3378r+945}$	$\frac{17}{20}$
a_6	$\frac{64r^6+768r^5+1808r^4-8576r^3-43668r^2-61072r-27309}{64r^6+1152r^5+8080r^4+27840r^3+48556r^2+39048r+10395}$	$-\frac{121}{80}$
a_7	$\frac{-128r^7-3264r^6-30240r^5-123696r^4-188760r^3+106812r^2+554810r+373335}{128r^7+3136r^6+31136r^5+160720r^4+459032r^3+709324r^2+528414r+135135}$	1

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 \ldots\right) \\
&= \sqrt{x}\left(1 - 2x + \frac{5x^2}{2} - 2x^3 + \frac{5x^4}{8} + \frac{17x^5}{20} - \frac{121x^6}{80} + x^7 + O(x^8)\right)
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = \frac{1}{2}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{-3-2r}{2r+1}$	-2	$\frac{4}{(2r+1)^2}$
b_2	$\frac{12r+14}{4r^2+8r+3}$	$\frac{5}{2}$	$\frac{-48r^2-112r-76}{(4r^2+8r+3)^2}$
b_3	$\frac{8r^3+12r^2-58r-71}{8r^3+36r^2+46r+15}$	-2	$\frac{192r^4+1664r^3+4704r^2+5472r+2396}{(8r^3+36r^2+46r+15)^2}$
b_4	$\frac{-16r^4-144r^3-288r^2+84r+289}{16r^4+128r^3+344r^2+352r+105}$	$\frac{5}{8}$	$256r^6-1792r^5-33600r^4-148096r^3-286608\ldots$ / $(16r^4+128r^3+344r^2+352r+\ldots$
b_5	$\frac{192r^4+1664r^3+4320r^2+3328r+300}{32r^5+400r^4+1840r^3+3800r^2+3378r+945}$	$\frac{17}{20}$	$-\frac{8(768r^8+13312r^7+90880r^6+302848r^5+4\ldots}{(32r^5+400r^4+1840\ldots}$
b_6	$\frac{64r^6+768r^5+1808r^4-8576r^3-43668r^2-61072r-27309}{64r^6+1152r^5+8080r^4+27840r^3+48556r^2+39048r+10395}$	$-\frac{121}{80}$	$24576r^{10}+802816r^9+11114496r^8+86130688\ldots$
b_7	$\frac{-128r^7-3264r^6-30240r^5-123696r^4-188760r^3+106812r^2+554810r+373335}{128r^7+3136r^6+31136r^5+160720r^4+459032r^3+709324r^2+528414r+135135}$	1	$16384r^{12}-229376r^{11}-21012480r^{10}-411738\ldots$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \ldots \\
&= \sqrt{x}\left(1 - 2x + \frac{5x^2}{2} - 2x^3 + \frac{5x^4}{8} + \frac{17x^5}{20} - \frac{121x^6}{80} + x^7 + O(x^8)\right)\ln(x) \\
&\quad + \sqrt{x}\left(x - \frac{9x^2}{4} + \frac{17x^3}{6} - \frac{205x^4}{96} + \frac{481x^5}{1200} + \frac{2109x^6}{1600} - \frac{1063x^7}{560} + O(x^8)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1\sqrt{x}\left(1-2x+\frac{5x^2}{2}-2x^3+\frac{5x^4}{8}+\frac{17x^5}{20}-\frac{121x^6}{80}+x^7+O(x^8)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1-2x+\frac{5x^2}{2}-2x^3+\frac{5x^4}{8}+\frac{17x^5}{20}-\frac{121x^6}{80}+x^7+O(x^8)\right)\ln(x)\right. \\
&\quad \left. + \sqrt{x}\left(x-\frac{9x^2}{4}+\frac{17x^3}{6}-\frac{205x^4}{96}+\frac{481x^5}{1200}+\frac{2109x^6}{1600}-\frac{1063x^7}{560}+O(x^8)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1\sqrt{x}\left(1-2x+\frac{5x^2}{2}-2x^3+\frac{5x^4}{8}+\frac{17x^5}{20}-\frac{121x^6}{80}+x^7+O(x^8)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1-2x+\frac{5x^2}{2}-2x^3+\frac{5x^4}{8}+\frac{17x^5}{20}-\frac{121x^6}{80}+x^7+O(x^8)\right)\ln(x)\right. \\
&\quad \left. + \sqrt{x}\left(x-\frac{9x^2}{4}+\frac{17x^3}{6}-\frac{205x^4}{96}+\frac{481x^5}{1200}+\frac{2109x^6}{1600}-\frac{1063x^7}{560}+O(x^8)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1\sqrt{x}\left(1-2x+\frac{5x^2}{2}-2x^3+\frac{5x^4}{8}+\frac{17x^5}{20}-\frac{121x^6}{80}+x^7+O(x^8)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1-2x+\frac{5x^2}{2}-2x^3+\frac{5x^4}{8}+\frac{17x^5}{20}-\frac{121x^6}{80}+x^7+O(x^8)\right)\ln(x)\right. \\
&\quad \left. + \sqrt{x}\left(x-\frac{9x^2}{4}+\frac{17x^3}{6}-\frac{205x^4}{96}+\frac{481x^5}{1200}+\frac{2109x^6}{1600}-\frac{1063x^7}{560}+O(x^8)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1\sqrt{x}\left(1-2x+\frac{5x^2}{2}-2x^3+\frac{5x^4}{8}+\frac{17x^5}{20}-\frac{121x^6}{80}+x^7+O(x^8)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1-2x+\frac{5x^2}{2}-2x^3+\frac{5x^4}{8}+\frac{17x^5}{20}-\frac{121x^6}{80}+x^7+O(x^8)\right)\ln(x)\right. \\
&\quad \left. + \sqrt{x}\left(x-\frac{9x^2}{4}+\frac{17x^3}{6}-\frac{205x^4}{96}+\frac{481x^5}{1200}+\frac{2109x^6}{1600}-\frac{1063x^7}{560}+O(x^8)\right)\right)
\end{aligned}
$$

Verified OK.

15.8.1 Maple step by step solution

Let's solve

$4x^2(x^2+x+1)\,y''+(12x^3+12x^2)\,y'+(3x^2+3x+1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(3x^2+3x+1)y}{4x^2(x^2+x+1)}-\frac{3(x+1)y'}{x^2+x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{3(x+1)y'}{x^2+x+1}+\frac{(3x^2+3x+1)y}{4x^2(x^2+x+1)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{3(x+1)}{x^2+x+1},P_3(x)=\frac{3x^2+3x+1}{4x^2(x^2+x+1)}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $\left(x\cdot P_2(x)\right)\bigg|_{x=0}=0$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $\left(x^2\cdot P_3(x)\right)\bigg|_{x=0}=\frac{1}{4}$

  - $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $4x^2(x^2+x+1)\,y''+12x^2(x+1)\,y'+(3x^2+3x+1)\,y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m\cdot y$ to series expansion for $m=0..2$

    $x^m\cdot y=\sum_{k=0}^{\infty}a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 2..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m} (k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0 (-1+2r)^2 x^r + \left(a_1 (1+2r)^2 + a_0 (3+2r)\,(1+2r)\right) x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k (2k+2r-1)^2 + a_{k-1} (2k\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(-1+2r)^2 = 0$

- Values of r that satisfy the indicial equation

  $r = \frac{1}{2}$

- Each term must be 0

  $a_1 (1+2r)^2 + a_0 (3+2r)\,(1+2r) = 0$

- Solve for the dependent coefficient(s)

  $a_1 = -\frac{(3+2r) a_0}{1+2r}$

- Each term in the series must be 0, giving the recursion relation

  $4\left((a_k + a_{k-2} + a_{k-1})\, k + (a_k + a_{k-2} + a_{k-1})\, r - \frac{a_k}{2} - \frac{3a_{k-2}}{2} + \frac{a_{k-1}}{2}\right) \left(k + r - \frac{1}{2}\right) = 0$

- Shift index using $k->k+2$

  $4\left((a_{k+2} + a_k + a_{k+1})\,(k+2) + (a_{k+2} + a_k + a_{k+1})\, r - \frac{a_{k+2}}{2} - \frac{3a_k}{2} + \frac{a_{k+1}}{2}\right) \left(k + \frac{3}{2} + r\right) = 0$

- Recursion relation that defines series solution to ODE

$a_{k+2} = -\frac{2ka_k+2ka_{k+1}+2ra_k+2ra_{k+1}+a_k+5a_{k+1}}{2k+2r+3}$

- Recursion relation for $r = \frac{1}{2}$

  $a_{k+2} = -\frac{2ka_k+2ka_{k+1}+2a_k+6a_{k+1}}{2k+4}$

- Solution for $r = \frac{1}{2}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+2} = -\frac{2ka_k+2ka_{k+1}+2a_k+6a_{k+1}}{2k+4}, a_1 = -2a_0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 5.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2+x+1)\,y''-x(-2x^2-4x+1)\,y'+y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+x^3+x^2)\,y''+(2x^3+4x^2-x)\,y'+y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{2x^2+4x-1}{(x^2+x+1)\,x}$$
$$q(x)=\frac{1}{x^2\,(x^2+x+1)}$$

Table 660: Table $p(x), q(x)$ singularites.

$p(x) = \frac{2x^2+4x-1}{(x^2+x+1)x}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2} - \frac{i\sqrt{3}}{2}$	"regular"
$x = -\frac{1}{2} + \frac{i\sqrt{3}}{2}$	"regular"

$q(x) = \frac{1}{x^2(x^2+x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2} - \frac{i\sqrt{3}}{2}$	"regular"
$x = -\frac{1}{2} + \frac{i\sqrt{3}}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{1}{2} - \frac{i\sqrt{3}}{2}, -\frac{1}{2} + \frac{i\sqrt{3}}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2 + x + 1)\, y'' + (2x^3 + 4x^2 - x)\, y' + y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x^2 + x + 1)\left(\sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}\right) + (2x^3 + 4x^2 - x)\left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r) (n+r-1) = \sum_{n=2}^{\infty} a_{n-2} (n+r-2) (n-3+r) x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r) (n+r-1) = \sum_{n=1}^{\infty} a_{n-1} (n+r-1) (n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 2a_{n-2} (n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 4a_{n-1} (n+r-1) x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2} (n+r-2) (n-3+r) x^{n+r}\right) + \left(\sum_{n=1}^{\infty} a_{n-1} (n+r-1) (n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2} (n+r-2) x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 4a_{n-1} (n+r-1) x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r}a_n(n+r)(n+r-1) - x^{n+r}a_n(n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - x^r a_0 r + a_0 x^r = 0$$

Or

$$(x^r r(-1+r) - x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(-1+r)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(-1+r)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 1$, Eqs (1A,1B) become

$$
\begin{aligned}
y_1(x) &= \sum_{n=0}^{\infty} a_n x^{1+n} \\
y_2(x) &= y_1(x) \ln (x) + \left(\sum_{n=1}^{\infty} b_n x^{1+n}\right)
\end{aligned}
$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
a_1 = \frac{-r - 3}{r}
$$

For $2 \le n$ the recursive equation is

$$
\begin{aligned}
&a_{n-2}(n+r-2)\,(n-3+r) + a_{n-1}(n+r-1)\,(n+r-2) + a_n(n+r)\,(n+r-1) \\
&+ 2a_{n-2}(n+r-2) + 4a_{n-1}(n+r-1) - a_n(n+r) + a_n = 0
\end{aligned} \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = -\frac{na_{n-2} + na_{n-1} + ra_{n-2} + ra_{n-1} - 2a_{n-2} + 2a_{n-1}}{n + r - 1} \tag{4}
$$

Which for the root $r = 1$ becomes

$$
a_n = \frac{(-a_{n-2} - a_{n-1})\,n + a_{n-2} - 3a_{n-1}}{n} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r}$	-4

For $n = 2$, using the above recursive equation gives

$$
a_2 = \frac{7r + 12}{(1 + r)\,r}
$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{19}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r}$	-4
a_2	$\frac{7r+12}{(1+r)r}$	$\frac{19}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{r^3 - 2r^2 - 40r - 57}{(2+r)\, r\, (1+r)}$$

Which for the root $r = 1$ becomes

$$a_3 = -\frac{49}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r}$	-4
a_2	$\frac{7r+12}{(1+r)r}$	$\frac{19}{2}$
a_3	$\frac{r^3-2r^2-40r-57}{(2+r)r(1+r)}$	$-\frac{49}{3}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{-r^4 - 11r^3 + 12r^2 + 221r + 294}{r\,(1+r)\,(2+r)\,(r+3)}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{515}{24}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r}$	-4
a_2	$\frac{7r+12}{(1+r)r}$	$\frac{19}{2}$
a_3	$\frac{r^3-2r^2-40r-57}{(2+r)r(1+r)}$	$-\frac{49}{3}$
a_4	$\frac{-r^4-11r^3+12r^2+221r+294}{r(1+r)(2+r)(r+3)}$	$\frac{515}{24}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{14r^4 + 108r^3 + 10r^2 - 1139r - 1545}{(4+r)\, r\, (1+r)\, (2+r)\, (r+3)}$$

Which for the root $r = 1$ becomes

$$a_5 = -\frac{319}{15}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r}$	-4
a_2	$\frac{7r+12}{(1+r)r}$	$\frac{19}{2}$
a_3	$\frac{r^3-2r^2-40r-57}{(2+r)r(1+r)}$	$-\frac{49}{3}$
a_4	$\frac{-r^4-11r^3+12r^2+221r+294}{r(1+r)(2+r)(r+3)}$	$\frac{515}{24}$
a_5	$\frac{14r^4+108r^3+10r^2-1139r-1545}{(4+r)r(1+r)(2+r)(r+3)}$	$-\frac{319}{15}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{r^6 + 5r^5 - 128r^4 - 1015r^3 - 1195r^2 + 4769r + 7656}{(5+r)\, r\, (1+r)\, (2+r)\, (r+3)\, (4+r)}$$

Which for the root $r = 1$ becomes

$$a_6 = \frac{10093}{720}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r}$	-4
a_2	$\frac{7r+12}{(1+r)r}$	$\frac{19}{2}$
a_3	$\frac{r^3-2r^2-40r-57}{(2+r)r(1+r)}$	$-\frac{49}{3}$
a_4	$\frac{-r^4-11r^3+12r^2+221r+294}{r(1+r)(2+r)(r+3)}$	$\frac{515}{24}$
a_5	$\frac{14r^4+108r^3+10r^2-1139r-1545}{(4+r)r(1+r)(2+r)(r+3)}$	$-\frac{319}{15}$
a_6	$\frac{r^6+5r^5-128r^4-1015r^3-1195r^2+4769r+7656}{(5+r)r(1+r)(2+r)(r+3)(4+r)}$	$\frac{10093}{720}$

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{-r^7 - 28r^6 - 165r^5 + 727r^4 + 8669r^3 + 18671r^2 - 6652r - 30279}{r(1+r)(2+r)(r+3)(4+r)(5+r)(6+r)}$$

Which for the root $r = 1$ becomes

$$a_7 = -\frac{647}{360}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-3}{r}$	-4
a_2	$\frac{7r+12}{(1+r)r}$	$\frac{19}{2}$
a_3	$\frac{r^3-2r^2-40r-57}{(2+r)r(1+r)}$	$-\frac{49}{3}$
a_4	$\frac{-r^4-11r^3+12r^2+221r+294}{r(1+r)(2+r)(r+3)}$	$\frac{515}{24}$
a_5	$\frac{14r^4+108r^3+10r^2-1139r-1545}{(4+r)r(1+r)(2+r)(r+3)}$	$-\frac{319}{15}$
a_6	$\frac{r^6+5r^5-128r^4-1015r^3-1195r^2+4769r+7656}{(5+r)r(1+r)(2+r)(r+3)(4+r)}$	$\frac{10093}{720}$
a_7	$\frac{-r^7-28r^6-165r^5+727r^4+8669r^3+18671r^2-6652r-30279}{r(1+r)(2+r)(r+3)(4+r)(5+r)(6+r)}$	$-\frac{647}{360}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 + a_7x^7 + a_8x^8 \dots\right) \\ &= x\left(-4x + 1 + \frac{19x^2}{2} - \frac{49x^3}{3} + \frac{515x^4}{24} - \frac{319x^5}{15} + \frac{10093x^6}{720} - \frac{647x^7}{360} + O(x^8)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{-r-3}{r}$	-4	$\frac{3}{r^2}$
b_2	$\frac{7r+12}{(1+r)r}$	$\frac{19}{2}$	$\frac{-7r^2-24r-12}{(1+r)^2 r^2}$
b_3	$\frac{r^3-2r^2-40r-57}{(2+r)r(1+r)}$	$-\frac{49}{3}$	$\frac{5r^4+84r^3+287r^2+342r+114}{(2+r)^2 r^2 (1+r)^2}$
b_4	$\frac{-r^4-11r^3+12r^2+221r+294}{r(1+r)(2+r)(r+3)}$	$\frac{515}{24}$	$\frac{5r^6-46r^5-874r^4-3960r^3-7651r^2-6468r-1764}{r^2(1+r)^2(2+r)^2(r+3)^2}$
b_5	$\frac{14r^4+108r^3+10r^2-1139r-1545}{(4+r)r(1+r)(2+r)(r+3)}$	$-\frac{319}{15}$	$\frac{-14r^8-216r^7-620r^6+5756r^5+47953r^4+146714r^3+219415r^2}{r^2(1+r)^2(2+r)^2(r+3)^2(4+r)^2}$
b_6	$\frac{r^6+5r^5-128r^4-1015r^3-1195r^2+4769r+7656}{(5+r)r(1+r)(2+r)(r+3)(4+r)}$	$\frac{10093}{720}$	$\frac{10r^{10}+426r^9+6065r^8+38576r^7+92115r^6-196670r^5-1845610}{r^2(1+r)^2(2+r)^2(r+3)^2(4+}$
b_7	$\frac{-r^7-28r^6-165r^5+727r^4+8669r^3+18671r^2-6652r-30279}{r(1+r)(2+r)(r+3)(4+r)(5+r)(6+r)}$	$-\frac{647}{360}$	$\frac{7r^{12}-20r^{11}-5821r^{10}-112866r^9-1033238r^8-5300410r^7-1505}{r^2(1+r)^2}$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \ldots \\
&= x\left(-4x + 1 + \frac{19x^2}{2} - \frac{49x^3}{3} + \frac{515x^4}{24} - \frac{319x^5}{15} + \frac{10093x^6}{720} - \frac{647x^7}{360} + O\left(x^8\right)\right)\ln(x) \\
&\quad + x\left(3x - \frac{43x^2}{4} + \frac{208x^3}{9} - \frac{10379x^4}{288} + \frac{76321x^5}{1800} - \frac{172499x^6}{4800} + \frac{39091x^7}{2400} + O\left(x^8\right)\right)
\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 y_1(x) + c_2 y_2(x)$$

$$
\begin{aligned}
&= c_1 x\left(-4x+1+\frac{19x^2}{2}-\frac{49x^3}{3}+\frac{515x^4}{24}-\frac{319x^5}{15}+\frac{10093x^6}{720}-\frac{647x^7}{360}+O\left(x^8\right)\right) \\
&+c_2\left(x\left(-4x+1+\frac{19x^2}{2}-\frac{49x^3}{3}+\frac{515x^4}{24}-\frac{319x^5}{15}+\frac{10093x^6}{720}-\frac{647x^7}{360}+O\left(x^8\right)\right)\ln\left(x\right)\right. \\
&\left.+x\left(3x-\frac{43x^2}{4}+\frac{208x^3}{9}-\frac{10379x^4}{288}+\frac{76321x^5}{1800}-\frac{172499x^6}{4800}+\frac{39091x^7}{2400}+O\left(x^8\right)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x\left(-4x+1+\frac{19x^2}{2}-\frac{49x^3}{3}+\frac{515x^4}{24}-\frac{319x^5}{15}+\frac{10093x^6}{720}-\frac{647x^7}{360}+O\left(x^8\right)\right) \\
&+c_2\left(x\left(-4x+1+\frac{19x^2}{2}-\frac{49x^3}{3}+\frac{515x^4}{24}-\frac{319x^5}{15}+\frac{10093x^6}{720}-\frac{647x^7}{360}+O\left(x^8\right)\right)\ln\left(x\right)\right. \\
&\left.+x\left(3x-\frac{43x^2}{4}+\frac{208x^3}{9}-\frac{10379x^4}{288}+\frac{76321x^5}{1800}-\frac{172499x^6}{4800}+\frac{39091x^7}{2400}+O\left(x^8\right)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x\left(-4x+1+\frac{19x^2}{2}-\frac{49x^3}{3}+\frac{515x^4}{24}-\frac{319x^5}{15}+\frac{10093x^6}{720}-\frac{647x^7}{360}+O\left(x^8\right)\right) \\
&+c_2\left(x\left(-4x+1+\frac{19x^2}{2}-\frac{49x^3}{3}+\frac{515x^4}{24}-\frac{319x^5}{15}+\frac{10093x^6}{720}-\frac{647x^7}{360}\right.\right. \\
&\left.+O\left(x^8\right)\right)\ln\left(x\right) \\
&\left.+x\left(3x-\frac{43x^2}{4}+\frac{208x^3}{9}-\frac{10379x^4}{288}+\frac{76321x^5}{1800}-\frac{172499x^6}{4800}+\frac{39091x^7}{2400}+O\left(x^8\right)\right)\right)
\end{aligned}
\tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x\left(-4x+1+\frac{19x^2}{2}-\frac{49x^3}{3}+\frac{515x^4}{24}-\frac{319x^5}{15}+\frac{10093x^6}{720}-\frac{647x^7}{360}+O\left(x^8\right)\right) \\
&+c_2\left(x\left(-4x+1+\frac{19x^2}{2}-\frac{49x^3}{3}+\frac{515x^4}{24}-\frac{319x^5}{15}+\frac{10093x^6}{720}-\frac{647x^7}{360}+O\left(x^8\right)\right)\ln\left(x\right)\right. \\
&\left.+x\left(3x-\frac{43x^2}{4}+\frac{208x^3}{9}-\frac{10379x^4}{288}+\frac{76321x^5}{1800}-\frac{172499x^6}{4800}+\frac{39091x^7}{2400}+O\left(x^8\right)\right)\right)
\end{aligned}
$$

Verified OK.

15.9.1 Maple step by step solution

Let's solve

$x^2(x^2+x+1)\,y''+(2x^3+4x^2-x)\,y'+y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{y}{x^2(x^2+x+1)}-\frac{(2x^2+4x-1)y'}{x(x^2+x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(2x^2+4x-1)y'}{x(x^2+x+1)}+\frac{y}{x^2(x^2+x+1)}=0$

□ Check to see if x_0 is a regular singular point

  ○ Define functions

  $\left[P_2(x)=\frac{2x^2+4x-1}{(x^2+x+1)x}, P_3(x)=\frac{1}{x^2(x^2+x+1)}\right]$

  ○ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left(x\cdot P_2(x)\right)\bigg|_{x=0}=-1$

  ○ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left(x^2\cdot P_3(x)\right)\bigg|_{x=0}=1$

  ○ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $x^2(x^2+x+1)\,y''+x(2x^2+4x-1)\,y'+y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ○ Convert $x^m\cdot y'$ to series expansion for $m=1..3$

  $x^m\cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m}\cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^{m}\cdot y''$ to series expansion for $m=2..4$

  $x^{m}\cdot y'' = \sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m}\cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}(-1+r)^{2} x^{r} + (a_{1}r^{2} + a_{0}r(3+r))\, x^{1+r} + \left(\sum_{k=2}^{\infty} (a_{k}(k+r-1)^{2} + a_{k-1}(k+r-1)\,(k+2+r)\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(-1+r)^{2} = 0$

- Values of r that satisfy the indicial equation

  $r = 1$

- Each term must be 0

  $a_{1}r^{2} + a_{0}r(3+r) = 0$

- Solve for the dependent coefficient(s)

  $a_{1} = -\frac{(3+r)a_{0}}{r}$

- Each term in the series must be 0, giving the recursion relation

  $((a_{k}+a_{k-2}+a_{k-1})\,k + (a_{k}+a_{k-2}+a_{k-1})\,r - a_{k} - 2a_{k-2} + 2a_{k-1})\,(k+r-1) = 0$

- Shift index using $k->k+2$

  $((a_{k+2}+a_{k}+a_{k+1})\,(k+2) + (a_{k+2}+a_{k}+a_{k+1})\,r - a_{k+2} - 2a_{k} + 2a_{k+1})\,(k+r+1) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{ka_{k}+ka_{k+1}+ra_{k}+ra_{k+1}+4a_{k+1}}{k+r+1}$

- Recursion relation for $r=1$

  $a_{k+2} = -\frac{ka_{k}+ka_{k+1}+a_{k}+5a_{k+1}}{k+2}$

- Solution for $r=1$

  $\left[y = \sum_{k=0}^{\infty} a_{k}x^{k+1}, a_{k+2} = -\frac{ka_{k}+ka_{k+1}+a_{k}+5a_{k+1}}{k+2}, a_{1} = -4a_{0}\right]$

Problem number: 6.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{9x^2y'' + 3x\left(-2x^2 + 3x + 5\right)y' + \left(-14x^2 + 12x + 1\right)y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$9x^2y'' + \left(-6x^3 + 9x^2 + 15x\right)y' + \left(-14x^2 + 12x + 1\right)y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = -\frac{2x^2 - 3x - 5}{3x}$$
$$q(x) = -\frac{14x^2 - 12x - 1}{9x^2}$$

Table 662: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{2x^2-3x-5}{3x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = -\frac{14x^2-12x-1}{9x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$9x^2y'' + (-6x^3 + 9x^2 + 15x)\, y' + (-14x^2 + 12x + 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\begin{aligned} &9x^2\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) \\ &+ (-6x^3 + 9x^2 + 15x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) \\ &+ (-14x^2 + 12x + 1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \end{aligned} \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-6x^{n+r+2} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 9x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 15x^{n+r} a_n (n+r)\right) \\
&+ \sum_{n=0}^{\infty} \left(-14x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 12x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0
\end{aligned}
\tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} \left(-6x^{n+r+2} a_n (n+r)\right) &= \sum_{n=2}^{\infty} \left(-6a_{n-2}(n+r-2)\, x^{n+r}\right) \\
\sum_{n=0}^{\infty} 9x^{1+n+r} a_n (n+r) &= \sum_{n=1}^{\infty} 9a_{n-1}(n+r-1)\, x^{n+r} \\
\sum_{n=0}^{\infty} \left(-14x^{n+r+2} a_n\right) &= \sum_{n=2}^{\infty} \left(-14a_{n-2} x^{n+r}\right) \\
\sum_{n=0}^{\infty} 12x^{1+n+r} a_n &= \sum_{n=1}^{\infty} 12a_{n-1} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=2}^{\infty} \left(-6a_{n-2}(n+r-2)\, x^{n+r}\right) \\
&+ \left(\sum_{n=1}^{\infty} 9a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 15x^{n+r} a_n (n+r)\right) \\
&+ \sum_{n=2}^{\infty} \left(-14a_{n-2} x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 12a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0
\end{aligned}
\tag{2B}
$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$9x^{n+r}a_n(n+r)(n+r-1) + 15x^{n+r}a_n(n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$9x^r a_0 r(-1+r) + 15x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(9x^r r(-1+r) + 15x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(3r+1\right)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$\left(3r+1\right)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -\frac{1}{3}$$
$$r_2 = -\frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(3r+1\right)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -\frac{1}{3}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-\frac{1}{3}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-\frac{1}{3}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -\frac{3}{3r+4}$$

For $2 \leq n$ the recursive equation is

$$9a_n(n+r)(n+r-1) - 6a_{n-2}(n+r-2) + 9a_{n-1}(n+r-1) + 15a_n(n+r) - 14a_{n-2} + 12a_{n-1} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{2a_{n-2} - 3a_{n-1}}{1+3n+3r} \tag{4}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_n = \frac{2a_{n-2} - 3a_{n-1}}{3n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -\frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{3}{3r+4}$	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{6r+17}{9r^2+33r+28}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_2 = \frac{5}{6}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{3}{3r+4}$	-1
a_2	$\frac{6r+17}{9r^2+33r+28}$	$\frac{5}{6}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-36r - 93}{27r^3 + 189r^2 + 414r + 280}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_3 = -\frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{3}{3r+4}$	-1
a_2	$\frac{6r+17}{9r^2+33r+28}$	$\frac{5}{6}$
a_3	$\frac{-36r-93}{27r^3+189r^2+414r+280}$	$-\frac{1}{2}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{36r^2 + 330r + 619}{81r^4 + 918r^3 + 3699r^2 + 6222r + 3640}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_4 = \frac{19}{72}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{3}{3r+4}$	-1
a_2	$\frac{6r+17}{9r^2+33r+28}$	$\frac{5}{6}$
a_3	$\frac{-36r-93}{27r^3+189r^2+414r+280}$	$-\frac{1}{2}$
a_4	$\frac{36r^2+330r+619}{81r^4+918r^3+3699r^2+6222r+3640}$	$\frac{19}{72}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-324r^2 - 2484r - 4275}{243r^5 + 4050r^4 + 25785r^3 + 77850r^2 + 110472r + 58240}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_5 = -\frac{43}{360}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{3}{3r+4}$	-1
a_2	$\frac{6r+17}{9r^2+33r+28}$	$\frac{5}{6}$
a_3	$\frac{-36r-93}{27r^3+189r^2+414r+280}$	$-\frac{1}{2}$
a_4	$\frac{36r^2+330r+619}{81r^4+918r^3+3699r^2+6222r+3640}$	$\frac{19}{72}$
a_5	$\frac{-324r^2-2484r-4275}{243r^5+4050r^4+25785r^3+77850r^2+110472r+58240}$	$-\frac{43}{360}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{216r^3 + 4104r^2 + 21726r + 32633}{729r^6 + 16767r^5 + 154305r^4 + 723465r^3 + 1810566r^2 + 2273688r + 1106560}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_6 = \frac{319}{6480}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{3}{3r+4}$	-1
a_2	$\frac{6r+17}{9r^2+33r+28}$	$\frac{5}{6}$
a_3	$\frac{-36r-93}{27r^3+189r^2+414r+280}$	$-\frac{1}{2}$
a_4	$\frac{36r^2+330r+619}{81r^4+918r^3+3699r^2+6222r+3640}$	$\frac{19}{72}$
a_5	$\frac{-324r^2-2484r-4275}{243r^5+4050r^4+25785r^3+77850r^2+110472r+58240}$	$-\frac{43}{360}$
a_6	$\frac{216r^3+4104r^2+21726r+32633}{729r^6+16767r^5+154305r^4+723465r^3+1810566r^2+2273688r+1106560}$	$\frac{319}{6480}$

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{-2592r^3 - 39528r^2 - 185220r - 260349}{2187r^7 + 66339r^6 + 831789r^5 + 5565105r^4 + 21347928r^3 + 46653516r^2 + 53340816r + 24344320}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_7 = -\frac{167}{9072}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{3}{3r+4}$	-1
a_2	$\frac{6r+17}{9r^2+33r+28}$	$\frac{5}{6}$
a_3	$\frac{-36r-93}{27r^3+189r^2+414r+280}$	$-\frac{1}{2}$
a_4	$\frac{36r^2+330r+619}{81r^4+918r^3+3699r^2+6222r+3640}$	$\frac{19}{72}$
a_5	$\frac{-324r^2-2484r-4275}{243r^5+4050r^4+25785r^3+77850r^2+110472r+58240}$	$-\frac{43}{360}$
a_6	$\frac{216r^3+4104r^2+21726r+32633}{729r^6+16767r^5+154305r^4+723465r^3+1810566r^2+2273688r+1106560}$	$\frac{319}{6480}$
a_7	$\frac{-2592r^3-39528r^2-185220r-260349}{2187r^7+66339r^6+831789r^5+5565105r^4+21347928r^3+46653516r^2+53340816r+24344320}$	$-\frac{167}{9072}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \frac{1}{x^{\frac{1}{3}}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 \dots\right) \\ &= \frac{1 - x + \frac{5x^2}{6} - \frac{x^3}{2} + \frac{19x^4}{72} - \frac{43x^5}{360} + \frac{319x^6}{6480} - \frac{167x^7}{9072} + O(x^8)}{x^{\frac{1}{3}}} \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = -\frac{1}{3}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts fr
b_1	$-\frac{3}{3r+4}$	-1	$\frac{9}{(3r+4)^2}$
b_2	$\frac{6r+17}{9r^2+33r+28}$	$\frac{5}{6}$	$\frac{-54r^2-306r-393}{(9r^2+33r+28)^2}$
b_3	$\frac{-36r-93}{27r^3+189r^2+414r+280}$	$-\frac{1}{2}$	$\frac{1944r^3+14337r^2+35154r+284}{(27r^3+189r^2+414r+280)^2}$
b_4	$\frac{36r^2+330r+619}{81r^4+918r^3+3699r^2+6222r+3640}$	$\frac{19}{72}$	$-\frac{6(972r^5+18873r^4+134406r^3}{(81r^4+918r^3+36}$
b_5	$\frac{-324r^2-2484r-4275}{243r^5+4050r^4+25785r^3+77850r^2+110472r+58240}$	$-\frac{43}{360}$	$\frac{236196r^6+5038848r^5+4372906}{(243r^5+4050}$
b_6	$\frac{216r^3+4104r^2+21726r+32633}{729r^6+16767r^5+154305r^4+723465r^3+1810566r^2+2273688r+1106560}$	$\frac{319}{6480}$	$-\frac{9(52488r^8+2134512r^7+3543}{(}$
b_7	$\frac{-2592r^3-39528r^2-185220r-260349}{2187r^7+66339r^6+831789r^5+5565105r^4+21347928r^3+46653516r^2+53340816r+24344320}$	$-\frac{167}{9072}$	$22674816r^9+948090744r^8+172$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \ldots \\ &= \frac{\left(1 - x + \frac{5x^2}{6} - \frac{x^3}{2} + \frac{19x^4}{72} - \frac{43x^5}{360} + \frac{319x^6}{6480} - \frac{167x^7}{9072} + O(x^8)\right)\ln(x)}{x^{\frac{1}{3}}} \\ &\quad + \frac{x - \frac{11x^2}{12} + \frac{25x^3}{36} - \frac{113x^4}{288} + \frac{4211x^5}{21600} - \frac{32773x^6}{388800} + \frac{126647x^7}{3810240} + O(x^8)}{x^{\frac{1}{3}}} \end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 y_1(x) + c_2 y_2(x)$$

$$
\begin{aligned}
&= \frac{c_1\left(1-x+\frac{5x^2}{6}-\frac{x^3}{2}+\frac{19x^4}{72}-\frac{43x^5}{360}+\frac{319x^6}{6480}-\frac{167x^7}{9072}+O(x^8)\right)}{x^{\frac{1}{3}}} \\
&\quad + c_2\left(\frac{\left(1-x+\frac{5x^2}{6}-\frac{x^3}{2}+\frac{19x^4}{72}-\frac{43x^5}{360}+\frac{319x^6}{6480}-\frac{167x^7}{9072}+O(x^8)\right)\ln(x)}{x^{\frac{1}{3}}}\right. \\
&\quad \left. + \frac{x-\frac{11x^2}{12}+\frac{25x^3}{36}-\frac{113x^4}{288}+\frac{4211x^5}{21600}-\frac{32773x^6}{388800}+\frac{126647x^7}{3810240}+O(x^8)}{x^{\frac{1}{3}}}\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(1-x+\frac{5x^2}{6}-\frac{x^3}{2}+\frac{19x^4}{72}-\frac{43x^5}{360}+\frac{319x^6}{6480}-\frac{167x^7}{9072}+O(x^8)\right)}{x^{\frac{1}{3}}} \\
&\quad + c_2\left(\frac{\left(1-x+\frac{5x^2}{6}-\frac{x^3}{2}+\frac{19x^4}{72}-\frac{43x^5}{360}+\frac{319x^6}{6480}-\frac{167x^7}{9072}+O(x^8)\right)\ln(x)}{x^{\frac{1}{3}}}\right. \\
&\quad \left. + \frac{x-\frac{11x^2}{12}+\frac{25x^3}{36}-\frac{113x^4}{288}+\frac{4211x^5}{21600}-\frac{32773x^6}{388800}+\frac{126647x^7}{3810240}+O(x^8)}{x^{\frac{1}{3}}}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= \frac{c_1\left(1-x+\frac{5x^2}{6}-\frac{x^3}{2}+\frac{19x^4}{72}-\frac{43x^5}{360}+\frac{319x^6}{6480}-\frac{167x^7}{9072}+O(x^8)\right)}{x^{\frac{1}{3}}} \\
&\quad + c_2\left(\frac{\left(1-x+\frac{5x^2}{6}-\frac{x^3}{2}+\frac{19x^4}{72}-\frac{43x^5}{360}+\frac{319x^6}{6480}-\frac{167x^7}{9072}+O(x^8)\right)\ln(x)}{x^{\frac{1}{3}}}\right. \\
&\quad \left. + \frac{x-\frac{11x^2}{12}+\frac{25x^3}{36}-\frac{113x^4}{288}+\frac{4211x^5}{21600}-\frac{32773x^6}{388800}+\frac{126647x^7}{3810240}+O(x^8)}{x^{\frac{1}{3}}}\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$y = \frac{c_1 \left(1-x+\frac{5x^2}{6}-\frac{x^3}{2}+\frac{19x^4}{72}-\frac{43x^5}{360}+\frac{319x^6}{6480}-\frac{167x^7}{9072}+O(x^8)\right)}{x^{\frac{1}{3}}} + c_2 \left(\frac{\left(1-x+\frac{5x^2}{6}-\frac{x^3}{2}+\frac{19x^4}{72}-\frac{43x^5}{360}+\frac{319x^6}{6480}-\frac{167x^7}{9072}+O(x^8)\right)\ln(x)}{x^{\frac{1}{3}}} + \frac{x-\frac{11x^2}{12}+\frac{25x^3}{36}-\frac{113x^4}{288}+\frac{4211x^5}{21600}-\frac{32773x^6}{388800}+\frac{126647x^7}{3810240}+O(x^8)}{x^{\frac{1}{3}}} \right)$$

Verified OK.

15.10.1 Maple step by step solution

Let's solve

$9x^2y'' + (-6x^3+9x^2+15x)\, y' + (-14x^2+12x+1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(14x^2-12x-1)y}{9x^2} + \frac{(2x^2-3x-5)y'}{3x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{(2x^2-3x-5)y'}{3x} - \frac{(14x^2-12x-1)y}{9x^2} = 0$

☐ Check to see if $x_0 = 0$ is a regular singular point

- ○ Define functions

  $\left[P_2(x) = -\frac{2x^2-3x-5}{3x}, P_3(x) = -\frac{14x^2-12x-1}{9x^2}\right]$

- ○ $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\Big|_{x=0} = \frac{5}{3}$

- ○ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\Big|_{x=0} = \frac{1}{9}$

- ○ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

$x_0 = 0$

- Multiply by denominators

$$9x^2y'' - 3x(2x^2 - 3x - 5)\,y' + (-14x^2 + 12x + 1)\,y = 0$$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- ◦ Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- ◦ Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k + r)\, x^{k+r-1+m}$$

- ◦ Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k + 1 - m + r)\, x^{k+r}$$

- ◦ Convert $x^2 \cdot y''$ to series expansion

$$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k(k + r)\,(k + r - 1)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(1 + 3r)^2\, x^r + \left(a_1(4 + 3r)^2 + 3a_0(4 + 3r)\right) x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(3k + 3r + 1)^2 + 3a_{k-1}(3k + 3r + 1$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1 + 3r)^2 = 0$$

- Values of r that satisfy the indicial equation

$$r = -\frac{1}{3}$$

- Each term must be 0

$$a_1(4 + 3r)^2 + 3a_0(4 + 3r) = 0$$

- Solve for the dependent coefficient(s)

$a_1 = -\frac{3a_0}{4+3r}$

- Each term in the series must be 0, giving the recursion relation

  $a_k(3k+3r+1)^2 + (3k+3r+1)(-2a_{k-2}+3a_{k-1}) = 0$
- Shift index using $k- >k+2$

  $a_{k+2}(3k+3r+7)^2 + (3k+3r+7)(-2a_k+3a_{k+1}) = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+2} = \frac{2a_k-3a_{k+1}}{3k+3r+7}$
- Recursion relation for $r = -\frac{1}{3}$

  $a_{k+2} = \frac{2a_k-3a_{k+1}}{3k+6}$
- Solution for $r = -\frac{1}{3}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{1}{3}}, a_{k+2} = \frac{2a_k-3a_{k+1}}{3k+6}, a_1 = -a_0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 7.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' + x(x^2 + x + 1)\,y' + x(2 - x)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The ODE is

$$x^2y'' + (x^3 + x^2 + x)\,y' + (-x^2 + 2x)\,y = 0$$

Or

$$x(y'x^2 + y'x - yx + y''x + y' + 2y) = 0$$

For $x \neq 0$ the above simplifies to

$$y''x + (x^2 + x + 1)\,y' - (-2 + x)\,y = 0$$

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + (x^3 + x^2 + x)\,y' + (-x^2 + 2x)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{x^2 + x + 1}{x}$$
$$q(x) = -\frac{-2 + x}{x}$$

Table 664: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x^2+x+1}{x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = -\frac{-2+x}{x}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2 y'' + (x^3 + x^2 + x) y' + (-x^2 + 2x) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$
\begin{aligned}
x^{2}\left(\sum_{n=0}^{\infty}(n+r)\,(n+r-1)\,a_{n}x^{n+r-2}\right) \\
+\left(x^{3}+x^{2}+x\right)\left(\sum_{n=0}^{\infty}(n+r)\,a_{n}x^{n+r-1}\right)+\left(-x^{2}+2x\right)\left(\sum_{n=0}^{\infty}a_{n}x^{n+r}\right)=0
\end{aligned} \tag{1}
$$

Which simplifies to

$$
\begin{aligned}
\left(\sum_{n=0}^{\infty}x^{n+r}a_{n}(n+r)\,(n+r-1)\right)+\left(\sum_{n=0}^{\infty}x^{n+r+2}a_{n}(n+r)\right) \\
+\left(\sum_{n=0}^{\infty}x^{1+n+r}a_{n}(n+r)\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_{n}(n+r)\right) \\
+\sum_{n=0}^{\infty}\left(-x^{n+r+2}a_{n}\right)+\left(\sum_{n=0}^{\infty}2x^{1+n+r}a_{n}\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty}x^{n+r+2}a_{n}(n+r) &= \sum_{n=2}^{\infty}a_{n-2}(n+r-2)\,x^{n+r} \\
\sum_{n=0}^{\infty}x^{1+n+r}a_{n}(n+r) &= \sum_{n=1}^{\infty}a_{n-1}(n+r-1)\,x^{n+r} \\
\sum_{n=0}^{\infty}\left(-x^{n+r+2}a_{n}\right) &= \sum_{n=2}^{\infty}\left(-a_{n-2}x^{n+r}\right) \\
\sum_{n=0}^{\infty}2x^{1+n+r}a_{n} &= \sum_{n=1}^{\infty}2a_{n-1}x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n + r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \sum_{n=2}^{\infty} \left(-a_{n-2} x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 2 a_{n-1} x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + x^{n+r} a_n (n+r) = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + x^r a_0 r = 0$$

Or

$$(x^r r(-1+r) + x^r r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^r r^2 = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 0$$
$$r_2 = 0$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^r r^2 = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = \frac{-2-r}{(1+r)^2}$$

For $2 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1)+a_{n-2}(n+r-2)+a_{n-1}(n+r-1)+a_n(n+r)-a_{n-2}+2a_{n-1}=0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{na_{n-2} + na_{n-1} + ra_{n-2} + ra_{n-1} - 3a_{n-2} + a_{n-1}}{n^2 + 2nr + r^2} \tag{4}$$

Which for the root $r = 0$ becomes

$$a_n = \frac{(-a_{n-2} - a_{n-1})\,n + 3a_{n-2} - a_{n-1}}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 0$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{(1+r)^2}$	-2

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-r^3 + 6r + 7}{(1+r)^2 (r+2)^2}$$

Which for the root $r = 0$ becomes

$$a_2 = \frac{7}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{(1+r)^2}$	-2
a_2	$\frac{-r^3+6r+7}{(1+r)^2(r+2)^2}$	$\frac{7}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{2r^4 + 10r^3 + 6r^2 - 23r - 28}{(1+r)^2 (r+2)^2 (r+3)^2}$$

Which for the root $r = 0$ becomes

$$a_3 = -\frac{7}{9}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{(1+r)^2}$	-2
a_2	$\frac{-r^3+6r+7}{(1+r)^2(r+2)^2}$	$\frac{7}{4}$
a_3	$\frac{2r^4+10r^3+6r^2-23r-28}{(1+r)^2(r+2)^2(r+3)^2}$	$-\frac{7}{9}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^6 + 5r^5 - 11r^4 - 96r^3 - 146r^2 - 16r + 77}{(1+r)^2 (r+2)^2 (r+3)^2 (r+4)^2}$$

Which for the root $r = 0$ becomes

$$a_4 = \frac{77}{576}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{(1+r)^2}$	-2
a_2	$\frac{-r^3+6r+7}{(1+r)^2(r+2)^2}$	$\frac{7}{4}$
a_3	$\frac{2r^4+10r^3+6r^2-23r-28}{(1+r)^2(r+2)^2(r+3)^2}$	$-\frac{7}{9}$
a_4	$\frac{r^6+5r^5-11r^4-96r^3-146r^2-16r+77}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2}$	$\frac{77}{576}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-3r^7 - 41r^6 - 189r^5 - 259r^4 + 468r^3 + 1716r^2 + 1651r + 434}{(1+r)^2 (r+2)^2 (r+3)^2 (r+4)^2 (r+5)^2}$$

Which for the root $r = 0$ becomes

$$a_5 = \frac{217}{7200}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{(1+r)^2}$	-2
a_2	$\frac{-r^3+6r+7}{(1+r)^2(r+2)^2}$	$\frac{7}{4}$
a_3	$\frac{2r^4+10r^3+6r^2-23r-28}{(1+r)^2(r+2)^2(r+3)^2}$	$-\frac{7}{9}$
a_4	$\frac{r^6+5r^5-11r^4-96r^3-146r^2-16r+77}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2}$	$\frac{77}{576}$
a_5	$\frac{-3r^7-41r^6-189r^5-259r^4+468r^3+1716r^2+1651r+434}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$\frac{217}{7200}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{-r^9 - 15r^8 - 47r^7 + 365r^6 + 3206r^5 + 9364r^4 + 10369r^3 - 2834r^2 - 15026r - 8813}{(1+r)^2 (r+2)^2 (r+3)^2 (r+4)^2 (r+5)^2 (r+6)^2}$$

Which for the root $r = 0$ becomes

$$a_6 = -\frac{8813}{518400}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{(1+r)^2}$	-2
a_2	$\frac{-r^3+6r+7}{(1+r)^2(r+2)^2}$	$\frac{7}{4}$
a_3	$\frac{2r^4+10r^3+6r^2-23r-28}{(1+r)^2(r+2)^2(r+3)^2}$	$-\frac{7}{9}$
a_4	$\frac{r^6+5r^5-11r^4-96r^3-146r^2-16r+77}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2}$	$\frac{77}{576}$
a_5	$\frac{-3r^7-41r^6-189r^5-259r^4+468r^3+1716r^2+1651r+434}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$\frac{217}{7200}$
a_6	$\frac{-r^9-15r^8-47r^7+365r^6+3206r^5+9364r^4+10369r^3-2834r^2-15026r-8813}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(r+6)^2}$	$-\frac{8813}{518400}$

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{4r^{10} + 112r^9 + 1264r^8 + 7170r^7 + 19330r^6 + 4756r^5 - 116404r^4 - 318504r^3 - 355034r^2 - 145179r}{(1+r)^2 (r+2)^2 (r+3)^2 (r+4)^2 (r+5)^2 (r+6)^2 (r+7)^2}$$

Which for the root $r = 0$ becomes

$$a_7 = \frac{143}{453600}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{(1+r)^2}$	-2
a_2	$\frac{-r^3+6r+7}{(1+r)^2(r+2)^2}$	$\frac{7}{4}$
a_3	$\frac{2r^4+10r^3+6r^2-23r-28}{(1+r)^2(r+2)^2(r+3)^2}$	$-\frac{7}{9}$
a_4	$\frac{r^6+5r^5-11r^4-96r^3-146r^2-16r+77}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2}$	$\frac{77}{576}$
a_5	$\frac{-3r^7-41r^6-189r^5-259r^4+468r^3+1716r^2+1651r+434}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$\frac{217}{7200}$
a_6	$\frac{-r^9-15r^8-47r^7+365r^6+3206r^5+9364r^4+10369r^3-2834r^2-15026r-8813}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(r+6)^2}$	$-\frac{8813}{518400}$
a_7	$\frac{4r^{10}+112r^9+1264r^8+7170r^7+19330r^6+4756r^5-116404r^4-318504r^3-355034r^2-145179r+8008}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(r+6)^2(r+7)^2}$	$\frac{143}{453600}$

Using the above table, then the first solution $y_1(x)$ becomes

$$
\begin{aligned}
y_1(x) &= a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 \dots \\
&= 1 - 2x + \frac{7x^2}{4} - \frac{7x^3}{9} + \frac{77x^4}{576} + \frac{217x^5}{7200} - \frac{8813x^6}{518400} + \frac{143x^7}{453600} + O(x^8)
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = 0$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n st
b_1	$\frac{-2-r}{(1+r)^2}$	-2	$\frac{r+3}{(1+r)^3}$
b_2	$\frac{-r^3+6r+7}{(1+r)^2(r+2)^2}$	$\frac{7}{4}$	$\frac{r^4-3r^3-24r^2-46r-}{(1+r)^3(r+2)^3}$
b_3	$\frac{2r^4+10r^3+6r^2-23r-28}{(1+r)^2(r+2)^2(r+3)^2}$	$-\frac{7}{9}$	$\frac{-4r^6-30r^5-40r^4+2}{(1+r)^3(r}$
b_4	$\frac{r^6+5r^5-11r^4-96r^3-146r^2-16r+77}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2}$	$\frac{77}{576}$	$-2r^9-15r^8+64r^7+1$
b_5	$\frac{-3r^7-41r^6-189r^5-259r^4+468r^3+1716r^2+1651r+434}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$\frac{217}{7200}$	$9r^{11}+209r^{10}+1920r$
b_6	$\frac{-r^9-15r^8-47r^7+365r^6+3206r^5+9364r^4+10369r^3-2834r^2-15026r-8813}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(r+6)^2}$	$-\frac{8813}{518400}$	$3r^{14}+81r^{13}+690r^{12}$
b_7	$\frac{4r^{10}+112r^9+1264r^8+7170r^7+19330r^6+4756r^5-116404r^4-318504r^3-355034r^2-145179r+8008}{(1+r)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(r+6)^2(r+7)^2}$	$\frac{143}{453600}$	$-16r^{16}-784r^{15}-169$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \dots \\
&= \left(1 - 2x + \frac{7x^2}{4} - \frac{7x^3}{9} + \frac{77x^4}{576} + \frac{217x^5}{7200} - \frac{8813x^6}{518400} + \frac{143x^7}{453600} + O(x^8)\right)\ln(x) \\
&\quad + 3x - \frac{15x^2}{4} + \frac{239x^3}{108} - \frac{2021x^4}{3456} - \frac{1241x^5}{54000} + \frac{93859x^6}{1728000} - \frac{311177x^7}{42336000} + O(x^8)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1\left(1-2x+\frac{7x^2}{4}-\frac{7x^3}{9}+\frac{77x^4}{576}+\frac{217x^5}{7200}-\frac{8813x^6}{518400}+\frac{143x^7}{453600}+O(x^8)\right) \\
&\quad + c_2\left(\left(1-2x+\frac{7x^2}{4}-\frac{7x^3}{9}+\frac{77x^4}{576}+\frac{217x^5}{7200}-\frac{8813x^6}{518400}+\frac{143x^7}{453600}+O(x^8)\right)\ln(x)\right. \\
&\quad \left.+3x-\frac{15x^2}{4}+\frac{239x^3}{108}-\frac{2021x^4}{3456}-\frac{1241x^5}{54000}+\frac{93859x^6}{1728000}-\frac{311177x^7}{42336000}+O(x^8)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1\left(1-2x+\frac{7x^2}{4}-\frac{7x^3}{9}+\frac{77x^4}{576}+\frac{217x^5}{7200}-\frac{8813x^6}{518400}+\frac{143x^7}{453600}+O(x^8)\right) \\
&\quad + c_2\left(\left(1-2x+\frac{7x^2}{4}-\frac{7x^3}{9}+\frac{77x^4}{576}+\frac{217x^5}{7200}-\frac{8813x^6}{518400}+\frac{143x^7}{453600}+O(x^8)\right)\ln(x)\right. \\
&\quad \left.+3x-\frac{15x^2}{4}+\frac{239x^3}{108}-\frac{2021x^4}{3456}-\frac{1241x^5}{54000}+\frac{93859x^6}{1728000}-\frac{311177x^7}{42336000}+O(x^8)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1\left(1-2x+\frac{7x^2}{4}-\frac{7x^3}{9}+\frac{77x^4}{576}+\frac{217x^5}{7200}-\frac{8813x^6}{518400}+\frac{143x^7}{453600}+O(x^8)\right) \\
&\quad + c_2\left(\left(1-2x+\frac{7x^2}{4}-\frac{7x^3}{9}+\frac{77x^4}{576}+\frac{217x^5}{7200}-\frac{8813x^6}{518400}+\frac{143x^7}{453600}+O(x^8)\right)\ln(x)\right. \\
&\quad \left.+3x-\frac{15x^2}{4}+\frac{239x^3}{108}-\frac{2021x^4}{3456}-\frac{1241x^5}{54000}+\frac{93859x^6}{1728000}-\frac{311177x^7}{42336000}+O(x^8)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1\left(1-2x+\frac{7x^2}{4}-\frac{7x^3}{9}+\frac{77x^4}{576}+\frac{217x^5}{7200}-\frac{8813x^6}{518400}+\frac{143x^7}{453600}+O(x^8)\right) \\
&\quad + c_2\left(\left(1-2x+\frac{7x^2}{4}-\frac{7x^3}{9}+\frac{77x^4}{576}+\frac{217x^5}{7200}-\frac{8813x^6}{518400}+\frac{143x^7}{453600}+O(x^8)\right)\ln(x)\right. \\
&\quad \left.+3x-\frac{15x^2}{4}+\frac{239x^3}{108}-\frac{2021x^4}{3456}-\frac{1241x^5}{54000}+\frac{93859x^6}{1728000}-\frac{311177x^7}{42336000}+O(x^8)\right)
\end{aligned}
$$

Verified OK.

15.11.1 Maple step by step solution

Let's solve

$x^2y'' + (x^3 + x^2 + x)\, y' + (-x^2 + 2x)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(-2+x)y}{x} - \frac{(x^2+x+1)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x^2+x+1)y'}{x} - \frac{(-2+x)y}{x} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{x^2+x+1}{x}, P_3(x) = -\frac{-2+x}{x}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\bigg|_{x=0} = 1$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\bigg|_{x=0} = 0$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $y''x + (x^2 + x + 1)\, y' + (2 - x)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 0..2$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r) \, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r) \, x^{k+r}$

- Convert $x \cdot y''$ to series expansion

  $x \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r) \, (k+r-1) \, x^{k+r-1}$

- Shift index using $k->k+1$

  $x \cdot y'' = \sum_{k=-1}^{\infty} a_{k+1} (k+1+r) \, (k+r) \, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0 r^2 x^{-1+r} + \left(a_1 (1+r)^2 + a_0 (2+r)\right) x^r + \left(\sum_{k=1}^{\infty} \left(a_{k+1} (k+1+r)^2 + a_k (k+r+2) + a_{k-1} (k-2\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $r^2 = 0$

- Values of r that satisfy the indicial equation

  $r = 0$

- Each term must be 0

  $a_1 (1+r)^2 + a_0 (2+r) = 0$

- Each term in the series must be 0, giving the recursion relation

  $k^2 a_{k+1} + (a_k + a_{k-1} + 2a_{k+1}) \, k + 2a_k - 2a_{k-1} + a_{k+1} = 0$

- Shift index using $k->k+1$

  $(k+1)^2 a_{k+2} + (a_{k+1} + a_k + 2a_{k+2}) \, (k+1) + 2a_{k+1} - 2a_k + a_{k+2} = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{a_k k + k a_{k+1} - a_k + 3a_{k+1}}{k^2+4k+4}$

- Recursion relation for $r = 0$

  $a_{k+2} = -\frac{a_k k + k a_{k+1} - a_k + 3a_{k+1}}{k^2+4k+4}$

- Solution for $r = 0$

$$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+2} = -\frac{a_k k + k a_{k+1} - a_k + 3a_{k+1}}{k^2 + 4k + 4}, a_1 + 2a_0 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 8.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(1+2x)\,y''+x\left(3x^2+14x+5\right)y'+\left(12x^2+18x+4\right)y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(2x^3+x^2\right)y''+\left(3x^3+14x^2+5x\right)y'+\left(12x^2+18x+4\right)y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}
p(x) &= \frac{3x^2+14x+5}{x\,(1+2x)}\\
q(x) &= \frac{12x^2+18x+4}{x^2\,(1+2x)}
\end{aligned}$$

Table 666: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3x^2+14x+5}{x(1+2x)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2}$	"regular"

$q(x) = \frac{12x^2+18x+4}{x^2(1+2x)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{1}{2}\right]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(1+2x)\,y'' + \left(3x^3 + 14x^2 + 5x\right) y' + \left(12x^2 + 18x + 4\right) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(1+2x)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(3x^3 + 14x^2 + 5x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(12x^2 + 18x + 4\right)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n(n+r)\,(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)\,(n+r-1)\right)\\
&+ \left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} 14x^{1+n+r} a_n(n+r)\right)\\
&+ \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} 12x^{n+r+2} a_n\right)\\
&+ \left(\sum_{n=0}^{\infty} 18x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0
\end{aligned}
\tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 2x^{1+n+r} a_n(n+r)\,(n+r-1) &= \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}\\
\sum_{n=0}^{\infty} 3x^{n+r+2} a_n(n+r) &= \sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)\,x^{n+r}\\
\sum_{n=0}^{\infty} 14x^{1+n+r} a_n(n+r) &= \sum_{n=1}^{\infty} 14a_{n-1}(n+r-1)\,x^{n+r}\\
\sum_{n=0}^{\infty} 12x^{n+r+2} a_n &= \sum_{n=2}^{\infty} 12a_{n-2}x^{n+r}\\
\sum_{n=0}^{\infty} 18x^{1+n+r} a_n &= \sum_{n=1}^{\infty} 18a_{n-1}x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)\,(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)\,x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 14a_{n-1}(n+r-1)\,x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n(n+r)\right) + \left(\sum_{n=2}^{\infty} 12a_{n-2}x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 18a_{n-1}x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n(n+r)\,(n+r-1) + 5x^{n+r} a_n(n+r) + 4a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) + 5x^r a_0 r + 4a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + 5x^r r + 4x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r+2\right)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$\left(r+2\right)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -2$$
$$r_2 = -2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(r+2\right)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -2$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-2}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-2}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -2$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &2a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) + 3a_{n-2}(n+r-2) \\ &+ 14a_{n-1}(n+r-1) + 5a_n(n+r) + 12a_{n-2} + 18a_{n-1} + 4a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{2na_{n-1} + 2ra_{n-1} + 3a_{n-2} + 4a_{n-1}}{n+r+2} \tag{4}$$

Which for the root $r = -2$ becomes

$$a_n = \frac{-2na_{n-1} - 3a_{n-2}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-2	-2

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4r + 13}{4 + r}$$

Which for the root $r = -2$ becomes

$$a_2 = \frac{5}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-2	-2
a_2	$\frac{4r+13}{4+r}$	$\frac{5}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-8r^2 - 60r - 106}{(4 + r)(5 + r)}$$

Which for the root $r = -2$ becomes

$$a_3 = -3$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-2	-2
a_2	$\frac{4r+13}{4+r}$	$\frac{5}{2}$
a_3	$\frac{-8r^2-60r-106}{(4+r)(5+r)}$	-3

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16r^3 + 204r^2 + 833r + 1077}{(6+r)(4+r)(5+r)}$$

Which for the root $r = -2$ becomes

$$a_4 = \frac{33}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-2	-2
a_2	$\frac{4r+13}{4+r}$	$\frac{5}{2}$
a_3	$\frac{-8r^2-60r-106}{(4+r)(5+r)}$	-3
a_4	$\frac{16r^3+204r^2+833r+1077}{(6+r)(4+r)(5+r)}$	$\frac{33}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-32r^4 - 608r^3 - 4198r^2 - 12418r - 13170}{(4+r)(5+r)(6+r)(7+r)}$$

Which for the root $r = -2$ becomes

$$a_5 = -\frac{129}{20}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-2	-2
a_2	$\frac{4r+13}{4+r}$	$\frac{5}{2}$
a_3	$\frac{-8r^2-60r-106}{(4+r)(5+r)}$	-3
a_4	$\frac{16r^3+204r^2+833r+1077}{(6+r)(4+r)(5+r)}$	$\frac{33}{8}$
a_5	$\frac{-32r^4-608r^3-4198r^2-12418r-13170}{(4+r)(5+r)(6+r)(7+r)}$	$-\frac{129}{20}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{64r^5 + 1680r^4 + 17176r^3 + 85221r^2 + 204304r + 188103}{(8 + r)(4 + r)(5 + r)(6 + r)(7 + r)}$$

Which for the root $r = -2$ becomes

$$a_6 = \frac{867}{80}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-2	-2
a_2	$\frac{4r+13}{4+r}$	$\frac{5}{2}$
a_3	$\frac{-8r^2-60r-106}{(4+r)(5+r)}$	-3
a_4	$\frac{16r^3+204r^2+833r+1077}{(6+r)(4+r)(5+r)}$	$\frac{33}{8}$
a_5	$\frac{-32r^4-608r^3-4198r^2-12418r-13170}{(4+r)(5+r)(6+r)(7+r)}$	$-\frac{129}{20}$
a_6	$\frac{64r^5+1680r^4+17176r^3+85221r^2+204304r+188103}{(8+r)(4+r)(5+r)(6+r)(7+r)}$	$\frac{867}{80}$

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{-128r^6 - 4416r^5 - 62000r^4 - 452424r^3 - 1804580r^2 - 3716136r - 3069774}{(4 + r)(5 + r)(6 + r)(7 + r)(8 + r)(9 + r)}$$

Which for the root $r = -2$ becomes

$$a_7 = -\frac{1059}{56}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-2	-2
a_2	$\frac{4r+13}{4+r}$	$\frac{5}{2}$
a_3	$\frac{-8r^2-60r-106}{(4+r)(5+r)}$	-3
a_4	$\frac{16r^3+204r^2+833r+1077}{(6+r)(4+r)(5+r)}$	$\frac{33}{8}$
a_5	$\frac{-32r^4-608r^3-4198r^2-12418r-13170}{(4+r)(5+r)(6+r)(7+r)}$	$-\frac{129}{20}$
a_6	$\frac{64r^5+1680r^4+17176r^3+85221r^2+204304r+188103}{(8+r)(4+r)(5+r)(6+r)(7+r)}$	$\frac{867}{80}$
a_7	$\frac{-128r^6-4416r^5-62000r^4-452424r^3-1804580r^2-3716136r-3069774}{(4+r)(5+r)(6+r)(7+r)(8+r)(9+r)}$	$-\frac{1059}{56}$

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \frac{1}{x^2}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 \dots\right) \\
&= \frac{1 - 2x + \frac{5x^2}{2} - 3x^3 + \frac{33x^4}{8} - \frac{129x^5}{20} + \frac{867x^6}{80} - \frac{1059x^7}{56} + O(x^8)}{x^2}
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = -2$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	-2	-2	0
b_2	$\frac{4r+13}{4+r}$	$\frac{5}{2}$	$\frac{3}{(4+r)^2}$
b_3	$\frac{-8r^2-60r-106}{(4+r)(5+r)}$	-3	$\frac{-12r^2-108r-246}{(4+r)^2(5+r)^2}$
b_4	$\frac{16r^3+204r^2+833r+1077}{(6+r)(4+r)(5+r)}$	$\frac{33}{8}$	$\frac{36r^4+702r^3+5130r^2+16650r+20262}{(6+r)^2(4+r)^2(5+r)^2}$
b_5	$\frac{-32r^4-608r^3-4198r^2-12418r-13170}{(4+r)(5+r)(6+r)(7+r)}$	$-\frac{129}{20}$	$-\frac{6(16r^6+510r^5+6745r^4+47376r^3+186407r^2+38}{(4+r)^2(5+r)^2(6+r)^2(7+r)^2}$
b_6	$\frac{64r^5+1680r^4+17176r^3+85221r^2+204304r+188103}{(8+r)(4+r)(5+r)(6+r)(7+r)}$	$\frac{867}{80}$	$\frac{240r^8+11088r^7+222897r^6+2546388r^5+18081150r}{(8+r)^2(4+r)^2(}$
b_7	$\frac{-128r^6-4416r^5-62000r^4-452424r^3-1804580r^2-3716136r-3069774}{(4+r)(5+r)(6+r)(7+r)(8+r)(9+r)}$	$-\frac{1059}{56}$	$-\frac{6(96r^{10}+6000r^9+167748r^8+2762496r^7+296738}{}$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \ldots \\
&= \frac{\left(1-2x+\frac{5x^2}{2}-3x^3+\frac{33x^4}{8}-\frac{129x^5}{20}+\frac{867x^6}{80}-\frac{1059x^7}{56}+O(x^8)\right)\ln(x)}{x^2} \\
&\quad + \frac{\frac{3x^2}{4}-\frac{13x^3}{6}+\frac{407x^4}{96}-\frac{9047x^5}{1200}+\frac{63851x^6}{4800}-\frac{559033x^7}{23520}+O(x^8)}{x^2}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= \frac{c_1\left(1-2x+\frac{5x^2}{2}-3x^3+\frac{33x^4}{8}-\frac{129x^5}{20}+\frac{867x^6}{80}-\frac{1059x^7}{56}+O(x^8)\right)}{x^2} \\
&\quad + c_2\left(\frac{\left(1-2x+\frac{5x^2}{2}-3x^3+\frac{33x^4}{8}-\frac{129x^5}{20}+\frac{867x^6}{80}-\frac{1059x^7}{56}+O(x^8)\right)\ln(x)}{x^2}\right. \\
&\quad \left. + \frac{\frac{3x^2}{4}-\frac{13x^3}{6}+\frac{407x^4}{96}-\frac{9047x^5}{1200}+\frac{63851x^6}{4800}-\frac{559033x^7}{23520}+O(x^8)}{x^2}\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(1-2x+\frac{5x^2}{2}-3x^3+\frac{33x^4}{8}-\frac{129x^5}{20}+\frac{867x^6}{80}-\frac{1059x^7}{56}+O(x^8)\right)}{x^2} \\
&\quad + c_2\left(\frac{\left(1-2x+\frac{5x^2}{2}-3x^3+\frac{33x^4}{8}-\frac{129x^5}{20}+\frac{867x^6}{80}-\frac{1059x^7}{56}+O(x^8)\right)\ln(x)}{x^2}\right. \\
&\quad \left. + \frac{\frac{3x^2}{4}-\frac{13x^3}{6}+\frac{407x^4}{96}-\frac{9047x^5}{1200}+\frac{63851x^6}{4800}-\frac{559033x^7}{23520}+O(x^8)}{x^2}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= \frac{c_1\left(1-2x+\frac{5x^2}{2}-3x^3+\frac{33x^4}{8}-\frac{129x^5}{20}+\frac{867x^6}{80}-\frac{1059x^7}{56}+O(x^8)\right)}{x^2} \\
&\quad + c_2\left(\frac{\left(1-2x+\frac{5x^2}{2}-3x^3+\frac{33x^4}{8}-\frac{129x^5}{20}+\frac{867x^6}{80}-\frac{1059x^7}{56}+O(x^8)\right)\ln(x)}{x^2}\right. \\
&\quad \left. + \frac{\frac{3x^2}{4}-\frac{13x^3}{6}+\frac{407x^4}{96}-\frac{9047x^5}{1200}+\frac{63851x^6}{4800}-\frac{559033x^7}{23520}+O(x^8)}{x^2}\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= \frac{c_1\left(1-2x+\frac{5x^2}{2}-3x^3+\frac{33x^4}{8}-\frac{129x^5}{20}+\frac{867x^6}{80}-\frac{1059x^7}{56}+O(x^8)\right)}{x^2} \\
&\quad + c_2\left(\frac{\left(1-2x+\frac{5x^2}{2}-3x^3+\frac{33x^4}{8}-\frac{129x^5}{20}+\frac{867x^6}{80}-\frac{1059x^7}{56}+O(x^8)\right)\ln(x)}{x^2}\right. \\
&\quad \left. + \frac{\frac{3x^2}{4}-\frac{13x^3}{6}+\frac{407x^4}{96}-\frac{9047x^5}{1200}+\frac{63851x^6}{4800}-\frac{559033x^7}{23520}+O(x^8)}{x^2}\right)
\end{aligned}
$$

Verified OK.

15.12.1 Maple step by step solution

Let's solve

$x^2(1+2x)\,y''+(3x^3+14x^2+5x)\,y'+(12x^2+18x+4)\,y=0$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y''=-\frac{2(6x^2+9x+2)y}{x^2(1+2x)}-\frac{(3x^2+14x+5)y'}{x(1+2x)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''+\frac{(3x^2+14x+5)y'}{x(1+2x)}+\frac{2(6x^2+9x+2)y}{x^2(1+2x)}=0$

☐ Check to see if x_0 is a regular singular point

- ○ Define functions

$\left[P_2(x)=\frac{3x^2+14x+5}{x(1+2x)},P_3(x)=\frac{2(6x^2+9x+2)}{x^2(1+2x)}\right]$

- ○ $x\cdot P_2(x)$ is analytic at $x=0$

$\left.(x\cdot P_2(x))\right|_{x=0}=5$

- ○ $x^2\cdot P_3(x)$ is analytic at $x=0$

$\left.(x^2\cdot P_3(x))\right|_{x=0}=4$

- ○ $x=0$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0=0$

- Multiply by denominators

$x^2(1+2x)\,y''+x(3x^2+14x+5)\,y'+(12x^2+18x+4)\,y=0$

- Assume series solution for y

$y=\sum_{k=0}^{\infty}a_kx^{k+r}$

☐ Rewrite ODE with series expansions

- ○ Convert $x^m\cdot y$ to series expansion for $m=0..2$

$x^m\cdot y=\sum_{k=0}^{\infty}a_kx^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty}a_{k-m}x^{k+r}$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..3$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty}a_{k}(k+r)\,x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,x^{k+r}$

- Convert $x^{m}\cdot y''$ to series expansion for $m=2..3$

  $x^{m}\cdot y''=\sum_{k=0}^{\infty}a_{k}(k+r)\,(k+r-1)\,x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m}\cdot y''=\sum_{k=-2+m}^{\infty}a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}(2+r)^{2}\,x^{r}+\left(a_{1}(3+r)^{2}+2a_{0}(3+r)^{2}\right)x^{1+r}+\left(\sum_{k=2}^{\infty}\left(a_{k}(k+r+2)^{2}+2a_{k-1}(k+r+2)^{2}+3a\right.\right.$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $(2+r)^{2}=0$

- Values of r that satisfy the indicial equation

  $r=-2$

- Each term must be 0

  $a_{1}(3+r)^{2}+2a_{0}(3+r)^{2}=0$

- Solve for the dependent coefficient(s)

  $a_{1}=-2a_{0}$

- Each term in the series must be 0, giving the recursion relation

  $((2k+2r+4)\,a_{k-1}+a_{k}(k+r+2)+3a_{k-2})\,(k+r+2)=0$

- Shift index using $k->k+2$

  $((2k+8+2r)\,a_{k+1}+a_{k+2}(k+r+4)+3a_{k})\,(k+r+4)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{2ka_{k+1}+2ra_{k+1}+3a_{k}+8a_{k+1}}{k+r+4}$

- Recursion relation for $r = -2$

  $a_{k+2} = -\frac{2k a_{k+1}+3a_k+4a_{k+1}}{k+2}$
- Solution for $r = -2$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-2}, a_{k+2} = -\frac{2k a_{k+1}+3a_k+4a_{k+1}}{k+2}, a_1 = -2a_0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 9.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2y'' + 2x(x^2+x+4)\,y' + (3x^2+5x+1)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$4x^2y'' + (2x^3+2x^2+8x)\,y' + (3x^2+5x+1)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$\begin{aligned} p(x) &= \frac{x^2+x+4}{2x} \\ q(x) &= \frac{3x^2+5x+1}{4x^2} \end{aligned}$$

Table 668: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x^2+x+4}{2x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{3x^2+5x+1}{4x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2y'' + (2x^3 + 2x^2 + 8x)\, y' + (3x^2 + 5x + 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2 \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2} \right) + (2x^3+2x^2+8x) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1} \right) + (3x^2+5x+1) \left(\sum_{n=0}^{\infty} a_n x^{n+r} \right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 5x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r) &= \sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r) &= \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\, x^{n+r} \\
\sum_{n=0}^{\infty} 3x^{n+r+2} a_n &= \sum_{n=2}^{\infty} 3a_{n-2} x^{n+r} \\
\sum_{n=0}^{\infty} 5x^{1+n+r} a_n &= \sum_{n=1}^{\infty} 5a_{n-1} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r}\right) \\
&+ \left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 5a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$4x^{n+r}a_n(n+r)(n+r-1) + 8x^{n+r}a_n(n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) + 8x^r a_0 r + a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) + 8x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(2r+1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(2r+1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -\frac{1}{2}$$
$$r_2 = -\frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(2r+1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -\frac{1}{2}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-\frac{1}{2}}$$

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-\frac{1}{2}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = \frac{-2r-5}{(2r+3)^2}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &4a_n(n+r)(n+r-1) + 2a_{n-2}(n+r-2) \\ &+ 2a_{n-1}(n+r-1) + 8a_n(n+r) + 3a_{n-2} + 5a_{n-1} + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{2na_{n-2} + 2na_{n-1} + 2ra_{n-2} + 2ra_{n-1} - a_{n-2} + 3a_{n-1}}{4n^2 + 8nr + 4r^2 + 4n + 4r + 1} \tag{4}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_n = \frac{(-a_{n-2} - a_{n-1})\,n + a_{n-2} - a_{n-1}}{2n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -\frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r-5}{(2r+3)^2}$	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-4r^3 - 16r^2 - 15r + 4}{8\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_2 = \frac{1}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r-5}{(2r+3)^2}$	-1
a_2	$\frac{-4r^3-16r^2-15r+4}{8\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2}$	$\frac{1}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{32r^4 + 296r^3 + 948r^2 + 1254r + 553}{64\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2\left(r+\frac{7}{2}\right)^2}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_3 = \frac{1}{18}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r-5}{(2r+3)^2}$	-1
a_2	$\frac{-4r^3-16r^2-15r+4}{8\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2}$	$\frac{1}{4}$
a_3	$\frac{32r^4+296r^3+948r^2+1254r+553}{64\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2\left(r+\frac{7}{2}\right)^2}$	$\frac{1}{18}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{64r^6 + 864r^5 + 4336r^4 + 9456r^3 + 6188r^2 - 6962r - 8827}{(2r+3)^2(2r+5)^2(2r+7)^2(4r^2+36r+81)}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_4 = -\frac{37}{1152}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r-5}{(2r+3)^2}$	-1
a_2	$\frac{-4r^3-16r^2-15r+4}{8\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2}$	$\frac{1}{4}$
a_3	$\frac{32r^4+296r^3+948r^2+1254r+553}{64\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2\left(r+\frac{7}{2}\right)^2}$	$\frac{1}{18}$
a_4	$\frac{64r^6+864r^5+4336r^4+9456r^3+6188r^2-6962r-8827}{(2r+3)^2(2r+5)^2(2r+7)^2(4r^2+36r+81)}$	$-\frac{37}{1152}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-192r^7 - 4192r^6 - 37504r^5 - 177440r^4 - 475836r^3 - 713390r^2 - 537382r - 144193}{512\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2\left(\frac{11}{2}+r\right)^2\left(r+\frac{7}{2}\right)^2\left(r+\frac{9}{2}\right)^2}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_5 = -\frac{17}{28800}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r-5}{(2r+3)^2}$	-1
a_2	$\frac{-4r^3-16r^2-15r+4}{8\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2}$	$\frac{1}{4}$
a_3	$\frac{32r^4+296r^3+948r^2+1254r+553}{64\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2\left(r+\frac{7}{2}\right)^2}$	$\frac{1}{18}$
a_4	$\frac{64r^6+864r^5+4336r^4+9456r^3+6188r^2-6962r-8827}{(2r+3)^2(2r+5)^2(2r+7)^2(4r^2+36r+81)}$	$-\frac{37}{1152}$
a_5	$\frac{-192r^7-4192r^6-37504r^5-177440r^4-475836r^3-713390r^2-537382r-144193}{512\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2\left(\frac{11}{2}+r\right)^2\left(r+\frac{7}{2}\right)^2\left(r+\frac{9}{2}\right)^2}$	$-\frac{17}{28800}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{-512r^9 - 14592r^8 - 172672r^7 - 1084672r^6 - 3760736r^5 - 6170848r^4 + 1039816r^3 + 21534576r^2 +}{\left(4r^2+52r+169\right)(2r+3)^2(2r+5)^2(11+2r)^2(2r+7)^2(2r+9)^2}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_6 = \frac{593}{259200}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r-5}{(2r+3)^2}$	-1
a_2	$\frac{-4r^3-16r^2-15r+4}{8(r+\frac{3}{2})^2(r+\frac{5}{2})^2}$	$\frac{1}{4}$
a_3	$\frac{32r^4+296r^3+948r^2+1254r+553}{64(r+\frac{3}{2})^2(r+\frac{5}{2})^2(r+\frac{7}{2})^2}$	$\frac{1}{18}$
a_4	$\frac{64r^6+864r^5+4336r^4+9456r^3+6188r^2-6962r-8827}{(2r+3)^2(2r+5)^2(2r+7)^2(4r^2+36r+81)}$	$-\frac{37}{1152}$
a_5	$\frac{-192r^7-4192r^6-37504r^5-177440r^4-475836r^3-713390r^2-537382r-144193}{512(r+\frac{3}{2})^2(r+\frac{5}{2})^2(\frac{11}{2}+r)^2(r+\frac{7}{2})^2(r+\frac{9}{2})^2}$	$-\frac{17}{28800}$
a_6	$\frac{-512r^9-14592r^8-172672r^7-1084672r^6-3760736r^5-6170848r^4+1039816r^3+21534576r^2+32373056r+16074527}{(4r^2+52r+169)(2r+3)^2(2r+5)^2(11+2r)^2(2r+7)^2(2r+9)^2}$	$\frac{593}{259200}$

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{4096r^{10} + 164864r^9 + 2890752r^8 + 28990080r^7 + 183413312r^6 + 760790176r^5 + 2078667344r^4 + 36}{16384\left(r+\frac{3}{2}\right)^2\left(r+\frac{15}{2}\right)^2\left(r+\frac{5}{2}\right)^2\left(\frac{11}{2}+r\right)^2\left(r+\frac{7}{2}\right)^2(r+}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_7 = -\frac{1913}{12700800}$$

And the table now becomes

n	$a_{n,r}$
a_0	1
a_1	$\frac{-2r-5}{(2r+3)^{2}}$
a_2	$\frac{-4r^{3}-16r^{2}-15r+4}{8\left(r+\frac{3}{2}\right)^{2}\left(r+\frac{5}{2}\right)^{2}}$
a_3	$\frac{32r^{4}+296r^{3}+948r^{2}+1254r+553}{64\left(r+\frac{3}{2}\right)^{2}\left(r+\frac{5}{2}\right)^{2}\left(r+\frac{7}{2}\right)^{2}}$
a_4	$\frac{64r^{6}+864r^{5}+4336r^{4}+9456r^{3}+6188r^{2}-6962r-8827}{(2r+3)^{2}(2r+5)^{2}(2r+7)^{2}(4r^{2}+36r+81)}$
a_5	$\frac{-192r^{7}-4192r^{6}-37504r^{5}-177440r^{4}-475836r^{3}-713390r^{2}-537382r-144193}{512\left(r+\frac{3}{2}\right)^{2}\left(r+\frac{5}{2}\right)^{2}\left(\frac{11}{2}+r\right)^{2}\left(r+\frac{7}{2}\right)^{2}\left(r+\frac{9}{2}\right)^{2}}$
a_6	$\frac{-512r^{9}-14592r^{8}-172672r^{7}-1084672r^{6}-3760736r^{5}-6170848r^{4}+1039816r^{3}+21534576r^{2}+32373056r+16074527}{(4r^{2}+52r+169)(2r+3)^{2}(2r+5)^{2}(11+2r)^{2}(2r+7)^{2}(2r+9)^{2}}$
a_7	$\frac{4096r^{10}+164864r^{9}+2890752r^{8}+28990080r^{7}+183413312r^{6}+760790176r^{5}+2078667344r^{4}+3646802552r^{3}+3838600668r^{2}+2071188906r-}{16384\left(r+\frac{3}{2}\right)^{2}\left(r+\frac{15}{2}\right)^{2}\left(r+\frac{5}{2}\right)^{2}\left(\frac{11}{2}+r\right)^{2}\left(r+\frac{7}{2}\right)^{2}\left(r+\frac{13}{2}\right)^{2}\left(r+\frac{9}{2}\right)^{2}}$

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \frac{1}{\sqrt{x}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 \dots\right) \\
&= \frac{1 - x + \frac{x^2}{4} + \frac{x^3}{18} - \frac{37x^4}{1152} - \frac{17x^5}{28800} + \frac{593x^6}{259200} - \frac{1913x^7}{12700800} + O(x^8)}{\sqrt{x}}
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = -\frac{1}{2}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$
b_0	1
b_1	$\frac{-2r-5}{(2r+3)^2}$
b_2	$\frac{-4r^3-16r^2-15r+4}{8\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2}$
b_3	$\frac{32r^4+296r^3+948r^2+1254r+553}{64\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2\left(r+\frac{7}{2}\right)^2}$
b_4	$\frac{64r^6+864r^5+4336r^4+9456r^3+6188r^2-6962r-8827}{(2r+3)^2(2r+5)^2(2r+7)^2(4r^2+36r+81)}$
b_5	$\frac{-192r^7-4192r^6-37504r^5-177440r^4-475836r^3-713390r^2-537382r-144193}{512\left(r+\frac{3}{2}\right)^2\left(r+\frac{5}{2}\right)^2\left(\frac{11}{2}+r\right)^2\left(r+\frac{7}{2}\right)^2\left(r+\frac{9}{2}\right)^2}$
b_6	$\frac{-512r^9-14592r^8-172672r^7-1084672r^6-3760736r^5-6170848r^4+1039816r^3+21534576r^2+32373056r+16074527}{(4r^2+52r+169)(2r+3)^2(2r+5)^2(11+2r)^2(2r+7)^2(2r+9)^2}$
b_7	$\frac{4096r^{10}+164864r^9+2890752r^8+28990080r^7+183413312r^6+760790176r^5+2078667344r^4+3646802552r^3+3838600668r^2+2071188906r+}{16384\left(r+\frac{3}{2}\right)^2\left(r+\frac{15}{2}\right)^2\left(r+\frac{5}{2}\right)^2\left(\frac{11}{2}+r\right)^2\left(r+\frac{7}{2}\right)^2\left(r+\frac{13}{2}\right)^2\left(r+\frac{9}{2}\right)^2}$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \dots \\
&= \frac{\left(1 - x + \frac{x^2}{4} + \frac{x^3}{18} - \frac{37x^4}{1152} - \frac{17x^5}{28800} + \frac{593x^6}{259200} - \frac{1913x^7}{12700800} + O(x^8)\right)\ln(x)}{\sqrt{x}} \\
&\quad + \frac{\frac{3x}{2} - \frac{13x^2}{16} + \frac{x^3}{54} + \frac{1103x^4}{13824} - \frac{19507x^5}{1728000} - \frac{98531x^6}{20736000} + \frac{982189x^7}{889056000} + O(x^8)}{\sqrt{x}}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= \frac{c_1\left(1 - x + \frac{x^2}{4} + \frac{x^3}{18} - \frac{37x^4}{1152} - \frac{17x^5}{28800} + \frac{593x^6}{259200} - \frac{1913x^7}{12700800} + O(x^8)\right)}{\sqrt{x}} \\
&\quad + c_2\left(\frac{\left(1 - x + \frac{x^2}{4} + \frac{x^3}{18} - \frac{37x^4}{1152} - \frac{17x^5}{28800} + \frac{593x^6}{259200} - \frac{1913x^7}{12700800} + O(x^8)\right)\ln(x)}{\sqrt{x}}\right. \\
&\quad \left. + \frac{\frac{3x}{2} - \frac{13x^2}{16} + \frac{x^3}{54} + \frac{1103x^4}{13824} - \frac{19507x^5}{1728000} - \frac{98531x^6}{20736000} + \frac{982189x^7}{889056000} + O(x^8)}{\sqrt{x}}\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(1-x+\frac{x^2}{4}+\frac{x^3}{18}-\frac{37x^4}{1152}-\frac{17x^5}{28800}+\frac{593x^6}{259200}-\frac{1913x^7}{12700800}+O(x^8)\right)}{\sqrt{x}} \\
&\quad + c_2\left(\frac{\left(1-x+\frac{x^2}{4}+\frac{x^3}{18}-\frac{37x^4}{1152}-\frac{17x^5}{28800}+\frac{593x^6}{259200}-\frac{1913x^7}{12700800}+O(x^8)\right)\ln(x)}{\sqrt{x}}\right. \\
&\quad \left. + \frac{\frac{3x}{2}-\frac{13x^2}{16}+\frac{x^3}{54}+\frac{1103x^4}{13824}-\frac{19507x^5}{1728000}-\frac{98531x^6}{20736000}+\frac{982189x^7}{889056000}+O(x^8)}{\sqrt{x}}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= \frac{c_1\left(1-x+\frac{x^2}{4}+\frac{x^3}{18}-\frac{37x^4}{1152}-\frac{17x^5}{28800}+\frac{593x^6}{259200}-\frac{1913x^7}{12700800}+O(x^8)\right)}{\sqrt{x}} \\
&\quad + c_2\left(\frac{\left(1-x+\frac{x^2}{4}+\frac{x^3}{18}-\frac{37x^4}{1152}-\frac{17x^5}{28800}+\frac{593x^6}{259200}-\frac{1913x^7}{12700800}+O(x^8)\right)\ln(x)}{\sqrt{x}}\right. \\
&\quad \left. + \frac{\frac{3x}{2}-\frac{13x^2}{16}+\frac{x^3}{54}+\frac{1103x^4}{13824}-\frac{19507x^5}{1728000}-\frac{98531x^6}{20736000}+\frac{982189x^7}{889056000}+O(x^8)}{\sqrt{x}}\right)
\end{aligned}
\tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= \frac{c_1\left(1-x+\frac{x^2}{4}+\frac{x^3}{18}-\frac{37x^4}{1152}-\frac{17x^5}{28800}+\frac{593x^6}{259200}-\frac{1913x^7}{12700800}+O(x^8)\right)}{\sqrt{x}} \\
&\quad + c_2\left(\frac{\left(1-x+\frac{x^2}{4}+\frac{x^3}{18}-\frac{37x^4}{1152}-\frac{17x^5}{28800}+\frac{593x^6}{259200}-\frac{1913x^7}{12700800}+O(x^8)\right)\ln(x)}{\sqrt{x}}\right. \\
&\quad \left. + \frac{\frac{3x}{2}-\frac{13x^2}{16}+\frac{x^3}{54}+\frac{1103x^4}{13824}-\frac{19507x^5}{1728000}-\frac{98531x^6}{20736000}+\frac{982189x^7}{889056000}+O(x^8)}{\sqrt{x}}\right)
\end{aligned}
$$

Verified OK.

15.13.1 Maple step by step solution

Let's solve

$4x^2y'' + (2x^3 + 2x^2 + 8x)\, y' + (3x^2 + 5x + 1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(3x^2+5x+1)y}{4x^2} - \frac{(x^2+x+4)y'}{2x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x^2+x+4)y'}{2x} + \frac{(3x^2+5x+1)y}{4x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{x^2+x+4}{2x}, P_3(x) = \frac{3x^2+5x+1}{4x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\Big|_{x=0} = 2$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\Big|_{x=0} = \frac{1}{4}$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $4x^2y'' + 2x(x^2 + x + 4)\, y' + (3x^2 + 5x + 1)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty}a_{k-m}x^{k+r}$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..3$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty}a_{k}(k+r)\,x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,x^{k+r}$

- Convert $x^{2}\cdot y''$ to series expansion

  $x^{2}\cdot y''=\sum_{k=0}^{\infty}a_{k}(k+r)\,(k+r-1)\,x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}(1+2r)^{2}\,x^{r}+\left(a_{1}(3+2r)^{2}+a_{0}(5+2r)\right)x^{1+r}+\left(\sum_{k=2}^{\infty}\left(a_{k}(2k+2r+1)^{2}+a_{k-1}(2k+2r+3)\right.\right.$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $(1+2r)^{2}=0$

- Values of r that satisfy the indicial equation

  $r=-\frac{1}{2}$

- Each term must be 0

  $a_{1}(3+2r)^{2}+a_{0}(5+2r)=0$

- Solve for the dependent coefficient(s)

  $a_{1}=-\frac{a_{0}(5+2r)}{4r^{2}+12r+9}$

- Each term in the series must be 0, giving the recursion relation

  $a_{k}(2k+2r+1)^{2}+a_{k-1}(2k+2r+3)+a_{k-2}(2k-1+2r)=0$

- Shift index using $k->k+2$

  $a_{k+2}(2k+2r+5)^{2}+a_{k+1}(2k+7+2r)+a_{k}(2k+2r+3)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{2ka_{k}+2ka_{k+1}+2ra_{k}+2ra_{k+1}+3a_{k}+7a_{k+1}}{(2k+2r+5)^{2}}$

- Recursion relation for $r=-\frac{1}{2}$

  $a_{k+2}=-\frac{2ka_{k}+2ka_{k+1}+2a_{k}+6a_{k+1}}{(2k+4)^{2}}$

- Solution for $r = -\frac{1}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{1}{2}}, a_{k+2} = -\frac{2k a_k + 2k a_{k+1} + 2a_k + 6a_{k+1}}{(2k+4)^2}, a_1 = -a_0\right]$$

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{16x^2y'' + 4x(2x^2 + x + 6)\, y' + (18x^2 + 5x + 1)\, y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$16x^2y'' + (8x^3 + 4x^2 + 24x)\, y' + (18x^2 + 5x + 1)\, y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$\begin{aligned} p(x) &= \frac{2x^2 + x + 6}{4x} \\ q(x) &= \frac{18x^2 + 5x + 1}{16x^2} \end{aligned}$$

Table 670: Table $p(x), q(x)$ singularites.

$p(x) = \frac{2x^2+x+6}{4x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{18x^2+5x+1}{16x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$16x^2y'' + (8x^3 + 4x^2 + 24x)\, y' + (18x^2 + 5x + 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$16x^2 \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (8x^3+4x^2+24x) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (18x^2+5x+1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 16x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r+2} a_n (n+r)\right) \\ + \left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 24x^{n+r} a_n (n+r)\right) \\ + \left(\sum_{n=0}^{\infty} 18x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 5x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 8x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 8a_{n-2} (n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 4a_{n-1} (n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 18x^{n+r+2} a_n = \sum_{n=2}^{\infty} 18a_{n-2} x^{n+r}$$

$$\sum_{n=0}^{\infty} 5x^{1+n+r} a_n = \sum_{n=1}^{\infty} 5a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 16x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=2}^{\infty} 8a_{n-2} (n+r-2)\, x^{n+r}\right) \\ + \left(\sum_{n=1}^{\infty} 4a_{n-1} (n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 24x^{n+r} a_n (n+r)\right) \\ + \left(\sum_{n=2}^{\infty} 18a_{n-2} x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 5a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$16x^{n+r} a_n (n+r)(n+r-1) + 24x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$16x^r a_0 r(-1+r) + 24x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(16x^r r(-1+r) + 24x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(4r+1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(4r+1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -\frac{1}{4}$$
$$r_2 = -\frac{1}{4}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(4r+1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -\frac{1}{4}$, Eqs (1A,1B) become

$$
\begin{aligned}
y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n-\frac{1}{4}} \\
y_2(x) &= y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-\frac{1}{4}}\right)
\end{aligned}
$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
a_1 = -\frac{1}{4r+5}
$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&16a_n(n+r)(n+r-1) + 8a_{n-2}(n+r-2) \\
&+ 4a_{n-1}(n+r-1) + 24a_n(n+r) + 18a_{n-2} + 5a_{n-1} + a_n = 0
\end{aligned} \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = -\frac{2a_{n-2} + a_{n-1}}{4n + 4r + 1} \tag{4}
$$

Which for the root $r = -\frac{1}{4}$ becomes

$$
a_n = \frac{-2a_{n-2} - a_{n-1}}{4n} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -\frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4r+5}$	$-\frac{1}{4}$

For $n = 2$, using the above recursive equation gives

$$
a_2 = \frac{-9 - 8r}{16r^2 + 56r + 45}
$$

Which for the root $r = -\frac{1}{4}$ becomes

$$a_2 = -\frac{7}{32}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4r+5}$	$-\frac{1}{4}$
a_2	$\frac{-9-8r}{16r^2+56r+45}$	$-\frac{7}{32}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{16r + 27}{64r^3 + 432r^2 + 908r + 585}$$

Which for the root $r = -\frac{1}{4}$ becomes

$$a_3 = \frac{23}{384}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4r+5}$	$-\frac{1}{4}$
a_2	$\frac{-9-8r}{16r^2+56r+45}$	$-\frac{7}{32}$
a_3	$\frac{16r+27}{64r^3+432r^2+908r+585}$	$\frac{23}{384}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{64r^2 + 264r + 207}{256r^4 + 2816r^3 + 10976r^2 + 17776r + 9945}$$

Which for the root $r = -\frac{1}{4}$ becomes

$$a_4 = \frac{145}{6144}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4r+5}$	$-\frac{1}{4}$
a_2	$\frac{-9-8r}{16r^2+56r+45}$	$-\frac{7}{32}$
a_3	$\frac{16r+27}{64r^3+432r^2+908r+585}$	$\frac{23}{384}$
a_4	$\frac{64r^2+264r+207}{256r^4+2816r^3+10976r^2+17776r+9945}$	$\frac{145}{6144}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-192r^2 - 1024r - 1125}{1024r^5 + 16640r^4 + 103040r^3 + 301600r^2 + 413076r + 208845}$$

Which for the root $r = -\frac{1}{4}$ becomes

$$a_5 = -\frac{881}{122880}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4r+5}$	$-\frac{1}{4}$
a_2	$\frac{-9-8r}{16r^2+56r+45}$	$-\frac{7}{32}$
a_3	$\frac{16r+27}{64r^3+432r^2+908r+585}$	$\frac{23}{384}$
a_4	$\frac{64r^2+264r+207}{256r^4+2816r^3+10976r^2+17776r+9945}$	$\frac{145}{6144}$
a_5	$\frac{-192r^2-1024r-1125}{1024r^5+16640r^4+103040r^3+301600r^2+413076r+208845}$	$-\frac{881}{122880}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{-512r^3 - 4608r^2 - 11720r - 7569}{4096r^6 + 92160r^5 + 828160r^4 + 3782400r^3 + 9192304r^2 + 11162280r + 5221125}$$

Which for the root $r = -\frac{1}{4}$ becomes

$$a_6 = -\frac{4919}{2949120}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4r+5}$	$-\frac{1}{4}$
a_2	$\frac{-9-8r}{16r^2+56r+45}$	$-\frac{7}{32}$
a_3	$\frac{16r+27}{64r^3+432r^2+908r+585}$	$\frac{23}{384}$
a_4	$\frac{64r^2+264r+207}{256r^4+2816r^3+10976r^2+17776r+9945}$	$\frac{145}{6144}$
a_5	$\frac{-192r^2-1024r-1125}{1024r^5+16640r^4+103040r^3+301600r^2+413076r+208845}$	$-\frac{881}{122880}$
a_6	$\frac{-512r^3-4608r^2-11720r-7569}{4096r^6+92160r^5+828160r^4+3782400r^3+9192304r^2+11162280r+5221125}$	$-\frac{4919}{2949120}$

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{2048r^3 + 22400r^2 + 71920r + 63819}{16384r^7 + 487424r^6 + 5985280r^5 + 39146240r^4 + 146458816r^3 + 311225936r^2 + 344590620r + 151}$$

Which for the root $r = -\frac{1}{4}$ becomes

$$a_7 = \frac{47207}{82575360}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4r+5}$	$-\frac{1}{4}$
a_2	$\frac{-9-8r}{16r^2+56r+45}$	$-\frac{7}{32}$
a_3	$\frac{16r+27}{64r^3+432r^2+908r+585}$	$\frac{23}{384}$
a_4	$\frac{64r^2+264r+207}{256r^4+2816r^3+10976r^2+17776r+9945}$	$\frac{145}{6144}$
a_5	$\frac{-192r^2-1024r-1125}{1024r^5+16640r^4+103040r^3+301600r^2+413076r+208845}$	$-\frac{881}{122880}$
a_6	$\frac{-512r^3-4608r^2-11720r-7569}{4096r^6+92160r^5+828160r^4+3782400r^3+9192304r^2+11162280r+5221125}$	$-\frac{4919}{2949120}$
a_7	$\frac{2048r^3+22400r^2+71920r+63819}{16384r^7+487424r^6+5985280r^5+39146240r^4+146458816r^3+311225936r^2+344590620r+151412625}$	$\frac{47207}{82575360}$

Using the above table, then the first solution $y_1(x)$ is

$$y_1(x) = \frac{1}{x^{\frac{1}{4}}}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 + a_7x^7 + a_8x^8 \dots\right)$$

$$= \frac{1 - \frac{x}{4} - \frac{7x^2}{32} + \frac{23x^3}{384} + \frac{145x^4}{6144} - \frac{881x^5}{122880} - \frac{4919x^6}{2949120} + \frac{47207x^7}{82575360} + O(x^8)}{x^{\frac{1}{4}}}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = -\frac{1}{4}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n
b_1	$-\frac{1}{4r+5}$	$-\frac{1}{4}$	$\frac{4}{(4r+5)^2}$
b_2	$\frac{-9-8r}{16r^2+56r+45}$	$-\frac{7}{32}$	$\frac{128r^2+288r+144}{(16r^2+56r+45)^2}$
b_3	$\frac{16r+27}{64r^3+432r^2+908r+585}$	$\frac{23}{384}$	$\frac{-2048r^3-12096r^2}{(64r^3+432r^2+}$
b_4	$\frac{64r^2+264r+207}{256r^4+2816r^3+10976r^2+17776r+9945}$	$\frac{145}{6144}$	$-\frac{8(4096r^5+4787}{(256r^4}$
b_5	$\frac{-192r^2-1024r-1125}{1024r^5+16640r^4+103040r^3+301600r^2+413076r+208845}$	$-\frac{881}{122880}$	$\frac{589824r^6+105840}{(10}$
b_6	$\frac{-512r^3-4608r^2-11720r-7569}{4096r^6+92160r^5+828160r^4+3782400r^3+9192304r^2+11162280r+5221125}$	$-\frac{4919}{2949120}$	$6291456r^8+16986$
b_7	$\frac{2048r^3+22400r^2+71920r+63819}{16384r^7+487424r^6+5985280r^5+39146240r^4+146458816r^3+311225936r^2+344590620r+151412625}$	$\frac{47207}{82575360}$	$-\frac{4(33554432r^9+}{}$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \ldots \\
&= \frac{\left(1 - \frac{x}{4} - \frac{7x^2}{32} + \frac{23x^3}{384} + \frac{145x^4}{6144} - \frac{881x^5}{122880} - \frac{4919x^6}{2949120} + \frac{47207x^7}{82575360} + O(x^8)\right)\ln(x)}{x^{\frac{1}{4}}} \\
&\quad + \frac{\frac{x}{4} + \frac{5x^2}{64} - \frac{157x^3}{2304} - \frac{841x^4}{73728} + \frac{65017x^5}{7372800} + \frac{50791x^6}{58982400} - \frac{953509x^7}{1284505600} + O(x^8)}{x^{\frac{1}{4}}}
\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 y_1(x) + c_2 y_2(x)$$

$$= \frac{c_1\left(1-\frac{x}{4}-\frac{7x^2}{32}+\frac{23x^3}{384}+\frac{145x^4}{6144}-\frac{881x^5}{122880}-\frac{4919x^6}{2949120}+\frac{47207x^7}{82575360}+O(x^8)\right)}{x^{\frac{1}{4}}} + c_2\left(\frac{\left(1-\frac{x}{4}-\frac{7x^2}{32}+\frac{23x^3}{384}+\frac{145x^4}{6144}-\frac{881x^5}{122880}-\frac{4919x^6}{2949120}+\frac{47207x^7}{82575360}+O(x^8)\right)\ln(x)}{x^{\frac{1}{4}}} + \frac{\frac{x}{4}+\frac{5x^2}{64}-\frac{157x^3}{2304}-\frac{841x^4}{73728}+\frac{65017x^5}{7372800}+\frac{50791x^6}{58982400}-\frac{953509x^7}{1284505600}+O(x^8)}{x^{\frac{1}{4}}}\right)$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= \frac{c_1\left(1-\frac{x}{4}-\frac{7x^2}{32}+\frac{23x^3}{384}+\frac{145x^4}{6144}-\frac{881x^5}{122880}-\frac{4919x^6}{2949120}+\frac{47207x^7}{82575360}+O(x^8)\right)}{x^{\frac{1}{4}}} + c_2\left(\frac{\left(1-\frac{x}{4}-\frac{7x^2}{32}+\frac{23x^3}{384}+\frac{145x^4}{6144}-\frac{881x^5}{122880}-\frac{4919x^6}{2949120}+\frac{47207x^7}{82575360}+O(x^8)\right)\ln(x)}{x^{\frac{1}{4}}} + \frac{\frac{x}{4}+\frac{5x^2}{64}-\frac{157x^3}{2304}-\frac{841x^4}{73728}+\frac{65017x^5}{7372800}+\frac{50791x^6}{58982400}-\frac{953509x^7}{1284505600}+O(x^8)}{x^{\frac{1}{4}}}\right) \end{aligned}$$

Summary
The solution(s) found are the following

$$y = \frac{c_1\left(1-\frac{x}{4}-\frac{7x^2}{32}+\frac{23x^3}{384}+\frac{145x^4}{6144}-\frac{881x^5}{122880}-\frac{4919x^6}{2949120}+\frac{47207x^7}{82575360}+O(x^8)\right)}{x^{\frac{1}{4}}} + c_2\left(\frac{\left(1-\frac{x}{4}-\frac{7x^2}{32}+\frac{23x^3}{384}+\frac{145x^4}{6144}-\frac{881x^5}{122880}-\frac{4919x^6}{2949120}+\frac{47207x^7}{82575360}+O(x^8)\right)\ln(x)}{x^{\frac{1}{4}}} + \frac{\frac{x}{4}+\frac{5x^2}{64}-\frac{157x^3}{2304}-\frac{841x^4}{73728}+\frac{65017x^5}{7372800}+\frac{50791x^6}{58982400}-\frac{953509x^7}{1284505600}+O(x^8)}{x^{\frac{1}{4}}}\right) \quad (1)$$

Verification of solutions

$$y = \frac{c_1 \left(1-\frac{x}{4}-\frac{7 x^{2}}{32}+\frac{23 x^{3}}{384}+\frac{145 x^{4}}{6144}-\frac{881 x^{5}}{122880}-\frac{4919 x^{6}}{2949120}+\frac{47207 x^{7}}{82575360}+O\left(x^{8}\right)\right)}{x^{\frac{1}{4}}} + c_2 \left(\frac{\left(1-\frac{x}{4}-\frac{7 x^{2}}{32}+\frac{23 x^{3}}{384}+\frac{145 x^{4}}{6144}-\frac{881 x^{5}}{122880}-\frac{4919 x^{6}}{2949120}+\frac{47207 x^{7}}{82575360}+O\left(x^{8}\right)\right) \ln \left(x \right)}{x^{\frac{1}{4}}} + \frac{\frac{x}{4}+\frac{5 x^{2}}{64}-\frac{157 x^{3}}{2304}-\frac{841 x^{4}}{73728}+\frac{65017 x^{5}}{7372800}+\frac{50791 x^{6}}{58982400}-\frac{953509 x^{7}}{1284505600}+O\left(x^{8}\right)}{x^{\frac{1}{4}}}\right)$$

Verified OK.

15.14.1 Maple step by step solution

Let's solve

$16x^2 y'' + (8x^3 + 4x^2 + 24x)\, y' + (18x^2 + 5x + 1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(18x^2+5x+1)y}{16x^2} - \frac{(2x^2+x+6)y'}{4x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(2x^2+x+6)y'}{4x} + \frac{(18x^2+5x+1)y}{16x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

- ○ Define functions

  $\left[P_2(x) = \frac{2x^2+x+6}{4x}, P_3(x) = \frac{18x^2+5x+1}{16x^2}\right]$

- ○ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left.(x \cdot P_2(x))\right|_{x=0} = \frac{3}{2}$

- ○ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left.(x^2 \cdot P_3(x))\right|_{x=0} = \frac{1}{16}$

- ○ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

$x_0 = 0$

- Multiply by denominators

$16x^2 y'' + 4x(2x^2 + x + 6)\, y' + (18x^2 + 5x + 1)\, y = 0$

- Assume series solution for y

$y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  - Shift index using $k- >k - m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  - Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k + r)\, x^{k+r-1+m}$

  - Shift index using $k- >k + 1 - m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k + 1 - m + r)\, x^{k+r}$

  - Convert $x^2 \cdot y''$ to series expansion

  $x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k + r)\,(k + r - 1)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(1 + 4r)^2 x^r + \left(a_1(5 + 4r)^2 + a_0(5 + 4r)\right) x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(4k + 4r + 1)^2 + a_{k-1}(4k + 4r + 1)\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$(1 + 4r)^2 = 0$

- Values of r that satisfy the indicial equation

$r = -\frac{1}{4}$

- Each term must be 0

$a_1(5 + 4r)^2 + a_0(5 + 4r) = 0$

- Solve for the dependent coefficient(s)

$a_1 = -\frac{a_0}{5+4r}$

- Each term in the series must be 0, giving the recursion relation

$a_k(4k+4r+1)^2 + (4k+4r+1)(2a_{k-2} + a_{k-1}) = 0$

- Shift index using $k- > k+2$

$a_{k+2}(4k+4r+9)^2 + (4k+4r+9)(2a_k + a_{k+1}) = 0$

- Recursion relation that defines series solution to ODE

$a_{k+2} = -\frac{2a_k + a_{k+1}}{4k+4r+9}$

- Recursion relation for $r = -\frac{1}{4}$

$a_{k+2} = -\frac{2a_k + a_{k+1}}{4k+8}$

- Solution for $r = -\frac{1}{4}$

$\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{1}{4}}, a_{k+2} = -\frac{2a_k + a_{k+1}}{4k+8}, a_1 = -\frac{a_0}{4}\right]$

Problem number: 11.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{9x^2(x+1)\,y''+3x\left(-x^2+11x+5\right)y'+\left(-7x^2+16x+1\right)y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(9x^3+9x^2\right)y''+\left(-3x^3+33x^2+15x\right)y'+\left(-7x^2+16x+1\right)y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{x^2-11x-5}{3x\,(x+1)}$$
$$q(x)=-\frac{7x^2-16x-1}{9x^2\,(x+1)}$$

Table 672: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{x^2-11x-5}{3x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = -\frac{7x^2-16x-1}{9x^2(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$9x^2(x+1)\, y'' + \left(-3x^3 + 33x^2 + 15x\right) y' + \left(-7x^2 + 16x + 1\right) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$9x^2(x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(-3x^3 + 33x^2 + 15x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(-7x^2 + 16x + 1\right)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 9x^{1+n+r} a_n(n+r)\,(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n(n+r)\,(n+r-1)\right) \\
&+\sum_{n=0}^{\infty}\left(-3x^{n+r+2} a_n(n+r)\right)+\left(\sum_{n=0}^{\infty} 33x^{1+n+r} a_n(n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 15x^{n+r} a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-7x^{n+r+2} a_n\right) \\
&+\left(\sum_{n=0}^{\infty} 16x^{1+n+r} a_n\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 9x^{1+n+r} a_n(n+r)\,(n+r-1) &= \sum_{n=1}^{\infty} 9a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r} \\
\sum_{n=0}^{\infty}\left(-3x^{n+r+2} a_n(n+r)\right) &= \sum_{n=2}^{\infty}\left(-3a_{n-2}(n+r-2)\,x^{n+r}\right) \\
\sum_{n=0}^{\infty} 33x^{1+n+r} a_n(n+r) &= \sum_{n=1}^{\infty} 33a_{n-1}(n+r-1)\,x^{n+r} \\
\sum_{n=0}^{\infty}\left(-7x^{n+r+2} a_n\right) &= \sum_{n=2}^{\infty}\left(-7a_{n-2}x^{n+r}\right) \\
\sum_{n=0}^{\infty} 16x^{1+n+r} a_n &= \sum_{n=1}^{\infty} 16a_{n-1}x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\begin{aligned}&\left(\sum_{n=1}^{\infty} 9a_{n-1}(n+r-1)\left(n+r-2\right)x^{n+r}\right)\\&+\left(\sum_{n=0}^{\infty} 9x^{n+r}a_n(n+r)\left(n+r-1\right)\right)+\sum_{n=2}^{\infty}\left(-3a_{n-2}(n+r-2)\,x^{n+r}\right)\\&+\left(\sum_{n=1}^{\infty} 33a_{n-1}(n+r-1)\,x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 15x^{n+r}a_n(n+r)\right)\\&+\sum_{n=2}^{\infty}\left(-7a_{n-2}x^{n+r}\right)+\left(\sum_{n=1}^{\infty} 16a_{n-1}x^{n+r}\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)=0\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$9x^{n+r}a_n(n+r)\left(n+r-1\right)+15x^{n+r}a_n(n+r)+a_n x^{n+r}=0$$

When $n=0$ the above becomes

$$9x^r a_0 r(-1+r)+15x^r a_0 r+a_0 x^r=0$$

Or

$$\left(9x^r r(-1+r)+15x^r r+x^r\right)a_0=0$$

Since $a_0\neq 0$ then the above simplifies to

$$x^r(3r+1)^2=0$$

Since the above is true for all x then the indicial equation becomes

$$(3r+1)^2=0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned}r_1&=-\frac{1}{3}\\r_2&=-\frac{1}{3}\end{aligned}$$

Since $a_0\neq 0$ then the indicial equation becomes

$$x^r(3r+1)^2=0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -\frac{1}{3}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-\frac{1}{3}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-\frac{1}{3}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -1$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} 9a_{n-1}(n+r-1)(n+r-2) + 9a_n(n+r)(n+r-1) - 3a_{n-2}(n+r-2) \\ + 33a_{n-1}(n+r-1) + 15a_n(n+r) - 7a_{n-2} + 16a_{n-1} + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{3na_{n-1} + 3ra_{n-1} - a_{n-2} + a_{n-1}}{1 + 3n + 3r} \tag{4}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_n = \frac{-3na_{n-1} + a_{n-2}}{3n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -\frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{3r + 8}{7 + 3r}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_2 = \frac{7}{6}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	$\frac{3r+8}{7+3r}$	$\frac{7}{6}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-9r^2 - 57r - 87}{9r^2 + 51r + 70}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_3 = -\frac{23}{18}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	$\frac{3r+8}{7+3r}$	$\frac{7}{6}$
a_3	$\frac{-9r^2-57r-87}{9r^2+51r+70}$	$-\frac{23}{18}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{27r^3 + 297r^2 + 1056r + 1211}{27r^3 + 270r^2 + 873r + 910}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_4 = \frac{11}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	$\frac{3r+8}{7+3r}$	$\frac{7}{6}$
a_3	$\frac{-9r^2-57r-87}{9r^2+51r+70}$	$-\frac{23}{18}$
a_4	$\frac{27r^3+297r^2+1056r+1211}{27r^3+270r^2+873r+910}$	$\frac{11}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-81r^4 - 1350r^3 - 8208r^2 - 21531r - 20507}{(16 + 3r)(9r^2 + 51r + 70)(13 + 3r)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_5 = -\frac{1577}{1080}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	$\frac{3r+8}{7+3r}$	$\frac{7}{6}$
a_3	$\frac{-9r^2-57r-87}{9r^2+51r+70}$	$-\frac{23}{18}$
a_4	$\frac{27r^3+297r^2+1056r+1211}{27r^3+270r^2+873r+910}$	$\frac{11}{8}$
a_5	$\frac{-81r^4-1350r^3-8208r^2-21531r-20507}{(16+3r)(9r^2+51r+70)(13+3r)}$	$-\frac{1577}{1080}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{243r^5 + 5670r^4 + 51597r^3 + 228465r^2 + 491139r + 409009}{243r^5 + 5265r^4 + 44415r^3 + 181935r^2 + 360942r + 276640}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_6 = \frac{3319}{2160}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	$\frac{3r+8}{7+3r}$	$\frac{7}{6}$
a_3	$\frac{-9r^2-57r-87}{9r^2+51r+70}$	$-\frac{23}{18}$
a_4	$\frac{27r^3+297r^2+1056r+1211}{27r^3+270r^2+873r+910}$	$\frac{11}{8}$
a_5	$\frac{-81r^4-1350r^3-8208r^2-21531r-20507}{(16+3r)(9r^2+51r+70)(13+3r)}$	$-\frac{1577}{1080}$
a_6	$\frac{243r^5+5670r^4+51597r^3+228465r^2+491139r+409009}{243r^5+5265r^4+44415r^3+181935r^2+360942r+276640}$	$\frac{3319}{2160}$

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{-729r^6 - 22599r^5 - 285120r^4 - 1870803r^3 - 6720192r^2 - 12502695r - 9387831}{(22 + 3r)(13 + 3r)(9r^2 + 51r + 70)(16 + 3r)(19 + 3r)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_7 = -\frac{72853}{45360}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	$\frac{3r+8}{7+3r}$	$\frac{7}{6}$
a_3	$\frac{-9r^2-57r-87}{9r^2+51r+70}$	$-\frac{23}{18}$
a_4	$\frac{27r^3+297r^2+1056r+1211}{27r^3+270r^2+873r+910}$	$\frac{11}{8}$
a_5	$\frac{-81r^4-1350r^3-8208r^2-21531r-20507}{(16+3r)(9r^2+51r+70)(13+3r)}$	$-\frac{1577}{1080}$
a_6	$\frac{243r^5+5670r^4+51597r^3+228465r^2+491139r+409009}{243r^5+5265r^4+44415r^3+181935r^2+360942r+276640}$	$\frac{3319}{2160}$
a_7	$\frac{-729r^6-22599r^5-285120r^4-1870803r^3-6720192r^2-12502695r-9387831}{(22+3r)(13+3r)(9r^2+51r+70)(16+3r)(19+3r)}$	$-\frac{72853}{45360}$

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \frac{1}{x^{\frac{1}{3}}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 \dots\right) \\
&= \frac{1 - x + \frac{7x^2}{6} - \frac{23x^3}{18} + \frac{11x^4}{8} - \frac{1577x^5}{1080} + \frac{3319x^6}{2160} - \frac{72853x^7}{45360} + O(x^8)}{x^{\frac{1}{3}}}
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = -\frac{1}{3}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	-1	-1	0
b_2	$\frac{3r+8}{7+3r}$	$\frac{7}{6}$	$-\frac{3}{(7+3r)^2}$
b_3	$\frac{-9r^2-57r-87}{9r^2+51r+70}$	$-\frac{23}{18}$	$\frac{54r^2+306r+447}{(9r^2+51r+70)^2}$
b_4	$\frac{27r^3+297r^2+1056r+1211}{27r^3+270r^2+873r+910}$	$\frac{11}{8}$	$\frac{-729r^4-9882r^3-50220r^2-113400r-96243}{(27r^3+270r^2+873r+910)^2}$
b_5	$\frac{-81r^4-1350r^3-8208r^2-21531r-20507}{(16+3r)(9r^2+51r+70)(13+3r)}$	$-\frac{1577}{1080}$	$\frac{8748r^6+205578r^5+2001105r^4+10325232r^3+}{(16+3r)^2(9r^2+51r+7}$
b_6	$\frac{243r^5+5670r^4+51597r^3+228465r^2+491139r+409009}{243r^5+5265r^4+44415r^3+181935r^2+360942r+276640}$	$\frac{3319}{2160}$	$\frac{-98415r^8-3490452r^7-53745525r^6-469145}{(243r^5+5}$
b_7	$\frac{-729r^6-22599r^5-285120r^4-1870803r^3-6720192r^2-12502695r-9387831}{(22+3r)(13+3r)(9r^2+51r+70)(16+3r)(19+3r)}$	$-\frac{72853}{45360}$	$\frac{1062882r^{10}+52553610r^9+1159663311r^8+15}{}$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \dots \\
&= \frac{\left(1 - x + \frac{7x^2}{6} - \frac{23x^3}{18} + \frac{11x^4}{8} - \frac{1577x^5}{1080} + \frac{3319x^6}{2160} - \frac{72853x^7}{45360} + O(x^8)\right)\ln(x)}{x^{\frac{1}{3}}} \\
&\quad + \frac{-\frac{x^2}{12} + \frac{13x^3}{108} - \frac{131x^4}{864} + \frac{11449x^5}{64800} - \frac{76919x^6}{388800} + \frac{4118557x^7}{19051200} + O(x^8)}{x^{\frac{1}{3}}}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= \frac{c_1\left(1 - x + \frac{7x^2}{6} - \frac{23x^3}{18} + \frac{11x^4}{8} - \frac{1577x^5}{1080} + \frac{3319x^6}{2160} - \frac{72853x^7}{45360} + O(x^8)\right)}{x^{\frac{1}{3}}} \\
&\quad + c_2\left(\frac{\left(1 - x + \frac{7x^2}{6} - \frac{23x^3}{18} + \frac{11x^4}{8} - \frac{1577x^5}{1080} + \frac{3319x^6}{2160} - \frac{72853x^7}{45360} + O(x^8)\right)\ln(x)}{x^{\frac{1}{3}}}\right. \\
&\quad \left. + \frac{-\frac{x^2}{12} + \frac{13x^3}{108} - \frac{131x^4}{864} + \frac{11449x^5}{64800} - \frac{76919x^6}{388800} + \frac{4118557x^7}{19051200} + O(x^8)}{x^{\frac{1}{3}}}\right)
\end{aligned}
$$

Hence the final solution is

$$y = y_h$$
$$= \frac{c_1 \left(1 - x + \frac{7x^2}{6} - \frac{23x^3}{18} + \frac{11x^4}{8} - \frac{1577x^5}{1080} + \frac{3319x^6}{2160} - \frac{72853x^7}{45360} + O(x^8)\right)}{x^{\frac{1}{3}}} + c_2 \left(\frac{\left(1 - x + \frac{7x^2}{6} - \frac{23x^3}{18} + \frac{11x^4}{8} - \frac{1577x^5}{1080} + \frac{3319x^6}{2160} - \frac{72853x^7}{45360} + O(x^8)\right) \ln(x)}{x^{\frac{1}{3}}} + \frac{-\frac{x^2}{12} + \frac{13x^3}{108} - \frac{131x^4}{864} + \frac{11449x^5}{64800} - \frac{76919x^6}{388800} + \frac{4118557x^7}{19051200} + O(x^8)}{x^{\frac{1}{3}}} \right)$$

Summary

The solution(s) found are the following

$$y = \frac{c_1 \left(1 - x + \frac{7x^2}{6} - \frac{23x^3}{18} + \frac{11x^4}{8} - \frac{1577x^5}{1080} + \frac{3319x^6}{2160} - \frac{72853x^7}{45360} + O(x^8)\right)}{x^{\frac{1}{3}}} + c_2 \left(\frac{\left(1 - x + \frac{7x^2}{6} - \frac{23x^3}{18} + \frac{11x^4}{8} - \frac{1577x^5}{1080} + \frac{3319x^6}{2160} - \frac{72853x^7}{45360} + O(x^8)\right) \ln(x)}{x^{\frac{1}{3}}} + \frac{-\frac{x^2}{12} + \frac{13x^3}{108} - \frac{131x^4}{864} + \frac{11449x^5}{64800} - \frac{76919x^6}{388800} + \frac{4118557x^7}{19051200} + O(x^8)}{x^{\frac{1}{3}}} \right) \tag{1}$$

Verification of solutions

$$y = \frac{c_1 \left(1 - x + \frac{7x^2}{6} - \frac{23x^3}{18} + \frac{11x^4}{8} - \frac{1577x^5}{1080} + \frac{3319x^6}{2160} - \frac{72853x^7}{45360} + O(x^8)\right)}{x^{\frac{1}{3}}} + c_2 \left(\frac{\left(1 - x + \frac{7x^2}{6} - \frac{23x^3}{18} + \frac{11x^4}{8} - \frac{1577x^5}{1080} + \frac{3319x^6}{2160} - \frac{72853x^7}{45360} + O(x^8)\right) \ln(x)}{x^{\frac{1}{3}}} + \frac{-\frac{x^2}{12} + \frac{13x^3}{108} - \frac{131x^4}{864} + \frac{11449x^5}{64800} - \frac{76919x^6}{388800} + \frac{4118557x^7}{19051200} + O(x^8)}{x^{\frac{1}{3}}} \right)$$

Verified OK.

15.15.1 Maple step by step solution

Let's solve

$9x^2(x+1)\,y''+(-3x^3+33x^2+15x)\,y'+(-7x^2+16x+1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{(7x^2-16x-1)y}{9x^2(x+1)}+\frac{(x^2-11x-5)y'}{3x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{(x^2-11x-5)y'}{3x(x+1)}-\frac{(7x^2-16x-1)y}{9x^2(x+1)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=-\frac{x^2-11x-5}{3x(x+1)},P_3(x)=-\frac{7x^2-16x-1}{9x^2(x+1)}\right]$

  ◦ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

  $\left((x+1)\cdot P_2(x)\right)\bigg|_{x=-1}=\frac{7}{3}$

  ◦ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

  $\left((x+1)^2\cdot P_3(x)\right)\bigg|_{x=-1}=0$

  ◦ $x=-1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-1$

- Multiply by denominators

  $9x^2(x+1)\,y''-3x(x^2-11x-5)\,y'+(-7x^2+16x+1)\,y=0$

- Change variables using $x=u-1$ so that the regular singular point is at $u=0$

  $(9u^3-18u^2+9u)\left(\frac{d^2}{du^2}y(u)\right)+(-3u^3+42u^2-60u+21)\left(\frac{d}{du}y(u)\right)+(-7u^2+30u-22)\,y(u)=$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..2$

  $$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

- Shift index using $k- >k - m$

  $$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..3$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$3a_0r(4+3r)\, u^{-1+r} + (3a_1(1+r)\,(7+3r) - 2a_0(9r^2+21r+11))\, u^r + (3a_2(2+r)\,(10+3r) - 2$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$3r(4+3r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{0, -\frac{4}{3}\right\}$$

- The coefficients of each power of u must be 0

  $$[3a_1(1+r)\,(7+3r) - 2a_0(9r^2+21r+11) = 0, 3a_2(2+r)\,(10+3r) - 2a_1(9r^2+39r+41) + 3a$$

- Solve for the dependent coefficient(s)

  $$\left\{a_1 = \frac{2a_0\,(9r^2+21r+11)}{3(3r^2+10r+7)}, a_2 = \frac{a_0\,(243r^4+1593r^3+3699r^2+3567r+1174)}{9(9r^4+78r^3+241r^2+312r+140)}\right\}$$

- Each term in the series must be 0, giving the recursion relation

  $$9(-2a_k+a_{k-1}+a_{k+1})\, k^2 + 3(6(-2a_k+a_{k-1}+a_{k+1})\, r - 14a_k - a_{k-2} + 5a_{k-1} + 10a_{k+1})\, k + 9($$

- Shift index using $k- >k+2$

$$9(-2a_{k+2}+a_{k+1}+a_{k+3})\left(k+2\right)^{2}+3(6(-2a_{k+2}+a_{k+1}+a_{k+3})r-14a_{k+2}-a_{k}+5a_{k+1}+10a_{k+}$$

- Recursion relation that defines series solution to ODE

$$a_{k+3}=-\frac{9k^{2}a_{k+1}-18k^{2}a_{k+2}+18kra_{k+1}-36kra_{k+2}+9r^{2}a_{k+1}-18r^{2}a_{k+2}-3ka_{k}+51ka_{k+1}-114ka_{k+2}-3ra_{k}+51ra_{k+1}-114ra}{3(3k^{2}+6kr+3r^{2}+22k+22r+39)}$$

- Recursion relation for $r=0$

$$a_{k+3}=-\frac{9k^{2}a_{k+1}-18k^{2}a_{k+2}-3ka_{k}+51ka_{k+1}-114ka_{k+2}-7a_{k}+72a_{k+1}-178a_{k+2}}{3(3k^{2}+22k+39)}$$

- Solution for $r=0$

$$\left[y(u)=\sum_{k=0}^{\infty}a_{k}u^{k},a_{k+3}=-\frac{9k^{2}a_{k+1}-18k^{2}a_{k+2}-3ka_{k}+51ka_{k+1}-114ka_{k+2}-7a_{k}+72a_{k+1}-178a_{k+2}}{3(3k^{2}+22k+39)},a_{1}=\frac{22a_{0}}{21},a_{2}=\right.$$

- Revert the change of variables $u=x+1$

$$\left[y=\sum_{k=0}^{\infty}a_{k}(x+1)^{k},a_{k+3}=-\frac{9k^{2}a_{k+1}-18k^{2}a_{k+2}-3ka_{k}+51ka_{k+1}-114ka_{k+2}-7a_{k}+72a_{k+1}-178a_{k+2}}{3(3k^{2}+22k+39)},a_{1}=\frac{22a_{0}}{21},\right.$$

- Recursion relation for $r=-\frac{4}{3}$

$$a_{k+3}=-\frac{9k^{2}a_{k+1}-18k^{2}a_{k+2}-3ka_{k}+27ka_{k+1}-66ka_{k+2}-3a_{k}+20a_{k+1}-58a_{k+2}}{3(3k^{2}+14k+15)}$$

- Solution for $r=-\frac{4}{3}$

$$\left[y(u)=\sum_{k=0}^{\infty}a_{k}u^{k-\frac{4}{3}},a_{k+3}=-\frac{9k^{2}a_{k+1}-18k^{2}a_{k+2}-3ka_{k}+27ka_{k+1}-66ka_{k+2}-3a_{k}+20a_{k+1}-58a_{k+2}}{3(3k^{2}+14k+15)},a_{1}=\frac{2a_{0}}{3},a_{2}=\right.$$

- Revert the change of variables $u=x+1$

$$\left[y=\sum_{k=0}^{\infty}a_{k}(x+1)^{k-\frac{4}{3}},a_{k+3}=-\frac{9k^{2}a_{k+1}-18k^{2}a_{k+2}-3ka_{k}+27ka_{k+1}-66ka_{k+2}-3a_{k}+20a_{k+1}-58a_{k+2}}{3(3k^{2}+14k+15)},a_{1}=\frac{2a_{0}}{3},\right.$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty}a_{k}(x+1)^{k}\right)+\left(\sum_{k=0}^{\infty}b_{k}(x+1)^{k-\frac{4}{3}}\right),a_{k+3}=-\frac{9k^{2}a_{1+k}-18k^{2}a_{k+2}-3ka_{k}+51ka_{1+k}-114ka_{k+2}-7a_{k}}{3(3k^{2}+22k+39)}\right.$$

Problem number: 12.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2y'' + (4x+1)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$4x^2y'' + (4x+1)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$\begin{aligned} p(x) &= 0 \\ q(x) &= \frac{4x+1}{4x^2} \end{aligned}$$

Table 674: Table $p(x), q(x)$ singularites.

$p(x) = 0$	
singularity	type

$q(x) = \frac{4x+1}{4x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : [∞]

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2y'' + (4x + 1) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2 \left(\sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}\right) + (4x + 1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n + r) (n + r - 1)\right) + \left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \quad \text{(2A)}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n = \sum_{n=1}^{\infty} 4a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 4a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \quad \text{(2B)}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n(n+r)(n+r-1) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$4x^r a_0 r(-1+r) + a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) + x^r) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(2r-1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(2r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = \frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(2r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{2}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{2}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$4a_n(n+r)(n+r-1) + 4a_{n-1} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{4a_{n-1}}{4n^2 + 8nr + 4r^2 - 4n - 4r + 1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{a_{n-1}}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{4}{(2r+1)^2}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{4}{(2r+1)^2}$	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{16}{(2r+1)^2 (2r+3)^2}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = \frac{1}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{4}{(2r+1)^2}$	-1
a_2	$\frac{16}{(2r+1)^2(2r+3)^2}$	$\frac{1}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{64}{(2r+1)^2 (2r+3)^2 (2r+5)^2}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = -\frac{1}{36}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{4}{(2r+1)^2}$	-1
a_2	$\frac{16}{(2r+1)^2(2r+3)^2}$	$\frac{1}{4}$
a_3	$-\frac{64}{(2r+1)^2(2r+3)^2(2r+5)^2}$	$-\frac{1}{36}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{256}{(2r+1)^2 (2r+3)^2 (2r+5)^2 (2r+7)^2}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{1}{576}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{4}{(2r+1)^2}$	-1
a_2	$\frac{16}{(2r+1)^2(2r+3)^2}$	$\frac{1}{4}$
a_3	$-\frac{64}{(2r+1)^2(2r+3)^2(2r+5)^2}$	$-\frac{1}{36}$
a_4	$\frac{256}{(2r+1)^2(2r+3)^2(2r+5)^2(2r+7)^2}$	$\frac{1}{576}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{1024}{(2r+1)^2 (2r+3)^2 (2r+5)^2 (2r+7)^2 (2r+9)^2}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = -\frac{1}{14400}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{4}{(2r+1)^2}$	-1
a_2	$\frac{16}{(2r+1)^2(2r+3)^2}$	$\frac{1}{4}$
a_3	$-\frac{64}{(2r+1)^2(2r+3)^2(2r+5)^2}$	$-\frac{1}{36}$
a_4	$\frac{256}{(2r+1)^2(2r+3)^2(2r+5)^2(2r+7)^2}$	$\frac{1}{576}$
a_5	$-\frac{1024}{(2r+1)^2(2r+3)^2(2r+5)^2(2r+7)^2(2r+9)^2}$	$-\frac{1}{14400}$

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= \sqrt{x}\left(1 - x + \frac{x^2}{4} - \frac{x^3}{36} + \frac{x^4}{576} - \frac{x^5}{14400} + O(x^6)\right)
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = \frac{1}{2}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n\left(r = \frac{1}{2}\right)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	$-\frac{4}{(2r+1)^2}$	-1	$\frac{16}{(2r+1)^3}$	2
b_2	$\frac{16}{(2r+1)^2(2r+3)^2}$	$\frac{1}{4}$	$\frac{-256r-256}{(2r+1)^3(2r+3)^3}$	$-\frac{3}{4}$
b_3	$-\frac{64}{(2r+1)^2(2r+3)^2(2r+5)^2}$	$-\frac{1}{36}$	$\frac{3072r^2+9216r+5888}{(2r+1)^3(2r+3)^3(2r+5)^3}$	$\frac{11}{108}$
b_4	$\frac{256}{(2r+1)^2(2r+3)^2(2r+5)^2(2r+7)^2}$	$\frac{1}{576}$	$-\frac{32768(2+r)\left(r^2+4r+\frac{11}{4}\right)}{(2r+1)^3(2r+3)^3(2r+5)^3(2r+7)^3}$	$-\frac{25}{3456}$
b_5	$-\frac{1024}{(2r+1)^2(2r+3)^2(2r+5)^2(2r+7)^2(2r+9)^2}$	$-\frac{1}{14400}$	$\frac{327680r^4+3276800r^3+11304960r^2+15564800r+6918144}{(2r+1)^3(2r+3)^3(2r+5)^3(2r+7)^3(2r+9)^3}$	$\frac{137}{432000}$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\ &= \sqrt{x}\left(1 - x + \frac{x^2}{4} - \frac{x^3}{36} + \frac{x^4}{576} - \frac{x^5}{14400} + O(x^6)\right)\ln(x) \\ &\quad + \sqrt{x}\left(2x - \frac{3x^2}{4} + \frac{11x^3}{108} - \frac{25x^4}{3456} + \frac{137x^5}{432000} + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1\sqrt{x}\left(1 - x + \frac{x^2}{4} - \frac{x^3}{36} + \frac{x^4}{576} - \frac{x^5}{14400} + O(x^6)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1 - x + \frac{x^2}{4} - \frac{x^3}{36} + \frac{x^4}{576} - \frac{x^5}{14400} + O(x^6)\right)\ln(x)\right. \\ &\quad \left. + \sqrt{x}\left(2x - \frac{3x^2}{4} + \frac{11x^3}{108} - \frac{25x^4}{3456} + \frac{137x^5}{432000} + O(x^6)\right)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1\sqrt{x}\left(1 - x + \frac{x^2}{4} - \frac{x^3}{36} + \frac{x^4}{576} - \frac{x^5}{14400} + O(x^6)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1 - x + \frac{x^2}{4} - \frac{x^3}{36} + \frac{x^4}{576} - \frac{x^5}{14400} + O(x^6)\right)\ln(x)\right. \\ &\quad \left. + \sqrt{x}\left(2x - \frac{3x^2}{4} + \frac{11x^3}{108} - \frac{25x^4}{3456} + \frac{137x^5}{432000} + O(x^6)\right)\right) \end{aligned}$$

<u>Summary</u>
The solution(s) found are the following

$$\begin{aligned} y &= c_1\sqrt{x}\left(1 - x + \frac{x^2}{4} - \frac{x^3}{36} + \frac{x^4}{576} - \frac{x^5}{14400} + O(x^6)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1 - x + \frac{x^2}{4} - \frac{x^3}{36} + \frac{x^4}{576} - \frac{x^5}{14400} + O(x^6)\right)\ln(x)\right. \\ &\quad \left. + \sqrt{x}\left(2x - \frac{3x^2}{4} + \frac{11x^3}{108} - \frac{25x^4}{3456} + \frac{137x^5}{432000} + O(x^6)\right)\right) \end{aligned} \tag{1}$$

Verification of solutions

$$
\begin{aligned}
y = {} & c_1\sqrt{x}\left(1-x+\frac{x^2}{4}-\frac{x^3}{36}+\frac{x^4}{576}-\frac{x^5}{14400}+O(x^6)\right) \\
& + c_2\left(\sqrt{x}\left(1-x+\frac{x^2}{4}-\frac{x^3}{36}+\frac{x^4}{576}-\frac{x^5}{14400}+O(x^6)\right)\ln(x)\right. \\
& \left. + \sqrt{x}\left(2x-\frac{3x^2}{4}+\frac{11x^3}{108}-\frac{25x^4}{3456}+\frac{137x^5}{432000}+O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.16.1 Maple step by step solution

Let's solve

$4x^2y''+(4x+1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(4x+1)y}{4x^2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(4x+1)y}{4x^2}=0$

□ Check to see if $x_0=0$ is a regular singular point

- ◦ Define functions

  $\left[P_2(x)=0, P_3(x)=\frac{4x+1}{4x^2}\right]$

- ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left.(x\cdot P_2(x))\right|_{x=0}=0$

- ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left.(x^2\cdot P_3(x))\right|_{x=0}=\frac{1}{4}$

- ◦ $x=0$is a regular singular point

  Check to see if $x_0=0$ is a regular singular point

  $x_0=0$

- Multiply by denominators

$$4x^2y'' + (4x+1)\,y = 0$$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..1$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- ◦ Shift index using $k- > k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- ◦ Convert $x^2 \cdot y''$ to series expansion

$$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\,x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(-1+2r)^2\,x^r + \left(\sum_{k=1}^{\infty} \left(a_k(2k+2r-1)^2 + 4a_{k-1}\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(-1+2r)^2 = 0$$

- Values of r that satisfy the indicial equation

$$r = \frac{1}{2}$$

- Each term in the series must be 0, giving the recursion relation

$$4\left(k+r-\frac{1}{2}\right)^2 a_k + 4a_{k-1} = 0$$

- Shift index using $k- > k + 1$

$$4\left(k+\frac{1}{2}+r\right)^2 a_{k+1} + 4a_k = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = -\frac{4a_k}{(2k+1+2r)^2}$$

- Recursion relation for $r = \frac{1}{2}$

$$a_{k+1} = -\frac{4a_k}{(2k+2)^2}$$

- Solution for $r = \frac{1}{2}$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+1}=-\frac{4a_k}{(2k+2)^2}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 13.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{36x^2(1-2x)\,y''+24x(1-9x)\,y'+(1-70x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(-72x^3+36x^2\right)y''+\left(-216x^2+24x\right)y'+(1-70x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{6x-\frac{2}{3}}{x\,(2x-1)}\\ q(x)&=\frac{70x-1}{36x^2\,(2x-1)}\end{aligned}$$

Table 676: Table $p(x), q(x)$ singularites.

$p(x) = \frac{6x-\frac{2}{3}}{x(2x-1)}$	
singularity	type
$x = 0$	"regular"
$x = \frac{1}{2}$	"regular"

$q(x) = \frac{70x-1}{36x^2(2x-1)}$	
singularity	type
$x = 0$	"regular"
$x = \frac{1}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, \frac{1}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-36y''x^2(2x-1) + \left(-216x^2 + 24x\right) y' + (1 - 70x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-36\left(\sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}\right) x^2(2x - 1) + \left(-216x^2 + 24x\right)\left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) + (1 - 70x)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=0}^{\infty}\left(-72x^{1+n+r}a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty}36x^{n+r}a_n(n+r)(n+r-1)\right)\\+\sum_{n=0}^{\infty}\left(-216x^{1+n+r}a_n(n+r)\right)+\left(\sum_{n=0}^{\infty}24x^{n+r}a_n(n+r)\right)\\+\left(\sum_{n=0}^{\infty}a_n x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-70x^{1+n+r}a_n\right)=0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty}\left(-72x^{1+n+r}a_n(n+r)(n+r-1)\right)=\sum_{n=1}^{\infty}\left(-72a_{n-1}(n+r-1)(n+r-2)\,x^{n+r}\right)$$

$$\sum_{n=0}^{\infty}\left(-216x^{1+n+r}a_n(n+r)\right)=\sum_{n=1}^{\infty}\left(-216a_{n-1}(n+r-1)\,x^{n+r}\right)$$

$$\sum_{n=0}^{\infty}\left(-70x^{1+n+r}a_n\right)=\sum_{n=1}^{\infty}\left(-70a_{n-1}x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\sum_{n=1}^{\infty}\left(-72a_{n-1}(n+r-1)(n+r-2)\,x^{n+r}\right)\\+\left(\sum_{n=0}^{\infty}36x^{n+r}a_n(n+r)(n+r-1)\right)+\sum_{n=1}^{\infty}\left(-216a_{n-1}(n+r-1)\,x^{n+r}\right)\\+\left(\sum_{n=0}^{\infty}24x^{n+r}a_n(n+r)\right)+\left(\sum_{n=0}^{\infty}a_n x^{n+r}\right)+\sum_{n=1}^{\infty}\left(-70a_{n-1}x^{n+r}\right)=0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$36x^{n+r}a_n(n+r)(n+r-1)+24x^{n+r}a_n(n+r)+a_n x^{n+r}=0$$

When $n = 0$ the above becomes

$$36x^r a_0 r(-1+r) + 24x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(36x^r r(-1+r) + 24x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(6r-1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(6r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{6}$$
$$r_2 = \frac{1}{6}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(6r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{6}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{6}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{6}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} -72a_{n-1}(n+r-1)(n+r-2) + 36a_n(n+r)(n+r-1) \\ -216a_{n-1}(n+r-1) + 24a_n(n+r) + a_n - 70a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{2(6n+6r+1)\, a_{n-1}}{-1+6n+6r} \tag{4}$$

Which for the root $r = \frac{1}{6}$ becomes

$$a_n = \frac{2(3n+1)\, a_{n-1}}{3n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{6}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{12r+14}{5+6r}$$

Which for the root $r = \frac{1}{6}$ becomes

$$a_1 = \frac{8}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12r+14}{5+6r}$	$\frac{8}{3}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{144r^2 + 480r + 364}{36r^2 + 96r + 55}$$

Which for the root $r = \frac{1}{6}$ becomes

$$a_2 = \frac{56}{9}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12r+14}{5+6r}$	$\frac{8}{3}$
a_2	$\frac{144r^2+480r+364}{36r^2+96r+55}$	$\frac{56}{9}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{1728r^3 + 11232r^2 + 22608r + 13832}{216r^3 + 1188r^2 + 1962r + 935}$$

Which for the root $r = \frac{1}{6}$ becomes

$$a_3 = \frac{1120}{81}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12r+14}{5+6r}$	$\frac{8}{3}$
a_2	$\frac{144r^2+480r+364}{36r^2+96r+55}$	$\frac{56}{9}$
a_3	$\frac{1728r^3+11232r^2+22608r+13832}{216r^3+1188r^2+1962r+935}$	$\frac{1120}{81}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{20736r^4 + 221184r^3 + 832896r^2 + 1296384r + 691600}{1296r^4 + 12096r^3 + 39096r^2 + 50736r + 21505}$$

Which for the root $r = \frac{1}{6}$ becomes

$$a_4 = \frac{7280}{243}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12r+14}{5+6r}$	$\frac{8}{3}$
a_2	$\frac{144r^2+480r+364}{36r^2+96r+55}$	$\frac{56}{9}$
a_3	$\frac{1728r^3+11232r^2+22608r+13832}{216r^3+1188r^2+1962r+935}$	$\frac{1120}{81}$
a_4	$\frac{20736r^4+221184r^3+832896r^2+1296384r+691600}{1296r^4+12096r^3+39096r^2+50736r+21505}$	$\frac{7280}{243}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{248832r^5 + 3939840r^4 + 23708160r^3 + 67196160r^2 + 88675008r + 42879200}{7776r^5 + 110160r^4 + 585360r^3 + 1438200r^2 + 1600374r + 623645}$$

Which for the root $r = \frac{1}{6}$ becomes

$$a_5 = \frac{46592}{729}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12r+14}{5+6r}$	$\frac{8}{3}$
a_2	$\frac{144r^2+480r+364}{36r^2+96r+55}$	$\frac{56}{9}$
a_3	$\frac{1728r^3+11232r^2+22608r+13832}{216r^3+1188r^2+1962r+935}$	$\frac{1120}{81}$
a_4	$\frac{20736r^4+221184r^3+832896r^2+1296384r+691600}{1296r^4+12096r^3+39096r^2+50736r+21505}$	$\frac{7280}{243}$
a_5	$\frac{248832r^5+3939840r^4+23708160r^3+67196160r^2+88675008r+42879200}{7776r^5+110160r^4+585360r^3+1438200r^2+1600374r+623645}$	$\frac{46592}{729}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{6}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{6}}\left(1 + \frac{8x}{3} + \frac{56x^2}{9} + \frac{1120x^3}{81} + \frac{7280x^4}{243} + \frac{46592x^5}{729} + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{6}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{12r+14}{5+6r}$	$\frac{8}{3}$	$-\frac{24}{(5+6r)^2}$
b_2	$\frac{144r^2+480r+364}{36r^2+96r+55}$	$\frac{56}{9}$	$-\frac{96(36r^2+108r+89)}{(36r^2+96r+55)^2}$
b_3	$\frac{1728r^3+11232r^2+22608r+13832}{216r^3+1188r^2+1962r+935}$	$\frac{1120}{81}$	$-\frac{288(1296r^4+10368r^3+31032r^2+41184r+20833)}{(216r^3+1188r^2+1962r+935)^2}$
b_4	$\frac{20736r^4+221184r^3+832896r^2+1296384r+691600}{1296r^4+12096r^3+39096r^2+50736r+21505}$	$\frac{7280}{243}$	$-\frac{768(46656r^6+699840r^5+4311792r^4+13957920r}{(1296r^4+12096r^3+39096r^2-}$
b_5	$\frac{248832r^5+3939840r^4+23708160r^3+67196160r^2+88675008r+42879200}{7776r^5+110160r^4+585360r^3+1438200r^2+1600374r+623645}$	$\frac{46592}{729}$	$-\frac{1920(1679616r^8+40310784r^7+416358144r^6+24}{(7776r^5+1}$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x) \ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= x^{\frac{1}{6}} \left(1 + \frac{8x}{3} + \frac{56x^2}{9} + \frac{1120x^3}{81} + \frac{7280x^4}{243} + \frac{46592x^5}{729} + O(x^6)\right) \ln(x) \\
&\quad + x^{\frac{1}{6}} \left(-\frac{2x}{3} - 2x^2 - \frac{1192x^3}{243} - \frac{8168x^4}{729} - \frac{270112x^5}{10935} + O(x^6)\right)
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{1}{6}} \left(1 + \frac{8x}{3} + \frac{56x^2}{9} + \frac{1120x^3}{81} + \frac{7280x^4}{243} + \frac{46592x^5}{729} + O(x^6)\right) \\
&\quad + c_2 \left(x^{\frac{1}{6}} \left(1 + \frac{8x}{3} + \frac{56x^2}{9} + \frac{1120x^3}{81} + \frac{7280x^4}{243} + \frac{46592x^5}{729} + O(x^6)\right) \ln(x) \right. \\
&\quad \left. + x^{\frac{1}{6}} \left(-\frac{2x}{3} - 2x^2 - \frac{1192x^3}{243} - \frac{8168x^4}{729} - \frac{270112x^5}{10935} + O(x^6)\right)\right)
\end{aligned}$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{1}{6}}\left(1+\frac{8x}{3}+\frac{56x^2}{9}+\frac{1120x^3}{81}+\frac{7280x^4}{243}+\frac{46592x^5}{729}+O\left(x^6\right)\right) \\
&\quad + c_2\left(x^{\frac{1}{6}}\left(1+\frac{8x}{3}+\frac{56x^2}{9}+\frac{1120x^3}{81}+\frac{7280x^4}{243}+\frac{46592x^5}{729}+O\left(x^6\right)\right)\ln\left(x\right)\right. \\
&\quad \left. + x^{\frac{1}{6}}\left(-\frac{2x}{3}-2x^2-\frac{1192x^3}{243}-\frac{8168x^4}{729}-\frac{270112x^5}{10935}+O\left(x^6\right)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^{\frac{1}{6}}\left(1+\frac{8x}{3}+\frac{56x^2}{9}+\frac{1120x^3}{81}+\frac{7280x^4}{243}+\frac{46592x^5}{729}+O\left(x^6\right)\right) \\
&\quad + c_2\left(x^{\frac{1}{6}}\left(1+\frac{8x}{3}+\frac{56x^2}{9}+\frac{1120x^3}{81}+\frac{7280x^4}{243}+\frac{46592x^5}{729}+O\left(x^6\right)\right)\ln\left(x\right)\right. \\
&\quad \left. + x^{\frac{1}{6}}\left(-\frac{2x}{3}-2x^2-\frac{1192x^3}{243}-\frac{8168x^4}{729}-\frac{270112x^5}{10935}+O\left(x^6\right)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x^{\frac{1}{6}}\left(1+\frac{8x}{3}+\frac{56x^2}{9}+\frac{1120x^3}{81}+\frac{7280x^4}{243}+\frac{46592x^5}{729}+O\left(x^6\right)\right) \\
&\quad + c_2\left(x^{\frac{1}{6}}\left(1+\frac{8x}{3}+\frac{56x^2}{9}+\frac{1120x^3}{81}+\frac{7280x^4}{243}+\frac{46592x^5}{729}+O\left(x^6\right)\right)\ln\left(x\right)\right. \\
&\quad \left. + x^{\frac{1}{6}}\left(-\frac{2x}{3}-2x^2-\frac{1192x^3}{243}-\frac{8168x^4}{729}-\frac{270112x^5}{10935}+O\left(x^6\right)\right)\right)
\end{aligned}
$$

Verified OK.

15.17.1 Maple step by step solution

Let's solve

$-36y''x^2(2x-1)+\left(-216x^2+24x\right)y'+\left(1-70x\right)y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(70x-1)y}{36x^2(2x-1)}-\frac{2(9x-1)y'}{3x(2x-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{2(9x-1)y'}{3x(2x-1)}+\frac{(70x-1)y}{36x^2(2x-1)}=0$

- ☐ Check to see if x_0 is a regular singular point
  - Define functions

    $\left[P_2(x)=\frac{2(9x-1)}{3x(2x-1)}, P_3(x)=\frac{70x-1}{36x^2(2x-1)}\right]$
  - $x\cdot P_2(x)$ is analytic at $x=0$

    $\left(x\cdot P_2(x)\right)\bigg|_{x=0}=\frac{2}{3}$
  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $\left(x^2\cdot P_3(x)\right)\bigg|_{x=0}=\frac{1}{36}$
  - $x=0$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0=0$

- Multiply by denominators

  $36y''x^2(2x-1)+24x(9x-1)y'+y(70x-1)=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_kx^{k+r}$

- ☐ Rewrite ODE with series expansions
  - Convert $x^m\cdot y$ to series expansion for $m=0..1$

    $x^m\cdot y=\sum_{k=0}^{\infty}a_kx^{k+r+m}$
  - Shift index using $k->k-m$

    $x^m\cdot y=\sum_{k=m}^{\infty}a_{k-m}x^{k+r}$
  - Convert $x^m\cdot y'$ to series expansion for $m=1..2$

    $x^m\cdot y'=\sum_{k=0}^{\infty}a_k(k+r)\,x^{k+r-1+m}$
  - Shift index using $k->k+1-m$

    $x^m\cdot y'=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

  $$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k- >k+2-m$

  $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$-a_0(-1+6r)^2 x^r + \left(\sum_{k=1}^{\infty} \left(-a_k(6k+6r-1)^2 + 2a_{k-1}(6k+1+6r)(6k+6r-1)\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$-(-1+6r)^2 = 0$$

- Values of r that satisfy the indicial equation

  $$r = \frac{1}{6}$$

- Each term in the series must be 0, giving the recursion relation

  $$-36\left(\left(-2k-2r-\frac{1}{3}\right) a_{k-1} + a_k\left(k+r-\frac{1}{6}\right)\right)\left(k+r-\frac{1}{6}\right) = 0$$

- Shift index using $k- >k+1$

  $$-36\left(\left(-2k-\frac{7}{3}-2r\right) a_k + a_{k+1}\left(k+\frac{5}{6}+r\right)\right)\left(k+\frac{5}{6}+r\right) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+1} = \frac{2(6k+6r+7)a_k}{6k+6r+5}$$

- Recursion relation for $r = \frac{1}{6}$

  $$a_{k+1} = \frac{2(6k+8)a_k}{6k+6}$$

- Solution for $r = \frac{1}{6}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{6}}, a_{k+1} = \frac{2(6k+8)a_k}{6k+6}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 14.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x+1)\,y''-x(3-x)\,y'+4y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^3+x^2)\,y''+(x^2-3x)\,y'+4y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{x-3}{x\,(x+1)}$$
$$q(x)=\frac{4}{(x+1)\,x^2}$$

Table 678: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x-3}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = \frac{4}{(x+1)x^2}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x+1)\,y'' + \left(x^2-3x\right)y' + 4y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + \left(x^2-3x\right)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + 4\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - 3x^{n+r} a_n (n+r) + 4a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - 3x^r a_0 r + 4a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - 3x^r r + 4x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r-2)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r-2)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 2$$
$$r_2 = 2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r-2)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 2$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+2}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+2}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ + a_{n-1}(n+r-1) - 3a_n(n+r) + 4a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n^2 + 2nr + r^2 - 2n - 2r + 1)}{n^2 + 2nr + r^2 - 4n - 4r + 4} \tag{4}$$

Which for the root $r = 2$ becomes

$$a_n = -\frac{a_{n-1}(1+n)^2}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{r^2}{(-1+r)^2}$$

Which for the root $r = 2$ becomes

$$a_1 = -4$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{r^2}{(-1+r)^2}$	-4

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(r+1)^2}{(-1+r)^2}$$

Which for the root $r = 2$ becomes

$$a_2 = 9$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{r^2}{(-1+r)^2}$	-4
a_2	$\frac{(r+1)^2}{(-1+r)^2}$	9

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{(r+2)^2}{(-1+r)^2}$$

Which for the root $r = 2$ becomes

$$a_3 = -16$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{r^2}{(-1+r)^2}$	-4
a_2	$\frac{(r+1)^2}{(-1+r)^2}$	9
a_3	$-\frac{(r+2)^2}{(-1+r)^2}$	-16

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(r+3)^2}{(-1+r)^2}$$

Which for the root $r = 2$ becomes

$$a_4 = 25$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{r^2}{(-1+r)^2}$	-4
a_2	$\frac{(r+1)^2}{(-1+r)^2}$	9
a_3	$-\frac{(r+2)^2}{(-1+r)^2}$	-16
a_4	$\frac{(r+3)^2}{(-1+r)^2}$	25

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(r+4)^2}{(-1+r)^2}$$

Which for the root $r = 2$ becomes

$$a_5 = -36$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{r^2}{(-1+r)^2}$	-4
a_2	$\frac{(r+1)^2}{(-1+r)^2}$	9
a_3	$-\frac{(r+2)^2}{(-1+r)^2}$	-16
a_4	$\frac{(r+3)^2}{(-1+r)^2}$	25
a_5	$-\frac{(r+4)^2}{(-1+r)^2}$	-36

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^2\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^2\left(-36x^5 + 25x^4 - 16x^3 + 9x^2 - 4x + 1 + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 2$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r=2)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	$-\frac{r^2}{(-1+r)^2}$	-4	$\frac{2r}{(-1+r)^3}$	4
b_2	$\frac{(r+1)^2}{(-1+r)^2}$	9	$\frac{-4r-4}{(-1+r)^3}$	-12
b_3	$-\frac{(r+2)^2}{(-1+r)^2}$	-16	$\frac{6r+12}{(-1+r)^3}$	24
b_4	$\frac{(r+3)^2}{(-1+r)^2}$	25	$\frac{-8r-24}{(-1+r)^3}$	-40
b_5	$-\frac{(r+4)^2}{(-1+r)^2}$	-36	$\frac{10r+40}{(-1+r)^3}$	60

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\ &= x^2\left(-36x^5 + 25x^4 - 16x^3 + 9x^2 - 4x + 1 + O(x^6)\right)\ln(x) \\ &\quad + x^2\left(60x^5 - 40x^4 + 24x^3 - 12x^2 + 4x + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^2\left(-36x^5 + 25x^4 - 16x^3 + 9x^2 - 4x + 1 + O(x^6)\right) \\ &\quad + c_2\Big(x^2\left(-36x^5 + 25x^4 - 16x^3 + 9x^2 - 4x + 1 + O(x^6)\right)\ln(x) \\ &\quad + x^2\left(60x^5 - 40x^4 + 24x^3 - 12x^2 + 4x + O(x^6)\right)\Big) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^2\left(-36x^5 + 25x^4 - 16x^3 + 9x^2 - 4x + 1 + O(x^6)\right) \\ &\quad + c_2\Big(x^2\left(-36x^5 + 25x^4 - 16x^3 + 9x^2 - 4x + 1 + O(x^6)\right)\ln(x) \\ &\quad + x^2\left(60x^5 - 40x^4 + 24x^3 - 12x^2 + 4x + O(x^6)\right)\Big) \end{aligned}$$

Summary
The solution(s) found are the following

$$
\begin{aligned}
y = {} & c_1 x^2\left(-36x^5+25x^4-16x^3+9x^2-4x+1+O\left(x^6\right)\right) \\
& + c_2\left(x^2\left(-36x^5+25x^4-16x^3+9x^2-4x+1+O\left(x^6\right)\right)\ln\left(x\right)\right. \\
& \left. + x^2\left(60x^5-40x^4+24x^3-12x^2+4x+O\left(x^6\right)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y = {} & c_1 x^2\left(-36x^5+25x^4-16x^3+9x^2-4x+1+O\left(x^6\right)\right) \\
& + c_2\left(x^2\left(-36x^5+25x^4-16x^3+9x^2-4x+1+O\left(x^6\right)\right)\ln\left(x\right)\right. \\
& \left. + x^2\left(60x^5-40x^4+24x^3-12x^2+4x+O\left(x^6\right)\right)\right)
\end{aligned}
$$

Verified OK.

15.18.1 Maple step by step solution

Let's solve

$x^2(x+1)\,y''+\left(x^2-3x\right)y'+4y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{4y}{x^2(x+1)}-\frac{(x-3)y'}{x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(x-3)y'}{x(x+1)}+\frac{4y}{x^2(x+1)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{x-3}{x(x+1)}, P_3(x)=\frac{4}{(x+1)x^2}\right]$

  - $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

    $\left.\left((x+1)\cdot P_2(x)\right)\right|_{x=-1}=4$

  - $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

    $\left.\left((x+1)^2\cdot P_3(x)\right)\right|_{x=-1}=0$

  - $x=-1$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0 = -1$

- Multiply by denominators

$x^2(x+1)\, y'' + x(x-3)\, y' + 4y = 0$

- Change variables using $x = u-1$ so that the regular singular point is at $u = 0$

$(u^3 - 2u^2 + u)\left(\frac{d^2}{du^2}y(u)\right) + (u^2 - 5u + 4)\left(\frac{d}{du}y(u)\right) + 4y(u) = 0$

- Assume series solution for $y(u)$

$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$

  - Shift index using $k->k+1-m$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$

  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

    $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$

  - Shift index using $k->k+2-m$

    $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$

Rewrite ODE with series expansions

$a_0 r(3+r)\, u^{-1+r} + \left(a_1(1+r)\,(4+r) - a_0(2r^2+3r-4)\right) u^r + \left(\sum_{k=1}^{\infty} \left(a_{k+1}(k+1+r)\,(k+4+r)\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$r(3+r) = 0$

- Values of r that satisfy the indicial equation

$r \in \{-3, 0\}$

- Each term must be 0

$a_1(1+r)\,(4+r) - a_0(2r^2+3r-4) = 0$

- Each term in the series must be 0, giving the recursion relation

  $a_{k+1}(k+1+r)(k+4+r) - a_k(2k^2+4kr+2r^2+3k+3r-4) + a_{k-1}(k+r-1)^2 = 0$
- Shift index using $k- >k+1$

  $a_{k+2}(k+2+r)(k+5+r) - a_{k+1}\left(2(k+1)^2+4(k+1)r+2r^2+3k-1+3r\right) + a_k(k+r)^2 =$
- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{k^2a_k-2k^2a_{k+1}+2kra_k-4kra_{k+1}+r^2a_k-2r^2a_{k+1}-7ka_{k+1}-7ra_{k+1}-a_{k+1}}{(k+2+r)(k+5+r)}$
- Recursion relation for $r=-3$

  $a_{k+2} = -\frac{k^2a_k-2k^2a_{k+1}-6ka_k+5ka_{k+1}+9a_k+2a_{k+1}}{(k-1)(k+2)}$
- Series not valid for $r=-3$, division by 0 in the recursion relation at $k=1$

  $a_{k+2} = -\frac{k^2a_k-2k^2a_{k+1}-6ka_k+5ka_{k+1}+9a_k+2a_{k+1}}{(k-1)(k+2)}$
- Recursion relation for $r=0$

  $a_{k+2} = -\frac{k^2a_k-2k^2a_{k+1}-7ka_{k+1}-a_{k+1}}{(k+2)(k+5)}$
- Solution for $r=0$

  $\left[y(u)=\sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{k^2a_k-2k^2a_{k+1}-7ka_{k+1}-a_{k+1}}{(k+2)(k+5)}, 4a_1+4a_0=0\right]$
- Revert the change of variables $u=x+1$

  $\left[y=\sum_{k=0}^{\infty} a_k(x+1)^k, a_{k+2} = -\frac{k^2a_k-2k^2a_{k+1}-7ka_{k+1}-a_{k+1}}{(k+2)(k+5)}, 4a_1+4a_0=0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 15.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(1-2x)\,y''-x(5-4x)\,y'+(9-4x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(-2x^3+x^2\right)y''+\left(4x^2-5x\right)y'+(9-4x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{4x-5}{x\,(2x-1)}$$
$$q(x)=\frac{4x-9}{x^2\,(2x-1)}$$

Table 680: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{4x-5}{x(2x-1)}$	
singularity	type
$x = 0$	"regular"
$x = \frac{1}{2}$	"regular"

$q(x) = \frac{4x-9}{x^2(2x-1)}$	
singularity	type
$x = 0$	"regular"
$x = \frac{1}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, \frac{1}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-y''x^2(2x-1) + \left(4x^2 - 5x\right) y' + (9 - 4x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) x^2(2x-1) + \left(4x^2 - 5x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (9 - 4x) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=0}^{\infty}\left(-2x^{1+n+r}a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty}4x^{1+n+r}a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-5x^{n+r}a_n(n+r)\right)+\left(\sum_{n=0}^{\infty}9a_nx^{n+r}\right)+\sum_{n=0}^{\infty}\left(-4x^{1+n+r}a_n\right)=0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty}\left(-2x^{1+n+r}a_n(n+r)(n+r-1)\right)=\sum_{n=1}^{\infty}\left(-2a_{n-1}(n+r-1)(n+r-2)x^{n+r}\right)$$

$$\sum_{n=0}^{\infty}4x^{1+n+r}a_n(n+r)=\sum_{n=1}^{\infty}4a_{n-1}(n+r-1)x^{n+r}$$

$$\sum_{n=0}^{\infty}\left(-4x^{1+n+r}a_n\right)=\sum_{n=1}^{\infty}\left(-4a_{n-1}x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\sum_{n=1}^{\infty}\left(-2a_{n-1}(n+r-1)(n+r-2)x^{n+r}\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)(n+r-1)\right)+\left(\sum_{n=1}^{\infty}4a_{n-1}(n+r-1)x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-5x^{n+r}a_n(n+r)\right)+\left(\sum_{n=0}^{\infty}9a_nx^{n+r}\right)+\sum_{n=1}^{\infty}\left(-4a_{n-1}x^{n+r}\right)=0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r}a_n(n+r)(n+r-1)-5x^{n+r}a_n(n+r)+9a_nx^{n+r}=0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - 5x^r a_0 r + 9a_0 x^r = 0$$

Or

$$(x^r r(-1+r) - 5x^r r + 9x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r-3)^2\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r-3)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 3 \\ r_2 &= 3 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r-3)^2\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 3$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+3}$$

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+3}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \le n$ the recursive equation is

$$\begin{aligned} -2a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ + 4a_{n-1}(n+r-1) - 5a_n(n+r) + 9a_n - 4a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{2(n+r-2)\,a_{n-1}}{-3+n+r} \tag{4}$$

Which for the root $r = 3$ becomes

$$a_n = \frac{2(1+n)\,a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 3$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-2+2r}{r-2}$$

Which for the root $r = 3$ becomes

$$a_1 = 4$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2+2r}{r-2}$	4

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4r}{r-2}$$

Which for the root $r = 3$ becomes

$$a_2 = 12$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2+2r}{r-2}$	4
a_2	$\frac{4r}{r-2}$	12

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{8+8r}{r-2}$$

Which for the root $r = 3$ becomes

$$a_3 = 32$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2+2r}{r-2}$	4
a_2	$\frac{4r}{r-2}$	12
a_3	$\frac{8+8r}{r-2}$	32

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{32+16r}{r-2}$$

Which for the root $r = 3$ becomes

$$a_4 = 80$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2+2r}{r-2}$	4
a_2	$\frac{4r}{r-2}$	12
a_3	$\frac{8+8r}{r-2}$	32
a_4	$\frac{32+16r}{r-2}$	80

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{96 + 32r}{r - 2}$$

Which for the root $r = 3$ becomes

$$a_5 = 192$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2+2r}{r-2}$	4
a_2	$\frac{4r}{r-2}$	12
a_3	$\frac{8+8r}{r-2}$	32
a_4	$\frac{32+16r}{r-2}$	80
a_5	$\frac{96+32r}{r-2}$	192

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^3 \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^3 \left(192x^5 + 80x^4 + 32x^3 + 12x^2 + 4x + 1 + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln (x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 3$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r = 3)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	$\frac{-2+2r}{r-2}$	4	$-\frac{2}{(r-2)^2}$	-2
b_2	$\frac{4r}{r-2}$	12	$-\frac{8}{(r-2)^2}$	-8
b_3	$\frac{8+8r}{r-2}$	32	$-\frac{24}{(r-2)^2}$	-24
b_4	$\frac{32+16r}{r-2}$	80	$-\frac{64}{(r-2)^2}$	-64
b_5	$\frac{96+32r}{r-2}$	192	$-\frac{160}{(r-2)^2}$	-160

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x) \ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\ &= x^3 \left(192x^5 + 80x^4 + 32x^3 + 12x^2 + 4x + 1 + O(x^6)\right) \ln(x) \\ &\quad + x^3 \left(-160x^5 - 64x^4 - 24x^3 - 8x^2 - 2x + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^3 \left(192x^5 + 80x^4 + 32x^3 + 12x^2 + 4x + 1 + O(x^6)\right) \\ &\quad + c_2 \left(x^3 \left(192x^5 + 80x^4 + 32x^3 + 12x^2 + 4x + 1 + O(x^6)\right) \ln(x) \right. \\ &\qquad \left. + x^3 \left(-160x^5 - 64x^4 - 24x^3 - 8x^2 - 2x + O(x^6)\right)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^3 \left(192x^5 + 80x^4 + 32x^3 + 12x^2 + 4x + 1 + O(x^6)\right) \\ &\quad + c_2 \left(x^3 \left(192x^5 + 80x^4 + 32x^3 + 12x^2 + 4x + 1 + O(x^6)\right) \ln(x) \right. \\ &\qquad \left. + x^3 \left(-160x^5 - 64x^4 - 24x^3 - 8x^2 - 2x + O(x^6)\right)\right) \end{aligned}$$

Summary
The solution(s) found are the following

$$
\begin{aligned}
y = c_1 x^3 \left(192x^5 + 80x^4 + 32x^3 + 12x^2 + 4x + 1 + O(x^6)\right) \\
+ c_2 \left(x^3 \left(192x^5 + 80x^4 + 32x^3 + 12x^2 + 4x + 1 + O(x^6)\right) \ln(x)\right. \\
\left. + x^3 \left(-160x^5 - 64x^4 - 24x^3 - 8x^2 - 2x + O(x^6)\right)\right)
\end{aligned}
\tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y = c_1 x^3 \left(192x^5 + 80x^4 + 32x^3 + 12x^2 + 4x + 1 + O(x^6)\right) \\
+ c_2 \left(x^3 \left(192x^5 + 80x^4 + 32x^3 + 12x^2 + 4x + 1 + O(x^6)\right) \ln(x)\right. \\
\left. + x^3 \left(-160x^5 - 64x^4 - 24x^3 - 8x^2 - 2x + O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.19.1 Maple step by step solution

Let's solve

$-y''x^2(2x-1) + (4x^2 - 5x)\, y' + (9 - 4x)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(4x-9)y}{x^2(2x-1)} + \frac{(4x-5)y'}{x(2x-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{(4x-5)y'}{x(2x-1)} + \frac{(4x-9)y}{x^2(2x-1)} = 0$

□ Check to see if x_0 is a regular singular point

- ◦ Define functions

  $\left[P_2(x) = -\frac{4x-5}{x(2x-1)}, P_3(x) = \frac{4x-9}{x^2(2x-1)}\right]$

- ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\Big|_{x=0} = -5$

- ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\Big|_{x=0} = 9$

- ◦ $x = 0$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0 = 0$

- Multiply by denominators

  $y'' x^2 (2x-1) - x(4x-5)\, y' + (4x-9)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

- □ Rewrite ODE with series expansions
  - Convert $x^m \cdot y$ to series expansion for $m = 0..1$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$
  - Shift index using $k- > k - m$

    $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$
  - Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$
  - Shift index using $k- > k + 1 - m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$
  - Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

    $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$
  - Shift index using $k- > k + 2 - m$

    $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m} (k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $-a_0 (-3+r)^2 x^r + \left(\sum_{k=1}^{\infty} \left(-a_k (k+r-3)^2 + 2a_{k-1} (k+r-2)\,(k+r-3)\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-(-3+r)^2 = 0$

- Values of r that satisfy the indicial equation

  $r = 3$

- Each term in the series must be 0, giving the recursion relation

  $-a_k(k+r-3)^2 + 2a_{k-1}(k+r-2)(k+r-3) = 0$

- Shift index using $k- > k+1$

  $-a_{k+1}(k+r-2)^2 + 2a_k(k+r-1)(k+r-2) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+1} = \frac{2a_k(k+r-1)}{k+r-2}$

- Recursion relation for $r = 3$

  $a_{k+1} = \frac{2a_k(k+2)}{k+1}$

- Solution for $r = 3$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+3}, a_{k+1} = \frac{2a_k(k+2)}{k+1}\right]$

Problem number: 16.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{25x^2y'' + x(15 + x)\, y' + (x + 1)\, y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$25x^2y'' + \left(x^2 + 15x\right) y' + (x + 1)\, y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{15 + x}{25x}$$
$$q(x) = \frac{x + 1}{25x^2}$$

Table 682: Table $p(x), q(x)$ singularites.

$p(x) = \frac{15+x}{25x}$	
singularity	type
$x = 0$	"regular"

$q(x) = \frac{x+1}{25x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$25x^2y'' + (x^2 + 15x)\, y' + (x + 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$25x^2\left(\sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}\right) + (x^2 + 15x)\left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) + (x + 1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 25x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} 15x^{n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 25x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 15x^{n+r} a_n(n+r)\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$25x^{n+r} a_n(n+r)(n+r-1) + 15x^{n+r} a_n(n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$25x^r a_0 r(-1+r) + 15x^r a_0 r + a_0 x^r = 0$$

Or

$$(25x^r r(-1+r) + 15x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(5r-1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(5r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{5}$$
$$r_2 = \frac{1}{5}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(5r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{5}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{5}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{5}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$25a_n(n+r)(n+r-1) + a_{n-1}(n+r-1) + 15a_n(n+r) + a_{n-1} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n+r)}{25n^2 + 50nr + 25r^2 - 10n - 10r + 1} \tag{4}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_n = -\frac{a_{n-1}(5n+1)}{125n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{5}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-1-r}{(5r+4)^2}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_1 = -\frac{6}{125}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{(5r+4)^2}$	$-\frac{6}{125}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(2+r)(1+r)}{(5r+4)^2 (5r+9)^2}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_2 = \frac{33}{31250}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{(5r+4)^2}$	$-\frac{6}{125}$
a_2	$\frac{(2+r)(1+r)}{(5r+4)^2(5r+9)^2}$	$\frac{33}{31250}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{(3+r)(2+r)(1+r)}{(5r+4)^2(5r+9)^2(5r+14)^2}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_3 = -\frac{88}{5859375}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{(5r+4)^2}$	$-\frac{6}{125}$
a_2	$\frac{(2+r)(1+r)}{(5r+4)^2(5r+9)^2}$	$\frac{33}{31250}$
a_3	$-\frac{(3+r)(2+r)(1+r)}{(5r+4)^2(5r+9)^2(5r+14)^2}$	$-\frac{88}{5859375}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(3+r)(2+r)(1+r)(4+r)}{(5r+4)^2(5r+9)^2(5r+14)^2(5r+19)^2}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_4 = \frac{77}{488281250}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{(5r+4)^2}$	$-\frac{6}{125}$
a_2	$\frac{(2+r)(1+r)}{(5r+4)^2(5r+9)^2}$	$\frac{33}{31250}$
a_3	$-\frac{(3+r)(2+r)(1+r)}{(5r+4)^2(5r+9)^2(5r+14)^2}$	$-\frac{88}{5859375}$
a_4	$\frac{(3+r)(2+r)(1+r)(4+r)}{(5r+4)^2(5r+9)^2(5r+14)^2(5r+19)^2}$	$\frac{77}{488281250}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(3+r)(2+r)(1+r)(4+r)(5+r)}{(5r+4)^2(5r+9)^2(5r+14)^2(5r+19)^2(5r+24)^2}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_5 = -\frac{1001}{762939453125}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{(5r+4)^2}$	$-\frac{6}{125}$
a_2	$\frac{(2+r)(1+r)}{(5r+4)^2(5r+9)^2}$	$\frac{33}{31250}$
a_3	$-\frac{(3+r)(2+r)(1+r)}{(5r+4)^2(5r+9)^2(5r+14)^2}$	$-\frac{88}{5859375}$
a_4	$\frac{(3+r)(2+r)(1+r)(4+r)}{(5r+4)^2(5r+9)^2(5r+14)^2(5r+19)^2}$	$\frac{77}{488281250}$
a_5	$-\frac{(3+r)(2+r)(1+r)(4+r)(5+r)}{(5r+4)^2(5r+9)^2(5r+14)^2(5r+19)^2(5r+24)^2}$	$-\frac{1001}{762939453125}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{5}}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= x^{\frac{1}{5}}\left(1 - \frac{6x}{125} + \frac{33x^2}{31250} - \frac{88x^3}{5859375} + \frac{77x^4}{488281250} - \frac{1001x^5}{762939453125} + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{5}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{-1-r}{(5r+4)^2}$	$-\frac{6}{125}$	$\frac{5r+6}{(5r+4)^3}$
b_2	$\frac{(2+r)(1+r)}{(5r+4)^2(5r+9)^2}$	$\frac{33}{31250}$	$\frac{-50r^3-225r^2-323r-152}{(5r+9)^3(5r+4)^3}$
b_3	$-\frac{(3+r)(2+r)(1+r)}{(5r+4)^2(5r+9)^2(5r+14)^2}$	$-\frac{88}{5859375}$	$\frac{375r^5+3675r^4+13885r^3+25263r^2+22142r+7536}{(5r+4)^3(5r+9)^3(5r+14)^3}$
b_4	$\frac{(3+r)(2+r)(1+r)(4+r)}{(5r+4)^2(5r+9)^2(5r+14)^2(5r+19)^2}$	$\frac{77}{488281250}$	$\frac{-2500r^7-42750r^6-303750r^5-1160040r^4-2566146r^3-3281970r}{(5r+9)^3(5r+14)^3(5r+19)^3(5r+4)^3}$
b_5	$-\frac{(3+r)(2+r)(1+r)(4+r)(5+r)}{(5r+4)^2(5r+9)^2(5r+14)^2(5r+19)^2(5r+24)^2}$	$-\frac{1001}{762939453125}$	$\frac{15625r^9+412500r^8+4713750r^7+30545250r^6+123443175r^5+321}{(5r+4)^3(5r+9)^3(5r+14}$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \ldots \\ &= x^{\frac{1}{5}}\left(1 - \frac{6x}{125} + \frac{33x^2}{31250} - \frac{88x^3}{5859375} + \frac{77x^4}{488281250} - \frac{1001x^5}{762939453125} + O(x^6)\right)\ln(x) \\ &\quad + x^{\frac{1}{5}}\left(\frac{7x}{125} - \frac{113x^2}{62500} + \frac{1091x^3}{35156250} - \frac{1721x^4}{4687500000} + \frac{609221x^5}{183105468750000} + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 y_1(x) + c_2 y_2(x)$$

$$
\begin{aligned}
&= c_1 x^{\frac{1}{5}} \left(1-\frac{6x}{125}+\frac{33x^2}{31250}-\frac{88x^3}{5859375}+\frac{77x^4}{488281250}-\frac{1001x^5}{762939453125}+O\left(x^6\right)\right) \\
&+ c_2 \left(x^{\frac{1}{5}} \left(1-\frac{6x}{125}+\frac{33x^2}{31250}-\frac{88x^3}{5859375}+\frac{77x^4}{488281250}-\frac{1001x^5}{762939453125} + O\left(x^6\right)\right) \ln\left(x\right) \right. \\
&\left. + x^{\frac{1}{5}} \left(\frac{7x}{125}-\frac{113x^2}{62500}+\frac{1091x^3}{35156250}-\frac{1721x^4}{4687500000}+\frac{609221x^5}{183105468750000}+O\left(x^6\right)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{1}{5}} \left(1-\frac{6x}{125}+\frac{33x^2}{31250}-\frac{88x^3}{5859375}+\frac{77x^4}{488281250}-\frac{1001x^5}{762939453125}+O\left(x^6\right)\right) \\
&+ c_2 \left(x^{\frac{1}{5}} \left(1-\frac{6x}{125}+\frac{33x^2}{31250}-\frac{88x^3}{5859375}+\frac{77x^4}{488281250}-\frac{1001x^5}{762939453125}+O\left(x^6\right)\right) \ln\left(x\right) \right. \\
&\left. + x^{\frac{1}{5}} \left(\frac{7x}{125}-\frac{113x^2}{62500}+\frac{1091x^3}{35156250}-\frac{1721x^4}{4687500000}+\frac{609221x^5}{183105468750000}+O\left(x^6\right)\right)\right)
\end{aligned}
$$

<u>Summary</u>

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^{\frac{1}{5}} \left(1-\frac{6x}{125}+\frac{33x^2}{31250}-\frac{88x^3}{5859375}+\frac{77x^4}{488281250}-\frac{1001x^5}{762939453125}+O\left(x^6\right)\right) \\
&+ c_2 \left(x^{\frac{1}{5}} \left(1-\frac{6x}{125}+\frac{33x^2}{31250}-\frac{88x^3}{5859375}+\frac{77x^4}{488281250}-\frac{1001x^5}{762939453125} + O\left(x^6\right)\right) \ln\left(x\right) \right. \\
&\left. + x^{\frac{1}{5}} \left(\frac{7x}{125}-\frac{113x^2}{62500}+\frac{1091x^3}{35156250}-\frac{1721x^4}{4687500000}+\frac{609221x^5}{183105468750000}+O\left(x^6\right)\right)\right)
\end{aligned} \tag{1}
$$

<u>Verification of solutions</u>

$$
\begin{aligned}
y &= c_1 x^{\frac{1}{5}} \left(1-\frac{6x}{125}+\frac{33x^2}{31250}-\frac{88x^3}{5859375}+\frac{77x^4}{488281250}-\frac{1001x^5}{762939453125}+O\left(x^6\right)\right) \\
&+ c_2 \left(x^{\frac{1}{5}} \left(1-\frac{6x}{125}+\frac{33x^2}{31250}-\frac{88x^3}{5859375}+\frac{77x^4}{488281250}-\frac{1001x^5}{762939453125}+O\left(x^6\right)\right) \ln\left(x\right) \right. \\
&\left. + x^{\frac{1}{5}} \left(\frac{7x}{125}-\frac{113x^2}{62500}+\frac{1091x^3}{35156250}-\frac{1721x^4}{4687500000}+\frac{609221x^5}{183105468750000}+O\left(x^6\right)\right)\right)
\end{aligned}
$$

Verified OK.

15.20.1 Maple step by step solution

Let's solve

$25x^2y'' + (x^2+15x)\,y' + (x+1)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(x+1)y}{25x^2} - \frac{(15+x)y'}{25x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(15+x)y'}{25x} + \frac{(x+1)y}{25x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{15+x}{25x}, P_3(x) = \frac{x+1}{25x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\bigg|_{x=0} = \frac{3}{5}$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = \frac{1}{25}$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $25x^2y'' + x(15+x)\,y' + (x+1)\,y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  ◦ Shift index using $k- >k-m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

  $$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- Shift index using $k- > k+1-m$

  $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

  $$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0 (-1+5r)^2 x^r + \left(\sum_{k=1}^{\infty} \left(a_k (5k+5r-1)^2 + a_{k-1}(k+r)\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(-1+5r)^2 = 0$$

- Values of r that satisfy the indicial equation

  $$r = \frac{1}{5}$$

- Each term in the series must be 0, giving the recursion relation

  $$a_k (5k+5r-1)^2 + a_{k-1}(k+r) = 0$$

- Shift index using $k- > k+1$

  $$a_{k+1} (5k+4+5r)^2 + a_k (k+r+1) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+1} = -\frac{a_k (k+r+1)}{(5k+4+5r)^2}$$

- Recursion relation for $r = \frac{1}{5}$

  $$a_{k+1} = -\frac{a_k \left(k+\frac{6}{5}\right)}{(5k+5)^2}$$

- Solution for $r = \frac{1}{5}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{5}}, a_{k+1} = -\frac{a_k \left(k+\frac{6}{5}\right)}{(5k+5)^2}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 17.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^{2}(2+x)\,y''+y'x^{2}+(1-x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(2x^{3}+4x^{2}\right)y''+y'x^{2}+(1-x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{1}{2x+4}$$
$$q(x)=-\frac{x-1}{2x^{2}\left(2+x\right)}$$

Table 684: Table $p(x), q(x)$ singularites.

$p(x) = \frac{1}{2x+4}$	
singularity	type
$x = -2$	"regular"

$q(x) = -\frac{x-1}{2x^2(2+x)}$	
singularity	type
$x = -2$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-2, 0, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2(2+x)\, y'' + y'x^2 + (1-x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2(2+x)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) x^2 + (1-x)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r) (n+r-1)\right) \\
+ \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n\right) = 0 \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r) (n+r-1) = \sum_{n=1}^{\infty} 2a_{n-1} (n+r-1) (n+r-2) x^{n+r}
$$

$$
\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} a_{n-1} (n+r-1) x^{n+r}
$$

$$
\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-a_{n-1} x^{n+r}\right)
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\left(\sum_{n=1}^{\infty} 2a_{n-1} (n+r-1) (n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r) (n+r-1)\right) \\
+ \left(\sum_{n=1}^{\infty} a_{n-1} (n+r-1) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) + \sum_{n=1}^{\infty} \left(-a_{n-1} x^{n+r}\right) = 0 \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
4x^{n+r} a_n (n+r) (n+r-1) + a_n x^{n+r} = 0
$$

When $n=0$ the above becomes

$$
4x^r a_0 r(-1+r) + a_0 x^r = 0
$$

Or

$$
\left(4x^r r(-1+r) + x^r\right) a_0 = 0
$$

Since $a_0 \neq 0$ then the above simplifies to

$$(2r-1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(2r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = \frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(2r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{2}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{2}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$2a_{n-1}(n+r-1)(n+r-2)+4a_n(n+r)(n+r-1)+a_{n-1}(n+r-1)+a_n-a_{n-1}=0 \quad (3)$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r-2)\,a_{n-1}}{-1+2n+2r} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{(2n-3)\,a_{n-1}}{4n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{1-r}{1+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = \frac{1}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1-r}{1+2r}$	$\frac{1}{4}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(-1+r)\,r}{4r^2+8r+3}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = -\frac{1}{32}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1-r}{1+2r}$	$\frac{1}{4}$
a_2	$\frac{(-1+r)r}{4r^2+8r+3}$	$-\frac{1}{32}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-r^3 + r}{8r^3 + 36r^2 + 46r + 15}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = \frac{1}{128}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1-r}{1+2r}$	$\frac{1}{4}$
a_2	$\frac{(-1+r)r}{4r^2+8r+3}$	$-\frac{1}{32}$
a_3	$\frac{-r^3+r}{8r^3+36r^2+46r+15}$	$\frac{1}{128}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r(r^2 - 1)(2 + r)}{(7 + 2r)(8r^3 + 36r^2 + 46r + 15)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = -\frac{5}{2048}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1-r}{1+2r}$	$\frac{1}{4}$
a_2	$\frac{(-1+r)r}{4r^2+8r+3}$	$-\frac{1}{32}$
a_3	$\frac{-r^3+r}{8r^3+36r^2+46r+15}$	$\frac{1}{128}$
a_4	$\frac{r(r^2-1)(2+r)}{(7+2r)(8r^3+36r^2+46r+15)}$	$-\frac{5}{2048}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-r^5 - 5r^4 - 5r^3 + 5r^2 + 6r}{32r^5 + 400r^4 + 1840r^3 + 3800r^2 + 3378r + 945}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = \frac{7}{8192}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1-r}{1+2r}$	$\frac{1}{4}$
a_2	$\frac{(-1+r)r}{4r^2+8r+3}$	$-\frac{1}{32}$
a_3	$\frac{-r^3+r}{8r^3+36r^2+46r+15}$	$\frac{1}{128}$
a_4	$\frac{r(r^2-1)(2+r)}{(7+2r)(8r^3+36r^2+46r+15)}$	$-\frac{5}{2048}$
a_5	$\frac{-r^5-5r^4-5r^3+5r^2+6r}{32r^5+400r^4+1840r^3+3800r^2+3378r+945}$	$\frac{7}{8192}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= \sqrt{x}\left(1 + \frac{x}{4} - \frac{x^2}{32} + \frac{x^3}{128} - \frac{5x^4}{2048} + \frac{7x^5}{8192} + O(x^6)\right)
\end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{2}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{1-r}{1+2r}$	$\frac{1}{4}$	$-\frac{3}{(1+2r)^2}$
b_2	$\frac{(-1+r)r}{4r^2+8r+3}$	$-\frac{1}{32}$	$\frac{12r^2+6r-3}{(4r^2+8r+3)^2}$
b_3	$\frac{-r^3+r}{8r^3+36r^2+46r+15}$	$\frac{1}{128}$	$\frac{-36r^4-108r^3-81r^2+15}{(8r^3+36r^2+46r+15)^2}$
b_4	$\frac{r(r^2-1)(2+r)}{(7+2r)(8r^3+36r^2+46r+15)}$	$-\frac{5}{2048}$	$\frac{96r^6+720r^5+1968r^4+2340r^3+966r^2-210r-210}{(8r^3+36r^2+46r+15)^2(7+2r)^2}$
b_5	$\frac{-r^5-5r^4-5r^3+5r^2+6r}{32r^5+400r^4+1840r^3+3800r^2+3378r+945}$	$\frac{7}{8192}$	$-\frac{15(16r^8+224r^7+1272r^6+3752r^5+6053r^4+4984r^3+1339r^2-630r-378)}{(32r^5+400r^4+1840r^3+3800r^2+3378r+945)^2}$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= \sqrt{x}\left(1 + \frac{x}{4} - \frac{x^2}{32} + \frac{x^3}{128} - \frac{5x^4}{2048} + \frac{7x^5}{8192} + O(x^6)\right)\ln(x) \\
&\quad + \sqrt{x}\left(-\frac{3x}{4} + \frac{3x^2}{64} - \frac{7x^3}{768} + \frac{61x^4}{24576} - \frac{391x^5}{491520} + O(x^6)\right)
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1\sqrt{x}\left(1 + \frac{x}{4} - \frac{x^2}{32} + \frac{x^3}{128} - \frac{5x^4}{2048} + \frac{7x^5}{8192} + O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1 + \frac{x}{4} - \frac{x^2}{32} + \frac{x^3}{128} - \frac{5x^4}{2048} + \frac{7x^5}{8192} + O(x^6)\right)\ln(x)\right. \\
&\quad \left. + \sqrt{x}\left(-\frac{3x}{4} + \frac{3x^2}{64} - \frac{7x^3}{768} + \frac{61x^4}{24576} - \frac{391x^5}{491520} + O(x^6)\right)\right)
\end{aligned}$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1\sqrt{x}\left(1+\frac{x}{4}-\frac{x^2}{32}+\frac{x^3}{128}-\frac{5x^4}{2048}+\frac{7x^5}{8192}+O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1+\frac{x}{4}-\frac{x^2}{32}+\frac{x^3}{128}-\frac{5x^4}{2048}+\frac{7x^5}{8192}+O(x^6)\right)\ln(x)\right. \\
&\quad \left. + \sqrt{x}\left(-\frac{3x}{4}+\frac{3x^2}{64}-\frac{7x^3}{768}+\frac{61x^4}{24576}-\frac{391x^5}{491520}+O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1\sqrt{x}\left(1+\frac{x}{4}-\frac{x^2}{32}+\frac{x^3}{128}-\frac{5x^4}{2048}+\frac{7x^5}{8192}+O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1+\frac{x}{4}-\frac{x^2}{32}+\frac{x^3}{128}-\frac{5x^4}{2048}+\frac{7x^5}{8192}+O(x^6)\right)\ln(x)\right. \\
&\quad \left. + \sqrt{x}\left(-\frac{3x}{4}+\frac{3x^2}{64}-\frac{7x^3}{768}+\frac{61x^4}{24576}-\frac{391x^5}{491520}+O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1\sqrt{x}\left(1+\frac{x}{4}-\frac{x^2}{32}+\frac{x^3}{128}-\frac{5x^4}{2048}+\frac{7x^5}{8192}+O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1+\frac{x}{4}-\frac{x^2}{32}+\frac{x^3}{128}-\frac{5x^4}{2048}+\frac{7x^5}{8192}+O(x^6)\right)\ln(x)\right. \\
&\quad \left. + \sqrt{x}\left(-\frac{3x}{4}+\frac{3x^2}{64}-\frac{7x^3}{768}+\frac{61x^4}{24576}-\frac{391x^5}{491520}+O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.21.1 Maple step by step solution

Let's solve

$2x^2(2+x)\,y''+y'x^2+(1-x)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{(x-1)y}{2x^2(2+x)}-\frac{y'}{2(2+x)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{y'}{2(2+x)}-\frac{(x-1)y}{2x^2(2+x)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x)=\frac{1}{2(2+x)}, P_3(x)=-\frac{x-1}{2x^2(2+x)}\right]$

  ◦ $(2+x)\cdot P_2(x)$ is analytic at $x=-2$

    $\left((2+x)\cdot P_2(x)\right)\bigg|_{x=-2}=\frac{1}{2}$

  ◦ $(2+x)^2\cdot P_3(x)$ is analytic at $x=-2$

    $\left((2+x)^2\cdot P_3(x)\right)\bigg|_{x=-2}=0$

  ◦ $x=-2$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0=-2$

- Multiply by denominators

  $2x^2(2+x)\,y''+y'x^2+(1-x)\,y=0$

- Change variables using $x=u-2$ so that the regular singular point is at $u=0$

  $(2u^3-8u^2+8u)\left(\frac{d^2}{du^2}y(u)\right)+(u^2-4u+4)\left(\frac{d}{du}y(u)\right)+(3-u)\,y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $u^m\cdot y(u)$ to series expansion for $m=0..1$

    $u^m\cdot y(u)=\sum_{k=0}^{\infty}a_k u^{k+r+m}$

  ◦ Shift index using $k->k-m$

    $u^m\cdot y(u)=\sum_{k=m}^{\infty}a_{k-m}u^{k+r}$

  ◦ Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..2$

    $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,u^{k+r-1+m}$

- Shift index using $k->k+1-m$

$$u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,u^{k+r}$$

- Convert $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m=1..3$

$$u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,(k+r-1)\,u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

$$u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=-2+m}^{\infty}a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$$

Rewrite ODE with series expansions

$$4a_0r(-1+2r)\,u^{-1+r}+\left(4a_1(1+r)\,(1+2r)-a_0(8r^2-4r-3)\right)u^r+\left(\sum_{k=1}^{\infty}\left(4a_{k+1}(k+1+r)\,(2k\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$4r(-1+2r)=0$$

- Values of r that satisfy the indicial equation

$$r\in\left\{0,\frac{1}{2}\right\}$$

- Each term must be 0

$$4a_1(1+r)\,(1+2r)-a_0(8r^2-4r-3)=0$$

- Each term in the series must be 0, giving the recursion relation

$$2(-4a_k+a_{k-1}+4a_{k+1})\,k^2+\left(4(-4a_k+a_{k-1}+4a_{k+1})\,r+4a_k-5a_{k-1}+12a_{k+1}\right)k+2(-4a_k+$$

- Shift index using $k->k+1$

$$2(-4a_{k+1}+a_k+4a_{k+2})\,(k+1)^2+\left(4(-4a_{k+1}+a_k+4a_{k+2})\,r+4a_{k+1}-5a_k+12a_{k+2}\right)(k+1)-$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{2k^2a_k-8k^2a_{k+1}+4kra_k-16kra_{k+1}+2r^2a_k-8r^2a_{k+1}-ka_k-12ka_{k+1}-ra_k-12ra_{k+1}-a_k-a_{k+1}}{4(2k^2+4kr+2r^2+7k+7r+6)}$$

- Recursion relation for $r=0$

$$a_{k+2}=-\frac{2k^2a_k-8k^2a_{k+1}-ka_k-12ka_{k+1}-a_k-a_{k+1}}{4(2k^2+7k+6)}$$

- Solution for $r=0$

$$\left[y(u)=\sum_{k=0}^{\infty}a_ku^k, a_{k+2}=-\frac{2k^2a_k-8k^2a_{k+1}-ka_k-12ka_{k+1}-a_k-a_{k+1}}{4(2k^2+7k+6)}, 4a_1+3a_0=0\right]$$

- Revert the change of variables $u=2+x$

$$\left[y=\sum_{k=0}^{\infty} a_k (2+x)^k, a_{k+2}=-\frac{2k^2 a_k-8k^2 a_{k+1}-k a_k-12k a_{k+1}-a_k-a_{k+1}}{4(2k^2+7k+6)}, 4a_1+3a_0=0\right]$$

- Recursion relation for $r=\frac{1}{2}$

$$a_{k+2}=-\frac{2k^2 a_k-8k^2 a_{k+1}+k a_k-20k a_{k+1}-a_k-9a_{k+1}}{4(2k^2+9k+10)}$$

- Solution for $r=\frac{1}{2}$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^{k+\frac{1}{2}}, a_{k+2}=-\frac{2k^2 a_k-8k^2 a_{k+1}+k a_k-20k a_{k+1}-a_k-9a_{k+1}}{4(2k^2+9k+10)}, 12a_1+3a_0=0\right]$$

- Revert the change of variables $u=2+x$

$$\left[y=\sum_{k=0}^{\infty} a_k (2+x)^{k+\frac{1}{2}}, a_{k+2}=-\frac{2k^2 a_k-8k^2 a_{k+1}+k a_k-20k a_{k+1}-a_k-9a_{k+1}}{4(2k^2+9k+10)}, 12a_1+3a_0=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k (2+x)^k\right)+\left(\sum_{k=0}^{\infty} b_k (2+x)^{k+\frac{1}{2}}\right), a_{k+2}=-\frac{2k^2 a_k-8k^2 a_{1+k}-k a_k-12k a_{1+k}-a_k-a_{1+k}}{4(2k^2+7k+6)}, 4a_1+\right.$$

Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 18.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(4x+9)\,y''+3y'x+(x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(4x^3+9x^2\right)y''+3y'x+(x+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{3}{x\,(4x+9)}$$
$$q(x)=\frac{x+1}{x^2\,(4x+9)}$$

Table 686: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3}{x(4x+9)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{9}{4}$	"regular"

$q(x) = \frac{x+1}{x^2(4x+9)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{9}{4}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{9}{4}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(4x+9)\, y'' + 3y'x + (x+1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(4x+9) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + 3\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) x + (x+1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) \tag{2A}$$
$$+ \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) \tag{2B}$$
$$+ \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$9x^{n+r} a_n (n+r)(n+r-1) + 3x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$9x^r a_0 r(-1+r) + 3x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(9x^r r(-1+r) + 3x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(3r-1)^2\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(3r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = \frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(3r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{3}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{3}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$4a_{n-1}(n+r-1)(n+r-2)+9a_n(n+r)(n+r-1)+3a_n(n+r)+a_{n-1}+a_n = 0 \quad (3)$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(4n^2+8nr+4r^2-12n-12r+9)}{9n^2+18nr+9r^2-6n-6r+1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = -\frac{(6n-7)^2\, a_{n-1}}{81n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{(2r-1)^2}{(3r+2)^2}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_1 = -\frac{1}{81}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(2r-1)^2}{(3r+2)^2}$	$-\frac{1}{81}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{16\left(r+\frac{1}{2}\right)^2\left(r-\frac{1}{2}\right)^2}{81\left(r+\frac{2}{3}\right)^2\left(r+\frac{5}{3}\right)^2}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = \frac{25}{26244}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(2r-1)^2}{(3r+2)^2}$	$-\frac{1}{81}$
a_2	$\frac{16\left(r+\frac{1}{2}\right)^2\left(r-\frac{1}{2}\right)^2}{81\left(r+\frac{2}{3}\right)^2\left(r+\frac{5}{3}\right)^2}$	$\frac{25}{26244}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{64\left(r+\frac{3}{2}\right)^2\left(r+\frac{1}{2}\right)^2\left(r-\frac{1}{2}\right)^2}{(3r+2)^2(3r+5)^2(9r^2+48r+64)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = -\frac{3025}{19131876}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(2r-1)^2}{(3r+2)^2}$	$-\frac{1}{81}$
a_2	$\frac{16\left(r+\frac{1}{2}\right)^2\left(r-\frac{1}{2}\right)^2}{81\left(r+\frac{2}{3}\right)^2\left(r+\frac{5}{3}\right)^2}$	$\frac{25}{26244}$
a_3	$-\frac{64\left(r+\frac{3}{2}\right)^2\left(r+\frac{1}{2}\right)^2\left(r-\frac{1}{2}\right)^2}{(3r+2)^2(3r+5)^2(9r^2+48r+64)}$	$-\frac{3025}{19131876}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(2r+3)^2(2r+1)^2(2r-1)^2(4r^2+20r+25)}{6561\left(r+\frac{8}{3}\right)^2\left(r+\frac{11}{3}\right)^2\left(r+\frac{2}{3}\right)^2\left(r+\frac{5}{3}\right)^2}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{874225}{24794911296}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(2r-1)^2}{(3r+2)^2}$	$-\frac{1}{81}$
a_2	$\frac{16\left(r+\frac{1}{2}\right)^2\left(r-\frac{1}{2}\right)^2}{81\left(r+\frac{2}{3}\right)^2\left(r+\frac{5}{3}\right)^2}$	$\frac{25}{26244}$
a_3	$-\frac{64\left(r+\frac{3}{2}\right)^2\left(r+\frac{1}{2}\right)^2\left(r-\frac{1}{2}\right)^2}{(3r+2)^2(3r+5)^2(9r^2+48r+64)}$	$-\frac{3025}{19131876}$
a_4	$\frac{(2r+3)^2(2r+1)^2(2r-1)^2(4r^2+20r+25)}{6561\left(r+\frac{8}{3}\right)^2\left(r+\frac{11}{3}\right)^2\left(r+\frac{2}{3}\right)^2\left(r+\frac{5}{3}\right)^2}$	$\frac{874225}{24794911296}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(2r+3)^2(2r+5)^2(7+2r)^2(2r+1)^2(2r-1)^2}{(3r+8)^2(3r+11)^2(3r+2)^2(3r+5)^2(9r^2+84r+196)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_5 = -\frac{18498601}{2008387814976}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(2r-1)^2}{(3r+2)^2}$	$-\frac{1}{81}$
a_2	$\frac{16\left(r+\frac{1}{2}\right)^2\left(r-\frac{1}{2}\right)^2}{81\left(r+\frac{2}{3}\right)^2\left(r+\frac{5}{3}\right)^2}$	$\frac{25}{26244}$
a_3	$-\frac{64\left(r+\frac{3}{2}\right)^2\left(r+\frac{1}{2}\right)^2\left(r-\frac{1}{2}\right)^2}{(3r+2)^2(3r+5)^2(9r^2+48r+64)}$	$-\frac{3025}{19131876}$
a_4	$\frac{(2r+3)^2(2r+1)^2(2r-1)^2(4r^2+20r+25)}{6561\left(r+\frac{8}{3}\right)^2\left(r+\frac{11}{3}\right)^2\left(r+\frac{2}{3}\right)^2\left(r+\frac{5}{3}\right)^2}$	$\frac{874225}{24794911296}$
a_5	$-\frac{(2r+3)^2(2r+5)^2(7+2r)^2(2r+1)^2(2r-1)^2}{(3r+8)^2(3r+11)^2(3r+2)^2(3r+5)^2(9r^2+84r+196)}$	$-\frac{18498601}{2008387814976}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(1 - \frac{x}{81} + \frac{25x^2}{26244} - \frac{3025x^3}{19131876} + \frac{874225x^4}{24794911296} - \frac{18498601x^5}{2008387814976} + O\left(x^6\right)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{3}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$-\frac{(2r-1)^2}{(3r+2)^2}$	$-\frac{1}{81}$	$\frac{-28r+14}{(3r+2)^3}$
b_2	$\frac{16\left(r+\frac{1}{2}\right)^2\left(r-\frac{1}{2}\right)^2}{81\left(r+\frac{2}{3}\right)^2\left(r+\frac{5}{3}\right)^2}$	$\frac{25}{26244}$	$\frac{672r^4+784r^3-196r-42}{(3r+5)^3(3r+2)^3}$
b_3	$-\frac{64\left(r+\frac{3}{2}\right)^2\left(r+\frac{1}{2}\right)^2\left(r-\frac{1}{2}\right)^2}{(3r+2)^2(3r+5)^2(9r^2+48r+64)}$	$-\frac{3025}{19131876}$	$-\frac{14(108r^4+468r^3+687r^2+390r+62)(2r+3)(4r^2-1)}{(3r+8)^3(3r+2)^3(3r+5)^3}$
b_4	$\frac{(2r+3)^2(2r+1)^2(2r-1)^2(4r^2+20r+25)}{6561\left(r+\frac{8}{3}\right)^2\left(r+\frac{11}{3}\right)^2\left(r+\frac{2}{3}\right)^2\left(r+\frac{5}{3}\right)^2}$	$\frac{874225}{24794911296}$	$28(2r+3)(864r^7+10368r^6+51048r^5+132484r^4+193156r^3 \ldots$ / $(3r+5)^3(3r+2)^3(3r+11)^3(3 \ldots$
b_5	$-\frac{(2r+3)^2(2r+5)^2(7+2r)^2(2r+1)^2(2r-1)^2}{(3r+8)^2(3r+11)^2(3r+2)^2(3r+5)^2(9r^2+84r+196)}$	$-\frac{18498601}{2008387814976}$	$-$ $70(1296r^8+21600r^7+150552r^6+569400r^5+1266613r^4+ \ldots$ / $14348907\left(r+\frac{14}{3}\right) \ldots$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \ldots \\
&= x^{\frac{1}{3}}\left(1 - \frac{x}{81} + \frac{25x^2}{26244} - \frac{3025x^3}{19131876} + \frac{874225x^4}{24794911296} - \frac{18498601x^5}{2008387814976} + O(x^6)\right)\ln(x) \\
&\quad + x^{\frac{1}{3}}\left(\frac{14x}{81} - \frac{35x^2}{2916} + \frac{110495x^3}{57395628} - \frac{62786185x^4}{148769467776} + \frac{1315043653x^5}{12050326889856} + O(x^6)\right)
\end{aligned}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 y_1(x) + c_2 y_2(x)$$

$$
\begin{aligned}
&= c_1 x^{\frac{1}{3}}\left(1-\frac{x}{81}+\frac{25x^2}{26244}-\frac{3025x^3}{19131876}+\frac{874225x^4}{24794911296}-\frac{18498601x^5}{2008387814976}+O\left(x^6\right)\right) \\
&+ c_2\left(x^{\frac{1}{3}}\left(1-\frac{x}{81}+\frac{25x^2}{26244}-\frac{3025x^3}{19131876}+\frac{874225x^4}{24794911296}-\frac{18498601x^5}{2008387814976}\right.\right. \\
&\left.+O\left(x^6\right)\right)\ln\left(x\right) \\
&\left.+x^{\frac{1}{3}}\left(\frac{14x}{81}-\frac{35x^2}{2916}+\frac{110495x^3}{57395628}-\frac{62786185x^4}{148769467776}+\frac{1315043653x^5}{12050326889856}+O\left(x^6\right)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{1}{3}}\left(1-\frac{x}{81}+\frac{25x^2}{26244}-\frac{3025x^3}{19131876}+\frac{874225x^4}{24794911296}-\frac{18498601x^5}{2008387814976}+O\left(x^6\right)\right) \\
&+ c_2\left(x^{\frac{1}{3}}\left(1-\frac{x}{81}+\frac{25x^2}{26244}-\frac{3025x^3}{19131876}+\frac{874225x^4}{24794911296}-\frac{18498601x^5}{2008387814976}\right.\right. \\
&\left.+O\left(x^6\right)\right)\ln\left(x\right) \\
&\left.+x^{\frac{1}{3}}\left(\frac{14x}{81}-\frac{35x^2}{2916}+\frac{110495x^3}{57395628}-\frac{62786185x^4}{148769467776}+\frac{1315043653x^5}{12050326889856}+O\left(x^6\right)\right)\right)
\end{aligned}
$$

<u>Summary</u>

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^{\frac{1}{3}}\left(1-\frac{x}{81}+\frac{25x^2}{26244}-\frac{3025x^3}{19131876}+\frac{874225x^4}{24794911296}-\frac{18498601x^5}{2008387814976}+O\left(x^6\right)\right) \\
&+ c_2\left(x^{\frac{1}{3}}\left(1-\frac{x}{81}+\frac{25x^2}{26244}-\frac{3025x^3}{19131876}+\frac{874225x^4}{24794911296}-\frac{18498601x^5}{2008387814976}\right.\right. \\
&\left.+O\left(x^6\right)\right)\ln\left(x\right) \\
&\left.+x^{\frac{1}{3}}\left(\frac{14x}{81}-\frac{35x^2}{2916}+\frac{110495x^3}{57395628}-\frac{62786185x^4}{148769467776}+\frac{1315043653x^5}{12050326889856}+O\left(x^6\right)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$y = c_1 x^{\frac{1}{3}} \left(1 - \frac{x}{81} + \frac{25x^2}{26244} - \frac{3025x^3}{19131876} + \frac{874225x^4}{24794911296} - \frac{18498601x^5}{2008387814976} + O(x^6)\right)$$
$$+ c_2 \left(x^{\frac{1}{3}} \left(1 - \frac{x}{81} + \frac{25x^2}{26244} - \frac{3025x^3}{19131876} + \frac{874225x^4}{24794911296} - \frac{18498601x^5}{2008387814976} + O(x^6)\right) \ln(x)\right.$$
$$\left. + x^{\frac{1}{3}} \left(\frac{14x}{81} - \frac{35x^2}{2916} + \frac{110495x^3}{57395628} - \frac{62786185x^4}{148769467776} + \frac{1315043653x^5}{12050326889856} + O(x^6)\right)\right)$$

Verified OK.

15.22.1 Maple step by step solution

Let's solve

$x^2(4x+9)y'' + 3y'x + (x+1)y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(x+1)y}{x^2(4x+9)} - \frac{3y'}{x(4x+9)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{3y'}{x(4x+9)} + \frac{(x+1)y}{x^2(4x+9)} = 0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{3}{x(4x+9)}, P_3(x) = \frac{x+1}{x^2(4x+9)}\right]$

  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $(x \cdot P_2(x))\Big|_{x=0} = \frac{1}{3}$

  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $(x^2 \cdot P_3(x))\Big|_{x=0} = \frac{1}{9}$

  - $x = 0$is a regular singular point

    Check to see if x_0 is a regular singular point

$x_0 = 0$

- Multiply by denominators

  $x^2(4x+9)\, y'' + 3y'x + (x+1)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..1$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  - Shift index using $k- >k - m$

    $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  - Convert $x \cdot y'$ to series expansion

    $x \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r}$

  - Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

    $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

  - Shift index using $k- >k + 2 - m$

    $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(-1+3r)^2\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(3k+3r-1)^2 + a_{k-1}(2k-3+2r)^2\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(-1+3r)^2 = 0$

- Values of r that satisfy the indicial equation

  $r = \frac{1}{3}$

- Each term in the series must be 0, giving the recursion relation

  $a_k(3k+3r-1)^2 + a_{k-1}(2k-3+2r)^2 = 0$

- Shift index using $k- >k + 1$

$$a_{k+1}(3k+2+3r)^2 + a_k(2k+2r-1)^2 = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = -\frac{a_k(2k+2r-1)^2}{(3k+2+3r)^2}$$

- Recursion relation for $r = \frac{1}{3}$

$$a_{k+1} = -\frac{a_k\left(2k-\frac{1}{3}\right)^2}{(3k+3)^2}$$

- Solution for $r = \frac{1}{3}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+1} = -\frac{a_k\left(2k-\frac{1}{3}\right)^2}{(3k+3)^2}\right]$$

ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' - x(-2x+3)\,y' + (3x+4)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + \left(2x^2 - 3x\right)y' + (3x+4)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{-3+2x}{x}$$
$$q(x) = \frac{3x+4}{x^2}$$

Table 688: Table $p(x), q(x)$ singularites.

$p(x) = \frac{-3+2x}{x}$	
singularity	type
$x = 0$	"regular"

$q(x) = \frac{3x+4}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2y'' + \left(2x^2 - 3x\right) y' + (3x + 4) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}\right) + \left(2x^2 - 3x\right) \left(\sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}\right) + (3x + 4) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{1+n+r} a_n = \sum_{n=1}^{\infty} 3a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} 3a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - 3x^{n+r} a_n (n+r) + 4a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - 3x^r a_0 r + 4a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - 3x^r r + 4x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r-2)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r-2)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 2$$
$$r_2 = 2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r-2)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 2$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+2}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+2}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) + 2a_{n-1}(n+r-1) - 3a_n(n+r) + 3a_{n-1} + 4a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(2n+2r+1)}{n^2+2nr+r^2-4n-4r+4} \tag{4}$$

Which for the root $r = 2$ becomes

$$a_n = \frac{a_{n-1}(-2n-5)}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-3-2r}{(-1+r)^2}$$

Which for the root $r = 2$ becomes

$$a_1 = -7$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-2r}{(-1+r)^2}$	-7

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4r^2+16r+15}{(-1+r)^2 r^2}$$

Which for the root $r = 2$ becomes

$$a_2 = \frac{63}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-2r}{(-1+r)^2}$	-7
a_2	$\frac{4r^2+16r+15}{(-1+r)^2 r^2}$	$\frac{63}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-8r^3 - 60r^2 - 142r - 105}{(-1+r)^2 r^2 (r+1)^2}$$

Which for the root $r = 2$ becomes

$$a_3 = -\frac{77}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-2r}{(-1+r)^2}$	-7
a_2	$\frac{4r^2+16r+15}{(-1+r)^2 r^2}$	$\frac{63}{4}$
a_3	$\frac{-8r^3-60r^2-142r-105}{(-1+r)^2 r^2 (r+1)^2}$	$-\frac{77}{4}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16r^4 + 192r^3 + 824r^2 + 1488r + 945}{(-1+r)^2 r^2 (r+1)^2 (r+2)^2}$$

Which for the root $r = 2$ becomes

$$a_4 = \frac{1001}{64}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-2r}{(-1+r)^2}$	-7
a_2	$\frac{4r^2+16r+15}{(-1+r)^2 r^2}$	$\frac{63}{4}$
a_3	$\frac{-8r^3-60r^2-142r-105}{(-1+r)^2 r^2 (r+1)^2}$	$-\frac{77}{4}$
a_4	$\frac{16r^4+192r^3+824r^2+1488r+945}{(-1+r)^2 r^2 (r+1)^2 (r+2)^2}$	$\frac{1001}{64}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-32r^5 - 560r^4 - 3760r^3 - 12040r^2 - 18258r - 10395}{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}$$

Which for the root $r = 2$ becomes

$$a_5 = -\frac{3003}{320}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-2r}{(-1+r)^2}$	-7
a_2	$\frac{4r^2+16r+15}{(-1+r)^2 r^2}$	$\frac{63}{4}$
a_3	$\frac{-8r^3-60r^2-142r-105}{(-1+r)^2 r^2 (r+1)^2}$	$-\frac{77}{4}$
a_4	$\frac{16r^4+192r^3+824r^2+1488r+945}{(-1+r)^2 r^2 (r+1)^2 (r+2)^2}$	$\frac{1001}{64}$
a_5	$\frac{-32r^5-560r^4-3760r^3-12040r^2-18258r-10395}{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}$	$-\frac{3003}{320}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= x^2 \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^2 \left(1 - 7x + \frac{63x^2}{4} - \frac{77x^3}{4} + \frac{1001x^4}{64} - \frac{3003x^5}{320} + O(x^6)\right)
\end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 2$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{-3-2r}{(-1+r)^2}$	-7	$\frac{8+2r}{(-1+r)^3}$
b_2	$\frac{4r^2+16r+15}{(-1+r)^2 r^2}$	$\frac{63}{4}$	$\frac{-8r^3-48r^2-44r+30}{(-1+r)^3 r^3}$
b_3	$\frac{-8r^3-60r^2-142r-105}{(-1+r)^2 r^2 (r+1)^2}$	$-\frac{77}{4}$	$\frac{24r^5+240r^4+718r^3+630r^2-142r-210}{(-1+r)^3 r^3 (r+1)^3}$
b_4	$\frac{16r^4+192r^3+824r^2+1488r+945}{(-1+r)^2 r^2 (r+1)^2 (r+2)^2}$	$\frac{1001}{64}$	$\frac{-64r^7-1024r^6-6096r^5-16880r^4-21176r^3-6876r^2+6756r+3780}{(-1+r)^3 r^3 (r+1)^3 (r+2)^3}$
b_5	$\frac{-32r^5-560r^4-3760r^3-12040r^2-18258r-10395}{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}$	$-\frac{3003}{320}$	$\frac{160r^9+3840r^8+37680r^7+196080r^6+582498r^5+971700r^4+774410r^3+37}{(-1+r)^3 r^3 (r+1)^3 (r+2)^3 (r+3)^3}$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\ &= x^2\left(1 - 7x + \frac{63x^2}{4} - \frac{77x^3}{4} + \frac{1001x^4}{64} - \frac{3003x^5}{320} + O(x^6)\right)\ln(x) \\ &\quad + x^2\left(12x - \frac{157x^2}{4} + \frac{2063x^3}{36} - \frac{59875x^4}{1152} + \frac{323399x^5}{9600} + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^2\left(1 - 7x + \frac{63x^2}{4} - \frac{77x^3}{4} + \frac{1001x^4}{64} - \frac{3003x^5}{320} + O(x^6)\right) \\ &\quad + c_2\left(x^2\left(1 - 7x + \frac{63x^2}{4} - \frac{77x^3}{4} + \frac{1001x^4}{64} - \frac{3003x^5}{320} + O(x^6)\right)\ln(x)\right. \\ &\quad \left. + x^2\left(12x - \frac{157x^2}{4} + \frac{2063x^3}{36} - \frac{59875x^4}{1152} + \frac{323399x^5}{9600} + O(x^6)\right)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^2\left(1 - 7x + \frac{63x^2}{4} - \frac{77x^3}{4} + \frac{1001x^4}{64} - \frac{3003x^5}{320} + O(x^6)\right) \\ &\quad + c_2\left(x^2\left(1 - 7x + \frac{63x^2}{4} - \frac{77x^3}{4} + \frac{1001x^4}{64} - \frac{3003x^5}{320} + O(x^6)\right)\ln(x)\right. \\ &\quad \left. + x^2\left(12x - \frac{157x^2}{4} + \frac{2063x^3}{36} - \frac{59875x^4}{1152} + \frac{323399x^5}{9600} + O(x^6)\right)\right) \end{aligned}$$

Summary
The solution(s) found are the following

$$
\begin{aligned}
y = c_1 x^2 \left(1-7x+\frac{63x^2}{4}-\frac{77x^3}{4}+\frac{1001x^4}{64}-\frac{3003x^5}{320}+O\left(x^6\right)\right) \\
+ c_2 \left(x^2 \left(1-7x+\frac{63x^2}{4}-\frac{77x^3}{4}+\frac{1001x^4}{64}-\frac{3003x^5}{320}+O\left(x^6\right)\right)\ln\left(x\right)\right. \\
\left. + x^2 \left(12x-\frac{157x^2}{4}+\frac{2063x^3}{36}-\frac{59875x^4}{1152}+\frac{323399x^5}{9600}+O\left(x^6\right)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y = c_1 x^2 \left(1-7x+\frac{63x^2}{4}-\frac{77x^3}{4}+\frac{1001x^4}{64}-\frac{3003x^5}{320}+O\left(x^6\right)\right) \\
+ c_2 \left(x^2 \left(1-7x+\frac{63x^2}{4}-\frac{77x^3}{4}+\frac{1001x^4}{64}-\frac{3003x^5}{320}+O\left(x^6\right)\right)\ln\left(x\right)\right. \\
\left. + x^2 \left(12x-\frac{157x^2}{4}+\frac{2063x^3}{36}-\frac{59875x^4}{1152}+\frac{323399x^5}{9600}+O\left(x^6\right)\right)\right)
\end{aligned}
$$

Verified OK.

15.23.1 Maple step by step solution

Let's solve

$x^2 y'' + \left(2x^2-3x\right) y' + \left(3x+4\right) y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(3x+4)y}{x^2} - \frac{(-3+2x)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(-3+2x)y'}{x} + \frac{(3x+4)y}{x^2} = 0$

☐ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{-3+2x}{x}, P_3(x) = \frac{3x+4}{x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\Big|_{x=0} = -3$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = 4$

- $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2 y'' + x(-3+2x)\, y' + (3x+4)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

- □ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..1$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  - Shift index using $k->k-m$

    $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  - Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$

  - Shift index using $k->k+1-m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$

  - Convert $x^2 \cdot y''$ to series expansion

    $x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0 (-2+r)^2\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k (k+r-2)^2 + a_{k-1}(2k+1+2r)\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(-2+r)^2 = 0$

- Values of r that satisfy the indicial equation

$r = 2$

- Each term in the series must be 0, giving the recursion relation

  $a_k(k+r-2)^2 + a_{k-1}(2k+1+2r) = 0$

- Shift index using $k- >k+1$

  $a_{k+1}(k+r-1)^2 + a_k(2k+2r+3) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+1} = -\frac{a_k(2k+2r+3)}{(k+r-1)^2}$

- Recursion relation for $r = 2$

  $a_{k+1} = -\frac{a_k(2k+7)}{(k+1)^2}$

- Solution for $r = 2$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+2}, a_{k+1} = -\frac{a_k(2k+7)}{(k+1)^2}\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 20.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x^2(-4x+1)\,y''+3x(1-6x)\,y'+(1-12x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(-4x^3+x^2\right)y''+\left(-18x^2+3x\right)y'+(1-12x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{-3+18x}{x\,(4x-1)}\\ q(x)&=\frac{12x-1}{x^2\,(4x-1)}\end{aligned}$$

Table 690: Table $p(x), q(x)$ singularites.

$p(x) = \frac{-3+18x}{x(4x-1)}$	
singularity	type
$x = 0$	"regular"
$x = \frac{1}{4}$	"regular"

$q(x) = \frac{12x-1}{x^2(4x-1)}$	
singularity	type
$x = 0$	"regular"
$x = \frac{1}{4}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, \frac{1}{4}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-y''x^2(4x-1) + \left(-18x^2 + 3x\right) y' + (1 - 12x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) x^2(4x-1) + \left(-18x^2 + 3x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (1-12x) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=0}^{\infty} \left(-4x^{1+n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r) (n+r-1)\right) + \sum_{n=0}^{\infty} \left(-18x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-12x^{1+n+r} a_n\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-4x^{1+n+r} a_n (n+r) (n+r-1)\right) = \sum_{n=1}^{\infty} \left(-4a_{n-1} (n+r-1) (n+r-2) x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} \left(-18x^{1+n+r} a_n (n+r)\right) = \sum_{n=1}^{\infty} \left(-18a_{n-1} (n+r-1) x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} \left(-12x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-12a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\sum_{n=1}^{\infty} \left(-4a_{n-1} (n+r-1) (n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r) (n+r-1)\right) + \sum_{n=1}^{\infty} \left(-18a_{n-1} (n+r-1) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) + \sum_{n=1}^{\infty} \left(-12a_{n-1} x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r) (n+r-1) + 3x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + 3x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + 3x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r+1\right)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$\left(r+1\right)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -1$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(r+1\right)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-1}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-1}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} -4a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ -18a_{n-1}(n+r-1) + 3a_n(n+r) + a_n - 12a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{2(2n+2r+1)\, a_{n-1}}{1+n+r} \tag{4}$$

Which for the root $r = -1$ becomes

$$a_n = \frac{(4n-2)\, a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{4r+6}{2+r}$$

Which for the root $r = -1$ becomes

$$a_1 = 2$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{4r+6}{2+r}$	2

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{16r^2 + 64r + 60}{(2+r)(3+r)}$$

Which for the root $r = -1$ becomes

$$a_2 = 6$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{4r+6}{2+r}$	2
a_2	$\frac{16r^2+64r+60}{(2+r)(3+r)}$	6

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{64r^3 + 480r^2 + 1136r + 840}{(2+r)(3+r)(4+r)}$$

Which for the root $r = -1$ becomes

$$a_3 = 20$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{4r+6}{2+r}$	2
a_2	$\frac{16r^2+64r+60}{(2+r)(3+r)}$	6
a_3	$\frac{64r^3+480r^2+1136r+840}{(2+r)(3+r)(4+r)}$	20

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{256r^4 + 3072r^3 + 13184r^2 + 23808r + 15120}{(2 + r)(3 + r)(4 + r)(5 + r)}$$

Which for the root $r = -1$ becomes

$$a_4 = 70$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{4r+6}{2+r}$	2
a_2	$\frac{16r^2+64r+60}{(2+r)(3+r)}$	6
a_3	$\frac{64r^3+480r^2+1136r+840}{(2+r)(3+r)(4+r)}$	20
a_4	$\frac{256r^4+3072r^3+13184r^2+23808r+15120}{(2+r)(3+r)(4+r)(5+r)}$	70

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{1024r^5 + 17920r^4 + 120320r^3 + 385280r^2 + 584256r + 332640}{(2 + r)(3 + r)(4 + r)(5 + r)(6 + r)}$$

Which for the root $r = -1$ becomes

$$a_5 = 252$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{4r+6}{2+r}$	2
a_2	$\frac{16r^2+64r+60}{(2+r)(3+r)}$	6
a_3	$\frac{64r^3+480r^2+1136r+840}{(2+r)(3+r)(4+r)}$	20
a_4	$\frac{256r^4+3072r^3+13184r^2+23808r+15120}{(2+r)(3+r)(4+r)(5+r)}$	70
a_5	$\frac{1024r^5+17920r^4+120320r^3+385280r^2+584256r+332640}{(2+r)(3+r)(4+r)(5+r)(6+r)}$	252

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \frac{1}{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= \frac{252x^5 + 70x^4 + 20x^3 + 6x^2 + 2x + 1 + O(x^6)}{x}
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = -1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{4r+6}{2+r}$	2	$\frac{2}{(2+r)^2}$
b_2	$\frac{16r^2+64r+60}{(2+r)(3+r)}$	6	$\frac{16r^2+72r+84}{(2+r)^2(3+r)^2}$
b_3	$\frac{64r^3+480r^2+1136r+840}{(2+r)(3+r)(4+r)}$	20	$\frac{96r^4+1056r^3+4344r^2+7920r+5424}{(2+r)^2(3+r)^2(4+r)^2}$
b_4	$\frac{256r^4+3072r^3+13184r^2+23808r+15120}{(2+r)(3+r)(4+r)(5+r)}$	70	$\frac{512r^6+9984r^5+80384r^4+341952r^3+810848r^2+1017120r+528480}{(5+r)^2(2+r)^2(3+r)^2(4+r)^2}$
b_5	$\frac{1024r^5+17920r^4+120320r^3+385280r^2+584256r+332640}{(2+r)(3+r)(4+r)(5+r)(6+r)}$	252	$\frac{2560r^8+76800r^7+997120r^6+7315200r^5+33160480r^4+95107200r^3}{(2+r)^2(3+r)^2(4+r)^2(5+r)^2(6+}$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= \frac{(252x^5 + 70x^4 + 20x^3 + 6x^2 + 2x + 1 + O(x^6))\ln(x)}{x} \\
&\quad + \frac{7x^2 + 2x + \frac{74x^3}{3} + \frac{533x^4}{6} + \frac{1627x^5}{5} + O(x^6)}{x}
\end{aligned}
$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= \frac{c_1(252x^5 + 70x^4 + 20x^3 + 6x^2 + 2x + 1 + O(x^6))}{x} \\ &\quad + c_2 \left(\frac{(252x^5 + 70x^4 + 20x^3 + 6x^2 + 2x + 1 + O(x^6)) \ln (x)}{x} \right. \\ &\quad \left. + \frac{7x^2 + 2x + \frac{74x^3}{3} + \frac{533x^4}{6} + \frac{1627x^5}{5} + O(x^6)}{x} \right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= \frac{c_1(252x^5 + 70x^4 + 20x^3 + 6x^2 + 2x + 1 + O(x^6))}{x} \\ &\quad + c_2 \left(\frac{(252x^5 + 70x^4 + 20x^3 + 6x^2 + 2x + 1 + O(x^6)) \ln (x)}{x} \right. \\ &\quad \left. + \frac{7x^2 + 2x + \frac{74x^3}{3} + \frac{533x^4}{6} + \frac{1627x^5}{5} + O(x^6)}{x} \right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y &= \frac{c_1(252x^5 + 70x^4 + 20x^3 + 6x^2 + 2x + 1 + O(x^6))}{x} \\ &\quad + c_2 \left(\frac{(252x^5 + 70x^4 + 20x^3 + 6x^2 + 2x + 1 + O(x^6)) \ln (x)}{x} \right. \\ &\quad \left. + \frac{7x^2 + 2x + \frac{74x^3}{3} + \frac{533x^4}{6} + \frac{1627x^5}{5} + O(x^6)}{x} \right) \end{aligned} \tag{1}$$

Verification of solutions

$$y = \frac{c_1(252x^5+70x^4+20x^3+6x^2+2x+1+O(x^6))}{x} + c_2\left(\frac{(252x^5+70x^4+20x^3+6x^2+2x+1+O(x^6))\ln(x)}{x} + \frac{7x^2+2x+\frac{74x^3}{3}+\frac{533x^4}{6}+\frac{1627x^5}{5}+O(x^6)}{x}\right)$$

Verified OK.

15.24.1 Maple step by step solution

Let's solve

$-y''x^2(4x-1)+(-18x^2+3x)\,y'+(1-12x)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(12x-1)y}{x^2(4x-1)}-\frac{3(-1+6x)y'}{x(4x-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{3(-1+6x)y'}{x(4x-1)}+\frac{(12x-1)y}{x^2(4x-1)}=0$

☐ Check to see if x_0 is a regular singular point

- ◦ Define functions

  $\left[P_2(x)=\frac{3(-1+6x)}{x(4x-1)}, P_3(x)=\frac{12x-1}{x^2(4x-1)}\right]$

- ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $(x\cdot P_2(x))\bigg|_{x=0}=3$

- ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $(x^2\cdot P_3(x))\bigg|_{x=0}=1$

- ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $y''x^2(4x-1)+3x(-1+6x)\,y'+(12x-1)\,y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m=0..1$

    $x^m \cdot y=\sum_{k=0}^{\infty} a_k x^{k+r+m}$

  ◦ Shift index using $k->k-m$

    $x^m \cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  ◦ Convert $x^m \cdot y'$ to series expansion for $m=1..2$

    $x^m \cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$

  ◦ Shift index using $k->k+1-m$

    $x^m \cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$

  ◦ Convert $x^m \cdot y''$ to series expansion for $m=2..3$

    $x^m \cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$

  ◦ Shift index using $k->k+2-m$

    $x^m \cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$

  Rewrite ODE with series expansions

  $-a_0(1+r)^2\,x^r+\left(\sum_{k=1}^{\infty}\left(-a_k(k+r+1)^2+2a_{k-1}(k+r+1)\,(2k+1+2r)\right)x^{k+r}\right)=0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-(1+r)^2=0$

- Values of r that satisfy the indicial equation

  $r=-1$

- Each term in the series must be 0, giving the recursion relation

  $-((-4k-4r-2)\,a_{k-1}+a_k(k+r+1))\,(k+r+1)=0$

- Shift index using $k->k+1$

  $-((-4k-6-4r)\, a_k + a_{k+1}(k+r+2))\, (k+r+2) = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+1} = \frac{2(2k+2r+3)a_k}{k+r+2}$
- Recursion relation for $r = -1$

  $a_{k+1} = \frac{2(2k+1)a_k}{k+1}$
- Solution for $r = -1$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+1} = \frac{2(2k+1)a_k}{k+1}\right]$

Problem number: 21.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x^2(1+2x)\,y''+x(3+5x)\,y'+(1-2x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(2x^3+x^2\right)y''+\left(5x^2+3x\right)y'+(1-2x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{3+5x}{x\,(1+2x)}$$
$$q(x)=-\frac{2x-1}{x^2\,(1+2x)}$$

Table 692: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3+5x}{x(1+2x)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2}$	"regular"

$q(x) = -\frac{2x-1}{x^2(1+2x)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{1}{2}, \infty\right]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(1+2x)\,y'' + \left(5x^2+3x\right)y' + (1-2x)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(1+2x)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + \left(5x^2+3x\right)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (1-2x)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 5x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-2x^{1+n+r} a_n\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 5x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 5a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-2x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-2a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 5a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) + \sum_{n=1}^{\infty} \left(-2a_{n-1} x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + 3x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + 3x^r a_0 r + a_0 x^r = 0$$

Or

$$(x^r r(-1+r) + 3x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r+1)^2\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r+1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -1$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r+1)^2\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-1}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-1}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &2a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ &+ 5a_{n-1}(n+r-1) + 3a_n(n+r) + a_n - 2a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(2n+2r-3)\, a_{n-1}}{1+n+r} \tag{4}$$

Which for the root $r = -1$ becomes

$$a_n = \frac{a_{n-1}(5-2n)}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-2r+1}{2+r}$$

Which for the root $r = -1$ becomes

$$a_1 = 3$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{2+r}$	3

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4r^2 - 1}{(3 + r)(2 + r)}$$

Which for the root $r = -1$ becomes

$$a_2 = \frac{3}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{2+r}$	3
a_2	$\frac{4r^2-1}{(3+r)(2+r)}$	$\frac{3}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-8r^3 - 12r^2 + 2r + 3}{(2 + r)(3 + r)(4 + r)}$$

Which for the root $r = -1$ becomes

$$a_3 = -\frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{2+r}$	3
a_2	$\frac{4r^2-1}{(3+r)(2+r)}$	$\frac{3}{2}$
a_3	$\frac{-8r^3-12r^2+2r+3}{(2+r)(3+r)(4+r)}$	$-\frac{1}{2}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16r^4 + 64r^3 + 56r^2 - 16r - 15}{(5 + r)(2 + r)(3 + r)(4 + r)}$$

Which for the root $r = -1$ becomes

$$a_4 = \frac{3}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{2+r}$	3
a_2	$\frac{4r^2-1}{(3+r)(2+r)}$	$\frac{3}{2}$
a_3	$\frac{-8r^3-12r^2+2r+3}{(2+r)(3+r)(4+r)}$	$-\frac{1}{2}$
a_4	$\frac{16r^4+64r^3+56r^2-16r-15}{(5+r)(2+r)(3+r)(4+r)}$	$\frac{3}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-32r^5 - 240r^4 - 560r^3 - 360r^2 + 142r + 105}{(2 + r)(3 + r)(4 + r)(5 + r)(6 + r)}$$

Which for the root $r = -1$ becomes

$$a_5 = -\frac{3}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{2+r}$	3
a_2	$\frac{4r^2-1}{(3+r)(2+r)}$	$\frac{3}{2}$
a_3	$\frac{-8r^3-12r^2+2r+3}{(2+r)(3+r)(4+r)}$	$-\frac{1}{2}$
a_4	$\frac{16r^4+64r^3+56r^2-16r-15}{(5+r)(2+r)(3+r)(4+r)}$	$\frac{3}{8}$
a_5	$\frac{-32r^5-240r^4-560r^3-360r^2+142r+105}{(2+r)(3+r)(4+r)(5+r)(6+r)}$	$-\frac{3}{8}$

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \frac{1}{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= \frac{3x + 1 + \frac{3x^2}{2} - \frac{x^3}{2} + \frac{3x^4}{8} - \frac{3x^5}{8} + O(x^6)}{x}
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = -1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{-2r+1}{2+r}$	3	$-\frac{5}{(2+r)^2}$
b_2	$\frac{4r^2-1}{(3+r)(2+r)}$	$\frac{3}{2}$	$\frac{20r^2+50r+5}{(2+r)^2(3+r)^2}$
b_3	$\frac{-8r^3-12r^2+2r+3}{(2+r)(3+r)(4+r)}$	$-\frac{1}{2}$	$\frac{-60r^4-420r^3-915r^2-630r-30}{(2+r)^2(3+r)^2(4+r)^2}$
b_4	$\frac{16r^4+64r^3+56r^2-16r-15}{(5+r)(2+r)(3+r)(4+r)}$	$\frac{3}{8}$	$\frac{160r^6+2160r^5+11200r^4+27900r^3+33430r^2+15570r+390}{(5+r)^2(2+r)^2(3+r)^2(4+r)^2}$
b_5	$\frac{-32r^5-240r^4-560r^3-360r^2+142r+105}{(2+r)(3+r)(4+r)(5+r)(6+r)}$	$-\frac{3}{8}$	$-\frac{5(80r^8+1760r^7+16120r^6+79640r^5+228985r^4+382580r^3+343325r^2+128040r+1}{(2+r)^2(3+r)^2(4+r)^2(5+r)^2(6+r)^2}$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= \frac{\left(3x + 1 + \frac{3x^2}{2} - \frac{x^3}{2} + \frac{3x^4}{8} - \frac{3x^5}{8} + O(x^6)\right)\ln(x)}{x} \\
&\quad + \frac{-5x - \frac{25x^2}{4} + \frac{5x^3}{4} - \frac{25x^4}{32} + \frac{113x^5}{160} + O(x^6)}{x}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= \frac{c_1 \left(3x+1+\frac{3x^2}{2}-\frac{x^3}{2}+\frac{3x^4}{8}-\frac{3x^5}{8}+O(x^6)\right)}{x} \\
&\quad + c_2 \left(\frac{\left(3x+1+\frac{3x^2}{2}-\frac{x^3}{2}+\frac{3x^4}{8}-\frac{3x^5}{8}+O(x^6)\right)\ln(x)}{x}\right. \\
&\quad \left. + \frac{-5x-\frac{25x^2}{4}+\frac{5x^3}{4}-\frac{25x^4}{32}+\frac{113x^5}{160}+O(x^6)}{x}\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= \frac{c_1 \left(3x+1+\frac{3x^2}{2}-\frac{x^3}{2}+\frac{3x^4}{8}-\frac{3x^5}{8}+O(x^6)\right)}{x} \\
&\quad + c_2 \left(\frac{\left(3x+1+\frac{3x^2}{2}-\frac{x^3}{2}+\frac{3x^4}{8}-\frac{3x^5}{8}+O(x^6)\right)\ln(x)}{x}\right. \\
&\quad \left. + \frac{-5x-\frac{25x^2}{4}+\frac{5x^3}{4}-\frac{25x^4}{32}+\frac{113x^5}{160}+O(x^6)}{x}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= \frac{c_1 \left(3x+1+\frac{3x^2}{2}-\frac{x^3}{2}+\frac{3x^4}{8}-\frac{3x^5}{8}+O(x^6)\right)}{x} \\
&\quad + c_2 \left(\frac{\left(3x+1+\frac{3x^2}{2}-\frac{x^3}{2}+\frac{3x^4}{8}-\frac{3x^5}{8}+O(x^6)\right)\ln(x)}{x}\right. \\
&\quad \left. + \frac{-5x-\frac{25x^2}{4}+\frac{5x^3}{4}-\frac{25x^4}{32}+\frac{113x^5}{160}+O(x^6)}{x}\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$y = \frac{c_1 \left(3x + 1 + \frac{3x^2}{2} - \frac{x^3}{2} + \frac{3x^4}{8} - \frac{3x^5}{8} + O(x^6)\right)}{x} + c_2 \left(\frac{\left(3x + 1 + \frac{3x^2}{2} - \frac{x^3}{2} + \frac{3x^4}{8} - \frac{3x^5}{8} + O(x^6)\right) \ln(x)}{x} + \frac{-5x - \frac{25x^2}{4} + \frac{5x^3}{4} - \frac{25x^4}{32} + \frac{113x^5}{160} + O(x^6)}{x} \right)$$

Verified OK.

15.25.1 Maple step by step solution

Let's solve

$x^2(1+2x)\,y'' + (5x^2+3x)\,y' + (1-2x)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(2x-1)y}{x^2(1+2x)} - \frac{(3+5x)y'}{x(1+2x)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(3+5x)y'}{x(1+2x)} - \frac{(2x-1)y}{x^2(1+2x)} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{3+5x}{x(1+2x)}, P_3(x) = -\frac{2x-1}{x^2(1+2x)}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\Big|_{x=0} = 3$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\Big|_{x=0} = 1$

  ◦ $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

$x_0 = 0$

- Multiply by denominators

  $x^2(1+2x)\, y'' + x(3+5x)\, y' + (1-2x)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..1$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  - Shift index using $k- >k-m$

    $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  - Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

  - Shift index using $k- >k+1-m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

  - Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

    $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

  - Shift index using $k- >k+2-m$

    $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(1+r)^2 x^r + \left(\sum_{k=1}^{\infty} \left(a_k(k+r+1)^2 + a_{k-1}(k+r+1)\,(2k-3+2r)\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(1+r)^2 = 0$

- Values of r that satisfy the indicial equation

  $r = -1$

- Each term in the series must be 0, giving the recursion relation

$$(k+r+1)\left(a_k(k+r+1)+a_{k-1}(2k-3+2r)\right)=0$$

- Shift index using $k->k+1$

$$(k+r+2)\left(a_{k+1}(k+r+2)+a_k(2k+2r-1)\right)=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1}=-\frac{a_k(2k+2r-1)}{k+r+2}$$

- Recursion relation for $r=-1$

$$a_{k+1}=-\frac{a_k(2k-3)}{k+1}$$

- Solution for $r=-1$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+1}=-\frac{a_k(2k-3)}{k+1}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 22.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2(x+1)\,y''-x(6-x)\,y'+(8-x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(2x^3+2x^2\right)y''+\left(x^2-6x\right)y'+(8-x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{x-6}{2x\,(x+1)}$$
$$q(x)=-\frac{x-8}{2x^2\,(x+1)}$$

Table 694: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x-6}{2x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = -\frac{x-8}{2x^2(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2(x+1)\, y'' + \left(x^2 - 6x\right) y' + (8 - x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2(x+1) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(x^2 - 6x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (8 - x) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n(n+r)\,(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n(n+r)\,(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-6x^{n+r} a_n(n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 8a_n x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-x^{1+n+r} a_n\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 2x^{1+n+r} a_n(n+r)\,(n+r-1) &= \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r} \\
\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r) &= \sum_{n=1}^{\infty} a_{n-1}(n+r-1)\,x^{n+r} \\
\sum_{n=0}^{\infty}\left(-x^{1+n+r} a_n\right) &= \sum_{n=1}^{\infty}\left(-a_{n-1} x^{n+r}\right)
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n(n+r)\,(n+r-1)\right)+\left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\,x^{n+r}\right) \\
&+\sum_{n=0}^{\infty}\left(-6x^{n+r} a_n(n+r)\right)+\left(\sum_{n=0}^{\infty} 8a_n x^{n+r}\right)+\sum_{n=1}^{\infty}\left(-a_{n-1} x^{n+r}\right)=0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
2x^{n+r} a_n(n+r)\,(n+r-1)-6x^{n+r} a_n(n+r)+8a_n x^{n+r}=0
$$

When $n = 0$ the above becomes

$$2x^r a_0 r(-1+r) - 6x^r a_0 r + 8a_0 x^r = 0$$

Or

$$\left(2x^r r(-1+r) - 6x^r r + 8x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$2x^r (r-2)^2 = 0$$

Since the above is true for all x then the indicial equation becomes

$$2(r-2)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 2$$
$$r_2 = 2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$2x^r (r-2)^2 = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 2$, Eqs (1A,1B) become

$$
\begin{aligned}
y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+2} \\
y_2(x) &= y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+2}\right)
\end{aligned}
$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$
\begin{aligned}
&2a_{n-1}(n+r-1)(n+r-2) + 2a_n(n+r)(n+r-1) \\
&+ a_{n-1}(n+r-1) - 6a_n(n+r) + 8a_n - a_{n-1} = 0
\end{aligned} \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = -\frac{(2n+2r-1)\, a_{n-1}}{2(n+r-2)} \tag{4}
$$

Which for the root $r = 2$ becomes

$$
a_n = -\frac{(2n+3)\, a_{n-1}}{2n} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$
a_1 = \frac{-1-2r}{-2+2r}
$$

Which for the root $r = 2$ becomes

$$
a_1 = -\frac{5}{2}
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-2r}{-2+2r}$	$-\frac{5}{2}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4r^2 + 8r + 3}{4r\,(-1+r)}$$

Which for the root $r = 2$ becomes

$$a_2 = \frac{35}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-2r}{-2+2r}$	$-\frac{5}{2}$
a_2	$\frac{4r^2+8r+3}{4r(-1+r)}$	$\frac{35}{8}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-8r^3 - 36r^2 - 46r - 15}{8r^3 - 8r}$$

Which for the root $r = 2$ becomes

$$a_3 = -\frac{105}{16}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-2r}{-2+2r}$	$-\frac{5}{2}$
a_2	$\frac{4r^2+8r+3}{4r(-1+r)}$	$\frac{35}{8}$
a_3	$\frac{-8r^3-36r^2-46r-15}{8r^3-8r}$	$-\frac{105}{16}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16r^4 + 128r^3 + 344r^2 + 352r + 105}{16r^4 + 32r^3 - 16r^2 - 32r}$$

Which for the root $r = 2$ becomes

$$a_4 = \frac{1155}{128}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-2r}{-2+2r}$	$-\frac{5}{2}$
a_2	$\frac{4r^2+8r+3}{4r(-1+r)}$	$\frac{35}{8}$
a_3	$\frac{-8r^3-36r^2-46r-15}{8r^3-8r}$	$-\frac{105}{16}$
a_4	$\frac{16r^4+128r^3+344r^2+352r+105}{16r^4+32r^3-16r^2-32r}$	$\frac{1155}{128}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-32r^5 - 400r^4 - 1840r^3 - 3800r^2 - 3378r - 945}{32r^5 + 160r^4 + 160r^3 - 160r^2 - 192r}$$

Which for the root $r = 2$ becomes

$$a_5 = -\frac{3003}{256}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-2r}{-2+2r}$	$-\frac{5}{2}$
a_2	$\frac{4r^2+8r+3}{4r(-1+r)}$	$\frac{35}{8}$
a_3	$\frac{-8r^3-36r^2-46r-15}{8r^3-8r}$	$-\frac{105}{16}$
a_4	$\frac{16r^4+128r^3+344r^2+352r+105}{16r^4+32r^3-16r^2-32r}$	$\frac{1155}{128}$
a_5	$\frac{-32r^5-400r^4-1840r^3-3800r^2-3378r-945}{32r^5+160r^4+160r^3-160r^2-192r}$	$-\frac{3003}{256}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^2\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^2\left(1 - \frac{5x}{2} + \frac{35x^2}{8} - \frac{105x^3}{16} + \frac{1155x^4}{128} - \frac{3003x^5}{256} + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 2$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	b
b_0	1	1	N/A since b_n starts from 1	[illegible]
b_1	$\frac{-1-2r}{-2+2r}$	$-\frac{5}{2}$	$\frac{3}{2(-1+r)^2}$	[illegible]
b_2	$\frac{4r^2+8r+3}{4r(-1+r)}$	$\frac{35}{8}$	$\frac{-3r^2-\frac{3}{2}r+\frac{3}{4}}{r^2(-1+r)^2}$	[illegible]
b_3	$\frac{-8r^3-36r^2-46r-15}{8r^3-8r}$	$-\frac{105}{16}$	$\frac{\frac{9}{2}r^4+\frac{27}{2}r^3+\frac{81}{8}r^2-\frac{15}{8}}{r^2(r^2-1)^2}$	[illegible]
b_4	$\frac{16r^4+128r^3+344r^2+352r+105}{16r^4+32r^3-16r^2-32r}$	$\frac{1155}{128}$	$\frac{-6r^6-45r^5-123r^4-\frac{585}{4}r^3-\frac{483}{8}r^2+\frac{105}{8}r+\frac{105}{8}}{r^2(r^3+2r^2-r-2)^2}$	[illegible]
b_5	$\frac{-32r^5-400r^4-1840r^3-3800r^2-3378r-945}{32r^5+160r^4+160r^3-160r^2-192r}$	$-\frac{3003}{256}$	$\frac{\frac{15}{2}r^8+105r^7+\frac{2385}{4}r^6+\frac{7035}{4}r^5+\frac{90795}{32}r^4+\frac{9345}{4}r^3+\frac{20085}{32}r^2-\frac{4725}{16}r-\frac{2835}{16}}{r^2(r^4+5r^3+5r^2-5r-6)^2}$	[illegible]

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \ldots \\ &= x^2\left(1 - \frac{5x}{2} + \frac{35x^2}{8} - \frac{105x^3}{16} + \frac{1155x^4}{128} - \frac{3003x^5}{256} + O(x^6)\right)\ln(x) \\ &\quad + x^2\left(\frac{3x}{2} - \frac{57x^2}{16} + \frac{583x^3}{96} - \frac{13771x^4}{1536} + \frac{187339x^5}{15360} + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^2\left(1 - \frac{5x}{2} + \frac{35x^2}{8} - \frac{105x^3}{16} + \frac{1155x^4}{128} - \frac{3003x^5}{256} + O(x^6)\right) \\ &\quad + c_2\left(x^2\left(1 - \frac{5x}{2} + \frac{35x^2}{8} - \frac{105x^3}{16} + \frac{1155x^4}{128} - \frac{3003x^5}{256} + O(x^6)\right)\ln(x)\right. \\ &\qquad \left. + x^2\left(\frac{3x}{2} - \frac{57x^2}{16} + \frac{583x^3}{96} - \frac{13771x^4}{1536} + \frac{187339x^5}{15360} + O(x^6)\right)\right) \end{aligned}$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^2 \left(1 - \frac{5x}{2} + \frac{35x^2}{8} - \frac{105x^3}{16} + \frac{1155x^4}{128} - \frac{3003x^5}{256} + O(x^6)\right) \\
&\quad + c_2 \left(x^2 \left(1 - \frac{5x}{2} + \frac{35x^2}{8} - \frac{105x^3}{16} + \frac{1155x^4}{128} - \frac{3003x^5}{256} + O(x^6)\right) \ln(x) \right. \\
&\qquad \left. + x^2 \left(\frac{3x}{2} - \frac{57x^2}{16} + \frac{583x^3}{96} - \frac{13771x^4}{1536} + \frac{187339x^5}{15360} + O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^2 \left(1 - \frac{5x}{2} + \frac{35x^2}{8} - \frac{105x^3}{16} + \frac{1155x^4}{128} - \frac{3003x^5}{256} + O(x^6)\right) \\
&\quad + c_2 \left(x^2 \left(1 - \frac{5x}{2} + \frac{35x^2}{8} - \frac{105x^3}{16} + \frac{1155x^4}{128} - \frac{3003x^5}{256} + O(x^6)\right) \ln(x) \right. \\
&\qquad \left. + x^2 \left(\frac{3x}{2} - \frac{57x^2}{16} + \frac{583x^3}{96} - \frac{13771x^4}{1536} + \frac{187339x^5}{15360} + O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x^2 \left(1 - \frac{5x}{2} + \frac{35x^2}{8} - \frac{105x^3}{16} + \frac{1155x^4}{128} - \frac{3003x^5}{256} + O(x^6)\right) \\
&\quad + c_2 \left(x^2 \left(1 - \frac{5x}{2} + \frac{35x^2}{8} - \frac{105x^3}{16} + \frac{1155x^4}{128} - \frac{3003x^5}{256} + O(x^6)\right) \ln(x) \right. \\
&\qquad \left. + x^2 \left(\frac{3x}{2} - \frac{57x^2}{16} + \frac{583x^3}{96} - \frac{13771x^4}{1536} + \frac{187339x^5}{15360} + O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.26.1 Maple step by step solution

Let's solve

$2x^2(x+1)\, y'' + (x^2 - 6x)\, y' + (8 - x)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(x-8)y}{2x^2(x+1)} - \frac{(x-6)y'}{2x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x-6)y'}{2x(x+1)} - \frac{(x-8)y}{2x^2(x+1)} = 0$

☐ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x) = \frac{x-6}{2x(x+1)}, P_3(x) = -\frac{x-8}{2x^2(x+1)}\right]$

  ◦ $(x+1) \cdot P_2(x)$ is analytic at $x = -1$

    $\left((x+1) \cdot P_2(x)\right)\bigg|_{x=-1} = \frac{7}{2}$

  ◦ $(x+1)^2 \cdot P_3(x)$ is analytic at $x = -1$

    $\left((x+1)^2 \cdot P_3(x)\right)\bigg|_{x=-1} = 0$

  ◦ $x = -1$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = -1$

- Multiply by denominators

  $2x^2(x+1)\,y'' + x(x-6)\,y' + (8-x)\,y = 0$

- Change variables using $x = u - 1$ so that the regular singular point is at $u = 0$

  $(2u^3 - 4u^2 + 2u)\left(\frac{d^2}{du^2}y(u)\right) + (u^2 - 8u + 7)\left(\frac{d}{du}y(u)\right) + (9-u)\,y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

  ◦ Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

    $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$

  ◦ Shift index using $k- >k - m$

    $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

  ◦ Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $$u^{m}\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,u^{k+r}$$

- Convert $u^{m}\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)$ to series expansion for $m=1..3$

  $$u^{m}\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)=\sum_{k=0}^{\infty}a_{k}(k+r)\,(k+r-1)\,u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

  $$u^{m}\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)=\sum_{k=-2+m}^{\infty}a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$$

  Rewrite ODE with series expansions

  $$a_{0}r(5+2r)\,u^{-1+r}+\left(a_{1}(1+r)\,(7+2r)-a_{0}(4r^{2}+4r-9)\right)u^{r}+\left(\sum_{k=1}^{\infty}\left(a_{k+1}(k+1+r)\,(2k+7+\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$r(5+2r)=0$$

- Values of r that satisfy the indicial equation

  $$r\in\left\{0,-\frac{5}{2}\right\}$$

- Each term must be 0

  $$a_{1}(1+r)\,(7+2r)-a_{0}(4r^{2}+4r-9)=0$$

- Each term in the series must be 0, giving the recursion relation

  $$(-4a_{k}+2a_{k-1}+2a_{k+1})\,k^{2}+\left((-8a_{k}+4a_{k-1}+4a_{k+1})\,r-4a_{k}-5a_{k-1}+9a_{k+1}\right)k+(-4a_{k}+2a$$

- Shift index using $k->k+1$

  $$(-4a_{k+1}+2a_{k}+2a_{k+2})\,(k+1)^{2}+\left((-8a_{k+1}+4a_{k}+4a_{k+2})\,r-4a_{k+1}-5a_{k}+9a_{k+2}\right)(k+1)+$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2}=-\frac{2k^{2}a_{k}-4k^{2}a_{k+1}+4kra_{k}-8kra_{k+1}+2r^{2}a_{k}-4r^{2}a_{k+1}-ka_{k}-12ka_{k+1}-ra_{k}-12ra_{k+1}-a_{k}+a_{k+1}}{2k^{2}+4kr+2r^{2}+13k+13r+18}$$

- Recursion relation for $r=0$

  $$a_{k+2}=-\frac{2k^{2}a_{k}-4k^{2}a_{k+1}-ka_{k}-12ka_{k+1}-a_{k}+a_{k+1}}{2k^{2}+13k+18}$$

- Solution for $r=0$

  $$\left[y(u)=\sum_{k=0}^{\infty}a_{k}u^{k},a_{k+2}=-\frac{2k^{2}a_{k}-4k^{2}a_{k+1}-ka_{k}-12ka_{k+1}-a_{k}+a_{k+1}}{2k^{2}+13k+18},7a_{1}+9a_{0}=0\right]$$

- Revert the change of variables $u=x+1$

$$\left[y=\sum_{k=0}^{\infty} a_k (x+1)^k, a_{k+2}=-\frac{2k^2 a_k-4k^2 a_{k+1}-k a_k-12k a_{k+1}-a_k+a_{k+1}}{2k^2+13k+18}, 7a_1+9a_0=0\right]$$

- Recursion relation for $r=-\frac{5}{2}$

$$a_{k+2}=-\frac{2k^2 a_k-4k^2 a_{k+1}-11k a_k+8k a_{k+1}+14a_k+6a_{k+1}}{2k^2+3k-2}$$

- Solution for $r=-\frac{5}{2}$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^{k-\frac{5}{2}}, a_{k+2}=-\frac{2k^2 a_k-4k^2 a_{k+1}-11k a_k+8k a_{k+1}+14a_k+6a_{k+1}}{2k^2+3k-2}, -3a_1-6a_0=0\right]$$

- Revert the change of variables $u=x+1$

$$\left[y=\sum_{k=0}^{\infty} a_k (x+1)^{k-\frac{5}{2}}, a_{k+2}=-\frac{2k^2 a_k-4k^2 a_{k+1}-11k a_k+8k a_{k+1}+14a_k+6a_{k+1}}{2k^2+3k-2}, -3a_1-6a_0=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k (x+1)^k\right)+\left(\sum_{k=0}^{\infty} b_k (x+1)^{k-\frac{5}{2}}\right), a_{k+2}=-\frac{2k^2 a_k-4k^2 a_{1+k}-k a_k-12k a_{1+k}-a_k+a_{1+k}}{2k^2+13k+18}, 7a_1+\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 23.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(1+2x)\,y''+x(5+9x)\,y'+(3x+4)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(2x^3+x^2\right)y''+\left(9x^2+5x\right)y'+(3x+4)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{5+9x}{x\,(1+2x)}$$
$$q(x)=\frac{3x+4}{x^2\,(1+2x)}$$

Table 696: Table $p(x), q(x)$ singularites.

$p(x) = \frac{5+9x}{x(1+2x)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2}$	"regular"

$q(x) = \frac{3x+4}{x^2(1+2x)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{1}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(1+2x)\, y'' + \left(9x^2+5x\right) y' + (3x+4)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(1+2x)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(9x^2+5x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (3x+4)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}
&\left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 9x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 9x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 9a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{1+n+r} a_n = \sum_{n=1}^{\infty} 3a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\begin{aligned}
&\left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 9a_{n-1}(n+r-1)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} 3a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0
\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + 5x^{n+r} a_n (n+r) + 4a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + 5x^r a_0 r + 4a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + 5x^r r + 4x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r+2)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r+2)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -2$$
$$r_2 = -2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r+2)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -2$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-2}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-2}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$2a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) + 9a_{n-1}(n+r-1) + 5a_n(n+r) + 3a_{n-1} + 4a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(2n+2r-1)\,a_{n-1}}{2+n+r} \tag{4}$$

Which for the root $r = -2$ becomes

$$a_n = \frac{a_{n-1}(5-2n)}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-1-2r}{3+r}$$

Which for the root $r = -2$ becomes

$$a_1 = 3$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-2r}{3+r}$	3

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4r^2 + 8r + 3}{(4 + r)(3 + r)}$$

Which for the root $r = -2$ becomes

$$a_2 = \frac{3}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-2r}{3+r}$	3
a_2	$\frac{4r^2+8r+3}{(4+r)(3+r)}$	$\frac{3}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-8r^3 - 36r^2 - 46r - 15}{(3 + r)(4 + r)(5 + r)}$$

Which for the root $r = -2$ becomes

$$a_3 = -\frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-2r}{3+r}$	3
a_2	$\frac{4r^2+8r+3}{(4+r)(3+r)}$	$\frac{3}{2}$
a_3	$\frac{-8r^3-36r^2-46r-15}{(3+r)(4+r)(5+r)}$	$-\frac{1}{2}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16r^4 + 128r^3 + 344r^2 + 352r + 105}{(6 + r)(3 + r)(4 + r)(5 + r)}$$

Which for the root $r = -2$ becomes

$$a_4 = \frac{3}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-2r}{3+r}$	3
a_2	$\frac{4r^2+8r+3}{(4+r)(3+r)}$	$\frac{3}{2}$
a_3	$\frac{-8r^3-36r^2-46r-15}{(3+r)(4+r)(5+r)}$	$-\frac{1}{2}$
a_4	$\frac{16r^4+128r^3+344r^2+352r+105}{(6+r)(3+r)(4+r)(5+r)}$	$\frac{3}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-32r^5 - 400r^4 - 1840r^3 - 3800r^2 - 3378r - 945}{(3 + r)(4 + r)(5 + r)(6 + r)(7 + r)}$$

Which for the root $r = -2$ becomes

$$a_5 = -\frac{3}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-2r}{3+r}$	3
a_2	$\frac{4r^2+8r+3}{(4+r)(3+r)}$	$\frac{3}{2}$
a_3	$\frac{-8r^3-36r^2-46r-15}{(3+r)(4+r)(5+r)}$	$-\frac{1}{2}$
a_4	$\frac{16r^4+128r^3+344r^2+352r+105}{(6+r)(3+r)(4+r)(5+r)}$	$\frac{3}{8}$
a_5	$\frac{-32r^5-400r^4-1840r^3-3800r^2-3378r-945}{(3+r)(4+r)(5+r)(6+r)(7+r)}$	$-\frac{3}{8}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{64r^6 + 1152r^5 + 8080r^4 + 27840r^3 + 48556r^2 + 39048r + 10395}{(8 + r)(3 + r)(4 + r)(5 + r)(6 + r)(7 + r)}$$

Which for the root $r = -2$ becomes

$$a_6 = \frac{7}{16}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-2r}{3+r}$	3
a_2	$\frac{4r^2+8r+3}{(4+r)(3+r)}$	$\frac{3}{2}$
a_3	$\frac{-8r^3-36r^2-46r-15}{(3+r)(4+r)(5+r)}$	$-\frac{1}{2}$
a_4	$\frac{16r^4+128r^3+344r^2+352r+105}{(6+r)(3+r)(4+r)(5+r)}$	$\frac{3}{8}$
a_5	$\frac{-32r^5-400r^4-1840r^3-3800r^2-3378r-945}{(3+r)(4+r)(5+r)(6+r)(7+r)}$	$-\frac{3}{8}$
a_6	$\frac{64r^6+1152r^5+8080r^4+27840r^3+48556r^2+39048r+10395}{(8+r)(3+r)(4+r)(5+r)(6+r)(7+r)}$	$\frac{7}{16}$

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{-128r^7 - 3136r^6 - 31136r^5 - 160720r^4 - 459032r^3 - 709324r^2 - 528414r - 135135}{(3 + r)(4 + r)(5 + r)(6 + r)(7 + r)(8 + r)(9 + r)}$$

Which for the root $r = -2$ becomes

$$a_7 = -\frac{9}{16}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-2r}{3+r}$	3
a_2	$\frac{4r^2+8r+3}{(4+r)(3+r)}$	$\frac{3}{2}$
a_3	$\frac{-8r^3-36r^2-46r-15}{(3+r)(4+r)(5+r)}$	$-\frac{1}{2}$
a_4	$\frac{16r^4+128r^3+344r^2+352r+105}{(6+r)(3+r)(4+r)(5+r)}$	$\frac{3}{8}$
a_5	$\frac{-32r^5-400r^4-1840r^3-3800r^2-3378r-945}{(3+r)(4+r)(5+r)(6+r)(7+r)}$	$-\frac{3}{8}$
a_6	$\frac{64r^6+1152r^5+8080r^4+27840r^3+48556r^2+39048r+10395}{(8+r)(3+r)(4+r)(5+r)(6+r)(7+r)}$	$\frac{7}{16}$
a_7	$\frac{-128r^7-3136r^6-31136r^5-160720r^4-459032r^3-709324r^2-528414r-135135}{(3+r)(4+r)(5+r)(6+r)(7+r)(8+r)(9+r)}$	$-\frac{9}{16}$

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \frac{1}{x^2}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 \dots\right) \\
&= \frac{3x + 1 + \frac{3x^2}{2} - \frac{x^3}{2} + \frac{3x^4}{8} - \frac{3x^5}{8} + \frac{7x^6}{16} - \frac{9x^7}{16} + O(x^8)}{x^2}
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = -2$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{-1-2r}{3+r}$	3	$-\frac{5}{(3+r)^2}$
b_2	$\frac{4r^2+8r+3}{(4+r)(3+r)}$	$\frac{3}{2}$	$\frac{20r^2+90r+75}{(3+r)^2(4+r)^2}$
b_3	$\frac{-8r^3-36r^2-46r-15}{(3+r)(4+r)(5+r)}$	$-\frac{1}{2}$	$\frac{-60r^4-660r^3-2535r^2-3960r-2055}{(3+r)^2(4+r)^2(5+r)^2}$
b_4	$\frac{16r^4+128r^3+344r^2+352r+105}{(6+r)(3+r)(4+r)(5+r)}$	$\frac{3}{8}$	$\frac{160r^6+3120r^5+24400r^4+97500r^3+208330r^2 \cdots}{(3+r)^2(4+r)^2(5+r)^2(6+r)^2 \cdots}$
b_5	$\frac{-32r^5-400r^4-1840r^3-3800r^2-3378r-945}{(3+r)(4+r)(5+r)(6+r)(7+r)}$	$-\frac{3}{8}$	$-\frac{5(80r^8+2400r^7+30680r^6+217800r^5+9361 \cdots}{(3+r)^2(4+r)^2 \cdots}$
b_6	$\frac{64r^6+1152r^5+8080r^4+27840r^3+48556r^2+39048r+10395}{(8+r)(3+r)(4+r)(5+r)(6+r)(7+r)}$	$\frac{7}{16}$	$\frac{960r^{10}+40800r^9+764400r^8+8302800r^7+578 \cdots}{\cdots}$
b_7	$\frac{-128r^7-3136r^6-31136r^5-160720r^4-459032r^3-709324r^2-528414r-135135}{(3+r)(4+r)(5+r)(6+r)(7+r)(8+r)(9+r)}$	$-\frac{9}{16}$	$-\frac{35(64r^{12}+3648r^{11}+93680r^{10}+1431840r^9 \cdots}{\cdots}$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \ldots \\
&= \frac{\left(3x + 1 + \frac{3x^2}{2} - \frac{x^3}{2} + \frac{3x^4}{8} - \frac{3x^5}{8} + \frac{7x^6}{16} - \frac{9x^7}{16} + O(x^8)\right)\ln(x)}{x^2} \\
&\quad + \frac{-5x - \frac{25x^2}{4} + \frac{5x^3}{4} - \frac{25x^4}{32} + \frac{113x^5}{160} - \frac{247x^6}{320} + \frac{2123x^7}{2240} + O(x^8)}{x^2}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= \frac{c_1\left(3x + 1 + \frac{3x^2}{2} - \frac{x^3}{2} + \frac{3x^4}{8} - \frac{3x^5}{8} + \frac{7x^6}{16} - \frac{9x^7}{16} + O(x^8)\right)}{x^2} \\
&\quad + c_2\left(\frac{\left(3x + 1 + \frac{3x^2}{2} - \frac{x^3}{2} + \frac{3x^4}{8} - \frac{3x^5}{8} + \frac{7x^6}{16} - \frac{9x^7}{16} + O(x^8)\right)\ln(x)}{x^2}\right. \\
&\qquad \left. + \frac{-5x - \frac{25x^2}{4} + \frac{5x^3}{4} - \frac{25x^4}{32} + \frac{113x^5}{160} - \frac{247x^6}{320} + \frac{2123x^7}{2240} + O(x^8)}{x^2}\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= \frac{c_1 \left(3x+1+\frac{3x^2}{2}-\frac{x^3}{2}+\frac{3x^4}{8}-\frac{3x^5}{8}+\frac{7x^6}{16}-\frac{9x^7}{16}+O(x^8)\right)}{x^2} \\
&\quad + c_2 \left(\frac{\left(3x+1+\frac{3x^2}{2}-\frac{x^3}{2}+\frac{3x^4}{8}-\frac{3x^5}{8}+\frac{7x^6}{16}-\frac{9x^7}{16}+O(x^8)\right)\ln(x)}{x^2}\right. \\
&\quad \left. + \frac{-5x-\frac{25x^2}{4}+\frac{5x^3}{4}-\frac{25x^4}{32}+\frac{113x^5}{160}-\frac{247x^6}{320}+\frac{2123x^7}{2240}+O(x^8)}{x^2}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= \frac{c_1 \left(3x+1+\frac{3x^2}{2}-\frac{x^3}{2}+\frac{3x^4}{8}-\frac{3x^5}{8}+\frac{7x^6}{16}-\frac{9x^7}{16}+O(x^8)\right)}{x^2} \\
&\quad + c_2 \left(\frac{\left(3x+1+\frac{3x^2}{2}-\frac{x^3}{2}+\frac{3x^4}{8}-\frac{3x^5}{8}+\frac{7x^6}{16}-\frac{9x^7}{16}+O(x^8)\right)\ln(x)}{x^2}\right. \\
&\quad \left. + \frac{-5x-\frac{25x^2}{4}+\frac{5x^3}{4}-\frac{25x^4}{32}+\frac{113x^5}{160}-\frac{247x^6}{320}+\frac{2123x^7}{2240}+O(x^8)}{x^2}\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= \frac{c_1 \left(3x+1+\frac{3x^2}{2}-\frac{x^3}{2}+\frac{3x^4}{8}-\frac{3x^5}{8}+\frac{7x^6}{16}-\frac{9x^7}{16}+O(x^8)\right)}{x^2} \\
&\quad + c_2 \left(\frac{\left(3x+1+\frac{3x^2}{2}-\frac{x^3}{2}+\frac{3x^4}{8}-\frac{3x^5}{8}+\frac{7x^6}{16}-\frac{9x^7}{16}+O(x^8)\right)\ln(x)}{x^2}\right. \\
&\quad \left. + \frac{-5x-\frac{25x^2}{4}+\frac{5x^3}{4}-\frac{25x^4}{32}+\frac{113x^5}{160}-\frac{247x^6}{320}+\frac{2123x^7}{2240}+O(x^8)}{x^2}\right)
\end{aligned}
$$

Verified OK.

15.27.1 Maple step by step solution

Let's solve

$x^2(1+2x)\,y''+(9x^2+5x)\,y'+(3x+4)\,y=0$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y''=-\frac{(3x+4)y}{x^2(1+2x)}-\frac{(5+9x)y'}{x(1+2x)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''+\frac{(5+9x)y'}{x(1+2x)}+\frac{(3x+4)y}{x^2(1+2x)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{5+9x}{x(1+2x)}, P_3(x)=\frac{3x+4}{x^2(1+2x)}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left(x\cdot P_2(x)\right)\bigg|_{x=0}=5$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left(x^2\cdot P_3(x)\right)\bigg|_{x=0}=4$

  ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

$x^2(1+2x)\,y''+x(5+9x)\,y'+(3x+4)\,y=0$

- Assume series solution for y

$y=\sum_{k=0}^{\infty}a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m\cdot y$ to series expansion for $m=0..1$

  $x^m\cdot y=\sum_{k=0}^{\infty}a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..2$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^{m}\cdot y''$ to series expansion for $m=2..3$

  $x^{m}\cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m}\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(2+r)^2\, x^{r}+\left(\sum_{k=1}^{\infty} \left(a_k(k+r+2)^2+a_{k-1}(k+r+2)\,(2k-1+2r)\right) x^{k+r}\right)=0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(2+r)^2=0$

- Values of r that satisfy the indicial equation

  $r=-2$

- Each term in the series must be 0, giving the recursion relation

  $(k+r+2)\left(a_k(k+r+2)+a_{k-1}(2k-1+2r)\right)=0$

- Shift index using $k->k+1$

  $(k+r+3)\left(a_{k+1}(k+r+3)+a_k(2k+2r+1)\right)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+1}=-\frac{a_k(2k+2r+1)}{k+r+3}$

- Recursion relation for $r=-2$

  $a_{k+1}=-\frac{a_k(2k-3)}{k+1}$

- Solution for $r=-2$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k-2}, a_{k+1}=-\frac{a_k(2k-3)}{k+1}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 24.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(1-2x)\,y''-x(4x+5)\,y'+(4x+9)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(-2x^3+x^2\right)y''+\left(-4x^2-5x\right)y'+(4x+9)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{4x+5}{x\,(2x-1)}$$
$$q(x)=-\frac{4x+9}{x^2\,(2x-1)}$$

Table 698: Table $p(x), q(x)$ singularites.

$p(x) = \frac{4x+5}{x(2x-1)}$	
singularity	type
$x = 0$	"regular"
$x = \frac{1}{2}$	"regular"

$q(x) = -\frac{4x+9}{x^2(2x-1)}$	
singularity	type
$x = 0$	"regular"
$x = \frac{1}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, \frac{1}{2}, \infty\right]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-y''x^2(2x-1) + \left(-4x^2 - 5x\right) y' + (4x+9)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) x^2(2x-1) + \left(-4x^2 - 5x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (4x+9)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\sum_{n=0}^{\infty}\left(-2x^{1+n+r}a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)(n+r-1)\right)\\
&+\sum_{n=0}^{\infty}\left(-4x^{1+n+r}a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-5x^{n+r}a_n(n+r)\right)\\
&+\left(\sum_{n=0}^{\infty}4x^{1+n+r}a_n\right)+\left(\sum_{n=0}^{\infty}9a_nx^{n+r}\right)=0
\end{aligned}
\tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty}\left(-2x^{1+n+r}a_n(n+r)(n+r-1)\right)&=\sum_{n=1}^{\infty}\left(-2a_{n-1}(n+r-1)(n+r-2)\,x^{n+r}\right)\\
\sum_{n=0}^{\infty}\left(-4x^{1+n+r}a_n(n+r)\right)&=\sum_{n=1}^{\infty}\left(-4a_{n-1}(n+r-1)\,x^{n+r}\right)\\
\sum_{n=0}^{\infty}4x^{1+n+r}a_n&=\sum_{n=1}^{\infty}4a_{n-1}x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\sum_{n=1}^{\infty}\left(-2a_{n-1}(n+r-1)(n+r-2)\,x^{n+r}\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)(n+r-1)\right)\\
&+\sum_{n=1}^{\infty}\left(-4a_{n-1}(n+r-1)\,x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-5x^{n+r}a_n(n+r)\right)\\
&+\left(\sum_{n=1}^{\infty}4a_{n-1}x^{n+r}\right)+\left(\sum_{n=0}^{\infty}9a_nx^{n+r}\right)=0
\end{aligned}
\tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
x^{n+r}a_n(n+r)(n+r-1)-5x^{n+r}a_n(n+r)+9a_nx^{n+r}=0
$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - 5x^r a_0 r + 9a_0 x^r = 0$$

Or

$$(x^r r(-1+r) - 5x^r r + 9x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r-3)^2\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r-3)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 3$$
$$r_2 = 3$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r-3)^2\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 3$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+3}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+3}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned}&-2a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1)\\&- 4a_{n-1}(n+r-1) - 5a_n(n+r) + 4a_{n-1} + 9a_n = 0\end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{2a_{n-1}(n^2 + 2nr + r^2 - n - r - 2)}{n^2 + 2nr + r^2 - 6n - 6r + 9} \tag{4}$$

Which for the root $r = 3$ becomes

$$a_n = \frac{2a_{n-1}(n^2 + 5n + 4)}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 3$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{2r^2 + 2r - 4}{(r-2)^2}$$

Which for the root $r = 3$ becomes

$$a_1 = 20$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2+2r-4}{(r-2)^2}$	20

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4(r+3)\, r(r+2)}{(-1+r)\,(r-2)^2}$$

Which for the root $r = 3$ becomes

$$a_2 = 180$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2+2r-4}{(r-2)^2}$	20
a_2	$\frac{4(r+3)r(r+2)}{(-1+r)(r-2)^2}$	180

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{8(r+4)\,(r+1)\,(r+3)\,(r+2)}{r\,(-1+r)\,(r-2)^2}$$

Which for the root $r = 3$ becomes

$$a_3 = 1120$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2+2r-4}{(r-2)^2}$	20
a_2	$\frac{4(r+3)r(r+2)}{(-1+r)(r-2)^2}$	180
a_3	$\frac{8(r+4)(r+1)(r+3)(r+2)}{r(-1+r)(r-2)^2}$	1120

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16(r+5)(r+2)^2(r+3)(r+4)}{r(r-2)^2(r^2-1)}$$

Which for the root $r = 3$ becomes

$$a_4 = 5600$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2+2r-4}{(r-2)^2}$	20
a_2	$\frac{4(r+3)r(r+2)}{(-1+r)(r-2)^2}$	180
a_3	$\frac{8(r+4)(r+1)(r+3)(r+2)}{r(-1+r)(r-2)^2}$	1120
a_4	$\frac{16(r+5)(r+2)^2(r+3)(r+4)}{r(r-2)^2(r^2-1)}$	5600

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{32(6+r)(r+3)^2(r+4)(r+5)}{r(r-2)^2(r^2-1)}$$

Which for the root $r = 3$ becomes

$$a_5 = 24192$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2+2r-4}{(r-2)^2}$	20
a_2	$\frac{4(r+3)r(r+2)}{(-1+r)(r-2)^2}$	180
a_3	$\frac{8(r+4)(r+1)(r+3)(r+2)}{r(-1+r)(r-2)^2}$	1120
a_4	$\frac{16(r+5)(r+2)^2(r+3)(r+4)}{r(r-2)^2(r^2-1)}$	5600
a_5	$\frac{32(6+r)(r+3)^2(r+4)(r+5)}{r(r-2)^2(r^2-1)}$	24192

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{64(7+r)(r+4)^2(r+5)(6+r)}{r(r-2)^2(r^2-1)}$$

Which for the root $r = 3$ becomes

$$a_6 = 94080$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2+2r-4}{(r-2)^2}$	20
a_2	$\frac{4(r+3)r(r+2)}{(-1+r)(r-2)^2}$	180
a_3	$\frac{8(r+4)(r+1)(r+3)(r+2)}{r(-1+r)(r-2)^2}$	1120
a_4	$\frac{16(r+5)(r+2)^2(r+3)(r+4)}{r(r-2)^2(r^2-1)}$	5600
a_5	$\frac{32(6+r)(r+3)^2(r+4)(r+5)}{r(r-2)^2(r^2-1)}$	24192
a_6	$\frac{64(7+r)(r+4)^2(r+5)(6+r)}{r(r-2)^2(r^2-1)}$	94080

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{128(8+r)(r+5)^2(6+r)(7+r)}{r(r-2)^2(r^2-1)}$$

Which for the root $r = 3$ becomes

$$a_7 = 337920$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2+2r-4}{(r-2)^2}$	20
a_2	$\frac{4(r+3)r(r+2)}{(-1+r)(r-2)^2}$	180
a_3	$\frac{8(r+4)(r+1)(r+3)(r+2)}{r(-1+r)(r-2)^2}$	1120
a_4	$\frac{16(r+5)(r+2)^2(r+3)(r+4)}{r(r-2)^2(r^2-1)}$	5600
a_5	$\frac{32(6+r)(r+3)^2(r+4)(r+5)}{r(r-2)^2(r^2-1)}$	24192
a_6	$\frac{64(7+r)(r+4)^2(r+5)(6+r)}{r(r-2)^2(r^2-1)}$	94080
a_7	$\frac{128(8+r)(r+5)^2(6+r)(7+r)}{r(r-2)^2(r^2-1)}$	337920

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^3\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 + a_7x^7 + a_8x^8 \dots\right) \\ &= x^3\left(337920x^7 + 94080x^6 + 24192x^5 + 5600x^4 + 1120x^3 + 180x^2 + 20x + 1 + O(x^8)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 3$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$	$b_n(r=3)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	$\frac{2r^2+2r-4}{(r-2)^2}$	20	$\frac{-10r+4}{(r-2)^3}$	-26
b_2	$\frac{4(r+3)r(r+2)}{(-1+r)(r-2)^2}$	180	$\frac{-40r^3-64r^2+104r+48}{(-1+r)^2(r-2)^3}$	-324
b_3	$\frac{8(r+4)(r+1)(r+3)(r+2)}{r(-1+r)(r-2)^2}$	1120	$-\frac{24(5r^5+28r^4+25r^3-58r^2-56r+16)}{r^2(-1+r)^2(r-2)^3}$	$-\frac{6968}{3}$
b_4	$\frac{16(r+5)(r+2)^2(r+3)(r+4)}{r(r-2)^2(r^2-1)}$	5600	$-\frac{64(r+2)(5r^6+48r^5+128r^4-301r^2-120r+60)}{r^2(r-2)^3(r^2-1)^2}$	$-\frac{37780}{3}$
b_5	$\frac{32(6+r)(r+3)^2(r+4)(r+5)}{r(r-2)^2(r^2-1)}$	24192	$-\frac{160(r+3)(5r^6+63r^5+233r^4+105r^3-622r^2-264r+144)}{r^2(r-2)^3(r^2-1)^2}$	-57360
b_6	$\frac{64(7+r)(r+4)^2(r+5)(6+r)}{r(r-2)^2(r^2-1)}$	94080	$-\frac{384(r+4)(5r^6+78r^5+368r^4+312r^3-1113r^2-490r+280)}{r^2(r-2)^3(r^2-1)^2}$	$-\frac{694736}{3}$
b_7	$\frac{128(8+r)(r+5)^2(6+r)(7+r)}{r(r-2)^2(r^2-1)}$	337920	$-\frac{896(r+5)(5r^6+93r^5+533r^4+651r^3-1810r^2-816r+480)}{r^2(r-2)^3(r^2-1)^2}$	$-\frac{2566144}{3}$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \dots \\
&= x^3\left(337920x^7+94080x^6+24192x^5+5600x^4+1120x^3+180x^2+20x+1+O(x^8)\right)\ln(x) \\
&\quad + x^3\left(-324x^2-26x-\frac{6968x^3}{3}-\frac{37780x^4}{3}-57360x^5-\frac{694736x^6}{3}-\frac{2566144x^7}{3} + O(x^8)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^3\left(337920x^7+94080x^6+24192x^5+5600x^4+1120x^3+180x^2+20x+1+O(x^8)\right) \\
&\quad + c_2\Bigg(x^3\left(337920x^7+94080x^6+24192x^5+5600x^4+1120x^3+180x^2+20x+1 + O(x^8)\right)\ln(x) \\
&\quad + x^3\left(-324x^2-26x-\frac{6968x^3}{3}-\frac{37780x^4}{3}-57360x^5 - \frac{694736x^6}{3}-\frac{2566144x^7}{3}+O(x^8)\right)\Bigg)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^3 \left(337920x^7 + 94080x^6 + 24192x^5 + 5600x^4 + 1120x^3 + 180x^2 + 20x + 1 + O(x^8)\right) \\
&\quad + c_2 \left(x^3 \left(337920x^7 + 94080x^6 + 24192x^5 + 5600x^4 + 1120x^3 + 180x^2 + 20x + 1 \right.\right. \\
&\quad \left. + O(x^8)\right) \ln(x) + x^3 \left(-324x^2 - 26x - \frac{6968x^3}{3} - \frac{37780x^4}{3} - 57360x^5 - \frac{694736x^6}{3} \right. \\
&\quad \left.\left. - \frac{2566144x^7}{3} + O(x^8) \right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^3 \left(337920x^7 + 94080x^6 + 24192x^5 + 5600x^4 + 1120x^3 + 180x^2 + 20x + 1 + O(x^8)\right) \\
&\quad + c_2 \left(x^3 \left(337920x^7 + 94080x^6 + 24192x^5 + 5600x^4 + 1120x^3 + 180x^2 + 20x + 1 \right.\right. \\
&\quad \left. + O(x^8)\right) \ln(x) + x^3 \left(-324x^2 - 26x - \frac{6968x^3}{3} - \frac{37780x^4}{3} - 57360x^5 \right. \\
&\quad \left.\left. - \frac{694736x^6}{3} - \frac{2566144x^7}{3} + O(x^8) \right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x^3 \left(337920x^7 + 94080x^6 + 24192x^5 + 5600x^4 + 1120x^3 + 180x^2 + 20x + 1 + O(x^8)\right) \\
&\quad + c_2 \left(x^3 \left(337920x^7 + 94080x^6 + 24192x^5 + 5600x^4 + 1120x^3 + 180x^2 + 20x + 1 \right.\right. \\
&\quad \left. + O(x^8)\right) \ln(x) + x^3 \left(-324x^2 - 26x - \frac{6968x^3}{3} - \frac{37780x^4}{3} - 57360x^5 - \frac{694736x^6}{3} \right. \\
&\quad \left.\left. - \frac{2566144x^7}{3} + O(x^8) \right)\right)
\end{aligned}
$$

Verified OK.

15.28.1 Maple step by step solution

Let's solve

$-y''x^2(2x-1)+(-4x^2-5x)\,y'+(4x+9)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{(4x+9)y}{x^2(2x-1)}-\frac{(4x+5)y'}{x(2x-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(4x+5)y'}{x(2x-1)}-\frac{(4x+9)y}{x^2(2x-1)}=0$

□ Check to see if x_0 is a regular singular point

- ◦ Define functions

  $\left[P_2(x)=\frac{4x+5}{x(2x-1)}, P_3(x)=-\frac{4x+9}{x^2(2x-1)}\right]$

- ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $(x\cdot P_2(x))\Big|_{x=0}=-5$

- ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $(x^2\cdot P_3(x))\Big|_{x=0}=9$

- ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $y''x^2(2x-1)+x(4x+5)\,y'+(-4x-9)\,y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_k x^{k+r}$

□ Rewrite ODE with series expansions

- ◦ Convert $x^m\cdot y$ to series expansion for $m=0..1$

  $x^m\cdot y=\sum_{k=0}^{\infty}a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $-a_0(-3+r)^2 x^r + \left(\sum_{k=1}^{\infty} \left(-a_k(k+r-3)^2 + 2a_{k-1}(k+1+r)\,(k-2+r)\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-(-3+r)^2 = 0$

- Values of r that satisfy the indicial equation

  $r = 3$

- Each term in the series must be 0, giving the recursion relation

  $-a_k(k+r-3)^2 + 2a_{k-1}(k+1+r)\,(k-2+r) = 0$

- Shift index using $k->k+1$

  $-a_{k+1}(k-2+r)^2 + 2a_k(k+r+2)\,(k+r-1) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+1} = \frac{2a_k(k+r+2)(k+r-1)}{(k-2+r)^2}$

- Recursion relation for $r = 3$

  $a_{k+1} = \frac{2a_k(k+5)(k+2)}{(k+1)^2}$

- Solution for $r = 3$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+3}, a_{k+1} = \frac{2a_k(k+5)(k+2)}{(k+1)^2}\right]$$

Problem number: 25.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(4x+1)\,y''-x(-4x+1)\,y'+(x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(4x^3+x^2\right)y''+\left(4x^2-x\right)y'+(x+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{4x-1}{x\,(4x+1)}$$
$$q(x)=\frac{x+1}{x^2\,(4x+1)}$$

Table 700: Table $p(x), q(x)$ singularites.

$p(x) = \frac{4x-1}{x(4x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{4}$	"regular"

$q(x) = \frac{x+1}{x^2(4x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{4}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{1}{4}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(4x+1)\, y'' + \left(4x^2 - x\right) y' + (x+1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(4x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(4x^2 - x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (x+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - x^r a_0 r + a_0 x^r = 0$$

Or

$$(x^r r(-1+r) - x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(-1+r)^2\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(-1+r)^2\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{1+n}$$

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{1+n}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &4a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ &+ 4a_{n-1}(n+r-1) - a_n(n+r) + a_{n-1} + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(4n^2 + 8nr + 4r^2 - 8n - 8r + 5)}{n^2 + 2nr + r^2 - 2n - 2r + 1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = \frac{a_{n-1}(-4n^2 - 1)}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-4r^2 - 1}{r^2}$$

Which for the root $r = 1$ becomes

$$a_1 = -5$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2-1}{r^2}$	-5

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{16r^4 + 32r^3 + 24r^2 + 8r + 5}{r^2 (r+1)^2}$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{85}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2-1}{r^2}$	-5
a_2	$\frac{16r^4+32r^3+24r^2+8r+5}{r^2(r+1)^2}$	$\frac{85}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-64r^6 - 384r^5 - 880r^4 - 960r^3 - 556r^2 - 216r - 85}{r^2 (r+1)^2 (r+2)^2}$$

Which for the root $r = 1$ becomes

$$a_3 = -\frac{3145}{36}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2-1}{r^2}$	-5
a_2	$\frac{16r^4+32r^3+24r^2+8r+5}{r^2(r+1)^2}$	$\frac{85}{4}$
a_3	$\frac{-64r^6-384r^5-880r^4-960r^3-556r^2-216r-85}{r^2(r+1)^2(r+2)^2}$	$-\frac{3145}{36}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)}{r^2(r+1)^2(r+2)^2(r+3)^2}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{204425}{576}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2-1}{r^2}$	-5
a_2	$\frac{16r^4+32r^3+24r^2+8r+5}{r^2(r+1)^2}$	$\frac{85}{4}$
a_3	$\frac{-64r^6-384r^5-880r^4-960r^3-556r^2-216r-85}{r^2(r+1)^2(r+2)^2}$	$-\frac{3145}{36}$
a_4	$\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)}{r^2(r+1)^2(r+2)^2(r+3)^2}$	$\frac{204425}{576}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)(4r^2+32r+65)}{r^2(r+1)^2(r+2)^2(r+3)^2(r+4)^2}$$

Which for the root $r = 1$ becomes

$$a_5 = -\frac{825877}{576}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2-1}{r^2}$	-5
a_2	$\frac{16r^4+32r^3+24r^2+8r+5}{r^2(r+1)^2}$	$\frac{85}{4}$
a_3	$\frac{-64r^6-384r^5-880r^4-960r^3-556r^2-216r-85}{r^2(r+1)^2(r+2)^2}$	$-\frac{3145}{36}$
a_4	$\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)}{r^2(r+1)^2(r+2)^2(r+3)^2}$	$\frac{204425}{576}$
a_5	$-\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)(4r^2+32r+65)}{r^2(r+1)^2(r+2)^2(r+3)^2(r+4)^2}$	$-\frac{825877}{576}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)(4r^2+32r+65)(4r^2+40r+101)}{r^2(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$$

Which for the root $r = 1$ becomes

$$a_6 = \frac{119752165}{20736}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2-1}{r^2}$	-5
a_2	$\frac{16r^4+32r^3+24r^2+8r+5}{r^2(r+1)^2}$	$\frac{85}{4}$
a_3	$\frac{-64r^6-384r^5-880r^4-960r^3-556r^2-216r-85}{r^2(r+1)^2(r+2)^2}$	$-\frac{3145}{36}$
a_4	$\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)}{r^2(r+1)^2(r+2)^2(r+3)^2}$	$\frac{204425}{576}$
a_5	$-\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)(4r^2+32r+65)}{r^2(r+1)^2(r+2)^2(r+3)^2(r+4)^2}$	$-\frac{825877}{576}$
a_6	$\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)(4r^2+32r+65)(4r^2+40r+101)}{r^2(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$\frac{119752165}{20736}$

For $n = 7$, using the above recursive equation gives

$$a_7 = -\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)(4r^2+32r+65)(4r^2+40r+101)(4r^2}{r^2(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(6+r)^2}$$

Which for the root $r = 1$ becomes

$$a_7 = -\frac{23591176505}{1016064}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2-1}{r^2}$	-5
a_2	$\frac{16r^4+32r^3+24r^2+8r+5}{r^2(r+1)^2}$	$\frac{85}{4}$
a_3	$\frac{-64r^6-384r^5-880r^4-960r^3-556r^2-216r-85}{r^2(r+1)^2(r+2)^2}$	$-\frac{3145}{36}$
a_4	$\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)}{r^2(r+1)^2(r+2)^2(r+3)^2}$	$\frac{204425}{576}$
a_5	$-\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)(4r^2+32r+65)}{r^2(r+1)^2(r+2)^2(r+3)^2(r+4)^2}$	$-\frac{825877}{576}$
a_6	$\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)(4r^2+32r+65)(4r^2+40r+101)}{r^2(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$\frac{119752165}{20736}$
a_7	$-\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)(4r^2+32r+65)(4r^2+40r+101)(4r^2+48r+145)}{r^2(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(6+r)^2}$	$-\frac{23591176505}{1016064}$

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 + a_7x^7 + a_8x^8 \dots\right) \\
&= x\left(1 - 5x + \frac{85x^2}{4} - \frac{3145x^3}{36} + \frac{204425x^4}{576} - \frac{825877x^5}{576} + \frac{119752165x^6}{20736} \right. \\
&\qquad \left. - \frac{23591176505x^7}{1016064} + O(x^8)\right)
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = 1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}$
b_0	1	1	N/A sinc
b_1	$\frac{-4r^2-1}{r^2}$	-5	$\frac{2}{r^3}$
b_2	$\frac{16r^4+32r^3+24r^2+8r+5}{r^2(r+1)^2}$	$\frac{85}{4}$	$\frac{-16r^3-24r}{r^3(r+}$
b_3	$\frac{-64r^6-384r^5-880r^4-960r^3-556r^2-216r-85}{r^2(r+1)^2(r+2)^2}$	$-\frac{3145}{36}$	$96r^6+576r^5$
b_4	$\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)}{r^2(r+1)^2(r+2)^2(r+3)^2}$	$\frac{204425}{576}$	$-512r^9-69$
b_5	$-\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)(4r^2+32r+65)}{r^2(r+1)^2(r+2)^2(r+3)^2(r+4)^2}$	$-\frac{825877}{576}$	$2560r^{12}+61$
b_6	$\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)(4r^2+32r+65)(4r^2+40r+101)}{r^2(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$\frac{119752165}{20736}$	$-12288r^{15}-$
b_7	$-\frac{(4r^2+24r+37)(4r^2+1)(4r^2+8r+5)(4r^2+16r+17)(4r^2+32r+65)(4r^2+40r+101)(4r^2+48r+145)}{r^2(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(6+r)^2}$	$-\frac{23591176505}{1016064}$	$57344r^{18}+3$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \ldots \\
&= x\left(1 - 5x + \frac{85x^2}{4} - \frac{3145x^3}{36} + \frac{204425x^4}{576} - \frac{825877x^5}{576} + \frac{119752165x^6}{20736} \right.\\
&\quad \left. - \frac{23591176505x^7}{1016064} + O(x^8)\right)\ln(x) + x\left(2x - \frac{39x^2}{4} + \frac{4499x^3}{108} - \frac{594305x^4}{3456} \right.\\
&\quad \left. + \frac{2420617x^5}{3456} - \frac{117547073x^6}{41472} + \frac{162576422327x^7}{14224896} + O(x^8)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x\left(1 - 5x + \frac{85x^2}{4} - \frac{3145x^3}{36} + \frac{204425x^4}{576} - \frac{825877x^5}{576} + \frac{119752165x^6}{20736} \right.\\
&\quad \left. - \frac{23591176505x^7}{1016064} + O(x^8)\right) \\
&\quad + c_2\left(x\left(1 - 5x + \frac{85x^2}{4} - \frac{3145x^3}{36} + \frac{204425x^4}{576} - \frac{825877x^5}{576} + \frac{119752165x^6}{20736} \right.\right.\\
&\quad \left. - \frac{23591176505x^7}{1016064} + O(x^8)\right)\ln(x) + x\left(2x - \frac{39x^2}{4} + \frac{4499x^3}{108} - \frac{594305x^4}{3456} \right.\\
&\quad \left.\left. + \frac{2420617x^5}{3456} - \frac{117547073x^6}{41472} + \frac{162576422327x^7}{14224896} + O(x^8)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$y = y_h$$
$$= c_1 x \left(1 - 5x + \frac{85x^2}{4} - \frac{3145x^3}{36} + \frac{204425x^4}{576} - \frac{825877x^5}{576} + \frac{119752165x^6}{20736} - \frac{23591176505x^7}{1016064} + O(x^8)\right) + c_2 \left(x \left(1 - 5x + \frac{85x^2}{4} - \frac{3145x^3}{36} + \frac{204425x^4}{576} - \frac{825877x^5}{576} + \frac{119752165x^6}{20736} - \frac{23591176505x^7}{1016064} + O(x^8)\right) \ln(x) + x \left(2x - \frac{39x^2}{4} + \frac{4499x^3}{108} - \frac{594305x^4}{3456} + \frac{2420617x^5}{3456} - \frac{117547073x^6}{41472} + \frac{162576422327x^7}{14224896} + O(x^8)\right)\right)$$

Summary

The solution(s) found are the following

$$y = c_1 x \left(1 - 5x + \frac{85x^2}{4} - \frac{3145x^3}{36} + \frac{204425x^4}{576} - \frac{825877x^5}{576} + \frac{119752165x^6}{20736} - \frac{23591176505x^7}{1016064} + O(x^8)\right) + c_2 \left(x \left(1 - 5x + \frac{85x^2}{4} - \frac{3145x^3}{36} + \frac{204425x^4}{576} - \frac{825877x^5}{576} + \frac{119752165x^6}{20736} - \frac{23591176505x^7}{1016064} + O(x^8)\right) \ln(x) + x \left(2x - \frac{39x^2}{4} + \frac{4499x^3}{108} - \frac{594305x^4}{3456} + \frac{2420617x^5}{3456} - \frac{117547073x^6}{41472} + \frac{162576422327x^7}{14224896} + O(x^8)\right)\right) \quad (1)$$

Verification of solutions

$$y = c_1 x \left(1 - 5x + \frac{85x^2}{4} - \frac{3145x^3}{36} + \frac{204425x^4}{576} - \frac{825877x^5}{576} + \frac{119752165x^6}{20736} - \frac{23591176505x^7}{1016064} + O(x^8)\right) + c_2 \left(x \left(1 - 5x + \frac{85x^2}{4} - \frac{3145x^3}{36} + \frac{204425x^4}{576} - \frac{825877x^5}{576} + \frac{119752165x^6}{20736} - \frac{23591176505x^7}{1016064} + O(x^8)\right) \ln(x) + x \left(2x - \frac{39x^2}{4} + \frac{4499x^3}{108} - \frac{594305x^4}{3456} + \frac{2420617x^5}{3456} - \frac{117547073x^6}{41472} + \frac{162576422327x^7}{14224896} + O(x^8)\right)\right)$$

Verified OK.

15.29.1 Maple step by step solution

Let's solve

$x^2(4x+1)\,y''+(4x^2-x)\,y'+(x+1)\,y=0$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y''=-\frac{(x+1)y}{x^2(4x+1)}-\frac{(4x-1)y'}{x(4x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''+\frac{(4x-1)y'}{x(4x+1)}+\frac{(x+1)y}{x^2(4x+1)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{4x-1}{x(4x+1)},P_3(x)=\frac{x+1}{x^2(4x+1)}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $(x\cdot P_2(x))\bigg|_{x=0}=-1$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $(x^2\cdot P_3(x))\bigg|_{x=0}=1$

  ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

$x^2(4x+1)\,y''+x(4x-1)\,y'+(x+1)\,y=0$

- Assume series solution for y

$y=\sum_{k=0}^{\infty}a_kx^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m\cdot y$ to series expansion for $m=0..1$

  $x^m\cdot y=\sum_{k=0}^{\infty}a_kx^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m}x^{k+r}$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..2$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\,x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$

- Convert $x^{m}\cdot y''$ to series expansion for $m=2..3$

  $x^{m}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\,x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m}\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}(-1+r)^{2}\,x^{r}+\left(\sum_{k=1}^{\infty}\left(a_{k}(k+r-1)^{2}+a_{k-1}\left(4(k-1)^{2}+8(k-1)\,r+4r^{2}+1\right)\right)x^{k+r}\right)=0$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $(-1+r)^{2}=0$

- Values of r that satisfy the indicial equation

  $r=1$

- Each term in the series must be 0, giving the recursion relation

  $a_{k}(k+r-1)^{2}+a_{k-1}(4k^{2}+8kr+4r^{2}-8k-8r+5)=0$

- Shift index using $k->k+1$

  $a_{k+1}(k+r)^{2}+a_{k}\left(4(k+1)^{2}+8(k+1)\,r+4r^{2}-8k-3-8r\right)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+1}=-\frac{a_{k}\left(4k^{2}+8kr+4r^{2}+1\right)}{(k+r)^{2}}$

- Recursion relation for $r=1$

  $a_{k+1}=-\frac{a_{k}\left(4k^{2}+8k+5\right)}{(k+1)^{2}}$

- Solution for $r=1$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+1}=-\frac{a_k(4k^2+8k+5)}{(k+1)^2}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 26.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x+1)\,y''+x(1+2x)\,y'+yx=0}$$

With the expansion point for the power series method at $x=0$.

The ODE is

$$x^2(x+1)\,y''+\left(2x^2+x\right)y'+yx=0$$

Or

$$x\left(x^2y''+2y'x+y''x+y+y'\right)=0$$

For $x\neq 0$ the above simplifies to

$$\left(x^2+x\right)y''+(1+2x)\,y'+y=0$$

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^3+x^2\right)y''+\left(2x^2+x\right)y'+yx=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x) = \frac{1+2x}{x(x+1)}$$
$$q(x) = \frac{1}{x(x+1)}$$

Table 702: Table $p(x), q(x)$ singularites.

$p(x) = \frac{1+2x}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = \frac{1}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x+1)\, y'' + \left(2x^2 + x\right) y' + yx = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$
\begin{aligned}
&x^{2}(x+1)\left(\sum_{n=0}^{\infty}(n+r)\,(n+r-1)\,a_{n}x^{n+r-2}\right)\\
&+\left(2x^{2}+x\right)\left(\sum_{n=0}^{\infty}(n+r)\,a_{n}x^{n+r-1}\right)+\left(\sum_{n=0}^{\infty}a_{n}x^{n+r}\right)x=0
\end{aligned}\tag{1}
$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty}x^{1+n+r}a_{n}(n+r)\,(n+r-1)\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_{n}(n+r)\,(n+r-1)\right)\\
&+\left(\sum_{n=0}^{\infty}2x^{1+n+r}a_{n}(n+r)\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_{n}(n+r)\right)+\left(\sum_{n=0}^{\infty}x^{1+n+r}a_{n}\right)=0
\end{aligned}\tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty}x^{1+n+r}a_{n}(n+r)\,(n+r-1)&=\sum_{n=1}^{\infty}a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}\\
\sum_{n=0}^{\infty}2x^{1+n+r}a_{n}(n+r)&=\sum_{n=1}^{\infty}2a_{n-1}(n+r-1)\,x^{n+r}\\
\sum_{n=0}^{\infty}x^{1+n+r}a_{n}&=\sum_{n=1}^{\infty}a_{n-1}x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=1}^{\infty}a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_{n}(n+r)\,(n+r-1)\right)\\
&+\left(\sum_{n=1}^{\infty}2a_{n-1}(n+r-1)\,x^{n+r}\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_{n}(n+r)\right)+\left(\sum_{n=1}^{\infty}a_{n-1}x^{n+r}\right)=0
\end{aligned}\tag{2B}
$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r}a_n(n+r)(n+r-1) + x^{n+r}a_n(n+r) = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + x^r a_0 r = 0$$

Or

$$(x^r r(-1+r) + x^r r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^r r^2 = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 0$$
$$r_2 = 0$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^r r^2 = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} & a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ & + 2a_{n-1}(n+r-1) + a_n(n+r) + a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n^2 + 2nr + r^2 - n - r + 1)}{n^2 + 2nr + r^2} \tag{4}$$

Which for the root $r = 0$ becomes

$$a_n = -\frac{a_{n-1}(n^2 - n + 1)}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 0$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-r^2 - r - 1}{(r+1)^2}$$

Which for the root $r = 0$ becomes

$$a_1 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-r-1}{(r+1)^2}$	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{r^4 + 4r^3 + 7r^2 + 6r + 3}{(r+1)^2 (r+2)^2}$$

Which for the root $r = 0$ becomes

$$a_2 = \frac{3}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-r-1}{(r+1)^2}$	-1
a_2	$\frac{r^4+4r^3+7r^2+6r+3}{(r+1)^2(r+2)^2}$	$\frac{3}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-r^6 - 9r^5 - 34r^4 - 69r^3 - 82r^2 - 57r - 21}{(r+1)^2 (r+2)^2 (r+3)^2}$$

Which for the root $r = 0$ becomes

$$a_3 = -\frac{7}{12}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-r-1}{(r+1)^2}$	-1
a_2	$\frac{r^4+4r^3+7r^2+6r+3}{(r+1)^2(r+2)^2}$	$\frac{3}{4}$
a_3	$\frac{-r^6-9r^5-34r^4-69r^3-82r^2-57r-21}{(r+1)^2(r+2)^2(r+3)^2}$	$-\frac{7}{12}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(r^2 + r + 1)(r^2 + 3r + 3)(r^2 + 5r + 7)(r^2 + 7r + 13)}{(r+1)^2 (r+2)^2 (r+3)^2 (r+4)^2}$$

Which for the root $r = 0$ becomes

$$a_4 = \frac{91}{192}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-r-1}{(r+1)^2}$	-1
a_2	$\frac{r^4+4r^3+7r^2+6r+3}{(r+1)^2(r+2)^2}$	$\frac{3}{4}$
a_3	$\frac{-r^6-9r^5-34r^4-69r^3-82r^2-57r-21}{(r+1)^2(r+2)^2(r+3)^2}$	$-\frac{7}{12}$
a_4	$\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2}$	$\frac{91}{192}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)(r^2+9r+21)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$$

Which for the root $r = 0$ becomes

$$a_5 = -\frac{637}{1600}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-r-1}{(r+1)^2}$	-1
a_2	$\frac{r^4+4r^3+7r^2+6r+3}{(r+1)^2(r+2)^2}$	$\frac{3}{4}$
a_3	$\frac{-r^6-9r^5-34r^4-69r^3-82r^2-57r-21}{(r+1)^2(r+2)^2(r+3)^2}$	$-\frac{7}{12}$
a_4	$\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2}$	$\frac{91}{192}$
a_5	$-\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)(r^2+9r+21)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$-\frac{637}{1600}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)(r^2+9r+21)(r^2+11r+31)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(6+r)^2}$$

Which for the root $r = 0$ becomes

$$a_6 = \frac{19747}{57600}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-r-1}{(r+1)^2}$	-1
a_2	$\frac{r^4+4r^3+7r^2+6r+3}{(r+1)^2(r+2)^2}$	$\frac{3}{4}$
a_3	$\frac{-r^6-9r^5-34r^4-69r^3-82r^2-57r-21}{(r+1)^2(r+2)^2(r+3)^2}$	$-\frac{7}{12}$
a_4	$\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2}$	$\frac{91}{192}$
a_5	$-\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)(r^2+9r+21)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$-\frac{637}{1600}$
a_6	$\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)(r^2+9r+21)(r^2+11r+31)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(6+r)^2}$	$\frac{19747}{57600}$

For $n = 7$, using the above recursive equation gives

$$a_7 = -\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)(r^2+9r+21)(r^2+11r+31)(r^2+13r+4}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(6+r)^2(7+r)^2}$$

Which for the root $r = 0$ becomes

$$a_7 = -\frac{17329}{57600}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-r-1}{(r+1)^2}$	-1
a_2	$\frac{r^4+4r^3+7r^2+6r+3}{(r+1)^2(r+2)^2}$	$\frac{3}{4}$
a_3	$\frac{-r^6-9r^5-34r^4-69r^3-82r^2-57r-21}{(r+1)^2(r+2)^2(r+3)^2}$	$-\frac{7}{12}$
a_4	$\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2}$	$\frac{91}{192}$
a_5	$-\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)(r^2+9r+21)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$-\frac{637}{1600}$
a_6	$\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)(r^2+9r+21)(r^2+11r+31)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(6+r)^2}$	$\frac{19747}{57600}$
a_7	$-\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)(r^2+9r+21)(r^2+11r+31)(r^2+13r+43)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(6+r)^2(7+r)^2}$	$-\frac{17329}{57600}$

Using the above table, then the first solution $y_1(x)$ becomes

$$
\begin{aligned}
y_1(x) &= a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 \dots \\
&= 1 - x + \frac{3x^2}{4} - \frac{7x^3}{12} + \frac{91x^4}{192} - \frac{637x^5}{1600} + \frac{19747x^6}{57600} - \frac{17329x^7}{57600} + O(x^8)
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r} \right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = 0$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts fro
b_1	$\frac{-r^2-r-1}{(r+1)^2}$	-1	$\frac{1-r}{(r+1)^3}$
b_2	$\frac{r^4+4r^3+7r^2+6r+3}{(r+1)^2(r+2)^2}$	$\frac{3}{4}$	$\frac{2r^4+6r^3+6r^2-2r-6}{(r+1)^3(r+2)^3}$
b_3	$\frac{-r^6-9r^5-34r^4-69r^3-82r^2-57r-21}{(r+1)^2(r+2)^2(r+3)^2}$	$-\frac{7}{12}$	$\frac{-3r^7-30r^6-126r^5-276r^4-30}{(r+1)^3(r+2)^3(}$
b_4	$\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2}$	$\frac{91}{192}$	$\frac{4r^{10}+80r^9+708r^8+3624r^7+11}{(}$
b_5	$-\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)(r^2+9r+21)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}$	$-\frac{637}{1600}$	$\frac{-5r^{13}-165r^{12}-2475r^{11}-2228}{}$
b_6	$\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)(r^2+9r+21)(r^2+11r+31)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(6+r)^2}$	$\frac{19747}{57600}$	$\frac{6r^{16}+294r^{15}+6660r^{14}+92460r}{}$
b_7	$-\frac{(r^2+r+1)(r^2+3r+3)(r^2+5r+7)(r^2+7r+13)(r^2+9r+21)(r^2+11r+31)(r^2+13r+43)}{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2(6+r)^2(7+r)^2}$	$-\frac{17329}{57600}$	$-\frac{7(r^{19}+68r^{18}+2163r^{17}+4274}{}$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x) \ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \dots \\
&= \left(1 - x + \frac{3x^2}{4} - \frac{7x^3}{12} + \frac{91x^4}{192} - \frac{637x^5}{1600} + \frac{19747x^6}{57600} - \frac{17329x^7}{57600} + O(x^8)\right) \ln(x) \\
&\quad + x - \frac{3x^2}{4} + \frac{5x^3}{9} - \frac{499x^4}{1152} + \frac{16919x^5}{48000} - \frac{56861x^6}{192000} + \frac{1027717x^7}{4032000} + O(x^8)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 \left(1 - x + \frac{3x^2}{4} - \frac{7x^3}{12} + \frac{91x^4}{192} - \frac{637x^5}{1600} + \frac{19747x^6}{57600} - \frac{17329x^7}{57600} + O(x^8)\right) \\
&+ c_2 \left(\left(1 - x + \frac{3x^2}{4} - \frac{7x^3}{12} + \frac{91x^4}{192} - \frac{637x^5}{1600} + \frac{19747x^6}{57600} - \frac{17329x^7}{57600} + O(x^8)\right) \ln(x) \right. \\
&\left. + x - \frac{3x^2}{4} + \frac{5x^3}{9} - \frac{499x^4}{1152} + \frac{16919x^5}{48000} - \frac{56861x^6}{192000} + \frac{1027717x^7}{4032000} + O(x^8)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 \left(1 - x + \frac{3x^2}{4} - \frac{7x^3}{12} + \frac{91x^4}{192} - \frac{637x^5}{1600} + \frac{19747x^6}{57600} - \frac{17329x^7}{57600} + O(x^8)\right) \\
&+ c_2 \left(\left(1 - x + \frac{3x^2}{4} - \frac{7x^3}{12} + \frac{91x^4}{192} - \frac{637x^5}{1600} + \frac{19747x^6}{57600} - \frac{17329x^7}{57600} + O(x^8)\right) \ln(x) \right. \\
&\left. + x - \frac{3x^2}{4} + \frac{5x^3}{9} - \frac{499x^4}{1152} + \frac{16919x^5}{48000} - \frac{56861x^6}{192000} + \frac{1027717x^7}{4032000} + O(x^8)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 \left(1 - x + \frac{3x^2}{4} - \frac{7x^3}{12} + \frac{91x^4}{192} - \frac{637x^5}{1600} + \frac{19747x^6}{57600} - \frac{17329x^7}{57600} + O(x^8)\right) \\

Verification of solutions

$$
\begin{aligned}
y &= c_1 \left(1 - x + \frac{3x^2}{4} - \frac{7x^3}{12} + \frac{91x^4}{192} - \frac{637x^5}{1600} + \frac{19747x^6}{57600} - \frac{17329x^7}{57600} + O(x^8)\right) \\
&+ c_2 \left(\left(1 - x + \frac{3x^2}{4} - \frac{7x^3}{12} + \frac{91x^4}{192} - \frac{637x^5}{1600} + \frac{19747x^6}{57600} - \frac{17329x^7}{57600} + O(x^8)\right) \ln(x) \right. \\
&\left. + x - \frac{3x^2}{4} + \frac{5x^3}{9} - \frac{499x^4}{1152} + \frac{16919x^5}{48000} - \frac{56861x^6}{192000} + \frac{1027717x^7}{4032000} + O(x^8)\right)
\end{aligned}
$$

Verified OK.

15.30.1 Maple step by step solution

Let's solve

$x^2(x+1)\,y''+(2x^2+x)\,y'+yx=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{y}{x(x+1)}-\frac{(1+2x)y'}{x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(1+2x)y'}{x(x+1)}+\frac{y}{x(x+1)}=0$

☐ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{1+2x}{x(x+1)},P_3(x)=\frac{1}{x(x+1)}\right]$

  ◦ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

  $\left((x+1)\cdot P_2(x)\right)\Big|_{x=-1}=1$

  ◦ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

  $\left((x+1)^2\cdot P_3(x)\right)\Big|_{x=-1}=0$

  ◦ $x=-1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-1$

- Multiply by denominators

  $x(x+1)\,y''+(1+2x)\,y'+y=0$

- Change variables using $x=u-1$ so that the regular singular point is at $u=0$

  $(u^2-u)\left(\frac{d^2}{du^2}y(u)\right)+(-1+2u)\left(\frac{d}{du}y(u)\right)+y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\, u^{k+r-1+m}$$

- Shift index using $k->k+1-m$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$-a_0 r^2 u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(-a_{k+1}(k+1+r)^2 + a_k(k^2+2kr+r^2+k+r+1)\right) u^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$-r^2 = 0$$

- Values of r that satisfy the indicial equation

  $$r = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$-a_{k+1}(k+1)^2 + a_k(k^2+k+1) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+1} = \frac{a_k(k^2+k+1)}{(k+1)^2}$$

- Recursion relation for $r = 0$

  $$a_{k+1} = \frac{a_k(k^2+k+1)}{(k+1)^2}$$

- Solution for $r = 0$

  $$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+1} = \frac{a_k(k^2+k+1)}{(k+1)^2}\right]$$

- Revert the change of variables $u = x+1$

  $$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^k, a_{k+1} = \frac{a_k(k^2+k+1)}{(k+1)^2}\right]$$

Problem number: 27.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(1-x)\,y''+x(7+x)\,y'+(9-x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(-x^3+x^2\right)y''+\left(x^2+7x\right)y'+(9-x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{7+x}{x\,(x-1)}$$
$$q(x)=\frac{-9+x}{x^2\,(x-1)}$$

Table 704: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{7+x}{x(x-1)}$	
singularity	type
$x = 0$	"regular"
$x = 1$	"regular"

$q(x) = \frac{-9+x}{x^2(x-1)}$	
singularity	type
$x = 0$	"regular"
$x = 1$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, 1, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-y''x^2(x-1) + (x^2 + 7x)\, y' + (9 - x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) x^2(x-1) + (x^2 + 7x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (9 - x)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 7x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 9a_n x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n (n+r)(n+r-1)\right) = \sum_{n=1}^{\infty} \left(-a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\sum_{n=1}^{\infty} \left(-a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 7x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 9a_n x^{n+r}\right) + \sum_{n=1}^{\infty} \left(-a_{n-1} x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + 7x^{n+r} a_n (n+r) + 9a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + 7x^r a_0 r + 9a_0 x^r = 0$$

Or

$$(x^r r(-1+r) + 7x^r r + 9x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r+3)^2\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r+3)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -3$$
$$r_2 = -3$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r+3)^2\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -3$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-3}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-3}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} -a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ + a_{n-1}(n+r-1) + 7a_n(n+r) + 9a_n - a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{a_{n-1}(n^2 + 2nr + r^2 - 4n - 4r + 4)}{n^2 + 2nr + r^2 + 6n + 6r + 9} \tag{4}$$

Which for the root $r = -3$ becomes

$$a_n = \frac{a_{n-1}(n-5)^2}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -3$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{(-1+r)^2}{(r+4)^2}$$

Which for the root $r = -3$ becomes

$$a_1 = 16$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{(-1+r)^2}{(r+4)^2}$	16

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(-1+r)^2 r^2}{(r+4)^2 (r+5)^2}$$

Which for the root $r = -3$ becomes

$$a_2 = 36$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{(-1+r)^2}{(r+4)^2}$	16
a_2	$\frac{(-1+r)^2 r^2}{(r+4)^2 (r+5)^2}$	36

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{(-1+r)^2 r^2 (r+1)^2}{(r+4)^2 (r+5)^2 (6+r)^2}$$

Which for the root $r = -3$ becomes

$$a_3 = 16$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{(-1+r)^2}{(r+4)^2}$	16
a_2	$\frac{(-1+r)^2 r^2}{(r+4)^2 (r+5)^2}$	36
a_3	$\frac{(-1+r)^2 r^2 (r+1)^2}{(r+4)^2 (r+5)^2 (6+r)^2}$	16

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2}{(r+4)^2 (r+5)^2 (6+r)^2 (7+r)^2}$$

Which for the root $r = -3$ becomes

$$a_4 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{(-1+r)^2}{(r+4)^2}$	16
a_2	$\frac{(-1+r)^2 r^2}{(r+4)^2 (r+5)^2}$	36
a_3	$\frac{(-1+r)^2 r^2 (r+1)^2}{(r+4)^2 (r+5)^2 (6+r)^2}$	16
a_4	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2}{(r+4)^2 (r+5)^2 (6+r)^2 (7+r)^2}$	1

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}{(r+4)^2 (r+5)^2 (6+r)^2 (7+r)^2 (8+r)^2}$$

Which for the root $r = -3$ becomes

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{(-1+r)^2}{(r+4)^2}$	16
a_2	$\frac{(-1+r)^2 r^2}{(r+4)^2 (r+5)^2}$	36
a_3	$\frac{(-1+r)^2 r^2 (r+1)^2}{(r+4)^2 (r+5)^2 (6+r)^2}$	16
a_4	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2}{(r+4)^2 (r+5)^2 (6+r)^2 (7+r)^2}$	1
a_5	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}{(r+4)^2 (r+5)^2 (6+r)^2 (7+r)^2 (8+r)^2}$	0

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}{(9+r)^2 (8+r)^2 (7+r)^2 (6+r)^2 (r+5)^2}$$

Which for the root $r = -3$ becomes

$$a_6 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{(-1+r)^2}{(r+4)^2}$	16
a_2	$\frac{(-1+r)^2 r^2}{(r+4)^2 (r+5)^2}$	36
a_3	$\frac{(-1+r)^2 r^2 (r+1)^2}{(r+4)^2 (r+5)^2 (6+r)^2}$	16
a_4	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2}{(r+4)^2 (r+5)^2 (6+r)^2 (7+r)^2}$	1
a_5	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}{(r+4)^2 (r+5)^2 (6+r)^2 (7+r)^2 (8+r)^2}$	0
a_6	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}{(9+r)^2 (8+r)^2 (7+r)^2 (6+r)^2 (r+5)^2}$	0

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}{(r+10)^2 (6+r)^2 (7+r)^2 (8+r)^2 (9+r)^2}$$

Which for the root $r = -3$ becomes

$$a_7 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{(-1+r)^2}{(r+4)^2}$	16
a_2	$\frac{(-1+r)^2 r^2}{(r+4)^2 (r+5)^2}$	36
a_3	$\frac{(-1+r)^2 r^2 (r+1)^2}{(r+4)^2 (r+5)^2 (6+r)^2}$	16
a_4	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2}{(r+4)^2 (r+5)^2 (6+r)^2 (7+r)^2}$	1
a_5	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}{(r+4)^2 (r+5)^2 (6+r)^2 (7+r)^2 (8+r)^2}$	0
a_6	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}{(9+r)^2 (8+r)^2 (7+r)^2 (6+r)^2 (r+5)^2}$	0
a_7	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}{(r+10)^2 (6+r)^2 (7+r)^2 (8+r)^2 (9+r)^2}$	0

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \frac{1}{x^3}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 \ldots\right) \\
&= \frac{x^4 + 16x^3 + 36x^2 + 16x + 1 + O(x^8)}{x^3}
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = -3$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{(-1+r)^2}{(r+4)^2}$	16	$\frac{-10+10r}{(r+4)^3}$
b_2	$\frac{(-1+r)^2 r^2}{(r+4)^2 (r+5)^2}$	36	$\frac{20r(-1+r)(r^2+4r-2)}{(r+4)^3 (r+5)^3}$
b_3	$\frac{(-1+r)^2 r^2 (r+1)^2}{(r+4)^2 (r+5)^2 (6+r)^2}$	16	$\frac{30r(r^4+10r^3+25r^2-8)(r^2-1)}{(r+4)^3 (r+5)^3 (6+r)^3}$
b_4	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2}{(r+4)^2 (r+5)^2 (6+r)^2 (7+r)^2}$	1	$\frac{40r(r+2)(r^6+18r^5+115r^4+300r^3+238r^2-84r-84)(r^2-1)}{(r+4)^3 (r+5)^3 (6+r)^3 (7+r)^3}$
b_5	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}{(r+4)^2 (r+5)^2 (6+r)^2 (7+r)^2 (8+r)^2}$	0	$\frac{50(r+2)(r^8+28r^7+314r^6+1792r^5+5417r^4+7924r^3+3340r^2-2688r-\frac{8064}{5})(r+3)(r+1)r(}{(r+4)^3 (r+5)^3 (6+r)^3 (7+r)^3 (8+r)^3}$
b_6	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}{(9+r)^2 (8+r)^2 (7+r)^2 (6+r)^2 (r+5)^2}$	0	$\frac{60r(r+2)(r+3)(r^8+32r^7+408r^6+2624r^5+8813r^4+14032r^3+6346r^2-5040r-3024)(r^2-}{(9+r)^3 (8+r)^3 (7+r)^3 (6+r)^3 (r+5)^3}$
b_7	$\frac{(-1+r)^2 r^2 (r+1)^2 (r+2)^2 (r+3)^2}{(r+10)^2 (6+r)^2 (7+r)^2 (8+r)^2 (9+r)^2}$	0	$\frac{70r(r+2)(r+3)(r^2+9r+12)(r^6+27r^5+259r^4+1017r^3+1252r^2-396r-432)(-1+r)(r+1)}{(r+10)^3 (6+r)^3 (7+r)^3 (8+r)^3 (9+r)^3}$

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x) \ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \dots \\
&= \frac{(x^4 + 16x^3 + 36x^2 + 16x + 1 + O(x^8)) \ln(x)}{x^3} + \frac{-150x^2 - 40x - \frac{280x^3}{3} - \frac{25x^4}{3} + O(x^8)}{x^3}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= \frac{c_1 (x^4 + 16x^3 + 36x^2 + 16x + 1 + O(x^8))}{x^3} \\
&\quad + c_2 \left(\frac{(x^4 + 16x^3 + 36x^2 + 16x + 1 + O(x^8)) \ln(x)}{x^3} \right. \\
&\quad \left. + \frac{-150x^2 - 40x - \frac{280x^3}{3} - \frac{25x^4}{3} + O(x^8)}{x^3} \right)
\end{aligned}
$$

Hence the final solution is

$$
y = y_h
$$

$$
\begin{aligned}
&= \frac{c_1(x^4+16x^3+36x^2+16x+1+O(x^8))}{x^3} \\
&\quad + c_2\left(\frac{(x^4+16x^3+36x^2+16x+1+O(x^8))\ln(x)}{x^3}\right. \\
&\quad \left. + \frac{-150x^2-40x-\frac{280x^3}{3}-\frac{25x^4}{3}+O(x^8)}{x^3}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= \frac{c_1(x^4+16x^3+36x^2+16x+1+O(x^8))}{x^3} \\
&\quad + c_2\left(\frac{(x^4+16x^3+36x^2+16x+1+O(x^8))\ln(x)}{x^3}\right. \\
&\quad \left. + \frac{-150x^2-40x-\frac{280x^3}{3}-\frac{25x^4}{3}+O(x^8)}{x^3}\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= \frac{c_1(x^4+16x^3+36x^2+16x+1+O(x^8))}{x^3} \\
&\quad + c_2\left(\frac{(x^4+16x^3+36x^2+16x+1+O(x^8))\ln(x)}{x^3}\right. \\
&\quad \left. + \frac{-150x^2-40x-\frac{280x^3}{3}-\frac{25x^4}{3}+O(x^8)}{x^3}\right)
\end{aligned}
$$

Verified OK.

15.31.1 Maple step by step solution

Let's solve

$-y''x^2(x-1)+(x^2+7x)\,y'+(9-x)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(-9+x)y}{x^2(x-1)}+\frac{(7+x)y'}{x(x-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y'' - \frac{(7+x)y'}{x(x-1)} + \frac{(-9+x)y}{x^2(x-1)} = 0$

☐ Check to see if x_0 is a regular singular point

- Define functions

  $\left[P_2(x) = -\frac{7+x}{x(x-1)}, P_3(x) = \frac{-9+x}{x^2(x-1)}\right]$

- $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\Big|_{x=0} = 7$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\Big|_{x=0} = 9$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $y''x^2(x-1) - x(7+x)\,y' + y(-9+x) = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k- >k-m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$

- Shift index using $k- >k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k->k+2-m$

  $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$-a_0(3+r)^2 x^r + \left(\sum_{k=1}^{\infty} \left(-a_k(k+r+3)^2 + a_{k-1}(k-2+r)^2\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$-(3+r)^2 = 0$$

- Values of r that satisfy the indicial equation

  $$r = -3$$

- Each term in the series must be 0, giving the recursion relation

  $$-a_k(k+r+3)^2 + a_{k-1}(k-2+r)^2 = 0$$

- Shift index using $k->k+1$

  $$-a_{k+1}(k+4+r)^2 + a_k(k+r-1)^2 = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+1} = \frac{a_k(k+r-1)^2}{(k+4+r)^2}$$

- Recursion relation for $r=-3$; series terminates at $k=4$

  $$a_{k+1} = \frac{a_k(k-4)^2}{(k+1)^2}$$

- Apply recursion relation for $k=0$

  $$a_1 = 16a_0$$

- Apply recursion relation for $k=1$

  $$a_2 = \frac{9a_1}{4}$$

- Express in terms of a_0

  $$a_2 = 36a_0$$

- Apply recursion relation for $k=2$

  $$a_3 = \frac{4a_2}{9}$$

- Express in terms of a_0

  $$a_3 = 16a_0$$

- Apply recursion relation for $k = 3$

  $a_4 = \frac{a_3}{16}$
- Express in terms of a_0

  $a_4 = a_0$
- Terminating series solution of the ODE for $r = -3$. Use reduction of order to find the second

  $y = a_0 \cdot (x^4 + 16x^3 + 36x^2 + 16x + 1)$

Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 28.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' - x(-x^2+1)\,y' + y(x^2+1) = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + (x^3 - x)\,y' + y(x^2+1) = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{x^2-1}{x}$$
$$q(x) = \frac{x^2+1}{x^2}$$

Table 706: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x^2-1}{x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{x^2+1}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2 y'' + (x^3 - x)\, y' + y(x^2 + 1) = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}\right) + (x^3 - x) \left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) (x^2 + 1) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n = \sum_{n=2}^{\infty} a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(-1+r)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(-1+r)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+1}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+1}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) + a_{n-2}(n+r-2) - a_n(n+r) + a_{n-2} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}}{n+r-1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{a_{n-2}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{1}{1+r}$$

Which for the root $r = 1$ becomes

$$a_2 = -\frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{(1+r)(3+r)}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{1}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{1}{(1+r)(3+r)}$	$\frac{1}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{1}{(1+r)(3+r)}$	$\frac{1}{8}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = 1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r=1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$	$\frac{1}{(1+r)^2}$	$\frac{1}{4}$
b_3	0	0	0	0
b_4	$\frac{1}{(1+r)(3+r)}$	$\frac{1}{8}$	$\frac{-4-2r}{(1+r)^2(3+r)^2}$	$-\frac{3}{32}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)\ln(x) + x\left(\frac{x^2}{4} - \frac{3x^4}{32} + O(x^6)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \\
&\quad + c_2\left(x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)\ln(x) + x\left(\frac{x^2}{4} - \frac{3x^4}{32} + O(x^6)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \\
&\quad + c_2 \left(x \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \ln(x) + x \left(\frac{x^2}{4} - \frac{3x^4}{32} + O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \\
&\quad + c_2 \left(x \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \ln(x) + x \left(\frac{x^2}{4} - \frac{3x^4}{32} + O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \\
&\quad + c_2 \left(x \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \ln(x) + x \left(\frac{x^2}{4} - \frac{3x^4}{32} + O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.32.1 Maple step by step solution

Let's solve

$x^2 y'' + (x^3 - x) y' + y(x^2 + 1) = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(x^2+1)y}{x^2} - \frac{(x^2-1)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 29.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2+1)\,y''-3x(-x^2+1)\,y'+4y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+x^2)\,y''+(3x^3-3x)\,y'+4y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{3x^2-3}{x\,(x^2+1)}$$
$$q(x)=\frac{4}{x^2\,(x^2+1)}$$

Table 708: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3x^2-3}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{4}{x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2 (x^2 + 1) y'' + (3x^3 - 3x) y' + 4y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 (x^2 + 1) \left(\sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2} \right) + (3x^3 - 3x) \left(\sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1} \right) + 4 \left(\sum_{n=0}^{\infty} a_n x^{n+r} \right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) \\ + \left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r) x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 3a_{n-2} (n+r-2) x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) \\ + \left(\sum_{n=2}^{\infty} 3a_{n-2} (n+r-2) x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - 3x^{n+r} a_n (n+r) + 4a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - 3x^r a_0 r + 4a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - 3x^r r + 4x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r-2)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r-2)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 2$$
$$r_2 = 2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r-2)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 2$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+2}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+2}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&a_{n-2}(n+r-2)(n-3+r)+a_n(n+r)(n+r-1) \\
&+3a_{n-2}(n+r-2)-3a_n(n+r)+4a_n=0
\end{aligned} \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = -\frac{(n+r)\, a_{n-2}}{n+r-2} \tag{4}
$$

Which for the root $r=2$ becomes

$$
a_n = -\frac{(n+2)\, a_{n-2}}{n} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r=2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n=2$, using the above recursive equation gives

$$
a_2 = \frac{-2-r}{r}
$$

Which for the root $r=2$ becomes

$$
a_2 = -2
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{r}$	-2

For $n=3$, using the above recursive equation gives

$$
a_3 = 0
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{r}$	-2
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4+r}{r}$$

Which for the root $r = 2$ becomes

$$a_4 = 3$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{r}$	-2
a_3	0	0
a_4	$\frac{4+r}{r}$	3

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{r}$	-2
a_3	0	0
a_4	$\frac{4+r}{r}$	3
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^2 \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^2 \left(1 - 2x^2 + 3x^4 + O(x^6)\right)
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = 2$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r=2)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{-2-r}{r}$	-2	$\frac{2}{r^2}$	$\frac{1}{2}$
b_3	0	0	0	0
b_4	$\frac{4+r}{r}$	3	$-\frac{4}{r^2}$	-1
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x) \ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= x^2 \left(1 - 2x^2 + 3x^4 + O(x^6)\right) \ln(x) + x^2 \left(\frac{x^2}{2} - x^4 + O(x^6)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^2 \left(1 - 2x^2 + 3x^4 + O(x^6)\right) \\
&\quad + c_2 \left(x^2 \left(1 - 2x^2 + 3x^4 + O(x^6)\right) \ln(x) + x^2 \left(\frac{x^2}{2} - x^4 + O(x^6)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^2 \left(1 - 2x^2 + 3x^4 + O(x^6)\right) \\
&\quad + c_2 \left(x^2 \left(1 - 2x^2 + 3x^4 + O(x^6)\right) \ln(x) + x^2 \left(\frac{x^2}{2} - x^4 + O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^2 \left(1 - 2x^2 + 3x^4 + O(x^6)\right) \\
&\quad + c_2 \left(x^2 \left(1 - 2x^2 + 3x^4 + O(x^6)\right) \ln(x) + x^2 \left(\frac{x^2}{2} - x^4 + O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x^2 \left(1 - 2x^2 + 3x^4 + O(x^6)\right) \\
&\quad + c_2 \left(x^2 \left(1 - 2x^2 + 3x^4 + O(x^6)\right) \ln(x) + x^2 \left(\frac{x^2}{2} - x^4 + O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.33.1 Maple step by step solution

Let's solve

$x^2(x^2+1)\,y'' + (3x^3 - 3x)\,y' + 4y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

Regular singular points : $[\infty, -\infty, 0]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2y'' + 2x^3y' + (3x^2 + 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2 \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + 2x^3 \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (3x^2+1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{2+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{2+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{2+n+r} a_n (n+r) = \sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{2+n+r} a_n = \sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r)(n+r-1) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$4x^r a_0 r(-1+r) + a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(2r-1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(2r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = \frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(2r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{2}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{2}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$4a_n(n+r)(n+r-1) + 2a_{n-2}(n+r-2) + 3a_{n-2} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}}{2n+2r-1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{a_{n-2}}{2n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{1}{3+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = -\frac{1}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{3+2r}$	$-\frac{1}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{3+2r}$	$-\frac{1}{4}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{4r^2 + 20r + 21}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{1}{32}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{3+2r}$	$-\frac{1}{4}$
a_3	0	0
a_4	$\frac{1}{4r^2+20r+21}$	$\frac{1}{32}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{3+2r}$	$-\frac{1}{4}$
a_3	0	0
a_4	$\frac{1}{4r^2+20r+21}$	$\frac{1}{32}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned}y_1(x) &= \sqrt{x}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6\dots\right)\\ &= \sqrt{x}\left(1 - \frac{x^2}{4} + \frac{x^4}{32} + O\left(x^6\right)\right)\end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr}a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{2}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$	$b_n\left(r = \frac{1}{2}\right)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$-\frac{1}{3+2r}$	$-\frac{1}{4}$	$\frac{2}{(3+2r)^2}$	$\frac{1}{8}$
b_3	0	0	0	0
b_4	$\frac{1}{4r^2+20r+21}$	$\frac{1}{32}$	$\frac{-20-8r}{(4r^2+20r+21)^2}$	$-\frac{3}{128}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6\dots\\ &= \sqrt{x}\left(1 - \frac{x^2}{4} + \frac{x^4}{32} + O\left(x^6\right)\right)\ln(x) + \sqrt{x}\left(\frac{x^2}{8} - \frac{3x^4}{128} + O\left(x^6\right)\right)\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x) &= c_1y_1(x) + c_2y_2(x)\\ &= c_1\sqrt{x}\left(1 - \frac{x^2}{4} + \frac{x^4}{32} + O\left(x^6\right)\right)\\ &\quad + c_2\left(\sqrt{x}\left(1 - \frac{x^2}{4} + \frac{x^4}{32} + O\left(x^6\right)\right)\ln(x) + \sqrt{x}\left(\frac{x^2}{8} - \frac{3x^4}{128} + O\left(x^6\right)\right)\right)\end{aligned}$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1\sqrt{x}\left(1-\frac{x^2}{4}+\frac{x^4}{32}+O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1-\frac{x^2}{4}+\frac{x^4}{32}+O(x^6)\right)\ln(x)+\sqrt{x}\left(\frac{x^2}{8}-\frac{3x^4}{128}+O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1\sqrt{x}\left(1-\frac{x^2}{4}+\frac{x^4}{32}+O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1-\frac{x^2}{4}+\frac{x^4}{32}+O(x^6)\right)\ln(x)+\sqrt{x}\left(\frac{x^2}{8}-\frac{3x^4}{128}+O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1\sqrt{x}\left(1-\frac{x^2}{4}+\frac{x^4}{32}+O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1-\frac{x^2}{4}+\frac{x^4}{32}+O(x^6)\right)\ln(x)+\sqrt{x}\left(\frac{x^2}{8}-\frac{3x^4}{128}+O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.34.1 Maple step by step solution

Let's solve

$4x^2y''+2x^3y'+(3x^2+1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{y'x}{2}-\frac{(3x^2+1)y}{4x^2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{y'x}{2}+\frac{(3x^2+1)y}{4x^2}=0$

☐ Check to see if $x_0=0$ is a regular singular point

- ○ Define functions

$\left[P_2(x) = \frac{x}{2}, P_3(x) = \frac{3x^2+1}{4x^2}\right]$

- $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\bigg|_{x=0} = 0$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\bigg|_{x=0} = \frac{1}{4}$

- $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $4x^2y'' + 2x^3y' + (3x^2 + 1)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k- >k - m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^3 \cdot y'$ to series expansion

  $x^3 \cdot y' = \sum_{k=0}^{\infty} a_k (k + r)\, x^{k+r+2}$

- Shift index using $k- >k - 2$

  $x^3 \cdot y' = \sum_{k=2}^{\infty} a_{k-2} (k - 2 + r)\, x^{k+r}$

- Convert $x^2 \cdot y''$ to series expansion

  $x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k + r)\,(k + r - 1)\, x^{k+r}$

  Rewrite ODE with series expansions

$$a_0(-1+2r)^2 x^r + a_1(1+2r)^2 x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(2k+2r-1)^2 + a_{k-2}(2k+2r-1)\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(-1+2r)^2 = 0$
- Values of r that satisfy the indicial equation

  $r = \frac{1}{2}$
- Each term must be 0

  $a_1(1+2r)^2 = 0$
- Solve for the dependent coefficient(s)

  $a_1 = 0$
- Each term in the series must be 0, giving the recursion relation

  $a_k(2k+2r-1)^2 + a_{k-2}(2k+2r-1) = 0$
- Shift index using $k- >k+2$

  $a_{k+2}(2k+2r+3)^2 + a_k(2k+2r+3) = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{a_k}{2k+2r+3}$
- Recursion relation for $r = \frac{1}{2}$

  $a_{k+2} = -\frac{a_k}{2k+4}$
- Solution for $r = \frac{1}{2}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+2} = -\frac{a_k}{2k+4}, a_1 = 0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 31.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2+1)\,y''-x(-2x^2+1)\,y'+y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+x^2)\,y''+(2x^3-x)\,y'+y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{2x^2-1}{x\,(x^2+1)}$$
$$q(x)=\frac{1}{x^2\,(x^2+1)}$$

Table 712: Table $p(x), q(x)$ singularites.

$p(x) = \frac{2x^2-1}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{1}{x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+1)\,y'' + (2x^3 - x)\,y' + y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (2x^3 - x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r}$$

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 2a_{n-2}(n+r-2) x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2) x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(-1+r)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(-1+r)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+1}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+1}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-2}(n+r-2)\,(n-3+r)+a_n(n+r)\,(n+r-1) \\ +2a_{n-2}(n+r-2)-a_n(n+r)+a_n=0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}(n+r-2)}{n+r-1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{a_{n-2}(n-1)}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{r}{1+r}$$

Which for the root $r = 1$ becomes

$$a_2 = -\frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r}{1+r}$	$-\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r}{1+r}$	$-\frac{1}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r(2+r)}{(3+r)(1+r)}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{3}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r}{1+r}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{r(2+r)}{(3+r)(1+r)}$	$\frac{3}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r}{1+r}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{r(2+r)}{(3+r)(1+r)}$	$\frac{3}{8}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned}y_1(x) &= x\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right)\\ &= x\left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)\end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r = 1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$-\frac{r}{1+r}$	$-\frac{1}{2}$	$-\frac{1}{(1+r)^2}$	$-\frac{1}{4}$
b_3	0	0	0	0
b_4	$\frac{r(2+r)}{(3+r)(1+r)}$	$\frac{3}{8}$	$\frac{2r^2+6r+6}{(1+r)^2(3+r)^2}$	$\frac{7}{32}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6 \dots\\ &= x\left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)\ln(x) + x\left(-\frac{x^2}{4} + \frac{7x^4}{32} + O(x^6)\right)\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x) &= c_1y_1(x) + c_2y_2(x)\\ &= c_1x\left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)\\ &\quad + c_2\left(x\left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)\ln(x) + x\left(-\frac{x^2}{4} + \frac{7x^4}{32} + O(x^6)\right)\right)\end{aligned}$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x \left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right) \\
&\quad + c_2 \left(x \left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right) \ln(x) + x \left(-\frac{x^2}{4} + \frac{7x^4}{32} + O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x \left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right) \\
&\quad + c_2 \left(x \left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right) \ln(x) + x \left(-\frac{x^2}{4} + \frac{7x^4}{32} + O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x \left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right) \\
&\quad + c_2 \left(x \left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right) \ln(x) + x \left(-\frac{x^2}{4} + \frac{7x^4}{32} + O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.35.1 Maple step by step solution

Let's solve

$x^2(x^2+1)\, y'' + (2x^3 - x)\, y' + y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{y}{x^2(x^2+1)} - \frac{(2x^2-1)y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(2x^2-1)y'}{x(x^2+1)} + \frac{y}{x^2(x^2+1)} = 0$

□ Check to see if x_0 is a regular singular point

  ○ Define functions

$\left[P_2(x) = \frac{2x^2-1}{x(x^2+1)}, P_3(x) = \frac{1}{x^2(x^2+1)}\right]$

- $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\bigg|_{x=0} = -1$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\bigg|_{x=0} = 1$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2(x^2+1)\, y'' + x(2x^2-1)\, y' + y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

- Shift index using $k- >k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k- >k+2-m$

  $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(-1+r)^2\, x^r + a_1 r^2 x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(k+r-1)^2 + a_{k-2}(k-2+r)\,(k+r-1)\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$(-1+r)^2 = 0$

- Values of r that satisfy the indicial equation

  $r = 1$

- Each term must be 0

  $a_1 r^2 = 0$

- Solve for the dependent coefficient(s)

  $a_1 = 0$

- Each term in the series must be 0, giving the recursion relation

  $(k+r-1)(a_k(k+r-1) + a_{k-2}(k-2+r)) = 0$

- Shift index using $k- >k+2$

  $(k+r+1)(a_{k+2}(k+r+1) + a_k(k+r)) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{a_k(k+r)}{k+r+1}$

- Recursion relation for $r = 1$

  $a_{k+2} = -\frac{a_k(k+1)}{k+2}$

- Solution for $r = 1$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+2} = -\frac{a_k(k+1)}{k+2}, a_1 = 0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 32.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2(x^2+2)\,y''+7x^3y'+(3x^2+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(2x^4+4x^2)\,y''+7x^3y'+(3x^2+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{7x}{2(x^2+2)}$$
$$q(x)=\frac{3x^2+1}{2x^2(x^2+2)}$$

Table 714: Table $p(x), q(x)$ singularites.

$p(x) = \frac{7x}{2(x^2+2)}$	
singularity	type
$x = -i\sqrt{2}$	"regular"
$x = i\sqrt{2}$	"regular"

$q(x) = \frac{3x^2+1}{2x^2(x^2+2)}$	
singularity	type
$x = 0$	"regular"
$x = -i\sqrt{2}$	"regular"
$x = i\sqrt{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-i\sqrt{2}, i\sqrt{2}, 0, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2(x^2+2)y'' + 7x^3y' + (3x^2+1)y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2(x^2+2)\left(\sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}\right) + 7x^3\left(\sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}\right) + (3x^2+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 7x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 7x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 7a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{n+r+2} a_n = \sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 7a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r)(n+r-1) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) + a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(2r-1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(2r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = \frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(2r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{2}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{2}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$2a_{n-2}(n+r-2)(n-3+r) + 4a_n(n+r)(n+r-1) + 7a_{n-2}(n+r-2) + 3a_{n-2} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r-1)\,a_{n-2}}{-1+2n+2r} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{(2n-1)\,a_{n-2}}{4n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-1-r}{3+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = -\frac{3}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{3+2r}$	$-\frac{3}{8}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{3+2r}$	$-\frac{3}{8}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 + 4r + 3}{4r^2 + 20r + 21}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{21}{128}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{3+2r}$	$-\frac{3}{8}$
a_3	0	0
a_4	$\frac{r^2+4r+3}{4r^2+20r+21}$	$\frac{21}{128}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{3+2r}$	$-\frac{3}{8}$
a_3	0	0
a_4	$\frac{r^2+4r+3}{4r^2+20r+21}$	$\frac{21}{128}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= \sqrt{x}\left(1 - \frac{3x^2}{8} + \frac{21x^4}{128} + O\left(x^6\right)\right)
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = \frac{1}{2}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n\left(r = \frac{1}{2}\right)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{-1-r}{3+2r}$	$-\frac{3}{8}$	$-\frac{1}{(3+2r)^2}$	$-\frac{1}{16}$
b_3	0	0	0	0
b_4	$\frac{r^2+4r+3}{4r^2+20r+21}$	$\frac{21}{128}$	$\frac{4r^2+18r+24}{(4r^2+20r+21)^2}$	$\frac{17}{512}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= \sqrt{x}\left(1 - \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right)\ln(x) + \sqrt{x}\left(-\frac{x^2}{16} + \frac{17x^4}{512} + O(x^6)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1\sqrt{x}\left(1 - \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1 - \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right)\ln(x) + \sqrt{x}\left(-\frac{x^2}{16} + \frac{17x^4}{512} + O(x^6)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1\sqrt{x}\left(1 - \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1 - \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right)\ln(x) + \sqrt{x}\left(-\frac{x^2}{16} + \frac{17x^4}{512} + O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1\sqrt{x}\left(1 - \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1 - \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right)\ln(x) + \sqrt{x}\left(-\frac{x^2}{16} + \frac{17x^4}{512} + O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1\sqrt{x}\left(1 - \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1 - \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right)\ln(x) + \sqrt{x}\left(-\frac{x^2}{16} + \frac{17x^4}{512} + O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $\left.(x\cdot P_2(x))\right|_{x=0}=0$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $\left.(x^2\cdot P_3(x))\right|_{x=0}=\frac{1}{4}$

  - $x=0$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0=0$

- Multiply by denominators

  $2x^2(x^2+2)\,y''+7x^3y'+(3x^2+1)\,y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_kx^{k+r}$

☐ Rewrite ODE with series expansions

  - Convert $x^m\cdot y$ to series expansion for $m=0..2$

    $x^m\cdot y=\sum_{k=0}^{\infty}a_kx^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^{3}\cdot y'$ to series expansion

  $x^{3}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\, x^{k+r+2}$

- Shift index using $k->k-2$

  $x^{3}\cdot y'=\sum_{k=2}^{\infty} a_{k-2}(k-2+r)\, x^{k+r}$

- Convert $x^{m}\cdot y''$ to series expansion for $m=2..4$

  $x^{m}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m}\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}(-1+2r)^{2} x^{r}+a_{1}(1+2r)^{2} x^{1+r}+\left(\sum_{k=2}^{\infty} \left(a_{k}(2k+2r-1)^{2}+a_{k-2}(2k+2r-1)\,(k+r-1)\right) x$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $(-1+2r)^{2}=0$

- Values of r that satisfy the indicial equation

  $r=\frac{1}{2}$

- Each term must be 0

  $a_{1}(1+2r)^{2}=0$

- Solve for the dependent coefficient(s)

  $a_{1}=0$

- Each term in the series must be 0, giving the recursion relation

  $4\left(k+r-\frac{1}{2}\right)\left(\frac{a_{k-2}(k+r-1)}{2}+a_{k}\left(k+r-\frac{1}{2}\right)\right)=0$

- Shift index using $k->k+2$

  $4\left(k+\frac{3}{2}+r\right)\left(\frac{a_{k}(k+r+1)}{2}+a_{k+2}\left(k+\frac{3}{2}+r\right)\right)=0$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{a_k(k+r+1)}{2k+2r+3}$$

- Recursion relation for $r = \frac{1}{2}$

$$a_{k+2} = -\frac{a_k\left(k+\frac{3}{2}\right)}{2k+4}$$

- Solution for $r = \frac{1}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+2} = -\frac{a_k\left(k+\frac{3}{2}\right)}{2k+4}, a_1 = 0\right]$$

Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 33.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2+1)\,y''-x(-4x^2+1)\,y'+y(2x^2+1)=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+x^2)\,y''+(4x^3-x)\,y'+y(2x^2+1)=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{4x^2-1}{x\,(x^2+1)}\\ q(x)&=\frac{2x^2+1}{x^2\,(x^2+1)}\end{aligned}$$

Table 716: Table $p(x), q(x)$ singularites.

$p(x) = \frac{4x^2-1}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{2x^2+1}{x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+1)\,y'' + (4x^3 - x)\,y' + y(2x^2+1) = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)(n+r-1)\,a_n x^{n+r-2}\right) + (4x^3 - x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)(2x^2+1) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r)\right)+\sum_{n=0}^{\infty}\left(-x^{n+r} a_n (n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1) &= \sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r} \\
\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r) &= \sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 2x^{n+r+2} a_n &= \sum_{n=2}^{\infty} 2a_{n-2} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right)+\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+\left(\sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)\, x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-x^{n+r} a_n (n+r)\right) \\
&+\left(\sum_{n=2}^{\infty} 2a_{n-2} x^{n+r}\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)=0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
x^{n+r} a_n (n+r)(n+r-1) - x^{n+r} a_n (n+r) + a_n x^{n+r} = 0
$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - x^r a_0 r + a_0 x^r = 0$$

Or

$$(x^r r(-1+r) - x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(-1+r)^2\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(-1+r)^2\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 1$, Eqs (1A,1B) become

$$
\begin{aligned}
y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+1} \\
y_2(x) &= y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+1}\right)
\end{aligned}
$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
a_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&a_{n-2}(n+r-2)(n-3+r) + a_n(n+r)(n+r-1) \\
&+ 4a_{n-2}(n+r-2) - a_n(n+r) + 2a_{n-2} + a_n = 0
\end{aligned} \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = -\frac{(n+r)\, a_{n-2}}{n+r-1} \tag{4}
$$

Which for the root $r = 1$ becomes

$$
a_n = -\frac{(n+1)\, a_{n-2}}{n} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$
a_2 = \frac{-2-r}{1+r}
$$

Which for the root $r = 1$ becomes

$$
a_2 = -\frac{3}{2}
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{1+r}$	$-\frac{3}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{1+r}$	$-\frac{3}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 + 6r + 8}{(3 + r)(1 + r)}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{15}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{1+r}$	$-\frac{3}{2}$
a_3	0	0
a_4	$\frac{r^2+6r+8}{(3+r)(1+r)}$	$\frac{15}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{1+r}$	$-\frac{3}{2}$
a_3	0	0
a_4	$\frac{r^2+6r+8}{(3+r)(1+r)}$	$\frac{15}{8}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= x\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$	$b_n(r = 1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{-2-r}{1+r}$	$-\frac{3}{2}$	$\frac{1}{(1+r)^2}$	$\frac{1}{4}$
b_3	0	0	0	0
b_4	$\frac{r^2+6r+8}{(3+r)(1+r)}$	$\frac{15}{8}$	$\frac{-2r^2-10r-14}{(1+r)^2(3+r)^2}$	$-\frac{13}{32}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= x\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)\right)\ln(x) + x\left(\frac{x^2}{4} - \frac{13x^4}{32} + O(x^6)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)\right) \\
&\quad + c_2\left(x\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)\right)\ln(x) + x\left(\frac{x^2}{4} - \frac{13x^4}{32} + O(x^6)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)\right) \\
&\quad + c_2\left(x\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)\right)\ln(x) + x\left(\frac{x^2}{4} - \frac{13x^4}{32} + O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)\right) \\
&\quad + c_2\left(x\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)\right)\ln(x) + x\left(\frac{x^2}{4} - \frac{13x^4}{32} + O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)\right) \\
&\quad + c_2\left(x\left(1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)\right)\ln(x) + x\left(\frac{x^2}{4} - \frac{13x^4}{32} + O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.37.1 Maple step by step solution

Let's solve

$x^2(x^2+1)\,y''+(4x^3-x)\,y'+y(2x^2+1)=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{y(2x^2+1)}{x^2(x^2+1)}-\frac{(4x^2-1)y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(4x^2-1)y'}{x(x^2+1)}+\frac{y(2x^2+1)}{x^2(x^2+1)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{4x^2-1}{x(x^2+1)}, P_3(x)=\frac{2x^2+1}{x^2(x^2+1)}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $(x\cdot P_2(x))\Big|_{x=0}=-1$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $(x^2\cdot P_3(x))\Big|_{x=0}=1$

  - $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $x^2(x^2+1)\,y''+x(4x^2-1)\,y'+y(2x^2+1)=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m\cdot y$ to series expansion for $m=0..2$

    $x^m\cdot y=\sum_{k=0}^{\infty}a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..3$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^{m}\cdot y''$ to series expansion for $m=2..4$

  $x^{m}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m}\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}(-1+r)^{2} x^{r}+a_{1} r^{2} x^{1+r}+\left(\sum_{k=2}^{\infty}\left(a_{k}(k+r-1)^{2}+a_{k-2}(k+r)\,(k+r-1)\right) x^{k+r}\right)=0$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $(-1+r)^{2}=0$

- Values of r that satisfy the indicial equation

  $r=1$

- Each term must be 0

  $a_{1} r^{2}=0$

- Solve for the dependent coefficient(s)

  $a_{1}=0$

- Each term in the series must be 0, giving the recursion relation

  $(k+r-1)\left(a_{k}(k+r-1)+a_{k-2}(k+r)\right)=0$

- Shift index using $k->k+2$

  $(k+r+1)\left(a_{k+2}(k+r+1)+a_{k}(k+r+2)\right)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{a_{k}(k+r+2)}{k+r+1}$

- Recursion relation for $r = 1$

  $a_{k+2} = -\frac{a_k(k+3)}{k+2}$

- Solution for $r = 1$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+2} = -\frac{a_k(k+3)}{k+2}, a_1 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 34.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

`[[_2nd_order, _with_linear_symmetries]]`

$$\boxed{4x^2(x^2+4)\,y''+3x(3x^2+8)\,y'+(-9x^2+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(4x^4+16x^2)\,y''+(9x^3+24x)\,y'+(-9x^2+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{\frac{9x^2}{4}+6}{x\,(x^2+4)}$$
$$q(x)=-\frac{9x^2-1}{4x^2\,(x^2+4)}$$

Table 718: Table $p(x), q(x)$ singularites.

$p(x) = \frac{\frac{9x^2}{4}+6}{x(x^2+4)}$	
singularity	type
$x = 0$	"regular"
$x = -2i$	"regular"
$x = 2i$	"regular"

$q(x) = -\frac{9x^2-1}{4x^2(x^2+4)}$	
singularity	type
$x = 0$	"regular"
$x = -2i$	"regular"
$x = 2i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -2i, 2i, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2(x^2+4)\, y'' + (9x^3+24x)\, y' + (-9x^2+1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2(x^2+4)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (9x^3+24x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (-9x^2+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} 16x^{n+r} a_n (n+r) (n+r-1)\right)$$
$$+ \left(\sum_{n=0}^{\infty} 9x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 24x^{n+r} a_n (n+r)\right) \tag{2A}$$
$$+ \sum_{n=0}^{\infty} \left(-9x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r) (n+r-1) = \sum_{n=2}^{\infty} 4a_{n-2} (n+r-2) (n-3+r) x^{n+r}$$

$$\sum_{n=0}^{\infty} 9x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 9a_{n-2} (n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-9x^{n+r+2} a_n\right) = \sum_{n=2}^{\infty} \left(-9a_{n-2} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 4a_{n-2} (n+r-2) (n-3+r) x^{n+r}\right)$$
$$+ \left(\sum_{n=0}^{\infty} 16x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=2}^{\infty} 9a_{n-2} (n+r-2) x^{n+r}\right) \tag{2B}$$
$$+ \left(\sum_{n=0}^{\infty} 24x^{n+r} a_n (n+r)\right) + \sum_{n=2}^{\infty} \left(-9a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$16x^{n+r} a_n (n+r) (n+r-1) + 24x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$16x^r a_0 r(-1+r) + 24x^r a_0 r + a_0 x^r = 0$$

Or

$$(16x^r r(-1+r) + 24x^r r + x^r) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(4r+1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(4r+1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -\frac{1}{4}$$
$$r_2 = -\frac{1}{4}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(4r+1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -\frac{1}{4}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-\frac{1}{4}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-\frac{1}{4}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} 4a_{n-2}(n+r-2)(n-3+r) + 16a_n(n+r)(n+r-1) \\ + 9a_{n-2}(n+r-2) + 24a_n(n+r) - 9a_{n-2} + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n-3+r)\, a_{n-2}}{1+4n+4r} \tag{4}$$

Which for the root $r = -\frac{1}{4}$ becomes

$$a_n = -\frac{(4n-13)\, a_{n-2}}{16n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -\frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1-r}{9+4r}$$

Which for the root $r = -\frac{1}{4}$ becomes

$$a_2 = \frac{5}{32}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-r}{9+4r}$	$\frac{5}{32}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-r}{9+4r}$	$\frac{5}{32}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 - 1}{(17 + 4r)(9 + 4r)}$$

Which for the root $r = -\frac{1}{4}$ becomes

$$a_4 = -\frac{15}{2048}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-r}{9+4r}$	$\frac{5}{32}$
a_3	0	0
a_4	$\frac{r^2-1}{(17+4r)(9+4r)}$	$-\frac{15}{2048}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-r}{9+4r}$	$\frac{5}{32}$
a_3	0	0
a_4	$\frac{r^2-1}{(17+4r)(9+4r)}$	$-\frac{15}{2048}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \frac{1}{x^{\frac{1}{4}}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \frac{1 + \frac{5x^2}{32} - \frac{15x^4}{2048} + O(x^6)}{x^{\frac{1}{4}}} \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = -\frac{1}{4}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$	$b_n(r = -\frac{1}{4})$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{1-r}{9+4r}$	$\frac{5}{32}$	$-\frac{13}{(9+4r)^2}$	$-\frac{13}{64}$
b_3	0	0	0	0
b_4	$\frac{r^2-1}{(17+4r)(9+4r)}$	$-\frac{15}{2048}$	$\frac{104r^2+338r+104}{(17+4r)^2(9+4r)^2}$	$\frac{13}{8192}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6 \dots \\
&= \frac{\left(1 + \frac{5x^2}{32} - \frac{15x^4}{2048} + O(x^6)\right)\ln(x)}{x^{\frac{1}{4}}} + \frac{-\frac{13x^2}{64} + \frac{13x^4}{8192} + O(x^6)}{x^{\frac{1}{4}}}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1y_1(x) + c_2y_2(x) \\
&= \frac{c_1\left(1 + \frac{5x^2}{32} - \frac{15x^4}{2048} + O(x^6)\right)}{x^{\frac{1}{4}}} \\
&\quad + c_2\left(\frac{\left(1 + \frac{5x^2}{32} - \frac{15x^4}{2048} + O(x^6)\right)\ln(x)}{x^{\frac{1}{4}}} + \frac{-\frac{13x^2}{64} + \frac{13x^4}{8192} + O(x^6)}{x^{\frac{1}{4}}}\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(1 + \frac{5x^2}{32} - \frac{15x^4}{2048} + O(x^6)\right)}{x^{\frac{1}{4}}} \\
&\quad + c_2\left(\frac{\left(1 + \frac{5x^2}{32} - \frac{15x^4}{2048} + O(x^6)\right)\ln(x)}{x^{\frac{1}{4}}} + \frac{-\frac{13x^2}{64} + \frac{13x^4}{8192} + O(x^6)}{x^{\frac{1}{4}}}\right)
\end{aligned}
$$

Summary
The solution(s) found are the following

$$y = \frac{c_1\left(1+\frac{5x^2}{32}-\frac{15x^4}{2048}+O(x^6)\right)}{x^{\frac{1}{4}}} + c_2\left(\frac{\left(1+\frac{5x^2}{32}-\frac{15x^4}{2048}+O(x^6)\right)\ln(x)}{x^{\frac{1}{4}}}+\frac{-\frac{13x^2}{64}+\frac{13x^4}{8192}+O(x^6)}{x^{\frac{1}{4}}}\right) \tag{1}$$

Verification of solutions

$$y = \frac{c_1\left(1+\frac{5x^2}{32}-\frac{15x^4}{2048}+O(x^6)\right)}{x^{\frac{1}{4}}} + c_2\left(\frac{\left(1+\frac{5x^2}{32}-\frac{15x^4}{2048}+O(x^6)\right)\ln(x)}{x^{\frac{1}{4}}}+\frac{-\frac{13x^2}{64}+\frac{13x^4}{8192}+O(x^6)}{x^{\frac{1}{4}}}\right)$$

Verified OK.

15.38.1 Maple step by step solution

Let's solve

$4x^2(x^2+4)\,y''+(9x^3+24x)\,y'+(-9x^2+1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{(9x^2-1)y}{4x^2(x^2+4)}-\frac{3(3x^2+8)y'}{4x(x^2+4)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{3(3x^2+8)y'}{4x(x^2+4)}-\frac{(9x^2-1)y}{4x^2(x^2+4)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{3(3x^2+8)}{4x(x^2+4)}, P_3(x)=-\frac{9x^2-1}{4x^2(x^2+4)}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $\left(x\cdot P_2(x)\right)\bigg|_{x=0}=\frac{3}{2}$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = \frac{1}{16}$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $4x^2(x^2+4)\, y'' + 3x(3x^2+8)\, y' + (-9x^2+1)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k- >k - m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

- Shift index using $k- >k + 1 - m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k- >k + 2 - m$

  $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(1+4r)^2 x^r + a_1(5+4r)^2 x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(4k+4r+1)^2 + a_{k-2}(4k+4r+1)\,(k-3+r)\right) x^{k+}\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(1+4r)^2 = 0$
- Values of r that satisfy the indicial equation

  $r = -\frac{1}{4}$
- Each term must be 0

  $a_1(5+4r)^2 = 0$
- Solve for the dependent coefficient(s)

  $a_1 = 0$
- Each term in the series must be 0, giving the recursion relation

  $16\left(\frac{a_{k-2}(k-3+r)}{4} + a_k\left(k+r+\frac{1}{4}\right)\right)\left(k+r+\frac{1}{4}\right) = 0$
- Shift index using $k->k+2$

  $16\left(\frac{a_k(k+r-1)}{4} + a_{k+2}\left(k+\frac{9}{4}+r\right)\right)\left(k+\frac{9}{4}+r\right) = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{a_k(k+r-1)}{4k+4r+9}$
- Recursion relation for $r = -\frac{1}{4}$

  $a_{k+2} = -\frac{a_k\left(k-\frac{5}{4}\right)}{4k+8}$
- Solution for $r = -\frac{1}{4}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{1}{4}}, a_{k+2} = -\frac{a_k\left(k-\frac{5}{4}\right)}{4k+8}, a_1 = 0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 35.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{3x^{2}\left(x^{2}+3\right) y''+x\left(11x^{2}+3\right) y'+\left(5x^{2}+1\right) y=0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(3x^{4}+9x^{2}\right) y''+\left(11x^{3}+3x\right) y'+\left(5x^{2}+1\right) y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{11x^{2}+3}{3x\left(x^{2}+3\right)}$$
$$q(x)=\frac{5x^{2}+1}{3x^{2}\left(x^{2}+3\right)}$$

Table 720: Table $p(x), q(x)$ singularites.

$p(x) = \frac{11x^2+3}{3x(x^2+3)}$	
singularity	type
$x = 0$	"regular"
$x = -i\sqrt{3}$	"regular"
$x = i\sqrt{3}$	"regular"

$q(x) = \frac{5x^2+1}{3x^2(x^2+3)}$	
singularity	type
$x = 0$	"regular"
$x = -i\sqrt{3}$	"regular"
$x = i\sqrt{3}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i\sqrt{3}, i\sqrt{3}, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$3x^2(x^2+3)\, y'' + (11x^3+3x)\, y' + (5x^2+1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$3x^2(x^2+3)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (11x^3+3x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (5x^2+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 11x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 11x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 11a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 5x^{n+r+2} a_n = \sum_{n=2}^{\infty} 5a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 11a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 5a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$9x^{n+r} a_n (n+r)(n+r-1) + 3x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$9x^r a_0 r(-1+r) + 3x^r a_0 r + a_0 x^r = 0$$

Or

$$(9x^r r(-1+r) + 3x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(3r-1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(3r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = \frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(3r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{3}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{3}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} 3a_{n-2}(n+r-2)(n-3+r) + 9a_n(n+r)(n+r-1) \\ + 11a_{n-2}(n+r-2) + 3a_n(n+r) + 5a_{n-2} + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r-1)\, a_{n-2}}{-1+3n+3r} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = -\frac{(3n-2)\, a_{n-2}}{9n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-1-r}{5+3r}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = -\frac{2}{9}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{5+3r}$	$-\frac{2}{9}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{5+3r}$	$-\frac{2}{9}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 + 4r + 3}{9r^2 + 48r + 55}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{5}{81}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{5+3r}$	$-\frac{2}{9}$
a_3	0	0
a_4	$\frac{r^2+4r+3}{9r^2+48r+55}$	$\frac{5}{81}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{5+3r}$	$-\frac{2}{9}$
a_3	0	0
a_4	$\frac{r^2+4r+3}{9r^2+48r+55}$	$\frac{5}{81}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(1 - \frac{2x^2}{9} + \frac{5x^4}{81} + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{3}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n\left(r = \frac{1}{3}\right)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{-1-r}{5+3r}$	$-\frac{2}{9}$	$-\frac{2}{(5+3r)^2}$	$-\frac{1}{18}$
b_3	0	0	0	0
b_4	$\frac{r^2+4r+3}{9r^2+48r+55}$	$\frac{5}{81}$	$\frac{12r^2+56r+76}{(9r^2+48r+55)^2}$	$\frac{1}{54}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6 \dots \\
&= x^{\frac{1}{3}}\left(1 - \frac{2x^2}{9} + \frac{5x^4}{81} + O(x^6)\right)\ln(x) + x^{\frac{1}{3}}\left(-\frac{x^2}{18} + \frac{x^4}{54} + O(x^6)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1y_1(x) + c_2y_2(x) \\
&= c_1x^{\frac{1}{3}}\left(1 - \frac{2x^2}{9} + \frac{5x^4}{81} + O(x^6)\right) \\
&\quad + c_2\left(x^{\frac{1}{3}}\left(1 - \frac{2x^2}{9} + \frac{5x^4}{81} + O(x^6)\right)\ln(x) + x^{\frac{1}{3}}\left(-\frac{x^2}{18} + \frac{x^4}{54} + O(x^6)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1x^{\frac{1}{3}}\left(1 - \frac{2x^2}{9} + \frac{5x^4}{81} + O(x^6)\right) \\
&\quad + c_2\left(x^{\frac{1}{3}}\left(1 - \frac{2x^2}{9} + \frac{5x^4}{81} + O(x^6)\right)\ln(x) + x^{\frac{1}{3}}\left(-\frac{x^2}{18} + \frac{x^4}{54} + O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1x^{\frac{1}{3}}\left(1 - \frac{2x^2}{9} + \frac{5x^4}{81} + O(x^6)\right) \\
&\quad + c_2\left(x^{\frac{1}{3}}\left(1 - \frac{2x^2}{9} + \frac{5x^4}{81} + O(x^6)\right)\ln(x) + x^{\frac{1}{3}}\left(-\frac{x^2}{18} + \frac{x^4}{54} + O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1x^{\frac{1}{3}}\left(1 - \frac{2x^2}{9} + \frac{5x^4}{81} + O(x^6)\right) \\
&\quad + c_2\left(x^{\frac{1}{3}}\left(1 - \frac{2x^2}{9} + \frac{5x^4}{81} + O(x^6)\right)\ln(x) + x^{\frac{1}{3}}\left(-\frac{x^2}{18} + \frac{x^4}{54} + O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.39.1 Maple step by step solution

Let's solve

$3x^2(x^2+3)\, y'' + (11x^3+3x)\, y' + (5x^2+1)\, y = 0$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y'' = -\frac{(5x^2+1)y}{3x^2(x^2+3)} - \frac{(11x^2+3)y'}{3x(x^2+3)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y'' + \frac{(11x^2+3)y'}{3x(x^2+3)} + \frac{(5x^2+1)y}{3x^2(x^2+3)} = 0$

□ Check to see if x_0 is a regular singular point

- ◦ Define functions

$\left[P_2(x) = \frac{11x^2+3}{3x(x^2+3)}, P_3(x) = \frac{5x^2+1}{3x^2(x^2+3)}\right]$

- ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

$\left(x \cdot P_2(x)\right)\bigg|_{x=0} = \frac{1}{3}$

- ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

$\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = \frac{1}{9}$

- ◦ $x = 0$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0 = 0$

- Multiply by denominators

$3x^2(x^2+3)\, y'' + x(11x^2+3)\, y' + (5x^2+1)\, y = 0$

- Assume series solution for y

$y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

- ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..3$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^{m}\cdot y''$ to series expansion for $m=2..4$

  $x^{m}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m}\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}(-1+3r)^{2} x^{r}+a_{1}(2+3r)^{2} x^{1+r}+\left(\sum_{k=2}^{\infty} \left(a_{k}(3k+3r-1)^{2}+a_{k-2}(3k+3r-1)\,(k+r-1)\right) x\right.$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $(-1+3r)^{2}=0$

- Values of r that satisfy the indicial equation

  $r=\frac{1}{3}$

- Each term must be 0

  $a_{1}(2+3r)^{2}=0$

- Solve for the dependent coefficient(s)

  $a_{1}=0$

- Each term in the series must be 0, giving the recursion relation

  $9\left(k+r-\frac{1}{3}\right)\left(\frac{a_{k-2}(k+r-1)}{3}+a_{k}\left(k+r-\frac{1}{3}\right)\right)=0$

- Shift index using $k->k+2$

  $9\left(k+\frac{5}{3}+r\right)\left(\frac{a_{k}(k+r+1)}{3}+a_{k+2}\left(k+\frac{5}{3}+r\right)\right)=0$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{a_k(k+r+1)}{3k+3r+5}$$

- Recursion relation for $r = \frac{1}{3}$

$$a_{k+2} = -\frac{a_k\left(k+\frac{4}{3}\right)}{3k+6}$$

- Solution for $r = \frac{1}{3}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+2} = -\frac{a_k\left(k+\frac{4}{3}\right)}{3k+6}, a_1 = 0\right]$$

Problem number: 36.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2\left(4x^2+1\right)y''+32x^3y'+y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(16x^4+4x^2\right)y''+32x^3y'+y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{8x}{4x^2+1}$$
$$q(x)=\frac{1}{4x^2\left(4x^2+1\right)}$$

Table 722: Table $p(x), q(x)$ singularites.

$p(x) = \frac{8x}{4x^2+1}$	
singularity	type
$x = -\frac{i}{2}$	"regular"
$x = \frac{i}{2}$	"regular"

$q(x) = \frac{1}{4x^2(4x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i}{2}$	"regular"
$x = \frac{i}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[-\frac{i}{2}, \frac{i}{2}, 0, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2(4x^2+1)\, y'' + 32x^3 y' + y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\begin{aligned} &4x^2(4x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) \\ &+ 32x^3\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \end{aligned} \tag{1}$$

Which simplifies to

$$
\left(\sum_{n=0}^{\infty} 16x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 32x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty} 16x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} 16a_{n-2}(n+r-2)(n-3+r)\,x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 32x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 32a_{n-2}(n+r-2)\,x^{n+r}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\left(\sum_{n=2}^{\infty} 16a_{n-2}(n+r-2)(n-3+r)\,x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 32a_{n-2}(n+r-2)\,x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
4x^{n+r} a_n (n+r)(n+r-1) + a_n x^{n+r} = 0
$$

When $n=0$ the above becomes

$$
4x^r a_0 r(-1+r) + a_0 x^r = 0
$$

Or

$$
(4x^r r(-1+r) + x^r)\,a_0 = 0
$$

Since $a_0 \neq 0$ then the above simplifies to

$$
(2r-1)^2 x^r = 0
$$

Since the above is true for all x then the indicial equation becomes

$$(2r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = \frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(2r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{2}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{2}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$16a_{n-2}(n+r-2)(n-3+r) + 4a_n(n+r)(n+r-1) + 32a_{n-2}(n+r-2) + a_n = 0 \quad (3)$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{16a_{n-2}(n^2 + 2nr + r^2 - 3n - 3r + 2)}{4n^2 + 8nr + 4r^2 - 4n - 4r + 1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{a_{n-2}(4n^2 - 8n + 3)}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{16(1+r)\,r}{(2r+3)^2}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = -\frac{3}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{16(1+r)r}{(2r+3)^2}$	$-\frac{3}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{16(1+r)r}{(2r+3)^2}$	$-\frac{3}{4}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{256(1+r)\,r(r+3)\,(r+2)}{(2r+3)^2\,(7+2r)^2}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{105}{64}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{16(1+r)r}{(2r+3)^2}$	$-\frac{3}{4}$
a_3	0	0
a_4	$\frac{256(1+r)r(r+3)(r+2)}{(2r+3)^2(7+2r)^2}$	$\frac{105}{64}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{16(1+r)r}{(2r+3)^2}$	$-\frac{3}{4}$
a_3	0	0
a_4	$\frac{256(1+r)r(r+3)(r+2)}{(2r+3)^2(7+2r)^2}$	$\frac{105}{64}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$y_1(x) = \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right)$$
$$= \sqrt{x}\left(1 - \frac{3x^2}{4} + \frac{105x^4}{64} + O\left(x^6\right)\right)$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{2}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n\left(r = \frac{1}{2}\right)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$-\frac{16(1+r)r}{(2r+3)^2}$	$-\frac{3}{4}$	$\frac{-64r-48}{(2r+3)^3}$	$-\frac{5}{4}$
b_3	0	0	0	0
b_4	$\frac{256(1+r)r(r+3)(r+2)}{(2r+3)^2(7+2r)^2}$	$\frac{105}{64}$	$\frac{4096r^4+29696r^3+78336r^2+87552r+32256}{(2r+3)^3(7+2r)^3}$	$\frac{389}{128}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6 \dots \\ &= \sqrt{x}\left(1 - \frac{3x^2}{4} + \frac{105x^4}{64} + O(x^6)\right)\ln(x) + \sqrt{x}\left(-\frac{5x^2}{4} + \frac{389x^4}{128} + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1y_1(x) + c_2y_2(x) \\ &= c_1\sqrt{x}\left(1 - \frac{3x^2}{4} + \frac{105x^4}{64} + O(x^6)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1 - \frac{3x^2}{4} + \frac{105x^4}{64} + O(x^6)\right)\ln(x) + \sqrt{x}\left(-\frac{5x^2}{4} + \frac{389x^4}{128} + O(x^6)\right)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1\sqrt{x}\left(1 - \frac{3x^2}{4} + \frac{105x^4}{64} + O(x^6)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1 - \frac{3x^2}{4} + \frac{105x^4}{64} + O(x^6)\right)\ln(x) + \sqrt{x}\left(-\frac{5x^2}{4} + \frac{389x^4}{128} + O(x^6)\right)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y &= c_1\sqrt{x}\left(1 - \frac{3x^2}{4} + \frac{105x^4}{64} + O(x^6)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1 - \frac{3x^2}{4} + \frac{105x^4}{64} + O(x^6)\right)\ln(x) + \sqrt{x}\left(-\frac{5x^2}{4} + \frac{389x^4}{128} + O(x^6)\right)\right) \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y &= c_1\sqrt{x}\left(1 - \frac{3x^2}{4} + \frac{105x^4}{64} + O(x^6)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1 - \frac{3x^2}{4} + \frac{105x^4}{64} + O(x^6)\right)\ln(x) + \sqrt{x}\left(-\frac{5x^2}{4} + \frac{389x^4}{128} + O(x^6)\right)\right) \end{aligned}$$

Verified OK.

15.40.1 Maple step by step solution

Let's solve

$4x^2(4x^2+1)\,y''+32x^3y'+y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{y}{4x^2(4x^2+1)}-\frac{8xy'}{4x^2+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{8xy'}{4x^2+1}+\frac{y}{4x^2(4x^2+1)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{8x}{4x^2+1}, P_3(x)=\frac{1}{4x^2(4x^2+1)}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $\left.(x\cdot P_2(x))\right|_{x=0}=0$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $\left.(x^2\cdot P_3(x))\right|_{x=0}=\frac{1}{4}$

  - $x=0$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0=0$

- Multiply by denominators

  $4x^2(4x^2+1)\,y''+32x^3y'+y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^3\cdot y'$ to series expansion

    $x^3\cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r+2}$

- Shift index using $k->k-2$

  $$x^3 \cdot y' = \sum_{k=2}^{\infty} a_{k-2}(k-2+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k->k+2-m$

  $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(-1+2r)^2 x^r + a_1(1+2r)^2 x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(2k+2r-1)^2 + 16a_{k-2}(k-2+r)\,(k+r-1)\right) x$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(-1+2r)^2 = 0$$

- Values of r that satisfy the indicial equation

  $$r = \frac{1}{2}$$

- Each term must be 0

  $$a_1(1+2r)^2 = 0$$

- Solve for the dependent coefficient(s)

  $$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$a_k(2k+2r-1)^2 + 16a_{k-2}(k-2+r)\,(k+r-1) = 0$$

- Shift index using $k->k+2$

  $$a_{k+2}(2k+3+2r)^2 + 16a_k(k+r)\,(k+r+1) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2} = -\frac{16a_k(k+r)(k+r+1)}{(2k+3+2r)^2}$$

- Recursion relation for $r = \frac{1}{2}$

  $$a_{k+2} = -\frac{16a_k\left(k+\frac{1}{2}\right)\left(k+\frac{3}{2}\right)}{(2k+4)^2}$$

- Solution for $r = \frac{1}{2}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+2} = -\frac{16a_k\left(k+\frac{1}{2}\right)\left(k+\frac{3}{2}\right)}{(2k+4)^2}, a_1 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 37.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{9x^2y'' - 3x(-2x^2 + 7)\,y' + (2x^2 + 25)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$9x^2y'' + (6x^3 - 21x)\,y' + (2x^2 + 25)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{2x^2 - 7}{3x}$$
$$q(x) = \frac{2x^2 + 25}{9x^2}$$

Table 724: Table $p(x), q(x)$ singularites.

$p(x) = \frac{2x^2-7}{3x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{2x^2+25}{9x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$9x^2y'' + (6x^3 - 21x) y' + (2x^2 + 25) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$9x^2 \left(\sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2} \right) + (6x^3 - 21x) \left(\sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1} \right) + (2x^2 + 25) \left(\sum_{n=0}^{\infty} a_n x^{n+r} \right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 6x^{n+r+2} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-21x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 25 a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 6x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 6a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n = \sum_{n=2}^{\infty} 2a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 6a_{n-2}(n+r-2)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-21x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 25 a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$9x^{n+r} a_n (n+r)(n+r-1) - 21x^{n+r} a_n (n+r) + 25 a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$9x^r a_0 r(-1+r) - 21x^r a_0 r + 25 a_0 x^r = 0$$

Or

$$\left(9x^r r(-1+r) - 21x^r r + 25x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(3r-5)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(3r-5)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{5}{3}$$
$$r_2 = \frac{5}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(3r-5)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{5}{3}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{5}{3}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{5}{3}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$9a_n(n+r)(n+r-1) + 6a_{n-2}(n+r-2) - 21a_n(n+r) + 2a_{n-2} + 25a_n = 0 \quad (3)$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{2a_{n-2}}{3n+3r-5} \quad (4)$$

Which for the root $r = \frac{5}{3}$ becomes

$$a_n = -\frac{2a_{n-2}}{3n} \quad (5)$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{5}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{2}{1+3r}$$

Which for the root $r = \frac{5}{3}$ becomes

$$a_2 = -\frac{1}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{2}{1+3r}$	$-\frac{1}{3}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{2}{1+3r}$	$-\frac{1}{3}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4}{9r^2 + 24r + 7}$$

Which for the root $r = \frac{5}{3}$ becomes

$$a_4 = \frac{1}{18}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{2}{1+3r}$	$-\frac{1}{3}$
a_3	0	0
a_4	$\frac{4}{9r^2+24r+7}$	$\frac{1}{18}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{2}{1+3r}$	$-\frac{1}{3}$
a_3	0	0
a_4	$\frac{4}{9r^2+24r+7}$	$\frac{1}{18}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$y_1(x) = x^{\frac{5}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right)$$
$$= x^{\frac{5}{3}}\left(1 - \frac{x^2}{3} + \frac{x^4}{18} + O(x^6)\right)$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{5}{3}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n\left(r = \frac{5}{3}\right)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$-\frac{2}{1+3r}$	$-\frac{1}{3}$	$\frac{6}{(1+3r)^2}$	$\frac{1}{6}$
b_3	0	0	0	0
b_4	$\frac{4}{9r^2+24r+7}$	$\frac{1}{18}$	$\frac{-96-72r}{(9r^2+24r+7)^2}$	$-\frac{1}{24}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$y_2(x) = y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots$$
$$= x^{\frac{5}{3}}\left(1 - \frac{x^2}{3} + \frac{x^4}{18} + O(x^6)\right)\ln(x) + x^{\frac{5}{3}}\left(\frac{x^2}{6} - \frac{x^4}{24} + O(x^6)\right)$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 y_1(x) + c_2 y_2(x)$$
$$= c_1 x^{\frac{5}{3}}\left(1 - \frac{x^2}{3} + \frac{x^4}{18} + O(x^6)\right)$$
$$+ c_2\left(x^{\frac{5}{3}}\left(1 - \frac{x^2}{3} + \frac{x^4}{18} + O(x^6)\right)\ln(x) + x^{\frac{5}{3}}\left(\frac{x^2}{6} - \frac{x^4}{24} + O(x^6)\right)\right)$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{5}{3}} \left(1 - \frac{x^2}{3} + \frac{x^4}{18} + O(x^6)\right) \\
&\quad + c_2 \left(x^{\frac{5}{3}} \left(1 - \frac{x^2}{3} + \frac{x^4}{18} + O(x^6)\right) \ln(x) + x^{\frac{5}{3}} \left(\frac{x^2}{6} - \frac{x^4}{24} + O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^{\frac{5}{3}} \left(1 - \frac{x^2}{3} + \frac{x^4}{18} + O(x^6)\right) \\
&\quad + c_2 \left(x^{\frac{5}{3}} \left(1 - \frac{x^2}{3} + \frac{x^4}{18} + O(x^6)\right) \ln(x) + x^{\frac{5}{3}} \left(\frac{x^2}{6} - \frac{x^4}{24} + O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x^{\frac{5}{3}} \left(1 - \frac{x^2}{3} + \frac{x^4}{18} + O(x^6)\right) \\
&\quad + c_2 \left(x^{\frac{5}{3}} \left(1 - \frac{x^2}{3} + \frac{x^4}{18} + O(x^6)\right) \ln(x) + x^{\frac{5}{3}} \left(\frac{x^2}{6} - \frac{x^4}{24} + O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.41.1 Maple step by step solution

Let's solve

$9x^2y'' + (6x^3 - 21x)\,y' + (2x^2 + 25)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(2x^2+25)y}{9x^2} - \frac{(2x^2-7)y'}{3x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(2x^2-7)y'}{3x} + \frac{(2x^2+25)y}{9x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

$\left[P_2(x)=\frac{2x^2-7}{3x}, P_3(x)=\frac{2x^2+25}{9x^2}\right]$

- $x\cdot P_2(x)$ is analytic at $x=0$

  $(x\cdot P_2(x))\bigg|_{x=0}=-\frac{7}{3}$
- $x^2\cdot P_3(x)$ is analytic at $x=0$

  $(x^2\cdot P_3(x))\bigg|_{x=0}=\frac{25}{9}$
- $x=0$is a regular singular point

  Check to see if $x_0=0$ is a regular singular point

  $x_0=0$

- Multiply by denominators

  $9x^2y''+3x(2x^2-7)\,y'+(2x^2+25)\,y=0$
- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $x^m\cdot y$ to series expansion for $m=0..2$

  $x^m\cdot y=\sum_{k=0}^{\infty} a_k x^{k+r+m}$
- Shift index using $k->k-m$

  $x^m\cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

Problem number: 38.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x^2(2x^2+1)\,y''+x(7x^2+3)\,y'+(-3x^2+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(2x^4+x^2)\,y''+(7x^3+3x)\,y'+(-3x^2+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{7x^2+3}{x\,(2x^2+1)}$$
$$q(x)=-\frac{3x^2-1}{x^2\,(2x^2+1)}$$

Table 726: Table $p(x), q(x)$ singularites.

$p(x) = \frac{7x^2+3}{x(2x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{2}}{2}$	"regular"
$x = \frac{i\sqrt{2}}{2}$	"regular"

$q(x) = -\frac{3x^2-1}{x^2(2x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{2}}{2}$	"regular"
$x = \frac{i\sqrt{2}}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{i\sqrt{2}}{2}, \frac{i\sqrt{2}}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(2x^2+1)\,y'' + (7x^3+3x)\,y' + (-3x^2+1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(2x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (7x^3+3x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (-3x^2+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}
&\left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 7x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) \\
&+ \sum_{n=0}^{\infty} \left(-3x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 7x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 7a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-3x^{n+r+2} a_n\right) = \sum_{n=2}^{\infty} \left(-3a_{n-2} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\begin{aligned}
&\left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 7a_{n-2}(n+r-2)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \sum_{n=2}^{\infty} \left(-3a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0
\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + 3x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + 3x^r a_0 r + a_0 x^r = 0$$

Or

$$(x^r r(-1+r) + 3x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r+1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r+1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -1$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r+1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-1}$$

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-1}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} 2a_{n-2}(n+r-2)(n-3+r) + a_n(n+r)(n+r-1) \\ + 7a_{n-2}(n+r-2) + 3a_n(n+r) - 3a_{n-2} + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(2n+2r-5)\, a_{n-2}}{1+n+r} \tag{4}$$

Which for the root $r = -1$ becomes

$$a_n = \frac{a_{n-2}(7-2n)}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1-2r}{3+r}$$

Which for the root $r = -1$ becomes

$$a_2 = \frac{3}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-2r}{3+r}$	$\frac{3}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-2r}{3+r}$	$\frac{3}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4r^2 + 4r - 3}{(5 + r)(3 + r)}$$

Which for the root $r = -1$ becomes

$$a_4 = -\frac{3}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-2r}{3+r}$	$\frac{3}{2}$
a_3	0	0
a_4	$\frac{4r^2+4r-3}{(5+r)(3+r)}$	$-\frac{3}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-2r}{3+r}$	$\frac{3}{2}$
a_3	0	0
a_4	$\frac{4r^2+4r-3}{(5+r)(3+r)}$	$-\frac{3}{8}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \frac{1}{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \frac{1 + \frac{3x^2}{2} - \frac{3x^4}{8} + O(x^6)}{x} \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = -1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r = -1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{1-2r}{3+r}$	$\frac{3}{2}$	$-\frac{7}{(3+r)^2}$	$-\frac{7}{4}$
b_3	0	0	0	0
b_4	$\frac{4r^2+4r-3}{(5+r)(3+r)}$	$-\frac{3}{8}$	$\frac{28r^2+126r+84}{(5+r)^2(3+r)^2}$	$-\frac{7}{32}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6\ldots \\
&= \frac{\left(1+\frac{3x^2}{2}-\frac{3x^4}{8}+O(x^6)\right)\ln(x)}{x} + \frac{-\frac{7x^2}{4}-\frac{7x^4}{32}+O(x^6)}{x}
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1y_1(x) + c_2y_2(x) \\
&= \frac{c_1\left(1+\frac{3x^2}{2}-\frac{3x^4}{8}+O(x^6)\right)}{x} \\
&\quad + c_2\left(\frac{\left(1+\frac{3x^2}{2}-\frac{3x^4}{8}+O(x^6)\right)\ln(x)}{x} + \frac{-\frac{7x^2}{4}-\frac{7x^4}{32}+O(x^6)}{x}\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(1+\frac{3x^2}{2}-\frac{3x^4}{8}+O(x^6)\right)}{x} \\
&\quad + c_2\left(\frac{\left(1+\frac{3x^2}{2}-\frac{3x^4}{8}+O(x^6)\right)\ln(x)}{x} + \frac{-\frac{7x^2}{4}-\frac{7x^4}{32}+O(x^6)}{x}\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y &= \frac{c_1\left(1+\frac{3x^2}{2}-\frac{3x^4}{8}+O(x^6)\right)}{x} \\
&\quad + c_2\left(\frac{\left(1+\frac{3x^2}{2}-\frac{3x^4}{8}+O(x^6)\right)\ln(x)}{x} + \frac{-\frac{7x^2}{4}-\frac{7x^4}{32}+O(x^6)}{x}\right)
\end{aligned} \tag{1}$$

Verification of solutions

$$y = \frac{c_1\left(1+\frac{3x^2}{2}-\frac{3x^4}{8}+O(x^6)\right)}{x} + c_2\left(\frac{\left(1+\frac{3x^2}{2}-\frac{3x^4}{8}+O(x^6)\right)\ln(x)}{x}+\frac{-\frac{7x^2}{4}-\frac{7x^4}{32}+O(x^6)}{x}\right)$$

Verified OK.

$$x^m \cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$$

- ○ Shift index using $k->k+1-m$

$$x^m \cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- ○ Convert $x^m \cdot y''$ to series expansion for $m=2..4$

$$x^m \cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- ○ Shift index using $k->k+2-m$

$$x^m \cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(1+r)^2\, x^r+a_1(2+r)^2\, x^{1+r}+\left(\sum_{k=2}^{\infty} \left(a_k(k+r+1)^2+a_{k-2}(k+r+1)\,(2k-5+2r)\right) x^{k+r}\right) =$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1+r)^2=0$$

- Values of r that satisfy the indicial equation

$$r=-1$$

- Each term must be 0

$$a_1(2+r)^2=0$$

- Solve for the dependent coefficient(s)

$a_1 = 0$

- Each term in the series must be 0, giving the recursion relation

  $(k+r+1)\left(a_k(k+r+1)+a_{k-2}(2k-5+2r)\right)=0$

- Shift index using $k->k+2$

  $(k+r+3)\left(a_{k+2}(k+r+3)+a_k(2k+2r-1)\right)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{a_k(2k+2r-1)}{k+r+3}$

- Recursion relation for $r=-1$

  $a_{k+2} = -\frac{a_k(2k-3)}{k+2}$

- Solution for $r=-1$

  $\left[y=\sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+2}=-\frac{a_k(2k-3)}{k+2}, a_1=0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 39.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x^2(x^2+1)\,y''+x(8x^2+3)\,y'+(12x^2+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+x^2)\,y''+(8x^3+3x)\,y'+(12x^2+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{8x^2+3}{x\,(x^2+1)}$$
$$q(x)=\frac{12x^2+1}{x^2\,(x^2+1)}$$

Table 728: Table $p(x), q(x)$ singularites.

$p(x) = \frac{8x^2+3}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{12x^2+1}{x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+1)\,y'' + (8x^3+3x)\,y' + (12x^2+1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (8x^3+3x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (12x^2+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 12x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r) x^{n+r}$$

$$\sum_{n=0}^{\infty} 8x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 8a_{n-2} (n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} 12x^{n+r+2} a_n = \sum_{n=2}^{\infty} 12a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 8a_{n-2} (n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 12a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + 3x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1 + r) + 3x^r a_0 r + a_0 x^r = 0$$

Or

$$(x^r r(-1 + r) + 3x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r + 1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r + 1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -1$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r + 1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r} \right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -1$, Eqs (1A,1B) become

$$
\begin{aligned}
y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n-1} \\
y_2(x) &= y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-1}\right)
\end{aligned}
$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
a_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&a_{n-2}(n+r-2)(n-3+r) + a_n(n+r)(n+r-1) \\
&+ 8a_{n-2}(n+r-2) + 3a_n(n+r) + 12a_{n-2} + a_n = 0
\end{aligned} \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = -\frac{(n+r+2)\, a_{n-2}}{1+n+r} \tag{4}
$$

Which for the root $r = -1$ becomes

$$
a_n = -\frac{(n+1)\, a_{n-2}}{n} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$
a_2 = \frac{-4-r}{3+r}
$$

Which for the root $r = -1$ becomes

$$a_2 = -\frac{3}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-r}{3+r}$	$-\frac{3}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-r}{3+r}$	$-\frac{3}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 + 10r + 24}{(5 + r)(3 + r)}$$

Which for the root $r = -1$ becomes

$$a_4 = \frac{15}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-r}{3+r}$	$-\frac{3}{2}$
a_3	0	0
a_4	$\frac{r^2+10r+24}{(5+r)(3+r)}$	$\frac{15}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-r}{3+r}$	$-\frac{3}{2}$
a_3	0	0
a_4	$\frac{r^2+10r+24}{(5+r)(3+r)}$	$\frac{15}{8}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \frac{1}{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \frac{1 - \frac{3x^2}{2} + \frac{15x^4}{8} + O(x^6)}{x} \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = -1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r = -1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{-4-r}{3+r}$	$-\frac{3}{2}$	$\frac{1}{(3+r)^2}$	$\frac{1}{4}$
b_3	0	0	0	0
b_4	$\frac{r^2+10r+24}{(5+r)(3+r)}$	$\frac{15}{8}$	$\frac{-2r^2-18r-42}{(5+r)^2(3+r)^2}$	$-\frac{13}{32}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6 \dots \\
&= \frac{\left(1-\frac{3x^2}{2}+\frac{15x^4}{8}+O(x^6)\right)\ln(x)}{x} + \frac{\frac{x^2}{4}-\frac{13x^4}{32}+O(x^6)}{x}
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1y_1(x) + c_2y_2(x) \\
&= \frac{c_1\left(1-\frac{3x^2}{2}+\frac{15x^4}{8}+O(x^6)\right)}{x} \\
&\quad + c_2\left(\frac{\left(1-\frac{3x^2}{2}+\frac{15x^4}{8}+O(x^6)\right)\ln(x)}{x} + \frac{\frac{x^2}{4}-\frac{13x^4}{32}+O(x^6)}{x}\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(1-\frac{3x^2}{2}+\frac{15x^4}{8}+O(x^6)\right)}{x} \\
&\quad + c_2\left(\frac{\left(1-\frac{3x^2}{2}+\frac{15x^4}{8}+O(x^6)\right)\ln(x)}{x} + \frac{\frac{x^2}{4}-\frac{13x^4}{32}+O(x^6)}{x}\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y &= \frac{c_1\left(1-\frac{3x^2}{2}+\frac{15x^4}{8}+O(x^6)\right)}{x} \\
&\quad + c_2\left(\frac{\left(1-\frac{3x^2}{2}+\frac{15x^4}{8}+O(x^6)\right)\ln(x)}{x} + \frac{\frac{x^2}{4}-\frac{13x^4}{32}+O(x^6)}{x}\right)
\end{aligned} \tag{1}$$

Verification of solutions

$$y = \frac{c_1 \left(1-\frac{3x^2}{2}+\frac{15x^4}{8}+O(x^6)\right)}{x} + c_2 \left(\frac{\left(1-\frac{3x^2}{2}+\frac{15x^4}{8}+O(x^6)\right)\ln(x)}{x} + \frac{\frac{x^2}{4}-\frac{13x^4}{32}+O(x^6)}{x}\right)$$

Verified OK.

15.43.1 Maple step by step solution

Let's solve

$x^2(x^2+1)\, y'' + (8x^3+3x)\, y' + (12x^2+1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(12x^2+1)y}{x^2(x^2+1)} - \frac{(8x^2+3)y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(8x^2+3)y'}{x(x^2+1)} + \frac{(12x^2+1)y}{x^2(x^2+1)} = 0$

☐ Check to see if x_0 is a regular singular point

- ○ Define functions

  $\left[P_2(x) = \frac{8x^2+3}{x(x^2+1)}, P_3(x) = \frac{12x^2+1}{x^2(x^2+1)}\right]$

- ○ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\Big|_{x=0} = 3$

- ○ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\Big|_{x=0} = 1$

- ○ $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

$$x^2(x^2+1)\,y''+x(8x^2+3)\,y'+(12x^2+1)\,y=0$$

- Assume series solution for y

$$y=\sum_{k=0}^{\infty} a_k x^{k+r}$$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m=0..2$

$$x^m \cdot y=\sum_{k=0}^{\infty} a_k x^{k+r+m}$$

  - Shift index using $k->k-m$

$$x^m \cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

  - Convert $x^m \cdot y'$ to series expansion for $m=1..3$

$$x^m \cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$$

  - Shift index using $k->k+1-m$

$$x^m \cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$$

  - Convert $x^m \cdot y''$ to series expansion for $m=2..4$

$$x^m \cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$$

  - Shift index using $k->k+2-m$

$$x^m \cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(1+r)^2\,x^r+a_1(2+r)^2\,x^{1+r}+\left(\sum_{k=2}^{\infty}\left(a_k(k+r+1)^2+a_{k-2}(k+2+r)\,(k+r+1)\right)x^{k+r}\right)=0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1+r)^2=0$$

- Values of r that satisfy the indicial equation

$$r=-1$$

- Each term must be 0

$$a_1(2+r)^2=0$$

- Solve for the dependent coefficient(s)

$a_1 = 0$

- Each term in the series must be 0, giving the recursion relation

  $(k+r+1)\left(a_k(k+r+1)+a_{k-2}(k+2+r)\right)=0$
- Shift index using $k->k+2$

  $(k+r+3)\left(a_{k+2}(k+r+3)+a_k(k+r+4)\right)=0$
- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{a_k(k+r+4)}{k+r+3}$
- Recursion relation for $r=-1$

  $a_{k+2}=-\frac{a_k(k+3)}{k+2}$
- Solution for $r=-1$

  $\left[y=\sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+2}=-\frac{a_k(k+3)}{k+2}, a_1=0\right]$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (x^3 - x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)(x^2 + 1) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)\right) \tag{2A}$$
$$+ \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} a_{n-2} (n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n = \sum_{n=2}^{\infty} a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} a_{n-2} (n+r-2)\, x^{n+r}\right) \tag{2B}$$
$$+ \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(-1+r)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(-1+r)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+1}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+1}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) + a_{n-2}(n+r-2) - a_n(n+r) + a_{n-2} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}}{n+r-1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{a_{n-2}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{1}{1+r}$$

Which for the root $r = 1$ becomes

$$a_2 = -\frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{(3+r)(1+r)}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{1}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{1}{(3+r)(1+r)}$	$\frac{1}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{1}{(3+r)(1+r)}$	$\frac{1}{8}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\
&= x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr}a_{n,r}
$$

And the above is then evaluated at $r = 1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$	$b_n(r=1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$	$\frac{1}{(1+r)^2}$	$\frac{1}{4}$
b_3	0	0	0	0
b_4	$\frac{1}{(3+r)(1+r)}$	$\frac{1}{8}$	$\frac{-4-2r}{(3+r)^2(1+r)^2}$	$-\frac{3}{32}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6 \dots \\
&= x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)\ln(x) + x\left(\frac{x^2}{4} - \frac{3x^4}{32} + O(x^6)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1y_1(x) + c_2y_2(x) \\
&= c_1x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \\
&\quad + c_2\left(x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)\ln(x) + x\left(\frac{x^2}{4} - \frac{3x^4}{32} + O(x^6)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x\left(1-\frac{x^2}{2}+\frac{x^4}{8}+O(x^6)\right) \\
&\quad + c_2\left(x\left(1-\frac{x^2}{2}+\frac{x^4}{8}+O(x^6)\right)\ln(x)+x\left(\frac{x^2}{4}-\frac{3x^4}{32}+O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x\left(1-\frac{x^2}{2}+\frac{x^4}{8}+O(x^6)\right) \\
&\quad + c_2\left(x\left(1-\frac{x^2}{2}+\frac{x^4}{8}+O(x^6)\right)\ln(x)+x\left(\frac{x^2}{4}-\frac{3x^4}{32}+O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x\left(1-\frac{x^2}{2}+\frac{x^4}{8}+O(x^6)\right) \\
&\quad + c_2\left(x\left(1-\frac{x^2}{2}+\frac{x^4}{8}+O(x^6)\right)\ln(x)+x\left(\frac{x^2}{4}-\frac{3x^4}{32}+O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.44.1 Maple step by step solution

Let's solve

$x^2y'' + (x^3 - x)\,y' + y(x^2+1) = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(x^2+1)y}{x^2} - \frac{(x^2-1)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x^2-1)y'}{x} + \frac{(x^2+1)y}{x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

$\left[P_2(x) = \frac{x^2-1}{x}, P_3(x) = \frac{x^2+1}{x^2}\right]$

- $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\bigg|_{x=0} = -1$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = 1$

- $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2y'' + x(x^2-1)\, y' + y(x^2+1) = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k- >k - m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

- Shift index using $k- >k + 1 - m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^2 \cdot y''$ to series expansion

  $x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r}$

  Rewrite ODE with series expansions

$$a_0(-1+r)^2 x^r + a_1 r^2 x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(k+r-1)^2 + a_{k-2}(k+r-1)\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(-1+r)^2 = 0$

- Values of r that satisfy the indicial equation

  $r = 1$

- Each term must be 0

  $a_1 r^2 = 0$

- Solve for the dependent coefficient(s)

  $a_1 = 0$

- Each term in the series must be 0, giving the recursion relation

  $(k+r-1)\left(a_k(k+r-1) + a_{k-2}\right) = 0$

- Shift index using $k- >k+2$

  $(k+r+1)\left(a_{k+2}(k+r+1) + a_k\right) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{a_k}{k+r+1}$

- Recursion relation for $r = 1$

  $a_{k+2} = -\frac{a_k}{k+2}$

- Solution for $r = 1$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+2} = -\frac{a_k}{k+2}, a_1 = 0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 41.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2\left(-2x^2+1\right)y''+x\left(-9x^2+5\right)y'+\left(-3x^2+4\right)y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(-2x^4+x^2\right)y''+\left(-9x^3+5x\right)y'+\left(-3x^2+4\right)y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{9x^2-5}{x\left(2x^2-1\right)}\\ q(x)&=\frac{3x^2-4}{x^2\left(2x^2-1\right)}\end{aligned}$$

Table 732: Table $p(x), q(x)$ singularites.

$p(x) = \frac{9x^2-5}{x(2x^2-1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{\sqrt{2}}{2}$	"regular"
$x = \frac{\sqrt{2}}{2}$	"regular"

$q(x) = \frac{3x^2-4}{x^2(2x^2-1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{\sqrt{2}}{2}$	"regular"
$x = \frac{\sqrt{2}}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-y''x^2(2x^2-1) + (-9x^3+5x)\,y' + (-3x^2+4)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) x^2(2x^2-1) + (-9x^3+5x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (-3x^2+4)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}
&\sum_{n=0}^{\infty} \left(-2x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \sum_{n=0}^{\infty} \left(-9x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) \\
&+ \sum_{n=0}^{\infty} \left(-3x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\begin{aligned}
\sum_{n=0}^{\infty} \left(-2x^{n+r+2} a_n (n+r)(n+r-1)\right) &= \sum_{n=2}^{\infty} \left(-2a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) \\
\sum_{n=0}^{\infty} \left(-9x^{n+r+2} a_n (n+r)\right) &= \sum_{n=2}^{\infty} \left(-9a_{n-2}(n+r-2)\, x^{n+r}\right) \\
\sum_{n=0}^{\infty} \left(-3x^{n+r+2} a_n\right) &= \sum_{n=2}^{\infty} \left(-3a_{n-2} x^{n+r}\right)
\end{aligned}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\begin{aligned}
&\sum_{n=2}^{\infty} \left(-2a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \sum_{n=2}^{\infty} \left(-9a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) \\
&+ \sum_{n=2}^{\infty} \left(-3a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0
\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + 5x^{n+r} a_n (n+r) + 4a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + 5x^r a_0 r + 4a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + 5x^r r + 4x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r+2)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r+2)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -2$$
$$r_2 = -2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r+2)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -2$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-2}$$

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-2}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &-2a_{n-2}(n+r-2)(n-3+r) + a_n(n+r)(n+r-1) \\ &- 9a_{n-2}(n+r-2) + 5a_n(n+r) - 3a_{n-2} + 4a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{a_{n-2}(2n^2 + 4nr + 2r^2 - n - r - 3)}{n^2 + 2nr + r^2 + 4n + 4r + 4} \tag{4}$$

Which for the root $r = -2$ becomes

$$a_n = \frac{a_{n-2}(2n^2 - 9n + 7)}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{2r^2 + 7r + 3}{(r+4)^2}$$

Which for the root $r = -2$ becomes

$$a_2 = -\frac{3}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2r^2+7r+3}{(r+4)^2}$	$-\frac{3}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2r^2+7r+3}{(r+4)^2}$	$-\frac{3}{4}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4r^4 + 44r^3 + 161r^2 + 220r + 75}{(r+4)^2 (r+6)^2}$$

Which for the root $r = -2$ becomes

$$a_4 = -\frac{9}{64}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2r^2+7r+3}{(r+4)^2}$	$-\frac{3}{4}$
a_3	0	0
a_4	$\frac{4r^4+44r^3+161r^2+220r+75}{(r+4)^2(r+6)^2}$	$-\frac{9}{64}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2r^2+7r+3}{(r+4)^2}$	$-\frac{3}{4}$
a_3	0	0
a_4	$\frac{4r^4+44r^3+161r^2+220r+75}{(r+4)^2(r+6)^2}$	$-\frac{9}{64}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned}y_1(x) &= \frac{1}{x^2}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \frac{1 - \frac{3x^2}{4} - \frac{9x^4}{64} + O(x^6)}{x^2}\end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = -2$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$	$b_n(r = -2)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{2r^2+7r+3}{(r+4)^2}$	$-\frac{3}{4}$	$\frac{9r+22}{(r+4)^3}$	$\frac{1}{2}$
b_3	0	0	0	0
b_4	$\frac{4r^4+44r^3+161r^2+220r+75}{(r+4)^2(r+6)^2}$	$-\frac{9}{64}$	$\frac{36r^4+502r^3+2508r^2+5228r+3780}{(r+4)^3(r+6)^3}$	$-\frac{21}{128}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6\dots\\ &= \frac{\left(1-\frac{3x^2}{4}-\frac{9x^4}{64}+O(x^6)\right)\ln(x)}{x^2} + \frac{\frac{x^2}{2}-\frac{21x^4}{128}+O(x^6)}{x^2}\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x) &= c_1y_1(x) + c_2y_2(x)\\ &= \frac{c_1\left(1-\frac{3x^2}{4}-\frac{9x^4}{64}+O(x^6)\right)}{x^2} + c_2\left(\frac{\left(1-\frac{3x^2}{4}-\frac{9x^4}{64}+O(x^6)\right)\ln(x)}{x^2} + \frac{\frac{x^2}{2}-\frac{21x^4}{128}+O(x^6)}{x^2}\right)\end{aligned}$$

Hence the final solution is

$$\begin{aligned}y &= y_h\\ &= \frac{c_1\left(1-\frac{3x^2}{4}-\frac{9x^4}{64}+O(x^6)\right)}{x^2} + c_2\left(\frac{\left(1-\frac{3x^2}{4}-\frac{9x^4}{64}+O(x^6)\right)\ln(x)}{x^2} + \frac{\frac{x^2}{2}-\frac{21x^4}{128}+O(x^6)}{x^2}\right)\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}y = &\frac{c_1\left(1-\frac{3x^2}{4}-\frac{9x^4}{64}+O(x^6)\right)}{x^2}\\ &+ c_2\left(\frac{\left(1-\frac{3x^2}{4}-\frac{9x^4}{64}+O(x^6)\right)\ln(x)}{x^2} + \frac{\frac{x^2}{2}-\frac{21x^4}{128}+O(x^6)}{x^2}\right)\end{aligned} \tag{1}$$

Verification of solutions

$$y = \frac{c_1\left(1-\frac{3x^2}{4}-\frac{9x^4}{64}+O(x^6)\right)}{x^2} + c_2\left(\frac{\left(1-\frac{3x^2}{4}-\frac{9x^4}{64}+O(x^6)\right)\ln(x)}{x^2}+\frac{\frac{x^2}{2}-\frac{21x^4}{128}+O(x^6)}{x^2}\right)$$

Verified OK.

15.45.1 Maple step by step solution

Let's solve

$-y''x^2(2x^2-1)+(-9x^3+5x)\,y'+(-3x^2+4)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(3x^2-4)y}{x^2(2x^2-1)}-\frac{(9x^2-5)y'}{x(2x^2-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(9x^2-5)y'}{x(2x^2-1)}+\frac{(3x^2-4)y}{x^2(2x^2-1)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{9x^2-5}{x(2x^2-1)}, P_3(x)=\frac{3x^2-4}{x^2(2x^2-1)}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $\left.(x\cdot P_2(x))\right|_{x=0}=5$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $\left.(x^2\cdot P_3(x))\right|_{x=0}=4$

  - $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

$$y''x^2(2x^2-1)+x(9x^2-5)\,y'+(3x^2-4)\,y=0$$

- Assume series solution for y

$$y=\sum_{k=0}^{\infty} a_k x^{k+r}$$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m=0..2$

$$x^m \cdot y=\sum_{k=0}^{\infty} a_k x^{k+r+m}$$

  - Shift index using $k->k-m$

$$x^m \cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

  - Convert $x^m \cdot y'$ to series expansion for $m=1..3$

$$x^m \cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$$

  - Shift index using $k->k+1-m$

$$x^m \cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$$

  - Convert $x^m \cdot y''$ to series expansion for $m=2..4$

$$x^m \cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$$

  - Shift index using $k->k+2-m$

$$x^m \cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$$

Rewrite ODE with series expansions

$$-a_0(2+r)^2\,x^r-a_1(3+r)^2\,x^{1+r}+\left(\sum_{k=2}^{\infty}\left(-a_k(k+r+2)^2+a_{k-2}(k+1+r)\,(2k-3+2r)\right)x^{k+r}\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-(2+r)^2=0$$

- Values of r that satisfy the indicial equation

$$r=-2$$

- Each term must be 0

$$-a_1(3+r)^2=0$$

- Solve for the dependent coefficient(s)

$a_1 = 0$

- Each term in the series must be 0, giving the recursion relation

  $-a_k(k+r+2)^2 + a_{k-2}(k+1+r)(2k-3+2r) = 0$

- Shift index using $k->k+2$

  $-a_{k+2}(k+4+r)^2 + a_k(k+r+3)(2k+2r+1) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = \frac{a_k(k+r+3)(2k+2r+1)}{(k+4+r)^2}$

- Recursion relation for $r = -2$

  $a_{k+2} = \frac{a_k(k+1)(2k-3)}{(k+2)^2}$

- Solution for $r = -2$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-2}, a_{k+2} = \frac{a_k(k+1)(2k-3)}{(k+2)^2}, a_1 = 0\right]$

Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 42.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2+2)\,y''+x(-x^2+14)\,y'+2(x^2+9)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+2x^2)\,y''+(-x^3+14x)\,y'+(2x^2+18)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{x^2-14}{(x^2+2)\,x}$$
$$q(x)=\frac{2x^2+18}{x^2\,(x^2+2)}$$

Table 734: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{x^2-14}{(x^2+2)x}$	
singularity	type
$x = 0$	"regular"
$x = -i\sqrt{2}$	"regular"
$x = i\sqrt{2}$	"regular"

$q(x) = \frac{2x^2+18}{x^2(x^2+2)}$	
singularity	type
$x = 0$	"regular"
$x = -i\sqrt{2}$	"regular"
$x = i\sqrt{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i\sqrt{2}, i\sqrt{2}, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+2)\,y'' + (-x^3+14x)\,y' + (2x^2+18)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x^2+2)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (-x^3+14x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (2x^2+18)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n(n+r)(n+r-1)\right) + \sum_{n=0}^{\infty}\left(-x^{n+r+2} a_n(n+r)\right)+\left(\sum_{n=0}^{\infty} 14x^{n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n\right)+\left(\sum_{n=0}^{\infty} 18 a_n x^{n+r}\right)=0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n(n+r)(n+r-1)=\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty}\left(-x^{n+r+2} a_n(n+r)\right)=\sum_{n=2}^{\infty}\left(-a_{n-2}(n+r-2)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n=\sum_{n=2}^{\infty} 2a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n(n+r)(n+r-1)\right) + \sum_{n=2}^{\infty}\left(-a_{n-2}(n+r-2)\, x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 14x^{n+r} a_n(n+r)\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2} x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 18 a_n x^{n+r}\right)=0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$2x^{n+r} a_n(n+r)(n+r-1)+14x^{n+r} a_n(n+r)+18 a_n x^{n+r}=0$$

When $n = 0$ the above becomes

$$2x^r a_0 r(-1+r) + 14x^r a_0 r + 18a_0 x^r = 0$$

Or

$$(2x^r r(-1+r) + 14x^r r + 18x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$2x^r (r+3)^2 = 0$$

Since the above is true for all x then the indicial equation becomes

$$2(r+3)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -3$$
$$r_2 = -3$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$2x^r (r+3)^2 = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -3$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-3}$$

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-3}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &a_{n-2}(n+r-2)(n-3+r) + 2a_n(n+r)(n+r-1) \\ &- a_{n-2}(n+r-2) + 14a_n(n+r) + 2a_{n-2} + 18a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}(n^2 + 2nr + r^2 - 6n - 6r + 10)}{2(n^2 + 2nr + r^2 + 6n + 6r + 9)} \tag{4}$$

Which for the root $r = -3$ becomes

$$a_n = -\frac{a_{n-2}(n^2 - 12n + 37)}{2n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -3$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-r^2 + 2r - 2}{2(5+r)^2}$$

Which for the root $r = -3$ becomes

$$a_2 = -\frac{17}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-r^2+2r-2}{2(5+r)^2}$	$-\frac{17}{8}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-r^2+2r-2}{2(5+r)^2}$	$-\frac{17}{8}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^4 + 4}{4 (5 + r)^2 (r + 7)^2}$$

Which for the root $r = -3$ becomes

$$a_4 = \frac{85}{256}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-r^2+2r-2}{2(5+r)^2}$	$-\frac{17}{8}$
a_3	0	0
a_4	$\frac{r^4+4}{4(5+r)^2(r+7)^2}$	$\frac{85}{256}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-r^2+2r-2}{2(5+r)^2}$	$-\frac{17}{8}$
a_3	0	0
a_4	$\frac{r^4+4}{4(5+r)^2(r+7)^2}$	$\frac{85}{256}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \frac{1}{x^3}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \frac{1 - \frac{17x^2}{8} + \frac{85x^4}{256} + O(x^6)}{x^3} \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = -3$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$	$b_n(r = -3)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{-r^2+2r-2}{2(5+r)^2}$	$-\frac{17}{8}$	$\frac{-6r+7}{(5+r)^3}$	$\frac{25}{8}$
b_3	0	0	0	0
b_4	$\frac{r^4+4}{4(5+r)^2(r+7)^2}$	$\frac{85}{256}$	$\frac{6r^4+35r^3-4r-24}{(5+r)^3(r+7)^3}$	$-\frac{471}{512}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6\dots \\
&= \frac{\left(1-\frac{17x^2}{8}+\frac{85x^4}{256}+O(x^6)\right)\ln(x)}{x^3} + \frac{\frac{25x^2}{8}-\frac{471x^4}{512}+O(x^6)}{x^3}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1y_1(x) + c_2y_2(x) \\
&= \frac{c_1\left(1-\frac{17x^2}{8}+\frac{85x^4}{256}+O(x^6)\right)}{x^3} \\
&\quad + c_2\left(\frac{\left(1-\frac{17x^2}{8}+\frac{85x^4}{256}+O(x^6)\right)\ln(x)}{x^3} + \frac{\frac{25x^2}{8}-\frac{471x^4}{512}+O(x^6)}{x^3}\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(1-\frac{17x^2}{8}+\frac{85x^4}{256}+O(x^6)\right)}{x^3} \\
&\quad + c_2\left(\frac{\left(1-\frac{17x^2}{8}+\frac{85x^4}{256}+O(x^6)\right)\ln(x)}{x^3} + \frac{\frac{25x^2}{8}-\frac{471x^4}{512}+O(x^6)}{x^3}\right)
\end{aligned}
$$

Summary
The solution(s) found are the following

$$
\begin{aligned}
y &= \frac{c_1 \left(1-\frac{17x^2}{8}+\frac{85x^4}{256}+O(x^6)\right)}{x^3} \\
&+ c_2 \left(\frac{\left(1-\frac{17x^2}{8}+\frac{85x^4}{256}+O(x^6)\right)\ln(x)}{x^3}+\frac{\frac{25x^2}{8}-\frac{471x^4}{512}+O(x^6)}{x^3}\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= \frac{c_1 \left(1-\frac{17x^2}{8}+\frac{85x^4}{256}+O(x^6)\right)}{x^3} \\
&+ c_2 \left(\frac{\left(1-\frac{17x^2}{8}+\frac{85x^4}{256}+O(x^6)\right)\ln(x)}{x^3}+\frac{\frac{25x^2}{8}-\frac{471x^4}{512}+O(x^6)}{x^3}\right)
\end{aligned}
$$

Verified OK.

15.46.1 Maple step by step solution

Let's solve

$x^2(x^2+2)\,y''+(-x^3+14x)\,y'+(2x^2+18)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{2(x^2+9)y}{x^2(x^2+2)}+\frac{(x^2-14)y'}{x(x^2+2)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{(x^2-14)y'}{x(x^2+2)}+\frac{2(x^2+9)y}{x^2(x^2+2)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=-\frac{x^2-14}{(x^2+2)x}, P_3(x)=\frac{2(x^2+9)}{x^2(x^2+2)}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left.(x\cdot P_2(x))\right|_{x=0}=7$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

$$\left(x^{2} \cdot P_{3}(x)\right)\Big|_{x=0} = 9$$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^{2}(x^{2}+2)\, y'' - x(x^{2}-14)\, y' + (2x^{2}+18)\, y = 0$

- Assume series solution for y

  $$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k - m$

  $$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

  $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

  $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m} (k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$2a_0(3+r)^{2} x^{r} + 2a_1(4+r)^{2} x^{1+r} + \left(\sum_{k=2}^{\infty} \left(2a_k(k+r+3)^{2} + a_{k-2}\left((k-2)^{2} + 2(k-2)\, r + r^{2} - 2\right.\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$2(3+r)^2 = 0$

- Values of r that satisfy the indicial equation

  $r = -3$

- Each term must be 0

  $2a_1(4+r)^2 = 0$

- Solve for the dependent coefficient(s)

  $a_1 = 0$

- Each term in the series must be 0, giving the recursion relation

  $2a_k(k+r+3)^2 + (k^2 + (2r-6)k + r^2 - 6r + 10)\, a_{k-2} = 0$

- Shift index using $k->k+2$

  $2a_{k+2}(k+5+r)^2 + \left((k+2)^2 + (2r-6)(k+2) + r^2 - 6r + 10\right) a_k = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{(k^2+2kr+r^2-2k-2r+2)a_k}{2(k+5+r)^2}$

- Recursion relation for $r = -3$

  $a_{k+2} = -\frac{(k^2-8k+17)a_k}{2(k+2)^2}$

- Solution for $r = -3$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-3}, a_{k+2} = -\frac{(k^2-8k+17)a_k}{2(k+2)^2}, a_1 = 0\right]$

Problem number: 43.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$x^2(x^2+1)\,y''+x(7x^2+3)\,y'+(8x^2+1)\,y=0$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+x^2)\,y''+(7x^3+3x)\,y'+(8x^2+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{7x^2+3}{x\,(x^2+1)}$$
$$q(x)=\frac{8x^2+1}{x^2\,(x^2+1)}$$

Table 736: Table $p(x), q(x)$ singularites.

$p(x) = \frac{7x^2+3}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{8x^2+1}{x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+1)\,y'' + (7x^3+3x)\,y' + (8x^2+1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (7x^3+3x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (8x^2+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 7x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 7x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 7a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 8x^{n+r+2} a_n = \sum_{n=2}^{\infty} 8a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 7a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 8a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + 3x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + 3x^r a_0 r + a_0 x^r = 0$$

Or

$$(x^r r(-1+r) + 3x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r+1)^2\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r+1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -1$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r+1)^2\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-1}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-1}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$a_{n-2}(n+r-2)(n-3+r) + a_n(n+r)(n+r-1) + 7a_{n-2}(n+r-2) + 3a_n(n+r) + 8a_{n-2} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}(n^2 + 2nr + r^2 + 2n + 2r)}{n^2 + 2nr + r^2 + 2n + 2r + 1} \tag{4}$$

Which for the root $r = -1$ becomes

$$a_n = \frac{a_{n-2}(-n^2 + 1)}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-r^2 - 6r - 8}{(r+3)^2}$$

Which for the root $r = -1$ becomes

$$a_2 = -\frac{3}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-r^2-6r-8}{(r+3)^2}$	$-\frac{3}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-r^2-6r-8}{(r+3)^2}$	$-\frac{3}{4}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(r+6)(r+2)(r+4)^2}{(r+3)^2(5+r)^2}$$

Which for the root $r = -1$ becomes

$$a_4 = \frac{45}{64}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-r^2-6r-8}{(r+3)^2}$	$-\frac{3}{4}$
a_3	0	0
a_4	$\frac{(r+6)(r+2)(r+4)^2}{(r+3)^2(5+r)^2}$	$\frac{45}{64}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-r^2-6r-8}{(r+3)^2}$	$-\frac{3}{4}$
a_3	0	0
a_4	$\frac{(r+6)(r+2)(r+4)^2}{(r+3)^2(5+r)^2}$	$\frac{45}{64}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \frac{1}{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \frac{1 - \frac{3x^2}{4} + \frac{45x^4}{64} + O(x^6)}{x} \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = -1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r = -1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{-r^2-6r-8}{(r+3)^2}$	$-\frac{3}{4}$	$-\frac{2}{(r+3)^3}$	$-\frac{1}{4}$
b_3	0	0	0	0
b_4	$\frac{(r+6)(r+2)(r+4)^2}{(r+3)^2(5+r)^2}$	$\frac{45}{64}$	$\frac{4(r+4)(r^2+8r+18)}{(r+3)^3(5+r)^3}$	$\frac{33}{128}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= \frac{\left(1 - \frac{3x^2}{4} + \frac{45x^4}{64} + O(x^6)\right)\ln(x)}{x} + \frac{-\frac{x^2}{4} + \frac{33x^4}{128} + O(x^6)}{x}
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= \frac{c_1\left(1 - \frac{3x^2}{4} + \frac{45x^4}{64} + O(x^6)\right)}{x} \\
&\quad + c_2\left(\frac{\left(1 - \frac{3x^2}{4} + \frac{45x^4}{64} + O(x^6)\right)\ln(x)}{x} + \frac{-\frac{x^2}{4} + \frac{33x^4}{128} + O(x^6)}{x}\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(1 - \frac{3x^2}{4} + \frac{45x^4}{64} + O(x^6)\right)}{x} \\
&\quad + c_2\left(\frac{\left(1 - \frac{3x^2}{4} + \frac{45x^4}{64} + O(x^6)\right)\ln(x)}{x} + \frac{-\frac{x^2}{4} + \frac{33x^4}{128} + O(x^6)}{x}\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$y = \frac{c_1\left(1-\frac{3x^2}{4}+\frac{45x^4}{64}+O(x^6)\right)}{x} + c_2\left(\frac{\left(1-\frac{3x^2}{4}+\frac{45x^4}{64}+O(x^6)\right)\ln(x)}{x}+\frac{-\frac{x^2}{4}+\frac{33x^4}{128}+O(x^6)}{x}\right) \tag{1}$$

Verification of solutions

$$y = \frac{c_1\left(1-\frac{3x^2}{4}+\frac{45x^4}{64}+O(x^6)\right)}{x} + c_2\left(\frac{\left(1-\frac{3x^2}{4}+\frac{45x^4}{64}+O(x^6)\right)\ln(x)}{x}+\frac{-\frac{x^2}{4}+\frac{33x^4}{128}+O(x^6)}{x}\right)$$

Verified OK.

    $$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$$

  - Shift index using $k->k+1-m$

    $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

  - Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

    $$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$$

  - Shift index using $k->k+2-m$

    $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(1+r)^2\, x^r + a_1(2+r)^2\, x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(k+r+1)^2 + a_{k-2}(k+r+2)\,(k+r)\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$(1+r)^{2} = 0$

- Values of r that satisfy the indicial equation

  $r = -1$

- Each term must be 0

  $a_{1}(2+r)^{2} = 0$

- Solve for the dependent coefficient(s)

  $a_{1} = 0$

- Each term in the series must be 0, giving the recursion relation

  $a_{k}(k+r+1)^{2} + a_{k-2}(k+r+2)(k+r) = 0$

- Shift index using $k- >k+2$

  $a_{k+2}(k+3+r)^{2} + a_{k}(k+r+4)(k+r+2) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{a_{k}(k+r+4)(k+r+2)}{(k+3+r)^{2}}$

- Recursion relation for $r = -1$

  $a_{k+2} = -\frac{a_{k}(k+3)(k+1)}{(k+2)^{2}}$

- Solution for $r = -1$

  $\left[y = \sum_{k=0}^{\infty} a_{k} x^{k-1}, a_{k+2} = -\frac{a_{k}(k+3)(k+1)}{(k+2)^{2}}, a_{1} = 0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 44.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(1-2x)\,y''+3y'x+(4x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(-2x^3+x^2\right)y''+3y'x+(4x+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{3}{x\,(2x-1)}$$
$$q(x)=-\frac{4x+1}{x^2\,(2x-1)}$$

Table 738: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{3}{x(2x-1)}$	
singularity	type
$x = 0$	"regular"
$x = \frac{1}{2}$	"regular"

$q(x) = -\frac{4x+1}{x^2(2x-1)}$	
singularity	type
$x = 0$	"regular"
$x = \frac{1}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, \frac{1}{2}, \infty\right]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-y''x^2(2x-1) + 3y'x + (4x+1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) x^2(2x-1) + 3\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) x + (4x+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\sum_{n=0}^{\infty}\left(-2x^{1+n+r}a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty}3x^{n+r}a_n(n+r)\right)+\left(\sum_{n=0}^{\infty}4x^{1+n+r}a_n\right)+\left(\sum_{n=0}^{\infty}a_n x^{n+r}\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty}\left(-2x^{1+n+r}a_n(n+r)(n+r-1)\right)=\sum_{n=1}^{\infty}\left(-2a_{n-1}(n+r-1)(n+r-2)x^{n+r}\right)
$$

$$
\sum_{n=0}^{\infty}4x^{1+n+r}a_n=\sum_{n=1}^{\infty}4a_{n-1}x^{n+r}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\sum_{n=1}^{\infty}\left(-2a_{n-1}(n+r-1)(n+r-2)x^{n+r}\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty}3x^{n+r}a_n(n+r)\right)+\left(\sum_{n=1}^{\infty}4a_{n-1}x^{n+r}\right)+\left(\sum_{n=0}^{\infty}a_n x^{n+r}\right)=0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
x^{n+r}a_n(n+r)(n+r-1)+3x^{n+r}a_n(n+r)+a_n x^{n+r}=0
$$

When $n=0$ the above becomes

$$
x^r a_0 r(-1+r)+3x^r a_0 r+a_0 x^r=0
$$

Or

$$
\left(x^r r(-1+r)+3x^r r+x^r\right)a_0=0
$$

Since $a_0\neq 0$ then the above simplifies to

$$
(r+1)^2 x^r=0
$$

Since the above is true for all x then the indicial equation becomes

$$(r+1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -1$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r+1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-1}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-1}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$-2a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) + 3a_n(n+r) + 4a_{n-1} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{2a_{n-1}(n^2 + 2nr + r^2 - 3n - 3r)}{n^2 + 2nr + r^2 + 2n + 2r + 1} \tag{4}$$

Which for the root $r = -1$ becomes

$$a_n = \frac{2a_{n-1}(n^2 - 5n + 4)}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{2r^2 - 2r - 4}{(r+2)^2}$$

Which for the root $r = -1$ becomes

$$a_1 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2-2r-4}{(r+2)^2}$	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4r^3 - 8r^2 - 4r + 8}{(r+3)^2 (r+2)}$$

Which for the root $r = -1$ becomes

$$a_2 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2-2r-4}{(r+2)^2}$	0
a_2	$\frac{4r^3-8r^2-4r+8}{(r+3)^2(r+2)}$	0

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{8r^4 - 16r^3 - 8r^2 + 16r}{(r+4)^2 (r+2)(r+3)}$$

Which for the root $r = -1$ becomes

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2-2r-4}{(r+2)^2}$	0
a_2	$\frac{4r^3-8r^2-4r+8}{(r+3)^2(r+2)}$	0
a_3	$\frac{8r^4-16r^3-8r^2+16r}{(r+4)^2(r+2)(r+3)}$	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16(r+1)^2 (-1+r)(r-2) r}{(5+r)^2 (r+3)(r+2)(r+4)}$$

Which for the root $r = -1$ becomes

$$a_4 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2-2r-4}{(r+2)^2}$	0
a_2	$\frac{4r^3-8r^2-4r+8}{(r+3)^2(r+2)}$	0
a_3	$\frac{8r^4-16r^3-8r^2+16r}{(r+4)^2(r+2)(r+3)}$	0
a_4	$\frac{16(r+1)^2(-1+r)(r-2)r}{(5+r)^2(r+3)(r+2)(r+4)}$	0

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{32(r+1)^2 (-1+r)(r-2)r}{(r+6)^2 (r+4)(r+3)(5+r)}$$

Which for the root $r = -1$ becomes

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2-2r-4}{(r+2)^2}$	0
a_2	$\frac{4r^3-8r^2-4r+8}{(r+3)^2(r+2)}$	0
a_3	$\frac{8r^4-16r^3-8r^2+16r}{(r+4)^2(r+2)(r+3)}$	0
a_4	$\frac{16(r+1)^2(-1+r)(r-2)r}{(5+r)^2(r+3)(r+2)(r+4)}$	0
a_5	$\frac{32(r+1)^2(-1+r)(r-2)r}{(r+6)^2(r+4)(r+3)(5+r)}$	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \frac{1}{x}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= \frac{1 + O(x^6)}{x} \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr}a_{n,r}$$

And the above is then evaluated at $r = -1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$	$b_n(r = -1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	$\frac{2r^2-2r-4}{(r+2)^2}$	0	$\frac{10r+4}{(r+2)^3}$	-6
b_2	$\frac{4r^3-8r^2-4r+8}{(r+3)^2(r+2)}$	0	$\frac{40r^3+56r^2-112r-80}{(r+3)^3(r+2)^2}$	6
b_3	$\frac{8r^4-16r^3-8r^2+16r}{(r+4)^2(r+2)(r+3)}$	0	$\frac{120r^5+528r^4+24r^3-1536r^2-480r+384}{(r+4)^3(r+2)^2(r+3)^2}$	$-\frac{8}{3}$
b_4	$\frac{16(r+1)^2(-1+r)(r-2)r}{(5+r)^2(r+3)(r+2)(r+4)}$	0	$\frac{64(r+1)(5r^6+42r^5+83r^4-84r^3-274r^2-12r+60)}{(5+r)^3(r+3)^2(r+2)^2(r+4)^2}$	0
b_5	$\frac{32(r+1)^2(-1+r)(r-2)r}{(r+6)^2(r+4)(r+3)(5+r)}$	0	$\frac{160(r+1)(5r^6+57r^5+173r^4-57r^3-634r^2-24r+144)}{(r+6)^3(r+4)^2(r+3)^2(5+r)^2}$	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6\dots \\
&= \frac{(1 + O(x^6))\ln(x)}{x} + \frac{6x^2 - 6x - \frac{8x^3}{3} + O(x^6)}{x}
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1y_1(x) + c_2y_2(x) \\
&= \frac{c_1(1 + O(x^6))}{x} + c_2\left(\frac{(1 + O(x^6))\ln(x)}{x} + \frac{6x^2 - 6x - \frac{8x^3}{3} + O(x^6)}{x}\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= \frac{c_1(1 + O(x^6))}{x} + c_2\left(\frac{(1 + O(x^6))\ln(x)}{x} + \frac{6x^2 - 6x - \frac{8x^3}{3} + O(x^6)}{x}\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$y = \frac{c_1(1+O(x^6))}{x} + c_2\left(\frac{(1+O(x^6))\ln(x)}{x} + \frac{6x^2-6x-\frac{8x^3}{3}+O(x^6)}{x}\right) \tag{1}$$

Verification of solutions

$$y = \frac{c_1(1+O(x^6))}{x} + c_2\left(\frac{(1+O(x^6))\ln(x)}{x} + \frac{6x^2-6x-\frac{8x^3}{3}+O(x^6)}{x}\right)$$

Verified OK.

15.48.1 Maple step by step solution

Let's solve

$-y''x^2(2x-1)+3y'x+(4x+1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{(4x+1)y}{x^2(2x-1)}+\frac{3y'}{x(2x-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{3y'}{x(2x-1)}-\frac{(4x+1)y}{x^2(2x-1)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x)=-\frac{3}{x(2x-1)}, P_3(x)=-\frac{4x+1}{x^2(2x-1)}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

    $\left.(x\cdot P_2(x))\right|_{x=0}=3$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

    $\left.(x^2\cdot P_3(x))\right|_{x=0}=1$

  ◦ $x=0$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0=0$

- Multiply by denominators

  $y''x^2(2x-1)-3y'x+(-4x-1)\,y=0$
- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m=0..1$

    $x^m\cdot y=\sum_{k=0}^{\infty} a_k x^{k+r+m}$
  - Shift index using $k->k-m$

    $x^m\cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$
  - Convert $x \cdot y'$ to series expansion

    $x\cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r}$
  - Convert $x^m \cdot y''$ to series expansion for $m=2..3$

    $x^m\cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$
  - Shift index using $k->k+2-m$

    $x^m\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$

  Rewrite ODE with series expansions

  $-a_0(1+r)^2\,x^r+\left(\sum_{k=1}^{\infty}\left(-a_k(k+r+1)^2+2a_{k-1}(k+r)\,(k-3+r)\right)x^{k+r}\right)=0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-(1+r)^2=0$
- Values of r that satisfy the indicial equation

  $r=-1$
- Each term in the series must be 0, giving the recursion relation

  $-a_k(k+r+1)^2+2a_{k-1}(k+r)\,(k-3+r)=0$
- Shift index using $k->k+1$

  $-a_{k+1}(k+2+r)^2+2a_k(k+r+1)\,(k+r-2)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+1} = \frac{2a_k(k+r+1)(k+r-2)}{(k+2+r)^2}$

- Recursion relation for $r = -1$; series terminates at $k = 3$

  $a_{k+1} = \frac{2a_k k(k-3)}{(k+1)^2}$

- Apply recursion relation for $k = 0$

  $a_1 = 0$

- Apply recursion relation for $k = 1$

  $a_2 = -a_1$

- Express in terms of a_0

  $a_2 = 0$

- Apply recursion relation for $k = 2$

  $a_3 = -\frac{4a_2}{9}$

- Express in terms of a_0

  $a_3 = 0$

- Terminating series solution of the ODE for $r = -1$. Use reduction of order to find the second

  $y = a_0 \cdot 0$

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x(x+1)\,y''+(1-x)\,y'+y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^2+x\right)y''+(1-x)\,y'+y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{x-1}{x\,(x+1)}$$
$$q(x)=\frac{1}{x\,(x+1)}$$

Table 740: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{x-1}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = \frac{1}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x(x+1)\,y'' + (1-x)\,y' + y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x(x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (1-x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} x^{n+r-1} a_n(n+r)(n+r-1)\right) \\ +\sum_{n=0}^{\infty}\left(-x^{n+r} a_n(n+r)\right)+\left(\sum_{n=0}^{\infty}(n+r) a_n x^{n+r-1}\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)=0 \tag{2A}$$

The next step is to make all powers of x be $n+r-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r-1} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)=\sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2) x^{n+r-1}$$

$$\sum_{n=0}^{\infty}\left(-x^{n+r} a_n(n+r)\right)=\sum_{n=1}^{\infty}\left(-a_{n-1}(n+r-1) x^{n+r-1}\right)$$

$$\sum_{n=0}^{\infty} a_n x^{n+r}=\sum_{n=1}^{\infty} a_{n-1} x^{n+r-1}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r-1$.

$$\left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2) x^{n+r-1}\right) \\ +\left(\sum_{n=0}^{\infty} x^{n+r-1} a_n(n+r)(n+r-1)\right)+\sum_{n=1}^{\infty}\left(-a_{n-1}(n+r-1) x^{n+r-1}\right) \\ +\left(\sum_{n=0}^{\infty}(n+r) a_n x^{n+r-1}\right)+\left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r-1}\right)=0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r-1} a_n(n+r)(n+r-1)+(n+r) a_n x^{n+r-1}=0$$

When $n=0$ the above becomes

$$x^{-1+r} a_0 r(-1+r)+r a_0 x^{-1+r}=0$$

Or

$$\left(x^{-1+r} r(-1+r)+r\, x^{-1+r}\right) a_0=0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^{-1+r} r^2=0$$

Since the above is true for all x then the indicial equation becomes

$$r^2=0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned}r_1&=0\\ r_2&=0\end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^{-1+r} r^2=0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x)=\sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x)=y_1(x) \ln (x)+\left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y=c_1 y_1(x)+c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0=1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n=0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0=1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned}&a_{n-1}(n+r-1)(n+r-2)+a_n(n+r)(n+r-1) \\ &\quad-a_{n-1}(n+r-1)+a_n(n+r)+a_{n-1}=0\end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n^2 + 2nr + r^2 - 4n - 4r + 4)}{n^2 + 2nr + r^2} \tag{4}$$

Which for the root $r = 0$ becomes

$$a_n = -\frac{a_{n-1}(n-2)^2}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 0$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{(-1+r)^2}{(r+1)^2}$$

Which for the root $r = 0$ becomes

$$a_1 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(-1+r)^2}{(r+1)^2}$	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(-1+r)^2 r^2}{(r+1)^2 (r+2)^2}$$

Which for the root $r = 0$ becomes

$$a_2 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(-1+r)^2}{(r+1)^2}$	-1
a_2	$\frac{(-1+r)^2 r^2}{(r+1)^2 (r+2)^2}$	0

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{(-1+r)^2 r^2}{(r+3)^2 (r+2)^2}$$

Which for the root $r = 0$ becomes

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(-1+r)^2}{(r+1)^2}$	-1
a_2	$\frac{(-1+r)^2 r^2}{(r+1)^2 (r+2)^2}$	0
a_3	$-\frac{(-1+r)^2 r^2}{(r+3)^2 (r+2)^2}$	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(-1+r)^2 r^2}{(r+4)^2 (r+3)^2}$$

Which for the root $r = 0$ becomes

$$a_4 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(-1+r)^2}{(r+1)^2}$	-1
a_2	$\frac{(-1+r)^2 r^2}{(r+1)^2 (r+2)^2}$	0
a_3	$-\frac{(-1+r)^2 r^2}{(r+3)^2 (r+2)^2}$	0
a_4	$\frac{(-1+r)^2 r^2}{(r+4)^2 (r+3)^2}$	0

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(-1+r)^2 r^2}{(5+r)^2 (r+4)^2}$$

Which for the root $r = 0$ becomes

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(-1+r)^2}{(r+1)^2}$	-1
a_2	$\frac{(-1+r)^2 r^2}{(r+1)^2 (r+2)^2}$	0
a_3	$-\frac{(-1+r)^2 r^2}{(r+3)^2 (r+2)^2}$	0
a_4	$\frac{(-1+r)^2 r^2}{(r+4)^2 (r+3)^2}$	0
a_5	$-\frac{(-1+r)^2 r^2}{(5+r)^2 (r+4)^2}$	0

Using the above table, then the first solution $y_1(x)$ becomes

$$\begin{aligned} y_1(x) &= a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots \\ &= 1 - x + O(x^6) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 0$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r = 0)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	$-\frac{(-1+r)^2}{(r+1)^2}$	-1	$\frac{4-4r}{(r+1)^3}$	4
b_2	$\frac{(-1+r)^2 r^2}{(r+1)^2 (r+2)^2}$	0	$\frac{8\left(r^2+r-\frac{1}{2}\right) r(-1+r)}{(r+1)^3 (r+2)^3}$	0
b_3	$-\frac{(-1+r)^2 r^2}{(r+3)^2 (r+2)^2}$	0	$-\frac{12r(-1+r)(r^2+2r-1)}{(r+3)^3 (r+2)^3}$	0
b_4	$\frac{(-1+r)^2 r^2}{(r+4)^2 (r+3)^2}$	0	$\frac{16r^4+32r^3-72r^2+24r}{(r+4)^3 (r+3)^3}$	0
b_5	$-\frac{(-1+r)^2 r^2}{(5+r)^2 (r+4)^2}$	0	$-\frac{20r(-1+r)(r^2+4r-2)}{(5+r)^3 (r+4)^3}$	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x) \ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \ldots \\ &= \left(1 - x + O(x^6)\right) \ln(x) + 4x + O(x^6) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1\left(1 - x + O(x^6)\right) + c_2\left(\left(1 - x + O(x^6)\right) \ln(x) + 4x + O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1\left(1 - x + O(x^6)\right) + c_2\left(\left(1 - x + O(x^6)\right) \ln(x) + 4x + O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1\left(1 - x + O(x^6)\right) + c_2\left(\left(1 - x + O(x^6)\right) \ln(x) + 4x + O(x^6)\right) \tag{1}$$

Verification of solutions

$$y = c_1\left(1 - x + O(x^6)\right) + c_2\left(\left(1 - x + O(x^6)\right) \ln(x) + 4x + O(x^6)\right)$$

Verified OK.

15.49.1 Maple step by step solution

Let's solve

$x(x+1)\,y''+(1-x)\,y'+y=0$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y''=-\frac{y}{x(x+1)}+\frac{(x-1)y'}{x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''-\frac{(x-1)y'}{x(x+1)}+\frac{y}{x(x+1)}=0$

☐ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=-\frac{x-1}{x(x+1)}, P_3(x)=\frac{1}{x(x+1)}\right]$

  ◦ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

  $\left((x+1)\cdot P_2(x)\right)\bigg|_{x=-1}=-2$

  ◦ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

  $\left((x+1)^2\cdot P_3(x)\right)\bigg|_{x=-1}=0$

  ◦ $x=-1$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0=-1$

- Multiply by denominators

$x(x+1)\,y''+(1-x)\,y'+y=0$

- Change variables using $x=u-1$ so that the regular singular point is at $u=0$

$(u^2-u)\left(\frac{d^2}{du^2}y(u)\right)+(2-u)\left(\frac{d}{du}y(u)\right)+y(u)=0$

- Assume series solution for $y(u)$

$y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\, u^{k+r-1+m}$
- Shift index using $k- > k+1-m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$
- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)(k+r-1)\, u^{k+r-2+m}$
- Shift index using $k- > k+2-m$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, u^{k+r}$

  Rewrite ODE with series expansions

  $-a_0 r(-3+r)\, u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(-a_{k+1}(k+1+r)(k-2+r) + a_k (k+r-1)^2\right) u^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-r(-3+r) = 0$
- Values of r that satisfy the indicial equation

  $r \in \{0, 3\}$
- Each term in the series must be 0, giving the recursion relation

  $-a_{k+1}(k+1+r)(k-2+r) + a_k (k+r-1)^2 = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+1} = \frac{a_k (k+r-1)^2}{(k+1+r)(k-2+r)}$
- Recursion relation for $r = 0$; series terminates at $k = 1$

  $a_{k+1} = \frac{a_k (k-1)^2}{(k+1)(k-2)}$
- Apply recursion relation for $k = 0$

  $a_1 = -\frac{a_0}{2}$
- Terminating series solution of the ODE for $r = 0$. Use reduction of order to find the second li

  $y(u) = a_0 \cdot \left(1 - \frac{u}{2}\right)$
- Revert the change of variables $u = x + 1$

  $\left[y = a_0\left(\frac{1}{2} - \frac{x}{2}\right)\right]$

- Recursion relation for $r = 3$

  $a_{k+1} = \frac{a_k (k+2)^2}{(k+4)(k+1)}$

- Solution for $r = 3$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+3}, a_{k+1} = \frac{a_k (k+2)^2}{(k+4)(k+1)}\right]$

- Revert the change of variables $u = x + 1$

  $\left[y = \sum_{k=0}^{\infty} a_k (x+1)^{k+3}, a_{k+1} = \frac{a_k (k+2)^2}{(k+4)(k+1)}\right]$

- Combine solutions and rename parameters

  $\left[y = a_0\left(\frac{1}{2} - \frac{x}{2}\right) + \left(\sum_{k=0}^{\infty} b_k (x+1)^{k+3}\right), b_{1+k} = \frac{b_k (k+2)^2}{(4+k)(1+k)}\right]$

Problem number: 46.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x^2(1-x)\, y'' + x(-2x+3)\, y' + (1+2x)\, y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(-x^3+x^2\right) y'' + \left(-2x^2+3x\right) y' + (1+2x)\, y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{-3+2x}{x\,(x-1)}$$
$$q(x) = -\frac{1+2x}{x^2\,(x-1)}$$

Table 742: Table $p(x), q(x)$ singularites.

$p(x) = \frac{-3+2x}{x(x-1)}$	
singularity	type
$x = 0$	"regular"
$x = 1$	"regular"

$q(x) = -\frac{1+2x}{x^2(x-1)}$	
singularity	type
$x = 0$	"regular"
$x = 1$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, 1, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-y''x^2(x-1) + \left(-2x^2 + 3x\right) y' + (1 + 2x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) x^2(x-1) + \left(-2x^2 + 3x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (1+2x) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\sum_{n=0}^{\infty}\left(-x^{1+n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right) \\
&+\sum_{n=0}^{\infty}\left(-2 x^{1+n+r} a_n(n+r)\right)+\left(\sum_{n=0}^{\infty} 3 x^{n+r} a_n(n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 2 x^{1+n+r} a_n\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty}\left(-x^{1+n+r} a_n(n+r)(n+r-1)\right) &= \sum_{n=1}^{\infty}\left(-a_{n-1}(n+r-1)(n+r-2) x^{n+r}\right) \\
\sum_{n=0}^{\infty}\left(-2 x^{1+n+r} a_n(n+r)\right) &= \sum_{n=1}^{\infty}\left(-2 a_{n-1}(n+r-1) x^{n+r}\right) \\
\sum_{n=0}^{\infty} 2 x^{1+n+r} a_n &= \sum_{n=1}^{\infty} 2 a_{n-1} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\sum_{n=1}^{\infty}\left(-a_{n-1}(n+r-1)(n+r-2) x^{n+r}\right)+\left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right) \\
&+\sum_{n=1}^{\infty}\left(-2 a_{n-1}(n+r-1) x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 3 x^{n+r} a_n(n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)+\left(\sum_{n=1}^{\infty} 2 a_{n-1} x^{n+r}\right)=0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
x^{n+r} a_n(n+r)(n+r-1)+3 x^{n+r} a_n(n+r)+a_n x^{n+r}=0
$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + 3x^r a_0 r + a_0 x^r = 0$$

Or

$$(x^r r(-1+r) + 3x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r+1)^2\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r+1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= -1 \\ r_2 &= -1 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r+1)^2\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-1}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-1}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} -a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ - 2a_{n-1}(n+r-1) + 3a_n(n+r) + a_n + 2a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{(n+r-2)\, a_{n-1}}{1+n+r} \tag{4}$$

Which for the root $r = -1$ becomes

$$a_n = \frac{(n-3)\, a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-1+r}{2+r}$$

Which for the root $r = -1$ becomes

$$a_1 = -2$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1+r}{2+r}$	-2

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(-1+r)\, r}{(2+r)\,(3+r)}$$

Which for the root $r = -1$ becomes

$$a_2 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1+r}{2+r}$	-2
a_2	$\frac{(-1+r)r}{(2+r)(3+r)}$	1

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{r^3 - r}{(2+r)\,(3+r)\,(4+r)}$$

Which for the root $r = -1$ becomes

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1+r}{2+r}$	-2
a_2	$\frac{(-1+r)r}{(2+r)(3+r)}$	1
a_3	$\frac{r^3-r}{(2+r)(3+r)(4+r)}$	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^3 - r}{(3 + r)(4 + r)(5 + r)}$$

Which for the root $r = -1$ becomes

$$a_4 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1+r}{2+r}$	-2
a_2	$\frac{(-1+r)r}{(2+r)(3+r)}$	1
a_3	$\frac{r^3-r}{(2+r)(3+r)(4+r)}$	0
a_4	$\frac{r^3-r}{(3+r)(4+r)(5+r)}$	0

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{r^3 - r}{(4 + r)(5 + r)(6 + r)}$$

Which for the root $r = -1$ becomes

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1+r}{2+r}$	-2
a_2	$\frac{(-1+r)r}{(2+r)(3+r)}$	1
a_3	$\frac{r^3-r}{(2+r)(3+r)(4+r)}$	0
a_4	$\frac{r^3-r}{(3+r)(4+r)(5+r)}$	0
a_5	$\frac{r^3-r}{(4+r)(5+r)(6+r)}$	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \frac{1}{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \frac{x^2 - 2x + 1 + O(x^6)}{x} \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = -1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r = -1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	$\frac{-1+r}{2+r}$	-2	$\frac{3}{(2+r)^2}$	3
b_2	$\frac{(-1+r)r}{(2+r)(3+r)}$	1	$\frac{6r^2+12r-6}{(2+r)^2(3+r)^2}$	-3
b_3	$\frac{r^3-r}{(2+r)(3+r)(4+r)}$	0	$\frac{9r^4+54r^3+81r^2-24}{(2+r)^2(3+r)^2(4+r)^2}$	$\frac{1}{3}$
b_4	$\frac{r^3-r}{(3+r)(4+r)(5+r)}$	0	$\frac{12r^4+96r^3+192r^2-60}{(3+r)^2(4+r)^2(5+r)^2}$	$\frac{1}{12}$
b_5	$\frac{r^3-r}{(4+r)(5+r)(6+r)}$	0	$\frac{15r^4+150r^3+375r^2-120}{(4+r)^2(5+r)^2(6+r)^2}$	$\frac{1}{30}$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\ &= \frac{(x^2 - 2x + 1 + O(x^6))\ln(x)}{x} + \frac{-3x^2 + 3x + \frac{x^3}{3} + \frac{x^4}{12} + \frac{x^5}{30} + O(x^6)}{x} \end{aligned}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= \frac{c_1(x^2 - 2x + 1 + O(x^6))}{x} \\
&\quad + c_2 \left(\frac{(x^2 - 2x + 1 + O(x^6)) \ln(x)}{x} + \frac{-3x^2 + 3x + \frac{x^3}{3} + \frac{x^4}{12} + \frac{x^5}{30} + O(x^6)}{x} \right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= \frac{c_1(x^2 - 2x + 1 + O(x^6))}{x} \\
&\quad + c_2 \left(\frac{(x^2 - 2x + 1 + O(x^6)) \ln(x)}{x} + \frac{-3x^2 + 3x + \frac{x^3}{3} + \frac{x^4}{12} + \frac{x^5}{30} + O(x^6)}{x} \right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= \frac{c_1(x^2 - 2x + 1 + O(x^6))}{x} \\
&\quad + c_2 \left(\frac{(x^2 - 2x + 1 + O(x^6)) \ln(x)}{x} + \frac{-3x^2 + 3x + \frac{x^3}{3} + \frac{x^4}{12} + \frac{x^5}{30} + O(x^6)}{x} \right)
\end{aligned}
\tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= \frac{c_1(x^2 - 2x + 1 + O(x^6))}{x} \\
&\quad + c_2 \left(\frac{(x^2 - 2x + 1 + O(x^6)) \ln(x)}{x} + \frac{-3x^2 + 3x + \frac{x^3}{3} + \frac{x^4}{12} + \frac{x^5}{30} + O(x^6)}{x} \right)
\end{aligned}
$$

Verified OK.

15.50.1 Maple step by step solution

Let's solve

$-y''x^2(x-1)+(-2x^2+3x)\,y'+(1+2x)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{(1+2x)y}{x^2(x-1)}-\frac{(-3+2x)y'}{x(x-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(-3+2x)y'}{x(x-1)}-\frac{(1+2x)y}{x^2(x-1)}=0$

□ Check to see if x_0 is a regular singular point

  ∘ Define functions

  $\left[P_2(x)=\frac{-3+2x}{x(x-1)},P_3(x)=-\frac{1+2x}{x^2(x-1)}\right]$

  ∘ $x\cdot P_2(x)$ is analytic at $x=0$

  $(x\cdot P_2(x))\bigg|_{x=0}=3$

  ∘ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $(x^2\cdot P_3(x))\bigg|_{x=0}=1$

  ∘ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $y''x^2(x-1)+x(-3+2x)\,y'+(-1-2x)\,y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_kx^{k+r}$

□ Rewrite ODE with series expansions

  ∘ Convert $x^m\cdot y$ to series expansion for $m=0..1$

  $x^m\cdot y=\sum_{k=0}^{\infty}a_kx^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m} \cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^{m} \cdot y'$ to series expansion for $m=1..2$

  $x^{m} \cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r) x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m} \cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r) x^{k+r}$

- Convert $x^{m} \cdot y''$ to series expansion for $m=2..3$

  $x^{m} \cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)(k+r-1) x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m} \cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r) x^{k+r}$

  Rewrite ODE with series expansions

  $-a_{0}(1+r)^{2} x^{r}+\left(\sum_{k=1}^{\infty}\left(-a_{k}(k+r+1)^{2}+a_{k-1}(k+r+1)(k-2+r)\right) x^{k+r}\right)=0$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $-(1+r)^{2}=0$

- Values of r that satisfy the indicial equation

  $r=-1$

- Each term in the series must be 0, giving the recursion relation

  $-a_{k}(k+r+1)^{2}+a_{k-1}(k+r+1)(k-2+r)=0$

- Shift index using $k->k+1$

  $-a_{k+1}(k+r+2)^{2}+a_{k}(k+r+2)(k+r-1)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+1}=\frac{a_{k}(k+r-1)}{k+r+2}$

- Recursion relation for $r=-1$; series terminates at $k=2$

  $a_{k+1}=\frac{a_{k}(k-2)}{k+1}$

- Apply recursion relation for $k=0$

  $a_{1}=-2 a_{0}$

- Apply recursion relation for $k = 1$

  $a_2 = -\frac{a_1}{2}$

- Express in terms of a_0

  $a_2 = a_0$

- Terminating series solution of the ODE for $r = -1$. Use reduction of order to find the second

  $y = a_0 \cdot (x^2 - 2x + 1)$

Problem number: 47.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2(x+1)\,y''+4y'x^2+(1-5x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(4x^3+4x^2\right)y''+4y'x^2+(1-5x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned} p(x) &= \frac{1}{x+1} \\ q(x) &= -\frac{5x-1}{4x^2\,(x+1)} \end{aligned}$$

Table 744: Table $p(x), q(x)$ singularites.

$p(x) = \frac{1}{x+1}$	
singularity	type
$x = -1$	"regular"

$q(x) = -\frac{5x-1}{4x^2(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2(x+1)\,y'' + 4y'x^2 + (1-5x)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2(x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + 4\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) x^2 + (1-5x)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n(n+r)(n+r-1)\right) \tag{2A}$$
$$+ \left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-5x^{1+n+r} a_n\right) = 0$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n(n+r)(n+r-1) = \sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n(n+r) = \sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-5x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-5a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n(n+r)(n+r-1)\right) \tag{2B}$$
$$+ \left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) + \sum_{n=1}^{\infty} \left(-5a_{n-1} x^{n+r}\right) = 0$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n(n+r)(n+r-1) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$4x^r a_0 r(-1+r) + a_0 x^r = 0$$

Or

$$\left(4x^r r(-1+r) + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(2r-1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(2r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = \frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(2r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{2}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{2}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$4a_{n-1}(n+r-1)(n+r-2)+4a_n(n+r)(n+r-1)+4a_{n-1}(n+r-1)+a_n-5a_{n-1}=0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(4n^2+8nr+4r^2-8n-8r-1)}{4n^2+8nr+4r^2-4n-4r+1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{a_{n-1}(n^2-n-1)}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-4r^2+5}{(2r+1)^2}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2+5}{(2r+1)^2}$	1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{16r^4+32r^3-24r^2-40r+5}{16\left(r+\frac{1}{2}\right)^2\left(r+\frac{3}{2}\right)^2}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = -\frac{1}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2+5}{(2r+1)^2}$	1
a_2	$\frac{16r^4+32r^3-24r^2-40r+5}{16\left(r+\frac{1}{2}\right)^2\left(r+\frac{3}{2}\right)^2}$	$-\frac{1}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-64r^6 - 384r^5 - 592r^4 + 192r^3 + 884r^2 + 360r - 55}{64\left(r + \frac{5}{2}\right)^2 \left(r + \frac{1}{2}\right)^2 \left(r + \frac{3}{2}\right)^2}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = \frac{5}{36}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2+5}{(2r+1)^2}$	1
a_2	$\frac{16r^4+32r^3-24r^2-40r+5}{16\left(r+\frac{1}{2}\right)^2\left(r+\frac{3}{2}\right)^2}$	$-\frac{1}{4}$
a_3	$\frac{-64r^6-384r^5-592r^4+192r^3+884r^2+360r-55}{64\left(r+\frac{5}{2}\right)^2\left(r+\frac{1}{2}\right)^2\left(r+\frac{3}{2}\right)^2}$	$\frac{5}{36}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(4r^2 + 24r + 31)(4r^2 - 5)(4r^2 + 8r - 1)(4r^2 + 16r + 11)}{(2r + 5)^2 (2r + 1)^2 (2r + 3)^2 (4r^2 + 28r + 49)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = -\frac{55}{576}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2+5}{(2r+1)^2}$	1
a_2	$\frac{16r^4+32r^3-24r^2-40r+5}{16\left(r+\frac{1}{2}\right)^2\left(r+\frac{3}{2}\right)^2}$	$-\frac{1}{4}$
a_3	$\frac{-64r^6-384r^5-592r^4+192r^3+884r^2+360r-55}{64\left(r+\frac{5}{2}\right)^2\left(r+\frac{1}{2}\right)^2\left(r+\frac{3}{2}\right)^2}$	$\frac{5}{36}$
a_4	$\frac{(4r^2+24r+31)(4r^2-5)(4r^2+8r-1)(4r^2+16r+11)}{(2r+5)^2(2r+1)^2(2r+3)^2(4r^2+28r+49)}$	$-\frac{55}{576}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(4r^2+24r+31)(4r^2-5)(4r^2+8r-1)(4r^2+16r+11)(4r^2+32r+59)}{1024\left(r+\frac{7}{2}\right)^2\left(r+\frac{9}{2}\right)^2\left(r+\frac{5}{2}\right)^2\left(r+\frac{1}{2}\right)^2\left(r+\frac{3}{2}\right)^2}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = \frac{209}{2880}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2+5}{(2r+1)^2}$	1
a_2	$\frac{16r^4+32r^3-24r^2-40r+5}{16\left(r+\frac{1}{2}\right)^2\left(r+\frac{3}{2}\right)^2}$	$-\frac{1}{4}$
a_3	$\frac{-64r^6-384r^5-592r^4+192r^3+884r^2+360r-55}{64\left(r+\frac{5}{2}\right)^2\left(r+\frac{1}{2}\right)^2\left(r+\frac{3}{2}\right)^2}$	$\frac{5}{36}$
a_4	$\frac{(4r^2+24r+31)(4r^2-5)(4r^2+8r-1)(4r^2+16r+11)}{(2r+5)^2(2r+1)^2(2r+3)^2(4r^2+28r+49)}$	$-\frac{55}{576}$
a_5	$-\frac{(4r^2+24r+31)(4r^2-5)(4r^2+8r-1)(4r^2+16r+11)(4r^2+32r+59)}{1024\left(r+\frac{7}{2}\right)^2\left(r+\frac{9}{2}\right)^2\left(r+\frac{5}{2}\right)^2\left(r+\frac{1}{2}\right)^2\left(r+\frac{3}{2}\right)^2}$	$\frac{209}{2880}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \sqrt{x}\left(x + 1 - \frac{x^2}{4} + \frac{5x^3}{36} - \frac{55x^4}{576} + \frac{209x^5}{2880} + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{2}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$
b_0	1	1	N/A since b_n starts from 1
b_1	$\frac{-4r^2+5}{(2r+1)^2}$	1	$\frac{-8r-20}{(2r+1)^3}$
b_2	$\frac{16r^4+32r^3-24r^2-40r+5}{16(r+\frac{1}{2})^2(r+\frac{3}{2})^2}$	$-\frac{1}{4}$	$\frac{128r^4+640r^3+768r^2+96r-200}{(2r+3)^3(2r+1)^3}$
b_3	$\frac{-64r^6-384r^5-592r^4+192r^3+884r^2+360r-55}{64(r+\frac{5}{2})^2(r+\frac{1}{2})^2(r+\frac{3}{2})^2}$	$\frac{5}{36}$	$-\frac{4(384r^7+4032r^6+15840r^5+29616r^4+26184r^3+690}{(2r+3)^3(2r+1)^3(2r+5)^3}$
b_4	$\frac{(4r^2+24r+31)(4r^2-5)(4r^2+8r-1)(4r^2+16r+11)}{(2r+5)^2(2r+1)^2(2r+3)^2(4r^2+28r+49)}$	$-\frac{55}{576}$	$\frac{16384r^{10}+311296r^9+2494464r^8+11059200r^7+29755}{(2r+}$
b_5	$-\frac{(4r^2+24r+31)(4r^2-5)(4r^2+8r-1)(4r^2+16r+11)(4r^2+32r+59)}{1024(r+\frac{7}{2})^2(r+\frac{9}{2})^2(r+\frac{5}{2})^2(r+\frac{1}{2})^2(r+\frac{3}{2})^2}$	$\frac{209}{2880}$	$-\frac{20(8192r^{13}+249856r^{12}+3379200r^{11}+26781696r^{10}}{}$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \ldots \\
&= \sqrt{x}\left(x + 1 - \frac{x^2}{4} + \frac{5x^3}{36} - \frac{55x^4}{576} + \frac{209x^5}{2880} + O(x^6)\right)\ln(x) \\
&\quad + \sqrt{x}\left(-3x + \frac{x^2}{4} - \frac{5x^3}{54} + \frac{175x^4}{3456} - \frac{2863x^5}{86400} + O(x^6)\right)
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1\sqrt{x}\left(x + 1 - \frac{x^2}{4} + \frac{5x^3}{36} - \frac{55x^4}{576} + \frac{209x^5}{2880} + O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(x + 1 - \frac{x^2}{4} + \frac{5x^3}{36} - \frac{55x^4}{576} + \frac{209x^5}{2880} + O(x^6)\right)\ln(x)\right. \\
&\qquad \left. + \sqrt{x}\left(-3x + \frac{x^2}{4} - \frac{5x^3}{54} + \frac{175x^4}{3456} - \frac{2863x^5}{86400} + O(x^6)\right)\right)
\end{aligned}$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1\sqrt{x}\left(x+1-\frac{x^2}{4}+\frac{5x^3}{36}-\frac{55x^4}{576}+\frac{209x^5}{2880}+O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(x+1-\frac{x^2}{4}+\frac{5x^3}{36}-\frac{55x^4}{576}+\frac{209x^5}{2880}+O(x^6)\right)\ln(x)\right. \\
&\qquad \left.+\sqrt{x}\left(-3x+\frac{x^2}{4}-\frac{5x^3}{54}+\frac{175x^4}{3456}-\frac{2863x^5}{86400}+O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1\sqrt{x}\left(x+1-\frac{x^2}{4}+\frac{5x^3}{36}-\frac{55x^4}{576}+\frac{209x^5}{2880}+O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(x+1-\frac{x^2}{4}+\frac{5x^3}{36}-\frac{55x^4}{576}+\frac{209x^5}{2880}+O(x^6)\right)\ln(x)\right. \\
&\qquad \left.+\sqrt{x}\left(-3x+\frac{x^2}{4}-\frac{5x^3}{54}+\frac{175x^4}{3456}-\frac{2863x^5}{86400}+O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1\sqrt{x}\left(x+1-\frac{x^2}{4}+\frac{5x^3}{36}-\frac{55x^4}{576}+\frac{209x^5}{2880}+O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(x+1-\frac{x^2}{4}+\frac{5x^3}{36}-\frac{55x^4}{576}+\frac{209x^5}{2880}+O(x^6)\right)\ln(x)\right. \\
&\qquad \left.+\sqrt{x}\left(-3x+\frac{x^2}{4}-\frac{5x^3}{54}+\frac{175x^4}{3456}-\frac{2863x^5}{86400}+O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

15.51.1 Maple step by step solution

Let's solve

$4x^2(x+1)\,y''+4y'x^2+(1-5x)\,y=0$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y''=\frac{(5x-1)y}{4x^2(x+1)}-\frac{y'}{x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{y'}{x+1} - \frac{(5x-1)y}{4x^2(x+1)} = 0$

☐ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{1}{x+1}, P_3(x) = -\frac{5x-1}{4x^2(x+1)}\right]$

  - $(x+1) \cdot P_2(x)$ is analytic at $x = -1$

    $\left((x+1) \cdot P_2(x)\right)\bigg|_{x=-1} = 1$

  - $(x+1)^2 \cdot P_3(x)$ is analytic at $x = -1$

    $\left((x+1)^2 \cdot P_3(x)\right)\bigg|_{x=-1} = 0$

  - $x = -1$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = -1$

- Multiply by denominators

  $4x^2(x+1) y'' + 4y'x^2 + (1-5x) y = 0$

- Change variables using $x = u - 1$ so that the regular singular point is at $u = 0$

  $(4u^3 - 8u^2 + 4u) \left(\frac{d^2}{du^2} y(u)\right) + (4u^2 - 8u + 4) \left(\frac{d}{du} y(u)\right) + (6 - 5u) y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

  - Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

    $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$

  - Shift index using $k- > k - m$

    $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

  - Convert $u^m \cdot \left(\frac{d}{du} y(u)\right)$ to series expansion for $m = 0..2$

    $u^m \cdot \left(\frac{d}{du} y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r) u^{k+r-1+m}$

- Shift index using $k->k+1-m$

$$u^{m}\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,u^{k+r}$$

- Convert $u^{m}\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)$ to series expansion for $m=1..3$

$$u^{m}\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)=\sum_{k=0}^{\infty}a_{k}(k+r)\,(k+r-1)\,u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

$$u^{m}\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)=\sum_{k=-2+m}^{\infty}a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$$

Rewrite ODE with series expansions

$$4a_{0}r^{2}u^{-1+r}+\left(4a_{1}(1+r)^{2}-2a_{0}(4r^{2}-3)\right)u^{r}+\left(\sum_{k=1}^{\infty}\left(4a_{k+1}(k+1+r)^{2}-2a_{k}(4k^{2}+8kr+4r^{2}\right.\right.$$

- a_{0}cannot be 0 by assumption, giving the indicial equation

$$4r^{2}=0$$

- Values of r that satisfy the indicial equation

$$r=0$$

- Each term must be 0

$$4a_{1}(1+r)^{2}-2a_{0}(4r^{2}-3)=0$$

- Each term in the series must be 0, giving the recursion relation

$$(-8a_{k}+4a_{k-1}+4a_{k+1})\,k^{2}+(-8a_{k-1}+8a_{k+1})\,k+6a_{k}-a_{k-1}+4a_{k+1}=0$$

- Shift index using $k->k+1$

$$(-8a_{k+1}+4a_{k}+4a_{k+2})\,(k+1)^{2}+(-8a_{k}+8a_{k+2})\,(k+1)+6a_{k+1}-a_{k}+4a_{k+2}=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{4k^{2}a_{k}-8k^{2}a_{k+1}-16ka_{k+1}-5a_{k}-2a_{k+1}}{4(k^{2}+4k+4)}$$

- Recursion relation for $r=0$

$$a_{k+2}=-\frac{4k^{2}a_{k}-8k^{2}a_{k+1}-16ka_{k+1}-5a_{k}-2a_{k+1}}{4(k^{2}+4k+4)}$$

- Solution for $r=0$

$$\left[y(u)=\sum_{k=0}^{\infty}a_{k}u^{k},a_{k+2}=-\frac{4k^{2}a_{k}-8k^{2}a_{k+1}-16ka_{k+1}-5a_{k}-2a_{k+1}}{4(k^{2}+4k+4)},4a_{1}+6a_{0}=0\right]$$

- Revert the change of variables $u=x+1$

$$\left[y=\sum_{k=0}^{\infty} a_k (x+1)^k\,, a_{k+2}=-\frac{4k^2a_k-8k^2a_{k+1}-16ka_{k+1}-5a_k-2a_{k+1}}{4(k^2+4k+4)}, 4a_1+6a_0=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 48.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(1-x)\,y''-x(3-5x)\,y'+(4-5x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(-x^3+x^2\right)y''+\left(5x^2-3x\right)y'+(4-5x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=-\frac{5x-3}{x\,(x-1)}\\q(x)&=\frac{5x-4}{x^2\,(x-1)}\end{aligned}$$

Table 746: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{5x-3}{x(x-1)}$	
singularity	type
$x = 0$	"regular"
$x = 1$	"regular"

$q(x) = \frac{5x-4}{x^2(x-1)}$	
singularity	type
$x = 0$	"regular"
$x = 1$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, 1, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-y''x^2(x-1) + (5x^2 - 3x)\, y' + (4 - 5x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\begin{gathered} -\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) x^2(x-1) \\ + (5x^2 - 3x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (4-5x)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \end{gathered} \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\sum_{n=0}^{\infty}\left(-x^{1+n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} 5 x^{1+n+r} a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-3 x^{n+r} a_n(n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 4 a_n x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-5 x^{1+n+r} a_n\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty}\left(-x^{1+n+r} a_n(n+r)(n+r-1)\right) &=\sum_{n=1}^{\infty}\left(-a_{n-1}(n+r-1)(n+r-2) x^{n+r}\right) \\
\sum_{n=0}^{\infty} 5 x^{1+n+r} a_n(n+r) &=\sum_{n=1}^{\infty} 5 a_{n-1}(n+r-1) x^{n+r} \\
\sum_{n=0}^{\infty}\left(-5 x^{1+n+r} a_n\right) &=\sum_{n=1}^{\infty}\left(-5 a_{n-1} x^{n+r}\right)
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\sum_{n=1}^{\infty}\left(-a_{n-1}(n+r-1)(n+r-2) x^{n+r}\right)+\left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right) \\
&+\left(\sum_{n=1}^{\infty} 5 a_{n-1}(n+r-1) x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-3 x^{n+r} a_n(n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 4 a_n x^{n+r}\right)+\sum_{n=1}^{\infty}\left(-5 a_{n-1} x^{n+r}\right)=0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
x^{n+r} a_n(n+r)(n+r-1)-3 x^{n+r} a_n(n+r)+4 a_n x^{n+r}=0
$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - 3x^r a_0 r + 4a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - 3x^r r + 4x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r-2)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r-2)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 2$$
$$r_2 = 2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r-2)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 2$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+2}$$

$$y_2(x) = y_1(x) \ln (x) + \left(\sum_{n=1}^{\infty} b_n x^{n+2}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} -a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ + 5a_{n-1}(n+r-1) - 3a_n(n+r) + 4a_n - 5a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{(n+r-6)\, a_{n-1}}{n+r-2} \tag{4}$$

Which for the root $r = 2$ becomes

$$a_n = \frac{(n-4)\, a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-5+r}{-1+r}$$

Which for the root $r = 2$ becomes

$$a_1 = -3$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-5+r}{-1+r}$	-3

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{r^2 - 9r + 20}{r(-1 + r)}$$

Which for the root $r = 2$ becomes

$$a_2 = 3$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-5+r}{-1+r}$	-3
a_2	$\frac{r^2-9r+20}{r(-1+r)}$	3

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{r^3 - 12r^2 + 47r - 60}{r^3 - r}$$

Which for the root $r = 2$ becomes

$$a_3 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-5+r}{-1+r}$	-3
a_2	$\frac{r^2-9r+20}{r(-1+r)}$	3
a_3	$\frac{r^3-12r^2+47r-60}{r^3-r}$	-1

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^4 - 14r^3 + 71r^2 - 154r + 120}{r(r^2 - 1)(2 + r)}$$

Which for the root $r = 2$ becomes

$$a_4 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-5+r}{-1+r}$	-3
a_2	$\frac{r^2-9r+20}{r(-1+r)}$	3
a_3	$\frac{r^3-12r^2+47r-60}{r^3-r}$	-1
a_4	$\frac{r^4-14r^3+71r^2-154r+120}{r(r^2-1)(2+r)}$	0

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{r^4 - 14r^3 + 71r^2 - 154r + 120}{(3 + r)(2 + r)(1 + r)r}$$

Which for the root $r = 2$ becomes

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-5+r}{-1+r}$	-3
a_2	$\frac{r^2-9r+20}{r(-1+r)}$	3
a_3	$\frac{r^3-12r^2+47r-60}{r^3-r}$	-1
a_4	$\frac{r^4-14r^3+71r^2-154r+120}{r(r^2-1)(2+r)}$	0
a_5	$\frac{r^4-14r^3+71r^2-154r+120}{(3+r)(2+r)(1+r)r}$	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^2 \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^2 \left(-x^3 + 3x^2 - 3x + 1 + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 2$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r = 2)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	$\frac{-5+r}{-1+r}$	-3	$\frac{4}{(-1+r)^2}$	4
b_2	$\frac{r^2-9r+20}{r(-1+r)}$	3	$\frac{8r^2-40r+20}{r^2(-1+r)^2}$	-7
b_3	$\frac{r^3-12r^2+47r-60}{r^3-r}$	-1	$\frac{12r^4-96r^3+192r^2-60}{r^2(r^2-1)^2}$	$\frac{11}{3}$
b_4	$\frac{r^4-14r^3+71r^2-154r+120}{r(r^2-1)(2+r)}$	0	$\frac{16r^6-144r^5+328r^4+192r^3-1016r^2+240r+240}{r^2(r^2-1)^2(2+r)^2}$	$-\frac{1}{4}$
b_5	$\frac{r^4-14r^3+71r^2-154r+120}{(3+r)(2+r)(1+r)r}$	0	$\frac{20r^6-120r^5-100r^4+1200r^3-40r^2-2640r-720}{(3+r)^2(2+r)^2(1+r)^2r^2}$	$-\frac{1}{20}$

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6 \dots \\ &= x^2(-x^3+3x^2-3x+1+O(x^6))\ln(x) + x^2\left(-7x^2+4x+\frac{11x^3}{3}-\frac{x^4}{4}-\frac{x^5}{20}+O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1y_1(x) + c_2y_2(x) \\ &= c_1x^2(-x^3+3x^2-3x+1+O(x^6)) + c_2\Bigg(x^2(-x^3+3x^2-3x+1+O(x^6))\ln(x) \\ &\quad + x^2\left(-7x^2+4x+\frac{11x^3}{3}-\frac{x^4}{4}-\frac{x^5}{20}+O(x^6)\right)\Bigg) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1x^2(-x^3+3x^2-3x+1+O(x^6)) + c_2\Bigg(x^2(-x^3+3x^2-3x+1+O(x^6))\ln(x) \\ &\quad + x^2\left(-7x^2+4x+\frac{11x^3}{3}-\frac{x^4}{4}-\frac{x^5}{20}+O(x^6)\right)\Bigg) \end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1 x^2 \left(-x^3+3x^2-3x+1+O(x^6)\right) + c_2 \left(x^2 \left(-x^3+3x^2-3x+1+O(x^6)\right) \ln(x) + x^2 \left(-7x^2+4x+\frac{11x^3}{3}-\frac{x^4}{4}-\frac{x^5}{20}+O(x^6)\right)\right) \tag{1}$$

Verification of solutions

$$y = c_1 x^2 \left(-x^3+3x^2-3x+1+O(x^6)\right) + c_2 \left(x^2 \left(-x^3+3x^2-3x+1+O(x^6)\right) \ln(x) + x^2 \left(-7x^2+4x+\frac{11x^3}{3}-\frac{x^4}{4}-\frac{x^5}{20}+O(x^6)\right)\right)$$

Verified OK.

15.52.1 Maple step by step solution

Let's solve

$-y''x^2(x-1)+(5x^2-3x)\,y'+(4-5x)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(5x-4)y}{x^2(x-1)}+\frac{(5x-3)y'}{x(x-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{(5x-3)y'}{x(x-1)}+\frac{(5x-4)y}{x^2(x-1)}=0$

□ Check to see if x_0 is a regular singular point

- ◦ Define functions

  $\left[P_2(x)=-\frac{5x-3}{x(x-1)}, P_3(x)=\frac{5x-4}{x^2(x-1)}\right]$

- ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left.(x\cdot P_2(x))\right|_{x=0}=-3$

- ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left.(x^2\cdot P_3(x))\right|_{x=0}=4$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $y''x^2(x-1) - x(5x-3)\,y' + y(5x-4) = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k- >k-m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$

- Shift index using $k- >k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$

- Shift index using $k- >k+2-m$

  $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$

  Rewrite ODE with series expansions

  $-a_0(-2+r)^2\,x^r + \left(\sum_{k=1}^{\infty} \left(-a_k(k+r-2)^2 + a_{k-1}(k+r-2)\,(k-6+r)\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-(-2+r)^2 = 0$

- Values of r that satisfy the indicial equation

$r=2$

- Each term in the series must be 0, giving the recursion relation

  $-a_k(k+r-2)^2+a_{k-1}(k+r-2)(k-6+r)=0$

- Shift index using $k->k+1$

  $-a_{k+1}(k+r-1)^2+a_k(k+r-1)(k+r-5)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+1}=\frac{a_k(k+r-5)}{k+r-1}$

- Recursion relation for $r=2$; series terminates at $k=3$

  $a_{k+1}=\frac{a_k(k-3)}{k+1}$

- Apply recursion relation for $k=0$

  $a_1=-3a_0$

- Apply recursion relation for $k=1$

  $a_2=-a_1$

- Express in terms of a_0

  $a_2=3a_0$

- Apply recursion relation for $k=2$

  $a_3=-\frac{a_2}{3}$

- Express in terms of a_0

  $a_3=-a_0$

- Terminating series solution of the ODE for $r=2$. Use reduction of order to find the second li

  $y=a_0\cdot(-x^3+3x^2-3x+1)$

Problem number: 49.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2+1)\,y''-x(9x^2+1)\,y'+(25x^2+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+x^2)\,y''+(-9x^3-x)\,y'+(25x^2+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{9x^2+1}{x\,(x^2+1)}$$
$$q(x)=\frac{25x^2+1}{x^2\,(x^2+1)}$$

Table 748: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{9x^2+1}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{25x^2+1}{x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+1)\,y'' + (-9x^3 - x)\,y' + (25x^2+1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (-9x^3 - x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (25x^2+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-9x^{n+r+2} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 25x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r) x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-9x^{n+r+2} a_n (n+r)\right) = \sum_{n=2}^{\infty} \left(-9a_{n-2} (n+r-2) x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} 25x^{n+r+2} a_n = \sum_{n=2}^{\infty} 25a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=2}^{\infty} \left(-9a_{n-2} (n+r-2) x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 25a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - x^r a_0 r + a_0 x^r = 0$$

Or

$$(x^r r(-1+r) - x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(-1+r)^2\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 1 \\ r_2 &= 1 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(-1+r)^2\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+1}$$

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+1}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-2}(n+r-2)(n-3+r) + a_n(n+r)(n+r-1) \\ - 9a_{n-2}(n+r-2) - a_n(n+r) + 25a_{n-2} + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}(n^2 + 2nr + r^2 - 14n - 14r + 49)}{n^2 + 2nr + r^2 - 2n - 2r + 1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{a_{n-2}(n-6)^2}{n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{(r-5)^2}{(1+r)^2}$$

Which for the root $r = 1$ becomes

$$a_2 = -4$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{(r-5)^2}{(1+r)^2}$	-4

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{(r-5)^2}{(1+r)^2}$	-4
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(r-5)^2 (r-3)^2}{(1+r)^2 (r+3)^2}$$

Which for the root $r = 1$ becomes

$$a_4 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{(r-5)^2}{(1+r)^2}$	-4
a_3	0	0
a_4	$\frac{(r-5)^2(r-3)^2}{(1+r)^2(r+3)^2}$	1

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{(r-5)^2}{(1+r)^2}$	-4
a_3	0	0
a_4	$\frac{(r-5)^2(r-3)^2}{(1+r)^2(r+3)^2}$	1
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \ldots\right) \\ &= x\left(x^4 - 4x^2 + 1 + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr}a_{n,r}$$

And the above is then evaluated at $r = 1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$	$b_n(r = 1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$-\frac{(r-5)^2}{(1+r)^2}$	-4	$\frac{-12r+60}{(1+r)^3}$	6
b_3	0	0	0	0
b_4	$\frac{(r-5)^2(r-3)^2}{(1+r)^2(r+3)^2}$	1	$\frac{24(r-5)(r-3)(r^2-2r-7)}{(1+r)^3(r+3)^3}$	-3
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6\dots\\ &= x\left(x^4 - 4x^2 + 1 + O(x^6)\right)\ln(x) + x\left(-3x^4 + 6x^2 + O(x^6)\right)\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x) &= c_1y_1(x) + c_2y_2(x)\\ &= c_1x\left(x^4 - 4x^2 + 1 + O(x^6)\right) + c_2\left(x\left(x^4 - 4x^2 + 1 + O(x^6)\right)\ln(x) + x\left(-3x^4 + 6x^2 + O(x^6)\right)\right)\end{aligned}$$

Hence the final solution is

$$\begin{aligned}y &= y_h\\ &= c_1x\left(x^4-4x^2+1+O(x^6)\right)+c_2\left(x\left(x^4-4x^2+1+O(x^6)\right)\ln(x)+x\left(-3x^4+6x^2+O(x^6)\right)\right)\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}y &= c_1x\left(x^4 - 4x^2 + 1 + O(x^6)\right)\\ &\quad + c_2\left(x\left(x^4 - 4x^2 + 1 + O(x^6)\right)\ln(x) + x\left(-3x^4 + 6x^2 + O(x^6)\right)\right)\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}y &= c_1x\left(x^4 - 4x^2 + 1 + O(x^6)\right)\\ &\quad + c_2\left(x\left(x^4 - 4x^2 + 1 + O(x^6)\right)\ln(x) + x\left(-3x^4 + 6x^2 + O(x^6)\right)\right)\end{aligned}$$

Verified OK.

15.53.1 Maple step by step solution

Let's solve

$x^2(x^2 + 1)\,y'' + (-9x^3 - x)\,y' + (25x^2 + 1)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(25x^2+1)y}{x^2(x^2+1)} + \frac{(9x^2+1)y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{(9x^2+1)y'}{x(x^2+1)} + \frac{(25x^2+1)y}{x^2(x^2+1)} = 0$

☐ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x) = -\frac{9x^2+1}{x(x^2+1)}, P_3(x) = \frac{25x^2+1}{x^2(x^2+1)}\right]$

  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $\left(x \cdot P_2(x)\right)\bigg|_{x=0} = -1$

  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = 1$

  - $x = 0$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = 0$

- Multiply by denominators

  $x^2(x^2+1)\, y'' - x(9x^2+1)\, y' + (25x^2+1)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  - Shift index using $k- >k - m$

    $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  - Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$

  - Shift index using $k- >k + 1 - m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k->k+2-m$

  $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(-1+r)^2 x^r + a_1 r^2 x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(k+r-1)^2 + a_{k-2}(k-7+r)^2\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(-1+r)^2 = 0$$

- Values of r that satisfy the indicial equation

  $$r = 1$$

- Each term must be 0

  $$a_1 r^2 = 0$$

- Solve for the dependent coefficient(s)

  $$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$a_k(k+r-1)^2 + a_{k-2}(k-7+r)^2 = 0$$

- Shift index using $k->k+2$

  $$a_{k+2}(k+1+r)^2 + a_k(k+r-5)^2 = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2} = -\frac{a_k(k+r-5)^2}{(k+1+r)^2}$$

- Recursion relation for $r = 1$; series terminates at $k = 4$

  $$a_{k+2} = -\frac{a_k(k-4)^2}{(k+2)^2}$$

- Solution for $r = 1$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+2} = -\frac{a_k(k-4)^2}{(k+2)^2}, a_1 = 0\right]$$

Problem number: 50.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{9x^2y'' + 3x(-x^2+1)\,y' + (7x^2+1)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$9x^2y'' + (-3x^3+3x)\,y' + (7x^2+1)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$\begin{aligned} p(x) &= -\frac{x^2-1}{3x} \\ q(x) &= \frac{7x^2+1}{9x^2} \end{aligned}$$

Table 750: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{x^2-1}{3x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{7x^2+1}{9x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$9x^2y'' + (-3x^3 + 3x)\, y' + (7x^2 + 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$9x^2 \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (-3x^3 + 3x) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (7x^2 + 1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-3x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 7x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-3x^{n+r+2} a_n (n+r)\right) = \sum_{n=2}^{\infty} \left(-3a_{n-2}(n+r-2)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} 7x^{n+r+2} a_n = \sum_{n=2}^{\infty} 7a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=2}^{\infty} \left(-3a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 7a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$9x^{n+r} a_n (n+r)(n+r-1) + 3x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$9x^r a_0 r(-1+r) + 3x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(9x^r r(-1+r) + 3x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(3r-1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(3r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = \frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(3r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{3}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{3}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$9a_n(n+r)(n+r-1) - 3a_{n-2}(n+r-2) + 3a_n(n+r) + 7a_{n-2} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{a_{n-2}(3n+3r-13)}{9n^2+18nr+9r^2-6n-6r+1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = \frac{a_{n-2}(n-4)}{3n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-7+3r}{(3r+5)^2}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = -\frac{1}{6}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-7+3r}{(3r+5)^2}$	$-\frac{1}{6}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-7+3r}{(3r+5)^2}$	$-\frac{1}{6}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{9r^2 - 24r + 7}{(3r+5)^2 (3r+11)^2}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-7+3r}{(3r+5)^2}$	$-\frac{1}{6}$
a_3	0	0
a_4	$\frac{9r^2-24r+7}{(3r+5)^2(3r+11)^2}$	0

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-7+3r}{(3r+5)^2}$	$-\frac{1}{6}$
a_3	0	0
a_4	$\frac{9r^2-24r+7}{(3r+5)^2(3r+11)^2}$	0
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^{\frac{1}{3}}\left(1 - \frac{x^2}{6} + O(x^6)\right)
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = \frac{1}{3}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n\left(r = \frac{1}{3}\right)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{-7+3r}{(3r+5)^2}$	$-\frac{1}{6}$	$\frac{-9r+57}{(3r+5)^3}$	$\frac{1}{4}$
b_3	0	0	0	0
b_4	$\frac{9r^2-24r+7}{(3r+5)^2(3r+11)^2}$	0	$\frac{-162r^3+648r^2+1890r-1992}{(3r+5)^3(3r+11)^3}$	$-\frac{1}{288}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6\ldots\\ &= x^{\frac{1}{3}}\left(1-\frac{x^2}{6}+O(x^6)\right)\ln(x) + x^{\frac{1}{3}}\left(\frac{x^2}{4}-\frac{x^4}{288}+O(x^6)\right)\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x) &= c_1y_1(x) + c_2y_2(x)\\ &= c_1x^{\frac{1}{3}}\left(1-\frac{x^2}{6}+O(x^6)\right)+c_2\left(x^{\frac{1}{3}}\left(1-\frac{x^2}{6}+O(x^6)\right)\ln(x)+x^{\frac{1}{3}}\left(\frac{x^2}{4}-\frac{x^4}{288}+O(x^6)\right)\right)\end{aligned}$$

Hence the final solution is

$$\begin{aligned}y &= y_h\\ &= c_1x^{\frac{1}{3}}\left(1-\frac{x^2}{6}+O(x^6)\right)+c_2\left(x^{\frac{1}{3}}\left(1-\frac{x^2}{6}+O(x^6)\right)\ln(x)+x^{\frac{1}{3}}\left(\frac{x^2}{4}-\frac{x^4}{288}+O(x^6)\right)\right)\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}y &= c_1x^{\frac{1}{3}}\left(1-\frac{x^2}{6}+O(x^6)\right)\\ &\quad+c_2\left(x^{\frac{1}{3}}\left(1-\frac{x^2}{6}+O(x^6)\right)\ln(x)+x^{\frac{1}{3}}\left(\frac{x^2}{4}-\frac{x^4}{288}+O(x^6)\right)\right)\end{aligned}\tag{1}$$

Verification of solutions

$$y = c_1x^{\frac{1}{3}}\left(1-\frac{x^2}{6}+O(x^6)\right)+c_2\left(x^{\frac{1}{3}}\left(1-\frac{x^2}{6}+O(x^6)\right)\ln(x)+x^{\frac{1}{3}}\left(\frac{x^2}{4}-\frac{x^4}{288}+O(x^6)\right)\right)$$

Verified OK.

15.54.1 Maple step by step solution

Let's solve

$9x^2y'' + (-3x^3 + 3x)\, y' + (7x^2 + 1)\, y = 0$

  $x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(-1+3r)^2\, x^r + a_1(2+3r)^2\, x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(3k+3r-1)^2 - a_{k-2}(3k-13+3r)\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(-1+3r)^2 = 0$

- Values of r that satisfy the indicial equation

  $r = \frac{1}{3}$

- Each term must be 0

  $a_1(2+3r)^2 = 0$

- Solve for the dependent coefficient(s)

  $a_1 = 0$

- Each term in the series must be 0, giving the recursion relation

  $a_k(3k+3r-1)^2 + (-3k+13-3r)\, a_{k-2} = 0$

- Shift index using $k->k+2$

  $a_{k+2}(3k+5+3r)^2 + a_k(-3k-3r+7) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = \frac{a_k(3k+3r-7)}{(3k+5+3r)^2}$

- Recursion relation for $r = \frac{1}{3}$; series terminates at $k = 2$

  $a_{k+2} = \frac{a_k(3k-6)}{(3k+6)^2}$

- Solution for $r = \frac{1}{3}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+2} = \frac{a_k(3k-6)}{(3k+6)^2}, a_1 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 51.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x(x^2+1)\,y''+\left(-x^2+1\right)y'-8yx=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^3+x\right)y''+\left(-x^2+1\right)y'-8yx=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{x^2-1}{x\,(x^2+1)}$$
$$q(x)=-\frac{8}{x^2+1}$$

Table 752: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{x^2-1}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = -\frac{8}{x^2+1}$	
singularity	type
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x(x^2+1)\, y'' + (-x^2+1)\, y' - 8yx = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (-x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) - 8\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) x = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r-1} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}\right) + \sum_{n=0}^{\infty} \left(-8x^{1+n+r} a_n\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r-1} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r-1}$$

$$\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n (n+r)\right) = \sum_{n=2}^{\infty} \left(-a_{n-2}(n+r-2) x^{n+r-1}\right)$$

$$\sum_{n=0}^{\infty} \left(-8x^{1+n+r} a_n\right) = \sum_{n=2}^{\infty} \left(-8a_{n-2} x^{n+r-1}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r-1$.

$$\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} x^{n+r-1} a_n (n+r)(n+r-1)\right) + \sum_{n=2}^{\infty} \left(-a_{n-2}(n+r-2) x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}\right) + \sum_{n=2}^{\infty} \left(-8a_{n-2} x^{n+r-1}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r-1} a_n (n+r)(n+r-1) + (n+r) a_n x^{n+r-1} = 0$$

When $n=0$ the above becomes

$$x^{-1+r} a_0 r(-1+r) + r a_0 x^{-1+r} = 0$$

Or

$$\left(x^{-1+r} r(-1+r)+r\, x^{-1+r}\right) a_0=0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^{-1+r} r^2=0$$

Since the above is true for all x then the indicial equation becomes

$$r^2=0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 0 \\ r_2 &= 0 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^{-1+r} r^2=0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x)=\sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x)=y_1(x) \ln(x)+\left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y=c_1 y_1(x)+c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0=1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n=0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0=1$. Substituting $n=1$ in Eq. (2B) gives

$$a_1=0$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&a_{n-2}(n+r-2)\,(n-3+r)+a_n(n+r)\,(n+r-1) \\
&-a_{n-2}(n+r-2)+a_n(n+r)-8a_{n-2}=0
\end{aligned} \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = -\frac{(n+r-6)\,a_{n-2}}{n+r} \tag{4}
$$

Which for the root $r=0$ becomes

$$
a_n = -\frac{(n-6)\,a_{n-2}}{n} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r=0$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n=2$, using the above recursive equation gives

$$
a_2 = \frac{4-r}{2+r}
$$

Which for the root $r=0$ becomes

$$
a_2 = 2
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{4-r}{2+r}$	2

For $n=3$, using the above recursive equation gives

$$
a_3 = 0
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{4-r}{2+r}$	2
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 - 6r + 8}{(4 + r)(2 + r)}$$

Which for the root $r = 0$ becomes

$$a_4 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{4-r}{2+r}$	2
a_3	0	0
a_4	$\frac{r^2-6r+8}{(4+r)(2+r)}$	1

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{4-r}{2+r}$	2
a_3	0	0
a_4	$\frac{r^2-6r+8}{(4+r)(2+r)}$	1
a_5	0	0

Using the above table, then the first solution $y_1(x)$ becomes

$$\begin{aligned}y_1(x) &= a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots \\ &= x^4 + 2x^2 + 1 + O(x^6)\end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 0$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r = 0)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{4-r}{2+r}$	2	$-\frac{6}{(2+r)^2}$	$-\frac{3}{2}$
b_3	0	0	0	0
b_4	$\frac{r^2-6r+8}{(4+r)(2+r)}$	1	$\frac{12r^2-96}{(2+r)^2(4+r)^2}$	$-\frac{3}{2}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}y_2(x) &= y_1(x) \ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\ &= \left(x^4 + 2x^2 + 1 + O(x^6)\right) \ln(x) - \frac{3x^2}{2} - \frac{3x^4}{2} + O(x^6)\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 \left(x^4+2x^2+1+O(x^6)\right) + c_2 \left(\left(x^4+2x^2+1+O(x^6)\right) \ln(x) - \frac{3x^2}{2} - \frac{3x^4}{2} + O(x^6)\right)\end{aligned}$$

Hence the final solution is

$$y = y_h$$

$$= c_1\left(x^4+2x^2+1+O(x^6)\right)+c_2\left(\left(x^4+2x^2+1+O(x^6)\right)\ln(x)-\frac{3x^2}{2}-\frac{3x^4}{2}+O(x^6)\right)$$

Summary

The solution(s) found are the following

$$y = c_1\left(x^4+2x^2+1+O(x^6)\right) + c_2\left(\left(x^4+2x^2+1+O(x^6)\right)\ln(x)-\frac{3x^2}{2}-\frac{3x^4}{2}+O(x^6)\right) \tag{1}$$

Verification of solutions

$$y = c_1\left(x^4+2x^2+1+O(x^6)\right)+c_2\left(\left(x^4+2x^2+1+O(x^6)\right)\ln(x)-\frac{3x^2}{2}-\frac{3x^4}{2}+O(x^6)\right)$$

Verified OK.

15.55.1 Maple step by step solution

Let's solve

$x(x^2+1)\,y''+(-x^2+1)\,y'-8yx=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{8y}{x^2+1}+\frac{(x^2-1)y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{(x^2-1)y'}{x(x^2+1)}-\frac{8y}{x^2+1}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x)=-\frac{x^2-1}{x(x^2+1)}, P_3(x)=-\frac{8}{x^2+1}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

    $\left.(x\cdot P_2(x))\right|_{x=0}=1$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $$\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = 0$$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $$x(x^2+1)\,y'' + (-x^2+1)\,y' - 8yx = 0$$

- Assume series solution for y

  $$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $x \cdot y$ to series expansion

  $$x \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+1}$$

- Shift index using $k- >k-1$

  $$x \cdot y = \sum_{k=1}^{\infty} a_{k-1} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 0..2$

  $$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k+1-m$

  $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 1..3$

  $$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k- >k+2-m$

  $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0 r^2 x^{-1+r} + a_1(1+r)^2\, x^r + \left(\sum_{k=1}^{\infty} \left(a_{k+1}(k+r+1)^2 + a_{k-1}(k+r+1)\,(k-5+r)\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $r^2 = 0$
- Values of r that satisfy the indicial equation

  $r = 0$
- Each term must be 0

  $a_1(1 + r)^2 = 0$
- Each term in the series must be 0, giving the recursion relation

  $((a_{k-1} + a_{k+1})\, k - 5a_{k-1} + a_{k+1})\,(k + 1) = 0$
- Shift index using $k- >k + 1$

  $((a_k + a_{k+2})\,(k + 1) - 5a_k + a_{k+2})\,(k + 2) = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{a_k(k-4)}{k+2}$
- Recursion relation for $r = 0$; series terminates at $k = 4$

  $a_{k+2} = -\frac{a_k(k-4)}{k+2}$
- Solution for $r = 0$

  $\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+2} = -\frac{a_k(k-4)}{k+2}, a_1 = 0\right]$

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2y'' + 2x\left(-x^2+4\right)y' + \left(7x^2+1\right)y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$4x^2y'' + \left(-2x^3+8x\right)y' + \left(7x^2+1\right)y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = -\frac{x^2-4}{2x}$$
$$q(x) = \frac{7x^2+1}{4x^2}$$

Table 754: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{x^2-4}{2x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{7x^2+1}{4x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2y'' + \left(-2x^3 + 8x\right) y' + \left(7x^2 + 1\right) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2 \left(\sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}\right) + \left(-2x^3 + 8x\right) \left(\sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}\right) + \left(7x^2 + 1\right) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-2x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 7x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-2x^{n+r+2} a_n (n+r)\right) = \sum_{n=2}^{\infty} \left(-2a_{n-2}(n+r-2)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} 7x^{n+r+2} a_n = \sum_{n=2}^{\infty} 7a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=2}^{\infty} \left(-2a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 7a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r)(n+r-1) + 8x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) + 8x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(4x^r r(-1+r) + 8x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(2r+1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(2r+1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -\frac{1}{2}$$
$$r_2 = -\frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(2r+1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = -\frac{1}{2}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-\frac{1}{2}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n-\frac{1}{2}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$4a_n(n+r)(n+r-1) - 2a_{n-2}(n+r-2) + 8a_n(n+r) + 7a_{n-2} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{a_{n-2}(2n+2r-11)}{4n^2+8nr+4r^2+4n+4r+1} \tag{4}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_n = \frac{a_{n-2}(n-6)}{2n^2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -\frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-7+2r}{(2r+5)^2}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_2 = -\frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-7+2r}{(2r+5)^2}$	$-\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-7+2r}{(2r+5)^2}$	$-\frac{1}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4r^2 - 20r + 21}{(2r+5)^2 (2r+9)^2}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_4 = \frac{1}{32}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-7+2r}{(2r+5)^2}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{4r^2-20r+21}{(2r+5)^2(2r+9)^2}$	$\frac{1}{32}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-7+2r}{(2r+5)^2}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{4r^2-20r+21}{(2r+5)^2(2r+9)^2}$	$\frac{1}{32}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \frac{1}{\sqrt{x}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= \frac{-\frac{x^2}{2} + 1 + \frac{x^4}{32} + O(x^6)}{\sqrt{x}}
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = -\frac{1}{2}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n\left(r = -\frac{1}{2}\right)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{-7+2r}{(2r+5)^2}$	$-\frac{1}{2}$	$\frac{-4r+38}{(2r+5)^3}$	$\frac{5}{8}$
b_3	0	0	0	0
b_4	$\frac{4r^2-20r+21}{(2r+5)^2(2r+9)^2}$	$\frac{1}{32}$	$\frac{-32r^3+240r^2+584r-2076}{(2r+5)^3(2r+9)^3}$	$-\frac{9}{128}$
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \ldots \\
&= \frac{\left(-\frac{x^2}{2} + 1 + \frac{x^4}{32} + O(x^6)\right)\ln(x)}{\sqrt{x}} + \frac{\frac{5x^2}{8} - \frac{9x^4}{128} + O(x^6)}{\sqrt{x}}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= \frac{c_1\left(-\frac{x^2}{2} + 1 + \frac{x^4}{32} + O(x^6)\right)}{\sqrt{x}} + c_2\left(\frac{\left(-\frac{x^2}{2} + 1 + \frac{x^4}{32} + O(x^6)\right)\ln(x)}{\sqrt{x}} + \frac{\frac{5x^2}{8} - \frac{9x^4}{128} + O(x^6)}{\sqrt{x}}\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(-\frac{x^2}{2} + 1 + \frac{x^4}{32} + O(x^6)\right)}{\sqrt{x}} + c_2\left(\frac{\left(-\frac{x^2}{2} + 1 + \frac{x^4}{32} + O(x^6)\right)\ln(x)}{\sqrt{x}} + \frac{\frac{5x^2}{8} - \frac{9x^4}{128} + O(x^6)}{\sqrt{x}}\right)
\end{aligned}
$$

<u>Summary</u>

The solution(s) found are the following

$$
\begin{aligned}
y = {} & \frac{c_1\left(-\frac{x^2}{2} + 1 + \frac{x^4}{32} + O(x^6)\right)}{\sqrt{x}} \\
& + c_2\left(\frac{\left(-\frac{x^2}{2} + 1 + \frac{x^4}{32} + O(x^6)\right)\ln(x)}{\sqrt{x}} + \frac{\frac{5x^2}{8} - \frac{9x^4}{128} + O(x^6)}{\sqrt{x}}\right)
\end{aligned} \tag{1}
$$

<u>Verification of solutions</u>

$$
\begin{aligned}
y = {} & \frac{c_1\left(-\frac{x^2}{2} + 1 + \frac{x^4}{32} + O(x^6)\right)}{\sqrt{x}} \\
& + c_2\left(\frac{\left(-\frac{x^2}{2} + 1 + \frac{x^4}{32} + O(x^6)\right)\ln(x)}{\sqrt{x}} + \frac{\frac{5x^2}{8} - \frac{9x^4}{128} + O(x^6)}{\sqrt{x}}\right)
\end{aligned}
$$

Verified OK.

15.56.1 Maple step by step solution

Let's solve

$4x^2y'' + (-2x^3 + 8x)\, y' + (7x^2 + 1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(7x^2+1)y}{4x^2} + \frac{(x^2-4)y'}{2x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{(x^2-4)y'}{2x} + \frac{(7x^2+1)y}{4x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = -\frac{x^2-4}{2x}, P_3(x) = \frac{7x^2+1}{4x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\bigg|_{x=0} = 2$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = \frac{1}{4}$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $4x^2y'' - 2x(x^2 - 4)\, y' + (7x^2 + 1)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $$x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m}x^{k+r}$$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..3$

  $$x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\,x^{k+r-1+m}$$

- Shift index using $k->k+1-m$

  $$x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$$

- Convert $x^{2}\cdot y''$ to series expansion

  $$x^{2}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\,x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_{0}(1+2r)^{2}\,x^{r}+a_{1}(3+2r)^{2}\,x^{1+r}+\left(\sum_{k=2}^{\infty}\left(a_{k}(2k+2r+1)^{2}-a_{k-2}(2k-11+2r)\right)x^{k+r}\right)=0$$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $$(1+2r)^{2}=0$$

- Values of r that satisfy the indicial equation

  $$r=-\frac{1}{2}$$

- Each term must be 0

  $$a_{1}(3+2r)^{2}=0$$

- Solve for the dependent coefficient(s)

  $$a_{1}=0$$

- Each term in the series must be 0, giving the recursion relation

  $$a_{k}(2k+2r+1)^{2}+(-2k+11-2r)\,a_{k-2}=0$$

- Shift index using $k->k+2$

  $$a_{k+2}(2k+5+2r)^{2}+a_{k}(-2k-2r+7)=0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2}=\frac{a_{k}(2k+2r-7)}{(2k+5+2r)^{2}}$$

- Recursion relation for $r=-\frac{1}{2}$; series terminates at $k=4$

  $$a_{k+2}=\frac{a_{k}(2k-8)}{(2k+4)^{2}}$$

- Solution for $r = -\frac{1}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{1}{2}}, a_{k+2} = \frac{a_k(2k-8)}{(2k+4)^2}, a_1 = 0\right]$$

Problem number: 58.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2(x+1)\,y''+8y'x^2+(x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(4x^3+4x^2\right)y''+8y'x^2+(x+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{2}{x+1}$$
$$q(x)=\frac{1}{4x^2}$$

Table 756: Table $p(x), q(x)$ singularites.

$p(x) = \frac{2}{x+1}$	
singularity	type
$x = -1$	"regular"

$q(x) = \frac{1}{4x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2(x+1)\, y'' + 8y'x^2 + (x+1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2(x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + 8\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) x^2 + (x+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 8x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 8x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 8a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 8a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r)(n+r-1) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$4x^r a_0 r(-1+r) + a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(2r-1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(2r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= \frac{1}{2} \\ r_2 &= \frac{1}{2} \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(2r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{2}$, Eqs (1A,1B) become

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}} \\ y_2(x) &= y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{2}}\right) \end{aligned}$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$4a_{n-1}(n+r-1)(n+r-2)+4a_n(n+r)(n+r-1)+8a_{n-1}(n+r-1)+a_{n-1}+a_n=0 \quad (3)$$

Solving for a_n from recursive equation (4) gives

$$a_n = -a_{n-1} \quad (4)$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -a_{n-1} \quad (5)$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -1$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = 1$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	1	1

For $n = 3$, using the above recursive equation gives

$$a_3 = -1$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	1	1
a_3	-1	-1

For $n = 4$, using the above recursive equation gives

$$a_4 = 1$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	1	1
a_3	-1	-1
a_4	1	1

For $n = 5$, using the above recursive equation gives

$$a_5 = -1$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	1	1
a_3	-1	-1
a_4	1	1
a_5	-1	-1

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{2}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n\left(r = \frac{1}{2}\right)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	-1	-1	0	0
b_2	1	1	0	0
b_3	-1	-1	0	0
b_4	1	1	0	0
b_5	-1	-1	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\ &= \sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right)\ln(x) + \sqrt{x}\, O(x^6) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1\sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right)\ln(x) + \sqrt{x}\, O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1\sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right)\ln(x) + \sqrt{x}\, O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y &= c_1\sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right)\ln(x) + \sqrt{x}\, O(x^6)\right) \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y &= c_1\sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right) \\ &\quad + c_2\left(\sqrt{x}\left(1 - x + x^2 - x^3 + x^4 - x^5 + O(x^6)\right)\ln(x) + \sqrt{x}\, O(x^6)\right) \end{aligned}$$

Verified OK.

15.57.1 Maple step by step solution

Let's solve

$4x^2(x+1)\, y'' + 8y'x^2 + (x+1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

$y'' = -\frac{2y'}{x+1} - \frac{y}{4x^2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{2y'}{x+1} + \frac{y}{4x^2} = 0$

□ Check to see if x_0 is a regular singular point

- ○ Define functions

  $\left[P_2(x) = \frac{2}{x+1}, P_3(x) = \frac{1}{4x^2}\right]$

- ○ $(x+1) \cdot P_2(x)$ is analytic at $x = -1$

  $\left((x+1) \cdot P_2(x)\right)\bigg|_{x=-1} = 2$

- ○ $(x+1)^2 \cdot P_3(x)$ is analytic at $x = -1$

  $\left((x+1)^2 \cdot P_3(x)\right)\bigg|_{x=-1} = 0$

- ○ $x = -1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = -1$

- Multiply by denominators

  $4x^2(x+1)\,y'' + 8y'x^2 + (x+1)\,y = 0$

- Change variables using $x = u - 1$ so that the regular singular point is at $u = 0$

  $(4u^3 - 8u^2 + 4u)\left(\frac{d^2}{du^2}y(u)\right) + (8u^2 - 16u + 8)\left(\frac{d}{du}y(u)\right) + uy(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

- ○ Convert $u \cdot y(u)$ to series expansion

  $u \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+1}$

- ○ Shift index using $k- >k-1$

  $u \cdot y(u) = \sum_{k=1}^{\infty} a_{k-1} u^{k+r}$

- ○ Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

$$u^{m}\cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_{k}(k+r)\, u^{k+r-1+m}$$

- Shift index using $k->k+1-m$

$$u^{m}\cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u^{m}\cdot \left(\frac{d^{2}}{du^{2}}y(u)\right)$ to series expansion for $m = 1..3$

$$u^{m}\cdot \left(\frac{d^{2}}{du^{2}}y(u)\right) = \sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

$$u^{m}\cdot \left(\frac{d^{2}}{du^{2}}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

Rewrite ODE with series expansions

$$4a_{0}r(1+r)\, u^{-1+r} + \left(4a_{1}(1+r)\,(2+r) - 8a_{0}r(1+r)\right) u^{r} + \left(\sum_{k=1}^{\infty} \left(4a_{k+1}(k+r+1)\,(k+2+r) -\right.\right.$$

- a_{0}cannot be 0 by assumption, giving the indicial equation

$$4r(1+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{-1, 0\}$$

- Each term must be 0

$$4a_{1}(1+r)\,(2+r) - 8a_{0}r(1+r) = 0$$

- Each term in the series must be 0, giving the recursion relation

$$a_{k-1}(2k-1+2r)^{2} - 8\left(\left(-\frac{k}{2}-\frac{r}{2}-1\right) a_{k+1} + a_{k}(k+r)\right)(k+r+1) = 0$$

- Shift index using $k->k+1$

$$a_{k}(2k+2r+1)^{2} - 8\left(\left(-\frac{k}{2}-\frac{3}{2}-\frac{r}{2}\right) a_{k+2} + a_{k+1}(k+r+1)\right)(k+2+r) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{4k^{2}a_{k}-8k^{2}a_{k+1}+8kra_{k}-16kra_{k+1}+4r^{2}a_{k}-8r^{2}a_{k+1}+4ka_{k}-24ka_{k+1}+4ra_{k}-24ra_{k+1}+a_{k}-16a_{k+1}}{4(k+3+r)(k+2+r)}$$

- Recursion relation for $r = -1$

$$a_{k+2} = -\frac{4k^{2}a_{k}-8k^{2}a_{k+1}-4ka_{k}-8ka_{k+1}+a_{k}}{4(k+2)(k+1)}$$

- Solution for $r = -1$

$$\left[y(u) = \sum_{k=0}^{\infty} a_{k}u^{k-1}, a_{k+2} = -\frac{4k^{2}a_{k}-8k^{2}a_{k+1}-4ka_{k}-8ka_{k+1}+a_{k}}{4(k+2)(k+1)}, 0 = 0\right]$$

- Revert the change of variables $u = x+1$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^{k-1}, a_{k+2} = -\frac{4k^2 a_k - 8k^2 a_{k+1} - 4k a_k - 8k a_{k+1} + a_k}{4(k+2)(k+1)}, 0 = 0\right]$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{4k^2 a_k - 8k^2 a_{k+1} + 4k a_k - 24k a_{k+1} + a_k - 16 a_{k+1}}{4(k+3)(k+2)}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{4k^2 a_k - 8k^2 a_{k+1} + 4k a_k - 24k a_{k+1} + a_k - 16 a_{k+1}}{4(k+3)(k+2)}, 8a_1 = 0\right]$$

- Revert the change of variables $u = x+1$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^k, a_{k+2} = -\frac{4k^2 a_k - 8k^2 a_{k+1} + 4k a_k - 24k a_{k+1} + a_k - 16 a_{k+1}}{4(k+3)(k+2)}, 8a_1 = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k (x+1)^{k-1}\right) + \left(\sum_{k=0}^{\infty} b_k (x+1)^k\right), a_{k+2} = -\frac{4k^2 a_k - 8k^2 a_{1+k} - 4k a_k - 8k a_{1+k} + a_k}{4(k+2)(1+k)}, 0 = 0, b_{k+2}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 59.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{9x^2(x+3)\,y''+3x(3+7x)\,y'+(4x+3)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(9x^3+27x^2\right)y''+\left(21x^2+9x\right)y'+(4x+3)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{3+7x}{3x\,(x+3)}$$
$$q(x)=\frac{4x+3}{9x^2\,(x+3)}$$

Table 758: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3+7x}{3x(x+3)}$	
singularity	type
$x = -3$	"regular"
$x = 0$	"regular"

$q(x) = \frac{4x+3}{9x^2(x+3)}$	
singularity	type
$x = -3$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-3, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$9x^2(x+3)\, y'' + \left(21x^2 + 9x\right) y' + (4x+3)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$9x^2(x+3) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(21x^2 + 9x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (4x+3) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 9x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 27x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 21x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} 3a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 9x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 9a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 21x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 21a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n = \sum_{n=1}^{\infty} 4a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 9a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 27x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 21a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} 4a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$27x^{n+r} a_n (n+r)(n+r-1) + 9x^{n+r} a_n (n+r) + 3a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$27x^r a_0 r(-1+r) + 9x^r a_0 r + 3a_0 x^r = 0$$

Or

$$(27x^r r(-1+r) + 9x^r r + 3x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$3(3r-1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$3(3r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = \frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$3(3r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{3}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{3}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \le n$ the recursive equation is

$$\begin{aligned} 9a_{n-1}(n+r-1)(n+r-2) + 27a_n(n+r)(n+r-1) \\ + 21a_{n-1}(n+r-1) + 9a_n(n+r) + 4a_{n-1} + 3a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}}{3} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = -\frac{a_{n-1}}{3} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{1}{3}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_1 = -\frac{1}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{3}$	$-\frac{1}{3}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1}{9}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = \frac{1}{9}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{3}$	$-\frac{1}{3}$
a_2	$\frac{1}{9}$	$\frac{1}{9}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{1}{27}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = -\frac{1}{27}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{3}$	$-\frac{1}{3}$
a_2	$\frac{1}{9}$	$\frac{1}{9}$
a_3	$-\frac{1}{27}$	$-\frac{1}{27}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{81}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{1}{81}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{3}$	$-\frac{1}{3}$
a_2	$\frac{1}{9}$	$\frac{1}{9}$
a_3	$-\frac{1}{27}$	$-\frac{1}{27}$
a_4	$\frac{1}{81}$	$\frac{1}{81}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{1}{243}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_5 = -\frac{1}{243}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{3}$	$-\frac{1}{3}$
a_2	$\frac{1}{9}$	$\frac{1}{9}$
a_3	$-\frac{1}{27}$	$-\frac{1}{27}$
a_4	$\frac{1}{81}$	$\frac{1}{81}$
a_5	$-\frac{1}{243}$	$-\frac{1}{243}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(-\frac{x}{3} + 1 + \frac{x^2}{9} - \frac{x^3}{27} + \frac{x^4}{81} - \frac{x^5}{243} + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{3}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n\left(r = \frac{1}{3}\right)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	$-\frac{1}{3}$	$-\frac{1}{3}$	0	0
b_2	$\frac{1}{9}$	$\frac{1}{9}$	0	0
b_3	$-\frac{1}{27}$	$-\frac{1}{27}$	0	0
b_4	$\frac{1}{81}$	$\frac{1}{81}$	0	0
b_5	$-\frac{1}{243}$	$-\frac{1}{243}$	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\ &= x^{\frac{1}{3}}\left(-\frac{x}{3} + 1 + \frac{x^2}{9} - \frac{x^3}{27} + \frac{x^4}{81} - \frac{x^5}{243} + O\left(x^6\right)\right)\ln(x) + x^{\frac{1}{3}} O\left(x^6\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{1}{3}}\left(-\frac{x}{3} + 1 + \frac{x^2}{9} - \frac{x^3}{27} + \frac{x^4}{81} - \frac{x^5}{243} + O\left(x^6\right)\right) \\ &\quad + c_2\left(x^{\frac{1}{3}}\left(-\frac{x}{3} + 1 + \frac{x^2}{9} - \frac{x^3}{27} + \frac{x^4}{81} - \frac{x^5}{243} + O\left(x^6\right)\right)\ln(x) + x^{\frac{1}{3}} O\left(x^6\right)\right) \end{aligned}$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{1}{3}} \left(-\frac{x}{3}+1+\frac{x^2}{9}-\frac{x^3}{27}+\frac{x^4}{81}-\frac{x^5}{243}+O(x^6)\right) \\
&\quad + c_2 \left(x^{\frac{1}{3}} \left(-\frac{x}{3}+1+\frac{x^2}{9}-\frac{x^3}{27}+\frac{x^4}{81}-\frac{x^5}{243}+O(x^6)\right) \ln(x) + x^{\frac{1}{3}} O(x^6)\right)
\end{aligned}
$$

Summary
The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^{\frac{1}{3}} \left(-\frac{x}{3}+1+\frac{x^2}{9}-\frac{x^3}{27}+\frac{x^4}{81}-\frac{x^5}{243}+O(x^6)\right) \\
&\quad + c_2 \left(x^{\frac{1}{3}} \left(-\frac{x}{3}+1+\frac{x^2}{9}-\frac{x^3}{27}+\frac{x^4}{81}-\frac{x^5}{243}+O(x^6)\right) \ln(x) + x^{\frac{1}{3}} O(x^6)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x^{\frac{1}{3}} \left(-\frac{x}{3}+1+\frac{x^2}{9}-\frac{x^3}{27}+\frac{x^4}{81}-\frac{x^5}{243}+O(x^6)\right) \\
&\quad + c_2 \left(x^{\frac{1}{3}} \left(-\frac{x}{3}+1+\frac{x^2}{9}-\frac{x^3}{27}+\frac{x^4}{81}-\frac{x^5}{243}+O(x^6)\right) \ln(x) + x^{\frac{1}{3}} O(x^6)\right)
\end{aligned}
$$

Verified OK.

15.58.1 Maple step by step solution

Let's solve

$9x^2(x+3)\,y''+(21x^2+9x)\,y'+(4x+3)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(4x+3)y}{9x^2(x+3)}-\frac{(3+7x)y'}{3x(x+3)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(3+7x)y'}{3x(x+3)}+\frac{(4x+3)y}{9x^2(x+3)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

$\left[P_2(x)=\frac{3+7x}{3x(x+3)}, P_3(x)=\frac{4x+3}{9x^2(x+3)}\right]$

- $(x+3)\cdot P_2(x)$ is analytic at $x=-3$

  $$\left((x+3)\cdot P_2(x)\right)\bigg|_{x=-3}=2$$

- $(x+3)^2\cdot P_3(x)$ is analytic at $x=-3$

  $$\left((x+3)^2\cdot P_3(x)\right)\bigg|_{x=-3}=0$$

- $x=-3$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-3$

- Multiply by denominators

  $$9x^2(x+3)\,y''+3x(3+7x)\,y'+(4x+3)\,y=0$$

- Change variables using $x=u-3$ so that the regular singular point is at $u=0$

  $$(9u^3-54u^2+81u)\left(\frac{d^2}{du^2}y(u)\right)+(21u^2-117u+162)\left(\frac{d}{du}y(u)\right)+(4u-9)\,y(u)=0$$

- Assume series solution for $y(u)$

  $$y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$$

- ☐ Rewrite ODE with series expansions

  - Convert $u^m\cdot y(u)$ to series expansion for $m=0..1$

    $$u^m\cdot y(u)=\sum_{k=0}^{\infty}a_k u^{k+r+m}$$

  - Shift index using $k->k-m$

    $$u^m\cdot y(u)=\sum_{k=m}^{\infty}a_{k-m}u^{k+r}$$

  - Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..2$

    $$u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,u^{k+r-1+m}$$

  - Shift index using $k->k+1-m$

    $$u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,u^{k+r}$$

  - Convert $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m=1..3$

$$u^{m}\cdot \left(\frac{d^{2}}{d u^{2}}y \left(u \right)\right)=\sum_{k =0}^{\infty}a_{k} \left(k +r \right) \left(k +r -1\right) u^{k +r -2+m}$$

- Shift index using $k->k +2-m$

$$u^{m}\cdot \left(\frac{d^{2}}{d u^{2}}y \left(u \right)\right)=\sum_{k =-2+m}^{\infty}a_{k +2-m} \left(k +2-m +r \right) \left(k +1-m +r \right) u^{k +r}$$

Rewrite ODE with series expansions

$$81 a_{0} r \left(1+r \right) u^{-1+r}+\left(81 a_{1} \left(1+r \right) \left(2+r \right)-9 a_{0} \left(1+r \right) \left(1+6 r \right)\right) u^{r}+\left(\sum_{k =1}^{\infty}\left(81 a_{k +1} \left(k +r +1\right) \left(k\right.\right.\right.$$

- a_{0}cannot be 0 by assumption, giving the indicial equation

$$81 r \left(1+r \right)=0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-1, 0\right\}$$

- Each term must be 0

$$81 a_{1} \left(1+r \right) \left(2+r \right)-9 a_{0} \left(1+r \right) \left(1+6 r \right)=0$$

- Each term in the series must be 0, giving the recursion relation

$$81 a_{k +1} \left(k +r +1\right) \left(k +2+r \right)-54 \left(k +r +\frac{1}{6}\right) \left(k +r +1\right) a_{k}+a_{k -1} \left(3 k -1+3 r \right)^{2}=0$$

- Shift index using $k->k +1$

$$81 a_{k +2} \left(k +2+r \right) \left(k +3+r \right)-54 \left(k +\frac{7}{6}+r \right) \left(k +2+r \right) a_{k +1}+a_{k} \left(3 k +3 r +2\right)^{2}=0$$

- Recursion relation that defines series solution to ODE

$$a_{k +2}=-\frac{9 k^{2} a_{k}-54 k^{2} a_{k +1}+18 k r a_{k}-108 k r a_{k +1}+9 r^{2} a_{k}-54 r^{2} a_{k +1}+12 k a_{k}-171 k a_{k +1}+12 r a_{k}-171 r a_{k +1}+4 a_{k}-126 a_{k +1}}{81 \left(k +2+r \right) \left(k +3+r \right)}$$

- Recursion relation for $r =-1$

$$a_{k +2}=-\frac{9 k^{2} a_{k}-54 k^{2} a_{k +1}-6 k a_{k}-63 k a_{k +1}+a_{k}-9 a_{k +1}}{81 \left(k +1\right) \left(k +2\right)}$$

- Solution for $r =-1$

$$\left[y \left(u \right)=\sum_{k =0}^{\infty}a_{k} u^{k -1}, a_{k +2}=-\frac{9 k^{2} a_{k}-54 k^{2} a_{k +1}-6 k a_{k}-63 k a_{k +1}+a_{k}-9 a_{k +1}}{81 \left(k +1\right) \left(k +2\right)}, 0=0\right]$$

- Revert the change of variables $u =x +3$

$$\left[y =\sum_{k =0}^{\infty}a_{k} \left(x +3\right)^{k -1}, a_{k +2}=-\frac{9 k^{2} a_{k}-54 k^{2} a_{k +1}-6 k a_{k}-63 k a_{k +1}+a_{k}-9 a_{k +1}}{81 \left(k +1\right) \left(k +2\right)}, 0=0\right]$$

- Recursion relation for $r =0$

$$a_{k +2}=-\frac{9 k^{2} a_{k}-54 k^{2} a_{k +1}+12 k a_{k}-171 k a_{k +1}+4 a_{k}-126 a_{k +1}}{81 \left(k +2\right) \left(k +3\right)}$$

- Solution for $r =0$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^k, a_{k+2}=-\frac{9k^2a_k-54k^2a_{k+1}+12ka_k-171ka_{k+1}+4a_k-126a_{k+1}}{81(k+2)(k+3)}, 162a_1-9a_0=0\right]$$

- Revert the change of variables $u=x+3$

$$\left[y=\sum_{k=0}^{\infty} a_k(x+3)^k, a_{k+2}=-\frac{9k^2a_k-54k^2a_{k+1}+12ka_k-171ka_{k+1}+4a_k-126a_{k+1}}{81(k+2)(k+3)}, 162a_1-9a_0=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k(x+3)^{k-1}\right)+\left(\sum_{k=0}^{\infty} b_k(x+3)^k\right), a_{k+2}=-\frac{9k^2a_k-54k^2a_{1+k}-6ka_k-63ka_{1+k}+a_k-9a_{1+k}}{81(1+k)(k+2)}, 0=\right.$$

Problem number: 60.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(-x^2+2)\, y'' - x(3x^2+2)\, y' + (-x^2+2)\, y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(-x^4+2x^2)\, y'' + (-3x^3-2x)\, y' + (-x^2+2)\, y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$\begin{aligned} p(x) &= \frac{3x^2+2}{x\,(x^2-2)} \\ q(x) &= \frac{1}{x^2} \end{aligned}$$

Table 760: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3x^2+2}{x(x^2-2)}$	
singularity	type
$x = 0$	"regular"
$x = \sqrt{2}$	"regular"
$x = -\sqrt{2}$	"regular"

$q(x) = \frac{1}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \sqrt{2}, -\sqrt{2}, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-y''x^2(x^2-2) + (-3x^3-2x)\,y' + (-x^2+2)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) x^2(x^2-2) + (-3x^3-2x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (-x^2+2)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}
&\sum_{n=0}^{\infty}\left(-x^{n+r+2} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 2 x^{n+r} a_n(n+r)(n+r-1)\right) \\
&\quad+\sum_{n=0}^{\infty}\left(-3 x^{n+r+2} a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-2 x^{n+r} a_n(n+r)\right) \\
&\quad+\sum_{n=0}^{\infty}\left(-x^{n+r+2} a_n\right)+\left(\sum_{n=0}^{\infty} 2 a_n x^{n+r}\right)=0
\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\begin{aligned}
\sum_{n=0}^{\infty}\left(-x^{n+r+2} a_n(n+r)(n+r-1)\right) &= \sum_{n=2}^{\infty}\left(-a_{n-2}(n+r-2)(n-3+r) x^{n+r}\right) \\
\sum_{n=0}^{\infty}\left(-3 x^{n+r+2} a_n(n+r)\right) &= \sum_{n=2}^{\infty}\left(-3 a_{n-2}(n+r-2) x^{n+r}\right) \\
\sum_{n=0}^{\infty}\left(-x^{n+r+2} a_n\right) &= \sum_{n=2}^{\infty}\left(-a_{n-2} x^{n+r}\right)
\end{aligned}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\begin{aligned}
&\sum_{n=2}^{\infty}\left(-a_{n-2}(n+r-2)(n-3+r) x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 2 x^{n+r} a_n(n+r)(n+r-1)\right) \\
&\quad+\sum_{n=2}^{\infty}\left(-3 a_{n-2}(n+r-2) x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-2 x^{n+r} a_n(n+r)\right) \\
&\quad+\sum_{n=2}^{\infty}\left(-a_{n-2} x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 2 a_n x^{n+r}\right)=0
\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$2 x^{n+r} a_n(n+r)(n+r-1)-2 x^{n+r} a_n(n+r)+2 a_n x^{n+r}=0$$

When $n = 0$ the above becomes

$$2x^r a_0 r(-1+r) - 2x^r a_0 r + 2a_0 x^r = 0$$

Or

$$(2x^r r(-1+r) - 2x^r r + 2x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$2x^r (-1+r)^2 = 0$$

Since the above is true for all x then the indicial equation becomes

$$2(-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$2x^r (-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+1}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+1}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned}-a_{n-2}(n+r-2)(n-3+r)+2a_n(n+r)(n+r-1)\\ -3a_{n-2}(n+r-2)-2a_n(n+r)-a_{n-2}+2a_n=0\end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{a_{n-2}}{2} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = \frac{a_{n-2}}{2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1}{2}$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1}{2}$	$\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1}{2}$	$\frac{1}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{4}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{1}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1}{2}$	$\frac{1}{2}$
a_3	0	0
a_4	$\frac{1}{4}$	$\frac{1}{4}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1}{2}$	$\frac{1}{2}$
a_3	0	0
a_4	$\frac{1}{4}$	$\frac{1}{4}$
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right)
\end{aligned}
$$

Now the second solution is found. The second solution is given by

$$
y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)
$$

Where b_n is found using

$$
b_n = \frac{d}{dr} a_{n,r}
$$

And the above is then evaluated at $r = 1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r=1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	$\frac{1}{2}$	$\frac{1}{2}$	0	0
b_3	0	0	0	0
b_4	$\frac{1}{4}$	$\frac{1}{4}$	0	0
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= x\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right)\ln(x) + xO(x^6)
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right) + c_2\left(x\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right)\ln(x) + xO(x^6)\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right) + c_2\left(x\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right)\ln(x) + xO(x^6)\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right) + c_2\left(x\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right)\ln(x) + xO(x^6)\right) \tag{1}$$

Verification of solutions

$$y = c_1 x\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right) + c_2\left(x\left(1 + \frac{x^2}{2} + \frac{x^4}{4} + O(x^6)\right)\ln(x) + xO(x^6)\right)$$

Verified OK.

15.59.1 Maple step by step solution

Let's solve

$-y''x^2(x^2-2) + (-3x^3-2x)\,y' + (-x^2+2)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

$y'' = -\frac{y}{x^2} - \frac{(3x^2+2)y'}{x(x^2-2)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(3x^2+2)y'}{x(x^2-2)} + \frac{y}{x^2} = 0$

□ Check to see if x_0 is a regular singular point

  ○ Define functions

  $\left[P_2(x) = \frac{3x^2+2}{x(x^2-2)}, P_3(x) = \frac{1}{x^2}\right]$

  ○ $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\bigg|_{x=0} = -1$

  ○ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\bigg|_{x=0} = 1$

  ○ $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $y''x^2(x^2-2) + x(3x^2+2)\, y' + y(x^2-2) = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ○ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  ○ Shift index using $k- >k-m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  ○ Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

  ○ Shift index using $k- >k+1-m$

$$x^{m} \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^{m} \cdot y''$ to series expansion for $m = 2..4$

$$x^{m} \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k- >k+2-m$

$$x^{m} \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$-2a_0(-1+r)^2\, x^r - 2a_1 r^2 x^{1+r} + \left(\sum_{k=2}^{\infty} \left(-2a_k(k+r-1)^2 + a_{k-2}(k+r-1)^2\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-2(-1+r)^2 = 0$$

- Values of r that satisfy the indicial equation

$$r = 1$$

- Each term must be 0

$$-2a_1 r^2 = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

$$-2\left(a_k - \frac{a_{k-2}}{2}\right)(k+r-1)^2 = 0$$

- Shift index using $k- >k+2$

$$-2\left(a_{k+2} - \frac{a_k}{2}\right)(k+r+1)^2 = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = \frac{a_k}{2}$$

- Recursion relation for $r = 1$

$$a_{k+2} = \frac{a_k}{2}$$

- Solution for $r = 1$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+2} = \frac{a_k}{2}, a_1 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS II. Exercises 7.6. Page 374
Problem number: 61.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{16x^2(x^2+1)\,y''+8x(9x^2+1)\,y'+(49x^2+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(16x^4+16x^2)\,y''+(72x^3+8x)\,y'+(49x^2+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned} p(x) &= \frac{9x^2+1}{2x\,(x^2+1)} \\ q(x) &= \frac{49x^2+1}{16x^2\,(x^2+1)} \end{aligned}$$

Table 762: Table $p(x), q(x)$ singularites.

$p(x) = \frac{9x^2+1}{2x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{49x^2+1}{16x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$16x^2(x^2+1)\, y'' + (72x^3+8x)\, y' + (49x^2+1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$16x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)(n+r-1)\, a_n x^{n+r-2}\right) + (72x^3+8x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (49x^2+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 16 x^{n+r+2} a_n (n+r) (n+r-1)\right)+\left(\sum_{n=0}^{\infty} 16 x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} 72 x^{n+r+2} a_n (n+r)\right)+\left(\sum_{n=0}^{\infty} 8 x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 49 x^{n+r+2} a_n\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 16 x^{n+r+2} a_n (n+r) (n+r-1) = \sum_{n=2}^{\infty} 16 a_{n-2} (n+r-2) (n-3+r) x^{n+r}$$

$$\sum_{n=0}^{\infty} 72 x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 72 a_{n-2} (n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} 49 x^{n+r+2} a_n = \sum_{n=2}^{\infty} 49 a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 16 a_{n-2} (n+r-2) (n-3+r) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 16 x^{n+r} a_n (n+r) (n+r-1)\right)+\left(\sum_{n=2}^{\infty} 72 a_{n-2} (n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 8 x^{n+r} a_n (n+r)\right)+\left(\sum_{n=2}^{\infty} 49 a_{n-2} x^{n+r}\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$16 x^{n+r} a_n (n+r) (n+r-1)+8 x^{n+r} a_n (n+r)+a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$16x^r a_0 r(-1+r) + 8x^r a_0 r + a_0 x^r = 0$$

Or

$$(16x^r r(-1+r) + 8x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(4r-1)^2\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(4r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{4}$$
$$r_2 = \frac{1}{4}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(4r-1)^2\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of

integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{4}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{4}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{4}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &16a_{n-2}(n+r-2)(n-3+r) + 16a_n(n+r)(n+r-1) \\ &+ 72a_{n-2}(n+r-2) + 8a_n(n+r) + 49a_{n-2} + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -a_{n-2} \tag{4}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_n = -a_{n-2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -1$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_2 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	-1	-1

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	-1	-1
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = 1$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_4 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	-1	-1
a_3	0	0
a_4	1	1

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	-1	-1
a_3	0	0
a_4	1	1
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{4}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{4}}\left(x^4 - x^2 + 1 + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{4}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n\left(r = \frac{1}{4}\right)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	0	0	0	0
b_2	-1	-1	0	0
b_3	0	0	0	0
b_4	1	1	0	0
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\ &= x^{\frac{1}{4}}\left(x^4 - x^2 + 1 + O(x^6)\right)\ln(x) + x^{\frac{1}{4}} O(x^6) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{1}{4}}\left(x^4 - x^2 + 1 + O(x^6)\right) + c_2\left(x^{\frac{1}{4}}\left(x^4 - x^2 + 1 + O(x^6)\right)\ln(x) + x^{\frac{1}{4}} O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{1}{4}}\left(x^4 - x^2 + 1 + O(x^6)\right) + c_2\left(x^{\frac{1}{4}}\left(x^4 - x^2 + 1 + O(x^6)\right)\ln(x) + x^{\frac{1}{4}} O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{4}}\left(x^4 - x^2 + 1 + O(x^6)\right) + c_2\left(x^{\frac{1}{4}}\left(x^4 - x^2 + 1 + O(x^6)\right)\ln(x) + x^{\frac{1}{4}} O(x^6)\right) \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{4}}\left(x^4 - x^2 + 1 + O(x^6)\right) + c_2\left(x^{\frac{1}{4}}\left(x^4 - x^2 + 1 + O(x^6)\right)\ln(x) + x^{\frac{1}{4}} O(x^6)\right)$$

Verified OK.

15.60.1 Maple step by step solution

Let's solve

$16x^2(x^2+1)\, y'' + (72x^3 + 8x)\, y' + (49x^2 + 1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(49x^2+1)y}{16x^2(x^2+1)} - \frac{(9x^2+1)y'}{2x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y'' + \frac{(9x^2+1)y'}{2x(x^2+1)} + \frac{(49x^2+1)y}{16x^2(x^2+1)} = 0$

☐ Check to see if x_0 is a regular singular point

- Define functions

  $\left[P_2(x) = \frac{9x^2+1}{2x(x^2+1)}, P_3(x) = \frac{49x^2+1}{16x^2(x^2+1)}\right]$

- $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\bigg|_{x=0} = \frac{1}{2}$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\bigg|_{x=0} = \frac{1}{16}$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

• Multiply by denominators

  $16x^2(x^2+1)\,y'' + 8x(9x^2+1)\,y' + (49x^2+1)\,y = 0$

• Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k- >k-m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$

- Shift index using $k- >k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)(k+r-1) x^{k+r-2+m}$$

- ○ Shift index using $k- >k+2-m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m} (k+2-m+r)(k+1-m+r) x^{k+r}$$

Rewrite ODE with series expansions

$$a_0 (-1+4r)^2 x^r + a_1 (3+4r)^2 x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k (4k+4r-1)^2 + a_{k-2} (4k+4r-1)^2\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(-1+4r)^2 = 0$$

- Values of r that satisfy the indicial equation

$$r = \frac{1}{4}$$

- Each term must be 0

$$a_1 (3+4r)^2 = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

$$(4k+4r-1)^2 (a_k + a_{k-2}) = 0$$

- Shift index using $k- >k+2$

$$(4k+4r+7)^2 (a_{k+2} + a_k) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -a_k$$

- Recursion relation for $r = \frac{1}{4}$

$$a_{k+2} = -a_k$$

- Solution for $r = \frac{1}{4}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{4}}, a_{k+2} = -a_k, a_1 = 0\right]$$

$$\boxed{x^2(3x+4)\,y''-x(4-3x)\,y'+4y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(3x^3+4x^2\right)y''+\left(3x^2-4x\right)y'+4y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{3x-4}{x\,(3x+4)}$$
$$q(x)=\frac{4}{x^2\,(3x+4)}$$

Table 764: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3x-4}{x(3x+4)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{4}{3}$	"regular"

$q(x) = \frac{4}{x^2(3x+4)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{4}{3}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{4}{3}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(3x+4)\, y'' + \left(3x^2 - 4x\right) y' + 4y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(3x+4) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(3x^2 - 4x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + 4\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-4x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r) (n+r-1) = \sum_{n=1}^{\infty} 3a_{n-1} (n+r-1) (n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 3a_{n-1} (n+r-1) x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 3a_{n-1} (n+r-1) (n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=1}^{\infty} 3a_{n-1} (n+r-1) x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-4x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r) (n+r-1) - 4x^{n+r} a_n (n+r) + 4a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$4x^r a_0 r(-1+r) - 4x^r a_0 r + 4a_0 x^r = 0$$

Or

$$\left(4x^r r(-1+r) - 4x^r r + 4x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$4x^r (-1+r)^2 = 0$$

Since the above is true for all x then the indicial equation becomes

$$4(-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$4x^r(-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{1+n}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{1+n}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$3a_{n-1}(n+r-1)(n+r-2) + 4a_n(n+r)(n+r-1) + 3a_{n-1}(n+r-1) - 4a_n(n+r) + 4a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{3a_{n-1}}{4} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{3a_{n-1}}{4} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{3}{4}$$

Which for the root $r = 1$ becomes

$$a_1 = -\frac{3}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{3}{4}$	$-\frac{3}{4}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{9}{16}$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{9}{16}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{3}{4}$	$-\frac{3}{4}$
a_2	$\frac{9}{16}$	$\frac{9}{16}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{27}{64}$$

Which for the root $r = 1$ becomes

$$a_3 = -\frac{27}{64}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{3}{4}$	$-\frac{3}{4}$
a_2	$\frac{9}{16}$	$\frac{9}{16}$
a_3	$-\frac{27}{64}$	$-\frac{27}{64}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{81}{256}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{81}{256}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{3}{4}$	$-\frac{3}{4}$
a_2	$\frac{9}{16}$	$\frac{9}{16}$
a_3	$-\frac{27}{64}$	$-\frac{27}{64}$
a_4	$\frac{81}{256}$	$\frac{81}{256}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{243}{1024}$$

Which for the root $r = 1$ becomes

$$a_5 = -\frac{243}{1024}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{3}{4}$	$-\frac{3}{4}$
a_2	$\frac{9}{16}$	$\frac{9}{16}$
a_3	$-\frac{27}{64}$	$-\frac{27}{64}$
a_4	$\frac{81}{256}$	$\frac{81}{256}$
a_5	$-\frac{243}{1024}$	$-\frac{243}{1024}$

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x\left(1 - \frac{3x}{4} + \frac{9x^2}{16} - \frac{27x^3}{64} + \frac{81x^4}{256} - \frac{243x^5}{1024} + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr}a_{n,r}$	$b_n(r=1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	$-\frac{3}{4}$	$-\frac{3}{4}$	0	0
b_2	$\frac{9}{16}$	$\frac{9}{16}$	0	0
b_3	$-\frac{27}{64}$	$-\frac{27}{64}$	0	0
b_4	$\frac{81}{256}$	$\frac{81}{256}$	0	0
b_5	$-\frac{243}{1024}$	$-\frac{243}{1024}$	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$
\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6\dots \\
&= x\left(1 - \frac{3x}{4} + \frac{9x^2}{16} - \frac{27x^3}{64} + \frac{81x^4}{256} - \frac{243x^5}{1024} + O(x^6)\right)\ln(x) + xO(x^6)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1y_1(x) + c_2y_2(x) \\
&= c_1x\left(1 - \frac{3x}{4} + \frac{9x^2}{16} - \frac{27x^3}{64} + \frac{81x^4}{256} - \frac{243x^5}{1024} + O(x^6)\right) \\
&\quad + c_2\left(x\left(1 - \frac{3x}{4} + \frac{9x^2}{16} - \frac{27x^3}{64} + \frac{81x^4}{256} - \frac{243x^5}{1024} + O(x^6)\right)\ln(x) + xO(x^6)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1x\left(1 - \frac{3x}{4} + \frac{9x^2}{16} - \frac{27x^3}{64} + \frac{81x^4}{256} - \frac{243x^5}{1024} + O(x^6)\right) \\
&\quad + c_2\left(x\left(1 - \frac{3x}{4} + \frac{9x^2}{16} - \frac{27x^3}{64} + \frac{81x^4}{256} - \frac{243x^5}{1024} + O(x^6)\right)\ln(x) + xO(x^6)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1x\left(1 - \frac{3x}{4} + \frac{9x^2}{16} - \frac{27x^3}{64} + \frac{81x^4}{256} - \frac{243x^5}{1024} + O(x^6)\right) \\
&\quad + c_2\left(x\left(1 - \frac{3x}{4} + \frac{9x^2}{16} - \frac{27x^3}{64} + \frac{81x^4}{256} - \frac{243x^5}{1024} + O(x^6)\right)\ln(x) + xO(x^6)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$y = c_1 x\left(1-\frac{3x}{4}+\frac{9x^2}{16}-\frac{27x^3}{64}+\frac{81x^4}{256}-\frac{243x^5}{1024}+O(x^6)\right)$$
$$+ c_2\left(x\left(1-\frac{3x}{4}+\frac{9x^2}{16}-\frac{27x^3}{64}+\frac{81x^4}{256}-\frac{243x^5}{1024}+O(x^6)\right)\ln(x)+xO(x^6)\right)$$

Verified OK.

15.61.1 Maple step by step solution

Let's solve

$x^2(3x+4)\, y'' + (3x^2-4x)\, y' + 4y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{4y}{x^2(3x+4)} - \frac{(3x-4)y'}{x(3x+4)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(3x-4)y'}{x(3x+4)} + \frac{4y}{x^2(3x+4)} = 0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{3x-4}{x(3x+4)}, P_3(x) = \frac{4}{x^2(3x+4)}\right]$

  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $\left.(x \cdot P_2(x))\right|_{x=0} = -1$

  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $\left.(x^2 \cdot P_3(x))\right|_{x=0} = 1$

  - $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2(3x+4)\, y'' + x(3x-4)\, y' + 4y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

  - Shift index using $k->k+1-m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

  - Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

    $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

  - Shift index using $k->k+2-m$

    $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $4a_0(-1+r)^2 x^r + \left(\sum_{k=1}^{\infty} \left(4a_k(k+r-1)^2 + 3a_{k-1}(k+r-1)^2\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $4(-1+r)^2 = 0$

- Values of r that satisfy the indicial equation

  $r = 1$

- Each term in the series must be 0, giving the recursion relation

  $(k+r-1)^2 (4a_k + 3a_{k-1}) = 0$

- Shift index using $k->k+1$

  $(k+r)^2 (4a_{k+1} + 3a_k) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+1} = -\frac{3a_k}{4}$

- Recursion relation for $r = 1$

  $a_{k+1} = -\frac{3a_k}{4}$

- Solution for $r = 1$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+1}=-\frac{3a_k}{4}\right]$$

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2(x^2+3x+1)\,y''+8x^2(2x+3)\,y'+(9x^2+3x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(4x^4+12x^3+4x^2)\,y''+(16x^3+24x^2)\,y'+(9x^2+3x+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{6+4x}{x^2+3x+1}\\ q(x)&=\frac{9x^2+3x+1}{4x^2\,(x^2+3x+1)}\end{aligned}$$

Table 766: Table $p(x), q(x)$ singularites.

$p(x) = \frac{6+4x}{x^2+3x+1}$	
singularity	type
$x = -\frac{3}{2} - \frac{\sqrt{5}}{2}$	"regular"
$x = \frac{\sqrt{5}}{2} - \frac{3}{2}$	"regular"

$q(x) = \frac{9x^2+3x+1}{4x^2(x^2+3x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{3}{2} - \frac{\sqrt{5}}{2}$	"regular"
$x = \frac{\sqrt{5}}{2} - \frac{3}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[-\frac{3}{2} - \frac{\sqrt{5}}{2}, \frac{\sqrt{5}}{2} - \frac{3}{2}, 0, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2(x^2+3x+1)\,y'' + (16x^3+24x^2)\,y' + (9x^2+3x+1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2(x^2+3x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (16x^3+24x^2)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (9x^2+3x+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r) (n+r-1)\right)+\left(\sum_{n=0}^{\infty} 12x^{1+n+r} a_n (n+r) (n+r-1)\right) \\
+\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r) (n+r-1)\right)+\left(\sum_{n=0}^{\infty} 16x^{n+r+2} a_n (n+r)\right) \\
+\left(\sum_{n=0}^{\infty} 24x^{1+n+r} a_n (n+r)\right)+\left(\sum_{n=0}^{\infty} 9x^{n+r+2} a_n\right) \\
+\left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)=0 \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r) (n+r-1)=\sum_{n=2}^{\infty} 4a_{n-2} (n+r-2) (n-3+r) x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 12x^{1+n+r} a_n (n+r) (n+r-1)=\sum_{n=1}^{\infty} 12a_{n-1} (n+r-1) (n+r-2) x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 16x^{n+r+2} a_n (n+r)=\sum_{n=2}^{\infty} 16a_{n-2} (n+r-2) x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 24x^{1+n+r} a_n (n+r)=\sum_{n=1}^{\infty} 24a_{n-1} (n+r-1) x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 9x^{n+r+2} a_n=\sum_{n=2}^{\infty} 9a_{n-2} x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 3x^{1+n+r} a_n=\sum_{n=1}^{\infty} 3a_{n-1} x^{n+r}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\begin{aligned}
&\left(\sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)\,(n-3+r)\,x^{n+r}\right) \\
&+\left(\sum_{n=1}^{\infty} 12a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 4x^{n+r}a_n(n+r)\,(n+r-1)\right)+\left(\sum_{n=2}^{\infty} 16a_{n-2}(n+r-2)\,x^{n+r}\right) \\
&+\left(\sum_{n=1}^{\infty} 24a_{n-1}(n+r-1)\,x^{n+r}\right)+\left(\sum_{n=2}^{\infty} 9a_{n-2}x^{n+r}\right) \\
&+\left(\sum_{n=1}^{\infty} 3a_{n-1}x^{n+r}\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)=0
\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r}a_n(n+r)\,(n+r-1)+a_n x^{n+r}=0$$

When $n=0$ the above becomes

$$4x^r a_0 r(-1+r)+a_0 x^r=0$$

Or

$$(4x^r r(-1+r)+x^r)\,a_0=0$$

Since $a_0\neq 0$ then the above simplifies to

$$(2r-1)^2\,x^r=0$$

Since the above is true for all x then the indicial equation becomes

$$(2r-1)^2=0$$

Solving for r gives the roots of the indicial equation as

$$r_1=\frac{1}{2}$$
$$r_2=\frac{1}{2}$$

Since $a_0\neq 0$ then the indicial equation becomes

$$(2r-1)^2\,x^r=0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{2}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{2}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -3$$

For $2 \leq n$ the recursive equation is

$$4a_{n-2}(n+r-2)(n-3+r) + 12a_{n-1}(n+r-1)(n+r-2) + 4a_n(n+r)(n+r-1) + 16a_{n-2}(n+r-2) + 24a_{n-1}(n+r-1) + 9a_{n-2} + 3a_{n-1} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -a_{n-2} - 3a_{n-1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -a_{n-2} - 3a_{n-1} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-3	-3

For $n = 2$, using the above recursive equation gives

$$a_2 = 8$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = 8$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-3	-3
a_2	8	8

For $n = 3$, using the above recursive equation gives

$$a_3 = -21$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = -21$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-3	-3
a_2	8	8
a_3	-21	-21

For $n = 4$, using the above recursive equation gives

$$a_4 = 55$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = 55$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-3	-3
a_2	8	8
a_3	-21	-21
a_4	55	55

For $n = 5$, using the above recursive equation gives

$$a_5 = -144$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = -144$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-3	-3
a_2	8	8
a_3	-21	-21
a_4	55	55
a_5	-144	-144

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \sqrt{x}\left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O\left(x^6\right)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x)\ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{2}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n\left(r = \frac{1}{2}\right)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	-3	-3	0	0
b_2	8	8	0	0
b_3	-21	-21	0	0
b_4	55	55	0	0
b_5	-144	-144	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned}
y_2(x) &= y_1(x)\ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= \sqrt{x}\left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right)\ln(x) + \sqrt{x}\, O(x^6)
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1\sqrt{x}\left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right)\ln(x) + \sqrt{x}\, O(x^6)\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1\sqrt{x}\left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right) \\
&\quad + c_2\left(\sqrt{x}\left(1 - 3x + 8x^2 - 21x^3 + 55x^4 - 144x^5 + O(x^6)\right)\ln(x) + \sqrt{x}\, O(x^6)\right)
\end{aligned}$$

Summary
The solution(s) found are the following

$$
\begin{aligned}
y = {} & c_1\sqrt{x}\left(1-3x+8x^2-21x^3+55x^4-144x^5+O(x^6)\right) \\
& + c_2\left(\sqrt{x}\left(1-3x+8x^2-21x^3+55x^4-144x^5+O(x^6)\right)\ln(x)+\sqrt{x}\,O(x^6)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y = {} & c_1\sqrt{x}\left(1-3x+8x^2-21x^3+55x^4-144x^5+O(x^6)\right) \\
& + c_2\left(\sqrt{x}\left(1-3x+8x^2-21x^3+55x^4-144x^5+O(x^6)\right)\ln(x)+\sqrt{x}\,O(x^6)\right)
\end{aligned}
$$

Verified OK.

15.62.1 Maple step by step solution

Let's solve

$4x^2(x^2+3x+1)\,y''+(16x^3+24x^2)\,y'+(9x^2+3x+1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(9x^2+3x+1)y}{4x^2(x^2+3x+1)}-\frac{2(2x+3)y'}{x^2+3x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{2(2x+3)y'}{x^2+3x+1}+\frac{(9x^2+3x+1)y}{4x^2(x^2+3x+1)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{2(2x+3)}{x^2+3x+1}, P_3(x)=\frac{9x^2+3x+1}{4x^2(x^2+3x+1)}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left.(x\cdot P_2(x))\right|_{x=0}=0$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left.(x^2\cdot P_3(x))\right|_{x=0}=\frac{1}{4}$

  ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $4x^2(x^2+3x+1)\, y''+8x^2(2x+3)\, y'+(9x^2+3x+1)\, y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m=0..2$

    $x^m \cdot y=\sum_{k=0}^{\infty} a_k x^{k+r+m}$

  ◦ Shift index using $k->k-m$

    $x^m \cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  ◦ Convert $x^m \cdot y'$ to series expansion for $m=2..3$

    $x^m \cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

  ◦ Shift index using $k->k+1-m$

    $x^m \cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

  ◦ Convert $x^m \cdot y''$ to series expansion for $m=2..4$

    $x^m \cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

  ◦ Shift index using $k->k+2-m$

    $x^m \cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(-1+2r)^2 x^r+\left(a_1(1+2r)^2+3a_0(1+2r)^2\right) x^{1+r}+\left(\sum_{k=2}^{\infty} \left(a_k(2k+2r-1)^2+3a_{k-1}(2k+2r\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(-1+2r)^2=0$

- Values of r that satisfy the indicial equation

  $r=\frac{1}{2}$

- Each term must be 0

  $a_1(1+2r)^2+3a_0(1+2r)^2=0$

- Solve for the dependent coefficient(s)

  $a_1 = -3a_0$
- Each term in the series must be 0, giving the recursion relation

  $(2k+2r-1)^2 (a_k + 3a_{k-1} + a_{k-2}) = 0$
- Shift index using $k->k+2$

  $(2k+2r+3)^2 (a_{k+2} + 3a_{k+1} + a_k) = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+2} = -3a_{k+1} - a_k$
- Recursion relation for $r = \frac{1}{2}$

  $a_{k+2} = -3a_{k+1} - a_k$
- Solution for $r = \frac{1}{2}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+2} = -3a_{k+1} - a_k, a_1 = -3a_0\right]$

Problem number: 64.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(1-x)^2 y'' - x\left(-3x^2+2x+1\right) y' + y\left(x^2+1\right) = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^4-2x^3+x^2\right) y'' + \left(3x^3-2x^2-x\right) y' + y\left(x^2+1\right) = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{3x+1}{x\,(x-1)}$$
$$q(x) = \frac{x^2+1}{x^2\,(x-1)^2}$$

Table 768: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3x+1}{x(x-1)}$	
singularity	type
$x = 0$	"regular"
$x = 1$	"regular"

$q(x) = \frac{x^2+1}{x^2(x-1)^2}$	
singularity	type
$x = 0$	"regular"
$x = 1$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, 1, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2 (x^2 - 2x + 1) y'' + (3x^3 - 2x^2 - x) y' + y(x^2 + 1) = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 (x^2 - 2x + 1) \left(\sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}\right) + (3x^3 - 2x^2 - x) \left(\sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) (x^2 + 1) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n(n+r)(n+r-1)\right)+\sum_{n=0}^{\infty}\left(-2 x^{1+n+r} a_n(n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 3 x^{n+r+2} a_n(n+r)\right) \\
&+\sum_{n=0}^{\infty}\left(-2 x^{1+n+r} a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-x^{n+r} a_n(n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n\right)+\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} x^{n+r+2} a_n(n+r)(n+r-1) &= \sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r} \\
\sum_{n=0}^{\infty}\left(-2 x^{1+n+r} a_n(n+r)(n+r-1)\right) &= \sum_{n=1}^{\infty}\left(-2 a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) \\
\sum_{n=0}^{\infty} 3 x^{n+r+2} a_n(n+r) &= \sum_{n=2}^{\infty} 3 a_{n-2}(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty}\left(-2 x^{1+n+r} a_n(n+r)\right) &= \sum_{n=1}^{\infty}\left(-2 a_{n-1}(n+r-1)\, x^{n+r}\right) \\
\sum_{n=0}^{\infty} x^{n+r+2} a_n &= \sum_{n=2}^{\infty} a_{n-2} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)\,(n-3+r)\,x^{n+r}\right) + \sum_{n=1}^{\infty} \left(-2a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)\,(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)\,x^{n+r}\right) + \sum_{n=1}^{\infty} \left(-2a_{n-1}(n+r-1)\,x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n(n+r)\right) + \left(\sum_{n=2}^{\infty} a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n(n+r)\,(n+r-1) - x^{n+r} a_n(n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^r (-1+r)^2 = 0$$

Since the above is true for all x then the indicial equation becomes

$$(-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^r (-1+r)^2 = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = 1$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{1+n}$$

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{1+n}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 2$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &a_{n-2}(n+r-2)(n-3+r) - 2a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ &+ 3a_{n-2}(n+r-2) - 2a_{n-1}(n+r-1) - a_n(n+r) + a_{n-2} + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -a_{n-2} + 2a_{n-1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -a_{n-2} + 2a_{n-1} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	2	2

For $n = 2$, using the above recursive equation gives

$$a_2 = 3$$

Which for the root $r = 1$ becomes

$$a_2 = 3$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	2	2
a_2	3	3

For $n = 3$, using the above recursive equation gives

$$a_3 = 4$$

Which for the root $r = 1$ becomes

$$a_3 = 4$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	2	2
a_2	3	3
a_3	4	4

For $n = 4$, using the above recursive equation gives

$$a_4 = 5$$

Which for the root $r = 1$ becomes

$$a_4 = 5$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	2	2
a_2	3	3
a_3	4	4
a_4	5	5

For $n = 5$, using the above recursive equation gives

$$a_5 = 6$$

Which for the root $r = 1$ becomes

$$a_5 = 6$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	2	2
a_2	3	3
a_3	4	4
a_4	5	5
a_5	6	6

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x\left(6x^5 + 5x^4 + 4x^3 + 3x^2 + 2x + 1 + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = 1$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n(r = 1)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	2	2	0	0
b_2	3	3	0	0
b_3	4	4	0	0
b_4	5	5	0	0
b_5	6	6	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x) \ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \ldots \\ &= x\left(6x^5 + 5x^4 + 4x^3 + 3x^2 + 2x + 1 + O(x^6)\right) \ln(x) + x O(x^6) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x\left(6x^5 + 5x^4 + 4x^3 + 3x^2 + 2x + 1 + O(x^6)\right) \\ &\quad + c_2\left(x\left(6x^5 + 5x^4 + 4x^3 + 3x^2 + 2x + 1 + O(x^6)\right) \ln(x) + x O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x\left(6x^5 + 5x^4 + 4x^3 + 3x^2 + 2x + 1 + O(x^6)\right) \\ &\quad + c_2\left(x\left(6x^5 + 5x^4 + 4x^3 + 3x^2 + 2x + 1 + O(x^6)\right) \ln(x) + x O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y &= c_1 x\left(6x^5 + 5x^4 + 4x^3 + 3x^2 + 2x + 1 + O(x^6)\right) \\ &\quad + c_2\left(x\left(6x^5 + 5x^4 + 4x^3 + 3x^2 + 2x + 1 + O(x^6)\right) \ln(x) + x O(x^6)\right) \end{aligned} \tag{1}$$

Verification of solutions

$$y = c_1 x\left(6x^5+5x^4+4x^3+3x^2+2x+1+O\left(x^6\right)\right) + c_2\left(x\left(6x^5+5x^4+4x^3+3x^2+2x+1+O\left(x^6\right)\right)\ln\left(x\right)+xO\left(x^6\right)\right)$$

Verified OK.

15.63.1 Maple step by step solution

Let's solve

$x^2(x^2-2x+1)\,y''+(3x^3-2x^2-x)\,y'+y(x^2+1)=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(x^2+1)y}{x^2(x^2-2x+1)}-\frac{y'(3x+1)}{x(x-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{y'(3x+1)}{x(x-1)}+\frac{(x^2+1)y}{x^2(x^2-2x+1)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x)=\frac{3x+1}{x(x-1)}, P_3(x)=\frac{x^2+1}{x^2(x^2-2x+1)}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

    $\left.(x\cdot P_2(x))\right|_{x=0}=-1$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

    $\left.(x^2\cdot P_3(x))\right|_{x=0}=1$

  ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $(x-1)\,y''x^2(x^2-2x+1)+(3x+1)\,x(x^2-2x+1)\,y'+(x^2+1)\,(x-1)\,y=0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

- ☐ Rewrite ODE with series expansions
  - Convert $x^m \cdot y$ to series expansion for $m = 0..3$

    $$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

  - Shift index using $k- > k - m$

    $$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

  - Convert $x^m \cdot y'$ to series expansion for $m = 1..4$

    $$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

  - Shift index using $k- > k + 1 - m$

    $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$$

  - Convert $x^m \cdot y''$ to series expansion for $m = 2..5$

    $$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$$

  - Shift index using $k- > k + 2 - m$

    $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m} (k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$-a_0(-1+r)^2 x^r + \left(-r^2 a_1 + a_0(3r^2 - 2r + 1)\right) x^{1+r} + \left(-a_2(1+r)^2 + a_1(3r^2 + 4r + 2) - a_0(3r^2$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$-(-1+r)^2 = 0$$

- Values of r that satisfy the indicial equation

  $$r = 1$$

- The coefficients of each power of x must be 0

  $$\left[-r^2 a_1 + a_0(3r^2 - 2r + 1) = 0, -a_2(1+r)^2 + a_1(3r^2 + 4r + 2) - a_0(3r^2 + 2r + 1) = 0\right]$$

- Solve for the dependent coefficient(s)

  $$\left\{a_1 = \frac{a_0(3r^2 - 2r + 1)}{r^2}, a_2 = \frac{2a_0(3r^4 + 2r^3 + 1)}{r^2(r^2 + 2r + 1)}\right\}$$

- Each term in the series must be 0, giving the recursion relation

  $-a_k(k+r-1)^2 + a_{k-3}(k-2+r)^2 + (-3k^2 + (-6r+10)k - 3r^2 + 10r - 9)a_{k-2} + 3(k^2 + (2r$

- Shift index using $k- >k+3$

  $-a_{k+3}(k+2+r)^2 + a_k(k+r+1)^2 + (-3(k+3)^2 + (-6r+10)(k+3) - 3r^2 + 10r - 9)a_{k+1}$

- Recursion relation that defines series solution to ODE

  $a_{k+3} = \frac{k^2a_k - 3k^2a_{k+1} + 3k^2a_{k+2} + 2kra_k - 6kra_{k+1} + 6kra_{k+2} + r^2a_k - 3r^2a_{k+1} + 3r^2a_{k+2} + 2ka_k - 8ka_{k+1} + 10ka_{k+2} + 2ra_k - 8ra_k}{(k+2+r)^2}$

- Recursion relation for $r = 1$

  $a_{k+3} = \frac{k^2a_k - 3k^2a_{k+1} + 3k^2a_{k+2} + 4ka_k - 14ka_{k+1} + 16ka_{k+2} + 4a_k - 17a_{k+1} + 22a_{k+2}}{(k+3)^2}$

- Solution for $r = 1$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+3} = \frac{k^2a_k - 3k^2a_{k+1} + 3k^2a_{k+2} + 4ka_k - 14ka_{k+1} + 16ka_{k+2} + 4a_k - 17a_{k+1} + 22a_{k+2}}{(k+3)^2}, a_1 = 2a_0, a_2 =\right.$

Problem number: 65.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Repeated root"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{9x^2(x^2+x+1)\,y''+3x(13x^2+7x+1)\,y'+(25x^2+4x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(9x^4+9x^3+9x^2)\,y''+(39x^3+21x^2+3x)\,y'+(25x^2+4x+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{13x^2+7x+1}{3\,(x^2+x+1)\,x}$$
$$q(x)=\frac{25x^2+4x+1}{9x^2\,(x^2+x+1)}$$

Table 770: Table $p(x), q(x)$ singularites.

$p(x) = \frac{13x^2+7x+1}{3(x^2+x+1)x}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2} - \frac{i\sqrt{3}}{2}$	"regular"
$x = -\frac{1}{2} + \frac{i\sqrt{3}}{2}$	"regular"

$q(x) = \frac{25x^2+4x+1}{9x^2(x^2+x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2} - \frac{i\sqrt{3}}{2}$	"regular"
$x = -\frac{1}{2} + \frac{i\sqrt{3}}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{1}{2} - \frac{i\sqrt{3}}{2}, -\frac{1}{2} + \frac{i\sqrt{3}}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$9x^2\left(x^2+x+1\right)y'' + \left(39x^3+21x^2+3x\right)y' + \left(25x^2+4x+1\right)y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$9x^2\left(x^2+x+1\right)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(39x^3+21x^2+3x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(25x^2+4x+1\right)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 9x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 9x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 39x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 21x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 25x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 9x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} 9a_{n-2}(n+r-2)(n-3+r) x^{n+r}$$

$$\sum_{n=0}^{\infty} 9x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 9a_{n-1}(n+r-1)(n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} 39x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 39a_{n-2}(n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} 21x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 21a_{n-1}(n+r-1) x^{n+r}$$

$$\sum_{n=0}^{\infty} 25x^{n+r+2} a_n = \sum_{n=2}^{\infty} 25a_{n-2} x^{n+r}$$

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n = \sum_{n=1}^{\infty} 4a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 9a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 9a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 39a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 21a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n(n+r)\right) + \left(\sum_{n=2}^{\infty} 25a_{n-2}x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 4a_{n-1}x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$9x^{n+r} a_n(n+r)(n+r-1) + 3x^{n+r} a_n(n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$9x^r a_0 r(-1+r) + 3x^r a_0 r + a_0 x^r = 0$$

Or

$$(9x^r r(-1+r) + 3x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(3r-1)^2 x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(3r-1)^2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = \frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(3r-1)^2 x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the root of the indicial equation is repeated, then we can construct two linearly independent solutions. The first solution has the form

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+r} \tag{1A}$$

Now the second solution y_2 is found using

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right) \tag{1B}$$

Then the general solution will be

$$y = c_1 y_1(x) + c_2 y_2(x)$$

In Eq (1B) the sum starts from 1 and not zero. In Eq (1A), a_0 is never zero, and is arbitrary and is typically taken as $a_0 = 1$, and $\{c_1, c_2\}$ are two arbitray constants of integration which can be found from initial conditions. Using the value of the indicial root found earlier, $r = \frac{1}{3}$, Eqs (1A,1B) become

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+\frac{1}{3}}\right)$$

We start by finding the first solution $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -1$$

For $2 \leq n$ the recursive equation is

$$9a_{n-2}(n+r-2)(n-3+r)+9a_{n-1}(n+r-1)(n+r-2)+9a_n(n+r)(n+r-1) \\ +39a_{n-2}(n+r-2)+21a_{n-1}(n+r-1)+3a_n(n+r)+25a_{n-2}+4a_{n-1}+a_n=0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -a_{n-2} - a_{n-1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = -a_{n-2} - a_{n-1} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	0	0

For $n = 3$, using the above recursive equation gives

$$a_3 = 1$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	0	0
a_3	1	1

For $n = 4$, using the above recursive equation gives

$$a_4 = -1$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	0	0
a_3	1	1
a_4	-1	-1

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	0	0
a_3	1	1
a_4	-1	-1
a_5	0	0

Using the above table, then the first solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(-x^4 + x^3 - x + 1 + O(x^6)\right) \end{aligned}$$

Now the second solution is found. The second solution is given by

$$y_2(x) = y_1(x) \ln(x) + \left(\sum_{n=1}^{\infty} b_n x^{n+r}\right)$$

Where b_n is found using

$$b_n = \frac{d}{dr} a_{n,r}$$

And the above is then evaluated at $r = \frac{1}{3}$. The above table for $a_{n,r}$ is used for this purpose. Computing the derivatives gives the following table

n	$b_{n,r}$	a_n	$b_{n,r} = \frac{d}{dr} a_{n,r}$	$b_n\left(r = \frac{1}{3}\right)$
b_0	1	1	N/A since b_n starts from 1	N/A
b_1	-1	-1	0	0
b_2	0	0	0	0
b_3	1	1	0	0
b_4	-1	-1	0	0
b_5	0	0	0	0

The above table gives all values of b_n needed. Hence the second solution is

$$\begin{aligned} y_2(x) &= y_1(x) \ln(x) + b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \ldots \\ &= x^{\frac{1}{3}} \left(-x^4 + x^3 - x + 1 + O(x^6)\right) \ln(x) + x^{\frac{1}{3}} O(x^6) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{1}{3}} \left(-x^4 + x^3 - x + 1 + O(x^6)\right) + c_2 \left(x^{\frac{1}{3}} \left(-x^4 + x^3 - x + 1 + O(x^6)\right) \ln(x) + x^{\frac{1}{3}} O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{1}{3}} \left(-x^4 + x^3 - x + 1 + O(x^6)\right) + c_2 \left(x^{\frac{1}{3}} \left(-x^4 + x^3 - x + 1 + O(x^6)\right) \ln(x) + x^{\frac{1}{3}} O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = {} & c_1 x^{\frac{1}{3}} \left(-x^4 + x^3 - x + 1 + O(x^6)\right) \\ & + c_2 \left(x^{\frac{1}{3}} \left(-x^4 + x^3 - x + 1 + O(x^6)\right) \ln(x) + x^{\frac{1}{3}} O(x^6)\right) \end{aligned} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{3}} \left(-x^4+x^3-x+1+O(x^6)\right)+c_2 \left(x^{\frac{1}{3}} \left(-x^4+x^3-x+1+O(x^6)\right) \ln(x)+x^{\frac{1}{3}} O(x^6)\right)$$

Verified OK.

15.64.1 Maple step by step solution

Let's solve

$9x^2(x^2+x+1)\, y''+(39x^3+21x^2+3x)\, y'+(25x^2+4x+1)\, y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(25x^2+4x+1)y}{9x^2(x^2+x+1)}-\frac{(13x^2+7x+1)y'}{3x(x^2+x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(13x^2+7x+1)y'}{3x(x^2+x+1)}+\frac{(25x^2+4x+1)y}{9x^2(x^2+x+1)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{13x^2+7x+1}{3(x^2+x+1)x}, P_3(x)=\frac{25x^2+4x+1}{9x^2(x^2+x+1)}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x=0$

  $(x \cdot P_2(x))\bigg|_{x=0}=\frac{1}{3}$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x=0$

  $(x^2 \cdot P_3(x))\bigg|_{x=0}=\frac{1}{9}$

  ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $9x^2(x^2+x+1)\, y''+3x(13x^2+7x+1)\, y'+(25x^2+4x+1)\, y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

- Rewrite ODE with series expansions
  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$
  - Shift index using $k->k-m$

    $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$
  - Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$
  - Shift index using $k->k+1-m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$
  - Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

    $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$
  - Shift index using $k->k+2-m$

    $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(-1+3r)^2 x^r + \left(a_1(2+3r)^2 + a_0(2+3r)^2\right) x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(3k+3r-1)^2 + a_{k-1}(3k+3r-\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(-1+3r)^2 = 0$
- Values of r that satisfy the indicial equation

  $r = \frac{1}{3}$
- Each term must be 0

  $a_1(2+3r)^2 + a_0(2+3r)^2 = 0$
- Solve for the dependent coefficient(s)

  $a_1 = -a_0$
- Each term in the series must be 0, giving the recursion relation

  $(3k+3r-1)^2 (a_k + a_{k-1} + a_{k-2}) = 0$

- Shift index using $k->k+2$

  $$\left(3k+3r+5\right)^{2} \left(a_{k+2}+a_{k+1}+a_{k}\right) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2} = -a_{k+1}-a_{k}$$

- Recursion relation for $r = \frac{1}{3}$

  $$a_{k+2} = -a_{k+1}-a_{k}$$

- Solution for $r = \frac{1}{3}$

  $$\left[y = \sum_{k=0}^{\infty} a_{k} x^{k+\frac{1}{3}}, a_{k+2} = -a_{k+1}-a_{k}, a_{1} = -a_{0}\right]$$

ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2(2+x)\,y'' - x(4-7x)\,y' - (5-3x)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(2x^3+4x^2\right)y'' + \left(7x^2-4x\right)y' + (3x-5)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{7x-4}{2x\,(2+x)}$$
$$q(x) = \frac{3x-5}{2x^2\,(2+x)}$$

Table 772: Table $p(x), q(x)$ singularites.

$p(x) = \frac{7x-4}{2x(2+x)}$	
singularity	type
$x = -2$	"regular"
$x = 0$	"regular"

$q(x) = \frac{3x-5}{2x^2(2+x)}$	
singularity	type
$x = -2$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-2, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2(2+x)\, y'' + \left(7x^2 - 4x\right) y' + (3x-5)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2(2+x) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(7x^2 - 4x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (3x-5) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 7x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-4x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-5a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1) &= \sum_{n=1}^{\infty} 2a_{n-1} (n+r-1)(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 7x^{1+n+r} a_n (n+r) &= \sum_{n=1}^{\infty} 7a_{n-1} (n+r-1)\, x^{n+r} \\
\sum_{n=0}^{\infty} 3x^{1+n+r} a_n &= \sum_{n=1}^{\infty} 3a_{n-1} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=1}^{\infty} 2a_{n-1} (n+r-1)(n+r-2)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 7a_{n-1} (n+r-1)\, x^{n+r}\right) \\
&+ \sum_{n=0}^{\infty} \left(-4x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} 3a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-5a_n x^{n+r}\right) = 0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
4x^{n+r} a_n (n+r)(n+r-1) - 4x^{n+r} a_n (n+r) - 5a_n x^{n+r} = 0
$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1 + r) - 4x^r a_0 r - 5a_0 x^r = 0$$

Or

$$(4x^r r(-1 + r) - 4x^r r - 5x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 - 8r - 5\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 - 8r - 5 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{5}{2}$$
$$r_2 = -\frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 - 8r - 5\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 3$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^{\frac{5}{2}} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{\sqrt{x}}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n + \frac{5}{2}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n - \frac{1}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} 2a_{n-1}(n+r-1)(n+r-2) + 4a_n(n+r)(n+r-1) \\ + 7a_{n-1}(n+r-1) - 4a_n(n+r) + 3a_{n-1} - 5a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r)\, a_{n-1}}{2n+2r-5} \tag{4}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_n = -\frac{(2n+5)\, a_{n-1}}{4n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{5}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-1-r}{-3+2r}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_1 = -\frac{7}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{-3+2r}$	$-\frac{7}{4}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{r^2+3r+2}{4r^2-8r+3}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_2 = \frac{63}{32}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{-3+2r}$	$-\frac{7}{4}$
a_2	$\frac{r^2+3r+2}{4r^2-8r+3}$	$\frac{63}{32}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-r^3 - 6r^2 - 11r - 6}{8r^3 - 12r^2 - 2r + 3}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_3 = -\frac{231}{128}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{-3+2r}$	$-\frac{7}{4}$
a_2	$\frac{r^2+3r+2}{4r^2-8r+3}$	$\frac{63}{32}$
a_3	$\frac{-r^3-6r^2-11r-6}{8r^3-12r^2-2r+3}$	$-\frac{231}{128}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^4 + 10r^3 + 35r^2 + 50r + 24}{16r^4 - 40r^2 + 9}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_4 = \frac{3003}{2048}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{-3+2r}$	$-\frac{7}{4}$
a_2	$\frac{r^2+3r+2}{4r^2-8r+3}$	$\frac{63}{32}$
a_3	$\frac{-r^3-6r^2-11r-6}{8r^3-12r^2-2r+3}$	$-\frac{231}{128}$
a_4	$\frac{r^4+10r^3+35r^2+50r+24}{16r^4-40r^2+9}$	$\frac{3003}{2048}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-r^5 - 15r^4 - 85r^3 - 225r^2 - 274r - 120}{(16r^4 - 40r^2 + 9)(5 + 2r)}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_5 = -\frac{9009}{8192}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{-3+2r}$	$-\frac{7}{4}$
a_2	$\frac{r^2+3r+2}{4r^2-8r+3}$	$\frac{63}{32}$
a_3	$\frac{-r^3-6r^2-11r-6}{8r^3-12r^2-2r+3}$	$-\frac{231}{128}$
a_4	$\frac{r^4+10r^3+35r^2+50r+24}{16r^4-40r^2+9}$	$\frac{3003}{2048}$
a_5	$\frac{-r^5-15r^4-85r^3-225r^2-274r-120}{(16r^4-40r^2+9)(5+2r)}$	$-\frac{9009}{8192}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{5}{2}}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= x^{\frac{5}{2}}\left(1 - \frac{7x}{4} + \frac{63x^2}{32} - \frac{231x^3}{128} + \frac{3003x^4}{2048} - \frac{9009x^5}{8192} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 3$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_3(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$
\begin{aligned}
a_N &= a_3 \\
&= \frac{-r^3 - 6r^2 - 11r - 6}{8r^3 - 12r^2 - 2r + 3}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\lim_{r\to r_2} \frac{-r^3 - 6r^2 - 11r - 6}{8r^3 - 12r^2 - 2r + 3} &= \lim_{r\to -\frac{1}{2}} \frac{-r^3 - 6r^2 - 11r - 6}{8r^3 - 12r^2 - 2r + 3} \\
&= \textit{undefined}
\end{aligned}
$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$
y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)
$$

Therefore

$$
\begin{aligned}
\frac{d}{dx} y_2(x) &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2} (n + r_2)}{x}\right) \\
&= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n + r_2)\right) \\
\frac{d^2}{dx^2} y_2(x) &= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2} (n + r_2)^2}{x^2} - \frac{b_n x^{n+r_2} (n + r_2)}{x^2}\right) \\
&= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n + r_2) (-1 + n + r_2)\right)
\end{aligned}
$$

Substituting these back into the given ode $2x^2(2 + x)\, y'' + (7x^2 - 4x)\, y' + (3x - 5)\, y = 0$

gives

$$
\begin{aligned}
&2x^2(2+x)\left(Cy_1''(x)\ln(x)+\frac{2Cy_1'(x)}{x}-\frac{Cy_1(x)}{x^2}\right.\\
&\left.+\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+\left(7x^2-4x\right)\left(Cy_1'(x)\ln(x)+\frac{Cy_1(x)}{x}+\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)\\
&+(3x-5)\left(Cy_1(x)\ln(x)+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)\right)=0
\end{aligned}
$$

Which can be written as

$$
\begin{aligned}
&\left(\left(2x^2(2+x)\,y_1''(x)+\left(7x^2-4x\right)y_1'(x)+(3x-5)\,y_1(x)\right)\ln(x)\right.\\
&\left.+2x^2(2+x)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{\left(7x^2-4x\right)y_1(x)}{x}\right)C\\
&+2x^2(2+x)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+\left(7x^2-4x\right)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(3x-5)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0
\end{aligned}
\tag{7}
$$

But since $y_1(x)$ is a solution to the ode, then

$$
2x^2(2+x)\,y_1''(x)+\left(7x^2-4x\right)y_1'(x)+(3x-5)\,y_1(x)=0
$$

Eq (7) simplifes to

$$
\begin{aligned}
&\left(2x^2(2+x)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{\left(7x^2-4x\right)y_1(x)}{x}\right)C\\
&+2x^2(2+x)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+\left(7x^2-4x\right)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(3x-5)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0
\end{aligned}
\tag{8}
$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\left(4x(2+x)\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) + (5x-8)\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)\right) C \\ + 2\left(x^3+2x^2\right)\left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) \\ + \left(7x^2-4x\right)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) + (3x-5)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{9}$$

Since $r_1 = \frac{5}{2}$ and $r_2 = -\frac{1}{2}$ then the above becomes

$$\left(4x(2+x)\left(\sum_{n=0}^{\infty} x^{\frac{3}{2}+n} a_n \left(n+\frac{5}{2}\right)\right) + (5x-8)\left(\sum_{n=0}^{\infty} a_n x^{n+\frac{5}{2}}\right)\right) C \\ + 2\left(x^3+2x^2\right)\left(\sum_{n=0}^{\infty} x^{-\frac{5}{2}+n} b_n \left(n-\frac{1}{2}\right)\left(-\frac{3}{2}+n\right)\right) \\ + \left(7x^2-4x\right)\left(\sum_{n=0}^{\infty} x^{-\frac{3}{2}+n} b_n \left(n-\frac{1}{2}\right)\right) + (3x-5)\left(\sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}\right) = 0 \tag{10}$$

Expanding $4C\,x^{\frac{5}{2}}$ as Taylor series around $x=0$ and keeping only the first 6 terms gives

$$\begin{aligned} 4C\,x^{\frac{5}{2}} &= 4C\,x^{\frac{5}{2}} + \dots \\ &= 4C\,x^{\frac{5}{2}} \end{aligned}$$

Expanding $5C\,x^{\frac{7}{2}}$ as Taylor series around $x=0$ and keeping only the first 6 terms gives

$$\begin{aligned} 5C\,x^{\frac{7}{2}} &= 5C\,x^{\frac{7}{2}} + \dots \\ &= 5C\,x^{\frac{7}{2}} \end{aligned}$$

Expanding $-8C\,x^{\frac{5}{2}}$ as Taylor series around $x=0$ and keeping only the first 6 terms gives

$$\begin{aligned} -8C\,x^{\frac{5}{2}} &= -8C\,x^{\frac{5}{2}} + \dots \\ &= -8C\,x^{\frac{5}{2}} \end{aligned}$$

Expanding $\frac{\sqrt{x}}{2}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{\sqrt{x}}{2} &= \frac{\sqrt{x}}{2} + \dots \\ &= \frac{\sqrt{x}}{2}\end{aligned}$$

Expanding $\frac{1}{\sqrt{x}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{1}{\sqrt{x}} &= \frac{1}{\sqrt{x}} + \dots \\ &= \frac{1}{\sqrt{x}}\end{aligned}$$

Expanding $\frac{7\sqrt{x}}{2}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{7\sqrt{x}}{2} &= \frac{7\sqrt{x}}{2} + \dots \\ &= \frac{7\sqrt{x}}{2}\end{aligned}$$

Expanding $-\frac{2}{\sqrt{x}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}-\frac{2}{\sqrt{x}} &= -\frac{2}{\sqrt{x}} + \dots \\ &= -\frac{2}{\sqrt{x}}\end{aligned}$$

Expanding $3\sqrt{x}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}3\sqrt{x} &= 3\sqrt{x} + \dots \\ &= 3\sqrt{x}\end{aligned}$$

Expanding $-\frac{5}{\sqrt{x}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}-\frac{5}{\sqrt{x}} &= -\frac{5}{\sqrt{x}} + \dots \\ &= -\frac{5}{\sqrt{x}}\end{aligned}$$

Which simplifies to

$$\begin{aligned}
&\left(\sum_{n=0}^{\infty} (8n+20)\, C a_n x^{n+\frac{5}{2}}\right) + \left(\sum_{n=0}^{\infty} (4n+10)\, C a_n x^{\frac{7}{2}+n}\right) \\
&+ \left(\sum_{n=0}^{\infty} 5C\, x^{\frac{7}{2}+n} a_n\right) + \sum_{n=0}^{\infty} \left(-8C\, x^{n+\frac{5}{2}} a_n\right) \\
&+ \left(\sum_{n=0}^{\infty} \frac{x^{n+\frac{1}{2}} b_n (4n^2-8n+3)}{2}\right) + \left(\sum_{n=0}^{\infty} x^{n-\frac{1}{2}} b_n (4n^2-8n+3)\right) \\
&+ \left(\sum_{n=0}^{\infty} \frac{7x^{n+\frac{1}{2}} b_n (2n-1)}{2}\right) + \left(\sum_{n=0}^{\infty} (-4n+2)\, b_n x^{n-\frac{1}{2}}\right) \\
&+ \left(\sum_{n=0}^{\infty} 3x^{n+\frac{1}{2}} b_n\right) + \sum_{n=0}^{\infty} \left(-5b_n x^{n-\frac{1}{2}}\right) = 0
\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n-\frac{1}{2}$ in each summation term. Going over each summation term above with power of x in it which is not already $x^{n-\frac{1}{2}}$ and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} (8n+20)\, C a_n x^{n+\frac{5}{2}} = \sum_{n=3}^{\infty} C a_{n-3} (8n-4)\, x^{n-\frac{1}{2}}$$

$$\sum_{n=0}^{\infty} (4n+10)\, C a_n x^{\frac{7}{2}+n} = \sum_{n=4}^{\infty} C a_{n-4} (4n-6)\, x^{n-\frac{1}{2}}$$

$$\sum_{n=0}^{\infty} 5C\, x^{\frac{7}{2}+n} a_n = \sum_{n=4}^{\infty} 5C a_{n-4} x^{n-\frac{1}{2}}$$

$$\sum_{n=0}^{\infty} \left(-8C\, x^{n+\frac{5}{2}} a_n\right) = \sum_{n=3}^{\infty} \left(-8C a_{n-3} x^{n-\frac{1}{2}}\right)$$

$$\sum_{n=0}^{\infty} \frac{x^{n+\frac{1}{2}} b_n (4n^2-8n+3)}{2} = \sum_{n=1}^{\infty} \frac{b_{n-1} \left(4(n-1)^2-8n+11\right) x^{n-\frac{1}{2}}}{2}$$

$$\sum_{n=0}^{\infty} \frac{7x^{n+\frac{1}{2}} b_n (2n-1)}{2} = \sum_{n=1}^{\infty} \frac{7b_{n-1}(-3+2n)\, x^{n-\frac{1}{2}}}{2}$$

$$\sum_{n=0}^{\infty} 3x^{n+\frac{1}{2}} b_n = \sum_{n=1}^{\infty} 3b_{n-1} x^{n-\frac{1}{2}}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-\frac{1}{2}$.

$$\begin{aligned}
&\left(\sum_{n=3}^{\infty} C a_{n-3}(8n-4)\, x^{n-\frac{1}{2}}\right)+\left(\sum_{n=4}^{\infty} C a_{n-4}(4n-6)\, x^{n-\frac{1}{2}}\right)\\
&+\left(\sum_{n=4}^{\infty} 5 C a_{n-4} x^{n-\frac{1}{2}}\right)+\sum_{n=3}^{\infty}\left(-8 C a_{n-3} x^{n-\frac{1}{2}}\right)\\
&\quad+\left(\sum_{n=1}^{\infty} \frac{b_{n-1}\left(4(n-1)^{2}-8n+11\right) x^{n-\frac{1}{2}}}{2}\right)\\
&\quad+\left(\sum_{n=0}^{\infty} x^{n-\frac{1}{2}} b_{n}\left(4n^{2}-8n+3\right)\right)+\left(\sum_{n=1}^{\infty} \frac{7 b_{n-1}(-3+2n)\, x^{n-\frac{1}{2}}}{2}\right)\\
&\quad+\left(\sum_{n=0}^{\infty}(-4n+2)\, b_{n} x^{n-\frac{1}{2}}\right)+\left(\sum_{n=1}^{\infty} 3 b_{n-1} x^{n-\frac{1}{2}}\right)+\sum_{n=0}^{\infty}\left(-5 b_{n} x^{n-\frac{1}{2}}\right)=0
\end{aligned} \tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0=1$. For $n=1$, Eq (2B) gives

$$b_0 - 8b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$1 - 8b_1 = 0$$

Solving the above for b_1 gives

$$b_1 = \frac{1}{8}$$

For $n=2$, Eq (2B) gives

$$6b_1 - 8b_2 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$\frac{3}{4} - 8b_2 = 0$$

Solving the above for b_2 gives

$$b_2 = \frac{3}{32}$$

For $n=N$, where $N=3$ which is the difference between the two roots, we are free to choose $b_3=0$. Hence for $n=3$, Eq (2B) gives

$$12C + \frac{45}{32} = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{15}{128}$$

For $n = 4$, Eq (2B) gives

$$(15a_0 + 20a_1) C + 28b_3 + 16b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$\frac{75}{32} + 16b_4 = 0$$

Solving the above for b_4 gives

$$b_4 = -\frac{75}{512}$$

For $n = 5$, Eq (2B) gives

$$(19a_1 + 28a_2) C + 45b_4 + 40b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-\frac{9375}{1024} + 40b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = \frac{1875}{8192}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{15}{128}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{15}{128}\left(x^{\frac{5}{2}}\left(1 - \frac{7x}{4} + \frac{63x^2}{32} - \frac{231x^3}{128} + \frac{3003x^4}{2048} - \frac{9009x^5}{8192} + O(x^6)\right)\right) \ln(x) + \frac{1 + \frac{x}{8} + \frac{3x^2}{32} - \frac{75x^4}{512} + \frac{1875x^5}{8192} + O(x^6)}{\sqrt{x}}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{5}{2}} \left(1-\frac{7x}{4}+\frac{63x^2}{32}-\frac{231x^3}{128}+\frac{3003x^4}{2048}-\frac{9009x^5}{8192}+O(x^6)\right) \\
&\quad + c_2 \left(-\frac{15}{128}\left(x^{\frac{5}{2}}\left(1-\frac{7x}{4}+\frac{63x^2}{32}-\frac{231x^3}{128}+\frac{3003x^4}{2048}-\frac{9009x^5}{8192}+O(x^6)\right)\right)\ln(x) \right. \\
&\quad \left. + \frac{1+\frac{x}{8}+\frac{3x^2}{32}-\frac{75x^4}{512}+\frac{1875x^5}{8192}+O(x^6)}{\sqrt{x}}\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{5}{2}} \left(1-\frac{7x}{4}+\frac{63x^2}{32}-\frac{231x^3}{128}+\frac{3003x^4}{2048}-\frac{9009x^5}{8192}+O(x^6)\right) \\
&\quad + c_2 \left(-\frac{15x^{\frac{5}{2}}\left(1-\frac{7x}{4}+\frac{63x^2}{32}-\frac{231x^3}{128}+\frac{3003x^4}{2048}-\frac{9009x^5}{8192}+O(x^6)\right)\ln(x)}{128} \right. \\
&\quad \left. + \frac{1+\frac{x}{8}+\frac{3x^2}{32}-\frac{75x^4}{512}+\frac{1875x^5}{8192}+O(x^6)}{\sqrt{x}}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^{\frac{5}{2}} \left(1-\frac{7x}{4}+\frac{63x^2}{32}-\frac{231x^3}{128}+\frac{3003x^4}{2048}-\frac{9009x^5}{8192}+O(x^6)\right) \\
&\quad + c_2 \left(-\frac{15x^{\frac{5}{2}}\left(1-\frac{7x}{4}+\frac{63x^2}{32}-\frac{231x^3}{128}+\frac{3003x^4}{2048}-\frac{9009x^5}{8192}+O(x^6)\right)\ln(x)}{128} \right. \\
&\quad \left. + \frac{1+\frac{x}{8}+\frac{3x^2}{32}-\frac{75x^4}{512}+\frac{1875x^5}{8192}+O(x^6)}{\sqrt{x}}\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$y = c_1 x^{\frac{5}{2}} \left(1-\frac{7x}{4}+\frac{63x^2}{32}-\frac{231x^3}{128}+\frac{3003x^4}{2048}-\frac{9009x^5}{8192}+O(x^6)\right) + c_2 \left(-\frac{15x^{\frac{5}{2}} \left(1-\frac{7x}{4}+\frac{63x^2}{32}-\frac{231x^3}{128}+\frac{3003x^4}{2048}-\frac{9009x^5}{8192}+O(x^6)\right) \ln(x)}{128} + \frac{1+\frac{x}{8}+\frac{3x^2}{32}-\frac{75x^4}{512}+\frac{1875x^5}{8192}+O(x^6)}{\sqrt{x}}\right)$$

Verified OK.

16.1.1 Maple step by step solution

Let's solve

$2x^2(2+x)\,y''+(7x^2-4x)\,y'+(3x-5)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(3x-5)y}{2x^2(2+x)}-\frac{(7x-4)y'}{2x(2+x)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(7x-4)y'}{2x(2+x)}+\frac{(3x-5)y}{2x^2(2+x)}=0$

□ Check to see if x_0 is a regular singular point

  ○ Define functions

  $\left[P_2(x)=\frac{7x-4}{2x(2+x)}, P_3(x)=\frac{3x-5}{2x^2(2+x)}\right]$

  ○ $(2+x)\cdot P_2(x)$ is analytic at $x=-2$

  $\left((2+x)\cdot P_2(x)\right)\bigg|_{x=-2}=\frac{9}{2}$

  ○ $(2+x)^2\cdot P_3(x)$ is analytic at $x=-2$

  $\left((2+x)^2\cdot P_3(x)\right)\bigg|_{x=-2}=0$

  ○ $x=-2$is a regular singular point

  Check to see if x_0 is a regular singular point

$x_0 = -2$

- Multiply by denominators

$$2x^2(2+x)\,y'' + x(7x-4)\,y' + (3x-5)\,y = 0$$

- Change variables using $x = u-2$ so that the regular singular point is at $u = 0$

$$(2u^3 - 8u^2 + 8u)\left(\frac{d^2}{du^2}y(u)\right) + (7u^2 - 32u + 36)\left(\frac{d}{du}y(u)\right) + (3u-11)\,y(u) = 0$$

- Assume series solution for $y(u)$

$$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$$

□ Rewrite ODE with series expansions

  - Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

$$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

  - Shift index using $k->k-m$

$$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

$$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$$

  - Shift index using $k->k+1-m$

$$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,u^{k+r}$$

  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\,u^{k+r-2+m}$$

  - Shift index using $k->k+2-m$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\,u^{k+r}$$

Rewrite ODE with series expansions

$$4a_0r(7+2r)\,u^{-1+r} + \left(4a_1(1+r)(9+2r) - a_0(8r^2+24r+11)\right)u^r + \left(\sum_{k=1}^{\infty} \left(4a_{k+1}(k+r+1)(2k\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$4r(7+2r) = 0$$

- Values of r that satisfy the indicial equation

  $r \in \left\{0, -\frac{7}{2}\right\}$

- Each term must be 0

  $4a_1(1+r)(9+2r) - a_0(8r^2+24r+11) = 0$

- Each term in the series must be 0, giving the recursion relation

  $2(-4a_k + a_{k-1} + 4a_{k+1})k^2 + (4(-4a_k + a_{k-1} + 4a_{k+1})r - 24a_k + a_{k-1} + 44a_{k+1})k + 2(-4a_k +$

- Shift index using $k- >k+1$

  $2(-4a_{k+1} + a_k + 4a_{k+2})(k+1)^2 + (4(-4a_{k+1} + a_k + 4a_{k+2})r - 24a_{k+1} + a_k + 44a_{k+2})(k+1)$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{2k^2a_k - 8k^2a_{k+1} + 4kra_k - 16kra_{k+1} + 2r^2a_k - 8r^2a_{k+1} + 5ka_k - 40ka_{k+1} + 5ra_k - 40ra_{k+1} + 3a_k - 43a_{k+1}}{4(2k^2+4kr+2r^2+15k+15r+22)}$

- Recursion relation for $r = 0$

  $a_{k+2} = -\frac{2k^2a_k - 8k^2a_{k+1} + 5ka_k - 40ka_{k+1} + 3a_k - 43a_{k+1}}{4(2k^2+15k+22)}$

- Solution for $r = 0$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{2k^2a_k - 8k^2a_{k+1} + 5ka_k - 40ka_{k+1} + 3a_k - 43a_{k+1}}{4(2k^2+15k+22)}, 36a_1 - 11a_0 = 0\right]$

- Revert the change of variables $u = 2 + x$

  $\left[y = \sum_{k=0}^{\infty} a_k (2+x)^k, a_{k+2} = -\frac{2k^2a_k - 8k^2a_{k+1} + 5ka_k - 40ka_{k+1} + 3a_k - 43a_{k+1}}{4(2k^2+15k+22)}, 36a_1 - 11a_0 = 0\right]$

- Recursion relation for $r = -\frac{7}{2}$

  $a_{k+2} = -\frac{2k^2a_k - 8k^2a_{k+1} - 9ka_k + 16ka_{k+1} + 10a_k - a_{k+1}}{4(2k^2+k-6)}$

- Solution for $r = -\frac{7}{2}$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{7}{2}}, a_{k+2} = -\frac{2k^2a_k - 8k^2a_{k+1} - 9ka_k + 16ka_{k+1} + 10a_k - a_{k+1}}{4(2k^2+k-6)}, -20a_1 - 25a_0 = 0\right]$

- Revert the change of variables $u = 2 + x$

  $\left[y = \sum_{k=0}^{\infty} a_k (2+x)^{k-\frac{7}{2}}, a_{k+2} = -\frac{2k^2a_k - 8k^2a_{k+1} - 9ka_k + 16ka_{k+1} + 10a_k - a_{k+1}}{4(2k^2+k-6)}, -20a_1 - 25a_0 = 0\right]$

- Combine solutions and rename parameters

  $\left[y = \left(\sum_{k=0}^{\infty} a_k (2+x)^k\right) + \left(\sum_{k=0}^{\infty} b_k (2+x)^{k-\frac{7}{2}}\right), a_{k+2} = -\frac{2k^2a_k - 8k^2a_{1+k} + 5ka_k - 40ka_{1+k} + 3a_k - 43a_{1+k}}{4(2k^2+15k+22)}, 36a\right.$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: Example 7.7.2 page 383.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(1-2x)\,y''+x(8-9x)\,y'+(6-3x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(-2x^3+x^2\right)y''+\left(-9x^2+8x\right)y'+(6-3x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{9x-8}{x\,(2x-1)}$$
$$q(x)=\frac{3x-6}{x^2\,(2x-1)}$$

Table 774: Table $p(x), q(x)$ singularites.

$p(x) = \frac{9x-8}{x(2x-1)}$	
singularity	type
$x = 0$	"regular"
$x = \frac{1}{2}$	"regular"

$q(x) = \frac{3x-6}{x^2(2x-1)}$	
singularity	type
$x = 0$	"regular"
$x = \frac{1}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, \frac{1}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-y''x^2(2x-1) + \left(-9x^2+8x\right)y' + (6-3x)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) x^2(2x-1) + \left(-9x^2+8x\right)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (6-3x)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=0}^{\infty} \left(-2x^{1+n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r) (n+r-1)\right) + \sum_{n=0}^{\infty} \left(-9x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 6a_n x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-3x^{1+n+r} a_n\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-2x^{1+n+r} a_n (n+r) (n+r-1)\right) = \sum_{n=1}^{\infty} \left(-2a_{n-1} (n+r-1) (n+r-2) x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} \left(-9x^{1+n+r} a_n (n+r)\right) = \sum_{n=1}^{\infty} \left(-9a_{n-1} (n+r-1) x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} \left(-3x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-3a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\sum_{n=1}^{\infty} \left(-2a_{n-1} (n+r-1) (n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r) (n+r-1)\right) + \sum_{n=1}^{\infty} \left(-9a_{n-1} (n+r-1) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 6a_n x^{n+r}\right) + \sum_{n=1}^{\infty} \left(-3a_{n-1} x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r) (n+r-1) + 8x^{n+r} a_n (n+r) + 6a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + 8x^r a_0 r + 6a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + 8x^r r + 6x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2 + 7r + 6\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 + 7r + 6 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -1$$
$$r_2 = -6$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(r^2 + 7r + 6\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 5$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \frac{\sum_{n=0}^{\infty} a_n x^n}{x}$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^6}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-1}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-6}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$-2a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ - 9a_{n-1}(n+r-1) + 8a_n(n+r) + 6a_n - 3a_{n-1} = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{a_{n-1}(2n^2 + 4nr + 2r^2 + 3n + 3r - 2)}{n^2 + 2nr + r^2 + 7n + 7r + 6} \tag{4}$$

Which for the root $r = -1$ becomes

$$a_n = \frac{a_{n-1}(2n^2 - n - 3)}{n(n+5)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{2r^2 + 7r + 3}{r^2 + 9r + 14}$$

Which for the root $r = -1$ becomes

$$a_1 = -\frac{1}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2+7r+3}{r^2+9r+14}$	$-\frac{1}{3}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4r^3 + 24r^2 + 35r + 12}{(r+8)(r+7)(r+2)}$$

Which for the root $r = -1$ becomes

$$a_2 = -\frac{1}{14}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2+7r+3}{r^2+9r+14}$	$-\frac{1}{3}$
a_2	$\frac{4r^3+24r^2+35r+12}{(r+8)(r+7)(r+2)}$	$-\frac{1}{14}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{8r^4 + 76r^3 + 226r^2 + 245r + 75}{(r+9)(r+2)(r+7)(r+8)}$$

Which for the root $r = -1$ becomes

$$a_3 = -\frac{1}{28}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2+7r+3}{r^2+9r+14}$	$-\frac{1}{3}$
a_2	$\frac{4r^3+24r^2+35r+12}{(r+8)(r+7)(r+2)}$	$-\frac{1}{14}$
a_3	$\frac{8r^4+76r^3+226r^2+245r+75}{(r+9)(r+2)(r+7)(r+8)}$	$-\frac{1}{28}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16r^5 + 224r^4 + 1112r^3 + 2416r^2 + 2217r + 630}{(r+10)(r+9)(r+2)(r+7)(r+8)}$$

Which for the root $r = -1$ becomes

$$a_4 = -\frac{25}{1008}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2+7r+3}{r^2+9r+14}$	$-\frac{1}{3}$
a_2	$\frac{4r^3+24r^2+35r+12}{(r+8)(r+7)(r+2)}$	$-\frac{1}{14}$
a_3	$\frac{8r^4+76r^3+226r^2+245r+75}{(r+9)(r+2)(r+7)(r+8)}$	$-\frac{1}{28}$
a_4	$\frac{16r^5+224r^4+1112r^3+2416r^2+2217r+630}{(r+10)(r+9)(r+2)(r+7)(r+8)}$	$-\frac{25}{1008}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{32r^5 + 400r^4 + 1840r^3 + 3800r^2 + 3378r + 945}{(r+11)(r+8)(r+2)(r+9)(r+10)}$$

Which for the root $r = -1$ becomes

$$a_5 = -\frac{1}{48}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2r^2+7r+3}{r^2+9r+14}$	$-\frac{1}{3}$
a_2	$\frac{4r^3+24r^2+35r+12}{(r+8)(r+7)(r+2)}$	$-\frac{1}{14}$
a_3	$\frac{8r^4+76r^3+226r^2+245r+75}{(r+9)(r+2)(r+7)(r+8)}$	$-\frac{1}{28}$
a_4	$\frac{16r^5+224r^4+1112r^3+2416r^2+2217r+630}{(r+10)(r+9)(r+2)(r+7)(r+8)}$	$-\frac{25}{1008}$
a_5	$\frac{32r^5+400r^4+1840r^3+3800r^2+3378r+945}{(r+11)(r+8)(r+2)(r+9)(r+10)}$	$-\frac{1}{48}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \frac{1}{x}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= \frac{1 - \frac{x}{3} - \frac{x^2}{14} - \frac{x^3}{28} - \frac{25x^4}{1008} - \frac{x^5}{48} + O(x^6)}{x} \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 5$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_5(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_5 \\ &= \frac{32r^5 + 400r^4 + 1840r^3 + 3800r^2 + 3378r + 945}{(r+11)(r+8)(r+2)(r+9)(r+10)} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} \frac{32r^5 + 400r^4 + 1840r^3 + 3800r^2 + 3378r + 945}{(r+11)(r+8)(r+2)(r+9)(r+10)} &= \lim_{r\to -6} \frac{32r^5 + 400r^4 + 1840r^3 + 3800r^2 + 3378r + 945}{(r+11)(r+8)(r+2)(r+9)(r+10)} \\ &= \frac{693}{32} \end{aligned}$$

The limit is $\frac{693}{32}$. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^{n-6} \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &-2b_{n-1}(n+r-1)(n+r-2) + b_n(n+r)(n+r-1) \\ &- 9b_{n-1}(n+r-1) + 8b_n(n+r) + 6b_n - 3b_{n-1} = 0 \end{aligned} \tag{4}$$

Which for for the root $r = -6$ becomes

$$-2b_{n-1}(n-7)(n-8) + b_n(n-6)(n-7) - 9b_{n-1}(n-7) + 8b_n(n-6) + 6b_n - 3b_{n-1} = 0 \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = \frac{b_{n-1}(2n^2 + 4nr + 2r^2 + 3n + 3r - 2)}{n^2 + 2nr + r^2 + 7n + 7r + 6} \tag{5}$$

Which for the root $r = -6$ becomes

$$b_n = \frac{b_{n-1}(2n^2 - 21n + 52)}{n^2 - 5n} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -6$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{2r^2 + 7r + 3}{r^2 + 9r + 14}$$

Which for the root $r = -6$ becomes

$$b_1 = -\frac{33}{4}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2r^2+7r+3}{r^2+9r+14}$	$-\frac{33}{4}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{4r^3 + 24r^2 + 35r + 12}{(r + 8)(r^2 + 9r + 14)}$$

Which for the root $r = -6$ becomes

$$b_2 = \frac{99}{4}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2r^2+7r+3}{r^2+9r+14}$	$-\frac{33}{4}$
b_2	$\frac{4r^3+24r^2+35r+12}{(r+8)(r+7)(r+2)}$	$\frac{99}{4}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{8r^4 + 76r^3 + 226r^2 + 245r + 75}{(r + 9)(r + 8)(r^2 + 9r + 14)}$$

Which for the root $r = -6$ becomes

$$b_3 = -\frac{231}{8}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2r^2+7r+3}{r^2+9r+14}$	$-\frac{33}{4}$
b_2	$\frac{4r^3+24r^2+35r+12}{(r+8)(r+7)(r+2)}$	$\frac{99}{4}$
b_3	$\frac{8r^4+76r^3+226r^2+245r+75}{(r+9)(r+2)(r+7)(r+8)}$	$-\frac{231}{8}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{16r^5 + 224r^4 + 1112r^3 + 2416r^2 + 2217r + 630}{(r + 10)(r + 9)(r + 8)(r^2 + 9r + 14)}$$

Which for the root $r = -6$ becomes

$$b_4 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2r^2+7r+3}{r^2+9r+14}$	$-\frac{33}{4}$
b_2	$\frac{4r^3+24r^2+35r+12}{(r+8)(r+7)(r+2)}$	$\frac{99}{4}$
b_3	$\frac{8r^4+76r^3+226r^2+245r+75}{(r+9)(r+2)(r+7)(r+8)}$	$-\frac{231}{8}$
b_4	$\frac{16r^5+224r^4+1112r^3+2416r^2+2217r+630}{(r+10)(r+9)(r+2)(r+7)(r+8)}$	0

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{32r^5 + 400r^4 + 1840r^3 + 3800r^2 + 3378r + 945}{(r + 11)(r + 8)(r + 2)(r + 9)(r + 10)}$$

Which for the root $r = -6$ becomes

$$b_5 = \frac{693}{32}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2r^2+7r+3}{r^2+9r+14}$	$-\frac{33}{4}$
b_2	$\frac{4r^3+24r^2+35r+12}{(r+8)(r+7)(r+2)}$	$\frac{99}{4}$
b_3	$\frac{8r^4+76r^3+226r^2+245r+75}{(r+9)(r+2)(r+7)(r+8)}$	$-\frac{231}{8}$
b_4	$\frac{16r^5+224r^4+1112r^3+2416r^2+2217r+630}{(r+10)(r+9)(r+2)(r+7)(r+8)}$	0
b_5	$\frac{32r^5+400r^4+1840r^3+3800r^2+3378r+945}{(r+11)(r+8)(r+2)(r+9)(r+10)}$	$\frac{693}{32}$

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= \frac{1}{x}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= \frac{1 - \frac{33x}{4} + \frac{99x^2}{4} - \frac{231x^3}{8} + \frac{693x^5}{32} + O(x^6)}{x^6}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= \frac{c_1\left(1 - \frac{x}{3} - \frac{x^2}{14} - \frac{x^3}{28} - \frac{25x^4}{1008} - \frac{x^5}{48} + O(x^6)\right)}{x} + \frac{c_2\left(1 - \frac{33x}{4} + \frac{99x^2}{4} - \frac{231x^3}{8} + \frac{693x^5}{32} + O(x^6)\right)}{x^6}
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(1 - \frac{x}{3} - \frac{x^2}{14} - \frac{x^3}{28} - \frac{25x^4}{1008} - \frac{x^5}{48} + O(x^6)\right)}{x} + \frac{c_2\left(1 - \frac{33x}{4} + \frac{99x^2}{4} - \frac{231x^3}{8} + \frac{693x^5}{32} + O(x^6)\right)}{x^6}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= \frac{c_1\left(1 - \frac{x}{3} - \frac{x^2}{14} - \frac{x^3}{28} - \frac{25x^4}{1008} - \frac{x^5}{48} + O(x^6)\right)}{x} \\
&\quad + \frac{c_2\left(1 - \frac{33x}{4} + \frac{99x^2}{4} - \frac{231x^3}{8} + \frac{693x^5}{32} + O(x^6)\right)}{x^6}
\end{aligned} \tag{1}
$$

Verification of solutions

$$y = \frac{c_1 \left(1-\frac{x}{3}-\frac{x^2}{14}-\frac{x^3}{28}-\frac{25x^4}{1008}-\frac{x^5}{48}+O(x^6)\right)}{x} + \frac{c_2 \left(1-\frac{33x}{4}+\frac{99x^2}{4}-\frac{231x^3}{8}+\frac{693x^5}{32}+O(x^6)\right)}{x^6}$$

Verified OK.

16.2.1 Maple step by step solution

Let's solve

$-y''x^2(2x-1)+(-9x^2+8x)\,y'+(6-3x)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{3(-2+x)y}{x^2(2x-1)}-\frac{(9x-8)y'}{x(2x-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(9x-8)y'}{x(2x-1)}+\frac{3(-2+x)y}{x^2(2x-1)}=0$

☐ Check to see if x_0 is a regular singular point

- ○ Define functions

  $\left[P_2(x)=\frac{9x-8}{x(2x-1)}, P_3(x)=\frac{3(-2+x)}{x^2(2x-1)}\right]$

- ○ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left.(x\cdot P_2(x))\right|_{x=0}=8$

- ○ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left.(x^2\cdot P_3(x))\right|_{x=0}=6$

- ○ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $y''x^2(2x-1)+x(9x-8)\,y'+(3x-6)\,y=0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..1$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- ◦ Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- ◦ Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- ◦ Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$$

- ◦ Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- ◦ Shift index using $k- >k + 2 - m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m} (k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$-a_0(6+r)\,(1+r)\, x^r + \left(\sum_{k=1}^{\infty} \left(-a_k(k+r+6)\,(k+r+1) + a_{k-1}(k+2+r)\,(2k-1+2r)\right) x^{k+r}\right)$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-(6+r)\,(1+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{-6, -1\}$$

- Each term in the series must be 0, giving the recursion relation

$$2(k+2+r)\left(k+r-\tfrac{1}{2}\right) a_{k-1} - a_k(k+r+6)\,(k+r+1) = 0$$

- Shift index using $k- >k + 1$

$$2(k+r+3)\left(k+\frac{1}{2}+r\right)a_k - a_{k+1}(k+7+r)(k+2+r) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = \frac{(k+r+3)(2k+2r+1)a_k}{(k+7+r)(k+2+r)}$$

- Recursion relation for $r = -6$; series terminates at $k = 3$

$$a_{k+1} = \frac{(k-3)(2k-11)a_k}{(k+1)(k-4)}$$

- Apply recursion relation for $k = 0$

$$a_1 = -\frac{33a_0}{4}$$

- Apply recursion relation for $k = 1$

$$a_2 = -3a_1$$

- Express in terms of a_0

$$a_2 = \frac{99a_0}{4}$$

- Apply recursion relation for $k = 2$

$$a_3 = -\frac{7a_2}{6}$$

- Express in terms of a_0

$$a_3 = -\frac{231a_0}{8}$$

- Terminating series solution of the ODE for $r = -6$. Use reduction of order to find the second

$$y = a_0 \cdot \left(1 - \frac{33}{4}x + \frac{99}{4}x^2 - \frac{231}{8}x^3\right)$$

- Recursion relation for $r = -1$

$$a_{k+1} = \frac{(k+2)(2k-1)a_k}{(k+6)(k+1)}$$

- Solution for $r = -1$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+1} = \frac{(k+2)(2k-1)a_k}{(k+6)(k+1)}\right]$$

- Combine solutions and rename parameters

$$\left[y = a_0 \cdot \left(1 - \frac{33}{4}x + \frac{99}{4}x^2 - \frac{231}{8}x^3\right) + \left(\sum_{k=0}^{\infty} b_k x^{k-1}\right), b_{1+k} = \frac{(k+2)(2k-1)b_k}{(k+6)(1+k)}\right]$$

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2+1)\,y''+x(10x^2+3)\,y'-(-14x^2+15)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+x^2)\,y''+(10x^3+3x)\,y'+(14x^2-15)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{10x^2+3}{x\,(x^2+1)}$$
$$q(x)=\frac{14x^2-15}{x^2\,(x^2+1)}$$

Table 776: Table $p(x), q(x)$ singularites.

$p(x) = \frac{10x^2+3}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{14x^2-15}{x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+1)\, y'' + (10x^3+3x)\, y' + (14x^2-15)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (10x^3+3x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (14x^2-15)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 10 x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3 x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 14 x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-15 a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1) &= \sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r)\, x^{n+r} \\
\sum_{n=0}^{\infty} 10 x^{n+r+2} a_n (n+r) &= \sum_{n=2}^{\infty} 10 a_{n-2} (n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 14 x^{n+r+2} a_n &= \sum_{n=2}^{\infty} 14 a_{n-2} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=2}^{\infty} 10 a_{n-2} (n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3 x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=2}^{\infty} 14 a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-15 a_n x^{n+r}\right) = 0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
x^{n+r} a_n (n+r)(n+r-1) + 3 x^{n+r} a_n (n+r) - 15 a_n x^{n+r} = 0
$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + 3x^r a_0 r - 15a_0 x^r = 0$$

Or

$$(x^r r(-1+r) + 3x^r r - 15x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(5+r)\,(r-3)\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(5+r)\,(r-3) = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 3 \\ r_2 &= -5 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(5+r)\,(r-3)\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 8$ is an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= x^3 \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^5} \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+3} \\ y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-5} \right) \end{aligned}$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-2}(n+r-2)(n-3+r)+a_n(n+r)(n+r-1) \\ +10a_{n-2}(n+r-2)+3a_n(n+r)+14a_{n-2}-15a_n=0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r)\,a_{n-2}}{n-3+r} \tag{4}$$

Which for the root $r = 3$ becomes

$$a_n = -\frac{(n+3)\,a_{n-2}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 3$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-2-r}{-1+r}$$

Which for the root $r = 3$ becomes

$$a_2 = -\frac{5}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{-1+r}$	$-\frac{5}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{-1+r}$	$-\frac{5}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 + 6r + 8}{r^2 - 1}$$

Which for the root $r = 3$ becomes

$$a_4 = \frac{35}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{-1+r}$	$-\frac{5}{2}$
a_3	0	0
a_4	$\frac{r^2+6r+8}{r^2-1}$	$\frac{35}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{-1+r}$	$-\frac{5}{2}$
a_3	0	0
a_4	$\frac{r^2+6r+8}{r^2-1}$	$\frac{35}{8}$
a_5	0	0

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{-r^3 - 12r^2 - 44r - 48}{(r^2 - 1)(3 + r)}$$

Which for the root $r = 3$ becomes

$$a_6 = -\frac{105}{16}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{-1+r}$	$-\frac{5}{2}$
a_3	0	0
a_4	$\frac{r^2+6r+8}{r^2-1}$	$\frac{35}{8}$
a_5	0	0
a_6	$\frac{-r^3-12r^2-44r-48}{(r^2-1)(3+r)}$	$-\frac{105}{16}$

For $n = 7$, using the above recursive equation gives

$$a_7 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{-1+r}$	$-\frac{5}{2}$
a_3	0	0
a_4	$\frac{r^2+6r+8}{r^2-1}$	$\frac{35}{8}$
a_5	0	0
a_6	$\frac{-r^3-12r^2-44r-48}{(r^2-1)(3+r)}$	$-\frac{105}{16}$
a_7	0	0

For $n = 8$, using the above recursive equation gives

$$a_8 = \frac{r^4 + 20r^3 + 140r^2 + 400r + 384}{(r^2 - 1)(3 + r)(5 + r)}$$

Which for the root $r = 3$ becomes

$$a_8 = \frac{1155}{128}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-2-r}{-1+r}$	$-\frac{5}{2}$
a_3	0	0
a_4	$\frac{r^2+6r+8}{r^2-1}$	$\frac{35}{8}$
a_5	0	0
a_6	$\frac{-r^3-12r^2-44r-48}{(r^2-1)(3+r)}$	$-\frac{105}{16}$
a_7	0	0
a_8	$\frac{r^4+20r^3+140r^2+400r+384}{(r^2-1)(3+r)(5+r)}$	$\frac{1155}{128}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= x^3\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 + a_7x^7 + a_8x^8 + a_9x^9 \dots\right) \\
&= x^3\left(1 - \frac{5x^2}{2} + \frac{35x^4}{8} - \frac{105x^6}{16} + \frac{1155x^8}{128} + O\left(x^9\right)\right)
\end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 8$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_8(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned}
a_N &= a_8 \\
&= \frac{r^4 + 20r^3 + 140r^2 + 400r + 384}{(r^2 - 1)(3 + r)(5 + r)}
\end{aligned}$$

Therefore

$$\begin{aligned}
\lim_{r\to r_2} \frac{r^4 + 20r^3 + 140r^2 + 400r + 384}{(r^2 - 1)(3 + r)(5 + r)} &= \lim_{r\to -5} \frac{r^4 + 20r^3 + 140r^2 + 400r + 384}{(r^2 - 1)(3 + r)(5 + r)} \\
&= \textit{undefined}
\end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned}
\frac{d}{dx}y_2(x) &= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n + r_2)}{x}\right) \\
&= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n + r_2)\right) \\
\frac{d^2}{dx^2}y_2(x) &= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n + r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n + r_2)}{x^2}\right) \\
&= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n + r_2)(-1 + n + r_2)\right)
\end{aligned}$$

Substituting these back into the given ode $x^2(x^2+1)\,y''+(10x^3+3x)\,y'+(14x^2-15)\,y=0$ gives

$$x^2(x^2+1)\left(Cy_1''(x)\ln(x)+\frac{2Cy_1'(x)}{x}-\frac{Cy_1(x)}{x^2}+\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+(10x^3+3x)\left(Cy_1'(x)\ln(x)+\frac{Cy_1(x)}{x}+\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)+(14x^2-15)\left(Cy_1(x)\ln(x)+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)\right)=0$$

Which can be written as

$$\left(\left(x^2(x^2+1)\,y_1''(x)+(10x^3+3x)\,y_1'(x)+(14x^2-15)\,y_1(x)\right)\ln(x)+x^2(x^2+1)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{(10x^3+3x)\,y_1(x)}{x}\right)C+x^2(x^2+1)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+(10x^3+3x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(14x^2-15)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0 \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$x^2(x^2+1)\,y_1''(x)+(10x^3+3x)\,y_1'(x)+(14x^2-15)\,y_1(x)=0$$

Eq (7) simplifes to

$$\left(x^2(x^2+1)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{(10x^3+3x)\,y_1(x)}{x}\right)C+x^2(x^2+1)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+(10x^3+3x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(14x^2-15)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0 \tag{8}$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$
\begin{aligned}
&\left(2x\left(x^2+1\right)\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right)+\left(9x^2+2\right)\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)\right) C \\
&+\left(x^4+x^2\right)\left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)\left(-1+n+r_2\right)\right) \\
&+\left(10x^3+3x\right)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right)+\left(14x^2-15\right)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)=0
\end{aligned} \tag{9}
$$

Since $r_1 = 3$ and $r_2 = -5$ then the above becomes

$$
\begin{aligned}
&\left(2x\left(x^2+1\right)\left(\sum_{n=0}^{\infty} x^{2+n} a_n (n+3)\right)+\left(9x^2+2\right)\left(\sum_{n=0}^{\infty} a_n x^{n+3}\right)\right) C \\
&+\left(x^4+x^2\right)\left(\sum_{n=0}^{\infty} x^{-7+n} b_n (n-5)\left(-6+n\right)\right) \\
&+\left(10x^3+3x\right)\left(\sum_{n=0}^{\infty} x^{-6+n} b_n (n-5)\right)+\left(14x^2-15\right)\left(\sum_{n=0}^{\infty} b_n x^{n-5}\right)=0
\end{aligned} \tag{10}
$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 2C\, x^{n+5} a_n (n+3)\right)+\left(\sum_{n=0}^{\infty} 2C\, x^{n+3} a_n (n+3)\right)+\left(\sum_{n=0}^{\infty} 9C\, x^{n+5} a_n\right) \\
&+\left(\sum_{n=0}^{\infty} 2C\, x^{n+3} a_n\right)+\left(\sum_{n=0}^{\infty} x^{n-3} b_n (-6+n)(n-5)\right) \\
&+\left(\sum_{n=0}^{\infty} x^{n-5} b_n (-6+n)(n-5)\right)+\left(\sum_{n=0}^{\infty} 10x^{n-3} b_n (n-5)\right) \\
&+\left(\sum_{n=0}^{\infty} 3x^{n-5} b_n (n-5)\right)+\left(\sum_{n=0}^{\infty} 14x^{n-3} b_n\right)+\sum_{n=0}^{\infty}\left(-15 b_n x^{n-5}\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n-5$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n-5} and

adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2C\, x^{n+5} a_n (n+3) = \sum_{n=10}^{\infty} 2C a_{n-10} (-7+n)\, x^{n-5}$$

$$\sum_{n=0}^{\infty} 2C\, x^{n+3} a_n (n+3) = \sum_{n=8}^{\infty} 2C a_{n-8} (n-5)\, x^{n-5}$$

$$\sum_{n=0}^{\infty} 9C\, x^{n+5} a_n = \sum_{n=10}^{\infty} 9C a_{n-10} x^{n-5}$$

$$\sum_{n=0}^{\infty} 2C\, x^{n+3} a_n = \sum_{n=8}^{\infty} 2C a_{n-8} x^{n-5}$$

$$\sum_{n=0}^{\infty} x^{n-3} b_n (-6+n)\,(n-5) = \sum_{n=2}^{\infty} b_{n-2} (n-8)\,(-7+n)\, x^{n-5}$$

$$\sum_{n=0}^{\infty} 10 x^{n-3} b_n (n-5) = \sum_{n=2}^{\infty} 10 b_{n-2} (-7+n)\, x^{n-5}$$

$$\sum_{n=0}^{\infty} 14 x^{n-3} b_n = \sum_{n=2}^{\infty} 14 b_{n-2} x^{n-5}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-5$.

$$\begin{aligned}
&\left(\sum_{n=10}^{\infty} 2C a_{n-10} (-7+n)\, x^{n-5}\right) + \left(\sum_{n=8}^{\infty} 2C a_{n-8} (n-5)\, x^{n-5}\right) \\
&+ \left(\sum_{n=10}^{\infty} 9C a_{n-10} x^{n-5}\right) + \left(\sum_{n=8}^{\infty} 2C a_{n-8} x^{n-5}\right) \\
&+ \left(\sum_{n=2}^{\infty} b_{n-2} (n-8)\,(-7+n)\, x^{n-5}\right) + \left(\sum_{n=0}^{\infty} x^{n-5} b_n (-6+n)\,(n-5)\right) \\
&+ \left(\sum_{n=2}^{\infty} 10 b_{n-2} (-7+n)\, x^{n-5}\right) + \left(\sum_{n=0}^{\infty} 3 x^{n-5} b_n (n-5)\right) \\
&+ \left(\sum_{n=2}^{\infty} 14 b_{n-2} x^{n-5}\right) + \sum_{n=0}^{\infty} \left(-15 b_n x^{n-5}\right) = 0
\end{aligned} \tag{2B}$$

For $n = 0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n = 1$, Eq (2B) gives

$$-7b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-7b_1 = 0$$

Solving the above for b_1 gives

$$b_1 = 0$$

For $n = 2$, Eq (2B) gives

$$-6b_0 - 12b_2 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-6 - 12b_2 = 0$$

Solving the above for b_2 gives

$$b_2 = -\frac{1}{2}$$

For $n = 3$, Eq (2B) gives

$$-6b_1 - 15b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-15b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 0$$

For $n = 4$, Eq (2B) gives

$$-4b_2 - 16b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$2 - 16b_4 = 0$$

Solving the above for b_4 gives

$$b_4 = \frac{1}{8}$$

For $n = 5$, Eq (2B) gives

$$-15b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-15b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = 0$$

For $n = 6$, Eq (2B) gives

$$6b_4 - 12b_6 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$\frac{3}{4} - 12b_6 = 0$$

Solving the above for b_6 gives

$$b_6 = \frac{1}{16}$$

For $n = 7$, Eq (2B) gives

$$-7b_7 + 14b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-7b_7 = 0$$

Solving the above for b_7 gives

$$b_7 = 0$$

For $n = N$, where $N = 8$ which is the difference between the two roots, we are free to choose $b_8 = 0$. Hence for $n = 8$, Eq (2B) gives

$$8C + \frac{3}{2} = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{3}{16}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{3}{16}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{3}{16}\left(x^3\left(1 - \frac{5x^2}{2} + \frac{35x^4}{8} - \frac{105x^6}{16} + \frac{1155x^8}{128} + O(x^9)\right)\right)\ln(x) + \frac{1 - \frac{x^2}{2} + \frac{x^4}{8} + \frac{x^6}{16} + O(x^9)}{x^5}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^3 \left(1 - \frac{5x^2}{2} + \frac{35x^4}{8} - \frac{105x^6}{16} + \frac{1155x^8}{128} + O(x^9)\right) \\
&\quad + c_2 \left(-\frac{3}{16}\left(x^3 \left(1 - \frac{5x^2}{2} + \frac{35x^4}{8} - \frac{105x^6}{16} + \frac{1155x^8}{128} + O(x^9)\right)\right) \ln(x) \right. \\
&\qquad \left. + \frac{1 - \frac{x^2}{2} + \frac{x^4}{8} + \frac{x^6}{16} + O(x^9)}{x^5}\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^3 \left(1 - \frac{5x^2}{2} + \frac{35x^4}{8} - \frac{105x^6}{16} + \frac{1155x^8}{128} + O(x^9)\right) \\
&\quad + c_2 \left(-\frac{3x^3 \left(1 - \frac{5x^2}{2} + \frac{35x^4}{8} - \frac{105x^6}{16} + \frac{1155x^8}{128} + O(x^9)\right) \ln(x)}{16} \right. \\
&\qquad \left. + \frac{1 - \frac{x^2}{2} + \frac{x^4}{8} + \frac{x^6}{16} + O(x^9)}{x^5}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^3 \left(1 - \frac{5x^2}{2} + \frac{35x^4}{8} - \frac{105x^6}{16} + \frac{1155x^8}{128} + O(x^9)\right) \\
&\quad + c_2 \left(-\frac{3x^3 \left(1 - \frac{5x^2}{2} + \frac{35x^4}{8} - \frac{105x^6}{16} + \frac{1155x^8}{128} + O(x^9)\right) \ln(x)}{16} \right. \\
&\qquad \left. + \frac{1 - \frac{x^2}{2} + \frac{x^4}{8} + \frac{x^6}{16} + O(x^9)}{x^5}\right)
\end{aligned}
\tag{1}
$$

Verification of solutions

$$y = c_1 x^3 \left(1 - \frac{5x^2}{2} + \frac{35x^4}{8} - \frac{105x^6}{16} + \frac{1155x^8}{128} + O(x^9)\right) + c_2 \left(-\frac{3x^3 \left(1 - \frac{5x^2}{2} + \frac{35x^4}{8} - \frac{105x^6}{16} + \frac{1155x^8}{128} + O(x^9)\right) \ln(x)}{16} + \frac{1 - \frac{x^2}{2} + \frac{x^4}{8} + \frac{x^6}{16} + O(x^9)}{x^5}\right)$$

Verified OK.

16.3.1 Maple step by step solution

Let's solve

$x^2(x^2+1)\, y'' + (10x^3 + 3x)\, y' + (14x^2 - 15)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(14x^2-15)y}{x^2(x^2+1)} - \frac{(10x^2+3)y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(10x^2+3)y'}{x(x^2+1)} + \frac{(14x^2-15)y}{x^2(x^2+1)} = 0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{10x^2+3}{x(x^2+1)}, P_3(x) = \frac{14x^2-15}{x^2(x^2+1)}\right]$

  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $\left(x \cdot P_2(x)\right)\Big|_{x=0} = 3$

  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $\left(x^2 \cdot P_3(x)\right)\Big|_{x=0} = -15$

  - $x = 0$is a regular singular point

    Check to see if x_0 is a regular singular point

$x_0 = 0$

- Multiply by denominators

  $x^2(x^2+1)\, y'' + x(10x^2+3)\, y' + (14x^2-15)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  - Shift index using $k- >k-m$

    $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  - Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

  - Shift index using $k- >k+1-m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

  - Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

    $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

  - Shift index using $k- >k+2-m$

    $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(5+r)\,(-3+r)\, x^r + a_1(6+r)\,(-2+r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(k+r+5)\,(k+r-3) + a_{k-2}(k+r-\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(5+r)\,(-3+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{-5, 3\}$

- Each term must be 0

$$a_1(6+r)(-2+r) = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

$$(k+r+5)\left(a_k(k+r-3) + a_{k-2}(k+r)\right) = 0$$

- Shift index using $k- >k+2$

$$(k+r+7)\left(a_{k+2}(k+r-1) + a_k(k+r+2)\right) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{a_k(k+r+2)}{k+r-1}$$

- Recursion relation for $r = -5$

$$a_{k+2} = -\frac{a_k(k-3)}{k-6}$$

- Series not valid for $r = -5$, division by 0 in the recursion relation at $k = 6$

$$a_{k+2} = -\frac{a_k(k-3)}{k-6}$$

- Recursion relation for $r = 3$

$$a_{k+2} = -\frac{a_k(k+5)}{k+2}$$

- Solution for $r = 3$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+3}, a_{k+2} = -\frac{a_k(k+5)}{k+2}, a_1 = 0\right]$$

Problem number: Example 7.7.4 page 387.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(-2x^2+1)\,y''+x(-13x^2+7)\,y'-14x^2y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(-2x^4+x^2)\,y''+(-13x^3+7x)\,y'-14x^2y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{13x^2-7}{x\,(2x^2-1)}$$
$$q(x)=\frac{14}{2x^2-1}$$

Table 778: Table $p(x), q(x)$ singularites.

$p(x) = \frac{13x^2-7}{x(2x^2-1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{\sqrt{2}}{2}$	"regular"
$x = \frac{\sqrt{2}}{2}$	"regular"

$q(x) = \frac{14}{2x^2-1}$	
singularity	type
$x = -\frac{\sqrt{2}}{2}$	"regular"
$x = \frac{\sqrt{2}}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-y''x^2(2x^2-1) + (-13x^3+7x)\,y' - 14x^2y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) x^2(2x^2-1) + (-13x^3+7x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) - 14x^2\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\sum_{n=0}^{\infty}\left(-2x^{n+r+2}a_n(n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)(n+r-1)\right)+\sum_{n=0}^{\infty}\left(-13x^{n+r+2}a_n(n+r)\right) \\
&+\left(\sum_{n=0}^{\infty}7x^{n+r}a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-14x^{n+r+2}a_n\right)=0
\end{aligned}
\tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty}\left(-2x^{n+r+2}a_n(n+r)(n+r-1)\right)&=\sum_{n=2}^{\infty}\left(-2a_{n-2}(n+r-2)(n-3+r)\,x^{n+r}\right) \\
\sum_{n=0}^{\infty}\left(-13x^{n+r+2}a_n(n+r)\right)&=\sum_{n=2}^{\infty}\left(-13a_{n-2}(n+r-2)\,x^{n+r}\right) \\
\sum_{n=0}^{\infty}\left(-14x^{n+r+2}a_n\right)&=\sum_{n=2}^{\infty}\left(-14a_{n-2}x^{n+r}\right)
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\sum_{n=2}^{\infty}\left(-2a_{n-2}(n+r-2)(n-3+r)\,x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)(n+r-1)\right)+\sum_{n=2}^{\infty}\left(-13a_{n-2}(n+r-2)\,x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty}7x^{n+r}a_n(n+r)\right)+\sum_{n=2}^{\infty}\left(-14a_{n-2}x^{n+r}\right)=0
\end{aligned}
\tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
x^{n+r}a_n(n+r)(n+r-1)+7x^{n+r}a_n(n+r)=0
$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1 + r) + 7x^r a_0 r = 0$$

Or

$$(x^r r(-1 + r) + 7x^r r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^r r(6 + r) = 0$$

Since the above is true for all x then the indicial equation becomes

$$r(6 + r) = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 0 \\ r_2 &= -6 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^r r(6 + r) = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 6$ is an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^n \\ y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^6} \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^n \\ y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-6} \right) \end{aligned}$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \le n$ the recursive equation is

$$\begin{aligned} -2a_{n-2}(n+r-2)(n-3+r) + a_n(n+r)(n+r-1) \\ -13a_{n-2}(n+r-2) + 7a_n(n+r) - 14a_{n-2} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{(2n+2r+3)\, a_{n-2}}{n+6+r} \tag{4}$$

Which for the root $r = 0$ becomes

$$a_n = \frac{(2n+3)\, a_{n-2}}{n+6} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 0$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{7+2r}{8+r}$$

Which for the root $r = 0$ becomes

$$a_2 = \frac{7}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{7+2r}{8+r}$	$\frac{7}{8}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{7+2r}{8+r}$	$\frac{7}{8}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4r^2 + 36r + 77}{(8+r)(10+r)}$$

Which for the root $r = 0$ becomes

$$a_4 = \frac{77}{80}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{7+2r}{8+r}$	$\frac{7}{8}$
a_3	0	0
a_4	$\frac{4r^2+36r+77}{(8+r)(10+r)}$	$\frac{77}{80}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{7+2r}{8+r}$	$\frac{7}{8}$
a_3	0	0
a_4	$\frac{4r^2+36r+77}{(8+r)(10+r)}$	$\frac{77}{80}$
a_5	0	0

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{8r^3 + 132r^2 + 694r + 1155}{(8+r)(10+r)(12+r)}$$

Which for the root $r = 0$ becomes

$$a_6 = \frac{77}{64}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{7+2r}{8+r}$	$\frac{7}{8}$
a_3	0	0
a_4	$\frac{4r^2+36r+77}{(8+r)(10+r)}$	$\frac{77}{80}$
a_5	0	0
a_6	$\frac{8r^3+132r^2+694r+1155}{(8+r)(10+r)(12+r)}$	$\frac{77}{64}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 \ldots \\ &= 1 + \frac{7x^2}{8} + \frac{77x^4}{80} + \frac{77x^6}{64} + O(x^7) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 6$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_6(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_6 \\ &= \frac{8r^3 + 132r^2 + 694r + 1155}{(8 + r)(10 + r)(12 + r)} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} \frac{8r^3 + 132r^2 + 694r + 1155}{(8 + r)(10 + r)(12 + r)} &= \lim_{r\to -6} \frac{8r^3 + 132r^2 + 694r + 1155}{(8 + r)(10 + r)(12 + r)} \\ &= \frac{5}{16} \end{aligned}$$

The limit is $\frac{5}{16}$. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^{n-6} \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq(3) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &-2b_{n-2}(n + r - 2)(n - 3 + r) + b_n(n + r)(n + r - 1) \\ &- 13b_{n-2}(n + r - 2) + 7b_n(n + r) - 14b_{n-2} = 0 \end{aligned} \tag{4}$$

Which for for the root $r = -6$ becomes

$$-2b_{n-2}(n-8)(n-9) + b_n(n-6)(n-7) - 13b_{n-2}(n-8) + 7b_n(n-6) - 14b_{n-2} = 0 \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = \frac{(2n + 2r + 3)\, b_{n-2}}{n + 6 + r} \tag{5}$$

Which for the root $r = -6$ becomes

$$b_n = \frac{(2n-9)\, b_{n-2}}{n} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -6$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{7+2r}{8+r}$$

Which for the root $r = -6$ becomes

$$b_2 = -\frac{5}{2}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{7+2r}{8+r}$	$-\frac{5}{2}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{7+2r}{8+r}$	$-\frac{5}{2}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{4r^2 + 36r + 77}{(8 + r)(10 + r)}$$

Which for the root $r = -6$ becomes

$$b_4 = \frac{5}{8}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{7+2r}{8+r}$	$-\frac{5}{2}$
b_3	0	0
b_4	$\frac{4r^2+36r+77}{(8+r)(10+r)}$	$\frac{5}{8}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{7+2r}{8+r}$	$-\frac{5}{2}$
b_3	0	0
b_4	$\frac{4r^2+36r+77}{(8+r)(10+r)}$	$\frac{5}{8}$
b_5	0	0

For $n = 6$, using the above recursive equation gives

$$b_6 = \frac{8r^3 + 132r^2 + 694r + 1155}{(8 + r)(10 + r)(12 + r)}$$

Which for the root $r = -6$ becomes

$$b_6 = \frac{5}{16}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{7+2r}{8+r}$	$-\frac{5}{2}$
b_3	0	0
b_4	$\frac{4r^2+36r+77}{(8+r)(10+r)}$	$\frac{5}{8}$
b_5	0	0
b_6	$\frac{8r^3+132r^2+694r+1155}{(8+r)(10+r)(12+r)}$	$\frac{5}{16}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= 1\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 \dots\right) \\ &= \frac{1 - \frac{5x^2}{2} + \frac{5x^4}{8} + \frac{5x^6}{16} + O(x^7)}{x^6} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 \left(1 + \frac{7x^2}{8} + \frac{77x^4}{80} + \frac{77x^6}{64} + O(x^7)\right) + \frac{c_2 \left(1 - \frac{5x^2}{2} + \frac{5x^4}{8} + \frac{5x^6}{16} + O(x^7)\right)}{x^6} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 \left(1 + \frac{7x^2}{8} + \frac{77x^4}{80} + \frac{77x^6}{64} + O(x^7)\right) + \frac{c_2 \left(1 - \frac{5x^2}{2} + \frac{5x^4}{8} + \frac{5x^6}{16} + O(x^7)\right)}{x^6} \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 \left(1 + \frac{7x^2}{8} + \frac{77x^4}{80} + \frac{77x^6}{64} + O(x^7)\right) + \frac{c_2 \left(1 - \frac{5x^2}{2} + \frac{5x^4}{8} + \frac{5x^6}{16} + O(x^7)\right)}{x^6} \tag{1}$$

Verification of solutions

$$y = c_1\left(1+\frac{7x^2}{8}+\frac{77x^4}{80}+\frac{77x^6}{64}+O\left(x^7\right)\right)+\frac{c_2\left(1-\frac{5x^2}{2}+\frac{5x^4}{8}+\frac{5x^6}{16}+O(x^7)\right)}{x^6}$$

Verified OK.

16.4.1 Maple step by step solution

Let's solve

$-y''x^2(2x^2-1)+\left(-13x^3+7x\right)y'-14x^2y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{14y}{2x^2-1}-\frac{(13x^2-7)y'}{x(2x^2-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(13x^2-7)y'}{x(2x^2-1)}+\frac{14y}{2x^2-1}=0$

☐ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{13x^2-7}{x(2x^2-1)}, P_3(x)=\frac{14}{2x^2-1}\right]$

  - $x \cdot P_2(x)$ is analytic at $x=0$

    $\left(x\cdot P_2(x)\right)\Big|_{x=0}=7$

  - $x^2 \cdot P_3(x)$ is analytic at $x=0$

    $\left(x^2\cdot P_3(x)\right)\Big|_{x=0}=0$

  - $x=0$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0=0$

- Multiply by denominators

  $14yx+\left(13x^2-7\right)y'+xy''(2x^2-1)=0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

□ Rewrite ODE with series expansions

- Convert $x \cdot y$ to series expansion

$$x \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+1}$$

- Shift index using $k- >k-1$

$$x \cdot y = \sum_{k=1}^{\infty} a_{k-1} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 0..2$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k+1-m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 1..3$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k- >k+2-m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m} (k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$-a_0 r(6+r)\, x^{-1+r} - a_1(1+r)\,(7+r)\, x^r + \left(\sum_{k=1}^{\infty} (-a_{k+1}(k+r+1)\,(k+7+r) + a_{k-1}(2k+5+$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-r(6+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{-6, 0\}$$

- Each term must be 0

$$-a_1(1+r)\,(7+r) = 0$$

- Each term in the series must be 0, giving the recursion relation

$$2(k+r+1)\left(\left(k+r+\frac{5}{2}\right) a_{k-1} - \frac{a_{k+1}(k+7+r)}{2}\right) = 0$$

- Shift index using $k->k+1$

  $$2(k+r+2)\left(\left(k+\frac{7}{2}+r\right)a_k-\frac{a_{k+2}(k+8+r)}{2}\right)=0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2}=\frac{(2k+2r+7)a_k}{k+8+r}$$

- Recursion relation for $r=-6$

  $$a_{k+2}=\frac{(2k-5)a_k}{k+2}$$

- Solution for $r=-6$

  $$\left[y=\sum_{k=0}^{\infty}a_k x^{k-6}, a_{k+2}=\frac{(2k-5)a_k}{k+2}, 5a_1=0\right]$$

- Recursion relation for $r=0$

  $$a_{k+2}=\frac{(2k+7)a_k}{k+8}$$

- Solution for $r=0$

  $$\left[y=\sum_{k=0}^{\infty}a_k x^{k}, a_{k+2}=\frac{(2k+7)a_k}{k+8}, -7a_1=0\right]$$

- Combine solutions and rename parameters

  $$\left[y=\left(\sum_{k=0}^{\infty}a_k x^{k-6}\right)+\left(\sum_{k=0}^{\infty}b_k x^{k}\right), a_{k+2}=\frac{(2k-5)a_k}{k+2}, 5a_1=0, b_{k+2}=\frac{(2k+7)b_k}{k+8}, -7b_1=0\right]$$

Problem number: 1.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' - 3y'x + (4x + 3)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' - 3y'x + (4x + 3)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = -\frac{3}{x}$$
$$q(x) = \frac{4x + 3}{x^2}$$

Table 780: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{3}{x}$	
singularity	type
$x = 0$	"regular"

$q(x) = \frac{4x+3}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : [∞]

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2y'' - 3y'x + (4x + 3)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2\left(\sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\,a_n x^{n+r-2}\right) - 3\left(\sum_{n=0}^{\infty} (n + r)\,a_n x^{n+r-1}\right) x + (4x + 3)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-3 x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4 x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} 3 a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4 x^{1+n+r} a_n = \sum_{n=1}^{\infty} 4 a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-3 x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} 4 a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3 a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - 3 x^{n+r} a_n (n+r) + 3 a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - 3 x^r a_0 r + 3 a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - 3 x^r r + 3 x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2 - 4r + 3\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 4r + 3 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 3$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(r^2 - 4r + 3\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 2$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^3 \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+3}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{1+n}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) - 3a_n(n+r) + 4a_{n-1} + 3a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{4a_{n-1}}{n^2 + 2nr + r^2 - 4n - 4r + 3} \tag{4}$$

Which for the root $r = 3$ becomes

$$a_n = -\frac{4a_{n-1}}{n(n+2)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 3$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{4}{r(r-2)}$$

Which for the root $r = 3$ becomes

$$a_1 = -\frac{4}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{4}{r(r-2)}$	$-\frac{4}{3}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{16}{r(r-2)(r^2-1)}$$

Which for the root $r = 3$ becomes

$$a_2 = \frac{2}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{4}{r(r-2)}$	$-\frac{4}{3}$
a_2	$\frac{16}{r(r-2)(r^2-1)}$	$\frac{2}{3}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{64}{r^6 - 5r^4 + 4r^2}$$

Which for the root $r = 3$ becomes

$$a_3 = -\frac{8}{45}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{4}{r(r-2)}$	$-\frac{4}{3}$
a_2	$\frac{16}{r(r-2)(r^2-1)}$	$\frac{2}{3}$
a_3	$-\frac{64}{r^6-5r^4+4r^2}$	$-\frac{8}{45}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{256}{r^2 (r^4 - 5r^2 + 4) (r^2 + 4r + 3)}$$

Which for the root $r = 3$ becomes

$$a_4 = \frac{4}{135}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{4}{r(r-2)}$	$-\frac{4}{3}$
a_2	$\frac{16}{r(r-2)(r^2-1)}$	$\frac{2}{3}$
a_3	$-\frac{64}{r^6-5r^4+4r^2}$	$-\frac{8}{45}$
a_4	$\frac{256}{r^2(r^4-5r^2+4)(r^2+4r+3)}$	$\frac{4}{135}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{1024}{r^2 (r-2) (r+2)^2 (-1+r) (r+1)^2 (r+3) (r+4)}$$

Which for the root $r = 3$ becomes

$$a_5 = -\frac{16}{4725}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{4}{r(r-2)}$	$-\frac{4}{3}$
a_2	$\frac{16}{r(r-2)(r^2-1)}$	$\frac{2}{3}$
a_3	$-\frac{64}{r^6-5r^4+4r^2}$	$-\frac{8}{45}$
a_4	$\frac{256}{r^2(r^4-5r^2+4)(r^2+4r+3)}$	$\frac{4}{135}$
a_5	$-\frac{1024}{r^2(r-2)(r+2)^2(-1+r)(r+1)^2(r+3)(r+4)}$	$-\frac{16}{4725}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^3\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= x^3\left(1 - \frac{4x}{3} + \frac{2x^2}{3} - \frac{8x^3}{45} + \frac{4x^4}{135} - \frac{16x^5}{4725} + O\left(x^6\right)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 2$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_2(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_2 \\ &= \frac{16}{r\left(r-2\right)\left(r^2-1\right)} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} \frac{16}{r\left(r-2\right)\left(r^2-1\right)} &= \lim_{r\to 1} \frac{16}{r\left(r-2\right)\left(r^2-1\right)} \\ &= \textit{undefined} \end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned}
\frac{d}{dx} y_2(x) &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\
&= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) \\
\frac{d^2}{dx^2} y_2(x) &= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\
&= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right)
\end{aligned}$$

Substituting these back into the given ode $x^2 y'' - 3y'x + (4x+3)\, y = 0$ gives

$$\begin{aligned}
&x^2 \left(C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \right. \\
&\left. + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) \\
&- 3\left(C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right) x \\
&+ (4x+3)\left(C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)\right) = 0
\end{aligned}$$

Which can be written as

$$\left(\left(\left(x^{2} y_1''(x)-3 y_1'(x) x+(4 x+3) y_1(x)\right) \ln (x)+x^{2}\left(\frac{2 y_1'(x)}{x}-\frac{y_1(x)}{x^{2}}\right)\right.\right.$$
$$\left.\left.-3 y_1(x)\right) C+x^{2}\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}\left(n+r_2\right)^{2}}{x^{2}}-\frac{b_n x^{n+r_2}\left(n+r_2\right)}{x^{2}}\right)\right)\right) \tag{7}$$
$$-3\left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}\left(n+r_2\right)}{x}\right) x+(4 x+3)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)=0$$

But since $y_1(x)$ is a solution to the ode, then

$$x^{2} y_1''(x)-3 y_1'(x) x+(4 x+3) y_1(x)=0$$

Eq (7) simplifes to

$$\left(x^{2}\left(\frac{2 y_1'(x)}{x}-\frac{y_1(x)}{x^{2}}\right)-3 y_1(x)\right) C$$
$$+x^{2}\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}\left(n+r_2\right)^{2}}{x^{2}}-\frac{b_n x^{n+r_2}\left(n+r_2\right)}{x^{2}}\right)\right) \tag{8}$$
$$-3\left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}\left(n+r_2\right)}{x}\right) x+(4 x+3)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)=0$$

Substituting $y_1=\sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\left(2\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n\left(n+r_1\right)\right) x-4\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)\right) C$$
$$+\left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n\left(n+r_2\right)\left(-1+n+r_2\right)\right) x^{2} \tag{9}$$
$$-3\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n\left(n+r_2\right)\right) x+(4 x+3)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)=0$$

Since $r_1=3$ and $r_2=1$ then the above becomes

$$\left(2\left(\sum_{n=0}^{\infty} x^{n+2} a_n(n+3)\right) x-4\left(\sum_{n=0}^{\infty} a_n x^{n+3}\right)\right) C+\left(\sum_{n=0}^{\infty} x^{n-1} b_n(1+n) n\right) x^{2} \tag{10}$$
$$-3\left(\sum_{n=0}^{\infty} x^{n} b_n(1+n)\right) x+(4 x+3)\left(\sum_{n=0}^{\infty} b_n x^{1+n}\right)=0$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2C\, x^{n+3} a_n (n+3)\right) + \sum_{n=0}^{\infty} \left(-4C a_n x^{n+3}\right) + \left(\sum_{n=0}^{\infty} n\, x^{1+n} b_n (1+n)\right) \\ + \sum_{n=0}^{\infty} \left(-3x^{1+n} b_n (1+n)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+2} b_n\right) + \left(\sum_{n=0}^{\infty} 3b_n x^{1+n}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $1+n$ in each summation term. Going over each summation term above with power of x in it which is not already x^{1+n} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2C\, x^{n+3} a_n (n+3) = \sum_{n=2}^{\infty} 2C a_{-2+n} (1+n)\, x^{1+n}$$

$$\sum_{n=0}^{\infty} \left(-4C a_n x^{n+3}\right) = \sum_{n=2}^{\infty} \left(-4C a_{-2+n} x^{1+n}\right)$$

$$\sum_{n=0}^{\infty} 4x^{n+2} b_n = \sum_{n=1}^{\infty} 4b_{n-1} x^{1+n}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $1+n$.

$$\left(\sum_{n=2}^{\infty} 2C a_{-2+n} (1+n)\, x^{1+n}\right) + \sum_{n=2}^{\infty} \left(-4C a_{-2+n} x^{1+n}\right) + \left(\sum_{n=0}^{\infty} n\, x^{1+n} b_n (1+n)\right) \\ + \sum_{n=0}^{\infty} \left(-3x^{1+n} b_n (1+n)\right) + \left(\sum_{n=1}^{\infty} 4b_{n-1} x^{1+n}\right) + \left(\sum_{n=0}^{\infty} 3b_n x^{1+n}\right) = 0 \tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n=1$, Eq (2B) gives

$$-b_1 + 4b_0 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-b_1 + 4 = 0$$

Solving the above for b_1 gives

$$b_1 = 4$$

For $n = N$, where $N = 2$ which is the difference between the two roots, we are free to choose $b_2 = 0$. Hence for $n = 2$, Eq (2B) gives

$$2C + 16 = 0$$

Which is solved for C. Solving for C gives

$$C = -8$$

For $n = 3$, Eq (2B) gives

$$4Ca_1 + 4b_2 + 3b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$3b_3 + \frac{128}{3} = 0$$

Solving the above for b_3 gives

$$b_3 = -\frac{128}{9}$$

For $n = 4$, Eq (2B) gives

$$6Ca_2 + 4b_3 + 8b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$8b_4 - \frac{800}{9} = 0$$

Solving the above for b_4 gives

$$b_4 = \frac{100}{9}$$

For $n = 5$, Eq (2B) gives

$$8Ca_3 + 4b_4 + 15b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$15b_5 + \frac{2512}{45} = 0$$

Solving the above for b_5 gives

$$b_5 = -\frac{2512}{675}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -8$ and all b_n, then the second solution becomes

$$
\begin{aligned}
y_2(x) = (-8) \left(x^3 \left(1 - \frac{4x}{3} + \frac{2x^2}{3} - \frac{8x^3}{45} + \frac{4x^4}{135} - \frac{16x^5}{4725} + O(x^6)\right)\right) \ln(x) \\
+ x \left(1 + 4x - \frac{128x^3}{9} + \frac{100x^4}{9} - \frac{2512x^5}{675} + O(x^6)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^3 \left(1 - \frac{4x}{3} + \frac{2x^2}{3} - \frac{8x^3}{45} + \frac{4x^4}{135} - \frac{16x^5}{4725} + O(x^6)\right) \\
&\quad + c_2 \left((-8) \left(x^3 \left(1 - \frac{4x}{3} + \frac{2x^2}{3} - \frac{8x^3}{45} + \frac{4x^4}{135} - \frac{16x^5}{4725} + O(x^6)\right)\right) \ln(x) \right. \\
&\quad \left. + x \left(1 + 4x - \frac{128x^3}{9} + \frac{100x^4}{9} - \frac{2512x^5}{675} + O(x^6)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^3 \left(1 - \frac{4x}{3} + \frac{2x^2}{3} - \frac{8x^3}{45} + \frac{4x^4}{135} - \frac{16x^5}{4725} + O(x^6)\right) \\
&\quad + c_2 \left(-8x^3 \left(1 - \frac{4x}{3} + \frac{2x^2}{3} - \frac{8x^3}{45} + \frac{4x^4}{135} - \frac{16x^5}{4725} + O(x^6)\right) \ln(x) \right. \\
&\quad \left. + x \left(1 + 4x - \frac{128x^3}{9} + \frac{100x^4}{9} - \frac{2512x^5}{675} + O(x^6)\right)\right)
\end{aligned}
$$

<u>Summary</u>

The solution(s) found are the following

$$
\begin{aligned}
y = c_1 x^3 \left(1 - \frac{4x}{3} + \frac{2x^2}{3} - \frac{8x^3}{45} + \frac{4x^4}{135} - \frac{16x^5}{4725} + O(x^6)\right) \\
+ c_2 \left(-8x^3 \left(1 - \frac{4x}{3} + \frac{2x^2}{3} - \frac{8x^3}{45} + \frac{4x^4}{135} - \frac{16x^5}{4725} + O(x^6)\right) \ln(x) \right. \\
\left. + x \left(1 + 4x - \frac{128x^3}{9} + \frac{100x^4}{9} - \frac{2512x^5}{675} + O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$y = c_1 x^3 \left(1 - \frac{4x}{3} + \frac{2x^2}{3} - \frac{8x^3}{45} + \frac{4x^4}{135} - \frac{16x^5}{4725} + O(x^6)\right) + c_2 \left(-8x^3 \left(1 - \frac{4x}{3} + \frac{2x^2}{3} - \frac{8x^3}{45} + \frac{4x^4}{135} - \frac{16x^5}{4725} + O(x^6)\right) \ln(x) + x \left(1 + 4x - \frac{128x^3}{9} + \frac{100x^4}{9} - \frac{2512x^5}{675} + O(x^6)\right)\right)$$

Verified OK.

16.5.1 Maple step by step solution

Let's solve

$x^2 y'' - 3y'x + (4x+3)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{3y'}{x} - \frac{(4x+3)y}{x^2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{3y'}{x} + \frac{(4x+3)y}{x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

    $\left[P_2(x) = -\frac{3}{x}, P_3(x) = \frac{4x+3}{x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

    $\left.(x \cdot P_2(x))\right|_{x=0} = -3$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $\left.(x^2 \cdot P_3(x))\right|_{x=0} = 3$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

$$x^2 y'' - 3y'x + (4x+3)\, y = 0$$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k-m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x \cdot y'$ to series expansion

$$x \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

$$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(-1+r)\,(-3+r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(k+r-1)\,(k+r-3) + 4a_{k-1}\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(-1+r)\,(-3+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{1, 3\}$$

- Each term in the series must be 0, giving the recursion relation

$$a_k(k+r-1)\,(k+r-3) + 4a_{k-1} = 0$$

- Shift index using $k- >k+1$

$$a_{k+1}(k+r)\,(k-2+r) + 4a_k = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = -\frac{4a_k}{(k+r)(k-2+r)}$$

- Recursion relation for $r = 1$

$$a_{k+1} = -\frac{4a_k}{(k+1)(k-1)}$$

- Series not valid for $r = 1$, division by 0 in the recursion relation at $k = 1$

  $a_{k+1} = -\frac{4a_k}{(k+1)(k-1)}$

- Recursion relation for $r = 3$

  $a_{k+1} = -\frac{4a_k}{(k+3)(k+1)}$

- Solution for $r = 3$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+3}, a_{k+1} = -\frac{4a_k}{(k+3)(k+1)}\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 2.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_Emden, _Fowler]]
```

$$\boxed{xy'' + y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$xy'' + y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = 0$$
$$q(x) = \frac{1}{x}$$

Table 782: Table $p(x), q(x)$ singularites.

$p(x) = 0$	
singularity	type

$q(x) = \frac{1}{x}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$xy'' + y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}\right) x + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r-1} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r-1} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} a_n x^{n+r} = \sum_{n=1}^{\infty} a_{n-1} x^{n+r-1}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r-1$.

$$\left(\sum_{n=0}^{\infty} x^{n+r-1} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r-1}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r-1} a_n (n+r)(n+r-1) = 0$$

When $n=0$ the above becomes

$$x^{-1+r} a_0 r(-1+r) = 0$$

Or

$$x^{-1+r} a_0 r(-1+r) = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^{-1+r} r(-1+r) = 0$$

Since the above is true for all x then the indicial equation becomes

$$r(-1+r) = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = 0$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^{-1+r} r(-1+r) = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 1$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right)$$

Or

$$y_1(x) = x \left(\sum_{n=0}^{\infty} a_n x^n \right)$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n \right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+1}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n \right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) + a_{n-1} = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}}{(n+r)(n+r-1)} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{a_{n-1}}{(n+1)\, n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{1}{(1+r)\, r}$$

Which for the root $r = 1$ becomes

$$a_1 = -\frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{(1+r)r}$	$-\frac{1}{2}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1}{(1+r)^2\, r\, (2+r)}$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{1}{12}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{(1+r)r}$	$-\frac{1}{2}$
a_2	$\frac{1}{(1+r)^2 r(2+r)}$	$\frac{1}{12}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{1}{(1+r)^2\, r\, (2+r)^2\, (3+r)}$$

Which for the root $r = 1$ becomes

$$a_3 = -\frac{1}{144}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{(1+r)r}$	$-\frac{1}{2}$
a_2	$\frac{1}{(1+r)^2 r(2+r)}$	$\frac{1}{12}$
a_3	$-\frac{1}{(1+r)^2 r(2+r)^2 (3+r)}$	$-\frac{1}{144}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{(1+r)^2 r (2+r)^2 (3+r)^2 (4+r)}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{1}{2880}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{(1+r)r}$	$-\frac{1}{2}$
a_2	$\frac{1}{(1+r)^2 r(2+r)}$	$\frac{1}{12}$
a_3	$-\frac{1}{(1+r)^2 r(2+r)^2 (3+r)}$	$-\frac{1}{144}$
a_4	$\frac{1}{(1+r)^2 r(2+r)^2 (3+r)^2 (4+r)}$	$\frac{1}{2880}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{1}{(1+r)^2 r (2+r)^2 (3+r)^2 (4+r)^2 (5+r)}$$

Which for the root $r = 1$ becomes

$$a_5 = -\frac{1}{86400}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{(1+r)r}$	$-\frac{1}{2}$
a_2	$\frac{1}{(1+r)^2 r(2+r)}$	$\frac{1}{12}$
a_3	$-\frac{1}{(1+r)^2 r(2+r)^2 (3+r)}$	$-\frac{1}{144}$
a_4	$\frac{1}{(1+r)^2 r(2+r)^2 (3+r)^2 (4+r)}$	$\frac{1}{2880}$
a_5	$-\frac{1}{(1+r)^2 r(2+r)^2 (3+r)^2 (4+r)^2 (5+r)}$	$-\frac{1}{86400}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x\left(1 - \frac{x}{2} + \frac{x^2}{12} - \frac{x^3}{144} + \frac{x^4}{2880} - \frac{x^5}{86400} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 1$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r \to r_2} a_1(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_1 \\ &= -\frac{1}{(1+r)\,r} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r \to r_2} -\frac{1}{(1+r)\,r} &= \lim_{r \to 0} -\frac{1}{(1+r)\,r} \\ &= \textit{undefined} \end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$
\begin{aligned}
\frac{d}{dx}y_2(x) &= C y_1'(x)\ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\
&= C y_1'(x)\ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) \\
\frac{d^2}{dx^2}y_2(x) &= C y_1''(x)\ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\
&= C y_1''(x)\ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right)
\end{aligned}
$$

Substituting these back into the given ode $xy'' + y = 0$ gives

$$
\left(C y_1''(x)\ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)x
$$
$$
+ C y_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0
$$

Which can be written as

$$
\begin{aligned}
&\left(\left(y_1''(x)\,x + y_1(x)\right)\ln(x) + \left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right)x\right)C \\
&+ \left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)x + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0
\end{aligned}
\tag{7}
$$

But since $y_1(x)$ is a solution to the ode, then

$$
y_1''(x)\,x + y_1(x) = 0
$$

Eq (7) simplifes to

$$
\begin{aligned}
&\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right)xC + \left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)x \\
&+ \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0
\end{aligned}
\tag{8}
$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\frac{\left(2\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) x - \left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)\right) C}{x} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) x + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{9}$$

Since $r_1 = 1$ and $r_2 = 0$ then the above becomes

$$\frac{\left(2\left(\sum_{n=0}^{\infty} x^{n} a_n (n+1)\right) x - \left(\sum_{n=0}^{\infty} a_n x^{n+1}\right)\right) C}{x} + \left(\sum_{n=0}^{\infty} x^{-2+n} b_n n(n-1)\right) x + \left(\sum_{n=0}^{\infty} b_n x^{n}\right) = 0 \tag{10}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2C\, x^n a_n (n+1)\right) + \sum_{n=0}^{\infty} (-C\, x^n a_n) + \left(\sum_{n=0}^{\infty} n\, x^{n-1} b_n (n-1)\right) + \left(\sum_{n=0}^{\infty} b_n x^n\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n-1} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2C\, x^n a_n (n+1) = \sum_{n=1}^{\infty} 2C a_{n-1} n\, x^{n-1}$$

$$\sum_{n=0}^{\infty} (-C\, x^n a_n) = \sum_{n=1}^{\infty} (-C a_{n-1} x^{n-1})$$

$$\sum_{n=0}^{\infty} b_n x^n = \sum_{n=1}^{\infty} b_{n-1} x^{n-1}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n - 1$.

$$\left(\sum_{n=1}^{\infty} 2C a_{n-1} n\, x^{n-1}\right) + \sum_{n\,=1}^{\infty} \left(-C a_{n-1} x^{n-1}\right) + \left(\sum_{n=0}^{\infty} n\, x^{n-1} b_n (n-1)\right) + \left(\sum_{n=1}^{\infty} b_{n-1} x^{n-1}\right) = 0 \tag{2B}$$

For $n = 0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n = N$, where $N = 1$ which is the difference between the two roots, we are free to choose $b_1 = 0$. Hence for $n = 1$, Eq (2B) gives

$$C + 1 = 0$$

Which is solved for C. Solving for C gives

$$C = -1$$

For $n = 2$, Eq (2B) gives

$$3Ca_1 + b_1 + 2b_2 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$2b_2 + \frac{3}{2} = 0$$

Solving the above for b_2 gives

$$b_2 = -\frac{3}{4}$$

For $n = 3$, Eq (2B) gives

$$5Ca_2 + b_2 + 6b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$6b_3 - \frac{7}{6} = 0$$

Solving the above for b_3 gives

$$b_3 = \frac{7}{36}$$

For $n = 4$, Eq (2B) gives

$$7Ca_3 + b_3 + 12b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$12b_4 + \frac{35}{144} = 0$$

Solving the above for b_4 gives

$$b_4 = -\frac{35}{1728}$$

For $n = 5$, Eq (2B) gives

$$9Ca_4 + b_4 + 20b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$20b_5 - \frac{101}{4320} = 0$$

Solving the above for b_5 gives

$$b_5 = \frac{101}{86400}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -1$ and all b_n, then the second solution becomes

$$\begin{aligned} y_2(x) = (-1)&\left(x\left(1 - \frac{x}{2} + \frac{x^2}{12} - \frac{x^3}{144} + \frac{x^4}{2880} - \frac{x^5}{86400} + O(x^6)\right)\right)\ln(x) \\ &+ 1 - \frac{3x^2}{4} + \frac{7x^3}{36} - \frac{35x^4}{1728} + \frac{101x^5}{86400} + O(x^6) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x\left(1 - \frac{x}{2} + \frac{x^2}{12} - \frac{x^3}{144} + \frac{x^4}{2880} - \frac{x^5}{86400} + O(x^6)\right) \\ &\quad + c_2\left((-1)\left(x\left(1 - \frac{x}{2} + \frac{x^2}{12} - \frac{x^3}{144} + \frac{x^4}{2880} - \frac{x^5}{86400} + O(x^6)\right)\right)\ln(x) + 1 \right. \\ &\quad \left. - \frac{3x^2}{4} + \frac{7x^3}{36} - \frac{35x^4}{1728} + \frac{101x^5}{86400} + O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x\left(1 - \frac{x}{2} + \frac{x^2}{12} - \frac{x^3}{144} + \frac{x^4}{2880} - \frac{x^5}{86400} + O(x^6)\right) \\ &\quad + c_2\left(-x\left(1 - \frac{x}{2} + \frac{x^2}{12} - \frac{x^3}{144} + \frac{x^4}{2880} - \frac{x^5}{86400} + O(x^6)\right)\ln(x) + 1 - \frac{3x^2}{4} + \frac{7x^3}{36} \right. \\ &\quad \left. - \frac{35x^4}{1728} + \frac{101x^5}{86400} + O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = {} & c_1 x\left(1-\frac{x}{2}+\frac{x^2}{12}-\frac{x^3}{144}+\frac{x^4}{2880}-\frac{x^5}{86400}+O\left(x^6\right)\right) \\
& + c_2\left(-x\left(1-\frac{x}{2}+\frac{x^2}{12}-\frac{x^3}{144}+\frac{x^4}{2880}-\frac{x^5}{86400}+O\left(x^6\right)\right)\ln\left(x\right)+1-\frac{3x^2}{4} \right. \\
& \left. +\frac{7x^3}{36}-\frac{35x^4}{1728}+\frac{101x^5}{86400}+O\left(x^6\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y = {} & c_1 x\left(1-\frac{x}{2}+\frac{x^2}{12}-\frac{x^3}{144}+\frac{x^4}{2880}-\frac{x^5}{86400}+O\left(x^6\right)\right) \\
& + c_2\left(-x\left(1-\frac{x}{2}+\frac{x^2}{12}-\frac{x^3}{144}+\frac{x^4}{2880}-\frac{x^5}{86400}+O\left(x^6\right)\right)\ln\left(x\right)+1-\frac{3x^2}{4}+\frac{7x^3}{36} \right. \\
& \left. -\frac{35x^4}{1728}+\frac{101x^5}{86400}+O\left(x^6\right)\right)
\end{aligned}
$$

Verified OK.

16.6.1 Maple step by step solution

Let's solve

$y''x+y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{y}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{y}{x}=0$

□ Check to see if $x_0=0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=0, P_3(x)=\frac{1}{x}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left(x\cdot P_2(x)\right)\bigg|_{x=0}=0$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = 0$

- $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $y''x + y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $x \cdot y''$ to series expansion

  $x \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\, x^{k+r-1}$

- Shift index using $k- > k+1$

  $x \cdot y'' = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)(k+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0 r(-1+r)\, x^{-1+r} + \left(\sum_{k=0}^{\infty} \left(a_{k+1}(k+1+r)(k+r) + a_k\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $r(-1+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{0, 1\}$

- Each term in the series must be 0, giving the recursion relation

  $a_{k+1}(k+1+r)(k+r) + a_k = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+1} = -\frac{a_k}{(k+1+r)(k+r)}$

- Recursion relation for $r = 0$

  $a_{k+1} = -\frac{a_k}{(k+1)k}$

- Solution for $r = 0$

  $\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+1} = -\frac{a_k}{(k+1) k}\right]$

- Recursion relation for $r = 1$

  $a_{k+1} = -\frac{a_k}{(k+2)(k+1)}$

- Solution for $r = 1$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+1} = -\frac{a_k}{(k+2)(k+1)}\right]$

- Combine solutions and rename parameters

  $\left[y = \left(\sum_{k=0}^{\infty} a_k x^k\right) + \left(\sum_{k=0}^{\infty} b_k x^{1+k}\right), a_{1+k} = -\frac{a_k}{(1+k) k}, b_{1+k} = -\frac{b_k}{(k+2)(1+k)}\right]$

$$\boxed{4x^2(x+1)\,y''+4x(1+2x)\,y'-(3x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(4x^3+4x^2\right)y''+\left(8x^2+4x\right)y'+(-3x-1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{1+2x}{x\,(x+1)}$$
$$q(x)=-\frac{3x+1}{4x^2\,(x+1)}$$

Table 784: Table $p(x), q(x)$ singularites.

$p(x) = \frac{1+2x}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = -\frac{3x+1}{4x^2(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2(x+1)\, y'' + \left(8x^2 + 4x\right) y' + (-3x - 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2(x+1) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(8x^2 + 4x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (-3x - 1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} 8x^{1+n+r} a_n (n+r)\right)+\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)\right) \\
&+\sum_{n=0}^{\infty}\left(-3x^{1+n+r} a_n\right)+\sum_{n=0}^{\infty}\left(-a_n x^{n+r}\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1) &= \sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 8x^{1+n+r} a_n (n+r) &= \sum_{n=1}^{\infty} 8a_{n-1}(n+r-1)\, x^{n+r} \\
\sum_{n=0}^{\infty}\left(-3x^{1+n+r} a_n\right) &= \sum_{n=1}^{\infty}\left(-3a_{n-1} x^{n+r}\right)
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=1}^{\infty} 8a_{n-1}(n+r-1)\, x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)\right)+\sum_{n=1}^{\infty}\left(-3a_{n-1} x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-a_n x^{n+r}\right)=0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
4x^{n+r} a_n (n+r)(n+r-1)+4x^{n+r} a_n (n+r)-a_n x^{n+r}=0
$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) + 4x^r a_0 r - a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) + 4x^r r - x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = -\frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 1$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sqrt{x} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{\sqrt{x}}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned}4a_{n-1}(n+r-1)(n+r-2)+4a_n(n+r)(n+r-1)\\+8a_{n-1}(n+r-1)+4a_n(n+r)-3a_{n-1}-a_n=0\end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(2n+2r-3)\,a_{n-1}}{2n+2r-1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{(n-1)\,a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-2r+1}{1+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{1+2r}$	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{2r-1}{3+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{1+2r}$	0
a_2	$\frac{2r-1}{3+2r}$	0

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-2r+1}{5+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{1+2r}$	0
a_2	$\frac{2r-1}{3+2r}$	0
a_3	$\frac{-2r+1}{5+2r}$	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{2r-1}{7+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{1+2r}$	0
a_2	$\frac{2r-1}{3+2r}$	0
a_3	$\frac{-2r+1}{5+2r}$	0
a_4	$\frac{2r-1}{7+2r}$	0

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-2r+1}{9+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r+1}{1+2r}$	0
a_2	$\frac{2r-1}{3+2r}$	0
a_3	$\frac{-2r+1}{5+2r}$	0
a_4	$\frac{2r-1}{7+2r}$	0
a_5	$\frac{-2r+1}{9+2r}$	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= \sqrt{x}\left(1 + O\left(x^6\right)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 1$. Now we need to determine if

C is zero or not. This is done by finding $\lim_{r \rightarrow r_2} a_1(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$
\begin{aligned}
a_N &= a_1 \\
&= \frac{-2r + 1}{1 + 2r}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\lim_{r \rightarrow r_2} \frac{-2r + 1}{1 + 2r} &= \lim_{r \rightarrow -\frac{1}{2}} \frac{-2r + 1}{1 + 2r} \\
&= \textit{undefined}
\end{aligned}
$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$
y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)
$$

Therefore

$$
\begin{aligned}
\frac{d}{dx} y_2(x) &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2} (n + r_2)}{x}\right) \\
&= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n + r_2)\right) \\
\frac{d^2}{dx^2} y_2(x) &= C y_1''(x) \ln(x) + \frac{2 C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2} (n + r_2)^2}{x^2} - \frac{b_n x^{n+r_2} (n + r_2)}{x^2}\right) \\
&= C y_1''(x) \ln(x) + \frac{2 C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n + r_2) (-1 + n + r_2)\right)
\end{aligned}
$$

Substituting these back into the given ode $4x^2(x + 1) y'' + (8x^2 + 4x) y' + (-3x - 1) y = 0$

gives

$$
\begin{aligned}
&4x^2(x+1)\left(Cy_1''(x)\ln(x)+\frac{2Cy_1'(x)}{x}-\frac{Cy_1(x)}{x^2}\right.\\
&\left.+\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+\left(8x^2+4x\right)\left(Cy_1'(x)\ln(x)+\frac{Cy_1(x)}{x}+\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)\\
&+(-3x-1)\left(Cy_1(x)\ln(x)+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)\right)=0
\end{aligned}
$$

Which can be written as

$$
\begin{aligned}
&\left(\left(4x^2(x+1)\,y_1''(x)+\left(8x^2+4x\right)y_1'(x)+(-3x-1)\,y_1(x)\right)\ln(x)\right.\\
&\left.+4x^2(x+1)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{\left(8x^2+4x\right)y_1(x)}{x}\right)C\\
&+4x^2(x+1)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+\left(8x^2+4x\right)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(-3x-1)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0
\end{aligned}
\tag{7}
$$

But since $y_1(x)$ is a solution to the ode, then

$$
4x^2(x+1)\,y_1''(x)+\left(8x^2+4x\right)y_1'(x)+(-3x-1)\,y_1(x)=0
$$

Eq (7) simplifes to

$$
\begin{aligned}
&\left(4x^2(x+1)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{\left(8x^2+4x\right)y_1(x)}{x}\right)C\\
&+4x^2(x+1)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+\left(8x^2+4x\right)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(-3x-1)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0
\end{aligned}
\tag{8}
$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$
\begin{aligned}
&\left(8x(x+1)\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right)+4\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)x\right)C \\
&+\left(4x^3+4x^2\right)\left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) \\
&+\left(8x^2+4x\right)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right)+(-3x-1)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)=0
\end{aligned}
\tag{9}
$$

Since $r_1 = \frac{1}{2}$ and $r_2 = -\frac{1}{2}$ then the above becomes

$$
\begin{aligned}
&\left(8x(x+1)\left(\sum_{n=0}^{\infty} x^{n-\frac{1}{2}} a_n \left(n+\frac{1}{2}\right)\right)+4\left(\sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}\right)x\right)C \\
&+\left(4x^3+4x^2\right)\left(\sum_{n=0}^{\infty} x^{-\frac{5}{2}+n} b_n \left(n-\frac{1}{2}\right)\left(-\frac{3}{2}+n\right)\right) \\
&+\left(8x^2+4x\right)\left(\sum_{n=0}^{\infty} x^{-\frac{3}{2}+n} b_n \left(n-\frac{1}{2}\right)\right)+(-3x-1)\left(\sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}\right)=0
\end{aligned}
\tag{10}
$$

Expanding $4C\sqrt{x}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$
\begin{aligned}
4C\sqrt{x} &= 4C\sqrt{x} + \dots \\
&= 4C\sqrt{x}
\end{aligned}
$$

Expanding $\sqrt{x}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$
\begin{aligned}
\sqrt{x} &= \sqrt{x} + \dots \\
&= \sqrt{x}
\end{aligned}
$$

Expanding $\frac{1}{\sqrt{x}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$
\begin{aligned}
\frac{1}{\sqrt{x}} &= \frac{1}{\sqrt{x}} + \dots \\
&= \frac{1}{\sqrt{x}}
\end{aligned}
$$

Expanding $4\sqrt{x}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$
\begin{aligned}
4\sqrt{x} &= 4\sqrt{x} + \dots \\
&= 4\sqrt{x}
\end{aligned}
$$

Expanding $\frac{2}{\sqrt{x}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{2}{\sqrt{x}} &= \frac{2}{\sqrt{x}} + \dots \\ &= \frac{2}{\sqrt{x}}\end{aligned}$$

Expanding $-3\sqrt{x}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}-3\sqrt{x} &= -3\sqrt{x} + \dots \\ &= -3\sqrt{x}\end{aligned}$$

Expanding $-\frac{1}{\sqrt{x}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}-\frac{1}{\sqrt{x}} &= -\frac{1}{\sqrt{x}} + \dots \\ &= -\frac{1}{\sqrt{x}}\end{aligned}$$

Which simplifies to

$$\begin{aligned}&\left(\sum_{n=0}^{\infty} (8n+4)\, C a_n x^{\frac{3}{2}+n}\right) + \left(\sum_{n=0}^{\infty} (8n+4)\, C a_n x^{n+\frac{1}{2}}\right) \\ &+ \left(\sum_{n=0}^{\infty} 4C\, x^{\frac{3}{2}+n} a_n\right) + \left(\sum_{n=0}^{\infty} x^{n+\frac{1}{2}} b_n \left(4n^2 - 8n + 3\right)\right) \\ &+ \left(\sum_{n=0}^{\infty} x^{n-\frac{1}{2}} b_n \left(4n^2 - 8n + 3\right)\right) + \left(\sum_{n=0}^{\infty} (8n-4)\, b_n x^{n+\frac{1}{2}}\right) \\ &+ \left(\sum_{n=0}^{\infty} (4n-2)\, b_n x^{n-\frac{1}{2}}\right) + \sum_{n=0}^{\infty} \left(-3x^{n+\frac{1}{2}} b_n\right) + \sum_{n=0}^{\infty} \left(-b_n x^{n-\frac{1}{2}}\right) = 0\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n - \frac{1}{2}$ in each summation term. Going over each summation term above with power of x in it which is not already $x^{n-\frac{1}{2}}$ and adjusting the power and the corresponding index gives

$$\begin{aligned}\sum_{n=0}^{\infty} (8n+4)\, C a_n x^{\frac{3}{2}+n} &= \sum_{n=2}^{\infty} C a_{n-2} (8n-12)\, x^{n-\frac{1}{2}} \\ \sum_{n=0}^{\infty} (8n+4)\, C a_n x^{n+\frac{1}{2}} &= \sum_{n=1}^{\infty} C a_{n-1} (8n-4)\, x^{n-\frac{1}{2}}\end{aligned}$$

$$\sum_{n=0}^{\infty} 4C\, x^{\frac{3}{2}+n} a_n = \sum_{n=2}^{\infty} 4C a_{n-2} x^{n-\frac{1}{2}}$$

$$\sum_{n=0}^{\infty} x^{n+\frac{1}{2}} b_n \left(4n^2-8n+3\right) = \sum_{n=1}^{\infty} b_{n-1}\left(4(n-1)^2-8n+11\right) x^{n-\frac{1}{2}}$$

$$\sum_{n=0}^{\infty} (8n-4)\, b_n x^{n+\frac{1}{2}} = \sum_{n=1}^{\infty} b_{n-1}(8n-12)\, x^{n-\frac{1}{2}}$$

$$\sum_{n=0}^{\infty} \left(-3x^{n+\frac{1}{2}} b_n\right) = \sum_{n=1}^{\infty} \left(-3b_{n-1} x^{n-\frac{1}{2}}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-\frac{1}{2}$.

$$\begin{aligned} &\left(\sum_{n=2}^{\infty} C a_{n-2}(8n-12)\, x^{n-\frac{1}{2}}\right) + \left(\sum_{n=1}^{\infty} C a_{n-1}(8n-4)\, x^{n-\frac{1}{2}}\right) \\ &+ \left(\sum_{n=2}^{\infty} 4C a_{n-2} x^{n-\frac{1}{2}}\right) + \left(\sum_{n=1}^{\infty} b_{n-1}\left(4(n-1)^2-8n+11\right) x^{n-\frac{1}{2}}\right) \\ &+ \left(\sum_{n=0}^{\infty} x^{n-\frac{1}{2}} b_n \left(4n^2-8n+3\right)\right) + \left(\sum_{n=1}^{\infty} b_{n-1}(8n-12)\, x^{n-\frac{1}{2}}\right) \\ &+ \left(\sum_{n=0}^{\infty} (4n-2)\, b_n x^{n-\frac{1}{2}}\right) + \sum_{n=1}^{\infty} \left(-3b_{n-1} x^{n-\frac{1}{2}}\right) + \sum_{n=0}^{\infty} \left(-b_n x^{n-\frac{1}{2}}\right) = 0 \end{aligned} \tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0=1$. For $n=N$, where $N=1$ which is the difference between the two roots, we are free to choose $b_1=0$. Hence for $n=1$, Eq (2B) gives

$$4C-4=0$$

Which is solved for C. Solving for C gives

$$C=1$$

For $n=2$, Eq (2B) gives

$$(8a_0+12a_1)\, C+8b_2=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$8+8b_2=0$$

Solving the above for b_2 gives

$$b_2 = -1$$

For $n = 3$, Eq (2B) gives

$$(16a_1 + 20a_2) C + 12b_2 + 24b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-12 + 24b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = \frac{1}{2}$$

For $n = 4$, Eq (2B) gives

$$(24a_2 + 28a_3) C + 32b_3 + 48b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$16 + 48b_4 = 0$$

Solving the above for b_4 gives

$$b_4 = -\frac{1}{3}$$

For $n = 5$, Eq (2B) gives

$$(32a_3 + 36a_4) C + 60b_4 + 80b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-20 + 80b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = \frac{1}{4}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = 1$ and all b_n, then the second solution becomes

$$y_2(x) = 1\left(\sqrt{x}\,(1 + O(x^6))\right) \ln(x) + \frac{1 - x^2 + \frac{x^3}{2} - \frac{x^4}{3} + \frac{x^5}{4} + O(x^6)}{\sqrt{x}}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1\sqrt{x}\,\left(1+O\left(x^6\right)\right)+c_2\left(1\left(\sqrt{x}\,\left(1+O\left(x^6\right)\right)\right)\ln\left(x\right)+\frac{1-x^2+\frac{x^3}{2}-\frac{x^4}{3}+\frac{x^5}{4}+O\left(x^6\right)}{\sqrt{x}}\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1\sqrt{x}\,\left(1+O\left(x^6\right)\right)+c_2\left(\sqrt{x}\,\left(1+O\left(x^6\right)\right)\ln\left(x\right)+\frac{1-x^2+\frac{x^3}{2}-\frac{x^4}{3}+\frac{x^5}{4}+O\left(x^6\right)}{\sqrt{x}}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = {} & c_1\sqrt{x}\,\left(1+O\left(x^6\right)\right) \\
& + c_2\left(\sqrt{x}\,\left(1+O\left(x^6\right)\right)\ln\left(x\right)+\frac{1-x^2+\frac{x^3}{2}-\frac{x^4}{3}+\frac{x^5}{4}+O\left(x^6\right)}{\sqrt{x}}\right)
\end{aligned}
\tag{1}
$$

Verification of solutions

$$
y = c_1\sqrt{x}\,\left(1+O\left(x^6\right)\right)+c_2\left(\sqrt{x}\,\left(1+O\left(x^6\right)\right)\ln\left(x\right)+\frac{1-x^2+\frac{x^3}{2}-\frac{x^4}{3}+\frac{x^5}{4}+O\left(x^6\right)}{\sqrt{x}}\right)
$$

Verified OK.

16.7.1 Maple step by step solution

Let's solve

$4x^2(x+1)\,y''+\left(8x^2+4x\right)y'+\left(-3x-1\right)y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{(3x+1)y}{4x^2(x+1)}-\frac{(1+2x)y'}{x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(1+2x)y'}{x(x+1)}-\frac{(3x+1)y}{4x^2(x+1)}=0$

- Check to see if x_0 is a regular singular point
  - Define functions

    $\left[P_2(x) = \frac{1+2x}{x(x+1)}, P_3(x) = -\frac{3x+1}{4x^2(x+1)}\right]$
  - $(x+1) \cdot P_2(x)$ is analytic at $x = -1$

    $\left((x+1) \cdot P_2(x)\right)\Big|_{x=-1} = 1$
  - $(x+1)^2 \cdot P_3(x)$ is analytic at $x = -1$

    $\left((x+1)^2 \cdot P_3(x)\right)\Big|_{x=-1} = 0$
  - $x = -1$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = -1$
- Multiply by denominators

  $4x^2(x+1)\, y'' + 4x(1+2x)\, y' + (-3x-1)\, y = 0$
- Change variables using $x = u - 1$ so that the regular singular point is at $u = 0$

  $(4u^3 - 8u^2 + 4u)\left(\frac{d^2}{du^2} y(u)\right) + (8u^2 - 12u + 4)\left(\frac{d}{du} y(u)\right) + (-3u+2)\, y(u) = 0$
- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$
- Rewrite ODE with series expansions
  - Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

    $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$
  - Shift index using $k- >k - m$

    $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$
  - Convert $u^m \cdot \left(\frac{d}{du} y(u)\right)$ to series expansion for $m = 0..2$

    $u^m \cdot \left(\frac{d}{du} y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\, u^{k+r-1+m}$
  - Shift index using $k- >k + 1 - m$

    $u^m \cdot \left(\frac{d}{du} y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$

- Convert $u^{m} \cdot \left(\frac{d^{2}}{d u^{2}}y \left(u \right)\right)$ to series expansion for $m =1..3$

  $$u^{m} \cdot \left(\frac{d^{2}}{d u^{2}}y \left(u \right)\right)=\sum_{k =0}^{\infty} a_{k} \left(k +r \right) \left(k +r -1\right) u^{k +r -2+m}$$

- Shift index using $k->k +2-m$

  $$u^{m} \cdot \left(\frac{d^{2}}{d u^{2}}y \left(u \right)\right)=\sum_{k =-2+m}^{\infty} a_{k +2-m} \left(k +2-m +r \right) \left(k +1-m +r \right) u^{k +r}$$

  Rewrite ODE with series expansions

  $$4 a_{0} r^{2} u^{-1+r}+\left(4 a_{1} \left(1+r \right)^{2}-2 a_{0} \left(4 r^{2}+2 r -1\right)\right) u^{r}+\left(\sum_{k =1}^{\infty} \left(4 a_{k +1} \left(k +1+r \right)^{2}-2 a_{k} \left(4 k^{2}+8 k r -\right.\right.\right.$$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $$4 r^{2}=0$$

- Values of r that satisfy the indicial equation

  $$r =0$$

- Each term must be 0

  $$4 a_{1} \left(1+r \right)^{2}-2 a_{0} \left(4 r^{2}+2 r -1\right)=0$$

- Each term in the series must be 0, giving the recursion relation

  $$\left(4 k^{2}-4 k -3\right) a_{k -1}+\left(-8 k^{2}-4 k +2\right) a_{k}+4 a_{k +1} \left(k +1\right)^{2}=0$$

- Shift index using $k->k +1$

  $$\left(4 \left(k +1\right)^{2}-4 k -7\right) a_{k}+\left(-8 \left(k +1\right)^{2}-4 k -2\right) a_{k +1}+4 a_{k +2} \left(k +2\right)^{2}=0$$

- Recursion relation that defines series solution to ODE

  $$a_{k +2}=-\frac{4 k^{2} a_{k}-8 k^{2} a_{k +1}+4 k a_{k}-20 k a_{k +1}-3 a_{k}-10 a_{k +1}}{4 \left(k +2\right)^{2}}$$

- Recursion relation for $r =0$

  $$a_{k +2}=-\frac{4 k^{2} a_{k}-8 k^{2} a_{k +1}+4 k a_{k}-20 k a_{k +1}-3 a_{k}-10 a_{k +1}}{4 \left(k +2\right)^{2}}$$

- Solution for $r =0$

  $$\left[y \left(u \right)=\sum_{k =0}^{\infty} a_{k} u^{k}, a_{k +2}=-\frac{4 k^{2} a_{k}-8 k^{2} a_{k +1}+4 k a_{k}-20 k a_{k +1}-3 a_{k}-10 a_{k +1}}{4 \left(k +2\right)^{2}}, 4 a_{1}+2 a_{0}=0\right]$$

- Revert the change of variables $u =x +1$

  $$\left[y =\sum_{k =0}^{\infty} a_{k} \left(x +1\right)^{k}, a_{k +2}=-\frac{4 k^{2} a_{k}-8 k^{2} a_{k +1}+4 k a_{k}-20 k a_{k +1}-3 a_{k}-10 a_{k +1}}{4 \left(k +2\right)^{2}}, 4 a_{1}+2 a_{0}=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 4.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x(x+1)\,y''+y'x+y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^2+x\right)y''+y'x+y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{1}{x+1}$$
$$q(x)=\frac{1}{x\,(x+1)}$$

Table 786: Table $p(x), q(x)$ singularites.

$p(x) = \frac{1}{x+1}$	
singularity	type
$x = -1$	"regular"

$q(x) = \frac{1}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x(x+1) y'' + y'x + y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x(x+1) \left(\sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}\right) + \left(\sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}\right) x + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r-1} a_n (n+r)(n+r-1)\right) \\ + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r-1} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r-1}$$

$$\sum_{n=0}^{\infty} x^{n+r} a_n (n+r) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r-1}$$

$$\sum_{n=0}^{\infty} a_n x^{n+r} = \sum_{n=1}^{\infty} a_{n-1} x^{n+r-1}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r-1$.

$$\left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} x^{n+r-1} a_n (n+r)(n+r-1)\right) \\ + \left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r-1}\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r-1}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r-1} a_n (n+r)(n+r-1) = 0$$

When $n=0$ the above becomes

$$x^{-1+r} a_0 r(-1+r) = 0$$

Or

$$x^{-1+r} a_0 r(-1+r) = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^{-1+r} r(-1+r) = 0$$

Since the above is true for all x then the indicial equation becomes

$$r(-1+r) = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = 0$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^{-1+r} r(-1+r) = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 1$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+1}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots

of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) + a_{n-1}(n+r-1) + a_{n-1} = 0 \quad (3)$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n^2 + 2nr + r^2 - 2n - 2r + 2)}{(n+r)(n+r-1)} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{a_{n-1}(n^2 + 1)}{(n+1)n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-r^2 - 1}{(1+r)r}$$

Which for the root $r = 1$ becomes

$$a_1 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-1}{(1+r)r}$	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(r^2+1)(r^2+2r+2)}{(1+r)^2 r(2+r)}$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{5}{6}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-1}{(1+r)r}$	-1
a_2	$\frac{(r^2+1)(r^2+2r+2)}{(1+r)^2 r(2+r)}$	$\frac{5}{6}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{(r^2+1)(r^2+2r+2)(r^2+4r+5)}{(1+r)^2 r (2+r)^2 (3+r)}$$

Which for the root $r = 1$ becomes

$$a_3 = -\frac{25}{36}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-1}{(1+r)r}$	-1
a_2	$\frac{(r^2+1)(r^2+2r+2)}{(1+r)^2 r(2+r)}$	$\frac{5}{6}$
a_3	$-\frac{(r^2+1)(r^2+2r+2)(r^2+4r+5)}{(1+r)^2 r(2+r)^2(3+r)}$	$-\frac{25}{36}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(r^2+1)(r^2+2r+2)(r^2+4r+5)(r^2+6r+10)}{(1+r)^2 r (2+r)^2 (3+r)^2 (4+r)}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{85}{144}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-1}{(1+r)r}$	-1
a_2	$\frac{(r^2+1)(r^2+2r+2)}{(1+r)^2 r(2+r)}$	$\frac{5}{6}$
a_3	$-\frac{(r^2+1)(r^2+2r+2)(r^2+4r+5)}{(1+r)^2 r(2+r)^2 (3+r)}$	$-\frac{25}{36}$
a_4	$\frac{(r^2+1)(r^2+2r+2)(r^2+4r+5)(r^2+6r+10)}{(1+r)^2 r(2+r)^2 (3+r)^2 (4+r)}$	$\frac{85}{144}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(r^2+1)(r^2+2r+2)(r^2+4r+5)(r^2+6r+10)(r^2+8r+17)}{(1+r)^2 r(2+r)^2 (3+r)^2 (4+r)^2 (5+r)}$$

Which for the root $r = 1$ becomes

$$a_5 = -\frac{221}{432}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-1}{(1+r)r}$	-1
a_2	$\frac{(r^2+1)(r^2+2r+2)}{(1+r)^2 r(2+r)}$	$\frac{5}{6}$
a_3	$-\frac{(r^2+1)(r^2+2r+2)(r^2+4r+5)}{(1+r)^2 r(2+r)^2 (3+r)}$	$-\frac{25}{36}$
a_4	$\frac{(r^2+1)(r^2+2r+2)(r^2+4r+5)(r^2+6r+10)}{(1+r)^2 r(2+r)^2 (3+r)^2 (4+r)}$	$\frac{85}{144}$
a_5	$-\frac{(r^2+1)(r^2+2r+2)(r^2+4r+5)(r^2+6r+10)(r^2+8r+17)}{(1+r)^2 r(2+r)^2 (3+r)^2 (4+r)^2 (5+r)}$	$-\frac{221}{432}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= x\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x\left(1 - x + \frac{5x^2}{6} - \frac{25x^3}{36} + \frac{85x^4}{144} - \frac{221x^5}{432} + O(x^6)\right)
\end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 1$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_1(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_1 \\ &= \frac{-r^2-1}{(1+r)\,r} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} \frac{-r^2-1}{(1+r)\,r} &= \lim_{r\to 0} \frac{-r^2-1}{(1+r)\,r} \\ &= \textit{undefined} \end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned} \frac{d}{dx} y_2(x) &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\ &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) \\ \frac{d^2}{dx^2} y_2(x) &= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \\ &\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\ &= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) \end{aligned}$$

Substituting these back into the given ode $x(x+1)\,y''+y'x+y=0$ gives

$$x(x+1)\left(Cy_1''(x)\ln\left(x\right)+\frac{2Cy_1'(x)}{x}-\frac{Cy_1(x)}{x^2}+\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+\left(Cy_1'(x)\ln\left(x\right)+\frac{Cy_1(x)}{x}+\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)x+Cy_1(x)\ln\left(x\right)+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0$$

Which can be written as

$$\left(\left(x(x+1)\,y_1''(x)+y_1'(x)\,x+y_1(x)\right)\ln\left(x\right)+x(x+1)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+y_1(x)\right)C+x(x+1)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)x+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0 \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$x(x+1)\,y_1''(x)+y_1'(x)\,x+y_1(x)=0$$

Eq (7) simplifes to

$$\left(x(x+1)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+y_1(x)\right)C+x(x+1)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)x+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0 \tag{8}$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\frac{\left(2x(x+1)\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) - \left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)\right) C}{x} + \frac{x^2(x+1)\left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) x^2 + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) x}{x} = 0 \tag{9}$$

Since $r_1 = 1$ and $r_2 = 0$ then the above becomes

$$\frac{\left(2x(x+1)\left(\sum_{n=0}^{\infty} x^{n} a_n (n+1)\right) - \left(\sum_{n=0}^{\infty} a_n x^{n+1}\right)\right) C}{x} + \frac{x^2(x+1)\left(\sum_{n=0}^{\infty} x^{-2+n} b_n n(n-1)\right) + \left(\sum_{n=0}^{\infty} x^{n-1} b_n n\right) x^2 + \left(\sum_{n=0}^{\infty} b_n x^{n}\right) x}{x} = 0 \tag{10}$$

Which simplifies to

$$\begin{aligned}&\left(\sum_{n=0}^{\infty} 2C\, x^{n+1} a_n (n+1)\right) + \left(\sum_{n=0}^{\infty} 2C\, x^{n} a_n (n+1)\right) \\ &+ \sum_{n=0}^{\infty} \left(-C\, x^n a_n\right) + \left(\sum_{n=0}^{\infty} x^n b_n n(n-1)\right) \\ &+ \left(\sum_{n=0}^{\infty} n\, x^{n-1} b_n (n-1)\right) + \left(\sum_{n=0}^{\infty} x^n b_n n\right) + \left(\sum_{n=0}^{\infty} b_n x^n\right) = 0\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n-1} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2C\, x^{n+1} a_n (n+1) = \sum_{n=2}^{\infty} 2C a_{-2+n} (n-1)\, x^{n-1}$$

$$\sum_{n=0}^{\infty} 2C\, x^{n} a_n (n+1) = \sum_{n=1}^{\infty} 2C a_{n-1} n\, x^{n-1}$$

$$\sum_{n=0}^{\infty} \left(-C\, x^{n} a_{n}\right) = \sum_{n=1}^{\infty} \left(-C a_{n-1} x^{n-1}\right)$$

$$\sum_{n=0}^{\infty} x^{n} b_{n} n(n-1) = \sum_{n=1}^{\infty} (n-1)\, b_{n-1}(-2+n)\, x^{n-1}$$

$$\sum_{n=0}^{\infty} x^{n} b_{n} n = \sum_{n=1}^{\infty} (n-1)\, b_{n-1} x^{n-1}$$

$$\sum_{n=0}^{\infty} b_{n} x^{n} = \sum_{n=1}^{\infty} b_{n-1} x^{n-1}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-1$.

$$\begin{aligned}
&\left(\sum_{n=2}^{\infty} 2C a_{-2+n}(n-1)\, x^{n-1}\right) + \left(\sum_{n=1}^{\infty} 2C a_{n-1} n\, x^{n-1}\right) + \sum_{n=1}^{\infty} \left(-C a_{n-1} x^{n-1}\right) \\
&+ \left(\sum_{n=1}^{\infty} (n-1)\, b_{n-1}(-2+n)\, x^{n-1}\right) + \left(\sum_{n=0}^{\infty} n\, x^{n-1} b_{n}(n-1)\right) \\
&+ \left(\sum_{n=1}^{\infty} (n-1)\, b_{n-1} x^{n-1}\right) + \left(\sum_{n=1}^{\infty} b_{n-1} x^{n-1}\right) = 0
\end{aligned} \tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n = N$, where $N = 1$ which is the difference between the two roots, we are free to choose $b_1 = 0$. Hence for $n = 1$, Eq (2B) gives

$$C + 1 = 0$$

Which is solved for C. Solving for C gives

$$C = -1$$

For $n = 2$, Eq (2B) gives

$$(2a_0 + 3a_1)\, C + 2b_1 + 2b_2 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$1 + 2b_2 = 0$$

Solving the above for b_2 gives

$$b_2 = -\frac{1}{2}$$

For $n = 3$, Eq (2B) gives

$$(4a_1 + 5a_2) C + 5b_2 + 6b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-\frac{8}{3} + 6b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = \frac{4}{9}$$

For $n = 4$, Eq (2B) gives

$$(6a_2 + 7a_3) C + 10b_3 + 12b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$\frac{155}{36} + 12b_4 = 0$$

Solving the above for b_4 gives

$$b_4 = -\frac{155}{432}$$

For $n = 5$, Eq (2B) gives

$$(8a_3 + 9a_4) C + 17b_4 + 20b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-\frac{1265}{216} + 20b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = \frac{253}{864}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -1$ and all b_n, then the second solution becomes

$$y_2(x) = (-1) \left(x\left(1 - x + \frac{5x^2}{6} - \frac{25x^3}{36} + \frac{85x^4}{144} - \frac{221x^5}{432} + O(x^6)\right)\right) \ln(x) + 1 - \frac{x^2}{2} + \frac{4x^3}{9} - \frac{155x^4}{432} + \frac{253x^5}{864} + O(x^6)$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x\left(1 - x + \frac{5x^2}{6} - \frac{25x^3}{36} + \frac{85x^4}{144} - \frac{221x^5}{432} + O\left(x^6\right)\right) \\
&\quad + c_2\left((-1)\left(x\left(1 - x + \frac{5x^2}{6} - \frac{25x^3}{36} + \frac{85x^4}{144} - \frac{221x^5}{432} + O\left(x^6\right)\right)\right)\ln\left(x\right) + 1 \right. \\
&\quad \left. - \frac{x^2}{2} + \frac{4x^3}{9} - \frac{155x^4}{432} + \frac{253x^5}{864} + O\left(x^6\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x\left(1 - x + \frac{5x^2}{6} - \frac{25x^3}{36} + \frac{85x^4}{144} - \frac{221x^5}{432} + O\left(x^6\right)\right) \\
&\quad + c_2\left(-x\left(1 - x + \frac{5x^2}{6} - \frac{25x^3}{36} + \frac{85x^4}{144} - \frac{221x^5}{432} + O\left(x^6\right)\right)\ln\left(x\right) + 1 - \frac{x^2}{2} + \frac{4x^3}{9} \right. \\
&\quad \left. - \frac{155x^4}{432} + \frac{253x^5}{864} + O\left(x^6\right)\right)
\end{aligned}
$$

<ins>Summary</ins>

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x\left(1 - x + \frac{5x^2}{6} - \frac{25x^3}{36} + \frac{85x^4}{144} - \frac{221x^5}{432} + O\left(x^6\right)\right) \\
&\quad + c_2\left(-x\left(1 - x + \frac{5x^2}{6} - \frac{25x^3}{36} + \frac{85x^4}{144} - \frac{221x^5}{432} + O\left(x^6\right)\right)\ln\left(x\right) + 1 - \frac{x^2}{2} \right. \\
&\quad \left. + \frac{4x^3}{9} - \frac{155x^4}{432} + \frac{253x^5}{864} + O\left(x^6\right)\right)
\end{aligned} \tag{1}
$$

<ins>Verification of solutions</ins>

$$
\begin{aligned}
y &= c_1 x\left(1 - x + \frac{5x^2}{6} - \frac{25x^3}{36} + \frac{85x^4}{144} - \frac{221x^5}{432} + O\left(x^6\right)\right) \\
&\quad + c_2\left(-x\left(1 - x + \frac{5x^2}{6} - \frac{25x^3}{36} + \frac{85x^4}{144} - \frac{221x^5}{432} + O\left(x^6\right)\right)\ln\left(x\right) + 1 - \frac{x^2}{2} + \frac{4x^3}{9} \right. \\
&\quad \left. - \frac{155x^4}{432} + \frac{253x^5}{864} + O\left(x^6\right)\right)
\end{aligned}
$$

Verified OK.

16.8.1 Maple step by step solution

Let's solve

$x(x+1)\,y''+y'x+y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{y}{x(x+1)}-\frac{y'}{x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{y'}{x+1}+\frac{y}{x(x+1)}=0$

☐ Check to see if x_0 is a regular singular point

- ○ Define functions

  $\left[P_2(x)=\frac{1}{x+1}, P_3(x)=\frac{1}{x(x+1)}\right]$

- ○ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

  $\left((x+1)\cdot P_2(x)\right)\Big|_{x=-1}=1$

- ○ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

  $\left((x+1)^2\cdot P_3(x)\right)\Big|_{x=-1}=0$

- ○ $x=-1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-1$

- Multiply by denominators

  $x(x+1)\,y''+y'x+y=0$

- Change variables using $x=u-1$ so that the regular singular point is at $u=0$

  $(u^2-u)\left(\frac{d^2}{du^2}y(u)\right)+(u-1)\left(\frac{d}{du}y(u)\right)+y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum\limits_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$$

- Shift index using $k- >k+1-m$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k- >k+2-m$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$-a_0 r^2 u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(-a_{k+1}(k+1+r)^2 + a_k(k^2+2kr+r^2+1)\right) u^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$-r^2 = 0$$

- Values of r that satisfy the indicial equation

  $$r = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$-a_{k+1}(k+1)^2 + a_k(k^2+1) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+1} = \frac{a_k(k^2+1)}{(k+1)^2}$$

- Recursion relation for $r = 0$

  $$a_{k+1} = \frac{a_k(k^2+1)}{(k+1)^2}$$

- Solution for $r = 0$

  $$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+1} = \frac{a_k(k^2+1)}{(k+1)^2}\right]$$

- Revert the change of variables $u = x+1$

  $$\left[y = \sum_{k=0}^{\infty} a_k(x+1)^k, a_{k+1} = \frac{a_k(k^2+1)}{(k+1)^2}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 5.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2(3x+2)\,y''+x(4+21x)\,y'-(1-9x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(6x^3+4x^2\right)y''+\left(21x^2+4x\right)y'+(9x-1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{4+21x}{2x\,(3x+2)}$$
$$q(x)=\frac{9x-1}{2x^2\,(3x+2)}$$

Table 788: Table $p(x), q(x)$ singularites.

$p(x) = \frac{4+21x}{2x(3x+2)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{2}{3}$	"regular"

$q(x) = \frac{9x-1}{2x^2(3x+2)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{2}{3}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{2}{3}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2(3x+2)\, y'' + \left(21x^2+4x\right) y' + (9x-1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2(3x+2)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(21x^2+4x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (9x-1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 6x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 21x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 9x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 6x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 6a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 21x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 21a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 9x^{1+n+r} a_n = \sum_{n=1}^{\infty} 9a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 6a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 21a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} 9a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r)(n+r-1) + 4x^{n+r} a_n (n+r) - a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) + 4x^r a_0 r - a_0 x^r = 0$$

Or

$$\left(4x^r r(-1+r) + 4x^r r - x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = -\frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 1$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sqrt{x} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{\sqrt{x}}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$6a_{n-1}(n+r-1)(n+r-2)+4a_n(n+r)(n+r-1) \\ +21a_{n-1}(n+r-1)+4a_n(n+r)+9a_{n-1}-a_n=0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{3(n+r)\,a_{n-1}}{2n+2r-1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{3(2n+1)\,a_{n-1}}{4n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-3-3r}{1+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = -\frac{9}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-3r}{1+2r}$	$-\frac{9}{4}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{9r^2+27r+18}{4r^2+8r+3}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = \frac{135}{32}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-3r}{1+2r}$	$-\frac{9}{4}$
a_2	$\frac{9r^2+27r+18}{4r^2+8r+3}$	$\frac{135}{32}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-27r^3 - 162r^2 - 297r - 162}{8r^3 + 36r^2 + 46r + 15}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = -\frac{945}{128}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-3r}{1+2r}$	$-\frac{9}{4}$
a_2	$\frac{9r^2+27r+18}{4r^2+8r+3}$	$\frac{135}{32}$
a_3	$\frac{-27r^3-162r^2-297r-162}{8r^3+36r^2+46r+15}$	$-\frac{945}{128}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{81r^4 + 810r^3 + 2835r^2 + 4050r + 1944}{16r^4 + 128r^3 + 344r^2 + 352r + 105}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{25515}{2048}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-3r}{1+2r}$	$-\frac{9}{4}$
a_2	$\frac{9r^2+27r+18}{4r^2+8r+3}$	$\frac{135}{32}$
a_3	$\frac{-27r^3-162r^2-297r-162}{8r^3+36r^2+46r+15}$	$-\frac{945}{128}$
a_4	$\frac{81r^4+810r^3+2835r^2+4050r+1944}{16r^4+128r^3+344r^2+352r+105}$	$\frac{25515}{2048}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{243(5+r)(4+r)(3+r)(2+r)(1+r)}{32r^5+400r^4+1840r^3+3800r^2+3378r+945}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = -\frac{168399}{8192}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3-3r}{1+2r}$	$-\frac{9}{4}$
a_2	$\frac{9r^2+27r+18}{4r^2+8r+3}$	$\frac{135}{32}$
a_3	$\frac{-27r^3-162r^2-297r-162}{8r^3+36r^2+46r+15}$	$-\frac{945}{128}$
a_4	$\frac{81r^4+810r^3+2835r^2+4050r+1944}{16r^4+128r^3+344r^2+352r+105}$	$\frac{25515}{2048}$
a_5	$-\frac{243(5+r)(4+r)(3+r)(2+r)(1+r)}{32r^5+400r^4+1840r^3+3800r^2+3378r+945}$	$-\frac{168399}{8192}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= \sqrt{x}\left(1 - \frac{9x}{4} + \frac{135x^2}{32} - \frac{945x^3}{128} + \frac{25515x^4}{2048} - \frac{168399x^5}{8192} + O(x^6)\right)
\end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 1$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\rightarrow r_2} a_1(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_1 \\ &= \frac{-3-3r}{1+2r} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\rightarrow r_2} \frac{-3-3r}{1+2r} &= \lim_{r\rightarrow -\frac{1}{2}} \frac{-3-3r}{1+2r} \\ &= \textit{undefined} \end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned} \frac{d}{dx} y_2(x) &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\ &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) \\ \frac{d^2}{dx^2} y_2(x) &= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \\ &\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\ &= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) \end{aligned}$$

Substituting these back into the given ode $2x^2(3x+2)\, y'' + (21x^2+4x)\, y' + (9x-1)\, y =$

0 gives

$$
\begin{aligned}
&2x^2(3x+2)\left(Cy_1''(x)\ln(x)+\frac{2Cy_1'(x)}{x}-\frac{Cy_1(x)}{x^2}\right.\\
&\left.+\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+\left(21x^2+4x\right)\left(Cy_1'(x)\ln(x)+\frac{Cy_1(x)}{x}+\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)\\
&+(9x-1)\left(Cy_1(x)\ln(x)+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)\right)=0
\end{aligned}
$$

Which can be written as

$$
\begin{aligned}
&\left(\left(2x^2(3x+2)\,y_1''(x)+\left(21x^2+4x\right)y_1'(x)+(9x-1)\,y_1(x)\right)\ln(x)\right.\\
&\left.+2x^2(3x+2)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{\left(21x^2+4x\right)y_1(x)}{x}\right)C\\
&+2x^2(3x+2)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+\left(21x^2+4x\right)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(9x-1)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0
\end{aligned}
\tag{7}
$$

But since $y_1(x)$ is a solution to the ode, then

$$
2x^2(3x+2)\,y_1''(x)+\left(21x^2+4x\right)y_1'(x)+(9x-1)\,y_1(x)=0
$$

Eq (7) simplifes to

$$
\begin{aligned}
&\left(2x^2(3x+2)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{\left(21x^2+4x\right)y_1(x)}{x}\right)C\\
&+2x^2(3x+2)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+\left(21x^2+4x\right)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(9x-1)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0
\end{aligned}
\tag{8}
$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\left(12\left(x+\frac{2}{3}\right)x\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right)+15\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)x\right)C \\ +\left(6x^3+4x^2\right)\left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) \\ +\left(21x^2+4x\right)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right)+(9x-1)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)=0 \tag{9}$$

Since $r_1 = \frac{1}{2}$ and $r_2 = -\frac{1}{2}$ then the above becomes

$$\left(12\left(x+\frac{2}{3}\right)x\left(\sum_{n=0}^{\infty} x^{n-\frac{1}{2}} a_n \left(n+\frac{1}{2}\right)\right)+15\left(\sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}\right)x\right)C \\ +\left(6x^3+4x^2\right)\left(\sum_{n=0}^{\infty} x^{-\frac{5}{2}+n} b_n \left(n-\frac{1}{2}\right)\left(-\frac{3}{2}+n\right)\right) \\ +\left(21x^2+4x\right)\left(\sum_{n=0}^{\infty} x^{-\frac{3}{2}+n} b_n \left(n-\frac{1}{2}\right)\right)+(9x-1)\left(\sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}\right)=0 \tag{10}$$

Expanding $4C\sqrt{x}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned} 4C\sqrt{x} &= 4C\sqrt{x}+\dots \\ &= 4C\sqrt{x} \end{aligned}$$

Expanding $\frac{3\sqrt{x}}{2}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned} \frac{3\sqrt{x}}{2} &= \frac{3\sqrt{x}}{2}+\dots \\ &= \frac{3\sqrt{x}}{2} \end{aligned}$$

Expanding $\frac{1}{\sqrt{x}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned} \frac{1}{\sqrt{x}} &= \frac{1}{\sqrt{x}}+\dots \\ &= \frac{1}{\sqrt{x}} \end{aligned}$$

Expanding $\frac{21\sqrt{x}}{2}$ as Taylor series around $x=0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{21\sqrt{x}}{2} &= \frac{21\sqrt{x}}{2} + \dots \\ &= \frac{21\sqrt{x}}{2}\end{aligned}$$

Expanding $\frac{2}{\sqrt{x}}$ as Taylor series around $x=0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{2}{\sqrt{x}} &= \frac{2}{\sqrt{x}} + \dots \\ &= \frac{2}{\sqrt{x}}\end{aligned}$$

Expanding $9\sqrt{x}$ as Taylor series around $x=0$ and keeping only the first 6 terms gives

$$\begin{aligned}9\sqrt{x} &= 9\sqrt{x} + \dots \\ &= 9\sqrt{x}\end{aligned}$$

Expanding $-\frac{1}{\sqrt{x}}$ as Taylor series around $x=0$ and keeping only the first 6 terms gives

$$\begin{aligned}-\frac{1}{\sqrt{x}} &= -\frac{1}{\sqrt{x}} + \dots \\ &= -\frac{1}{\sqrt{x}}\end{aligned}$$

Which simplifies to

$$\begin{aligned}&\left(\sum_{n=0}^{\infty} (12n+6)\, C a_n x^{\frac{3}{2}+n}\right) + \left(\sum_{n=0}^{\infty} (8n+4)\, C a_n x^{n+\frac{1}{2}}\right) \\ &+ \left(\sum_{n=0}^{\infty} 15C\, x^{\frac{3}{2}+n} a_n\right) + \left(\sum_{n=0}^{\infty} \frac{3x^{n+\frac{1}{2}} b_n (4n^2-8n+3)}{2}\right) \\ &+ \left(\sum_{n=0}^{\infty} x^{n-\frac{1}{2}} b_n (4n^2-8n+3)\right) + \left(\sum_{n=0}^{\infty} \frac{21x^{n+\frac{1}{2}} b_n (2n-1)}{2}\right) \\ &+ \left(\sum_{n=0}^{\infty} (4n-2)\, b_n x^{n-\frac{1}{2}}\right) + \left(\sum_{n=0}^{\infty} 9x^{n+\frac{1}{2}} b_n\right) + \sum_{n=0}^{\infty} \left(-b_n x^{n-\frac{1}{2}}\right) = 0\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n-\frac{1}{2}$ in each summation term. Going over each summation term above with power of x in it which is not already $x^{n-\frac{1}{2}}$ and

adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(12n+6\right) C a_{n} x^{\frac{3}{2}+n} = \sum_{n=2}^{\infty} C a_{n-2} \left(12n-18\right) x^{n-\frac{1}{2}}$$

$$\sum_{n=0}^{\infty} \left(8n+4\right) C a_{n} x^{n+\frac{1}{2}} = \sum_{n=1}^{\infty} C a_{n-1} \left(8n-4\right) x^{n-\frac{1}{2}}$$

$$\sum_{n=0}^{\infty} 15 C\, x^{\frac{3}{2}+n} a_{n} = \sum_{n=2}^{\infty} 15 C a_{n-2} x^{n-\frac{1}{2}}$$

$$\sum_{n=0}^{\infty} \frac{3 x^{n+\frac{1}{2}} b_{n} \left(4n^{2}-8n+3\right)}{2} = \sum_{n=1}^{\infty} \frac{3 b_{n-1} \left(4 \left(n-1\right)^{2}-8n+11\right) x^{n-\frac{1}{2}}}{2}$$

$$\sum_{n=0}^{\infty} \frac{21 x^{n+\frac{1}{2}} b_{n} \left(2n-1\right)}{2} = \sum_{n=1}^{\infty} \frac{21 b_{n-1} \left(-3+2n\right) x^{n-\frac{1}{2}}}{2}$$

$$\sum_{n=0}^{\infty} 9 x^{n+\frac{1}{2}} b_{n} = \sum_{n=1}^{\infty} 9 b_{n-1} x^{n-\frac{1}{2}}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-\frac{1}{2}$.

$$\begin{aligned} &\left(\sum_{n=2}^{\infty} C a_{n-2} \left(12n-18\right) x^{n-\frac{1}{2}}\right) + \left(\sum_{n=1}^{\infty} C a_{n-1} \left(8n-4\right) x^{n-\frac{1}{2}}\right) \\ &+ \left(\sum_{n=2}^{\infty} 15 C a_{n-2} x^{n-\frac{1}{2}}\right) + \left(\sum_{n=1}^{\infty} \frac{3 b_{n-1} \left(4 \left(n-1\right)^{2}-8n+11\right) x^{n-\frac{1}{2}}}{2}\right) \\ &+ \left(\sum_{n=0}^{\infty} x^{n-\frac{1}{2}} b_{n} \left(4n^{2}-8n+3\right)\right) + \left(\sum_{n=1}^{\infty} \frac{21 b_{n-1} \left(-3+2n\right) x^{n-\frac{1}{2}}}{2}\right) \\ &+ \left(\sum_{n=0}^{\infty} \left(4n-2\right) b_{n} x^{n-\frac{1}{2}}\right) + \left(\sum_{n=1}^{\infty} 9 b_{n-1} x^{n-\frac{1}{2}}\right) + \sum_{n=0}^{\infty} \left(-b_{n} x^{n-\frac{1}{2}}\right) = 0 \end{aligned} \tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0=1$. For $n=N$, where $N=1$ which is the difference between the two roots, we are free to choose $b_1=0$. Hence for $n=1$, Eq (2B) gives

$$4C+3=0$$

Which is solved for C. Solving for C gives

$$C = -\frac{3}{4}$$

For $n = 2$, Eq (2B) gives

$$(21a_0 + 12a_1) C + 18b_1 + 8b_2 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$\frac{9}{2} + 8b_2 = 0$$

Solving the above for b_2 gives

$$b_2 = -\frac{9}{16}$$

For $n = 3$, Eq (2B) gives

$$(33a_1 + 20a_2) C + 45b_2 + 24b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-\frac{1053}{32} + 24b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = \frac{351}{256}$$

For $n = 4$, Eq (2B) gives

$$(45a_2 + 28a_3) C + 84b_3 + 48b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$\frac{8181}{64} + 48b_4 = 0$$

Solving the above for b_4 gives

$$b_4 = -\frac{2727}{1024}$$

For $n = 5$, Eq (2B) gives

$$(57a_3 + 36a_4) C + 135b_4 + 80b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-\frac{778815}{2048} + 80b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = \frac{155763}{32768}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{3}{4}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{3}{4}\left(\sqrt{x}\left(1 - \frac{9x}{4} + \frac{135x^2}{32} - \frac{945x^3}{128} + \frac{25515x^4}{2048} - \frac{168399x^5}{8192} + O(x^6)\right)\right)\ln(x) + \frac{1 - \frac{9x^2}{16} + \frac{351x^3}{256} - \frac{2727x^4}{1024} + \frac{155763x^5}{32768} + O(x^6)}{\sqrt{x}}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1\sqrt{x}\left(1 - \frac{9x}{4} + \frac{135x^2}{32} - \frac{945x^3}{128} + \frac{25515x^4}{2048} - \frac{168399x^5}{8192} + O(x^6)\right) \\ &\quad + c_2\left(-\frac{3}{4}\left(\sqrt{x}\left(1 - \frac{9x}{4} + \frac{135x^2}{32} - \frac{945x^3}{128} + \frac{25515x^4}{2048} - \frac{168399x^5}{8192} + O(x^6)\right)\right)\ln(x) \right. \\ &\qquad \left. + \frac{1 - \frac{9x^2}{16} + \frac{351x^3}{256} - \frac{2727x^4}{1024} + \frac{155763x^5}{32768} + O(x^6)}{\sqrt{x}}\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1\sqrt{x}\left(1 - \frac{9x}{4} + \frac{135x^2}{32} - \frac{945x^3}{128} + \frac{25515x^4}{2048} - \frac{168399x^5}{8192} + O(x^6)\right) \\ &\quad + c_2\left(-\frac{3\sqrt{x}\left(1 - \frac{9x}{4} + \frac{135x^2}{32} - \frac{945x^3}{128} + \frac{25515x^4}{2048} - \frac{168399x^5}{8192} + O(x^6)\right)\ln(x)}{4} \right. \\ &\qquad \left. + \frac{1 - \frac{9x^2}{16} + \frac{351x^3}{256} - \frac{2727x^4}{1024} + \frac{155763x^5}{32768} + O(x^6)}{\sqrt{x}}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1\sqrt{x}\left(1-\frac{9x}{4}+\frac{135x^2}{32}-\frac{945x^3}{128}+\frac{25515x^4}{2048}-\frac{168399x^5}{8192}+O(x^6)\right) + c_2\left(-\frac{3\sqrt{x}\left(1-\frac{9x}{4}+\frac{135x^2}{32}-\frac{945x^3}{128}+\frac{25515x^4}{2048}-\frac{168399x^5}{8192}+O(x^6)\right)\ln(x)}{4} + \frac{1-\frac{9x^2}{16}+\frac{351x^3}{256}-\frac{2727x^4}{1024}+\frac{155763x^5}{32768}+O(x^6)}{\sqrt{x}}\right) \tag{1}$$

Verification of solutions

$$y = c_1\sqrt{x}\left(1-\frac{9x}{4}+\frac{135x^2}{32}-\frac{945x^3}{128}+\frac{25515x^4}{2048}-\frac{168399x^5}{8192}+O(x^6)\right) + c_2\left(-\frac{3\sqrt{x}\left(1-\frac{9x}{4}+\frac{135x^2}{32}-\frac{945x^3}{128}+\frac{25515x^4}{2048}-\frac{168399x^5}{8192}+O(x^6)\right)\ln(x)}{4} + \frac{1-\frac{9x^2}{16}+\frac{351x^3}{256}-\frac{2727x^4}{1024}+\frac{155763x^5}{32768}+O(x^6)}{\sqrt{x}}\right)$$

Verified OK.

16.9.1 Maple step by step solution

Let's solve

$2x^2(3x+2)\,y''+(21x^2+4x)\,y'+(9x-1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(9x-1)y}{2x^2(3x+2)}-\frac{(4+21x)y'}{2x(3x+2)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(4+21x)y'}{2x(3x+2)}+\frac{(9x-1)y}{2x^2(3x+2)}=0$

☐ Check to see if x_0 is a regular singular point

  ◦ Define functions

$\left[P_2(x)=\frac{4+21x}{2x(3x+2)}, P_3(x)=\frac{9x-1}{2x^2(3x+2)}\right]$

- $x \cdot P_2(x)$ is analytic at $x=0$

  $\left(x \cdot P_2(x)\right)\bigg|_{x=0}=1$

- $x^2 \cdot P_3(x)$ is analytic at $x=0$

  $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0}=-\frac{1}{4}$

- $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $2x^2(3x+2)\,y''+x(4+21x)\,y'+(9x-1)\,y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m=0..1$

  $x^m \cdot y=\sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^m \cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m=1..2$

  $x^m \cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^m \cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m=2..3$

  $x^m \cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$

- Shift index using $k->k+2-m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(1+2r)(-1+2r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(2k+2r+1)(2k+2r-1) + 3a_{k-1}(2k+2r+1)(k+r)\right) x^{k+$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1+2r)(-1+2r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-\frac{1}{2}, \frac{1}{2}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$4\left(k+r+\frac{1}{2}\right)\left(\left(k+r-\frac{1}{2}\right)a_k + \frac{3a_{k-1}(k+r)}{2}\right) = 0$$

- Shift index using $k->k+1$

$$4\left(k+\frac{3}{2}+r\right)\left(\left(k+r+\frac{1}{2}\right)a_{k+1} + \frac{3a_k(k+r+1)}{2}\right) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = -\frac{3a_k(k+r+1)}{2k+2r+1}$$

- Recursion relation for $r = -\frac{1}{2}$

$$a_{k+1} = -\frac{3a_k\left(k+\frac{1}{2}\right)}{2k}$$

- Solution for $r = -\frac{1}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{1}{2}}, a_{k+1} = -\frac{3a_k\left(k+\frac{1}{2}\right)}{2k}\right]$$

- Recursion relation for $r = \frac{1}{2}$

$$a_{k+1} = -\frac{3a_k\left(k+\frac{3}{2}\right)}{2k+2}$$

- Solution for $r = \frac{1}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+1} = -\frac{3a_k\left(k+\frac{3}{2}\right)}{2k+2}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-\frac{1}{2}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{2}}\right), a_{1+k} = -\frac{3a_k\left(k+\frac{1}{2}\right)}{2k}, b_{1+k} = -\frac{3b_k\left(k+\frac{3}{2}\right)}{2k+2}\right]$$

Problem number: 6.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' + x(2+x)\,y' - (-3x+2)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + \left(x^2 + 2x\right)y' + (3x-2)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{2+x}{x}$$
$$q(x) = \frac{3x-2}{x^2}$$

Table 790: Table $p(x), q(x)$ singularites.

$p(x) = \frac{2+x}{x}$	
singularity	type
$x = 0$	"regular"

$q(x) = \frac{3x-2}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2 y'' + (x^2 + 2x)\, y' + (3x - 2)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}\right) + (x^2 + 2x) \left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) + (3x - 2) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-2a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{1+n+r} a_n = \sum_{n=1}^{\infty} 3a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} 3a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-2a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + 2x^{n+r} a_n (n+r) - 2a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) + 2x^r a_0 r - 2a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + 2x^r r - 2x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2 + r - 2\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 + r - 2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = -2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(r^2 + r - 2\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 3$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^2}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{1+n}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-2}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$a_n(n + r)(n + r - 1) + a_{n-1}(n + r - 1) + 2a_n(n + r) + 3a_{n-1} - 2a_n = 0 \qquad (3)$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}}{n+r-1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{1}{r}$$

Which for the root $r = 1$ becomes

$$a_1 = -1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r}$	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1}{r(1+r)}$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r}$	-1
a_2	$\frac{1}{r(1+r)}$	$\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{1}{r(1+r)(r+2)}$$

Which for the root $r = 1$ becomes

$$a_3 = -\frac{1}{6}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r}$	-1
a_2	$\frac{1}{r(1+r)}$	$\frac{1}{2}$
a_3	$-\frac{1}{r(1+r)(r+2)}$	$-\frac{1}{6}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{r(1+r)(r+2)(3+r)}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{1}{24}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r}$	-1
a_2	$\frac{1}{r(1+r)}$	$\frac{1}{2}$
a_3	$-\frac{1}{r(1+r)(r+2)}$	$-\frac{1}{6}$
a_4	$\frac{1}{r(1+r)(r+2)(3+r)}$	$\frac{1}{24}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{1}{r(1+r)(r+2)(3+r)(4+r)}$$

Which for the root $r = 1$ becomes

$$a_5 = -\frac{1}{120}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r}$	-1
a_2	$\frac{1}{r(1+r)}$	$\frac{1}{2}$
a_3	$-\frac{1}{r(1+r)(r+2)}$	$-\frac{1}{6}$
a_4	$\frac{1}{r(1+r)(r+2)(3+r)}$	$\frac{1}{24}$
a_5	$-\frac{1}{r(1+r)(r+2)(3+r)(4+r)}$	$-\frac{1}{120}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x\big(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6\dots\big) \\ &= x\left(1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} - \frac{x^5}{120} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 3$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_3(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_3 \\ &= -\frac{1}{r(1+r)(r+2)} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} -\frac{1}{r(1+r)(r+2)} &= \lim_{r\to -2} -\frac{1}{r(1+r)(r+2)} \\ &= \textit{undefined} \end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$
\begin{aligned}
\frac{d}{dx}y_2(x) &= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\
&= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n+r_2)\right) \\
\frac{d^2}{dx^2}y_2(x) &= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\
&= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n+r_2)(-1+n+r_2)\right)
\end{aligned}
$$

Substituting these back into the given ode $x^2y'' + (x^2+2x)\,y' + (3x-2)\,y = 0$ gives

$$
\begin{aligned}
& x^2\left(Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2}\right. \\
&\left. + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) \\
&+ (x^2+2x)\left(Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right) \\
&+ (3x-2)\left(Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)\right) = 0
\end{aligned}
$$

Which can be written as

$$
\begin{aligned}
&\left(\left(x^2y_1''(x) + (x^2+2x)\,y_1'(x) + (3x-2)\,y_1(x)\right)\ln(x) + x^2\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right)\right. \\
&\left. + \frac{(x^2+2x)\,y_1(x)}{x}\right)C + x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) \\
&+ (x^2+2x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right) + (3x-2)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0
\end{aligned} \tag{7}
$$

But since $y_1(x)$ is a solution to the ode, then

$$x^2 y_1''(x) + (x^2 + 2x)\, y_1'(x) + (3x - 2)\, y_1(x) = 0$$

Eq (7) simplifes to

$$\begin{aligned}
&\left(x^2\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) + \frac{(x^2+2x)\, y_1(x)}{x}\right) C \\
&+ x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) \\
&+ (x^2+2x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right) + (3x-2)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0
\end{aligned} \tag{8}$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\begin{aligned}
&\left(2\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) x + (x+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)\right) C \\
&+ \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) x^2 \\
&+ (x^2+2x)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) + (3x-2)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0
\end{aligned} \tag{9}$$

Since $r_1 = 1$ and $r_2 = -2$ then the above becomes

$$\begin{aligned}
&\left(2\left(\sum_{n=0}^{\infty} x^{n} a_n (1+n)\right) x + (x+1)\left(\sum_{n=0}^{\infty} a_n x^{1+n}\right)\right) C \\
&+ \left(\sum_{n=0}^{\infty} x^{-4+n} b_n (n-2)(-3+n)\right) x^2 \\
&+ (x^2+2x)\left(\sum_{n=0}^{\infty} x^{-3+n} b_n (n-2)\right) + (3x-2)\left(\sum_{n=0}^{\infty} b_n x^{n-2}\right) = 0
\end{aligned} \tag{10}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2C\,x^{1+n} a_n (1+n)\right)+\left(\sum_{n=0}^{\infty} C\,x^{n+2} a_n\right)+\left(\sum_{n=0}^{\infty} C\,x^{1+n} a_n\right)$$
$$+\left(\sum_{n=0}^{\infty} x^{n-2} b_n \left(n^2-5n+6\right)\right)+\left(\sum_{n=0}^{\infty} x^{n-1} b_n (n-2)\right)$$
$$+\left(\sum_{n=0}^{\infty} 2x^{n-2} b_n (n-2)\right)+\left(\sum_{n=0}^{\infty} 3x^{n-1} b_n\right)+\sum_{n=0}^{\infty}\left(-2b_n x^{n-2}\right)=0 \tag{2A}$$

The next step is to make all powers of x be $n-2$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n-2} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2C\,x^{1+n} a_n (1+n)=\sum_{n=3}^{\infty} 2C a_{-3+n} (n-2)\,x^{n-2}$$

$$\sum_{n=0}^{\infty} C\,x^{n+2} a_n=\sum_{n=4}^{\infty} C a_{-4+n} x^{n-2}$$

$$\sum_{n=0}^{\infty} C\,x^{1+n} a_n=\sum_{n=3}^{\infty} C a_{-3+n} x^{n-2}$$

$$\sum_{n=0}^{\infty} x^{n-1} b_n (n-2)=\sum_{n=1}^{\infty} b_{n-1}(-3+n)\,x^{n-2}$$

$$\sum_{n=0}^{\infty} 3x^{n-1} b_n=\sum_{n=1}^{\infty} 3b_{n-1} x^{n-2}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-2$.

$$\left(\sum_{n=3}^{\infty} 2C a_{-3+n} (n-2)\,x^{n-2}\right)+\left(\sum_{n=4}^{\infty} C a_{-4+n} x^{n-2}\right)+\left(\sum_{n=3}^{\infty} C a_{-3+n} x^{n-2}\right)$$
$$+\left(\sum_{n=0}^{\infty} x^{n-2} b_n \left(n^2-5n+6\right)\right)+\left(\sum_{n=1}^{\infty} b_{n-1}(-3+n)\,x^{n-2}\right)$$
$$+\left(\sum_{n=0}^{\infty} 2x^{n-2} b_n (n-2)\right)+\left(\sum_{n=1}^{\infty} 3b_{n-1} x^{n-2}\right)+\sum_{n=0}^{\infty}\left(-2b_n x^{n-2}\right)=0 \tag{2B}$$

For $n = 0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n = 1$, Eq (2B) gives

$$b_0 - 2b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$1 - 2b_1 = 0$$

Solving the above for b_1 gives

$$b_1 = \frac{1}{2}$$

For $n = 2$, Eq (2B) gives

$$2b_1 - 2b_2 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$1 - 2b_2 = 0$$

Solving the above for b_2 gives

$$b_2 = \frac{1}{2}$$

For $n = N$, where $N = 3$ which is the difference between the two roots, we are free to choose $b_3 = 0$. Hence for $n = 3$, Eq (2B) gives

$$3C + \frac{3}{2} = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{1}{2}$$

For $n = 4$, Eq (2B) gives

$$(a_0 + 5a_1)\, C + 4b_3 + 4b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$2 + 4b_4 = 0$$

Solving the above for b_4 gives

$$b_4 = -\frac{1}{2}$$

For $n = 5$, Eq (2B) gives

$$(a_1 + 7a_2)\, C + 5b_4 + 10b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-\frac{15}{4}+10b_5=0$$

Solving the above for b_5 gives

$$b_5=\frac{3}{8}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x)=Cy_1(x)\ln(x)+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)$$

Using the above value found for $C=-\frac{1}{2}$ and all b_n, then the second solution becomes

$$\begin{aligned}y_2(x)=&-\frac{1}{2}\left(x\left(1-x+\frac{x^2}{2}-\frac{x^3}{6}+\frac{x^4}{24}-\frac{x^5}{120}+O\left(x^6\right)\right)\right)\ln(x)\\&+\frac{1+\frac{x}{2}+\frac{x^2}{2}-\frac{x^4}{2}+\frac{3x^5}{8}+O(x^6)}{x^2}\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x)&=c_1y_1(x)+c_2y_2(x)\\&=c_1x\left(1-x+\frac{x^2}{2}-\frac{x^3}{6}+\frac{x^4}{24}-\frac{x^5}{120}+O\left(x^6\right)\right)\\&\quad+c_2\left(-\frac{1}{2}\left(x\left(1-x+\frac{x^2}{2}-\frac{x^3}{6}+\frac{x^4}{24}-\frac{x^5}{120}+O\left(x^6\right)\right)\right)\ln(x)\right.\\&\quad\left.+\frac{1+\frac{x}{2}+\frac{x^2}{2}-\frac{x^4}{2}+\frac{3x^5}{8}+O(x^6)}{x^2}\right)\end{aligned}$$

Hence the final solution is

$$\begin{aligned}y&=y_h\\&=c_1x\left(1-x+\frac{x^2}{2}-\frac{x^3}{6}+\frac{x^4}{24}-\frac{x^5}{120}+O\left(x^6\right)\right)\\&\quad+c_2\left(-\frac{x\left(1-x+\frac{x^2}{2}-\frac{x^3}{6}+\frac{x^4}{24}-\frac{x^5}{120}+O(x^6)\right)\ln(x)}{2}\right.\\&\quad\left.+\frac{1+\frac{x}{2}+\frac{x^2}{2}-\frac{x^4}{2}+\frac{3x^5}{8}+O(x^6)}{x^2}\right)\end{aligned}$$

Summary
The solution(s) found are the following

$$
y = c_1 x \left(1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} - \frac{x^5}{120} + O(x^6)\right) + c_2 \left(-\frac{x\left(1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} - \frac{x^5}{120} + O(x^6)\right)\ln(x)}{2} + \frac{1 + \frac{x}{2} + \frac{x^2}{2} - \frac{x^4}{2} + \frac{3x^5}{8} + O(x^6)}{x^2}\right) \tag{1}
$$

Verification of solutions

$$
y = c_1 x \left(1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} - \frac{x^5}{120} + O(x^6)\right) + c_2 \left(-\frac{x\left(1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} - \frac{x^5}{120} + O(x^6)\right)\ln(x)}{2} + \frac{1 + \frac{x}{2} + \frac{x^2}{2} - \frac{x^4}{2} + \frac{3x^5}{8} + O(x^6)}{x^2}\right)
$$

Verified OK.

16.10.1 Maple step by step solution

Let's solve

$x^2 y'' + (x^2 + 2x) y' + (3x - 2) y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(3x-2)y}{x^2} - \frac{(2+x)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(2+x)y'}{x} + \frac{(3x-2)y}{x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{2+x}{x}, P_3(x) = \frac{3x-2}{x^2}\right]$

- $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\bigg|_{x=0} = 2$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = -2$

- $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2 y'' + x(2+x)\, y' + (3x-2)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k- >k-m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$

- Shift index using $k- >k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$

- Convert $x^2 \cdot y''$ to series expansion

  $x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(2+r)\,(-1+r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(k+r+2)\,(k+r-1) + a_{k-1}(k+r+2)\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(2+r)(-1+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{-2, 1\}$

- Each term in the series must be 0, giving the recursion relation

  $(k+r+2)(a_k(k+r-1)+a_{k-1}) = 0$

- Shift index using $k- >k+1$

  $(k+r+3)(a_{k+1}(k+r)+a_k) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+1} = -\frac{a_k}{k+r}$

- Recursion relation for $r = -2$

  $a_{k+1} = -\frac{a_k}{k-2}$

- Series not valid for $r = -2$, division by 0 in the recursion relation at $k = 2$

  $a_{k+1} = -\frac{a_k}{k-2}$

- Recursion relation for $r = 1$

  $a_{k+1} = -\frac{a_k}{k+1}$

- Solution for $r = 1$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+1} = -\frac{a_k}{k+1}\right]$

Problem number: 7.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2y'' + 4y'x - (9 - x)\, y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$4x^2y'' + 4y'x + (-9 + x)\, y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$\begin{aligned} p(x) &= \frac{1}{x} \\ q(x) &= \frac{-9 + x}{4x^2} \end{aligned}$$

Table 792: Table $p(x), q(x)$ singularites.

$p(x) = \frac{1}{x}$	
singularity	type
$x = 0$	"regular"

$q(x) = \frac{-9+x}{4x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : [∞]

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2y'' + 4y'x + (-9 + x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2\left(\sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}\right) + 4\left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) x + (-9 + x) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n(n+r)\,(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n(n+r)\right) + \sum_{n=0}^{\infty} \left(-9a_n x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n(n+r)\,(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n(n+r)\right) + \sum_{n=0}^{\infty} \left(-9a_n x^{n+r}\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n(n+r)\,(n+r-1) + 4x^{n+r} a_n(n+r) - 9a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$4x^r a_0 r(-1+r) + 4x^r a_0 r - 9a_0 x^r = 0$$

Or

$$\left(4x^r r(-1+r) + 4x^r r - 9x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 - 9\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 - 9 = 0$$

Solving for r gives the roots of the indicial equation as

$$
\begin{aligned}
r_1 &= \frac{3}{2} \\
r_2 &= -\frac{3}{2}
\end{aligned}
$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$
(4r^2 - 9)\, x^r = 0
$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 3$ is an integer, then we can construct two linearly independent solutions

$$
\begin{aligned}
y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right) \\
y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)
\end{aligned}
$$

Or

$$
\begin{aligned}
y_1(x) &= x^{\frac{3}{2}} \left(\sum_{n=0}^{\infty} a_n x^n\right) \\
y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^{\frac{3}{2}}}
\end{aligned}
$$

Or

$$
\begin{aligned}
y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+\frac{3}{2}} \\
y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{3}{2}}\right)
\end{aligned}
$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$
4a_n(n+r)(n+r-1) + 4a_n(n+r) - 9a_n + a_{n-1} = 0 \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = -\frac{a_{n-1}}{4n^2 + 8nr + 4r^2 - 9} \tag{4}
$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_n = -\frac{a_{n-1}}{4n(n+3)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{3}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{1}{4r^2 + 8r - 5}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_1 = -\frac{1}{16}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4r^2+8r-5}$	$-\frac{1}{16}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1}{16r^4 + 96r^3 + 136r^2 - 24r - 35}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_2 = \frac{1}{640}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4r^2+8r-5}$	$-\frac{1}{16}$
a_2	$\frac{1}{16r^4+96r^3+136r^2-24r-35}$	$\frac{1}{640}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{1}{64r^6 + 768r^5 + 3280r^4 + 5760r^3 + 2956r^2 - 1488r - 945}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_3 = -\frac{1}{46080}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4r^2+8r-5}$	$-\frac{1}{16}$
a_2	$\frac{1}{16r^4+96r^3+136r^2-24r-35}$	$\frac{1}{640}$
a_3	$-\frac{1}{64r^6+768r^5+3280r^4+5760r^3+2956r^2-1488r-945}$	$-\frac{1}{46080}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{(64r^6 + 768r^5 + 3280r^4 + 5760r^3 + 2956r^2 - 1488r - 945)(4r^2 + 32r + 55)}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_4 = \frac{1}{5160960}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4r^2+8r-5}$	$-\frac{1}{16}$
a_2	$\frac{1}{16r^4+96r^3+136r^2-24r-35}$	$\frac{1}{640}$
a_3	$-\frac{1}{64r^6+768r^5+3280r^4+5760r^3+2956r^2-1488r-945}$	$-\frac{1}{46080}$
a_4	$\frac{1}{(64r^6+768r^5+3280r^4+5760r^3+2956r^2-1488r-945)(4r^2+32r+55)}$	$\frac{1}{5160960}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{1}{(64r^6 + 768r^5 + 3280r^4 + 5760r^3 + 2956r^2 - 1488r - 945)(4r^2 + 32r + 55)(4r^2 + 40r + 91)}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_5 = -\frac{1}{825753600}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4r^2+8r-5}$	$-\frac{1}{16}$
a_2	$\frac{1}{16r^4+96r^3+136r^2-24r-35}$	$\frac{1}{640}$
a_3	$-\frac{1}{64r^6+768r^5+3280r^4+5760r^3+2956r^2-1488r-945}$	$-\frac{1}{46080}$
a_4	$\frac{1}{(64r^6+768r^5+3280r^4+5760r^3+2956r^2-1488r-945)(4r^2+32r+55)}$	$\frac{1}{5160960}$
a_5	$-\frac{1}{(64r^6+768r^5+3280r^4+5760r^3+2956r^2-1488r-945)(4r^2+32r+55)(4r^2+40r+91)}$	$-\frac{1}{825753600}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{3}{2}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{3}{2}}\left(1 - \frac{x}{16} + \frac{x^2}{640} - \frac{x^3}{46080} + \frac{x^4}{5160960} - \frac{x^5}{825753600} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 3$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_3(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_3 \\ &= -\frac{1}{64r^6 + 768r^5 + 3280r^4 + 5760r^3 + 2956r^2 - 1488r - 945} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} -\frac{1}{64r^6 + 768r^5 + 3280r^4 + 5760r^3 + 2956r^2 - 1488r - 945} &= \lim_{r\to -\frac{3}{2}} -\frac{1}{64r^6 + 768r^5 + 3280r^4 + 5760r^3 + 2956r^2 - 1488r - 945} \\ &= \textit{undefined} \end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned}
\frac{d}{dx}y_2(x) &= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\
&= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n+r_2)\right) \\
\frac{d^2}{dx^2}y_2(x) &= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\
&= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n+r_2)(-1+n+r_2)\right)
\end{aligned}$$

Substituting these back into the given ode $4x^2y'' + 4y'x + (-9+x)\,y = 0$ gives

$$\begin{aligned}
&4x^2\Bigg(Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\Bigg) \\
&\quad + 4\left(Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)x \\
&\quad + (-9+x)\left(Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)\right) = 0
\end{aligned}$$

Which can be written as

$$\left(\left(\left(4x^2 y_1''(x) + 4y_1'(x)\, x + (-9+x)\, y_1(x)\right) \ln(x) + 4x^2 \left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) + 4y_1(x)\right) C + 4x^2 \left(\sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2} (n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2} (n+r_2)}{x^2}\right)\right) + 4\left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2} (n+r_2)}{x}\right) x + (-9+x) \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$4x^2 y_1''(x) + 4y_1'(x)\, x + (-9+x)\, y_1(x) = 0$$

Eq (7) simplifes to

$$\left(4x^2 \left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) + 4y_1(x)\right) C + 4x^2 \left(\sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2} (n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2} (n+r_2)}{x^2}\right)\right) + 4\left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2} (n+r_2)}{x}\right) x + (-9+x) \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{8}$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$4\left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2) (-1+n+r_2)\right) x^2 + 8x \left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) C + 4\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) x + (-9+x) \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{9}$$

Since $r_1 = \frac{3}{2}$ and $r_2 = -\frac{3}{2}$ then the above becomes

$$4\left(\sum_{n=0}^{\infty} x^{-\frac{7}{2}+n} b_n \left(n-\frac{3}{2}\right) \left(-\frac{5}{2}+n\right)\right) x^2 + 8x \left(\sum_{n=0}^{\infty} x^{\frac{1}{2}+n} a_n \left(n+\frac{3}{2}\right)\right) C + 4\left(\sum_{n=0}^{\infty} x^{-\frac{5}{2}+n} b_n \left(n-\frac{3}{2}\right)\right) x + (-9+x) \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{3}{2}}\right) = 0 \tag{10}$$

Expanding $-\frac{9}{x^{\frac{3}{2}}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}-\frac{9}{x^{\frac{3}{2}}} &= -\frac{9}{x^{\frac{3}{2}}} + \dots \\ &= -\frac{9}{x^{\frac{3}{2}}}\end{aligned}$$

Expanding $\frac{1}{\sqrt{x}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{1}{\sqrt{x}} &= \frac{1}{\sqrt{x}} + \dots \\ &= \frac{1}{\sqrt{x}}\end{aligned}$$

Which simplifies to

$$\begin{aligned}&\left(\sum_{n=0}^{\infty} x^{n-\frac{3}{2}} b_n \left(4n^2 - 16n + 15\right)\right) + \left(\sum_{n=0}^{\infty} (8n + 12)\, C a_n x^{n+\frac{3}{2}}\right) \\ &+ \left(\sum_{n=0}^{\infty} (-6 + 4n)\, b_n x^{n-\frac{3}{2}}\right) + \sum_{n=0}^{\infty} \left(-9 b_n x^{n-\frac{3}{2}}\right) + \left(\sum_{n=0}^{\infty} x^{n-\frac{1}{2}} b_n\right) = 0\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n - \frac{3}{2}$ in each summation term. Going over each summation term above with power of x in it which is not already $x^{n-\frac{3}{2}}$ and adjusting the power and the corresponding index gives

$$\begin{aligned}\sum_{n=0}^{\infty} (8n + 12)\, C a_n x^{n+\frac{3}{2}} &= \sum_{n=3}^{\infty} C a_{n-3} (8n - 12)\, x^{n-\frac{3}{2}} \\ \sum_{n=0}^{\infty} x^{n-\frac{1}{2}} b_n &= \sum_{n=1}^{\infty} b_{n-1} x^{n-\frac{3}{2}}\end{aligned}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n - \frac{3}{2}$.

$$\begin{aligned}&\left(\sum_{n=0}^{\infty} x^{n-\frac{3}{2}} b_n \left(4n^2 - 16n + 15\right)\right) + \left(\sum_{n=3}^{\infty} C a_{n-3} (8n - 12)\, x^{n-\frac{3}{2}}\right) \\ &+ \left(\sum_{n=0}^{\infty} (-6 + 4n)\, b_n x^{n-\frac{3}{2}}\right) + \sum_{n=0}^{\infty} \left(-9 b_n x^{n-\frac{3}{2}}\right) + \left(\sum_{n=1}^{\infty} b_{n-1} x^{n-\frac{3}{2}}\right) = 0\end{aligned} \tag{2B}$$

For $n = 0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n = 1$, Eq (2B) gives

$$-8b_1 + b_0 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-8b_1 + 1 = 0$$

Solving the above for b_1 gives

$$b_1 = \frac{1}{8}$$

For $n = 2$, Eq (2B) gives

$$-8b_2 + b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-8b_2 + \frac{1}{8} = 0$$

Solving the above for b_2 gives

$$b_2 = \frac{1}{64}$$

For $n = N$, where $N = 3$ which is the difference between the two roots, we are free to choose $b_3 = 0$. Hence for $n = 3$, Eq (2B) gives

$$12C + \frac{1}{64} = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{1}{768}$$

For $n = 4$, Eq (2B) gives

$$20Ca_1 + b_3 + 16b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$16b_4 + \frac{5}{3072} = 0$$

Solving the above for b_4 gives

$$b_4 = -\frac{5}{49152}$$

For $n = 5$, Eq (2B) gives

$$28Ca_2 + b_4 + 40b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$40b_5 - \frac{13}{81920} = 0$$

Solving the above for b_5 gives

$$b_5 = \frac{13}{3276800}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{1}{768}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{1}{768}\left(x^{\frac{3}{2}}\left(1 - \frac{x}{16} + \frac{x^2}{640} - \frac{x^3}{46080} + \frac{x^4}{5160960} - \frac{x^5}{825753600} + O(x^6)\right)\right)\ln(x) + \frac{1 + \frac{x}{8} + \frac{x^2}{64} - \frac{5x^4}{49152} + \frac{13x^5}{3276800} + O(x^6)}{x^{\frac{3}{2}}}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{3}{2}}\left(1 - \frac{x}{16} + \frac{x^2}{640} - \frac{x^3}{46080} + \frac{x^4}{5160960} - \frac{x^5}{825753600} + O(x^6)\right) \\ &\quad + c_2\left(-\frac{1}{768}\left(x^{\frac{3}{2}}\left(1 - \frac{x}{16} + \frac{x^2}{640} - \frac{x^3}{46080} + \frac{x^4}{5160960} - \frac{x^5}{825753600} + O(x^6)\right)\right)\ln(x) \right. \\ &\quad \left. + \frac{1 + \frac{x}{8} + \frac{x^2}{64} - \frac{5x^4}{49152} + \frac{13x^5}{3276800} + O(x^6)}{x^{\frac{3}{2}}}\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{3}{2}}\left(1 - \frac{x}{16} + \frac{x^2}{640} - \frac{x^3}{46080} + \frac{x^4}{5160960} - \frac{x^5}{825753600} + O(x^6)\right) \\ &\quad + c_2\left(-\frac{x^{\frac{3}{2}}\left(1 - \frac{x}{16} + \frac{x^2}{640} - \frac{x^3}{46080} + \frac{x^4}{5160960} - \frac{x^5}{825753600} + O(x^6)\right)\ln(x)}{768} \right. \\ &\quad \left. + \frac{1 + \frac{x}{8} + \frac{x^2}{64} - \frac{5x^4}{49152} + \frac{13x^5}{3276800} + O(x^6)}{x^{\frac{3}{2}}}\right) \end{aligned}$$

Summary
The solution(s) found are the following

$$
\begin{aligned}
y = {} & c_1 x^{\frac{3}{2}} \left(1-\frac{x}{16}+\frac{x^2}{640}-\frac{x^3}{46080}+\frac{x^4}{5160960}-\frac{x^5}{825753600}+O\left(x^6\right)\right) \\
& + c_2 \left(-\frac{x^{\frac{3}{2}} \left(1-\frac{x}{16}+\frac{x^2}{640}-\frac{x^3}{46080}+\frac{x^4}{5160960}-\frac{x^5}{825753600}+O\left(x^6\right)\right) \ln\left(x\right)}{768} \right. \\
& \left. + \frac{1+\frac{x}{8}+\frac{x^2}{64}-\frac{5x^4}{49152}+\frac{13x^5}{3276800}+O\left(x^6\right)}{x^{\frac{3}{2}}}\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y = {} & c_1 x^{\frac{3}{2}} \left(1-\frac{x}{16}+\frac{x^2}{640}-\frac{x^3}{46080}+\frac{x^4}{5160960}-\frac{x^5}{825753600}+O\left(x^6\right)\right) \\
& + c_2 \left(-\frac{x^{\frac{3}{2}} \left(1-\frac{x}{16}+\frac{x^2}{640}-\frac{x^3}{46080}+\frac{x^4}{5160960}-\frac{x^5}{825753600}+O\left(x^6\right)\right) \ln\left(x\right)}{768} \right. \\
& \left. + \frac{1+\frac{x}{8}+\frac{x^2}{64}-\frac{5x^4}{49152}+\frac{13x^5}{3276800}+O\left(x^6\right)}{x^{\frac{3}{2}}}\right)
\end{aligned}
$$

Verified OK.

16.11.1 Maple step by step solution

Let's solve

$4x^2y'' + 4y'x + \left(-9+x\right)y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{y'}{x} - \frac{\left(-9+x\right)y}{4x^2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{y'}{x} + \frac{\left(-9+x\right)y}{4x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{1}{x}, P_3(x) = \frac{-9+x}{4x^2}\right]$

- $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\bigg|_{x=0} = 1$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = -\frac{9}{4}$

- $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $4x^2 y'' + 4y'x + (-9 + x)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

- ☐ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..1$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  - Shift index using $k- >k - m$

    $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  - Convert $x \cdot y'$ to series expansion

    $x \cdot y' = \sum_{k=0}^{\infty} a_k (k + r)\, x^{k+r}$

  - Convert $x^2 \cdot y''$ to series expansion

    $x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k + r)\,(k + r - 1)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(3 + 2r)\,(-3 + 2r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(2k + 2r + 3)\,(2k + 2r - 3) + a_{k-1}\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(3 + 2r)\,(-3 + 2r) = 0$

- Values of r that satisfy the indicial equation

$r \in \left\{-\frac{3}{2}, \frac{3}{2}\right\}$

- Each term in the series must be 0, giving the recursion relation

  $a_k(4k^2 + 8kr + 4r^2 - 9) + a_{k-1} = 0$

- Shift index using $k- >k + 1$

  $a_{k+1}\left(4(k+1)^2 + 8(k+1)\,r + 4r^2 - 9\right) + a_k = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+1} = -\frac{a_k}{4k^2+8kr+4r^2+8k+8r-5}$

- Recursion relation for $r = -\frac{3}{2}$

  $a_{k+1} = -\frac{a_k}{4k^2-4k-8}$

- Series not valid for $r = -\frac{3}{2}$, division by 0 in the recursion relation at $k = 2$

  $a_{k+1} = -\frac{a_k}{4k^2-4k-8}$

- Recursion relation for $r = \frac{3}{2}$

  $a_{k+1} = -\frac{a_k}{4k^2+20k+16}$

- Solution for $r = \frac{3}{2}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{3}{2}}, a_{k+1} = -\frac{a_k}{4k^2+20k+16}\right]$

Problem number: 8.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' + 10y'x + (x + 14)\, y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + 10y'x + (x + 14)\, y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{10}{x}$$
$$q(x) = \frac{x + 14}{x^2}$$

Table 794: Table $p(x), q(x)$ singularites.

$p(x) = \frac{10}{x}$	
singularity	type
$x = 0$	"regular"

$q(x) = \frac{x+14}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2y'' + 10y'x + (x + 14)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}\right) + 10\left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) x + (x + 14) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 10 x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} 14 a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 10 x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 14 a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + 10 x^{n+r} a_n (n+r) + 14 a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) + 10 x^r a_0 r + 14 a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + 10 x^r r + 14 x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r+7)(r+2)\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r+7)(r+2) = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -2$$
$$r_2 = -7$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r+7)(r+2)x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 5$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = Cy_1(x)\ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \frac{\sum_{n=0}^{\infty} a_n x^n}{x^2}$$
$$y_2(x) = Cy_1(x)\ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^7}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-2}$$
$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-7}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) + 10a_n(n+r) + a_{n-1} + 14a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}}{n^2 + 2nr + r^2 + 9n + 9r + 14} \tag{4}$$

Which for the root $r = -2$ becomes

$$a_n = -\frac{a_{n-1}}{n(n+5)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{1}{r^2 + 11r + 24}$$

Which for the root $r = -2$ becomes

$$a_1 = -\frac{1}{6}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r^2+11r+24}$	$-\frac{1}{6}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1}{(r+8)(r+3)(r+9)(r+4)}$$

Which for the root $r = -2$ becomes

$$a_2 = \frac{1}{84}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r^2+11r+24}$	$-\frac{1}{6}$
a_2	$\frac{1}{(r+8)(r+3)(r+9)(r+4)}$	$\frac{1}{84}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{1}{(r+8)(r+3)(r+9)(r+4)(r+10)(5+r)}$$

Which for the root $r = -2$ becomes

$$a_3 = -\frac{1}{2016}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r^2+11r+24}$	$-\frac{1}{6}$
a_2	$\frac{1}{(r+8)(r+3)(r+9)(r+4)}$	$\frac{1}{84}$
a_3	$-\frac{1}{(r+8)(r+3)(r+9)(r+4)(r+10)(5+r)}$	$-\frac{1}{2016}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{(r+8)(r+3)(r+9)(r+4)(r+10)(5+r)(r+11)(r+6)}$$

Which for the root $r = -2$ becomes

$$a_4 = \frac{1}{72576}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r^2+11r+24}$	$-\frac{1}{6}$
a_2	$\frac{1}{(r+8)(r+3)(r+9)(r+4)}$	$\frac{1}{84}$
a_3	$-\frac{1}{(r+8)(r+3)(r+9)(r+4)(r+10)(5+r)}$	$-\frac{1}{2016}$
a_4	$\frac{1}{(r+8)(r+3)(r+9)(r+4)(r+10)(5+r)(r+11)(r+6)}$	$\frac{1}{72576}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{1}{(r+8)(r+3)(r+9)(r+4)(r+10)(5+r)(r+11)(r+6)(r+12)(r+7)}$$

Which for the root $r = -2$ becomes

$$a_5 = -\frac{1}{3628800}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{r^2+11r+24}$	$-\frac{1}{6}$
a_2	$\frac{1}{(r+8)(r+3)(r+9)(r+4)}$	$\frac{1}{84}$
a_3	$-\frac{1}{(r+8)(r+3)(r+9)(r+4)(r+10)(5+r)}$	$-\frac{1}{2016}$
a_4	$\frac{1}{(r+8)(r+3)(r+9)(r+4)(r+10)(5+r)(r+11)(r+6)}$	$\frac{1}{72576}$
a_5	$-\frac{1}{(r+8)(r+3)(r+9)(r+4)(r+10)(5+r)(r+11)(r+6)(r+12)(r+7)}$	$-\frac{1}{3628800}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \frac{1}{x^2}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \frac{1 - \frac{x}{6} + \frac{x^2}{84} - \frac{x^3}{2016} + \frac{x^4}{72576} - \frac{x^5}{3628800} + O(x^6)}{x^2} \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 5$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r \to r_2} a_5(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_5 \\ &= -\frac{1}{(r+8)(r+3)(r+9)(r+4)(r+10)(5+r)(r+11)(r+6)(r+12)(r+7)} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r \to r_2} -\frac{1}{(r+8)(r+3)(r+9)(r+4)(r+10)(5+r)(r+11)(r+6)(r+12)(r+7)} &= \lim_{r \to -7} -\frac{}{(r+8)(r+} \\ &= \textit{undefined} \end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned}
\frac{d}{dx}y_2(x) &= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\
&= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n+r_2)\right) \\
\frac{d^2}{dx^2}y_2(x) &= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\
&= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n+r_2)(-1+n+r_2)\right)
\end{aligned}$$

Substituting these back into the given ode $x^2y'' + 10y'x + (x+14)\,y = 0$ gives

$$\begin{aligned}
&x^2\left(Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2}\right. \\
&\left.+ \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) \\
&+ 10\left(Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)x \\
&+ (x+14)\left(Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)\right) = 0
\end{aligned}$$

Which can be written as

$$\begin{aligned}&\left(\left(x^{2} y_{1}''(x)+10 y_{1}'(x) x+(x+14) y_{1}(x)\right) \ln (x)+x^{2}\left(\frac{2 y_{1}'(x)}{x}-\frac{y_{1}(x)}{x^{2}}\right)\right. \\&\left.+10 y_{1}(x)\right) C+x^{2}\left(\sum_{n=0}^{\infty}\left(\frac{b_{n} x^{n+r_{2}}\left(n+r_{2}\right)^{2}}{x^{2}}-\frac{b_{n} x^{n+r_{2}}\left(n+r_{2}\right)}{x^{2}}\right)\right) \\&+10\left(\sum_{n=0}^{\infty} \frac{b_{n} x^{n+r_{2}}\left(n+r_{2}\right)}{x}\right) x+(x+14)\left(\sum_{n=0}^{\infty} b_{n} x^{n+r_{2}}\right)=0\end{aligned} \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$x^{2} y_{1}''(x)+10 y_{1}'(x) x+(x+14) y_{1}(x)=0$$

Eq (7) simplifes to

$$\begin{aligned}&\left(x^{2}\left(\frac{2 y_{1}'(x)}{x}-\frac{y_{1}(x)}{x^{2}}\right)+10 y_{1}(x)\right) C \\&+x^{2}\left(\sum_{n=0}^{\infty}\left(\frac{b_{n} x^{n+r_{2}}\left(n+r_{2}\right)^{2}}{x^{2}}-\frac{b_{n} x^{n+r_{2}}\left(n+r_{2}\right)}{x^{2}}\right)\right) \\&+10\left(\sum_{n=0}^{\infty} \frac{b_{n} x^{n+r_{2}}\left(n+r_{2}\right)}{x}\right) x+(x+14)\left(\sum_{n=0}^{\infty} b_{n} x^{n+r_{2}}\right)=0\end{aligned} \tag{8}$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\begin{aligned}&\left(2\left(\sum_{n=0}^{\infty} x^{-1+n+r_{1}} a_{n}\left(n+r_{1}\right)\right) x+9\left(\sum_{n=0}^{\infty} a_{n} x^{n+r_{1}}\right)\right) C \\&+\left(\sum_{n=0}^{\infty} x^{-2+n+r_{2}} b_{n}\left(n+r_{2}\right)\left(-1+n+r_{2}\right)\right) x^{2} \\&+10\left(\sum_{n=0}^{\infty} x^{-1+n+r_{2}} b_{n}\left(n+r_{2}\right)\right) x+(x+14)\left(\sum_{n=0}^{\infty} b_{n} x^{n+r_{2}}\right)=0\end{aligned} \tag{9}$$

Since $r_1 = -2$ and $r_2 = -7$ then the above becomes

$$\begin{aligned}
&\left(2\left(\sum_{n=0}^{\infty} x^{-3+n} a_n (n-2)\right) x + 9\left(\sum_{n=0}^{\infty} a_n x^{n-2}\right)\right) C \\
&+ \left(\sum_{n=0}^{\infty} x^{-9+n} b_n (n-7)(-8+n)\right) x^2 \\
&+ 10\left(\sum_{n=0}^{\infty} x^{-8+n} b_n (n-7)\right) x + (x+14)\left(\sum_{n=0}^{\infty} b_n x^{n-7}\right) = 0
\end{aligned} \tag{10}$$

Which simplifies to

$$\begin{aligned}
&\left(\sum_{n=0}^{\infty} 2C\, x^{n-2} a_n (n-2)\right) + \left(\sum_{n=0}^{\infty} 9C a_n x^{n-2}\right) + \left(\sum_{n=0}^{\infty} x^{n-7} b_n (-8+n)(n-7)\right) \\
&+ \left(\sum_{n=0}^{\infty} 10 x^{n-7} b_n (n-7)\right) + \left(\sum_{n=0}^{\infty} x^{n-6} b_n\right) + \left(\sum_{n=0}^{\infty} 14 b_n x^{n-7}\right) = 0
\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n-7$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n-7} and adjusting the power and the corresponding index gives

$$\begin{aligned}
\sum_{n=0}^{\infty} 2C\, x^{n-2} a_n (n-2) &= \sum_{n=5}^{\infty} 2C a_{n-5} (n-7)\, x^{n-7} \\
\sum_{n=0}^{\infty} 9C a_n x^{n-2} &= \sum_{n=5}^{\infty} 9C a_{n-5} x^{n-7} \\
\sum_{n=0}^{\infty} x^{n-6} b_n &= \sum_{n=1}^{\infty} b_{n-1} x^{n-7}
\end{aligned}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n-7$.

$$\left(\sum_{n=5}^{\infty} 2C a_{n-5}(n-7)\, x^{n-7}\right)+\left(\sum_{n=5}^{\infty} 9C a_{n-5} x^{n-7}\right) \\ +\left(\sum_{n=0}^{\infty} x^{n-7} b_{n}(-8+n)\,(n-7)\right)+\left(\sum_{n=0}^{\infty} 10 x^{n-7} b_{n}(n-7)\right) \\ +\left(\sum_{n=1}^{\infty} b_{n-1} x^{n-7}\right)+\left(\sum_{n=0}^{\infty} 14 b_{n} x^{n-7}\right)=0 \tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0=1$. For $n=1$, Eq (2B) gives

$$-4b_1+b_0=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-4b_1+1=0$$

Solving the above for b_1 gives

$$b_1=\frac{1}{4}$$

For $n=2$, Eq (2B) gives

$$-6b_2+b_1=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-6b_2+\frac{1}{4}=0$$

Solving the above for b_2 gives

$$b_2=\frac{1}{24}$$

For $n=3$, Eq (2B) gives

$$-6b_3+b_2=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-6b_3+\frac{1}{24}=0$$

Solving the above for b_3 gives

$$b_3=\frac{1}{144}$$

For $n=4$, Eq (2B) gives

$$-4b_4+b_3=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-4b_4 + \frac{1}{144} = 0$$

Solving the above for b_4 gives

$$b_4 = \frac{1}{576}$$

For $n = N$, where $N = 5$ which is the difference between the two roots, we are free to choose $b_5 = 0$. Hence for $n = 5$, Eq (2B) gives

$$5C + \frac{1}{576} = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{1}{2880}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{1}{2880}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{1}{2880}\left(\frac{1 - \frac{x}{6} + \frac{x^2}{84} - \frac{x^3}{2016} + \frac{x^4}{72576} - \frac{x^5}{3628800} + O(x^6)}{x^2}\right)\ln(x) + \frac{1 + \frac{x}{4} + \frac{x^2}{24} + \frac{x^3}{144} + \frac{x^4}{576} + O(x^6)}{x^7}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= \frac{c_1\left(1 - \frac{x}{6} + \frac{x^2}{84} - \frac{x^3}{2016} + \frac{x^4}{72576} - \frac{x^5}{3628800} + O(x^6)\right)}{x^2} \\ &\quad + c_2\left(-\frac{1}{2880}\left(\frac{1 - \frac{x}{6} + \frac{x^2}{84} - \frac{x^3}{2016} + \frac{x^4}{72576} - \frac{x^5}{3628800} + O(x^6)}{x^2}\right)\ln(x) + \frac{1 + \frac{x}{4} + \frac{x^2}{24} + \frac{x^3}{144} + \frac{x^4}{576} + O(x^6)}{x^7}\right) \end{aligned}$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= \frac{c_1 \left(1-\frac{x}{6}+\frac{x^2}{84}-\frac{x^3}{2016}+\frac{x^4}{72576}-\frac{x^5}{3628800}+O(x^6)\right)}{x^2} \\
&\quad + c_2 \left(-\frac{\left(1-\frac{x}{6}+\frac{x^2}{84}-\frac{x^3}{2016}+\frac{x^4}{72576}-\frac{x^5}{3628800}+O(x^6)\right)\ln(x)}{2880x^2} \right. \\
&\quad \left. + \frac{1+\frac{x}{4}+\frac{x^2}{24}+\frac{x^3}{144}+\frac{x^4}{576}+O(x^6)}{x^7}\right)
\end{aligned}
$$

<u>Summary</u>

The solution(s) found are the following

$$
\begin{aligned}
y &= \frac{c_1 \left(1-\frac{x}{6}+\frac{x^2}{84}-\frac{x^3}{2016}+\frac{x^4}{72576}-\frac{x^5}{3628800}+O(x^6)\right)}{x^2} \\
&\quad + c_2 \left(-\frac{\left(1-\frac{x}{6}+\frac{x^2}{84}-\frac{x^3}{2016}+\frac{x^4}{72576}-\frac{x^5}{3628800}+O(x^6)\right)\ln(x)}{2880x^2} \right. \\
&\quad \left. + \frac{1+\frac{x}{4}+\frac{x^2}{24}+\frac{x^3}{144}+\frac{x^4}{576}+O(x^6)}{x^7}\right)
\end{aligned} \tag{1}
$$

<u>Verification of solutions</u>

$$
\begin{aligned}
y &= \frac{c_1 \left(1-\frac{x}{6}+\frac{x^2}{84}-\frac{x^3}{2016}+\frac{x^4}{72576}-\frac{x^5}{3628800}+O(x^6)\right)}{x^2} \\
&\quad + c_2 \left(-\frac{\left(1-\frac{x}{6}+\frac{x^2}{84}-\frac{x^3}{2016}+\frac{x^4}{72576}-\frac{x^5}{3628800}+O(x^6)\right)\ln(x)}{2880x^2} \right. \\
&\quad \left. + \frac{1+\frac{x}{4}+\frac{x^2}{24}+\frac{x^3}{144}+\frac{x^4}{576}+O(x^6)}{x^7}\right)
\end{aligned}
$$

Verified OK.

16.12.1 Maple step by step solution

Let's solve

$x^2y'' + 10y'x + (x + 14)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{10y'}{x} - \frac{(x+14)y}{x^2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{10y'}{x} + \frac{(x+14)y}{x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

    $\left[P_2(x) = \frac{10}{x}, P_3(x) = \frac{x+14}{x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

    $(x \cdot P_2(x))\Big|_{x=0} = 10$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $(x^2 \cdot P_3(x))\Big|_{x=0} = 14$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2y'' + 10y'x + (x + 14)\,y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..1$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  ◦ Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x \cdot y'$ to series expansion

$$x \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

$$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0 (7+r)\,(2+r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k (k+r+7)\,(k+r+2) + a_{k-1}\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(7+r)\,(2+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{-7, -2\}$$

- Each term in the series must be 0, giving the recursion relation

$$a_k (k+r+7)\,(k+r+2) + a_{k-1} = 0$$

- Shift index using $k- >k+1$

$$a_{k+1} (k+8+r)\,(k+3+r) + a_k = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = -\frac{a_k}{(k+8+r)(k+3+r)}$$

- Recursion relation for $r = -7$

$$a_{k+1} = -\frac{a_k}{(k+1)(k-4)}$$

- Series not valid for $r = -7$, division by 0 in the recursion relation at $k = 4$

$$a_{k+1} = -\frac{a_k}{(k+1)(k-4)}$$

- Recursion relation for $r = -2$

$$a_{k+1} = -\frac{a_k}{(k+6)(k+1)}$$

- Solution for $r = -2$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-2}, a_{k+1} = -\frac{a_k}{(k+6)(k+1)}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 9.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2(x+1)\,y''+4x(3+8x)\,y'-(5-49x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(4x^3+4x^2\right)y''+\left(32x^2+12x\right)y'+(49x-5)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{3+8x}{x\,(x+1)}\\q(x)&=\frac{49x-5}{4x^2\,(x+1)}\end{aligned}$$

Table 796: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3+8x}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = \frac{49x-5}{4x^2(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2(x+1)\,y'' + \left(32x^2+12x\right)y' + (49x-5)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2(x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + \left(32x^2+12x\right)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (49x-5)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 32x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 12x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 49x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-5a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 32x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 32a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 49x^{1+n+r} a_n = \sum_{n=1}^{\infty} 49a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 32a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 12x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} 49a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-5a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r)(n+r-1) + 12x^{n+r} a_n (n+r) - 5a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) + 12x^r a_0 r - 5a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) + 12x^r r - 5x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 + 8r - 5\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 + 8r - 5 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = -\frac{5}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 + 8r - 5\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 3$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sqrt{x} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^{\frac{5}{2}}}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{5}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned}
&4a_{n-1}(n+r-1)(n+r-2) + 4a_n(n+r)(n+r-1) \\
&+ 32a_{n-1}(n+r-1) + 12a_n(n+r) + 49a_{n-1} - 5a_n = 0
\end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(5+2n+2r)\, a_{n-1}}{2n+2r-1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{(3+n)\, a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-7-2r}{1+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = -4$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-7-2r}{1+2r}$	-4

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4r^2+32r+63}{4r^2+8r+3}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = 10$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-7-2r}{1+2r}$	-4
a_2	$\frac{4r^2+32r+63}{4r^2+8r+3}$	10

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-8r^3 - 108r^2 - 478r - 693}{8r^3 + 36r^2 + 46r + 15}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = -20$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-7-2r}{1+2r}$	-4
a_2	$\frac{4r^2+32r+63}{4r^2+8r+3}$	10
a_3	$\frac{-8r^3-108r^2-478r-693}{8r^3+36r^2+46r+15}$	-20

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{8r^3 + 132r^2 + 718r + 1287}{8r^3 + 36r^2 + 46r + 15}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = 35$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-7-2r}{1+2r}$	-4
a_2	$\frac{4r^2+32r+63}{4r^2+8r+3}$	10
a_3	$\frac{-8r^3-108r^2-478r-693}{8r^3+36r^2+46r+15}$	-20
a_4	$\frac{8r^3+132r^2+718r+1287}{8r^3+36r^2+46r+15}$	35

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-8r^3 - 156r^2 - 1006r - 2145}{8r^3 + 36r^2 + 46r + 15}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = -56$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-7-2r}{1+2r}$	-4
a_2	$\frac{4r^2+32r+63}{4r^2+8r+3}$	10
a_3	$\frac{-8r^3-108r^2-478r-693}{8r^3+36r^2+46r+15}$	-20
a_4	$\frac{8r^3+132r^2+718r+1287}{8r^3+36r^2+46r+15}$	35
a_5	$\frac{-8r^3-156r^2-1006r-2145}{8r^3+36r^2+46r+15}$	-56

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \sqrt{x}\left(1 - 4x + 10x^2 - 20x^3 + 35x^4 - 56x^5 + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 3$. Now we need to determine if

C is zero or not. This is done by finding $\lim_{r\rightarrow r_2} a_3(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned}
a_N &= a_3 \\
&= \frac{-8r^3 - 108r^2 - 478r - 693}{8r^3 + 36r^2 + 46r + 15}
\end{aligned}$$

Therefore

$$\begin{aligned}
\lim_{r\rightarrow r_2} \frac{-8r^3 - 108r^2 - 478r - 693}{8r^3 + 36r^2 + 46r + 15} &= \lim_{r\rightarrow -\frac{5}{2}} \frac{-8r^3 - 108r^2 - 478r - 693}{8r^3 + 36r^2 + 46r + 15} \\
&= \textit{undefined}
\end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned}
\frac{d}{dx}y_2(x) &= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\
&= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n+r_2)\right) \\
\frac{d^2}{dx^2}y_2(x) &= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\
&= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n+r_2)(-1+n+r_2)\right)
\end{aligned}$$

Substituting these back into the given ode $4x^2(x+1)\,y'' + (32x^2+12x)\,y' + (49x-5)\,y =$

0 gives

$$
\begin{aligned}
&4x^2(x+1)\left(Cy_1''(x)\ln(x)+\frac{2Cy_1'(x)}{x}-\frac{Cy_1(x)}{x^2}\right.\\
&\left.+\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+\left(32x^2+12x\right)\left(Cy_1'(x)\ln(x)+\frac{Cy_1(x)}{x}+\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)\\
&+(49x-5)\left(Cy_1(x)\ln(x)+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)\right)=0
\end{aligned}
$$

Which can be written as

$$
\begin{aligned}
&\left(\left(4x^2(x+1)\,y_1''(x)+\left(32x^2+12x\right)y_1'(x)+(49x-5)\,y_1(x)\right)\ln(x)\right.\\
&\left.+4x^2(x+1)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{(32x^2+12x)\,y_1(x)}{x}\right)C\\
&+4x^2(x+1)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+\left(32x^2+12x\right)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(49x-5)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0
\end{aligned}
\tag{7}
$$

But since $y_1(x)$ is a solution to the ode, then

$$
4x^2(x+1)\,y_1''(x)+\left(32x^2+12x\right)y_1'(x)+(49x-5)\,y_1(x)=0
$$

Eq (7) simplifes to

$$
\begin{aligned}
&\left(4x^2(x+1)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{(32x^2+12x)\,y_1(x)}{x}\right)C\\
&+4x^2(x+1)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+\left(32x^2+12x\right)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(49x-5)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0
\end{aligned}
\tag{8}
$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\left(8x(x+1)\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n(n+r_1)\right)+4(7x+2)\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)\right)C \\ +4\left(x^3+x^2\right)\left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n+r_2)\left(-1+n+r_2\right)\right) \\ +4\left(8x^2+3x\right)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n+r_2)\right)+(49x-5)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)=0 \tag{9}$$

Since $r_1 = \frac{1}{2}$ and $r_2 = -\frac{5}{2}$ then the above becomes

$$\left(8x(x+1)\left(\sum_{n=0}^{\infty} x^{-\frac{1}{2}+n} a_n\left(n+\frac{1}{2}\right)\right)+4(7x+2)\left(\sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}\right)\right)C \\ +4\left(x^3+x^2\right)\left(\sum_{n=0}^{\infty} x^{-\frac{9}{2}+n} b_n\left(n-\frac{5}{2}\right)\left(-\frac{7}{2}+n\right)\right) \\ +4\left(8x^2+3x\right)\left(\sum_{n=0}^{\infty} x^{-\frac{7}{2}+n} b_n\left(n-\frac{5}{2}\right)\right)+(49x-5)\left(\sum_{n=0}^{\infty} b_n x^{n-\frac{5}{2}}\right)=0 \tag{10}$$

Expanding $4C\sqrt{x}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned} 4C\sqrt{x} &= 4C\sqrt{x}+\dots \\ &= 4C\sqrt{x} \end{aligned}$$

Expanding $28C\,x^{\frac{3}{2}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned} 28C\,x^{\frac{3}{2}} &= 28C\,x^{\frac{3}{2}}+\dots \\ &= 28C\,x^{\frac{3}{2}} \end{aligned}$$

Expanding $8C\sqrt{x}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned} 8C\sqrt{x} &= 8C\sqrt{x}+\dots \\ &= 8C\sqrt{x} \end{aligned}$$

Expanding $\frac{1}{x^{\frac{3}{2}}}$ as Taylor series around $x=0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{1}{x^{\frac{3}{2}}} &= \frac{1}{x^{\frac{3}{2}}} + \dots \\ &= \frac{1}{x^{\frac{3}{2}}}\end{aligned}$$

Expanding $\frac{1}{x^{\frac{5}{2}}}$ as Taylor series around $x=0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{1}{x^{\frac{5}{2}}} &= \frac{1}{x^{\frac{5}{2}}} + \dots \\ &= \frac{1}{x^{\frac{5}{2}}}\end{aligned}$$

Expanding $\frac{16}{x^{\frac{3}{2}}}$ as Taylor series around $x=0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{16}{x^{\frac{3}{2}}} &= \frac{16}{x^{\frac{3}{2}}} + \dots \\ &= \frac{16}{x^{\frac{3}{2}}}\end{aligned}$$

Expanding $\frac{6}{x^{\frac{5}{2}}}$ as Taylor series around $x=0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{6}{x^{\frac{5}{2}}} &= \frac{6}{x^{\frac{5}{2}}} + \dots \\ &= \frac{6}{x^{\frac{5}{2}}}\end{aligned}$$

Expanding $\frac{49}{x^{\frac{3}{2}}}$ as Taylor series around $x=0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{49}{x^{\frac{3}{2}}} &= \frac{49}{x^{\frac{3}{2}}} + \dots \\ &= \frac{49}{x^{\frac{3}{2}}}\end{aligned}$$

Expanding $-\frac{5}{x^{\frac{5}{2}}}$ as Taylor series around $x=0$ and keeping only the first 6 terms gives

$$\begin{aligned}-\frac{5}{x^{\frac{5}{2}}} &= -\frac{5}{x^{\frac{5}{2}}} + \dots \\ &= -\frac{5}{x^{\frac{5}{2}}}\end{aligned}$$

Which simplifies to

$$\begin{aligned}&\left(\sum_{n=0}^{\infty}\left(8n+4\right)C a_{n} x^{\frac{3}{2}+n}\right)+\left(\sum_{n=0}^{\infty}\left(8n+4\right)C a_{n} x^{n+\frac{1}{2}}\right)\\&+\left(\sum_{n=0}^{\infty}28C\,x^{\frac{3}{2}+n} a_{n}\right)+\left(\sum_{n=0}^{\infty}8C\,x^{n+\frac{1}{2}} a_{n}\right)\\&+\left(\sum_{n=0}^{\infty}x^{n-\frac{3}{2}} b_{n}\left(4n^{2}-24n+35\right)\right)+\left(\sum_{n=0}^{\infty}x^{n-\frac{5}{2}} b_{n}\left(4n^{2}-24n+35\right)\right)\\&+\left(\sum_{n=0}^{\infty}\left(32n-80\right) b_{n} x^{n-\frac{3}{2}}\right)+\left(\sum_{n=0}^{\infty}\left(12n-30\right) b_{n} x^{n-\frac{5}{2}}\right)\\&+\left(\sum_{n=0}^{\infty}49x^{n-\frac{3}{2}} b_{n}\right)+\sum_{n=0}^{\infty}\left(-5b_{n} x^{n-\frac{5}{2}}\right)=0\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n-\frac{5}{2}$ in each summation term. Going over each summation term above with power of x in it which is not already $x^{n-\frac{5}{2}}$ and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty}\left(8n+4\right)C a_{n} x^{\frac{3}{2}+n}=\sum_{n=4}^{\infty}C a_{n-4}\left(8n-28\right) x^{n-\frac{5}{2}}$$

$$\sum_{n=0}^{\infty}\left(8n+4\right)C a_{n} x^{n+\frac{1}{2}}=\sum_{n=3}^{\infty}C a_{n-3}\left(8n-20\right) x^{n-\frac{5}{2}}$$

$$\sum_{n=0}^{\infty}28C\,x^{\frac{3}{2}+n} a_{n}=\sum_{n=4}^{\infty}28C a_{n-4} x^{n-\frac{5}{2}}$$

$$\sum_{n=0}^{\infty}8C\,x^{n+\frac{1}{2}} a_{n}=\sum_{n=3}^{\infty}8C a_{n-3} x^{n-\frac{5}{2}}$$

$$\sum_{n=0}^{\infty}x^{n-\frac{3}{2}} b_{n}\left(4n^{2}-24n+35\right)=\sum_{n=1}^{\infty}b_{n-1}\left(4(n-1)^{2}-24n+59\right) x^{n-\frac{5}{2}}$$

$$\sum_{n=0}^{\infty}\left(32n-80\right) b_{n} x^{n-\frac{3}{2}}=\sum_{n=1}^{\infty}b_{n-1}\left(32n-112\right) x^{n-\frac{5}{2}}$$

$$\sum_{n=0}^{\infty}49x^{n-\frac{3}{2}} b_{n}=\sum_{n=1}^{\infty}49b_{n-1} x^{n-\frac{5}{2}}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n - \frac{5}{2}$.

$$\begin{aligned}
&\left(\sum_{n=4}^{\infty} C a_{n-4}(8n-28)\, x^{n-\frac{5}{2}}\right) + \left(\sum_{n=3}^{\infty} C a_{n-3}(8n-20)\, x^{n-\frac{5}{2}}\right) \\
&+ \left(\sum_{n=4}^{\infty} 28 C a_{n-4} x^{n-\frac{5}{2}}\right) + \left(\sum_{n=3}^{\infty} 8 C a_{n-3} x^{n-\frac{5}{2}}\right) \\
&+ \left(\sum_{n=1}^{\infty} b_{n-1}\left(4(n-1)^2 - 24n + 59\right) x^{n-\frac{5}{2}}\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n-\frac{5}{2}} b_n \left(4n^2 - 24n + 35\right)\right) + \left(\sum_{n=1}^{\infty} b_{n-1}(32n-112)\, x^{n-\frac{5}{2}}\right) \\
&+ \left(\sum_{n=0}^{\infty} (12n-30)\, b_n x^{n-\frac{5}{2}}\right) + \left(\sum_{n=1}^{\infty} 49 b_{n-1} x^{n-\frac{5}{2}}\right) + \sum_{n=0}^{\infty} \left(-5 b_n x^{n-\frac{5}{2}}\right) = 0
\end{aligned} \tag{2B}$$

For $n = 0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n = 1$, Eq (2B) gives

$$4b_0 - 8b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$4 - 8b_1 = 0$$

Solving the above for b_1 gives

$$b_1 = \frac{1}{2}$$

For $n = 2$, Eq (2B) gives

$$16b_1 - 8b_2 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$8 - 8b_2 = 0$$

Solving the above for b_2 gives

$$b_2 = 1$$

For $n = N$, where $N = 3$ which is the difference between the two roots, we are free to choose $b_3 = 0$. Hence for $n = 3$, Eq (2B) gives

$$12C + 36 = 0$$

Which is solved for C. Solving for C gives

$$C = -3$$

For $n = 4$, Eq (2B) gives

$$(32a_0 + 20a_1) C + 64b_3 + 16b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$144 + 16b_4 = 0$$

Solving the above for b_4 gives

$$b_4 = -9$$

For $n = 5$, Eq (2B) gives

$$(40a_1 + 28a_2) C + 100b_4 + 40b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-1260 + 40b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = \frac{63}{2}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -3$ and all b_n, then the second solution becomes

$$\begin{aligned} y_2(x) &= (-3) \left(\sqrt{x}\left(1 - 4x + 10x^2 - 20x^3 + 35x^4 - 56x^5 + O(x^6)\right)\right) \ln(x) \\ &\quad + \frac{1 + \frac{x}{2} + x^2 - 9x^4 + \frac{63x^5}{2} + O(x^6)}{x^{\frac{5}{2}}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 \sqrt{x}\left(1 - 4x + 10x^2 - 20x^3 + 35x^4 - 56x^5 + O(x^6)\right) \\ &\quad + c_2 \left((-3) \left(\sqrt{x}\left(1 - 4x + 10x^2 - 20x^3 + 35x^4 - 56x^5 + O(x^6)\right)\right) \ln(x) \right. \\ &\quad \left. + \frac{1 + \frac{x}{2} + x^2 - 9x^4 + \frac{63x^5}{2} + O(x^6)}{x^{\frac{5}{2}}} \right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned}y &= y_h \\ &= c_1\sqrt{x}\left(1-4x+10x^2-20x^3+35x^4-56x^5+O\left(x^6\right)\right) \\ &\quad + c_2\left(-3\sqrt{x}\left(1-4x+10x^2-20x^3+35x^4-56x^5+O\left(x^6\right)\right)\ln\left(x\right) + \frac{1+\frac{x}{2}+x^2-9x^4+\frac{63x^5}{2}+O(x^6)}{x^{\frac{5}{2}}}\right)\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}y &= c_1\sqrt{x}\left(1-4x+10x^2-20x^3+35x^4-56x^5+O\left(x^6\right)\right) \\ &\quad + c_2\left(-3\sqrt{x}\left(1-4x+10x^2-20x^3+35x^4-56x^5+O\left(x^6\right)\right)\ln\left(x\right) + \frac{1+\frac{x}{2}+x^2-9x^4+\frac{63x^5}{2}+O(x^6)}{x^{\frac{5}{2}}}\right)\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}y &= c_1\sqrt{x}\left(1-4x+10x^2-20x^3+35x^4-56x^5+O\left(x^6\right)\right) \\ &\quad + c_2\left(-3\sqrt{x}\left(1-4x+10x^2-20x^3+35x^4-56x^5+O\left(x^6\right)\right)\ln\left(x\right) + \frac{1+\frac{x}{2}+x^2-9x^4+\frac{63x^5}{2}+O(x^6)}{x^{\frac{5}{2}}}\right)\end{aligned}$$

Verified OK.

16.13.1 Maple step by step solution

Let's solve

$4x^2(x+1)\,y''+(32x^2+12x)\,y'+(49x-5)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(49x-5)y}{4x^2(x+1)}-\frac{(3+8x)y'}{x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(3+8x)y'}{x(x+1)} + \frac{(49x-5)y}{4x^2(x+1)} = 0$

☐ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{3+8x}{x(x+1)}, P_3(x) = \frac{49x-5}{4x^2(x+1)}\right]$

  - $(x+1) \cdot P_2(x)$ is analytic at $x = -1$

    $\left((x+1) \cdot P_2(x)\right)\bigg|_{x=-1} = 5$

  - $(x+1)^2 \cdot P_3(x)$ is analytic at $x = -1$

    $\left((x+1)^2 \cdot P_3(x)\right)\bigg|_{x=-1} = 0$

  - $x = -1$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = -1$

- Multiply by denominators

  $4x^2(x+1)\, y'' + 4x(3+8x)\, y' + (49x-5)\, y = 0$

- Change variables using $x = u - 1$ so that the regular singular point is at $u = 0$

  $(4u^3 - 8u^2 + 4u)\left(\frac{d^2}{du^2}y(u)\right) + (32u^2 - 52u + 20)\left(\frac{d}{du}y(u)\right) + (49u - 54)\, y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

  - Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

    $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$

  - Shift index using $k- >k - m$

    $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $u^{m}\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,u^{k+r}$

- Convert $u^{m}\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)$ to series expansion for $m=1..3$

  $u^{m}\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)=\sum_{k=0}^{\infty}a_{k}(k+r)\,(k+r-1)\,u^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $u^{m}\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)=\sum_{k=-2+m}^{\infty}a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$

  Rewrite ODE with series expansions

  $4a_{0}r(4+r)\,u^{-1+r}+\left(4a_{1}(1+r)\,(5+r)-2a_{0}(4r^{2}+22r+27)\right)u^{r}+\left(\sum_{k=1}^{\infty}\left(4a_{k+1}(k+1+r)\,(k+\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $4r(4+r)=0$

- Values of r that satisfy the indicial equation

  $r\in\{-4,0\}$

- Each term must be 0

  $4a_{1}(1+r)\,(5+r)-2a_{0}(4r^{2}+22r+27)=0$

- Each term in the series must be 0, giving the recursion relation

  $4a_{k+1}(k+1+r)\,(k+5+r)-2a_{k}(4k^{2}+8kr+4r^{2}+22k+22r+27)+a_{k-1}(2k+5+2r)^{2}=($

- Shift index using $k->k+1$

  $4a_{k+2}(k+2+r)\,(k+6+r)-2a_{k+1}\left(4(k+1)^{2}+8(k+1)\,r+4r^{2}+22k+49+22r\right)+a_{k}(2k+$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{4k^{2}a_{k}-8k^{2}a_{k+1}+8kra_{k}-16kra_{k+1}+4r^{2}a_{k}-8r^{2}a_{k+1}+28ka_{k}-60ka_{k+1}+28ra_{k}-60ra_{k+1}+49a_{k}-106a_{k+1}}{4(k+2+r)(k+6+r)}$

- Recursion relation for $r=-4$

  $a_{k+2}=-\frac{4k^{2}a_{k}-8k^{2}a_{k+1}-4ka_{k}+4ka_{k+1}+a_{k}+6a_{k+1}}{4(k-2)(k+2)}$

- Series not valid for $r=-4$, division by 0 in the recursion relation at $k=2$

  $a_{k+2}=-\frac{4k^{2}a_{k}-8k^{2}a_{k+1}-4ka_{k}+4ka_{k+1}+a_{k}+6a_{k+1}}{4(k-2)(k+2)}$

- Recursion relation for $r=0$

  $a_{k+2}=-\frac{4k^{2}a_{k}-8k^{2}a_{k+1}+28ka_{k}-60ka_{k+1}+49a_{k}-106a_{k+1}}{4(k+2)(k+6)}$

- Solution for $r=0$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^k, a_{k+2}=-\frac{4k^2a_k-8k^2a_{k+1}+28ka_k-60ka_{k+1}+49a_k-106a_{k+1}}{4(k+2)(k+6)}, 20a_1-54a_0=0\right]$$

- Revert the change of variables $u=x+1$

$$\left[y=\sum_{k=0}^{\infty} a_k(x+1)^k, a_{k+2}=-\frac{4k^2a_k-8k^2a_{k+1}+28ka_k-60ka_{k+1}+49a_k-106a_{k+1}}{4(k+2)(k+6)}, 20a_1-54a_0=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 10.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x+1)\,y''-x(3+10x)\,y'+30yx=0}$$

With the expansion point for the power series method at $x=0$.

The ODE is

$$x^2(x+1)\,y''+\left(-10x^2-3x\right)y'+30yx=0$$

Or

$$x\left(x^2y''-10y'x+y''x+30y-3y'\right)=0$$

For $x\neq 0$ the above simplifies to

$$\left(x^2+x\right)y''+(-3-10x)\,y'+30y=0$$

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^3+x^2\right)y''+\left(-10x^2-3x\right)y'+30yx=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x) = -\frac{3+10x}{x(x+1)}$$
$$q(x) = \frac{30}{x(x+1)}$$

Table 798: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{3+10x}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = \frac{30}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x+1)\,y'' + \left(-10x^2 - 3x\right) y' + 30yx = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$
\begin{aligned}
&x^2(x+1)\left(\sum_{n=0}^{\infty}(n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) \\
&+\left(-10x^2-3x\right)\left(\sum_{n=0}^{\infty}(n+r)\,a_n x^{n+r-1}\right)+30\left(\sum_{n=0}^{\infty}a_n x^{n+r}\right)x=0
\end{aligned} \tag{1}
$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty}x^{1+n+r}a_n(n+r)\,(n+r-1)\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)\,(n+r-1)\right) \\
&+\sum_{n=0}^{\infty}\left(-10x^{1+n+r}a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-3x^{n+r}a_n(n+r)\right)+\left(\sum_{n=0}^{\infty}30x^{1+n+r}a_n\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty}x^{1+n+r}a_n(n+r)\,(n+r-1)&=\sum_{n=1}^{\infty}a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r} \\
\sum_{n=0}^{\infty}\left(-10x^{1+n+r}a_n(n+r)\right)&=\sum_{n=1}^{\infty}\left(-10a_{n-1}(n+r-1)\,x^{n+r}\right) \\
\sum_{n=0}^{\infty}30x^{1+n+r}a_n&=\sum_{n=1}^{\infty}30a_{n-1}x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=1}^{\infty}a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)\,(n+r-1)\right)+\sum_{n=1}^{\infty}\left(-10a_{n-1}(n+r-1)\,x^{n+r}\right) \\
&+\sum_{n=0}^{\infty}\left(-3x^{n+r}a_n(n+r)\right)+\left(\sum_{n=1}^{\infty}30a_{n-1}x^{n+r}\right)=0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - 3x^{n+r} a_n (n+r) = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - 3x^r a_0 r = 0$$

Or

$$(x^r r(-1+r) - 3x^r r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^r r(-4+r) = 0$$

Since the above is true for all x then the indicial equation becomes

$$r(-4+r) = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 4$$
$$r_2 = 0$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^r r(-4+r) = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^4 \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+4}$$

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ -10a_{n-1}(n+r-1) - 3a_n(n+r) + 30a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n^2 + 2nr + r^2 - 13n - 13r + 42)}{n^2 + 2nr + r^2 - 4n - 4r} \tag{4}$$

Which for the root $r = 4$ becomes

$$a_n = -\frac{a_{n-1}(n^2 - 5n + 6)}{n(n+4)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 4$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-r^2 + 11r - 30}{r^2 - 2r - 3}$$

Which for the root $r = 4$ becomes

$$a_1 = -\frac{2}{5}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+11r-30}{r^2-2r-3}$	$-\frac{2}{5}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(-4+r)(r-5)^2(r-6)}{r^4 - 2r^3 - 7r^2 + 8r + 12}$$

Which for the root $r = 4$ becomes

$$a_2 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+11r-30}{r^2-2r-3}$	$-\frac{2}{5}$
a_2	$\frac{(-4+r)(r-5)^2(r-6)}{r^4-2r^3-7r^2+8r+12}$	0

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{(r-6)(r-5)^2(-4+r)^2}{r^5 + 3r^4 - 5r^3 - 15r^2 + 4r + 12}$$

Which for the root $r = 4$ becomes

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+11r-30}{r^2-2r-3}$	$-\frac{2}{5}$
a_2	$\frac{(-4+r)(r-5)^2(r-6)}{r^4-2r^3-7r^2+8r+12}$	0
a_3	$-\frac{(r-6)(r-5)^2(-4+r)^2}{r^5+3r^4-5r^3-15r^2+4r+12}$	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(r-6)(r-5)^2(-4+r)^2(r-3)}{(r+4)\,r\,(r^4 + 5r^3 + 5r^2 - 5r - 6)}$$

Which for the root $r = 4$ becomes

$$a_4 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+11r-30}{r^2-2r-3}$	$-\frac{2}{5}$
a_2	$\frac{(-4+r)(r-5)^2(r-6)}{r^4-2r^3-7r^2+8r+12}$	0
a_3	$-\frac{(r-6)(r-5)^2(-4+r)^2}{r^5+3r^4-5r^3-15r^2+4r+12}$	0
a_4	$\frac{(r-6)(r-5)^2(-4+r)^2(r-3)}{(r+4)r(r^4+5r^3+5r^2-5r-6)}$	0

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(r-6)(r-5)^2(-4+r)^2(r-3)(r-2)}{(5+r)(r+1)^2(r+3)(r+2)r(r+4)}$$

Which for the root $r = 4$ becomes

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+11r-30}{r^2-2r-3}$	$-\frac{2}{5}$
a_2	$\frac{(-4+r)(r-5)^2(r-6)}{r^4-2r^3-7r^2+8r+12}$	0
a_3	$-\frac{(r-6)(r-5)^2(-4+r)^2}{r^5+3r^4-5r^3-15r^2+4r+12}$	0
a_4	$\frac{(r-6)(r-5)^2(-4+r)^2(r-3)}{(r+4)r(r^4+5r^3+5r^2-5r-6)}$	0
a_5	$-\frac{(r-6)(r-5)^2(-4+r)^2(r-3)(r-2)}{(5+r)(r+1)^2(r+3)(r+2)r(r+4)}$	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^4(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots) \\ &= x^4\left(1 - \frac{2x}{5} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$
\begin{aligned}
a_N &= a_4 \\
&= \frac{(r-6)(r-5)^2(-4+r)^2(r-3)}{(r+4)\,r\,(r^4+5r^3+5r^2-5r-6)}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\lim_{r\to r_2} \frac{(r-6)(r-5)^2(-4+r)^2(r-3)}{(r+4)\,r\,(r^4+5r^3+5r^2-5r-6)} &= \lim_{r\to 0} \frac{(r-6)(r-5)^2(-4+r)^2(r-3)}{(r+4)\,r\,(r^4+5r^3+5r^2-5r-6)} \\
&= \textit{undefined}
\end{aligned}
$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$
y_2(x) = C y_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)
$$

Therefore

$$
\begin{aligned}
\frac{d}{dx} y_2(x) &= C y_1'(x)\ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\
&= C y_1'(x)\ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) \\
\frac{d^2}{dx^2} y_2(x) &= C y_1''(x)\ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\
&= C y_1''(x)\ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right)
\end{aligned}
$$

Substituting these back into the given ode $x^2(x+1)\,y'' + (-10x^2-3x)\,y' + 30yx = 0$

gives

$$
\begin{aligned}
&x^{2}(x+1)\left(Cy_1''(x)\ln(x)+\frac{2Cy_1'(x)}{x}-\frac{Cy_1(x)}{x^{2}}\right.\\
&\left.+\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^{2}}{x^{2}}-\frac{b_n x^{n+r_2}(n+r_2)}{x^{2}}\right)\right)\\
&+\left(-10x^{2}-3x\right)\left(Cy_1'(x)\ln(x)+\frac{Cy_1(x)}{x}+\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)\\
&+30\left(Cy_1(x)\ln(x)+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)\right)x=0
\end{aligned}
$$

Which can be written as

$$
\begin{aligned}
&\left(\left(x^{2}(x+1)\,y_1''(x)+\left(-10x^{2}-3x\right)y_1'(x)+30y_1(x)\,x\right)\ln(x)\right.\\
&\left.+x^{2}(x+1)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^{2}}\right)+\frac{\left(-10x^{2}-3x\right)y_1(x)}{x}\right)C\\
&+x^{2}(x+1)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^{2}}{x^{2}}-\frac{b_n x^{n+r_2}(n+r_2)}{x^{2}}\right)\right)\\
&+\left(-10x^{2}-3x\right)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+30\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)x=0
\end{aligned}
\tag{7}
$$

But since $y_1(x)$ is a solution to the ode, then

$$
x^{2}(x+1)\,y_1''(x)+\left(-10x^{2}-3x\right)y_1'(x)+30y_1(x)\,x=0
$$

Eq (7) simplifes to

$$
\begin{aligned}
&\left(x^{2}(x+1)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^{2}}\right)+\frac{\left(-10x^{2}-3x\right)y_1(x)}{x}\right)C\\
&+x^{2}(x+1)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^{2}}{x^{2}}-\frac{b_n x^{n+r_2}(n+r_2)}{x^{2}}\right)\right)\\
&+\left(-10x^{2}-3x\right)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+30\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)x=0
\end{aligned}
\tag{8}
$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\begin{gathered}
\left(2x(x+1)\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n(n+r_1)\right)+(-11x-4)\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)\right) C \\
+x^2(x+1)\left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n+r_2)(-1+n+r_2)\right) \\
+\left(-10x^2-3x\right)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n+r_2)\right)+30\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) x=0
\end{gathered} \tag{9}$$

Since $r_1 = 4$ and $r_2 = 0$ then the above becomes

$$\begin{gathered}
\left(2x(x+1)\left(\sum_{n=0}^{\infty} x^{3+n} a_n(n+4)\right)+(-11x-4)\left(\sum_{n=0}^{\infty} a_n x^{n+4}\right)\right) C \\
+x^2(x+1)\left(\sum_{n=0}^{\infty} x^{-2+n} b_n n(n-1)\right) \\
+\left(-10x^2-3x\right)\left(\sum_{n=0}^{\infty} x^{n-1} b_n n\right)+30\left(\sum_{n=0}^{\infty} b_n x^n\right) x=0
\end{gathered} \tag{10}$$

Which simplifies to

$$\begin{gathered}
\left(\sum_{n=0}^{\infty} 2C\, x^{n+5} a_n(n+4)\right)+\left(\sum_{n=0}^{\infty} 2C\, x^{n+4} a_n(n+4)\right)+\sum_{n=0}^{\infty}\left(-11C\, x^{n+5} a_n\right) \\
+\sum_{n=0}^{\infty}\left(-4C\, x^{n+4} a_n\right)+\left(\sum_{n=0}^{\infty} n\, x^{1+n} b_n(n-1)\right)+\left(\sum_{n=0}^{\infty} x^n b_n n(n-1)\right) \\
+\sum_{n=0}^{\infty}\left(-10n\, x^{1+n} b_n\right)+\sum_{n=0}^{\infty}\left(-3x^n b_n n\right)+\left(\sum_{n=0}^{\infty} 30x^{1+n} b_n\right)=0
\end{gathered} \tag{2A}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the

power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2C\, x^{n+5} a_n (n+4) = \sum_{n=5}^{\infty} 2C a_{n-5} (n-1)\, x^n$$

$$\sum_{n=0}^{\infty} 2C\, x^{n+4} a_n (n+4) = \sum_{n=4}^{\infty} 2C a_{-4+n} n\, x^n$$

$$\sum_{n=0}^{\infty} \left(-11C\, x^{n+5} a_n\right) = \sum_{n=5}^{\infty} \left(-11C a_{n-5} x^n\right)$$

$$\sum_{n=0}^{\infty} \left(-4C\, x^{n+4} a_n\right) = \sum_{n=4}^{\infty} \left(-4C a_{-4+n} x^n\right)$$

$$\sum_{n=0}^{\infty} n\, x^{1+n} b_n (n-1) = \sum_{n=1}^{\infty} (n-1)\, b_{n-1} (-2+n)\, x^n$$

$$\sum_{n=0}^{\infty} \left(-10n\, x^{1+n} b_n\right) = \sum_{n=1}^{\infty} \left(-10(n-1)\, b_{n-1} x^n\right)$$

$$\sum_{n=0}^{\infty} 30 x^{1+n} b_n = \sum_{n=1}^{\infty} 30 b_{n-1} x^n$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to n.

$$\begin{aligned} &\left(\sum_{n=5}^{\infty} 2C a_{n-5} (n-1)\, x^n\right) + \left(\sum_{n=4}^{\infty} 2C a_{-4+n} n\, x^n\right) + \sum_{n=5}^{\infty} \left(-11C a_{n-5} x^n\right) \\ &+ \sum_{n=4}^{\infty} \left(-4C a_{-4+n} x^n\right) + \left(\sum_{n=1}^{\infty} (n-1)\, b_{n-1} (-2+n)\, x^n\right) \\ &+ \left(\sum_{n=0}^{\infty} x^n b_n n(n-1)\right) + \sum_{n=1}^{\infty} \left(-10(n-1)\, b_{n-1} x^n\right) \\ &+ \sum_{n=0}^{\infty} \left(-3x^n b_n n\right) + \left(\sum_{n=1}^{\infty} 30 b_{n-1} x^n\right) = 0 \end{aligned} \tag{2B}$$

For $n = 0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n = 1$, Eq (2B) gives

$$-3b_1 + 30b_0 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_1 + 30 = 0$$

Solving the above for b_1 gives

$$b_1 = 10$$

For $n = 2$, Eq (2B) gives

$$-4b_2 + 20b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-4b_2 + 200 = 0$$

Solving the above for b_2 gives

$$b_2 = 50$$

For $n = 3$, Eq (2B) gives

$$12b_2 - 3b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$600 - 3b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 200$$

For $n = N$, where $N = 4$ which is the difference between the two roots, we are free to choose $b_4 = 0$. Hence for $n = 4$, Eq (2B) gives

$$4C + 1200 = 0$$

Which is solved for C. Solving for C gives

$$C = -300$$

For $n = 5$, Eq (2B) gives

$$(-3a_0 + 6a_1)\, C + 2b_4 + 5b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$1620 + 5b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = -324$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -300$ and all b_n, then the second solution becomes

$$y_2(x) = (-300)\left(x^4\left(1-\frac{2x}{5}+O(x^6)\right)\right)\ln(x)+1+10x+50x^2+200x^3-324x^5+O(x^6)$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x) &= c_1y_1(x) + c_2y_2(x)\\ &= c_1x^4\left(1-\frac{2x}{5}+O(x^6)\right) + c_2\left((-300)\left(x^4\left(1-\frac{2x}{5}+O(x^6)\right)\right)\ln(x)+1+10x\right.\\ &\qquad \left. + 50x^2+200x^3-324x^5+O(x^6)\right)\end{aligned}$$

Hence the final solution is

$$\begin{aligned}y &= y_h\\ &= c_1x^4\left(1-\frac{2x}{5}+O(x^6)\right)\\ &\quad + c_2\left(-300x^4\left(1-\frac{2x}{5}+O(x^6)\right)\ln(x)+1+10x+50x^2+200x^3-324x^5+O(x^6)\right)\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}y &= c_1x^4\left(1-\frac{2x}{5}+O(x^6)\right)\\ &\quad + c_2\left(-300x^4\left(1-\frac{2x}{5}+O(x^6)\right)\ln(x)+1+10x+50x^2+200x^3-324x^5+O(x^6)\right)\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}y &= c_1x^4\left(1-\frac{2x}{5}+O(x^6)\right)\\ &\quad + c_2\left(-300x^4\left(1-\frac{2x}{5}+O(x^6)\right)\ln(x)+1+10x+50x^2+200x^3-324x^5+O(x^6)\right)\end{aligned}$$

Verified OK.

16.14.1 Maple step by step solution

Let's solve

$x^2(x+1)\,y''+(-10x^2-3x)\,y'+30yx=0$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y''=-\frac{30y}{x(x+1)}+\frac{(3+10x)y'}{x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''-\frac{(3+10x)y'}{x(x+1)}+\frac{30y}{x(x+1)}=0$

□ Check to see if x_0 is a regular singular point

- ○ Define functions

$\left[P_2(x)=-\frac{3+10x}{x(x+1)},P_3(x)=\frac{30}{x(x+1)}\right]$

- ○ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

$\left((x+1)\cdot P_2(x)\right)\Bigg|_{x=-1}=-7$

- ○ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

$\left((x+1)^2\cdot P_3(x)\right)\Bigg|_{x=-1}=0$

- ○ $x=-1$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0=-1$

- Multiply by denominators

$x(x+1)\,y''+(-3-10x)\,y'+30y=0$

- Change variables using $x=u-1$ so that the regular singular point is at $u=0$

$(u^2-u)\left(\frac{d^2}{du^2}y(u)\right)+(7-10u)\left(\frac{d}{du}y(u)\right)+30y(u)=0$

- Assume series solution for $y(u)$

$y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$

- Shift index using $k- >k+1-m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$

- Shift index using $k- >k+2-m$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$

  Rewrite ODE with series expansions

  $-a_0 r(-8+r)\, u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(-a_{k+1}(k+1+r)\,(k-7+r) + a_k(k+r-5)\,(k+r-6)\right) u^{k+r}\right) =$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-r(-8+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{0, 8\}$

- Each term in the series must be 0, giving the recursion relation

  $-a_{k+1}(k+1+r)\,(k-7+r) + a_k(k+r-5)\,(k+r-6) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+1} = \frac{a_k(k+r-5)(k+r-6)}{(k+1+r)(k-7+r)}$

- Recursion relation for $r = 0$; series terminates at $k = 5$

  $a_{k+1} = \frac{a_k(k-5)(k-6)}{(k+1)(k-7)}$

- Apply recursion relation for $k = 0$

  $a_1 = -\frac{30a_0}{7}$

- Apply recursion relation for $k = 1$

  $a_2 = -\frac{5a_1}{3}$

- Express in terms of a_0

  $a_2 = \frac{50a_0}{7}$

- Apply recursion relation for $k = 2$

  $a_3 = -\frac{4a_2}{5}$
- Express in terms of a_0

  $a_3 = -\frac{40a_0}{7}$
- Apply recursion relation for $k = 3$

  $a_4 = -\frac{3a_3}{8}$
- Express in terms of a_0

  $a_4 = \frac{15a_0}{7}$
- Apply recursion relation for $k = 4$

  $a_5 = -\frac{2a_4}{15}$
- Express in terms of a_0

  $a_5 = -\frac{2a_0}{7}$
- Terminating series solution of the ODE for $r = 0$. Use reduction of order to find the second li

  $y(u) = a_0 \cdot \left(1 - \frac{30}{7}u + \frac{50}{7}u^2 - \frac{40}{7}u^3 + \frac{15}{7}u^4 - \frac{2}{7}u^5\right)$
- Revert the change of variables $u = x + 1$

  $\left[y = a_0\left(\frac{5}{7}x^4 - \frac{2}{7}x^5\right)\right]$
- Recursion relation for $r = 8$

  $a_{k+1} = \frac{a_k(k+3)(k+2)}{(k+9)(k+1)}$
- Solution for $r = 8$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+8}, a_{k+1} = \frac{a_k(k+3)(k+2)}{(k+9)(k+1)}\right]$
- Revert the change of variables $u = x + 1$

  $\left[y = \sum_{k=0}^{\infty} a_k(x+1)^{k+8}, a_{k+1} = \frac{a_k(k+3)(k+2)}{(k+9)(k+1)}\right]$
- Combine solutions and rename parameters

  $\left[y = a_0\left(\frac{5}{7}x^4 - \frac{2}{7}x^5\right) + \left(\sum_{k=0}^{\infty} b_k(x+1)^{k+8}\right), b_{1+k} = \frac{b_k(k+3)(k+2)}{(k+9)(1+k)}\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 11.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' + x(x+1)\,y' - 3y(x+3) = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + (x^2 + x)\,y' + (-3x - 9)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{x+1}{x}$$
$$q(x) = -\frac{3(x+3)}{x^2}$$

Table 800: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x+1}{x}$	
singularity	type
$x = 0$	"regular"

$q(x) = -\frac{3(x+3)}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : [∞]

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2y'' + \left(x^2 + x\right) y' + (-3x - 9)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(x^2 + x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (-3x - 9) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)\right) \\ + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-3x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-9a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} a_{n-1} (n+r-1) x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-3x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-3a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=1}^{\infty} a_{n-1} (n+r-1) x^{n+r}\right) \\ + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \sum_{n=1}^{\infty} \left(-3a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-9a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r) (n+r-1) + x^{n+r} a_n (n+r) - 9a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) + x^r a_0 r - 9a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + x^r r - 9x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2 - 9\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 9 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 3$$
$$r_2 = -3$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(r^2 - 9\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 6$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^3 \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^3}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+3}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-3}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) + a_{n-1}(n+r-1) + a_n(n+r) - 3a_{n-1} - 9a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n+r-4)}{n^2+2nr+r^2-9} \tag{4}$$

Which for the root $r = 3$ becomes

$$a_n = -\frac{a_{n-1}(n-1)}{n(n+6)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 3$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{3-r}{r^2+2r-8}$$

Which for the root $r = 3$ becomes

$$a_1 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-r}{r^2+2r-8}$	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-3+r}{r^3+8r^2+11r-20}$$

Which for the root $r = 3$ becomes

$$a_2 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-r}{r^2+2r-8}$	0
a_2	$\frac{-3+r}{r^3+8r^2+11r-20}$	0

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{3 - r}{(r + 6) r (5 + r) (r + 4)}$$

Which for the root $r = 3$ becomes

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-r}{r^2+2r-8}$	0
a_2	$\frac{-3+r}{r^3+8r^2+11r-20}$	0
a_3	$\frac{3-r}{(r+6)r(5+r)(r+4)}$	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{-3 + r}{(r + 6) (5 + r) (r + 4) (r + 7) (r + 1)}$$

Which for the root $r = 3$ becomes

$$a_4 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-r}{r^2+2r-8}$	0
a_2	$\frac{-3+r}{r^3+8r^2+11r-20}$	0
a_3	$\frac{3-r}{(r+6)r(5+r)(r+4)}$	0
a_4	$\frac{-3+r}{(r+6)(5+r)(r+4)(r+7)(r+1)}$	0

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{3 - r}{(r + 6) (5 + r) (r + 4) (r + 7) (r + 8) (r + 2)}$$

Which for the root $r = 3$ becomes

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-r}{r^2+2r-8}$	0
a_2	$\frac{-3+r}{r^3+8r^2+11r-20}$	0
a_3	$\frac{3-r}{(r+6)r(5+r)(r+4)}$	0
a_4	$\frac{-3+r}{(r+6)(5+r)(r+4)(r+7)(r+1)}$	0
a_5	$\frac{3-r}{(r+6)(5+r)(r+4)(r+7)(r+8)(r+2)}$	0

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{-3 + r}{(r + 6)(5 + r)(r + 4)(r + 7)(r + 8)(r + 9)(r + 3)}$$

Which for the root $r = 3$ becomes

$$a_6 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-r}{r^2+2r-8}$	0
a_2	$\frac{-3+r}{r^3+8r^2+11r-20}$	0
a_3	$\frac{3-r}{(r+6)r(5+r)(r+4)}$	0
a_4	$\frac{-3+r}{(r+6)(5+r)(r+4)(r+7)(r+1)}$	0
a_5	$\frac{3-r}{(r+6)(5+r)(r+4)(r+7)(r+8)(r+2)}$	0
a_6	$\frac{-3+r}{(r+6)(5+r)(r+4)(r+7)(r+8)(r+9)(r+3)}$	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^3 \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 \dots\right) \\ &= x^3 \left(1 + O(x^7)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 6$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_6(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$
\begin{aligned}
a_N &= a_6 \\
&= \frac{-3+r}{(r+6)(5+r)(r+4)(r+7)(r+8)(r+9)(r+3)}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\lim_{r\to r_2} \frac{-3+r}{(r+6)(5+r)(r+4)(r+7)(r+8)(r+9)(r+3)} &= \lim_{r\to -3} \frac{-3+r}{(r+6)(5+r)(r+4)(r+7)(r+8)(r-} \\
&= \textit{undefined}
\end{aligned}
$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$
y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)
$$

Therefore

$$
\begin{aligned}
\frac{d}{dx}y_2(x) &= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\
&= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n+r_2)\right) \\
\frac{d^2}{dx^2}y_2(x) &= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\
&= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n+r_2)(-1+n+r_2)\right)
\end{aligned}
$$

Substituting these back into the given ode $x^2 y'' + (x^2+x)\,y' + (-3x-9)\,y = 0$ gives

$$x^2\left(Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) + (x^2+x)\left(Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right) + (-3x-9)\left(Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)\right) = 0$$

Which can be written as

$$\left(\left(x^2 y_1''(x) + (x^2+x)\,y_1'(x) + (-3x-9)\,y_1(x)\right)\ln(x) + x^2\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) + \frac{(x^2+x)\,y_1(x)}{x}\right)C + x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) + (x^2+x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right) + (-3x-9)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$x^2 y_1''(x) + (x^2+x)\,y_1'(x) + (-3x-9)\,y_1(x) = 0$$

Eq (7) simplifes to

$$\left(x^2\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) + \frac{(x^2+x)\,y_1(x)}{x}\right)C + x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) + (x^2+x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right) + (-3x-9)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{8}$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\left(\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right) x + 2\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) x\right) C + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) x^2 + (x^2+x)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) + (-3x-9)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{9}$$

Since $r_1 = 3$ and $r_2 = -3$ then the above becomes

$$\left(\left(\sum_{n=0}^{\infty} a_n x^{n+3}\right) x + 2\left(\sum_{n=0}^{\infty} x^{2+n} a_n (n+3)\right) x\right) C + \left(\sum_{n=0}^{\infty} x^{-5+n} b_n (n-3)(-4+n)\right) x^2 + (x^2+x)\left(\sum_{n=0}^{\infty} x^{-4+n} b_n (n-3)\right) + (-3x-9)\left(\sum_{n=0}^{\infty} b_n x^{n-3}\right) = 0 \tag{10}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} C\, x^{4+n} a_n\right) + \left(\sum_{n=0}^{\infty} 2C\, x^{n+3} a_n (n+3)\right) + \left(\sum_{n=0}^{\infty} x^{n-3} b_n (-4+n)(n-3)\right) + \left(\sum_{n=0}^{\infty} x^{n-2} b_n (n-3)\right) + \left(\sum_{n=0}^{\infty} x^{n-3} b_n (n-3)\right) + \sum_{n=0}^{\infty} \left(-3x^{n-2} b_n\right) + \sum_{n=0}^{\infty} \left(-9 b_n x^{n-3}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n-3$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n-3} and

adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} C\, x^{4+n} a_n = \sum_{n=7}^{\infty} C a_{n-7} x^{n-3}$$

$$\sum_{n=0}^{\infty} 2C\, x^{n+3} a_n (n+3) = \sum_{n=6}^{\infty} 2C a_{n-6} (n-3)\, x^{n-3}$$

$$\sum_{n=0}^{\infty} x^{n-2} b_n (n-3) = \sum_{n=1}^{\infty} b_{n-1} (-4+n)\, x^{n-3}$$

$$\sum_{n=0}^{\infty} \left(-3x^{n-2} b_n\right) = \sum_{n=1}^{\infty} \left(-3b_{n-1} x^{n-3}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-3$.

$$\begin{aligned} &\left(\sum_{n=7}^{\infty} C a_{n-7} x^{n-3}\right) + \left(\sum_{n=6}^{\infty} 2C a_{n-6} (n-3)\, x^{n-3}\right) \\ &+ \left(\sum_{n=0}^{\infty} x^{n-3} b_n (-4+n)\,(n-3)\right) + \left(\sum_{n=1}^{\infty} b_{n-1}(-4+n)\, x^{n-3}\right) \\ &+ \left(\sum_{n=0}^{\infty} x^{n-3} b_n (n-3)\right) + \sum_{n=1}^{\infty} \left(-3b_{n-1} x^{n-3}\right) + \sum_{n=0}^{\infty} \left(-9b_n x^{n-3}\right) = 0 \end{aligned} \tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n=1$, Eq (2B) gives

$$-5b_1 - 6b_0 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-5b_1 - 6 = 0$$

Solving the above for b_1 gives

$$b_1 = -\frac{6}{5}$$

For $n=2$, Eq (2B) gives

$$-8b_2 - 5b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-8b_2 + 6 = 0$$

Solving the above for b_2 gives

$$b_2 = \frac{3}{4}$$

For $n = 3$, Eq (2B) gives

$$-4b_2 - 9b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3 - 9b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = -\frac{1}{3}$$

For $n = 4$, Eq (2B) gives

$$-8b_4 - 3b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-8b_4 + 1 = 0$$

Solving the above for b_4 gives

$$b_4 = \frac{1}{8}$$

For $n = 5$, Eq (2B) gives

$$-5b_5 - 2b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-5b_5 - \frac{1}{4} = 0$$

Solving the above for b_5 gives

$$b_5 = -\frac{1}{20}$$

For $n = N$, where $N = 6$ which is the difference between the two roots, we are free to choose $b_6 = 0$. Hence for $n = 6$, Eq (2B) gives

$$6C + \frac{1}{20} = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{1}{120}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{1}{120}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{1}{120}\left(x^3\left(1+O\left(x^7\right)\right)\right)\ln(x) + \frac{1 - \frac{6x}{5} + \frac{3x^2}{4} - \frac{x^3}{3} + \frac{x^4}{8} - \frac{x^5}{20} + O(x^7)}{x^3}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^3\left(1+O\left(x^7\right)\right) \\ &\quad + c_2\left(-\frac{1}{120}\left(x^3\left(1+O\left(x^7\right)\right)\right)\ln(x) + \frac{1 - \frac{6x}{5} + \frac{3x^2}{4} - \frac{x^3}{3} + \frac{x^4}{8} - \frac{x^5}{20} + O(x^7)}{x^3}\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^3\left(1+O\left(x^7\right)\right) + c_2\left(-\frac{x^3(1+O(x^7))\ln(x)}{120} + \frac{1 - \frac{6x}{5} + \frac{3x^2}{4} - \frac{x^3}{3} + \frac{x^4}{8} - \frac{x^5}{20} + O(x^7)}{x^3}\right) \end{aligned}$$

<u>Summary</u>

The solution(s) found are the following

$$\begin{aligned} y &= c_1 x^3\left(1+O\left(x^7\right)\right) \\ &\quad + c_2\left(-\frac{x^3(1+O(x^7))\ln(x)}{120} + \frac{1 - \frac{6x}{5} + \frac{3x^2}{4} - \frac{x^3}{3} + \frac{x^4}{8} - \frac{x^5}{20} + O(x^7)}{x^3}\right) \end{aligned} \tag{1}$$

<u>Verification of solutions</u>

$$y = c_1 x^3\left(1+O\left(x^7\right)\right) + c_2\left(-\frac{x^3(1+O(x^7))\ln(x)}{120} + \frac{1 - \frac{6x}{5} + \frac{3x^2}{4} - \frac{x^3}{3} + \frac{x^4}{8} - \frac{x^5}{20} + O(x^7)}{x^3}\right)$$

Verified OK.

16.15.1 Maple step by step solution

Let's solve

$x^2y'' + (x^2 + x)\, y' + (-3x - 9)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{3(x+3)y}{x^2} - \frac{(x+1)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x+1)y'}{x} - \frac{3(x+3)y}{x^2} = 0$

☐ Check to see if $x_0 = 0$ is a regular singular point

- ○ Define functions

  $\left[P_2(x) = \frac{x+1}{x}, P_3(x) = -\frac{3(x+3)}{x^2}\right]$

- ○ $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\bigg|_{x=0} = 1$

- ○ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\bigg|_{x=0} = -9$

- ○ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2y'' + x(x + 1)\, y' + (-3x - 9)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- ○ Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $$x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..2$

  $$x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\, x^{k+r-1+m}$$

- Shift index using $k->k+1-m$

  $$x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^{2}\cdot y''$ to series expansion

  $$x^{2}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_{0}(3+r)\,(-3+r)\, x^{r}+\left(\sum_{k=1}^{\infty} \left(a_{k}(k+r+3)\,(k+r-3)+a_{k-1}(k-4+r)\right) x^{k+r}\right)=0$$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $$(3+r)\,(-3+r)=0$$

- Values of r that satisfy the indicial equation

  $$r\in\{-3,3\}$$

- Each term in the series must be 0, giving the recursion relation

  $$a_{k}(k+r+3)\,(k+r-3)+a_{k-1}(k-4+r)=0$$

- Shift index using $k->k+1$

  $$a_{k+1}(k+4+r)\,(k-2+r)+a_{k}(k+r-3)=0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+1}=-\frac{a_{k}(k+r-3)}{(k+4+r)(k-2+r)}$$

- Recursion relation for $r=-3$; series terminates at $k=6$

  $$a_{k+1}=-\frac{a_{k}(k-6)}{(k+1)(k-5)}$$

- Series not valid for $r=-3$, division by 0 in the recursion relation at $k=5$

  $$a_{k+1}=-\frac{a_{k}(k-6)}{(k+1)(k-5)}$$

- Recursion relation for $r=3$

  $$a_{k+1}=-\frac{a_{k}k}{(k+7)(k+1)}$$

- Solution for $r = 3$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+3}, a_{k+1} = -\frac{a_k k}{(k+7)(k+1)}\right]$$

Problem number: 12.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' + x(1-2x)\,y' - (x+4)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + \left(-2x^2 + x\right)y' + (-x-4)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = -\frac{2x-1}{x}$$
$$q(x) = -\frac{x+4}{x^2}$$

Table 802: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{2x-1}{x}$	
singularity	type
$x = 0$	"regular"

$q(x) = -\frac{x+4}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2y'' + (-2x^2 + x)\, y' + (-x - 4)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}\right) + (-2x^2 + x) \left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) + (-x - 4) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-2x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-4a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-2x^{1+n+r} a_n (n+r)\right) = \sum_{n=1}^{\infty} \left(-2a_{n-1}(n+r-1)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=1}^{\infty} \left(-2a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \sum_{n=1}^{\infty} \left(-a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-4a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + x^{n+r} a_n (n+r) - 4a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + x^r a_0 r - 4a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + x^r r - 4x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2 - 4\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 4 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 2 \\ r_2 &= -2 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(r^2 - 4\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right) \\ y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= x^2 \left(\sum_{n=0}^{\infty} a_n x^n\right) \\ y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^2} \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+2} \\ y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-2}\right) \end{aligned}$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) - 2a_{n-1}(n+r-1) + a_n(n+r) - a_{n-1} - 4a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{a_{n-1}(2n+2r-1)}{n^2+2nr+r^2-4} \tag{4}$$

Which for the root $r = 2$ becomes

$$a_n = \frac{a_{n-1}(2n+3)}{n\,(n+4)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{1+2r}{r^2+2r-3}$$

Which for the root $r = 2$ becomes

$$a_1 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1+2r}{r^2+2r-3}$	1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4r^2+8r+3}{(r+3)\,(-1+r)\,r\,(r+4)}$$

Which for the root $r = 2$ becomes

$$a_2 = \frac{7}{12}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1+2r}{r^2+2r-3}$	1
a_2	$\frac{4r^2+8r+3}{(r+3)(-1+r)r(r+4)}$	$\frac{7}{12}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{8r^3 + 36r^2 + 46r + 15}{(r+3)(-1+r)r(r+4)(5+r)(r+1)}$$

Which for the root $r = 2$ becomes

$$a_3 = \frac{1}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1+2r}{r^2+2r-3}$	1
a_2	$\frac{4r^2+8r+3}{(r+3)(-1+r)r(r+4)}$	$\frac{7}{12}$
a_3	$\frac{8r^3+36r^2+46r+15}{(r+3)(-1+r)r(r+4)(5+r)(r+1)}$	$\frac{1}{4}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16r^4 + 128r^3 + 344r^2 + 352r + 105}{(r+3)r(r+4)(5+r)(r^2+8r+12)(r^2-1)}$$

Which for the root $r = 2$ becomes

$$a_4 = \frac{11}{128}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1+2r}{r^2+2r-3}$	1
a_2	$\frac{4r^2+8r+3}{(r+3)(-1+r)r(r+4)}$	$\frac{7}{12}$
a_3	$\frac{8r^3+36r^2+46r+15}{(r+3)(-1+r)r(r+4)(5+r)(r+1)}$	$\frac{1}{4}$
a_4	$\frac{16r^4+128r^3+344r^2+352r+105}{(r+3)r(r+4)(5+r)(r^2+8r+12)(r^2-1)}$	$\frac{11}{128}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{32r^5 + 400r^4 + 1840r^3 + 3800r^2 + 3378r + 945}{r(-1+r)(5+r)(r+4)(r+3)^2(r+1)(r+6)(r+2)(r+7)}$$

Which for the root $r = 2$ becomes

$$a_5 = \frac{143}{5760}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1+2r}{r^2+2r-3}$	1
a_2	$\frac{4r^2+8r+3}{(r+3)(-1+r)r(r+4)}$	$\frac{7}{12}$
a_3	$\frac{8r^3+36r^2+46r+15}{(r+3)(-1+r)r(r+4)(5+r)(r+1)}$	$\frac{1}{4}$
a_4	$\frac{16r^4+128r^3+344r^2+352r+105}{(r+3)r(r+4)(5+r)(r^2+8r+12)(r^2-1)}$	$\frac{11}{128}$
a_5	$\frac{32r^5+400r^4+1840r^3+3800r^2+3378r+945}{r(-1+r)(5+r)(r+4)(r+3)^2(r+1)(r+6)(r+2)(r+7)}$	$\frac{143}{5760}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^2\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^2\left(1 + x + \frac{7x^2}{12} + \frac{x^3}{4} + \frac{11x^4}{128} + \frac{143x^5}{5760} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_4 \\ &= \frac{16r^4 + 128r^3 + 344r^2 + 352r + 105}{(r+3)\, r\,(r+4)\,(5+r)\,(r^2+8r+12)\,(r^2-1)} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} \frac{16r^4 + 128r^3 + 344r^2 + 352r + 105}{(r+3)\, r\,(r+4)\,(5+r)\,(r^2+8r+12)\,(r^2-1)} &= \lim_{r\to -2} \frac{16r^4 + 128r^3 + 344r^2 + 352r + 105}{(r+3)\, r\,(r+4)\,(5+r)\,(r^2+8r+12)\,(r^2-1)} \\ &= \textit{undefined} \end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = Cy_1(x) \ln (x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned}
\frac{d}{dx} y_2(x) &= Cy_1'(x) \ln (x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\
&= Cy_1'(x) \ln (x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) \\
\frac{d^2}{dx^2} y_2(x) &= Cy_1''(x) \ln (x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\
&= Cy_1''(x) \ln (x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right)
\end{aligned}$$

Substituting these back into the given ode $x^2 y'' + (-2x^2 + x) y' + (-x-4) y = 0$ gives

$$\begin{aligned}
&x^2 \left(Cy_1''(x) \ln (x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} \right. \\
&\left. + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) \\
&+ (-2x^2 + x) \left(Cy_1'(x) \ln (x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right) \\
&+ (-x-4) \left(Cy_1(x) \ln (x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)\right) = 0
\end{aligned}$$

Which can be written as

$$\left(\left(\left(x^{2} y_{1}''(x)+\left(-2x^{2}+x\right) y_{1}'(x)+\left(-x-4\right) y_{1}(x)\right) \ln \left(x\right)+x^{2} \left(\frac{2 y_{1}'(x)}{x}-\frac{y_{1}(x)}{x^{2}}\right)\right.\right.$$
$$\left.\left.+\frac{\left(-2x^{2}+x\right) y_{1}(x)}{x}\right) C+x^{2} \left(\sum_{n=0}^{\infty} \left(\frac{b_{n} x^{n+r_{2}} \left(n+r_{2}\right)^{2}}{x^{2}}-\frac{b_{n} x^{n+r_{2}} \left(n+r_{2}\right)}{x^{2}}\right)\right)\right) \tag{7}$$
$$+\left(-2x^{2}+x\right) \left(\sum_{n=0}^{\infty} \frac{b_{n} x^{n+r_{2}} \left(n+r_{2}\right)}{x}\right)+\left(-x-4\right) \left(\sum_{n=0}^{\infty} b_{n} x^{n+r_{2}}\right)=0$$

But since $y_1(x)$ is a solution to the ode, then

$$x^{2} y_{1}''(x)+\left(-2x^{2}+x\right) y_{1}'(x)+\left(-x-4\right) y_{1}(x)=0$$

Eq (7) simplifes to

$$\left(x^{2} \left(\frac{2 y_{1}'(x)}{x}-\frac{y_{1}(x)}{x^{2}}\right)+\frac{\left(-2x^{2}+x\right) y_{1}(x)}{x}\right) C$$
$$+x^{2} \left(\sum_{n=0}^{\infty} \left(\frac{b_{n} x^{n+r_{2}} \left(n+r_{2}\right)^{2}}{x^{2}}-\frac{b_{n} x^{n+r_{2}} \left(n+r_{2}\right)}{x^{2}}\right)\right)\Bigg) \tag{8}$$
$$+\left(-2x^{2}+x\right) \left(\sum_{n=0}^{\infty} \frac{b_{n} x^{n+r_{2}} \left(n+r_{2}\right)}{x}\right)+\left(-x-4\right) \left(\sum_{n=0}^{\infty} b_{n} x^{n+r_{2}}\right)=0$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\left(2 \left(\sum_{n=0}^{\infty} x^{-1+n+r_{1}} a_{n} \left(n+r_{1}\right)\right) x-2 \left(\sum_{n=0}^{\infty} a_{n} x^{n+r_{1}}\right) x\right) C$$
$$+\left(\sum_{n=0}^{\infty} x^{-2+n+r_{2}} b_{n} \left(n+r_{2}\right) \left(-1+n+r_{2}\right)\right) x^{2} \tag{9}$$
$$+\left(-2x^{2}+x\right) \left(\sum_{n=0}^{\infty} x^{-1+n+r_{2}} b_{n} \left(n+r_{2}\right)\right)+\left(-x-4\right) \left(\sum_{n=0}^{\infty} b_{n} x^{n+r_{2}}\right)=0$$

Since $r_1 = 2$ and $r_2 = -2$ then the above becomes

$$\left(2\left(\sum_{n=0}^{\infty} x^{1+n} a_n (n+2)\right) x - 2\left(\sum_{n=0}^{\infty} a_n x^{n+2}\right) x\right) C \\ + \left(\sum_{n=0}^{\infty} x^{-4+n} b_n (n-2)(-3+n)\right) x^2 \\ + (-2x^2 + x)\left(\sum_{n=0}^{\infty} x^{-3+n} b_n (n-2)\right) + (-x-4)\left(\sum_{n=0}^{\infty} b_n x^{n-2}\right) = 0 \tag{10}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2C\, x^{n+2} a_n (n+2)\right) + \sum_{n=0}^{\infty} \left(-2C\, x^{3+n} a_n\right) \\ + \left(\sum_{n=0}^{\infty} x^{n-2} b_n (n^2 - 5n + 6)\right) + \sum_{n=0}^{\infty} \left(-2x^{n-1} b_n (n-2)\right) \\ + \left(\sum_{n=0}^{\infty} x^{n-2} b_n (n-2)\right) + \sum_{n=0}^{\infty} \left(-x^{n-1} b_n\right) + \sum_{n=0}^{\infty} \left(-4 b_n x^{n-2}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n-2$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n-2} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2C\, x^{n+2} a_n (n+2) = \sum_{n=4}^{\infty} 2C a_{-4+n} (n-2)\, x^{n-2}$$

$$\sum_{n=0}^{\infty} \left(-2C\, x^{3+n} a_n\right) = \sum_{n=5}^{\infty} \left(-2C a_{n-5} x^{n-2}\right)$$

$$\sum_{n=0}^{\infty} \left(-2x^{n-1} b_n (n-2)\right) = \sum_{n=1}^{\infty} \left(-2 b_{n-1} (-3+n)\, x^{n-2}\right)$$

$$\sum_{n=0}^{\infty} \left(-x^{n-1} b_n\right) = \sum_{n=1}^{\infty} \left(-b_{n-1} x^{n-2}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-2$.

$$\left(\sum_{n=4}^{\infty} 2Ca_{-4+n}(n-2)\, x^{n-2}\right) + \sum_{n\, =5}^{\infty} \left(-2Ca_{n-5}x^{n-2}\right) + \left(\sum_{n=0}^{\infty} x^{n-2} b_n (n^2-5n+6)\right) + \sum_{n\, =1}^{\infty} \left(-2b_{n-1}(-3+n)\, x^{n-2}\right) + \left(\sum_{n=0}^{\infty} x^{n-2} b_n (n-2)\right) + \sum_{n\, =1}^{\infty} \left(-b_{n-1}x^{n-2}\right) + \sum_{n\, =0}^{\infty} \left(-4b_n x^{n-2}\right) = 0 \tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0=1$. For $n=1$, Eq (2B) gives

$$-3b_1+3b_0=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_1+3=0$$

Solving the above for b_1 gives

$$b_1=1$$

For $n=2$, Eq (2B) gives

$$b_1-4b_2=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$1-4b_2=0$$

Solving the above for b_2 gives

$$b_2=\frac{1}{4}$$

For $n=3$, Eq (2B) gives

$$-3b_3-b_2=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_3-\frac{1}{4}=0$$

Solving the above for b_3 gives

$$b_3=-\frac{1}{12}$$

For $n = N$, where $N = 4$ which is the difference between the two roots, we are free to choose $b_4 = 0$. Hence for $n = 4$, Eq (2B) gives

$$4C + \frac{1}{4} = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{1}{16}$$

For $n = 5$, Eq (2B) gives

$$(-2a_0 + 6a_1) C - 5b_4 + 5b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-\frac{1}{4} + 5b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = \frac{1}{20}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{1}{16}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{1}{16}\left(x^2\left(1 + x + \frac{7x^2}{12} + \frac{x^3}{4} + \frac{11x^4}{128} + \frac{143x^5}{5760} + O(x^6)\right)\right) \ln(x) + \frac{1 + x + \frac{x^2}{4} - \frac{x^3}{12} + \frac{x^5}{20} + O(x^6)}{x^2}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^2\left(1 + x + \frac{7x^2}{12} + \frac{x^3}{4} + \frac{11x^4}{128} + \frac{143x^5}{5760} + O(x^6)\right) \\
&\quad + c_2\left(-\frac{1}{16}\left(x^2\left(1 + x + \frac{7x^2}{12} + \frac{x^3}{4} + \frac{11x^4}{128} + \frac{143x^5}{5760} + O(x^6)\right)\right) \ln(x) \right.\\
&\quad \left. + \frac{1 + x + \frac{x^2}{4} - \frac{x^3}{12} + \frac{x^5}{20} + O(x^6)}{x^2}\right)
\end{aligned}$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^2 \left(1 + x + \frac{7x^2}{12} + \frac{x^3}{4} + \frac{11x^4}{128} + \frac{143x^5}{5760} + O\left(x^6\right)\right) \\
&\quad + c_2 \left(-\frac{x^2 \left(1 + x + \frac{7x^2}{12} + \frac{x^3}{4} + \frac{11x^4}{128} + \frac{143x^5}{5760} + O(x^6)\right) \ln(x)}{16} \right. \\
&\qquad \left. + \frac{1 + x + \frac{x^2}{4} - \frac{x^3}{12} + \frac{x^5}{20} + O(x^6)}{x^2}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^2 \left(1 + x + \frac{7x^2}{12} + \frac{x^3}{4} + \frac{11x^4}{128} + \frac{143x^5}{5760} + O\left(x^6\right)\right) \\
&\quad + c_2 \left(-\frac{x^2 \left(1 + x + \frac{7x^2}{12} + \frac{x^3}{4} + \frac{11x^4}{128} + \frac{143x^5}{5760} + O(x^6)\right) \ln(x)}{16} \right. \\
&\qquad \left. + \frac{1 + x + \frac{x^2}{4} - \frac{x^3}{12} + \frac{x^5}{20} + O(x^6)}{x^2}\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x^2 \left(1 + x + \frac{7x^2}{12} + \frac{x^3}{4} + \frac{11x^4}{128} + \frac{143x^5}{5760} + O\left(x^6\right)\right) \\
&\quad + c_2 \left(-\frac{x^2 \left(1 + x + \frac{7x^2}{12} + \frac{x^3}{4} + \frac{11x^4}{128} + \frac{143x^5}{5760} + O(x^6)\right) \ln(x)}{16} \right. \\
&\qquad \left. + \frac{1 + x + \frac{x^2}{4} - \frac{x^3}{12} + \frac{x^5}{20} + O(x^6)}{x^2}\right)
\end{aligned}
$$

Verified OK.

16.16.1 Maple step by step solution

Let's solve

$x^2 y'' + (-2x^2 + x)\, y' + (-x - 4)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(x+4)y}{x^2} + \frac{(2x-1)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{(2x-1)y'}{x} - \frac{(x+4)y}{x^2} = 0$

☐ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = -\frac{2x-1}{x}, P_3(x) = -\frac{x+4}{x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\Big|_{x=0} = 1$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\Big|_{x=0} = -4$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2 y'' - x(2x - 1)\, y' + (-x - 4)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  ◦ Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k+1-m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

$$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(2+r)\,(-2+r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(k+r+2)\,(k+r-2) - a_{k-1}(2k-1+2r)\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(2+r)\,(-2+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{-2, 2\}$$

- Each term in the series must be 0, giving the recursion relation

$$a_k(k+r+2)\,(k+r-2) - 2\left(k-\tfrac{1}{2}+r\right) a_{k-1} = 0$$

- Shift index using $k- >k+1$

$$a_{k+1}(k+3+r)\,(k+r-1) - 2\left(k+\tfrac{1}{2}+r\right) a_k = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = \frac{(2k+2r+1)a_k}{(k+3+r)(k+r-1)}$$

- Recursion relation for $r = -2$

$$a_{k+1} = \frac{(2k-3)a_k}{(k+1)(k-3)}$$

- Series not valid for $r = -2$, division by 0 in the recursion relation at $k = 3$

$$a_{k+1} = \frac{(2k-3)a_k}{(k+1)(k-3)}$$

- Recursion relation for $r = 2$

$$a_{k+1} = \frac{(2k+5)a_k}{(k+5)(k+1)}$$

- Solution for $r = 2$

$$\left[y=\sum_{k=0}^{\infty}a_k x^{k+2}, a_{k+1}=\frac{(2k+5)a_k}{(k+5)(k+1)}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 13.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x(x+1)\, y'' - 4y' - 2y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^2 + x\right) y'' - 2y - 4y' = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = -\frac{4}{x\,(x+1)}$$
$$q(x) = -\frac{2}{x\,(x+1)}$$

Table 804: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{4}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = -\frac{2}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x(x+1)\,y'' - 4y' - 2y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x(x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) - 4\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) - 2\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r-1} a_n (n+r)(n+r-1)\right) \\ + \sum_{n=0}^{\infty} \left(-4(n+r) a_n x^{n+r-1}\right) + \sum_{n=0}^{\infty} \left(-2 a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r-1} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r-1}$$

$$\sum_{n=0}^{\infty} \left(-2 a_n x^{n+r}\right) = \sum_{n=1}^{\infty} \left(-2 a_{n-1} x^{n+r-1}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r-1$.

$$\left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} x^{n+r-1} a_n (n+r)(n+r-1)\right) \\ + \sum_{n=0}^{\infty} \left(-4(n+r) a_n x^{n+r-1}\right) + \sum_{n=1}^{\infty} \left(-2 a_{n-1} x^{n+r-1}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r-1} a_n (n+r)(n+r-1) - 4(n+r) a_n x^{n+r-1} = 0$$

When $n = 0$ the above becomes

$$x^{-1+r} a_0 r(-1+r) - 4 r a_0 x^{-1+r} = 0$$

Or

$$\left(x^{-1+r} r(-1+r) - 4r\, x^{-1+r}\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$r\, x^{-1+r}(-5+r) = 0$$

Since the above is true for all x then the indicial equation becomes

$$r(-5+r) = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 5$$
$$r_2 = 0$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$r\, x^{-1+r}(-5+r) = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 5$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x)\ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^5\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+5}$$
$$y_2(x) = C y_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) - 4a_n(n+r) - 2a_{n-1} = 0 \quad (3)$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r-3)\, a_{n-1}}{n-5+r} \tag{4}$$

Which for the root $r = 5$ becomes

$$a_n = -\frac{(n+2)\, a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 5$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{2-r}{-4+r}$$

Which for the root $r = 5$ becomes

$$a_1 = -3$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2-r}{-4+r}$	-3

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{r^2-3r+2}{(-4+r)\,(r-3)}$$

Which for the root $r = 5$ becomes

$$a_2 = 6$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2-r}{-4+r}$	-3
a_2	$\frac{r^2-3r+2}{(-4+r)(r-3)}$	6

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{r(-1+r)}{(-4+r)(r-3)}$$

Which for the root $r = 5$ becomes

$$a_3 = -10$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2-r}{-4+r}$	-3
a_2	$\frac{r^2-3r+2}{(-4+r)(r-3)}$	6
a_3	$-\frac{r(-1+r)}{(-4+r)(r-3)}$	-10

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r(1+r)}{(-4+r)(r-3)}$$

Which for the root $r = 5$ becomes

$$a_4 = 15$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2-r}{-4+r}$	-3
a_2	$\frac{r^2-3r+2}{(-4+r)(r-3)}$	6
a_3	$-\frac{r(-1+r)}{(-4+r)(r-3)}$	-10
a_4	$\frac{r(1+r)}{(-4+r)(r-3)}$	15

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(1+r)(2+r)}{(-4+r)(r-3)}$$

Which for the root $r = 5$ becomes

$$a_5 = -21$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2-r}{-4+r}$	-3
a_2	$\frac{r^2-3r+2}{(-4+r)(r-3)}$	6
a_3	$-\frac{r(-1+r)}{(-4+r)(r-3)}$	-10
a_4	$\frac{r(1+r)}{(-4+r)(r-3)}$	15
a_5	$-\frac{(1+r)(2+r)}{(-4+r)(r-3)}$	-21

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^5\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= x^5\left(1 - 3x + 6x^2 - 10x^3 + 15x^4 - 21x^5 + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 5$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_5(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_5 \\ &= -\frac{(1+r)(2+r)}{(-4+r)(r-3)} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} -\frac{(1+r)(2+r)}{(-4+r)(r-3)} &= \lim_{r\to 0} -\frac{(1+r)(2+r)}{(-4+r)(r-3)} \\ &= -\frac{1}{6} \end{aligned}$$

The limit is $-\frac{1}{6}$. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^n \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$b_{n-1}(n+r-1)(n+r-2) + b_n(n+r)(n+r-1) - 4(n+r) b_n - 2b_{n-1} = 0 \quad (4)$$

Which for for the root $r = 0$ becomes

$$b_{n-1}(n-1)(n-2) + b_n n(n-1) - 4n b_n - 2b_{n-1} = 0 \quad \text{(4A)}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{(n+r-3) b_{n-1}}{n-5+r} \quad (5)$$

Which for the root $r = 0$ becomes

$$b_n = -\frac{(n-3) b_{n-1}}{n-5} \quad (6)$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = 0$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{-2+r}{-4+r}$$

Which for the root $r = 0$ becomes

$$b_1 = -\frac{1}{2}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2-r}{-4+r}$	$-\frac{1}{2}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{r^2 - 3r + 2}{(-4+r)(r-3)}$$

Which for the root $r = 0$ becomes

$$b_2 = \frac{1}{6}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2-r}{-4+r}$	$-\frac{1}{2}$
b_2	$\frac{r^2-3r+2}{(-4+r)(r-3)}$	$\frac{1}{6}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{r(-1+r)}{(-4+r)(r-3)}$$

Which for the root $r = 0$ becomes

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2-r}{-4+r}$	$-\frac{1}{2}$
b_2	$\frac{r^2-3r+2}{(-4+r)(r-3)}$	$\frac{1}{6}$
b_3	$-\frac{r(-1+r)}{(-4+r)(r-3)}$	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r(1+r)}{(-4+r)(r-3)}$$

Which for the root $r = 0$ becomes

$$b_4 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2-r}{-4+r}$	$-\frac{1}{2}$
b_2	$\frac{r^2-3r+2}{(-4+r)(r-3)}$	$\frac{1}{6}$
b_3	$-\frac{r(-1+r)}{(-4+r)(r-3)}$	0
b_4	$\frac{r(1+r)}{(-4+r)(r-3)}$	0

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{(1+r)(2+r)}{(-4+r)(r-3)}$$

Which for the root $r = 0$ becomes

$$b_5 = -\frac{1}{6}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2-r}{-4+r}$	$-\frac{1}{2}$
b_2	$\frac{r^2-3r+2}{(-4+r)(r-3)}$	$\frac{1}{6}$
b_3	$-\frac{r(-1+r)}{(-4+r)(r-3)}$	0
b_4	$\frac{r(1+r)}{(-4+r)(r-3)}$	0
b_5	$-\frac{(1+r)(2+r)}{(-4+r)(r-3)}$	$-\frac{1}{6}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned}
y_2(x) &= b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\
&= 1 - \frac{x}{2} + \frac{x^2}{6} - \frac{x^5}{6} + O(x^6)
\end{aligned}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^5 \left(1-3x+6x^2-10x^3+15x^4-21x^5+O(x^6)\right)+c_2\left(1-\frac{x}{2}+\frac{x^2}{6}-\frac{x^5}{6}+O(x^6)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^5 \left(1-3x+6x^2-10x^3+15x^4-21x^5+O(x^6)\right)+c_2\left(1-\frac{x}{2}+\frac{x^2}{6}-\frac{x^5}{6}+O(x^6)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
y = c_1 x^5 \left(1-3x+6x^2-10x^3+15x^4-21x^5+O(x^6)\right)+c_2\left(1-\frac{x}{2}+\frac{x^2}{6}-\frac{x^5}{6}+O(x^6)\right) \tag{1}
$$

Verification of solutions

$$
y = c_1 x^5 \left(1-3x+6x^2-10x^3+15x^4-21x^5+O(x^6)\right)+c_2\left(1-\frac{x}{2}+\frac{x^2}{6}-\frac{x^5}{6}+O(x^6)\right)
$$

Verified OK.

16.17.1 Maple step by step solution

Let's solve

$x(x+1)\, y'' - 4y' - 2y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{2y}{x(x+1)} + \frac{4y'}{x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{4y'}{x(x+1)} - \frac{2y}{x(x+1)} = 0$

☐ Check to see if x_0 is a regular singular point

- ◦ Define functions

$\left[P_2(x) = -\frac{4}{x(x+1)}, P_3(x) = -\frac{2}{x(x+1)}\right]$

- $(x+1) \cdot P_2(x)$ is analytic at $x = -1$

  $\left((x+1) \cdot P_2(x)\right) \Big|_{x=-1} = 4$

- $(x+1)^2 \cdot P_3(x)$ is analytic at $x = -1$

  $\left((x+1)^2 \cdot P_3(x)\right) \Big|_{x=-1} = 0$

- $x = -1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = -1$

- Multiply by denominators

  $x(x+1)\, y'' - 4y' - 2y = 0$

- Change variables using $x = u - 1$ so that the regular singular point is at $u = 0$

  $(u^2 - u)\left(\frac{d^2}{du^2}y(u)\right) - 4\frac{d}{du}y(u) - 2y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $\frac{d}{du}y(u)$ to series expansion

  $\frac{d}{du}y(u) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1}$

- Shift index using $k- >k+1$

  $\frac{d}{du}y(u) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\, u^{k+r}$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$

- Shift index using $k- >k+2-m$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$

  Rewrite ODE with series expansions

$$-a_0 r(3+r)\, u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(-a_{k+1}(k+1+r)\,(k+4+r) + a_k(k+1+r)\,(k+r-2)\right) u^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-r(3+r) = 0$
- Values of r that satisfy the indicial equation

  $r \in \{-3, 0\}$
- Each term in the series must be 0, giving the recursion relation

  $((-k-r-4)\, a_{k+1} + a_k(k+r-2))\,(k+1+r) = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+1} = \frac{a_k(k+r-2)}{k+4+r}$
- Recursion relation for $r = -3$; series terminates at $k = 5$

  $a_{k+1} = \frac{a_k(k-5)}{k+1}$
- Apply recursion relation for $k = 0$

  $a_1 = -5a_0$
- Apply recursion relation for $k = 1$

  $a_2 = -2a_1$
- Express in terms of a_0

  $a_2 = 10a_0$
- Apply recursion relation for $k = 2$

  $a_3 = -a_2$
- Express in terms of a_0

  $a_3 = -10a_0$
- Apply recursion relation for $k = 3$

  $a_4 = -\frac{a_3}{2}$
- Express in terms of a_0

  $a_4 = 5a_0$
- Apply recursion relation for $k = 4$

  $a_5 = -\frac{a_4}{5}$
- Express in terms of a_0

  $a_5 = -a_0$

- Terminating series solution of the ODE for $r = -3$. Use reduction of order to find the second

  $y(u) = a_0 \cdot (-u^5 + 5u^4 - 10u^3 + 10u^2 - 5u + 1)$
- Revert the change of variables $u = x + 1$

  $[y = -a_0 x^5]$
- Recursion relation for $r = 0$; series terminates at $k = 2$

  $a_{k+1} = \frac{a_k(k-2)}{k+4}$
- Apply recursion relation for $k = 0$

  $a_1 = -\frac{a_0}{2}$
- Apply recursion relation for $k = 1$

  $a_2 = -\frac{a_1}{5}$
- Express in terms of a_0

  $a_2 = \frac{a_0}{10}$
- Terminating series solution of the ODE for $r = 0$. Use reduction of order to find the second li

  $y(u) = a_0 \cdot \left(1 - \frac{1}{2}u + \frac{1}{10}u^2\right)$
- Revert the change of variables $u = x + 1$

  $\left[y = a_0\left(\frac{3}{5} - \frac{3}{10}x + \frac{1}{10}x^2\right)\right]$
- Combine solutions and rename parameters

  $\left[y = -a_0 x^5 + b_0\left(\frac{3}{5} - \frac{3}{10}x + \frac{1}{10}x^2\right)\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 14.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(1+2x)\,y''+x(9+13x)\,y'+(7+5x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(2x^3+x^2\right)y''+\left(13x^2+9x\right)y'+(7+5x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{9+13x}{x\,(1+2x)}$$
$$q(x)=\frac{7+5x}{x^2\,(1+2x)}$$

Table 806: Table $p(x), q(x)$ singularites.

$p(x) = \frac{9+13x}{x(1+2x)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2}$	"regular"

$q(x) = \frac{7+5x}{x^2(1+2x)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{1}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(1+2x)\, y'' + \left(13x^2 + 9x\right) y' + (7+5x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(1+2x) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(13x^2+9x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (7+5x) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}
&\left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 13x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 7a_n x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 5x^{1+n+r} a_n\right) = 0
\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 13x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 13a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 5x^{1+n+r} a_n = \sum_{n=1}^{\infty} 5a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\begin{aligned}
&\left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 13a_{n-1}(n+r-1)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 7a_n x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 5a_{n-1} x^{n+r}\right) = 0
\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + 9x^{n+r} a_n (n+r) + 7a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + 9x^r a_0 r + 7a_0 x^r = 0$$

Or

$$(x^r r(-1+r) + 9x^r r + 7x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2 + 8r + 7\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 + 8r + 7 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -1$$
$$r_2 = -7$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(r^2 + 8r + 7\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 6$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \frac{\sum_{n=0}^{\infty} a_n x^n}{x}$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^7}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-1}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-7}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} 2a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ + 13a_{n-1}(n+r-1) + 9a_n(n+r) + 7a_n + 5a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(2n^2 + 4nr + 2r^2 + 7n + 7r - 4)}{n^2 + 2nr + r^2 + 8n + 8r + 7} \tag{4}$$

Which for the root $r = -1$ becomes

$$a_n = -\frac{a_{n-1}(2n^2 + 3n - 9)}{n(n+6)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-2r^2 - 11r - 5}{r^2 + 10r + 16}$$

Which for the root $r = -1$ becomes

$$a_1 = \frac{4}{7}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r^2-11r-5}{r^2+10r+16}$	$\frac{4}{7}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4r^4 + 52r^3 + 211r^2 + 273r + 90}{(r+8)(r+2)(r+9)(r+3)}$$

Which for the root $r = -1$ becomes

$$a_2 = -\frac{5}{28}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r^2-11r-5}{r^2+10r+16}$	$\frac{4}{7}$
a_2	$\frac{4r^4+52r^3+211r^2+273r+90}{(r+8)(r+2)(r+9)(r+3)}$	$-\frac{5}{28}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-8r^6 - 180r^5 - 1550r^4 - 6375r^3 - 12752r^2 - 11265r - 3150}{(r+8)(r+2)(r+9)(r+3)(r+10)(r+4)}$$

Which for the root $r = -1$ becomes

$$a_3 = \frac{5}{42}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r^2-11r-5}{r^2+10r+16}$	$\frac{4}{7}$
a_2	$\frac{4r^4+52r^3+211r^2+273r+90}{(r+8)(r+2)(r+9)(r+3)}$	$-\frac{5}{28}$
a_3	$\frac{-8r^6-180r^5-1550r^4-6375r^3-12752r^2-11265r-3150}{(r+8)(r+2)(r+9)(r+3)(r+10)(r+4)}$	$\frac{5}{42}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16r^6 + 336r^5 + 2680r^4 + 10200r^3 + 19129r^2 + 16149r + 4410}{(r+11)(r+4)(r+10)(r+3)(r+9)(r+2)}$$

Which for the root $r = -1$ becomes

$$a_4 = -\frac{5}{48}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r^2-11r-5}{r^2+10r+16}$	$\frac{4}{7}$
a_2	$\frac{4r^4+52r^3+211r^2+273r+90}{(r+8)(r+2)(r+9)(r+3)}$	$-\frac{5}{28}$
a_3	$\frac{-8r^6-180r^5-1550r^4-6375r^3-12752r^2-11265r-3150}{(r+8)(r+2)(r+9)(r+3)(r+10)(r+4)}$	$\frac{5}{42}$
a_4	$\frac{16r^6+336r^5+2680r^4+10200r^3+19129r^2+16149r+4410}{(r+11)(r+4)(r+10)(r+3)(r+9)(r+2)}$	$-\frac{5}{48}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-32r^6 - 624r^5 - 4640r^4 - 16680r^3 - 29978r^2 - 24591r - 6615}{(r + 12)(r + 2)(r + 3)(r + 10)(r + 4)(r + 11)}$$

Which for the root $r = -1$ becomes

$$a_5 = \frac{7}{66}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r^2-11r-5}{r^2+10r+16}$	$\frac{4}{7}$
a_2	$\frac{4r^4+52r^3+211r^2+273r+90}{(r+8)(r+2)(r+9)(r+3)}$	$-\frac{5}{28}$
a_3	$\frac{-8r^6-180r^5-1550r^4-6375r^3-12752r^2-11265r-3150}{(r+8)(r+2)(r+9)(r+3)(r+10)(r+4)}$	$\frac{5}{42}$
a_4	$\frac{16r^6+336r^5+2680r^4+10200r^3+19129r^2+16149r+4410}{(r+11)(r+4)(r+10)(r+3)(r+9)(r+2)}$	$-\frac{5}{48}$
a_5	$\frac{-32r^6-624r^5-4640r^4-16680r^3-29978r^2-24591r-6615}{(r+12)(r+2)(r+3)(r+10)(r+4)(r+11)}$	$\frac{7}{66}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{64r^6 + 1152r^5 + 8080r^4 + 27840r^3 + 48556r^2 + 39048r + 10395}{(r + 13)(r + 11)(r + 4)(r + 3)(r + 2)(r + 12)}$$

Which for the root $r = -1$ becomes

$$a_6 = -\frac{21}{176}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r^2-11r-5}{r^2+10r+16}$	$\frac{4}{7}$
a_2	$\frac{4r^4+52r^3+211r^2+273r+90}{(r+8)(r+2)(r+9)(r+3)}$	$-\frac{5}{28}$
a_3	$\frac{-8r^6-180r^5-1550r^4-6375r^3-12752r^2-11265r-3150}{(r+8)(r+2)(r+9)(r+3)(r+10)(r+4)}$	$\frac{5}{42}$
a_4	$\frac{16r^6+336r^5+2680r^4+10200r^3+19129r^2+16149r+4410}{(r+11)(r+4)(r+10)(r+3)(r+9)(r+2)}$	$-\frac{5}{48}$
a_5	$\frac{-32r^6-624r^5-4640r^4-16680r^3-29978r^2-24591r-6615}{(r+12)(r+2)(r+3)(r+10)(r+4)(r+11)}$	$\frac{7}{66}$
a_6	$\frac{64r^6+1152r^5+8080r^4+27840r^3+48556r^2+39048r+10395}{(r+13)(r+11)(r+4)(r+3)(r+2)(r+12)}$	$-\frac{21}{176}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \frac{1}{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 \dots\right) \\ &= \frac{1 + \frac{4x}{7} - \frac{5x^2}{28} + \frac{5x^3}{42} - \frac{5x^4}{48} + \frac{7x^5}{66} - \frac{21x^6}{176} + O(x^7)}{x} \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 6$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_6(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_6 \\ &= \frac{64r^6 + 1152r^5 + 8080r^4 + 27840r^3 + 48556r^2 + 39048r + 10395}{(r+13)(r+11)(r+4)(r+3)(r+2)(r+12)} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} \frac{64r^6 + 1152r^5 + 8080r^4 + 27840r^3 + 48556r^2 + 39048r + 10395}{(r+13)(r+11)(r+4)(r+3)(r+2)(r+12)} &= \lim_{r\to -7} \frac{64r^6 + 1152r^5 + 8080r^4 + 2}{(r+13)(r+11)(r} \\ &= -\frac{3003}{160} \end{aligned}$$

The limit is $-\frac{3003}{160}$. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$
\begin{aligned}
y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\
&= \sum_{n=0}^{\infty} b_n x^{n-7}
\end{aligned}
$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$
\begin{aligned}
&2b_{n-1}(n+r-1)(n+r-2) + b_n(n+r)(n+r-1) \\
&+ 13b_{n-1}(n+r-1) + 9b_n(n+r) + 7b_n + 5b_{n-1} = 0
\end{aligned} \tag{4}
$$

Which for for the root $r = -7$ becomes

$$
2b_{n-1}(n-8)(n-9) + b_n(n-7)(n-8) + 13b_{n-1}(n-8) + 9b_n(n-7) + 7b_n + 5b_{n-1} = 0 \tag{4A}
$$

Solving for b_n from the recursive equation (4) gives

$$
b_n = -\frac{b_{n-1}(2n^2 + 4nr + 2r^2 + 7n + 7r - 4)}{n^2 + 2nr + r^2 + 8n + 8r + 7} \tag{5}
$$

Which for the root $r = -7$ becomes

$$
b_n = -\frac{b_{n-1}(2n^2 - 21n + 45)}{n^2 - 6n} \tag{6}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -7$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$
b_1 = -\frac{2r^2 + 11r + 5}{r^2 + 10r + 16}
$$

Which for the root $r = -7$ becomes

$$
b_1 = \frac{26}{5}
$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2r^2-11r-5}{r^2+10r+16}$	$\frac{26}{5}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{4r^4 + 52r^3 + 211r^2 + 273r + 90}{(r^2 + 10r + 16)(r^2 + 12r + 27)}$$

Which for the root $r = -7$ becomes

$$b_2 = \frac{143}{20}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2r^2-11r-5}{r^2+10r+16}$	$\frac{26}{5}$
b_2	$\frac{4r^4+52r^3+211r^2+273r+90}{(r+8)(r+2)(r+9)(r+3)}$	$\frac{143}{20}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{8r^6 + 180r^5 + 1550r^4 + 6375r^3 + 12752r^2 + 11265r + 3150}{(r^2 + 10r + 16)(r^2 + 12r + 27)(r^2 + 14r + 40)}$$

Which for the root $r = -7$ becomes

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2r^2-11r-5}{r^2+10r+16}$	$\frac{26}{5}$
b_2	$\frac{4r^4+52r^3+211r^2+273r+90}{(r+8)(r+2)(r+9)(r+3)}$	$\frac{143}{20}$
b_3	$\frac{-8r^6-180r^5-1550r^4-6375r^3-12752r^2-11265r-3150}{(r+8)(r+2)(r+9)(r+3)(r+10)(r+4)}$	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{16r^6 + 336r^5 + 2680r^4 + 10200r^3 + 19129r^2 + 16149r + 4410}{(r + 11)(r^2 + 14r + 40)(r^2 + 12r + 27)(r + 2)}$$

Which for the root $r = -7$ becomes

$$b_4 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2r^2-11r-5}{r^2+10r+16}$	$\frac{26}{5}$
b_2	$\frac{4r^4+52r^3+211r^2+273r+90}{(r+8)(r+2)(r+9)(r+3)}$	$\frac{143}{20}$
b_3	$\frac{-8r^6-180r^5-1550r^4-6375r^3-12752r^2-11265r-3150}{(r+8)(r+2)(r+9)(r+3)(r+10)(r+4)}$	0
b_4	$\frac{16r^6+336r^5+2680r^4+10200r^3+19129r^2+16149r+4410}{(r+11)(r+4)(r+10)(r+3)(r+9)(r+2)}$	0

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{32r^6 + 624r^5 + 4640r^4 + 16680r^3 + 29978r^2 + 24591r + 6615}{(r + 12)(r + 2)(r + 3)(r^2 + 14r + 40)(r + 11)}$$

Which for the root $r = -7$ becomes

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2r^2-11r-5}{r^2+10r+16}$	$\frac{26}{5}$
b_2	$\frac{4r^4+52r^3+211r^2+273r+90}{(r+8)(r+2)(r+9)(r+3)}$	$\frac{143}{20}$
b_3	$\frac{-8r^6-180r^5-1550r^4-6375r^3-12752r^2-11265r-3150}{(r+8)(r+2)(r+9)(r+3)(r+10)(r+4)}$	0
b_4	$\frac{16r^6+336r^5+2680r^4+10200r^3+19129r^2+16149r+4410}{(r+11)(r+4)(r+10)(r+3)(r+9)(r+2)}$	0
b_5	$\frac{-32r^6-624r^5-4640r^4-16680r^3-29978r^2-24591r-6615}{(r+12)(r+2)(r+3)(r+10)(r+4)(r+11)}$	0

For $n = 6$, using the above recursive equation gives

$$b_6 = \frac{64r^6 + 1152r^5 + 8080r^4 + 27840r^3 + 48556r^2 + 39048r + 10395}{(r+13)(r+11)(r+4)(r+3)(r+2)(r+12)}$$

Which for the root $r = -7$ becomes

$$b_6 = -\frac{3003}{160}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2r^2-11r-5}{r^2+10r+16}$	$\frac{26}{5}$
b_2	$\frac{4r^4+52r^3+211r^2+273r+90}{(r+8)(r+2)(r+9)(r+3)}$	$\frac{143}{20}$
b_3	$\frac{-8r^6-180r^5-1550r^4-6375r^3-12752r^2-11265r-3150}{(r+8)(r+2)(r+9)(r+3)(r+10)(r+4)}$	0
b_4	$\frac{16r^6+336r^5+2680r^4+10200r^3+19129r^2+16149r+4410}{(r+11)(r+4)(r+10)(r+3)(r+9)(r+2)}$	0
b_5	$\frac{-32r^6-624r^5-4640r^4-16680r^3-29978r^2-24591r-6615}{(r+12)(r+2)(r+3)(r+10)(r+4)(r+11)}$	0
b_6	$\frac{64r^6+1152r^5+8080r^4+27840r^3+48556r^2+39048r+10395}{(r+13)(r+11)(r+4)(r+3)(r+2)(r+12)}$	$-\frac{3003}{160}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= \frac{1}{x}\left(b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6 + b_7x^7 \dots\right) \\ &= \frac{1 + \frac{26x}{5} + \frac{143x^2}{20} - \frac{3003x^6}{160} + O(x^7)}{x^7} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1y_1(x) + c_2y_2(x) \\ &= \frac{c_1\left(1 + \frac{4x}{7} - \frac{5x^2}{28} + \frac{5x^3}{42} - \frac{5x^4}{48} + \frac{7x^5}{66} - \frac{21x^6}{176} + O(x^7)\right)}{x} \\ &+ \frac{c_2\left(1 + \frac{26x}{5} + \frac{143x^2}{20} - \frac{3003x^6}{160} + O(x^7)\right)}{x^7} \end{aligned}$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(1+\frac{4x}{7}-\frac{5x^2}{28}+\frac{5x^3}{42}-\frac{5x^4}{48}+\frac{7x^5}{66}-\frac{21x^6}{176}+O(x^7)\right)}{x} \\
&+ \frac{c_2\left(1+\frac{26x}{5}+\frac{143x^2}{20}-\frac{3003x^6}{160}+O(x^7)\right)}{x^7}
\end{aligned}
$$

<u>Summary</u>

The solution(s) found are the following

$$
\begin{aligned}
y = &\frac{c_1\left(1+\frac{4x}{7}-\frac{5x^2}{28}+\frac{5x^3}{42}-\frac{5x^4}{48}+\frac{7x^5}{66}-\frac{21x^6}{176}+O(x^7)\right)}{x} \\
&+ \frac{c_2\left(1+\frac{26x}{5}+\frac{143x^2}{20}-\frac{3003x^6}{160}+O(x^7)\right)}{x^7}
\end{aligned} \tag{1}
$$

<u>Verification of solutions</u>

$$
\begin{aligned}
y = &\frac{c_1\left(1+\frac{4x}{7}-\frac{5x^2}{28}+\frac{5x^3}{42}-\frac{5x^4}{48}+\frac{7x^5}{66}-\frac{21x^6}{176}+O(x^7)\right)}{x} \\
&+ \frac{c_2\left(1+\frac{26x}{5}+\frac{143x^2}{20}-\frac{3003x^6}{160}+O(x^7)\right)}{x^7}
\end{aligned}
$$

Verified OK.

16.18.1 Maple step by step solution

Let's solve

$x^2(1+2x)\,y''+(13x^2+9x)\,y'+(7+5x)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(7+5x)y}{x^2(1+2x)}-\frac{(9+13x)y'}{x(1+2x)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(9+13x)y'}{x(1+2x)}+\frac{(7+5x)y}{x^2(1+2x)}=0$

- □ Check to see if x_0 is a regular singular point

- Define functions

  $\left[P_2(x) = \frac{9+13x}{x(1+2x)}, P_3(x) = \frac{7+5x}{x^2(1+2x)}\right]$

- $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\bigg|_{x=0} = 9$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\bigg|_{x=0} = 7$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2(1+2x)\, y'' + x(9+13x)\, y' + (7+5x)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k- >k - m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

- Shift index using $k- >k + 1 - m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m}\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}(7+r)\,(1+r)\,x^{r}+\left(\sum_{k=1}^{\infty}\left(a_{k}(k+r+7)\,(k+r+1)+a_{k-1}(k+4+r)\,(2k-1+2r)\right)x^{k+r}\right)=$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $(7+r)\,(1+r)=0$

- Values of r that satisfy the indicial equation

  $r\in\{-7,-1\}$

- Each term in the series must be 0, giving the recursion relation

  $2\left(k-\frac{1}{2}+r\right)(k+4+r)\,a_{k-1}+a_{k}(k+r+7)\,(k+r+1)=0$

- Shift index using $k->k+1$

  $2\left(k+\frac{1}{2}+r\right)(k+r+5)\,a_{k}+a_{k+1}(k+8+r)\,(k+2+r)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+1}=-\frac{(2k+2r+1)(k+r+5)a_{k}}{(k+8+r)(k+2+r)}$

- Recursion relation for $r=-7$; series terminates at $k=2$

  $a_{k+1}=-\frac{(2k-13)(k-2)a_{k}}{(k+1)(k-5)}$

- Apply recursion relation for $k=0$

  $a_{1}=\frac{26a_{0}}{5}$

- Apply recursion relation for $k=1$

  $a_{2}=\frac{11a_{1}}{8}$

- Express in terms of a_{0}

  $a_{2}=\frac{143a_{0}}{20}$

- Terminating series solution of the ODE for $r=-7$. Use reduction of order to find the second

  $y=a_{0}\cdot\left(1+\frac{26}{5}x+\frac{143}{20}x^{2}\right)$

- Recursion relation for $r=-1$

  $a_{k+1}=-\frac{(2k-1)(k+4)a_{k}}{(k+7)(k+1)}$

- Solution for $r=-1$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+1}=-\frac{(2k-1)(k+4)a_k}{(k+7)(k+1)}\right]$$

- Combine solutions and rename parameters

$$\left[y=a_0\cdot\left(1+\frac{26}{5}x+\frac{143}{20}x^2\right)+\left(\sum_{k=0}^{\infty} b_k x^{k-1}\right), b_{1+k}=-\frac{(2k-1)(4+k)b_k}{(k+7)(1+k)}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 15.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2(1+2x)\,y''-2x(-x+4)\,y'-(7+5x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(8x^3+4x^2\right)y''+\left(2x^2-8x\right)y'+(-5x-7)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{x-4}{2x\,(1+2x)}\\q(x)&=-\frac{7+5x}{4x^2\,(1+2x)}\end{aligned}$$

Table 808: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x-4}{2x(1+2x)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2}$	"regular"

$q(x) = -\frac{7+5x}{4x^2(1+2x)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{1}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2(1+2x)\, y'' + \left(2x^2 - 8x\right) y' + (-5x - 7)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2(1+2x) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(2x^2 - 8x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (-5x-7) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 8x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-8x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-5x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-7a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 8x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 8a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-5x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-5a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 8a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-8x^{n+r} a_n (n+r)\right) + \sum_{n=1}^{\infty} \left(-5a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-7a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r)(n+r-1) - 8x^{n+r} a_n (n+r) - 7a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) - 8x^r a_0 r - 7a_0 x^r = 0$$

Or

$$\left(4x^r r(-1+r) - 8x^r r - 7x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 - 12r - 7\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 - 12r - 7 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{7}{2}$$
$$r_2 = -\frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 - 12r - 7\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^{\frac{7}{2}}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{\sqrt{x}}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{7}{2}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} 8a_{n-1}(n+r-1)(n+r-2) + 4a_n(n+r)(n+r-1) \\ + 2a_{n-1}(n+r-1) - 8a_n(n+r) - 5a_{n-1} - 7a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(8n^2 + 16nr + 8r^2 - 22n - 22r + 9)}{4n^2 + 8nr + 4r^2 - 12n - 12r - 7} \tag{4}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_n = -\frac{a_{n-1}(4n^2 + 17n + 15)}{2n(n+4)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{7}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-8r^2 + 6r + 5}{4r^2 - 4r - 15}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_1 = -\frac{18}{5}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-8r^2+6r+5}{4r^2-4r-15}$	$-\frac{18}{5}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{32r^3 - 32r^2 - 14r + 5}{8r^3 - 12r^2 - 50r + 75}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_2 = \frac{39}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-8r^2+6r+5}{4r^2-4r-15}$	$-\frac{18}{5}$
a_2	$\frac{32r^3-32r^2-14r+5}{8r^3-12r^2-50r+75}$	$\frac{39}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-128r^4 + 32r^3 + 152r^2 + 22r - 15}{(4r^2 + 12r - 7)(4r^2 - 16r + 15)}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_3 = -\frac{663}{28}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-8r^2+6r+5}{4r^2-4r-15}$	$-\frac{18}{5}$
a_2	$\frac{32r^3-32r^2-14r+5}{8r^3-12r^2-50r+75}$	$\frac{39}{4}$
a_3	$\frac{-128r^4+32r^3+152r^2+22r-15}{(4r^2+12r-7)(4r^2-16r+15)}$	$-\frac{663}{28}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{256r^4 + 256r^3 - 544r^2 - 304r + 105}{16r^4 - 232r^2 + 384r - 135}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_4 = \frac{13923}{256}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-8r^2+6r+5}{4r^2-4r-15}$	$-\frac{18}{5}$
a_2	$\frac{32r^3-32r^2-14r+5}{8r^3-12r^2-50r+75}$	$\frac{39}{4}$
a_3	$\frac{-128r^4+32r^3+152r^2+22r-15}{(4r^2+12r-7)(4r^2-16r+15)}$	$-\frac{663}{28}$
a_4	$\frac{256r^4+256r^3-544r^2-304r+105}{16r^4-232r^2+384r-135}$	$\frac{13923}{256}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-1024r^5 - 3840r^4 - 640r^3 + 7200r^2 + 2924r - 1155}{32r^5 + 80r^4 - 560r^3 + 40r^2 + 1098r - 495}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_5 = -\frac{7735}{64}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-8r^2+6r+5}{4r^2-4r-15}$	$-\frac{18}{5}$
a_2	$\frac{32r^3-32r^2-14r+5}{8r^3-12r^2-50r+75}$	$\frac{39}{4}$
a_3	$\frac{-128r^4+32r^3+152r^2+22r-15}{(4r^2+12r-7)(4r^2-16r+15)}$	$-\frac{663}{28}$
a_4	$\frac{256r^4+256r^3-544r^2-304r+105}{16r^4-232r^2+384r-135}$	$\frac{13923}{256}$
a_5	$\frac{-1024r^5-3840r^4-640r^3+7200r^2+2924r-1155}{32r^5+80r^4-560r^3+40r^2+1098r-495}$	$-\frac{7735}{64}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{7}{2}}(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots) \\ &= x^{\frac{7}{2}}\left(1 - \frac{18x}{5} + \frac{39x^2}{4} - \frac{663x^3}{28} + \frac{13923x^4}{256} - \frac{7735x^5}{64} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\rightarrow r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_4 \\ &= \frac{256r^4 + 256r^3 - 544r^2 - 304r + 105}{16r^4 - 232r^2 + 384r - 135} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\rightarrow r_2} \frac{256r^4 + 256r^3 - 544r^2 - 304r + 105}{16r^4 - 232r^2 + 384r - 135} &= \lim_{r\rightarrow -\frac{1}{2}} \frac{256r^4 + 256r^3 - 544r^2 - 304r + 105}{16r^4 - 232r^2 + 384r - 135} \\ &= -\frac{35}{128} \end{aligned}$$

The limit is $-\frac{35}{128}$. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}} \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} 8b_{n-1}(n+r-1)(n+r-2) + 4b_n(n+r)(n+r-1) \\ + 2b_{n-1}(n+r-1) - 8b_n(n+r) - 5b_{n-1} - 7b_n = 0 \end{aligned} \tag{4}$$

Which for for the root $r = -\frac{1}{2}$ becomes

$$\begin{aligned} 8b_{n-1}\left(n-\frac{3}{2}\right)\left(n-\frac{5}{2}\right) + 4b_n\left(n-\frac{1}{2}\right)\left(n-\frac{3}{2}\right) \\ + 2b_{n-1}\left(n-\frac{3}{2}\right) - 8b_n\left(n-\frac{1}{2}\right) - 5b_{n-1} - 7b_n = 0 \end{aligned} \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{b_{n-1}(8n^2 + 16nr + 8r^2 - 22n - 22r + 9)}{4n^2 + 8nr + 4r^2 - 12n - 12r - 7} \tag{5}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_n = -\frac{b_{n-1}(8n^2 - 30n + 22)}{4n^2 - 16n} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{8r^2 - 6r - 5}{4r^2 - 4r - 15}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_1 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-8r^2+6r+5}{4r^2-4r-15}$	0

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{32r^3 - 32r^2 - 14r + 5}{(4r^2 + 4r - 15)(2r - 5)}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_2 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-8r^2+6r+5}{4r^2-4r-15}$	0
b_2	$\frac{32r^3-32r^2-14r+5}{8r^3-12r^2-50r+75}$	0

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{128r^4 - 32r^3 - 152r^2 - 22r + 15}{(2r-5)(2r-3)(4r^2+12r-7)}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-8r^2+6r+5}{4r^2-4r-15}$	0
b_2	$\frac{32r^3-32r^2-14r+5}{8r^3-12r^2-50r+75}$	0
b_3	$\frac{-128r^4+32r^3+152r^2+22r-15}{16r^4-16r^3-160r^2+292r-105}$	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{256r^4 + 256r^3 - 544r^2 - 304r + 105}{(2r+9)(2r-1)(2r-5)(2r-3)}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_4 = -\frac{35}{128}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-8r^2+6r+5}{4r^2-4r-15}$	0
b_2	$\frac{32r^3-32r^2-14r+5}{8r^3-12r^2-50r+75}$	0
b_3	$\frac{-128r^4+32r^3+152r^2+22r-15}{16r^4-16r^3-160r^2+292r-105}$	0
b_4	$\frac{256r^4+256r^3-544r^2-304r+105}{16r^4-232r^2+384r-135}$	$-\frac{35}{128}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{1024r^5 + 3840r^4 + 640r^3 - 7200r^2 - 2924r + 1155}{(2r-1)(2r-5)(2r-3)(4r^2+28r+33)}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_5 = \frac{63}{64}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-8r^2+6r+5}{4r^2-4r-15}$	0
b_2	$\frac{32r^3-32r^2-14r+5}{8r^3-12r^2-50r+75}$	0
b_3	$\frac{-128r^4+32r^3+152r^2+22r-15}{16r^4-16r^3-160r^2+292r-105}$	0
b_4	$\frac{256r^4+256r^3-544r^2-304r+105}{16r^4-232r^2+384r-135}$	$-\frac{35}{128}$
b_5	$\frac{-1024r^5-3840r^4-640r^3+7200r^2+2924r-1155}{32r^5+80r^4-560r^3+40r^2+1098r-495}$	$\frac{63}{64}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned}
y_2(x) &= x^{\frac{7}{2}}(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots) \\
&= \frac{1 - \frac{35x^4}{128} + \frac{63x^5}{64} + O(x^6)}{\sqrt{x}}
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{7}{2}} \left(1 - \frac{18x}{5} + \frac{39x^2}{4} - \frac{663x^3}{28} + \frac{13923x^4}{256} - \frac{7735x^5}{64} + O(x^6)\right) \\
&+ \frac{c_2 \left(1 - \frac{35x^4}{128} + \frac{63x^5}{64} + O(x^6)\right)}{\sqrt{x}}
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{7}{2}} \left(1 - \frac{18x}{5} + \frac{39x^2}{4} - \frac{663x^3}{28} + \frac{13923x^4}{256} - \frac{7735x^5}{64} + O(x^6)\right) \\
&+ \frac{c_2 \left(1 - \frac{35x^4}{128} + \frac{63x^5}{64} + O(x^6)\right)}{\sqrt{x}}
\end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1 x^{\frac{7}{2}} \left(1 - \frac{18x}{5} + \frac{39x^2}{4} - \frac{663x^3}{28} + \frac{13923x^4}{256} - \frac{7735x^5}{64} + O(x^6)\right) + \frac{c_2 \left(1 - \frac{35x^4}{128} + \frac{63x^5}{64} + O(x^6)\right)}{\sqrt{x}} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{7}{2}} \left(1 - \frac{18x}{5} + \frac{39x^2}{4} - \frac{663x^3}{28} + \frac{13923x^4}{256} - \frac{7735x^5}{64} + O(x^6)\right) + \frac{c_2 \left(1 - \frac{35x^4}{128} + \frac{63x^5}{64} + O(x^6)\right)}{\sqrt{x}}$$

Verified OK.

16.19.1 Maple step by step solution

Let's solve

$4x^2(1+2x)\,y'' + (2x^2-8x)\,y' + (-5x-7)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(7+5x)y}{4x^2(1+2x)} - \frac{(x-4)y'}{2x(1+2x)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x-4)y'}{2x(1+2x)} - \frac{(7+5x)y}{4x^2(1+2x)} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{x-4}{2x(1+2x)}, P_3(x) = -\frac{7+5x}{4x^2(1+2x)}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left.(x \cdot P_2(x))\right|_{x=0} = -2$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

$\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = -\frac{7}{4}$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $4x^2(1+2x)\, y'' + 2x(x-4)\, y' + (-5x-7)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k- >k-m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

- Shift index using $k- >k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k- >k+2-m$

  $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(1+2r)\,(-7+2r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(2k+2r+1)\,(2k+2r-7) + a_{k-1}(2k-1+2r)\,(4k-9+4r\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1+2r)(-7+2r)=0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-\frac{1}{2}, \frac{7}{2}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$8\left(k-\frac{1}{2}+r\right)\left(k-\frac{9}{4}+r\right)a_{k-1}+4\left(k+r-\frac{7}{2}\right)\left(k+r+\frac{1}{2}\right)a_k=0$$

- Shift index using $k->k+1$

$$8\left(k+r+\frac{1}{2}\right)\left(k-\frac{5}{4}+r\right)a_k+4\left(k-\frac{5}{2}+r\right)\left(k+\frac{3}{2}+r\right)a_{k+1}=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1}=-\frac{(2k+2r+1)(4k+4r-5)a_k}{(2k-5+2r)(2k+3+2r)}$$

- Recursion relation for $r=-\frac{1}{2}$

$$a_{k+1}=-\frac{2k(4k-7)a_k}{(2k-6)(2k+2)}$$

- Series not valid for $r=-\frac{1}{2}$, division by 0 in the recursion relation at $k=3$

$$a_{k+1}=-\frac{2k(4k-7)a_k}{(2k-6)(2k+2)}$$

- Recursion relation for $r=\frac{7}{2}$

$$a_{k+1}=-\frac{(2k+8)(4k+9)a_k}{(2k+2)(2k+10)}$$

- Solution for $r=\frac{7}{2}$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k+\frac{7}{2}}, a_{k+1}=-\frac{(2k+8)(4k+9)a_k}{(2k+2)(2k+10)}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 16.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{3x^2(x+3)\,y''-x(15+x)\,y'-20y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(3x^3+9x^2\right)y''+\left(-x^2-15x\right)y'-20y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{15+x}{3x\,(x+3)}$$
$$q(x)=-\frac{20}{3x^2\,(x+3)}$$

Table 810: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{15+x}{3x(x+3)}$	
singularity	type
$x = -3$	"regular"
$x = 0$	"regular"

$q(x) = -\frac{20}{3x^2(x+3)}$	
singularity	type
$x = -3$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-3, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$3x^2(x+3)\, y'' + \left(-x^2 - 15x\right) y' - 20y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$3x^2(x+3)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(-x^2 - 15x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) - 20\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-15x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-20 a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 3a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n (n+r)\right) = \sum_{n=1}^{\infty} \left(-a_{n-1}(n+r-1)\, x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 3a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=1}^{\infty} \left(-a_{n-1}(n+r-1)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-15x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-20 a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$9x^{n+r} a_n (n+r)(n+r-1) - 15x^{n+r} a_n (n+r) - 20 a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$9x^r a_0 r(-1+r) - 15x^r a_0 r - 20 a_0 x^r = 0$$

Or

$$\left(9x^r r(-1+r) - 15x^r r - 20x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(9r^2 - 24r - 20\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$9r^2 - 24r - 20 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= \frac{10}{3} \\ r_2 &= -\frac{2}{3} \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(9r^2 - 24r - 20\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= x^{\frac{10}{3}} \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^{\frac{2}{3}}} \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+\frac{10}{3}} \\ y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{2}{3}} \right) \end{aligned}$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots

of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \le n$ the recursive equation is

$$\begin{aligned} 3a_{n-1}(n+r-1)(n+r-2) + 9a_n(n+r)(n+r-1) \\ - a_{n-1}(n+r-1) - 15a_n(n+r) - 20a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(3n^2 + 6nr + 3r^2 - 10n - 10r + 7)}{9n^2 + 18nr + 9r^2 - 24n - 24r - 20} \tag{4}$$

Which for the root $r = \frac{10}{3}$ becomes

$$a_n = -\frac{a_{n-1}(3n^2 + 10n + 7)}{9n(n+4)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{10}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-3r^2 + 4r}{9r^2 - 6r - 35}$$

Which for the root $r = \frac{10}{3}$ becomes

$$a_1 = -\frac{4}{9}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3r^2+4r}{9r^2-6r-35}$	$-\frac{4}{9}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{r(3r^2 + 2r - 1)}{(3r+8)(9r^2 - 6r - 35)}$$

Which for the root $r = \frac{10}{3}$ becomes

$$a_2 = \frac{13}{81}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3r^2+4r}{9r^2-6r-35}$	$-\frac{4}{9}$
a_2	$\frac{r(3r^2+2r-1)}{(3r+8)(9r^2-6r-35)}$	$\frac{13}{81}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-3r^4 - 11r^3 - 12r^2 - 4r}{81r^4 + 459r^3 + 135r^2 - 2523r - 3080}$$

Which for the root $r = \frac{10}{3}$ becomes

$$a_3 = -\frac{832}{15309}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3r^2+4r}{9r^2-6r-35}$	$-\frac{4}{9}$
a_2	$\frac{r(3r^2+2r-1)}{(3r+8)(9r^2-6r-35)}$	$\frac{13}{81}$
a_3	$\frac{-3r^4-11r^3-12r^2-4r}{81r^4+459r^3+135r^2-2523r-3080}$	$-\frac{832}{15309}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(r+1)(r+2)r(r+3)}{81r^4 + 702r^3 + 1107r^2 - 3738r - 8624}$$

Which for the root $r = \frac{10}{3}$ becomes

$$a_4 = \frac{2470}{137781}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3r^2+4r}{9r^2-6r-35}$	$-\frac{4}{9}$
a_2	$\frac{r(3r^2+2r-1)}{(3r+8)(9r^2-6r-35)}$	$\frac{13}{81}$
a_3	$\frac{-3r^4-11r^3-12r^2-4r}{81r^4+459r^3+135r^2-2523r-3080}$	$-\frac{832}{15309}$
a_4	$\frac{(r+1)(r+2)r(r+3)}{81r^4+702r^3+1107r^2-3738r-8624}$	$\frac{2470}{137781}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(r+4)(r+1)(r+2)r(r+3)}{243r^5 + 3240r^4 + 12420r^3 - 90r^2 - 76503r - 91630}$$

Which for the root $r = \frac{10}{3}$ becomes

$$a_5 = -\frac{21736}{3720087}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-3r^2+4r}{9r^2-6r-35}$	$-\frac{4}{9}$
a_2	$\frac{r(3r^2+2r-1)}{(3r+8)(9r^2-6r-35)}$	$\frac{13}{81}$
a_3	$\frac{-3r^4-11r^3-12r^2-4r}{81r^4+459r^3+135r^2-2523r-3080}$	$-\frac{832}{15309}$
a_4	$\frac{(r+1)(r+2)r(r+3)}{81r^4+702r^3+1107r^2-3738r-8624}$	$\frac{2470}{137781}$
a_5	$-\frac{(r+4)(r+1)(r+2)r(r+3)}{243r^5+3240r^4+12420r^3-90r^2-76503r-91630}$	$-\frac{21736}{3720087}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{10}{3}}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= x^{\frac{10}{3}}\left(1 - \frac{4x}{9} + \frac{13x^2}{81} - \frac{832x^3}{15309} + \frac{2470x^4}{137781} - \frac{21736x^5}{3720087} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r \to r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_4 \\ &= \frac{(r+1)(r+2)r(r+3)}{81r^4 + 702r^3 + 1107r^2 - 3738r - 8624} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r \to r_2} \frac{(r+1)(r+2)r(r+3)}{81r^4 + 702r^3 + 1107r^2 - 3738r - 8624} &= \lim_{r \to -\frac{2}{3}} \frac{(r+1)(r+2)r(r+3)}{81r^4 + 702r^3 + 1107r^2 - 3738r - 8624} \\ &= \frac{7}{59049} \end{aligned}$$

The limit is $\frac{7}{59049}$. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^{n-\frac{2}{3}} \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &3b_{n-1}(n+r-1)(n+r-2) + 9b_n(n+r)(n+r-1) \\ &- b_{n-1}(n+r-1) - 15b_n(n+r) - 20b_n = 0 \end{aligned} \tag{4}$$

Which for for the root $r = -\frac{2}{3}$ becomes

$$\begin{aligned} &3b_{n-1}\left(n-\frac{5}{3}\right)\left(n-\frac{8}{3}\right) + 9b_n\left(n-\frac{2}{3}\right)\left(n-\frac{5}{3}\right) \\ &- b_{n-1}\left(n-\frac{5}{3}\right) - 15b_n\left(n-\frac{2}{3}\right) - 20b_n = 0 \end{aligned} \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{b_{n-1}(3n^2 + 6nr + 3r^2 - 10n - 10r + 7)}{9n^2 + 18nr + 9r^2 - 24n - 24r - 20} \tag{5}$$

Which for the root $r = -\frac{2}{3}$ becomes

$$b_n = -\frac{b_{n-1}(3n^2 - 14n + 15)}{9n^2 - 36n} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{2}{3}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{r(3r - 4)}{9r^2 - 6r - 35}$$

Which for the root $r = -\frac{2}{3}$ becomes

$$b_1 = \frac{4}{27}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-3r^2+4r}{9r^2-6r-35}$	$\frac{4}{27}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{r(3r^2 + 2r - 1)}{(3r + 8)(9r^2 - 6r - 35)}$$

Which for the root $r = -\frac{2}{3}$ becomes

$$b_2 = -\frac{1}{243}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-3r^2+4r}{9r^2-6r-35}$	$\frac{4}{27}$
b_2	$\frac{r(3r^2+2r-1)}{(3r+8)(9r^2-6r-35)}$	$-\frac{1}{243}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{(3r^2+8r+4)\, r(r+1)}{(3r+11)\,(3r+8)\,(9r^2-6r-35)}$$

Which for the root $r = -\frac{2}{3}$ becomes

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-3r^2+4r}{9r^2-6r-35}$	$\frac{4}{27}$
b_2	$\frac{r(3r^2+2r-1)}{(3r+8)(9r^2-6r-35)}$	$-\frac{1}{243}$
b_3	$\frac{-3r^4-11r^3-12r^2-4r}{81r^4+459r^3+135r^2-2523r-3080}$	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{(r+1)\,(r+2)\, r(r+3)}{(3r+14)\,(3r-7)\,(3r+8)\,(3r+11)}$$

Which for the root $r = -\frac{2}{3}$ becomes

$$b_4 = \frac{7}{59049}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-3r^2+4r}{9r^2-6r-35}$	$\frac{4}{27}$
b_2	$\frac{r(3r^2+2r-1)}{(3r+8)(9r^2-6r-35)}$	$-\frac{1}{243}$
b_3	$\frac{-3r^4-11r^3-12r^2-4r}{81r^4+459r^3+135r^2-2523r-3080}$	0
b_4	$\frac{(r+1)(r+2)r(r+3)}{81r^4+702r^3+1107r^2-3738r-8624}$	$\frac{7}{59049}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{(r+4)\,(r+1)\,(r+2)\, r(r+3)}{(3r+11)\,(3r-7)\,(3r+14)\,(9r^2+66r+85)}$$

Which for the root $r = -\frac{2}{3}$ becomes

$$b_5 = -\frac{28}{531441}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-3r^2+4r}{9r^2-6r-35}$	$\frac{4}{27}$
b_2	$\frac{r(3r^2+2r-1)}{(3r+8)(9r^2-6r-35)}$	$-\frac{1}{243}$
b_3	$\frac{-3r^4-11r^3-12r^2-4r}{81r^4+459r^3+135r^2-2523r-3080}$	0
b_4	$\frac{(r+1)(r+2)r(r+3)}{81r^4+702r^3+1107r^2-3738r-8624}$	$\frac{7}{59049}$
b_5	$-\frac{(r+4)(r+1)(r+2)r(r+3)}{(3r+11)(3r-7)(3r+14)(9r^2+66r+85)}$	$-\frac{28}{531441}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{10}{3}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 + \frac{4x}{27} - \frac{x^2}{243} + \frac{7x^4}{59049} - \frac{28x^5}{531441} + O(x^6)}{x^{\frac{2}{3}}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{10}{3}}\left(1 - \frac{4x}{9} + \frac{13x^2}{81} - \frac{832x^3}{15309} + \frac{2470x^4}{137781} - \frac{21736x^5}{3720087} + O(x^6)\right) \\ &+ \frac{c_2\left(1 + \frac{4x}{27} - \frac{x^2}{243} + \frac{7x^4}{59049} - \frac{28x^5}{531441} + O(x^6)\right)}{x^{\frac{2}{3}}} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{10}{3}}\left(1 - \frac{4x}{9} + \frac{13x^2}{81} - \frac{832x^3}{15309} + \frac{2470x^4}{137781} - \frac{21736x^5}{3720087} + O(x^6)\right) \\ &+ \frac{c_2\left(1 + \frac{4x}{27} - \frac{x^2}{243} + \frac{7x^4}{59049} - \frac{28x^5}{531441} + O(x^6)\right)}{x^{\frac{2}{3}}} \end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1 x^{\frac{10}{3}} \left(1 - \frac{4x}{9} + \frac{13x^2}{81} - \frac{832x^3}{15309} + \frac{2470x^4}{137781} - \frac{21736x^5}{3720087} + O(x^6)\right) + \frac{c_2 \left(1 + \frac{4x}{27} - \frac{x^2}{243} + \frac{7x^4}{59049} - \frac{28x^5}{531441} + O(x^6)\right)}{x^{\frac{2}{3}}} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{10}{3}} \left(1 - \frac{4x}{9} + \frac{13x^2}{81} - \frac{832x^3}{15309} + \frac{2470x^4}{137781} - \frac{21736x^5}{3720087} + O(x^6)\right) + \frac{c_2 \left(1 + \frac{4x}{27} - \frac{x^2}{243} + \frac{7x^4}{59049} - \frac{28x^5}{531441} + O(x^6)\right)}{x^{\frac{2}{3}}}$$

Verified OK.

16.20.1 Maple step by step solution

Let's solve

$3x^2(x+3)\, y'' + (-x^2 - 15x)\, y' - 20y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(15+x)y'}{3x(x+3)} + \frac{20y}{3x^2(x+3)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{(15+x)y'}{3x(x+3)} - \frac{20y}{3x^2(x+3)} = 0$

☐ Check to see if x_0 is a regular singular point

- ◦ Define functions

  $\left[P_2(x) = -\frac{15+x}{3x(x+3)}, P_3(x) = -\frac{20}{3x^2(x+3)}\right]$

- ◦ $(x+3) \cdot P_2(x)$ is analytic at $x = -3$

  $\left((x+3) \cdot P_2(x)\right)\Big|_{x=-3} = \frac{4}{3}$

- ◦ $(x+3)^2 \cdot P_3(x)$ is analytic at $x = -3$

$$\left((x+3)^2 \cdot P_3(x)\right)\bigg|_{x=-3} = 0$$

- $x = -3$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = -3$

- Multiply by denominators

  $3x^2(x+3)\,y'' - x(15+x)\,y' - 20y = 0$

- Change variables using $x = u - 3$ so that the regular singular point is at $u = 0$

  $(3u^3 - 18u^2 + 27u)\left(\frac{d^2}{du^2}y(u)\right) + (-u^2 - 9u + 36)\left(\frac{d}{du}y(u)\right) - 20y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$

- Shift index using $k- >k+1-m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,u^{k+r}$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\,u^{k+r-2+m}$

- Shift index using $k- >k+2-m$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\,u^{k+r}$

  Rewrite ODE with series expansions

  $9a_0 r(1+3r)\,u^{-1+r} + (9a_1(1+r)(4+3r) - a_0(18r^2 - 9r + 20))\,u^r + \left(\sum_{k=1}^{\infty} (9a_{k+1}(k+1+r)(3k\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $9r(1+3r) = 0$

- Values of r that satisfy the indicial equation

$r \in \left\{0, -\frac{1}{3}\right\}$

- Each term must be 0

$$9a_1(1+r)(4+3r) - a_0(18r^2 - 9r + 20) = 0$$

- Each term in the series must be 0, giving the recursion relation

$$3(-6a_k + a_{k-1} + 9a_{k+1})k^2 + (6(-6a_k + a_{k-1} + 9a_{k+1})r + 9a_k - 10a_{k-1} + 63a_{k+1})k + 3(-6a_k +$$

- Shift index using $k- > k+1$

$$3(-6a_{k+1} + a_k + 9a_{k+2})(k+1)^2 + (6(-6a_{k+1} + a_k + 9a_{k+2})r + 9a_{k+1} - 10a_k + 63a_{k+2})(k+1)$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{3k^2a_k - 18k^2a_{k+1} + 6kra_k - 36kra_{k+1} + 3r^2a_k - 18r^2a_{k+1} - 4ka_k - 27ka_{k+1} - 4ra_k - 27ra_{k+1} - 29a_{k+1}}{9(3k^2 + 6kr + 3r^2 + 13k + 13r + 14)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{3k^2a_k - 18k^2a_{k+1} - 4ka_k - 27ka_{k+1} - 29a_{k+1}}{9(3k^2 + 13k + 14)}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{3k^2a_k - 18k^2a_{k+1} - 4ka_k - 27ka_{k+1} - 29a_{k+1}}{9(3k^2 + 13k + 14)}, 36a_1 - 20a_0 = 0\right]$$

- Revert the change of variables $u = x + 3$

$$\left[y = \sum_{k=0}^{\infty} a_k(x+3)^k, a_{k+2} = -\frac{3k^2a_k - 18k^2a_{k+1} - 4ka_k - 27ka_{k+1} - 29a_{k+1}}{9(3k^2 + 13k + 14)}, 36a_1 - 20a_0 = 0\right]$$

- Recursion relation for $r = -\frac{1}{3}$

$$a_{k+2} = -\frac{3k^2a_k - 18k^2a_{k+1} - 6ka_k - 15ka_{k+1} + \frac{5}{3}a_k - 22a_{k+1}}{9(3k^2 + 11k + 10)}$$

- Solution for $r = -\frac{1}{3}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{1}{3}}, a_{k+2} = -\frac{3k^2a_k - 18k^2a_{k+1} - 6ka_k - 15ka_{k+1} + \frac{5}{3}a_k - 22a_{k+1}}{9(3k^2 + 11k + 10)}, 18a_1 - 25a_0 = 0\right]$$

- Revert the change of variables $u = x + 3$

$$\left[y = \sum_{k=0}^{\infty} a_k(x+3)^{k-\frac{1}{3}}, a_{k+2} = -\frac{3k^2a_k - 18k^2a_{k+1} - 6ka_k - 15ka_{k+1} + \frac{5}{3}a_k - 22a_{k+1}}{9(3k^2 + 11k + 10)}, 18a_1 - 25a_0 = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k(x+3)^k\right) + \left(\sum_{k=0}^{\infty} b_k(x+3)^{k-\frac{1}{3}}\right), a_{k+2} = -\frac{3k^2a_k - 18k^2a_{1+k} - 4ka_k - 27ka_{1+k} - 29a_{1+k}}{9(3k^2 + 13k + 14)}, 36a_1 -\right.$$

Problem number: 17.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x+1)\,y''+x(1-10x)\,y'-(9-10x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^3+x^2\right)y''+\left(-10x^2+x\right)y'+(10x-9)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{10x-1}{x\,(x+1)}$$
$$q(x)=\frac{10x-9}{x^2\,(x+1)}$$

Table 812: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{10x-1}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = \frac{10x-9}{x^2(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x+1)\,y'' + \left(-10x^2 + x\right) y' + (10x - 9)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + \left(-10x^2 + x\right)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (10x - 9)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right)$$
$$+ \sum_{n=0}^{\infty} \left(-10x^{1+n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)\right) \tag{2A}$$
$$+ \left(\sum_{n=0}^{\infty} 10x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-9a_n x^{n+r}\right) = 0$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r)(n+r-1) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-10x^{1+n+r} a_n(n+r)\right) = \sum_{n=1}^{\infty} \left(-10a_{n-1}(n+r-1)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} 10x^{1+n+r} a_n = \sum_{n=1}^{\infty} 10a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right)$$
$$+ \sum_{n=1}^{\infty} \left(-10a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)\right) \tag{2B}$$
$$+ \left(\sum_{n=1}^{\infty} 10a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-9a_n x^{n+r}\right) = 0$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n(n+r)(n+r-1) + x^{n+r} a_n(n+r) - 9a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + x^r a_0 r - 9a_0 x^r = 0$$

Or

$$(x^r r(-1+r) + x^r r - 9x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r^2 - 9)\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 9 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 3$$
$$r_2 = -3$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r^2 - 9)\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 6$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^3\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^3}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+3}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-3}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ -10a_{n-1}(n+r-1) + a_n(n+r) + 10a_{n-1} - 9a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n^2 + 2nr + r^2 - 13n - 13r + 22)}{n^2 + 2nr + r^2 - 9} \tag{4}$$

Which for the root $r = 3$ becomes

$$a_n = -\frac{a_{n-1}(n^2 - 7n - 8)}{n(n+6)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 3$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-r^2 + 11r - 10}{r^2 + 2r - 8}$$

Which for the root $r = 3$ becomes

$$a_1 = 2$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+11r-10}{r^2+2r-8}$	2

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(r-9)\,r(r-10)}{r^3 + 7r^2 + 2r - 40}$$

Which for the root $r = 3$ becomes

$$a_2 = \frac{9}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+11r-10}{r^2+2r-8}$	2
a_2	$\frac{(r-9)r(r-10)}{r^3+7r^2+2r-40}$	$\frac{9}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{(r-9)(r-10)(r+1)(r-8)}{r^4+13r^3+44r^2-28r-240}$$

Which for the root $r = 3$ becomes

$$a_3 = \frac{5}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+11r-10}{r^2+2r-8}$	2
a_2	$\frac{(r-9)r(r-10)}{r^3+7r^2+2r-40}$	$\frac{9}{4}$
a_3	$-\frac{(r-9)(r-10)(r+1)(r-8)}{r^4+13r^3+44r^2-28r-240}$	$\frac{5}{3}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(r+2)(r-7)(r-8)(r-10)(r-9)}{r^5+20r^4+135r^3+280r^2-436r-1680}$$

Which for the root $r = 3$ becomes

$$a_4 = \frac{5}{6}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+11r-10}{r^2+2r-8}$	2
a_2	$\frac{(r-9)r(r-10)}{r^3+7r^2+2r-40}$	$\frac{9}{4}$
a_3	$-\frac{(r-9)(r-10)(r+1)(r-8)}{r^4+13r^3+44r^2-28r-240}$	$\frac{5}{3}$
a_4	$\frac{(r+2)(r-7)(r-8)(r-10)(r-9)}{r^5+20r^4+135r^3+280r^2-436r-1680}$	$\frac{5}{6}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(r+3)(r-6)(r-9)(r-10)(r-8)(r-7)}{(r+8)(r+7)(r+5)(r+4)(r-2)(r+6)}$$

Which for the root $r = 3$ becomes

$$a_5 = \frac{3}{11}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+11r-10}{r^2+2r-8}$	2
a_2	$\frac{(r-9)r(r-10)}{r^3+7r^2+2r-40}$	$\frac{9}{4}$
a_3	$-\frac{(r-9)(r-10)(r+1)(r-8)}{r^4+13r^3+44r^2-28r-240}$	$\frac{5}{3}$
a_4	$\frac{(r+2)(r-7)(r-8)(r-10)(r-9)}{r^5+20r^4+135r^3+280r^2-436r-1680}$	$\frac{5}{6}$
a_5	$-\frac{(r+3)(r-6)(r-9)(r-10)(r-8)(r-7)}{(r+8)(r+7)(r+5)(r+4)(r-2)(r+6)}$	$\frac{3}{11}$

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{(r-7)(r-8)(r-10)(r-9)(r-6)(r-5)}{(r+9)(r+6)(r-2)(r+5)(r+7)(r+8)}$$

Which for the root $r = 3$ becomes

$$a_6 = \frac{7}{132}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+11r-10}{r^2+2r-8}$	2
a_2	$\frac{(r-9)r(r-10)}{r^3+7r^2+2r-40}$	$\frac{9}{4}$
a_3	$-\frac{(r-9)(r-10)(r+1)(r-8)}{r^4+13r^3+44r^2-28r-240}$	$\frac{5}{3}$
a_4	$\frac{(r+2)(r-7)(r-8)(r-10)(r-9)}{r^5+20r^4+135r^3+280r^2-436r-1680}$	$\frac{5}{6}$
a_5	$-\frac{(r+3)(r-6)(r-9)(r-10)(r-8)(r-7)}{(r+8)(r+7)(r+5)(r+4)(r-2)(r+6)}$	$\frac{3}{11}$
a_6	$\frac{(r-7)(r-8)(r-10)(r-9)(r-6)(r-5)}{(r+9)(r+6)(r-2)(r+5)(r+7)(r+8)}$	$\frac{7}{132}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^3\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 + a_7x^7 \dots\right) \\ &= x^3\left(1 + 2x + \frac{9x^2}{4} + \frac{5x^3}{3} + \frac{5x^4}{6} + \frac{3x^5}{11} + \frac{7x^6}{132} + O(x^7)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 6$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_6(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_6 \\ &= \frac{(r-7)(r-8)(r-10)(r-9)(r-6)(r-5)}{(r+9)(r+6)(r-2)(r+5)(r+7)(r+8)} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} \frac{(r-7)(r-8)(r-10)(r-9)(r-6)(r-5)}{(r+9)(r+6)(r-2)(r+5)(r+7)(r+8)} &= \lim_{r\to -3} \frac{(r-7)(r-8)(r-10)(r-9)(r-6)(r-5)}{(r+9)(r+6)(r-2)(r+5)(r+7)(r+8)} \\ &= -\frac{1716}{5} \end{aligned}$$

The limit is $-\frac{1716}{5}$. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^{n-3} \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} b_{n-1}(n+r-1)(n+r-2) + b_n(n+r)(n+r-1) \\ - 10b_{n-1}(n+r-1) + b_n(n+r) + 10b_{n-1} - 9b_n = 0 \end{aligned} \tag{4}$$

Which for for the root $r = -3$ becomes

$$b_{n-1}(n-4)(n-5)+b_n(n-3)(n-4)-10b_{n-1}(n-4)+b_n(n-3)+10b_{n-1}-9b_n = 0 \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{b_{n-1}(n^2 + 2nr + r^2 - 13n - 13r + 22)}{n^2 + 2nr + r^2 - 9} \tag{5}$$

Which for the root $r = -3$ becomes

$$b_n = -\frac{b_{n-1}(n^2 - 19n + 70)}{n^2 - 6n} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -3$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{r^2 - 11r + 10}{r^2 + 2r - 8}$$

Which for the root $r = -3$ becomes

$$b_1 = \frac{52}{5}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+11r-10}{r^2+2r-8}$	$\frac{52}{5}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{(r-9)\, r(r-10)}{(r+5)\,(r^2+2r-8)}$$

Which for the root $r = -3$ becomes

$$b_2 = \frac{234}{5}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+11r-10}{r^2+2r-8}$	$\frac{52}{5}$
b_2	$\frac{(r-9)r(r-10)}{r^3+7r^2+2r-40}$	$\frac{234}{5}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{(r-9)\,(r-10)\,(r^2-7r-8)}{(r+5)\,(r^2+2r-8)\,(r+6)}$$

Which for the root $r = -3$ becomes

$$b_3 = \frac{572}{5}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+11r-10}{r^2+2r-8}$	$\frac{52}{5}$
b_2	$\frac{(r-9)r(r-10)}{r^3+7r^2+2r-40}$	$\frac{234}{5}$
b_3	$-\frac{(r-9)(r-10)(r+1)(r-8)}{(r+5)(r+4)(r-2)(r+6)}$	$\frac{572}{5}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{(r^2 - 5r - 14)(r - 8)(r - 10)(r - 9)}{(r + 7)(r + 5)(r^2 + 2r - 8)(r + 6)}$$

Which for the root $r = -3$ becomes

$$b_4 = 143$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+11r-10}{r^2+2r-8}$	$\frac{52}{5}$
b_2	$\frac{(r-9)r(r-10)}{r^3+7r^2+2r-40}$	$\frac{234}{5}$
b_3	$-\frac{(r-9)(r-10)(r+1)(r-8)}{(r+5)(r+4)(r-2)(r+6)}$	$\frac{572}{5}$
b_4	$\frac{(r+2)(r-7)(r-8)(r-10)(r-9)}{(r+7)(r+5)(r+4)(r-2)(r+6)}$	143

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{(r^2 - 3r - 18)(r - 9)(r - 10)(r - 8)(r - 7)}{(r + 8)(r + 7)(r + 5)(r^2 + 2r - 8)(r + 6)}$$

Which for the root $r = -3$ becomes

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+11r-10}{r^2+2r-8}$	$\frac{52}{5}$
b_2	$\frac{(r-9)r(r-10)}{r^3+7r^2+2r-40}$	$\frac{234}{5}$
b_3	$-\frac{(r-9)(r-10)(r+1)(r-8)}{(r+5)(r+4)(r-2)(r+6)}$	$\frac{572}{5}$
b_4	$\frac{(r+2)(r-7)(r-8)(r-10)(r-9)}{(r+7)(r+5)(r+4)(r-2)(r+6)}$	143
b_5	$-\frac{(r+3)(r-6)(r-9)(r-10)(r-8)(r-7)}{(r+8)(r+7)(r+5)(r+4)(r-2)(r+6)}$	0

For $n = 6$, using the above recursive equation gives

$$b_6 = \frac{(r-7)(r-8)(r-10)(r-9)(r-6)(r-5)}{(r+9)(r+6)(r-2)(r+5)(r+7)(r+8)}$$

Which for the root $r = -3$ becomes

$$b_6 = -\frac{1716}{5}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+11r-10}{r^2+2r-8}$	$\frac{52}{5}$
b_2	$\frac{(r-9)r(r-10)}{r^3+7r^2+2r-40}$	$\frac{234}{5}$
b_3	$-\frac{(r-9)(r-10)(r+1)(r-8)}{(r+5)(r+4)(r-2)(r+6)}$	$\frac{572}{5}$
b_4	$\frac{(r+2)(r-7)(r-8)(r-10)(r-9)}{(r+7)(r+5)(r+4)(r-2)(r+6)}$	143
b_5	$-\frac{(r+3)(r-6)(r-9)(r-10)(r-8)(r-7)}{(r+8)(r+7)(r+5)(r+4)(r-2)(r+6)}$	0
b_6	$\frac{(r-7)(r-8)(r-10)(r-9)(r-6)(r-5)}{(r+9)(r+6)(r-2)(r+5)(r+7)(r+8)}$	$-\frac{1716}{5}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^3 \left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 \dots\right) \\ &= \frac{1 + \frac{52x}{5} + \frac{234x^2}{5} + \frac{572x^3}{5} + 143x^4 - \frac{1716x^6}{5} + O(x^7)}{x^3} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^3 \left(1 + 2x + \frac{9x^2}{4} + \frac{5x^3}{3} + \frac{5x^4}{6} + \frac{3x^5}{11} + \frac{7x^6}{132} + O(x^7)\right) \\ &\quad + \frac{c_2 \left(1 + \frac{52x}{5} + \frac{234x^2}{5} + \frac{572x^3}{5} + 143x^4 - \frac{1716x^6}{5} + O(x^7)\right)}{x^3} \end{aligned}$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^3 \left(1+2x+\frac{9x^2}{4}+\frac{5x^3}{3}+\frac{5x^4}{6}+\frac{3x^5}{11}+\frac{7x^6}{132}+O(x^7)\right) \\
&\quad + \frac{c_2 \left(1+\frac{52x}{5}+\frac{234x^2}{5}+\frac{572x^3}{5}+143x^4-\frac{1716x^6}{5}+O(x^7)\right)}{x^3}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^3 \left(1+2x+\frac{9x^2}{4}+\frac{5x^3}{3}+\frac{5x^4}{6}+\frac{3x^5}{11}+\frac{7x^6}{132}+O(x^7)\right) \\
&\quad + \frac{c_2 \left(1+\frac{52x}{5}+\frac{234x^2}{5}+\frac{572x^3}{5}+143x^4-\frac{1716x^6}{5}+O(x^7)\right)}{x^3}
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x^3 \left(1+2x+\frac{9x^2}{4}+\frac{5x^3}{3}+\frac{5x^4}{6}+\frac{3x^5}{11}+\frac{7x^6}{132}+O(x^7)\right) \\
&\quad + \frac{c_2 \left(1+\frac{52x}{5}+\frac{234x^2}{5}+\frac{572x^3}{5}+143x^4-\frac{1716x^6}{5}+O(x^7)\right)}{x^3}
\end{aligned}
$$

Verified OK.

16.21.1 Maple step by step solution

Let's solve

$x^2(x+1)\, y'' + (-10x^2+x)\, y' + (10x-9)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(10x-9)y}{x^2(x+1)} + \frac{(10x-1)y'}{x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{(10x-1)y'}{x(x+1)} + \frac{(10x-9)y}{x^2(x+1)} = 0$

☐ Check to see if x_0 is a regular singular point

  ◦ Define functions

$\left[P_2(x) = -\frac{10x-1}{x(x+1)}, P_3(x) = \frac{10x-9}{x^2(x+1)}\right]$

- $(x+1) \cdot P_2(x)$ is analytic at $x=-1$

  $\left((x+1) \cdot P_2(x)\right)\bigg|_{x=-1} = -11$

- $(x+1)^2 \cdot P_3(x)$ is analytic at $x=-1$

  $\left((x+1)^2 \cdot P_3(x)\right)\bigg|_{x=-1} = 0$

- $x=-1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = -1$

- Multiply by denominators

  $x^2(x+1)\, y'' - x(10x-1)\, y' + (10x-9)\, y = 0$

- Change variables using $x = u-1$ so that the regular singular point is at $u=0$

  $(u^3 - 2u^2 + u)\left(\frac{d^2}{du^2}y(u)\right) + (-10u^2 + 21u - 11)\left(\frac{d}{du}y(u)\right) + (10u - 19)\, y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

  $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$

- Shift index using $k->k-m$

  $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\, u^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, u^{k+r}$$

Rewrite ODE with series expansions

$$a_0 r(-12+r)\, u^{-1+r} + (a_1(1+r)(-11+r) - a_0(2r^2-23r+19))\, u^r + \left(\sum_{k=1}^{\infty} (a_{k+1}(k+1+r)(k\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$r(-12+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{0, 12\}$$

- Each term must be 0

$$a_1(1+r)(-11+r) - a_0(2r^2-23r+19) = 0$$

- Each term in the series must be 0, giving the recursion relation

$$(-2a_k + a_{k-1} + a_{k+1})\, k^2 + ((-4a_k + 2a_{k-1} + 2a_{k+1})\, r + 23a_k - 13a_{k-1} - 10a_{k+1})\, k + (-2a_k + a$$

- Shift index using $k->k+1$

$$(-2a_{k+1} + a_k + a_{k+2})\,(k+1)^2 + ((-4a_{k+1} + 2a_k + 2a_{k+2})\, r + 23a_{k+1} - 13a_k - 10a_{k+2})\,(k+1) -$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} + 2kra_k - 4kra_{k+1} + r^2 a_k - 2r^2 a_{k+1} - 11ka_k + 19ka_{k+1} - 11ra_k + 19ra_{k+1} + 10a_k + 2a_{k+1}}{k^2 + 2kr + r^2 - 8k - 8r - 20}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} - 11ka_k + 19ka_{k+1} + 10a_k + 2a_{k+1}}{k^2 - 8k - 20}$$

- Series not valid for $r = 0$, division by 0 in the recursion relation at $k = 10$

$$a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} - 11ka_k + 19ka_{k+1} + 10a_k + 2a_{k+1}}{k^2 - 8k - 20}$$

- Recursion relation for $r = 12$

$$a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} + 13ka_k - 29ka_{k+1} + 22a_k - 58a_{k+1}}{k^2 + 16k + 28}$$

- Solution for $r = 12$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+12}, a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} + 13ka_k - 29ka_{k+1} + 22a_k - 58a_{k+1}}{k^2 + 16k + 28}, 13a_1 - 31a_0 = 0\right]$$

- Revert the change of variables $u = x + 1$

$$\left[y=\sum_{k=0}^{\infty} a_k (x+1)^{k+12}, a_{k+2}=-\frac{k^2 a_k-2k^2 a_{k+1}+13k a_k-29k a_{k+1}+22a_k-58a_{k+1}}{k^2+16k+28}, 13a_1-31a_0=0\right]$$

Problem number: 18.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x+1)\,y''+3y'x^2-(6-x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^3+x^2\right)y''+3y'x^2+(x-6)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{3}{x+1}$$
$$q(x)=\frac{x-6}{x^2\,(x+1)}$$

Table 814: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3}{x+1}$	
singularity	type
$x = -1$	"regular"

$q(x) = \frac{x-6}{x^2(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x+1)\, y'' + 3y'x^2 + (x-6)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x+1) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + 3\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) x^2 + (x-6) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-6a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 3a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 3a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-6a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - 6a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - 6a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - 6x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2 - r - 6\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - r - 6 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 3 \\ r_2 &= -2 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(r^2 - r - 6\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 5$ is an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= x^3 \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^2} \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+3} \\ y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-2} \right) \end{aligned}$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots

of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$a_{n-1}(n+r-1)(n+r-2)+a_n(n+r)(n+r-1)+3a_{n-1}(n+r-1)+a_{n-1}-6a_n=0 \quad (3)$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n^2 + 2nr + r^2)}{n^2 + 2nr + r^2 - n - r - 6} \tag{4}$$

Which for the root $r = 3$ becomes

$$a_n = -\frac{a_{n-1}(n+3)^2}{n(n+5)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 3$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{(r+1)^2}{r^2 + r - 6}$$

Which for the root $r = 3$ becomes

$$a_1 = -\frac{8}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(r+1)^2}{r^2+r-6}$	$-\frac{8}{3}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(r+1)^2 (r+2)^2}{r^4 + 4r^3 - 7r^2 - 22r + 24}$$

Which for the root $r = 3$ becomes

$$a_2 = \frac{100}{21}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(r+1)^2}{r^2+r-6}$	$-\frac{8}{3}$
a_2	$\frac{(r+1)^2(r+2)^2}{r^4+4r^3-7r^2-22r+24}$	$\frac{100}{21}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{(r+3)(r+1)^2(r+2)^2}{r^5+6r^4-5r^3-42r^2+40r}$$

Which for the root $r = 3$ becomes

$$a_3 = -\frac{50}{7}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(r+1)^2}{r^2+r-6}$	$-\frac{8}{3}$
a_2	$\frac{(r+1)^2(r+2)^2}{r^4+4r^3-7r^2-22r+24}$	$\frac{100}{21}$
a_3	$-\frac{(r+3)(r+1)^2(r+2)^2}{r^5+6r^4-5r^3-42r^2+40r}$	$-\frac{50}{7}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(r+2)^2(r+1)(r+3)(r+4)}{r^5+8r^4-r^3-68r^2+60r}$$

Which for the root $r = 3$ becomes

$$a_4 = \frac{175}{18}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(r+1)^2}{r^2+r-6}$	$-\frac{8}{3}$
a_2	$\frac{(r+1)^2(r+2)^2}{r^4+4r^3-7r^2-22r+24}$	$\frac{100}{21}$
a_3	$-\frac{(r+3)(r+1)^2(r+2)^2}{r^5+6r^4-5r^3-42r^2+40r}$	$-\frac{50}{7}$
a_4	$\frac{(r+2)^2(r+1)(r+3)(r+4)}{r^5+8r^4-r^3-68r^2+60r}$	$\frac{175}{18}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(r+4)(r+3)(r+1)(r+2)(r+5)}{r^5+10r^4+5r^3-100r^2+84r}$$

Which for the root $r = 3$ becomes

$$a_5 = -\frac{112}{9}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(r+1)^2}{r^2+r-6}$	$-\frac{8}{3}$
a_2	$\frac{(r+1)^2(r+2)^2}{r^4+4r^3-7r^2-22r+24}$	$\frac{100}{21}$
a_3	$-\frac{(r+3)(r+1)^2(r+2)^2}{r^5+6r^4-5r^3-42r^2+40r}$	$-\frac{50}{7}$
a_4	$\frac{(r+2)^2(r+1)(r+3)(r+4)}{r^5+8r^4-r^3-68r^2+60r}$	$\frac{175}{18}$
a_5	$-\frac{(r+4)(r+3)(r+1)(r+2)(r+5)}{r^5+10r^4+5r^3-100r^2+84r}$	$-\frac{112}{9}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^3\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= x^3\left(1 - \frac{8x}{3} + \frac{100x^2}{21} - \frac{50x^3}{7} + \frac{175x^4}{18} - \frac{112x^5}{9} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 5$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\rightarrow r_2} a_5(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_5 \\ &= -\frac{(r+4)(r+3)(r+1)(r+2)(r+5)}{r^5+10r^4+5r^3-100r^2+84r} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\rightarrow r_2} -\frac{(r+4)(r+3)(r+1)(r+2)(r+5)}{r^5+10r^4+5r^3-100r^2+84r} &= \lim_{r\rightarrow -2} -\frac{(r+4)(r+3)(r+1)(r+2)(r+5)}{r^5+10r^4+5r^3-100r^2+84r} \\ &= 0 \end{aligned}$$

The limit is 0. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^{n-2} \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$b_{n-1}(n+r-1)(n+r-2)+b_n(n+r)(n+r-1)+3b_{n-1}(n+r-1)+b_{n-1}-6b_n = 0 \quad (4)$$

Which for for the root $r = -2$ becomes

$$b_{n-1}(n-3)(n-4)+b_n(n-2)(n-3)+3b_{n-1}(n-3)+b_{n-1}-6b_n = 0 \quad \text{(4A)}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{b_{n-1}(n^2+2nr+r^2)}{n^2+2nr+r^2-n-r-6} \quad (5)$$

Which for the root $r = -2$ becomes

$$b_n = -\frac{b_{n-1}(n^2-4n+4)}{n^2-5n} \quad (6)$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -2$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{r^2 + 2r + 1}{r^2 + r - 6}$$

Which for the root $r = -2$ becomes

$$b_1 = \frac{1}{4}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{(r+1)^2}{r^2+r-6}$	$\frac{1}{4}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{r^4 + 6r^3 + 13r^2 + 12r + 4}{(r^2 + r - 6)(r^2 + 3r - 4)}$$

Which for the root $r = -2$ becomes

$$b_2 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{(r+1)^2}{r^2+r-6}$	$\frac{1}{4}$
b_2	$\frac{(r+1)^2(r+2)^2}{r^4+4r^3-7r^2-22r+24}$	0

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{r^5 + 9r^4 + 31r^3 + 51r^2 + 40r + 12}{(r^2 + 3r - 4)(r - 2)\, r\,(r + 5)}$$

Which for the root $r = -2$ becomes

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{(r+1)^2}{r^2+r-6}$	$\frac{1}{4}$
b_2	$\frac{(r+1)^2(r+2)^2}{r^4+4r^3-7r^2-22r+24}$	0
b_3	$-\frac{(r+3)(r+1)^2(r+2)^2}{(r+5)r(-1+r)(r-2)(r+4)}$	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^5 + 12r^4 + 55r^3 + 120r^2 + 124r + 48}{(r+6)(r+5)r(r-2)(-1+r)}$$

Which for the root $r = -2$ becomes

$$b_4 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{(r+1)^2}{r^2+r-6}$	$\frac{1}{4}$
b_2	$\frac{(r+1)^2(r+2)^2}{r^4+4r^3-7r^2-22r+24}$	0
b_3	$-\frac{(r+3)(r+1)^2(r+2)^2}{(r+5)r(-1+r)(r-2)(r+4)}$	0
b_4	$\frac{(r+2)^2(r+1)(r+3)(r+4)}{(r+6)(r+5)(-1+r)(r-2)r}$	0

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{r^5 + 15r^4 + 85r^3 + 225r^2 + 274r + 120}{(r+7)(-1+r)(r-2)r(r+6)}$$

Which for the root $r = -2$ becomes

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{(r+1)^2}{r^2+r-6}$	$\frac{1}{4}$
b_2	$\frac{(r+1)^2(r+2)^2}{r^4+4r^3-7r^2-22r+24}$	0
b_3	$-\frac{(r+3)(r+1)^2(r+2)^2}{(r+5)r(-1+r)(r-2)(r+4)}$	0
b_4	$\frac{(r+2)^2(r+1)(r+3)(r+4)}{(r+6)(r+5)(-1+r)(r-2)r}$	0
b_5	$\frac{-r^5-15r^4-85r^3-225r^2-274r-120}{(r+7)(-1+r)(r-2)r(r+6)}$	0

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= x^3\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= \frac{1 + \frac{x}{4} + O(x^6)}{x^2}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^3 \left(1 - \frac{8x}{3} + \frac{100x^2}{21} - \frac{50x^3}{7} + \frac{175x^4}{18} - \frac{112x^5}{9} + O(x^6)\right) + \frac{c_2\left(1 + \frac{x}{4} + O(x^6)\right)}{x^2}
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^3 \left(1 - \frac{8x}{3} + \frac{100x^2}{21} - \frac{50x^3}{7} + \frac{175x^4}{18} - \frac{112x^5}{9} + O(x^6)\right) + \frac{c_2\left(1 + \frac{x}{4} + O(x^6)\right)}{x^2}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
y = c_1 x^3 \left(1 - \frac{8x}{3} + \frac{100x^2}{21} - \frac{50x^3}{7} + \frac{175x^4}{18} - \frac{112x^5}{9} + O(x^6)\right) + \frac{c_2\left(1 + \frac{x}{4} + O(x^6)\right)}{x^2} \tag{1}
$$

Verification of solutions

$$
y = c_1 x^3 \left(1 - \frac{8x}{3} + \frac{100x^2}{21} - \frac{50x^3}{7} + \frac{175x^4}{18} - \frac{112x^5}{9} + O(x^6)\right) + \frac{c_2\left(1 + \frac{x}{4} + O(x^6)\right)}{x^2}
$$

Verified OK.

16.22.1 Maple step by step solution

Let's solve

$x^2(x+1)\, y'' + 3y'x^2 + (x-6)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{3y'}{x+1} - \frac{(x-6)y}{x^2(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{3y'}{x+1} + \frac{(x-6)y}{x^2(x+1)} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{3}{x+1}, P_3(x) = \frac{x-6}{x^2(x+1)}\right]$

  ◦ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

  $\left((x+1)\cdot P_2(x)\right)\Big|_{x=-1} = 3$

  ◦ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

  $\left((x+1)^2\cdot P_3(x)\right)\Big|_{x=-1} = 0$

  ◦ $x=-1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = -1$

- Multiply by denominators

  $x^2(x+1)\, y'' + 3y'x^2 + (x-6)\, y = 0$

- Change variables using $x = u-1$ so that the regular singular point is at $u=0$

  $(u^3 - 2u^2 + u)\left(\frac{d^2}{du^2}y(u)\right) + (3u^2 - 6u + 3)\left(\frac{d}{du}y(u)\right) + (u-7)\, y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

  $$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

- Shift index using $k- >k - m$

  $$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d}{du} y(u)\right)$ to series expansion for $m = 0..2$

  $$u^m \cdot \left(\frac{d}{du} y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\, u^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

  $$u^m \cdot \left(\frac{d}{du} y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d^2}{du^2} y(u)\right)$ to series expansion for $m = 1..3$

  $$u^m \cdot \left(\frac{d^2}{du^2} y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

  $$u^m \cdot \left(\frac{d^2}{du^2} y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0 r(2+r)\, u^{-1+r} + \left(a_1(1+r)\,(3+r) - a_0(2r^2+4r+7)\right) u^r + \left(\sum_{k=1}^{\infty} \left(a_{k+1}(k+r+1)\,(k+3+r)\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$r(2+r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \{-2, 0\}$$

- Each term must be 0

  $$a_1(1+r)\,(3+r) - a_0(2r^2+4r+7) = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$a_{k-1}(k+r)^2 + a_{k+1}(k+r+1)\,(k+3+r) - 2\left(k^2 + (2r+2)\,k + r^2 + 2r + \frac{7}{2}\right) a_k = 0$$

- Shift index using $k- >k + 1$

  $$a_k(k+r+1)^2 + a_{k+2}(k+r+2)\,(k+4+r) - 2\left((k+1)^2 + (2r+2)\,(k+1) + r^2 + 2r + \frac{7}{2}\right) a_{k+1}$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} + 2kra_k - 4kra_{k+1} + r^2 a_k - 2r^2 a_{k+1} + 2ka_k - 8ka_{k+1} + 2ra_k - 8ra_{k+1} + a_k - 13a_{k+1}}{(k+r+2)(k+4+r)}$$

- Recursion relation for $r = -2$

$$a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} - 2ka_k + a_k - 5a_{k+1}}{k(k+2)}$$

- Series not valid for $r = -2$, division by 0 in the recursion relation at $k = 0$

$$a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} - 2ka_k + a_k - 5a_{k+1}}{k(k+2)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} + 2ka_k - 8ka_{k+1} + a_k - 13a_{k+1}}{(k+2)(k+4)}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} + 2ka_k - 8ka_{k+1} + a_k - 13a_{k+1}}{(k+2)(k+4)}, 3a_1 - 7a_0 = 0\right]$$

- Revert the change of variables $u = x + 1$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^k, a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} + 2ka_k - 8ka_{k+1} + a_k - 13a_{k+1}}{(k+2)(k+4)}, 3a_1 - 7a_0 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 19.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(1+2x)\,y''-2x(3+14x)\,y'+(6+100x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(2x^3+x^2\right)y''+\left(-28x^2-6x\right)y'+(6+100x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{2(3+14x)}{x\,(1+2x)}$$
$$q(x)=\frac{6+100x}{x^2\,(1+2x)}$$

Table 816: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{2(3+14x)}{x(1+2x)}$	
singularity	type
$x = 0$	"regular"

singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{1}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(1+2x)\, y'' + \left(-28x^2 - 6x\right) y' + (6 + 100x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(1+2x) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(-28x^2 - 6x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (6+100x) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \sum_{n=0}^{\infty} \left(-28x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-6x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 6a_n x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 100x^{1+n+r} a_n\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}
$$

$$
\sum_{n=0}^{\infty} \left(-28x^{1+n+r} a_n (n+r)\right) = \sum_{n=1}^{\infty} \left(-28a_{n-1}(n+r-1)\, x^{n+r}\right)
$$

$$
\sum_{n=0}^{\infty} 100x^{1+n+r} a_n = \sum_{n=1}^{\infty} 100a_{n-1} x^{n+r}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \sum_{n=1}^{\infty} \left(-28a_{n-1}(n+r-1)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-6x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 6a_n x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 100a_{n-1} x^{n+r}\right) = 0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
x^{n+r} a_n (n+r)(n+r-1) - 6x^{n+r} a_n (n+r) + 6a_n x^{n+r} = 0
$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - 6x^r a_0 r + 6a_0 x^r = 0$$

Or

$$(x^r r(-1+r) - 6x^r r + 6x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2 - 7r + 6\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 7r + 6 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 6$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(r^2 - 7r + 6\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 5$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^6\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+6}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{1+n}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$
\begin{aligned}
&2a_{n-1}(n+r-1)(n+r-2)+a_n(n+r)(n+r-1) \\
&\quad -28a_{n-1}(n+r-1)-6a_n(n+r)+6a_n+100a_{n-1}=0
\end{aligned} \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = -\frac{2(n+r-11)\,a_{n-1}}{n+r-1} \tag{4}
$$

Which for the root $r = 6$ becomes

$$
a_n = -\frac{2(n-5)\,a_{n-1}}{n+5} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 6$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$
a_1 = \frac{20-2r}{r}
$$

Which for the root $r = 6$ becomes

$$
a_1 = \frac{4}{3}
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{20-2r}{r}$	$\frac{4}{3}$

For $n = 2$, using the above recursive equation gives

$$
a_2 = \frac{4r^2-76r+360}{r(1+r)}
$$

Which for the root $r = 6$ becomes

$$a_2 = \frac{8}{7}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{20-2r}{r}$	$\frac{4}{3}$
a_2	$\frac{4r^2-76r+360}{r(1+r)}$	$\frac{8}{7}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-8r^3 + 216r^2 - 1936r + 5760}{r(1+r)(2+r)}$$

Which for the root $r = 6$ becomes

$$a_3 = \frac{4}{7}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{20-2r}{r}$	$\frac{4}{3}$
a_2	$\frac{4r^2-76r+360}{r(1+r)}$	$\frac{8}{7}$
a_3	$\frac{-8r^3+216r^2-1936r+5760}{r(1+r)(2+r)}$	$\frac{4}{7}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16r^4 - 544r^3 + 6896r^2 - 38624r + 80640}{r(1+r)(2+r)(3+r)}$$

Which for the root $r = 6$ becomes

$$a_4 = \frac{8}{63}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{20-2r}{r}$	$\frac{4}{3}$
a_2	$\frac{4r^2-76r+360}{r(1+r)}$	$\frac{8}{7}$
a_3	$\frac{-8r^3+216r^2-1936r+5760}{r(1+r)(2+r)}$	$\frac{4}{7}$
a_4	$\frac{16r^4-544r^3+6896r^2-38624r+80640}{r(1+r)(2+r)(3+r)}$	$\frac{8}{63}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{32(-10+r)(-6+r)(-7+r)(-8+r)(-9+r)}{(4+r)(1+r)(2+r)r(3+r)}$$

Which for the root $r = 6$ becomes

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{20-2r}{r}$	$\frac{4}{3}$
a_2	$\frac{4r^2-76r+360}{r(1+r)}$	$\frac{8}{7}$
a_3	$\frac{-8r^3+216r^2-1936r+5760}{r(1+r)(2+r)}$	$\frac{4}{7}$
a_4	$\frac{16r^4-544r^3+6896r^2-38624r+80640}{r(1+r)(2+r)(3+r)}$	$\frac{8}{63}$
a_5	$-\frac{32(-10+r)(-6+r)(-7+r)(-8+r)(-9+r)}{(4+r)(1+r)(2+r)r(3+r)}$	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= x^6\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \ldots\right) \\
&= x^6\left(1 + \frac{4x}{3} + \frac{8x^2}{7} + \frac{4x^3}{7} + \frac{8x^4}{63} + O(x^6)\right)
\end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 5$. Now we need to determine if

C is zero or not. This is done by finding $\lim_{r \to r_2} a_5(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_5 \\ &= -\frac{32(-10+r)(-6+r)(-7+r)(-8+r)(-9+r)}{(4+r)(1+r)(2+r)r(3+r)} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r \to r_2} -\frac{32(-10+r)(-6+r)(-7+r)(-8+r)(-9+r)}{(4+r)(1+r)(2+r)r(3+r)} &= \lim_{r \to 1} -\frac{32(-10+r)(-6+r)(-7+r)(-8+r)}{(4+r)(1+r)(2+r)r(3+r)} \\ &= 4032 \end{aligned}$$

The limit is 4032. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^{1+n} \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &2b_{n-1}(n+r-1)(n+r-2) + b_n(n+r)(n+r-1) \\ &- 28b_{n-1}(n+r-1) - 6b_n(n+r) + 6b_n + 100b_{n-1} = 0 \end{aligned} \tag{4}$$

Which for for the root $r = 1$ becomes

$$2b_{n-1}n(n-1) + b_n(1+n)n - 28b_{n-1}n - 6b_n(1+n) + 6b_n + 100b_{n-1} = 0 \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{2(n+r-11)b_{n-1}}{n+r-1} \tag{5}$$

Which for the root $r = 1$ becomes

$$b_n = -\frac{2(n-10)b_{n-1}}{n} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{2(-10 + r)}{r}$$

Which for the root $r = 1$ becomes

$$b_1 = 18$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{20-2r}{r}$	18

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{4r^2 - 76r + 360}{r(1 + r)}$$

Which for the root $r = 1$ becomes

$$b_2 = 144$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{20-2r}{r}$	18
b_2	$\frac{4r^2-76r+360}{r(1+r)}$	144

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{8(r^3 - 27r^2 + 242r - 720)}{r(1 + r)(2 + r)}$$

Which for the root $r = 1$ becomes

$$b_3 = 672$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{20-2r}{r}$	18
b_2	$\frac{4r^2-76r+360}{r(1+r)}$	144
b_3	$\frac{-8r^3+216r^2-1936r+5760}{r(1+r)(2+r)}$	672

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{16r^4 - 544r^3 + 6896r^2 - 38624r + 80640}{r(1+r)(2+r)(3+r)}$$

Which for the root $r = 1$ becomes

$$b_4 = 2016$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{20-2r}{r}$	18
b_2	$\frac{4r^2-76r+360}{r(1+r)}$	144
b_3	$\frac{-8r^3+216r^2-1936r+5760}{r(1+r)(2+r)}$	672
b_4	$\frac{16r^4-544r^3+6896r^2-38624r+80640}{r(1+r)(2+r)(3+r)}$	2016

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{32(r^5 - 40r^4 + 635r^3 - 5000r^2 + 19524r - 30240)}{r(1+r)(2+r)(3+r)(4+r)}$$

Which for the root $r = 1$ becomes

$$b_5 = 4032$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{20-2r}{r}$	18
b_2	$\frac{4r^2-76r+360}{r(1+r)}$	144
b_3	$\frac{-8r^3+216r^2-1936r+5760}{r(1+r)(2+r)}$	672
b_4	$\frac{16r^4-544r^3+6896r^2-38624r+80640}{r(1+r)(2+r)(3+r)}$	2016
b_5	$-\frac{32(-10+r)(-6+r)(-7+r)(-8+r)(-9+r)}{(4+r)(1+r)(2+r)r(3+r)}$	4032

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned}
y_2(x) &= x^6\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= x\left(1 + 18x + 144x^2 + 672x^3 + 2016x^4 + 4032x^5 + O(x^6)\right)
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^6 \left(1 + \frac{4x}{3} + \frac{8x^2}{7} + \frac{4x^3}{7} + \frac{8x^4}{63} + O(x^6)\right) \\
&\quad + c_2 x\left(1 + 18x + 144x^2 + 672x^3 + 2016x^4 + 4032x^5 + O(x^6)\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x^6 \left(1 + \frac{4x}{3} + \frac{8x^2}{7} + \frac{4x^3}{7} + \frac{8x^4}{63} + O(x^6)\right) \\
&\quad + c_2 x\left(1 + 18x + 144x^2 + 672x^3 + 2016x^4 + 4032x^5 + O(x^6)\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y = {}& c_1 x^6 \left(1 + \frac{4x}{3} + \frac{8x^2}{7} + \frac{4x^3}{7} + \frac{8x^4}{63} + O(x^6)\right) \\
& + c_2 x\left(1 + 18x + 144x^2 + 672x^3 + 2016x^4 + 4032x^5 + O(x^6)\right)
\end{aligned} \tag{1}$$

Verification of solutions

$$y = c_1 x^6 \left(1+\frac{4x}{3}+\frac{8x^2}{7}+\frac{4x^3}{7}+\frac{8x^4}{63}+O(x^6)\right) + c_2 x\left(1+18x+144x^2+672x^3+2016x^4+4032x^5+O(x^6)\right)$$

Verified OK.

16.23.1 Maple step by step solution

Let's solve

$x^2(1+2x)\,y''+(-28x^2-6x)\,y'+(6+100x)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{2(3+50x)y}{x^2(1+2x)}+\frac{2(3+14x)y'}{x(1+2x)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{2(3+14x)y'}{x(1+2x)}+\frac{2(3+50x)y}{x^2(1+2x)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=-\frac{2(3+14x)}{x(1+2x)}, P_3(x)=\frac{2(3+50x)}{x^2(1+2x)}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $(x\cdot P_2(x))\Big|_{x=0}=-6$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $(x^2\cdot P_3(x))\Big|_{x=0}=6$

  - $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $x^2(1+2x)\,y''-2x(3+14x)\,y'+(6+100x)\,y=0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(-1+r)(-6+r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(k+r-1)(k+r-6) + 2a_{k-1}(k+r-6)(k-11+r)\right) x^{k+r}\right)$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(-1+r)(-6+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{1, 6\}$$

- Each term in the series must be 0, giving the recursion relation

$$(k+r-6)\left((2k+2r-22)\, a_{k-1} + a_k(k+r-1)\right) = 0$$

- Shift index using $k- >k + 1$

$$(k+r-5)\left((2k+2r-20)\, a_k + a_{k+1}(k+r)\right) = 0$$

- Recursion relation that defines series solution to ODE

$a_{k+1} = -\frac{2(k+r-10)a_k}{k+r}$

- Recursion relation for $r = 1$; series terminates at $k = 9$

  $a_{k+1} = -\frac{2(k-9)a_k}{k+1}$

- Recursion relation that defines the terminating series solution of the ODE for $r = 1$

  $\left[y = \sum_{k=0}^{8} a_k x^{k+1}, a_{k+1} = -\frac{2(k-9)a_k}{k+1}\right]$

- Recursion relation for $r = 6$; series terminates at $k = 4$

  $a_{k+1} = -\frac{2(k-4)a_k}{k+6}$

- Apply recursion relation for $k = 0$

  $a_1 = \frac{4a_0}{3}$

- Apply recursion relation for $k = 1$

  $a_2 = \frac{6a_1}{7}$

- Express in terms of a_0

  $a_2 = \frac{8a_0}{7}$

- Apply recursion relation for $k = 2$

  $a_3 = \frac{a_2}{2}$

- Express in terms of a_0

  $a_3 = \frac{4a_0}{7}$

- Apply recursion relation for $k = 3$

  $a_4 = \frac{2a_3}{9}$

- Express in terms of a_0

  $a_4 = \frac{8a_0}{63}$

- Terminating series solution of the ODE for $r = 6$. Use reduction of order to find the second li

  $y = a_0 \cdot \left(1 + \frac{4}{3}x + \frac{8}{7}x^2 + \frac{4}{7}x^3 + \frac{8}{63}x^4\right)$

- Combine solutions and rename parameters

  $\left[y = \left(\sum_{k=0}^{8} a_k x^{1+k}\right) + b_0 \cdot \left(1 + \frac{4}{3}x + \frac{8}{7}x^2 + \frac{4}{7}x^3 + \frac{8}{63}x^4\right), a_{1+k} = -\frac{2(k-9)a_k}{1+k}\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 20.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x+1)\,y''-x(6+11x)\,y'+(6+32x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^3+x^2\right)y''+\left(-11x^2-6x\right)y'+(6+32x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{6+11x}{x\,(x+1)}$$
$$q(x)=\frac{6+32x}{x^2\,(x+1)}$$

Table 818: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{6+11x}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = \frac{6+32x}{x^2(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x+1)\, y'' + \left(-11x^2 - 6x\right) y' + (6 + 32x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x+1) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(-11x^2 - 6x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (6 + 32x) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-11 x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-6 x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 6 a_n x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 32 x^{1+n+r} a_n\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} a_{n-1} (n+r-1)(n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-11 x^{1+n+r} a_n (n+r)\right) = \sum_{n=1}^{\infty} \left(-11 a_{n-1} (n+r-1) x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} 32 x^{1+n+r} a_n = \sum_{n=1}^{\infty} 32 a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} a_{n-1} (n+r-1)(n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=1}^{\infty} \left(-11 a_{n-1} (n+r-1) x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-6 x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 6 a_n x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 32 a_{n-1} x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - 6 x^{n+r} a_n (n+r) + 6 a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - 6x^r a_0 r + 6a_0 x^r = 0$$

Or

$$(x^r r(-1+r) - 6x^r r + 6x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2 - 7r + 6\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 7r + 6 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 6$$
$$r_2 = 1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(r^2 - 7r + 6\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 5$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^6 \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+6}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{1+n}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ &- 11a_{n-1}(n+r-1) - 6a_n(n+r) + 6a_n + 32a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n^2 + 2nr + r^2 - 14n - 14r + 45)}{n^2 + 2nr + r^2 - 7n - 7r + 6} \tag{4}$$

Which for the root $r = 6$ becomes

$$a_n = -\frac{a_{n-1}(n^2 - 2n - 3)}{n(n+5)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 6$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-r^2 + 12r - 32}{r(r-5)}$$

Which for the root $r = 6$ becomes

$$a_1 = \frac{2}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+12r-32}{r(r-5)}$	$\frac{2}{3}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{r^3 - 18r^2 + 101r - 168}{(r+1)r(r-5)}$$

Which for the root $r = 6$ becomes

$$a_2 = \frac{1}{7}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+12r-32}{r(r-5)}$	$\frac{2}{3}$
a_2	$\frac{r^3-18r^2+101r-168}{(r+1)r(r-5)}$	$\frac{1}{7}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-r^4 + 23r^3 - 188r^2 + 628r - 672}{(r+2)(r+1)r(r-5)}$$

Which for the root $r = 6$ becomes

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+12r-32}{r(r-5)}$	$\frac{2}{3}$
a_2	$\frac{r^3-18r^2+101r-168}{(r+1)r(r-5)}$	$\frac{1}{7}$
a_3	$\frac{-r^4+23r^3-188r^2+628r-672}{(r+2)(r+1)r(r-5)}$	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^4 - 22r^3 + 167r^2 - 482r + 336}{(r+3)r(r+1)(r+2)}$$

Which for the root $r = 6$ becomes

$$a_4 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+12r-32}{r(r-5)}$	$\frac{2}{3}$
a_2	$\frac{r^3-18r^2+101r-168}{(r+1)r(r-5)}$	$\frac{1}{7}$
a_3	$\frac{-r^4+23r^3-188r^2+628r-672}{(r+2)(r+1)r(r-5)}$	0
a_4	$\frac{r^4-22r^3+167r^2-482r+336}{(r+3)r(r+1)(r+2)}$	0

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-r^4 + 25r^3 - 230r^2 + 920r - 1344}{(r+4)(r+3)(r+1)(r+2)}$$

Which for the root $r = 6$ becomes

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+12r-32}{r(r-5)}$	$\frac{2}{3}$
a_2	$\frac{r^3-18r^2+101r-168}{(r+1)r(r-5)}$	$\frac{1}{7}$
a_3	$\frac{-r^4+23r^3-188r^2+628r-672}{(r+2)(r+1)r(r-5)}$	0
a_4	$\frac{r^4-22r^3+167r^2-482r+336}{(r+3)r(r+1)(r+2)}$	0
a_5	$\frac{-r^4+25r^3-230r^2+920r-1344}{(r+4)(r+3)(r+1)(r+2)}$	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^6 \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^6 \left(1 + \frac{2x}{3} + \frac{x^2}{7} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 5$. Now we need to determine if

C is zero or not. This is done by finding $\lim_{r\rightarrow r_2} a_5(r)$. If this limit exists, then $C=0$, else we need to keep the log term and $C\neq 0$. The above table shows that

$$
\begin{aligned}
a_N &= a_5 \\
&= \frac{-r^4+25r^3-230r^2+920r-1344}{(r+4)(r+3)(r+1)(r+2)}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\lim_{r\rightarrow r_2} \frac{-r^4+25r^3-230r^2+920r-1344}{(r+4)(r+3)(r+1)(r+2)} &= \lim_{r\rightarrow 1} \frac{-r^4+25r^3-230r^2+920r-1344}{(r+4)(r+3)(r+1)(r+2)} \\
&= -\frac{21}{4}
\end{aligned}
$$

The limit is $-\frac{21}{4}$. Since the limit exists then the log term is not needed and we can set $C=0$. Therefore the second solution has the form

$$
\begin{aligned}
y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\
&= \sum_{n=0}^{\infty} b_n x^{1+n}
\end{aligned}
$$

Eq (3) derived above is used to find all b_n coefficients. The case $n=0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0=1$. For $1\leq n$ the recursive equation is

$$
\begin{aligned}
&b_{n-1}(n+r-1)(n+r-2)+b_n(n+r)(n+r-1) \\
&-11b_{n-1}(n+r-1)-6b_n(n+r)+6b_n+32b_{n-1}=0
\end{aligned}
\tag{4}
$$

Which for for the root $r=1$ becomes

$$
b_{n-1}n(n-1)+b_n(1+n)n-11b_{n-1}n-6b_n(1+n)+6b_n+32b_{n-1}=0 \tag{4A}
$$

Solving for b_n from the recursive equation (4) gives

$$
b_n = -\frac{b_{n-1}(n^2+2nr+r^2-14n-14r+45)}{n^2+2nr+r^2-7n-7r+6} \tag{5}
$$

Which for the root $r=1$ becomes

$$
b_n = -\frac{b_{n-1}(n^2-12n+32)}{n^2-5n} \tag{6}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{r^2 - 12r + 32}{r (r - 5)}$$

Which for the root $r = 1$ becomes

$$b_1 = \frac{21}{4}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+12r-32}{r(r-5)}$	$\frac{21}{4}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{r^3 - 18r^2 + 101r - 168}{(r + 1) r (r - 5)}$$

Which for the root $r = 1$ becomes

$$b_2 = \frac{21}{2}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+12r-32}{r(r-5)}$	$\frac{21}{4}$
b_2	$\frac{r^3-18r^2+101r-168}{(r+1)r(r-5)}$	$\frac{21}{2}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{r^4 - 23r^3 + 188r^2 - 628r + 672}{(r + 2) (r + 1) r (r - 5)}$$

Which for the root $r = 1$ becomes

$$b_3 = \frac{35}{4}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+12r-32}{r(r-5)}$	$\frac{21}{4}$
b_2	$\frac{r^3-18r^2+101r-168}{(r+1)r(r-5)}$	$\frac{21}{2}$
b_3	$\frac{-r^4+23r^3-188r^2+628r-672}{(r+2)(r+1)r(r-5)}$	$\frac{35}{4}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^4 - 22r^3 + 167r^2 - 482r + 336}{(r+3)\, r\, (r+1)\, (r+2)}$$

Which for the root $r = 1$ becomes

$$b_4 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+12r-32}{r(r-5)}$	$\frac{21}{4}$
b_2	$\frac{r^3-18r^2+101r-168}{(r+1)r(r-5)}$	$\frac{21}{2}$
b_3	$\frac{-r^4+23r^3-188r^2+628r-672}{(r+2)(r+1)r(r-5)}$	$\frac{35}{4}$
b_4	$\frac{r^4-22r^3+167r^2-482r+336}{(r+3)r(r+1)(r+2)}$	0

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{r^4 - 25r^3 + 230r^2 - 920r + 1344}{(r+4)\,(r+3)\,(r+1)\,(r+2)}$$

Which for the root $r = 1$ becomes

$$b_5 = -\frac{21}{4}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+12r-32}{r(r-5)}$	$\frac{21}{4}$
b_2	$\frac{r^3-18r^2+101r-168}{(r+1)r(r-5)}$	$\frac{21}{2}$
b_3	$\frac{-r^4+23r^3-188r^2+628r-672}{(r+2)(r+1)r(r-5)}$	$\frac{35}{4}$
b_4	$\frac{r^4-22r^3+167r^2-482r+336}{(r+3)r(r+1)(r+2)}$	0
b_5	$\frac{-r^4+25r^3-230r^2+920r-1344}{(r+4)(r+3)(r+1)(r+2)}$	$-\frac{21}{4}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^6(b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6 \dots) \\ &= x\left(1 + \frac{21x}{4} + \frac{21x^2}{2} + \frac{35x^3}{4} - \frac{21x^5}{4} + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1y_1(x) + c_2y_2(x) \\ &= c_1x^6\left(1 + \frac{2x}{3} + \frac{x^2}{7} + O(x^6)\right) + c_2x\left(1 + \frac{21x}{4} + \frac{21x^2}{2} + \frac{35x^3}{4} - \frac{21x^5}{4} + O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1x^6\left(1 + \frac{2x}{3} + \frac{x^2}{7} + O(x^6)\right) + c_2x\left(1 + \frac{21x}{4} + \frac{21x^2}{2} + \frac{35x^3}{4} - \frac{21x^5}{4} + O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1x^6\left(1 + \frac{2x}{3} + \frac{x^2}{7} + O(x^6)\right) + c_2x\left(1 + \frac{21x}{4} + \frac{21x^2}{2} + \frac{35x^3}{4} - \frac{21x^5}{4} + O(x^6)\right) \tag{1}$$

Verification of solutions

$$y = c_1x^6\left(1 + \frac{2x}{3} + \frac{x^2}{7} + O(x^6)\right) + c_2x\left(1 + \frac{21x}{4} + \frac{21x^2}{2} + \frac{35x^3}{4} - \frac{21x^5}{4} + O(x^6)\right)$$

Verified OK.

16.24.1 Maple step by step solution

Let's solve

$x^2(x+1)\,y''+(-11x^2-6x)\,y'+(6+32x)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{2(3+16x)y}{x^2(x+1)}+\frac{(6+11x)y'}{x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{(6+11x)y'}{x(x+1)}+\frac{2(3+16x)y}{x^2(x+1)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=-\frac{6+11x}{x(x+1)}, P_3(x)=\frac{2(3+16x)}{x^2(x+1)}\right]$

  ◦ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

  $\left((x+1)\cdot P_2(x)\right)\Big|_{x=-1}=-5$

  ◦ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

  $\left((x+1)^2\cdot P_3(x)\right)\Big|_{x=-1}=0$

  ◦ $x=-1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-1$

- Multiply by denominators

  $x^2(x+1)\,y''-x(6+11x)\,y'+(6+32x)\,y=0$

- Change variables using $x=u-1$ so that the regular singular point is at $u=0$

  $(u^3-2u^2+u)\left(\frac{d^2}{du^2}y(u)\right)+(-11u^2+16u-5)\left(\frac{d}{du}y(u)\right)+(-26+32u)\,y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

  $$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

- Shift index using $k- >k - m$

  $$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0 r(-6+r)\, u^{-1+r} + \left(a_1(1+r)\,(-5+r) - 2a_0(r^2-9r+13)\right) u^r + \left(\sum_{k=1}^{\infty} \left(a_{k+1}(k+1+r)\,(k-5\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$r(-6+r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \{0, 6\}$$

- Each term must be 0

  $$a_1(1+r)\,(-5+r) - 2a_0(r^2-9r+13) = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$(-2a_k + a_{k-1} + a_{k+1})\, k^2 + 2((-2a_k + a_{k-1} + a_{k+1})\, r + 9a_k - 7a_{k-1} - 2a_{k+1})\, k + (-2a_k + a_{k-1} -$$

- Shift index using $k- >k + 1$

  $$(-2a_{k+1} + a_k + a_{k+2})\,(k+1)^2 + 2((-2a_{k+1} + a_k + a_{k+2})\, r + 9a_{k+1} - 7a_k - 2a_{k+2})\,(k+1) + (-$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} + 2kra_k - 4kra_{k+1} + r^2 a_k - 2r^2 a_{k+1} - 12ka_k + 14ka_{k+1} - 12ra_k + 14ra_{k+1} + 32a_k - 10a_{k+1}}{k^2 + 2kr + r^2 - 2k - 2r - 8}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} - 12ka_k + 14ka_{k+1} + 32a_k - 10a_{k+1}}{k^2 - 2k - 8}$$

- Series not valid for $r = 0$, division by 0 in the recursion relation at $k = 4$

$$a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} - 12ka_k + 14ka_{k+1} + 32a_k - 10a_{k+1}}{k^2 - 2k - 8}$$

- Recursion relation for $r = 6$

$$a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} - 10ka_{k+1} - 4a_k + 2a_{k+1}}{k^2 + 10k + 16}$$

- Solution for $r = 6$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+6}, a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} - 10ka_{k+1} - 4a_k + 2a_{k+1}}{k^2 + 10k + 16}, 7a_1 + 10a_0 = 0\right]$$

- Revert the change of variables $u = x + 1$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^{k+6}, a_{k+2} = -\frac{k^2 a_k - 2k^2 a_{k+1} - 10ka_{k+1} - 4a_k + 2a_{k+1}}{k^2 + 10k + 16}, 7a_1 + 10a_0 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 21.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2(x+1)\,y''+4x(4x+1)\,y'-(49+27x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(4x^3+4x^2\right)y''+\left(16x^2+4x\right)y'+(-27x-49)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{4x+1}{x\,(x+1)}$$
$$q(x)=-\frac{49+27x}{4x^2\,(x+1)}$$

Table 820: Table $p(x), q(x)$ singularites.

$p(x) = \frac{4x+1}{x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = -\frac{49+27x}{4x^2(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2(x+1)\, y'' + \left(16x^2 + 4x\right) y' + (-27x - 49)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2(x+1) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(16x^2 + 4x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (-27x - 49) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 16x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)\right) \\
&+ \sum_{n=0}^{\infty} \left(-27x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-49a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1) &= \sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 16x^{1+n+r} a_n (n+r) &= \sum_{n=1}^{\infty} 16a_{n-1}(n+r-1)\, x^{n+r} \\
\sum_{n=0}^{\infty} \left(-27x^{1+n+r} a_n\right) &= \sum_{n=1}^{\infty} \left(-27a_{n-1} x^{n+r}\right)
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=1}^{\infty} 16a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)\right) \\
&+ \sum_{n=1}^{\infty} \left(-27a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-49a_n x^{n+r}\right) = 0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
4x^{n+r} a_n (n+r)(n+r-1) + 4x^{n+r} a_n (n+r) - 49a_n x^{n+r} = 0
$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) + 4x^r a_0 r - 49a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) + 4x^r r - 49x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 - 49\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 - 49 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{7}{2}$$
$$r_2 = -\frac{7}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 - 49\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 7$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^{\frac{7}{2}} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^{\frac{7}{2}}}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{7}{2}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{7}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$4a_{n-1}(n+r-1)(n+r-2) + 4a_n(n+r)(n+r-1) \\ + 16a_{n-1}(n+r-1) + 4a_n(n+r) - 27a_{n-1} - 49a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(2n+2r-5)\, a_{n-1}}{2n+2r-7} \tag{4}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_n = -\frac{(1+n)\, a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{7}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{3-2r}{2r-5}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_1 = -2$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-2r}{2r-5}$	-2

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{2r-1}{2r-5}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_2 = 3$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-2r}{2r-5}$	-2
a_2	$\frac{2r-1}{2r-5}$	3

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-1-2r}{2r-5}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_3 = -4$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-2r}{2r-5}$	-2
a_2	$\frac{2r-1}{2r-5}$	3
a_3	$\frac{-1-2r}{2r-5}$	-4

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{3+2r}{2r-5}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_4 = 5$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-2r}{2r-5}$	-2
a_2	$\frac{2r-1}{2r-5}$	3
a_3	$\frac{-1-2r}{2r-5}$	-4
a_4	$\frac{3+2r}{2r-5}$	5

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-5 - 2r}{2r - 5}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_5 = -6$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-2r}{2r-5}$	-2
a_2	$\frac{2r-1}{2r-5}$	3
a_3	$\frac{-1-2r}{2r-5}$	-4
a_4	$\frac{3+2r}{2r-5}$	5
a_5	$\frac{-5-2r}{2r-5}$	-6

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{7 + 2r}{2r - 5}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_6 = 7$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-2r}{2r-5}$	-2
a_2	$\frac{2r-1}{2r-5}$	3
a_3	$\frac{-1-2r}{2r-5}$	-4
a_4	$\frac{3+2r}{2r-5}$	5
a_5	$\frac{-5-2r}{2r-5}$	-6
a_6	$\frac{7+2r}{2r-5}$	7

For $n = 7$, using the above recursive equation gives

$$a_7 = \frac{-9 - 2r}{2r - 5}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_7 = -8$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-2r}{2r-5}$	-2
a_2	$\frac{2r-1}{2r-5}$	3
a_3	$\frac{-1-2r}{2r-5}$	-4
a_4	$\frac{3+2r}{2r-5}$	5
a_5	$\frac{-5-2r}{2r-5}$	-6
a_6	$\frac{7+2r}{2r-5}$	7
a_7	$\frac{-9-2r}{2r-5}$	-8

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{7}{2}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 \dots\right) \\ &= x^{\frac{7}{2}}\left(1 - 2x + 3x^2 - 4x^3 + 5x^4 - 6x^5 + 7x^6 - 8x^7 + O(x^8)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 7$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r \to r_2} a_7(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_7 \\ &= \frac{-9 - 2r}{2r - 5} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r \to r_2} \frac{-9 - 2r}{2r - 5} &= \lim_{r \to -\frac{7}{2}} \frac{-9 - 2r}{2r - 5} \\ &= \frac{1}{6} \end{aligned}$$

The limit is $\frac{1}{6}$. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^{n-\frac{7}{2}} \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &4b_{n-1}(n + r - 1)(n + r - 2) + 4b_n(n + r)(n + r - 1) \\ &+ 16b_{n-1}(n + r - 1) + 4b_n(n + r) - 27b_{n-1} - 49b_n = 0 \end{aligned} \tag{4}$$

Which for for the root $r = -\frac{7}{2}$ becomes

$$\begin{aligned} &4b_{n-1}\left(n - \frac{9}{2}\right)\left(n - \frac{11}{2}\right) + 4b_n\left(n - \frac{7}{2}\right)\left(n - \frac{9}{2}\right) \\ &+ 16b_{n-1}\left(n - \frac{9}{2}\right) + 4b_n\left(n - \frac{7}{2}\right) - 27b_{n-1} - 49b_n = 0 \end{aligned} \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{(2n+2r-5)\, b_{n-1}}{2n+2r-7} \tag{5}$$

Which for the root $r = -\frac{7}{2}$ becomes

$$b_n = -\frac{(2n-12)\, b_{n-1}}{2n-14} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{7}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{-3+2r}{2r-5}$$

Which for the root $r = -\frac{7}{2}$ becomes

$$b_1 = -\frac{5}{6}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3-2r}{2r-5}$	$-\frac{5}{6}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{2r-1}{2r-5}$$

Which for the root $r = -\frac{7}{2}$ becomes

$$b_2 = \frac{2}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3-2r}{2r-5}$	$-\frac{5}{6}$
b_2	$\frac{2r-1}{2r-5}$	$\frac{2}{3}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{1+2r}{2r-5}$$

Which for the root $r = -\frac{7}{2}$ becomes

$$b_3 = -\frac{1}{2}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3-2r}{2r-5}$	$-\frac{5}{6}$
b_2	$\frac{2r-1}{2r-5}$	$\frac{2}{3}$
b_3	$\frac{-1-2r}{2r-5}$	$-\frac{1}{2}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{3+2r}{2r-5}$$

Which for the root $r = -\frac{7}{2}$ becomes

$$b_4 = \frac{1}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3-2r}{2r-5}$	$-\frac{5}{6}$
b_2	$\frac{2r-1}{2r-5}$	$\frac{2}{3}$
b_3	$\frac{-1-2r}{2r-5}$	$-\frac{1}{2}$
b_4	$\frac{3+2r}{2r-5}$	$\frac{1}{3}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{5+2r}{2r-5}$$

Which for the root $r = -\frac{7}{2}$ becomes

$$b_5 = -\frac{1}{6}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3-2r}{2r-5}$	$-\frac{5}{6}$
b_2	$\frac{2r-1}{2r-5}$	$\frac{2}{3}$
b_3	$\frac{-1-2r}{2r-5}$	$-\frac{1}{2}$
b_4	$\frac{3+2r}{2r-5}$	$\frac{1}{3}$
b_5	$\frac{-5-2r}{2r-5}$	$-\frac{1}{6}$

For $n = 6$, using the above recursive equation gives

$$b_6 = \frac{7+2r}{2r-5}$$

Which for the root $r = -\frac{7}{2}$ becomes

$$b_6 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3-2r}{2r-5}$	$-\frac{5}{6}$
b_2	$\frac{2r-1}{2r-5}$	$\frac{2}{3}$
b_3	$\frac{-1-2r}{2r-5}$	$-\frac{1}{2}$
b_4	$\frac{3+2r}{2r-5}$	$\frac{1}{3}$
b_5	$\frac{-5-2r}{2r-5}$	$-\frac{1}{6}$
b_6	$\frac{7+2r}{2r-5}$	0

For $n = 7$, using the above recursive equation gives

$$b_7 = -\frac{9 + 2r}{2r - 5}$$

Which for the root $r = -\frac{7}{2}$ becomes

$$b_7 = \frac{1}{6}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3-2r}{2r-5}$	$-\frac{5}{6}$
b_2	$\frac{2r-1}{2r-5}$	$\frac{2}{3}$
b_3	$\frac{-1-2r}{2r-5}$	$-\frac{1}{2}$
b_4	$\frac{3+2r}{2r-5}$	$\frac{1}{3}$
b_5	$\frac{-5-2r}{2r-5}$	$-\frac{1}{6}$
b_6	$\frac{7+2r}{2r-5}$	0
b_7	$\frac{-9-2r}{2r-5}$	$\frac{1}{6}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{7}{2}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 \dots\right) \\ &= \frac{1 - \frac{5x}{6} + \frac{2x^2}{3} - \frac{x^3}{2} + \frac{x^4}{3} - \frac{x^5}{6} + \frac{x^7}{6} + O(x^8)}{x^{\frac{7}{2}}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{7}{2}}\left(1 - 2x + 3x^2 - 4x^3 + 5x^4 - 6x^5 + 7x^6 - 8x^7 + O(x^8)\right) \\ &+ \frac{c_2\left(1 - \frac{5x}{6} + \frac{2x^2}{3} - \frac{x^3}{2} + \frac{x^4}{3} - \frac{x^5}{6} + \frac{x^7}{6} + O(x^8)\right)}{x^{\frac{7}{2}}} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{7}{2}}\left(1 - 2x + 3x^2 - 4x^3 + 5x^4 - 6x^5 + 7x^6 - 8x^7 + O(x^8)\right) \\ &+ \frac{c_2\left(1 - \frac{5x}{6} + \frac{2x^2}{3} - \frac{x^3}{2} + \frac{x^4}{3} - \frac{x^5}{6} + \frac{x^7}{6} + O(x^8)\right)}{x^{\frac{7}{2}}} \end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1 x^{\frac{7}{2}} \left(1-2x+3x^2-4x^3+5x^4-6x^5+7x^6-8x^7+O(x^8)\right) + \frac{c_2 \left(1-\frac{5x}{6}+\frac{2x^2}{3}-\frac{x^3}{2}+\frac{x^4}{3}-\frac{x^5}{6}+\frac{x^7}{6}+O(x^8)\right)}{x^{\frac{7}{2}}} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{7}{2}} \left(1-2x+3x^2-4x^3+5x^4-6x^5+7x^6-8x^7+O(x^8)\right) + \frac{c_2 \left(1-\frac{5x}{6}+\frac{2x^2}{3}-\frac{x^3}{2}+\frac{x^4}{3}-\frac{x^5}{6}+\frac{x^7}{6}+O(x^8)\right)}{x^{\frac{7}{2}}}$$

Verified OK.

16.25.1 Maple step by step solution

Let's solve

$4x^2(x+1)\, y'' + (16x^2+4x)\, y' + (-27x-49)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(49+27x)y}{4x^2(x+1)} - \frac{(4x+1)y'}{x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(4x+1)y'}{x(x+1)} - \frac{(49+27x)y}{4x^2(x+1)} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x) = \frac{4x+1}{x(x+1)}, P_3(x) = -\frac{49+27x}{4x^2(x+1)}\right]$

  ◦ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

    $\left((x+1)\cdot P_2(x)\right)\Big|_{x=-1} = 3$

  ◦ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

    $\left((x+1)^2\cdot P_3(x)\right)\Big|_{x=-1} = 0$

  ◦ $x=-1$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0 = -1$

- Multiply by denominators

$4x^2(x+1)\,y'' + 4x(4x+1)\,y' + (-27x-49)\,y = 0$

- Change variables using $x = u-1$ so that the regular singular point is at $u = 0$

$(4u^3 - 8u^2 + 4u)\left(\frac{d^2}{du^2}y(u)\right) + (16u^2 - 28u + 12)\left(\frac{d}{du}y(u)\right) + (-27u - 22)\,y(u) = 0$

- Assume series solution for $y(u)$

$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

    $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$

  - Shift index using $k->k-m$

    $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$

  - Shift index using $k->k+1-m$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,u^{k+r}$

  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

    $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,u^{k+r-2+m}$

  - Shift index using $k->k+2-m$

    $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$

Rewrite ODE with series expansions

$4a_0 r(2+r)\,u^{-1+r} + (4a_1(1+r)\,(3+r) - 2a_0(4r^2+10r+11))\,u^r + \left(\sum_{k=1}^{\infty} (4a_{k+1}(k+1+r)\,(k+\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$4r(2+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{-2, 0\}$

- Each term must be 0

  $4a_1(1+r)(3+r) - 2a_0(4r^2 + 10r + 11) = 0$

- Each term in the series must be 0, giving the recursion relation

  $4(-2a_k + a_{k-1} + a_{k+1})k^2 + 4(2(-2a_k + a_{k-1} + a_{k+1})r - 5a_k + a_{k-1} + 4a_{k+1})k + 4(-2a_k + a_{k-}$

- Shift index using $k- >k+1$

  $4(-2a_{k+1} + a_k + a_{k+2})(k+1)^2 + 4(2(-2a_{k+1} + a_k + a_{k+2})r - 5a_{k+1} + a_k + 4a_{k+2})(k+1) + 4($

- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{4k^2a_k - 8k^2a_{k+1} + 8kra_k - 16kra_{k+1} + 4r^2a_k - 8r^2a_{k+1} + 12ka_k - 36ka_{k+1} + 12ra_k - 36ra_{k+1} - 27a_k - 50a_{k+1}}{4(k^2 + 2kr + r^2 + 6k + 6r + 8)}$

- Recursion relation for $r = -2$

  $a_{k+2} = -\frac{4k^2a_k - 8k^2a_{k+1} - 4ka_k - 4ka_{k+1} - 35a_k - 10a_{k+1}}{4(k^2 + 2k)}$

- Series not valid for $r = -2$, division by 0 in the recursion relation at $k = 0$

  $a_{k+2} = -\frac{4k^2a_k - 8k^2a_{k+1} - 4ka_k - 4ka_{k+1} - 35a_k - 10a_{k+1}}{4(k^2 + 2k)}$

- Recursion relation for $r = 0$

  $a_{k+2} = -\frac{4k^2a_k - 8k^2a_{k+1} + 12ka_k - 36ka_{k+1} - 27a_k - 50a_{k+1}}{4(k^2 + 6k + 8)}$

- Solution for $r = 0$

  $$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{4k^2a_k - 8k^2a_{k+1} + 12ka_k - 36ka_{k+1} - 27a_k - 50a_{k+1}}{4(k^2 + 6k + 8)}, 12a_1 - 22a_0 = 0\right]$$

- Revert the change of variables $u = x + 1$

  $$\left[y = \sum_{k=0}^{\infty} a_k(x+1)^k, a_{k+2} = -\frac{4k^2a_k - 8k^2a_{k+1} + 12ka_k - 36ka_{k+1} - 27a_k - 50a_{k+1}}{4(k^2 + 6k + 8)}, 12a_1 - 22a_0 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 22.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries], [_2nd_order, _linear, `
   _with_symmetry_[0,F(x)]`]]
```

$$\boxed{x^2(1+2x)\,y''-x(9+8x)\,y'-12yx=0}$$

With the expansion point for the power series method at $x=0$.

The ODE is

$$\left(2x^3+x^2\right)y''+\left(-8x^2-9x\right)y'-12yx=0$$

Or

$$x\left(2x^2y''+y''x-8y'x-9y'-12y\right)=0$$

For $x\neq 0$ the above simplifies to

$$\left(2x^2+x\right)y''+(-8x-9)\,y'-12y=0$$

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(2x^3+x^2\right)y''+\left(-8x^2-9x\right)y'-12yx=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x) = -\frac{9+8x}{(1+2x)\,x}$$
$$q(x) = -\frac{12}{x\,(1+2x)}$$

Table 822: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{9+8x}{(1+2x)x}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2}$	"regular"

$q(x) = -\frac{12}{x(1+2x)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{1}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(1+2x)\,y'' + \left(-8x^2 - 9x\right) y' - 12yx = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$
\begin{aligned}
& x^2(1+2x)\left(\sum_{n=0}^{\infty}(n+r)(n+r-1)\,a_n x^{n+r-2}\right) \\
& +\left(-8x^2-9x\right)\left(\sum_{n=0}^{\infty}(n+r)\,a_n x^{n+r-1}\right)-12\left(\sum_{n=0}^{\infty}a_n x^{n+r}\right)x=0
\end{aligned}
\tag{1}
$$

Which simplifies to

$$
\begin{aligned}
& \left(\sum_{n=0}^{\infty}2x^{1+n+r}a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)(n\right. \\
& \left.+r-1)\right)+\sum_{n=0}^{\infty}\left(-8x^{1+n+r}a_n(n+r)\right)+\sum_{n=0}^{\infty}\left(-9x^{n+r}a_n(n\right. \\
& \left.+r)\right)+\sum_{n=0}^{\infty}\left(-12x^{1+n+r}a_n\right)=0
\end{aligned}
\tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty}2x^{1+n+r}a_n(n+r)(n+r-1) &= \sum_{n=1}^{\infty}2a_{n-1}(n+r-1)(n+r-2)\,x^{n+r} \\
\sum_{n=0}^{\infty}\left(-8x^{1+n+r}a_n(n+r)\right) &= \sum_{n=1}^{\infty}\left(-8a_{n-1}(n+r-1)\,x^{n+r}\right) \\
\sum_{n=0}^{\infty}\left(-12x^{1+n+r}a_n\right) &= \sum_{n=1}^{\infty}\left(-12a_{n-1}x^{n+r}\right)
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=1}^{\infty} \left(-8a_{n-1}(n+r-1)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-9x^{n+r} a_n (n+r)\right) + \sum_{n=1}^{\infty} \left(-12a_{n-1} x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - 9x^{n+r} a_n (n+r) = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - 9x^r a_0 r = 0$$

Or

$$\left(x^r r(-1+r) - 9x^r r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^r r(-10+r) = 0$$

Since the above is true for all x then the indicial equation becomes

$$r(-10+r) = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 10$$
$$r_2 = 0$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^r r(-10+r) = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 10$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^{10} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+10}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} 2a_{n-1}(n+r-1)(n+r-2) + a_n(n+r)(n+r-1) \\ - 8a_{n-1}(n+r-1) - 9a_n(n+r) - 12a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{2(n+r-7)\,a_{n-1}}{n-10+r} \tag{4}$$

Which for the root $r = 10$ becomes

$$a_n = -\frac{2(n+3)\,a_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 10$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{12 - 2r}{-9 + r}$$

Which for the root $r = 10$ becomes

$$a_1 = -8$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12-2r}{-9+r}$	-8

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4r^2 - 44r + 120}{(-9 + r)(-8 + r)}$$

Which for the root $r = 10$ becomes

$$a_2 = 40$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12-2r}{-9+r}$	-8
a_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	40

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-8r^3 + 120r^2 - 592r + 960}{(-9 + r)(-8 + r)(r - 7)}$$

Which for the root $r = 10$ becomes

$$a_3 = -160$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12-2r}{-9+r}$	-8
a_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	40
a_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	-160

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16r^3 - 192r^2 + 752r - 960}{(-9+r)(-8+r)(r-7)}$$

Which for the root $r = 10$ becomes

$$a_4 = 560$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12-2r}{-9+r}$	-8
a_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	40
a_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	-160
a_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	560

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{32(-3+r)(-4+r)(-2+r)}{(-9+r)(-8+r)(r-7)}$$

Which for the root $r = 10$ becomes

$$a_5 = -1792$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12-2r}{-9+r}$	-8
a_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	40
a_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	-160
a_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	560
a_5	$-\frac{32(-3+r)(-4+r)(-2+r)}{(-9+r)(-8+r)(r-7)}$	-1792

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{64(-3+r)(-2+r)(-1+r)}{(-9+r)(-8+r)(r-7)}$$

Which for the root $r = 10$ becomes

$$a_6 = 5376$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12-2r}{-9+r}$	-8
a_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	40
a_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	-160
a_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	560
a_5	$-\frac{32(-3+r)(-4+r)(-2+r)}{(-9+r)(-8+r)(r-7)}$	-1792
a_6	$\frac{64(-3+r)(-2+r)(-1+r)}{(-9+r)(-8+r)(r-7)}$	5376

For $n = 7$, using the above recursive equation gives

$$a_7 = -\frac{128(-2+r)(-1+r)r}{(-9+r)(-8+r)(r-7)}$$

Which for the root $r = 10$ becomes

$$a_7 = -15360$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12-2r}{-9+r}$	-8
a_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	40
a_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	-160
a_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	560
a_5	$-\frac{32(-3+r)(-4+r)(-2+r)}{(-9+r)(-8+r)(r-7)}$	-1792
a_6	$\frac{64(-3+r)(-2+r)(-1+r)}{(-9+r)(-8+r)(r-7)}$	5376
a_7	$-\frac{128(-2+r)(-1+r)r}{(-9+r)(-8+r)(r-7)}$	-15360

For $n = 8$, using the above recursive equation gives

$$a_8 = \frac{256r^3 - 256r}{(-9+r)(-8+r)(r-7)}$$

Which for the root $r = 10$ becomes

$$a_8 = 42240$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12-2r}{-9+r}$	-8
a_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	40
a_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	-160
a_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	560
a_5	$-\frac{32(-3+r)(-4+r)(-2+r)}{(-9+r)(-8+r)(r-7)}$	-1792
a_6	$\frac{64(-3+r)(-2+r)(-1+r)}{(-9+r)(-8+r)(r-7)}$	5376
a_7	$-\frac{128(-2+r)(-1+r)r}{(-9+r)(-8+r)(r-7)}$	-15360
a_8	$\frac{256r^3-256r}{(-9+r)(-8+r)(r-7)}$	42240

For $n = 9$, using the above recursive equation gives

$$a_9 = -\frac{512(2+r)\,r(1+r)}{(-9+r)\,(-8+r)\,(r-7)}$$

Which for the root $r = 10$ becomes

$$a_9 = -112640$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12-2r}{-9+r}$	-8
a_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	40
a_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	-160
a_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	560
a_5	$-\frac{32(-3+r)(-4+r)(-2+r)}{(-9+r)(-8+r)(r-7)}$	-1792
a_6	$\frac{64(-3+r)(-2+r)(-1+r)}{(-9+r)(-8+r)(r-7)}$	5376
a_7	$-\frac{128(-2+r)(-1+r)r}{(-9+r)(-8+r)(r-7)}$	-15360
a_8	$\frac{256r^3-256r}{(-9+r)(-8+r)(r-7)}$	42240
a_9	$-\frac{512(2+r)r(1+r)}{(-9+r)(-8+r)(r-7)}$	-112640

For $n = 10$, using the above recursive equation gives

$$a_{10} = \frac{1024(2+r)\,(1+r)\,(3+r)}{(-9+r)\,(-8+r)\,(r-7)}$$

Which for the root $r = 10$ becomes

$$a_{10} = 292864$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{12-2r}{-9+r}$	-8
a_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	40
a_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	-160
a_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	560
a_5	$-\frac{32(-3+r)(-4+r)(-2+r)}{(-9+r)(-8+r)(r-7)}$	-1792
a_6	$\frac{64(-3+r)(-2+r)(-1+r)}{(-9+r)(-8+r)(r-7)}$	5376
a_7	$-\frac{128(-2+r)(-1+r)r}{(-9+r)(-8+r)(r-7)}$	-15360
a_8	$\frac{256r^3-256r}{(-9+r)(-8+r)(r-7)}$	42240
a_9	$-\frac{512(2+r)r(1+r)}{(-9+r)(-8+r)(r-7)}$	-112640
a_{10}	$\frac{1024(2+r)(1+r)(3+r)}{(-9+r)(-8+r)(r-7)}$	292864

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}y_1(x) &= x^{10}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 + a_7x^7 + a_8x^8 + a_9x^9 + a_{10}x^{10} + a_{11}x^{11}\dots\right) \\ &= x^{10}\left(1 - 8x + 40x^2 - 160x^3 + 560x^4 - 1792x^5 + 5376x^6 - 15360x^7 + 42240x^8 - 112640x^9 + 2928\right.\end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 10$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_{10}(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned}a_N &= a_{10} \\ &= \frac{1024(2+r)(1+r)(3+r)}{(-9+r)(-8+r)(r-7)}\end{aligned}$$

Therefore

$$\begin{aligned}\lim_{r\to r_2} \frac{1024(2+r)(1+r)(3+r)}{(-9+r)(-8+r)(r-7)} &= \lim_{r\to 0} \frac{1024(2+r)(1+r)(3+r)}{(-9+r)(-8+r)(r-7)} \\ &= -\frac{256}{21}\end{aligned}$$

The limit is $-\frac{256}{21}$. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^n \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &2b_{n-1}(n+r-1)(n+r-2) + b_n(n+r)(n+r-1) \\ &- 8b_{n-1}(n+r-1) - 9b_n(n+r) - 12b_{n-1} = 0 \end{aligned} \tag{4}$$

Which for for the root $r = 0$ becomes

$$2b_{n-1}(n-1)(n-2) + b_n n(n-1) - 8b_{n-1}(n-1) - 9b_n n - 12b_{n-1} = 0 \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{2(n+r-7)\, b_{n-1}}{n-10+r} \tag{5}$$

Which for the root $r = 0$ becomes

$$b_n = -\frac{2(n-7)\, b_{n-1}}{n-10} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = 0$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{2(-6+r)}{-9+r}$$

Which for the root $r = 0$ becomes

$$b_1 = -\frac{4}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{12-2r}{-9+r}$	$-\frac{4}{3}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{4r^2 - 44r + 120}{(-9+r)(-8+r)}$$

Which for the root $r = 0$ becomes

$$b_2 = \frac{5}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{12-2r}{-9+r}$	$-\frac{4}{3}$
b_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	$\frac{5}{3}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{8(r^3 - 15r^2 + 74r - 120)}{(-9+r)(-8+r)(r-7)}$$

Which for the root $r = 0$ becomes

$$b_3 = -\frac{40}{21}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{12-2r}{-9+r}$	$-\frac{4}{3}$
b_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	$\frac{5}{3}$
b_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	$-\frac{40}{21}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{16r^3 - 192r^2 + 752r - 960}{(-9+r)(-8+r)(r-7)}$$

Which for the root $r = 0$ becomes

$$b_4 = \frac{40}{21}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{12-2r}{-9+r}$	$-\frac{4}{3}$
b_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	$\frac{5}{3}$
b_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	$-\frac{40}{21}$
b_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	$\frac{40}{21}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{32(r^2 - 7r + 12)(-2+r)}{(-9+r)(-8+r)(r-7)}$$

Which for the root $r = 0$ becomes

$$b_5 = -\frac{32}{21}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{12-2r}{-9+r}$	$-\frac{4}{3}$
b_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	$\frac{5}{3}$
b_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	$-\frac{40}{21}$
b_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	$\frac{40}{21}$
b_5	$-\frac{32(-3+r)(-4+r)(-2+r)}{(-9+r)(-8+r)(r-7)}$	$-\frac{32}{21}$

For $n = 6$, using the above recursive equation gives

$$b_6 = \frac{64(-3+r)(-2+r)(-1+r)}{(-9+r)(-8+r)(r-7)}$$

Which for the root $r = 0$ becomes

$$b_6 = \frac{16}{21}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{12-2r}{-9+r}$	$-\frac{4}{3}$
b_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	$\frac{5}{3}$
b_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	$-\frac{40}{21}$
b_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	$\frac{40}{21}$
b_5	$-\frac{32(-3+r)(-4+r)(-2+r)}{(-9+r)(-8+r)(r-7)}$	$-\frac{32}{21}$
b_6	$\frac{64(-3+r)(-2+r)(-1+r)}{(-9+r)(-8+r)(r-7)}$	$\frac{16}{21}$

For $n = 7$, using the above recursive equation gives

$$b_7 = -\frac{128(-2+r)(-1+r)r}{(-9+r)(-8+r)(r-7)}$$

Which for the root $r = 0$ becomes

$$b_7 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{12-2r}{-9+r}$	$-\frac{4}{3}$
b_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	$\frac{5}{3}$
b_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	$-\frac{40}{21}$
b_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	$\frac{40}{21}$
b_5	$-\frac{32(-3+r)(-4+r)(-2+r)}{(-9+r)(-8+r)(r-7)}$	$-\frac{32}{21}$
b_6	$\frac{64(-3+r)(-2+r)(-1+r)}{(-9+r)(-8+r)(r-7)}$	$\frac{16}{21}$
b_7	$-\frac{128(-2+r)(-1+r)r}{(-9+r)(-8+r)(r-7)}$	0

For $n = 8$, using the above recursive equation gives

$$b_8 = \frac{256r(-1+r)(1+r)}{(-9+r)(-8+r)(r-7)}$$

Which for the root $r = 0$ becomes

$$b_8 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{12-2r}{-9+r}$	$-\frac{4}{3}$
b_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	$\frac{5}{3}$
b_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	$-\frac{40}{21}$
b_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	$\frac{40}{21}$
b_5	$-\frac{32(-3+r)(-4+r)(-2+r)}{(-9+r)(-8+r)(r-7)}$	$-\frac{32}{21}$
b_6	$\frac{64(-3+r)(-2+r)(-1+r)}{(-9+r)(-8+r)(r-7)}$	$\frac{16}{21}$
b_7	$-\frac{128(-2+r)(-1+r)r}{(-9+r)(-8+r)(r-7)}$	0
b_8	$\frac{256r^3-256r}{(-9+r)(-8+r)(r-7)}$	0

For $n = 9$, using the above recursive equation gives

$$b_9 = -\frac{512(2+r)\, r(1+r)}{(-9+r)\,(-8+r)\,(r-7)}$$

Which for the root $r = 0$ becomes

$$b_9 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{12-2r}{-9+r}$	$-\frac{4}{3}$
b_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	$\frac{5}{3}$
b_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	$-\frac{40}{21}$
b_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	$\frac{40}{21}$
b_5	$-\frac{32(-3+r)(-4+r)(-2+r)}{(-9+r)(-8+r)(r-7)}$	$-\frac{32}{21}$
b_6	$\frac{64(-3+r)(-2+r)(-1+r)}{(-9+r)(-8+r)(r-7)}$	$\frac{16}{21}$
b_7	$-\frac{128(-2+r)(-1+r)r}{(-9+r)(-8+r)(r-7)}$	0
b_8	$\frac{256r^3-256r}{(-9+r)(-8+r)(r-7)}$	0
b_9	$-\frac{512(2+r)r(1+r)}{(-9+r)(-8+r)(r-7)}$	0

For $n = 10$, using the above recursive equation gives

$$b_{10} = \frac{1024(2+r)\,(1+r)\,(3+r)}{(-9+r)\,(-8+r)\,(r-7)}$$

Which for the root $r = 0$ becomes

$$b_{10} = -\frac{256}{21}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{12-2r}{-9+r}$	$-\frac{4}{3}$
b_2	$\frac{4r^2-44r+120}{(-9+r)(-8+r)}$	$\frac{5}{3}$
b_3	$\frac{-8r^3+120r^2-592r+960}{(-9+r)(-8+r)(r-7)}$	$-\frac{40}{21}$
b_4	$\frac{16r^3-192r^2+752r-960}{(-9+r)(-8+r)(r-7)}$	$\frac{40}{21}$
b_5	$-\frac{32(-3+r)(-4+r)(-2+r)}{(-9+r)(-8+r)(r-7)}$	$-\frac{32}{21}$
b_6	$\frac{64(-3+r)(-2+r)(-1+r)}{(-9+r)(-8+r)(r-7)}$	$\frac{16}{21}$
b_7	$-\frac{128(-2+r)(-1+r)r}{(-9+r)(-8+r)(r-7)}$	0
b_8	$\frac{256r^3-256r}{(-9+r)(-8+r)(r-7)}$	0
b_9	$-\frac{512(2+r)r(1+r)}{(-9+r)(-8+r)(r-7)}$	0
b_{10}	$\frac{1024(2+r)(1+r)(3+r)}{(-9+r)(-8+r)(r-7)}$	$-\frac{256}{21}$

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6 + b_7x^7 + b_8x^8 + b_9x^9 + b_{10}x^{10} + b_{11}x^{11}\dots \\
&= 1 - \frac{4x}{3} + \frac{5x^2}{3} - \frac{40x^3}{21} + \frac{40x^4}{21} - \frac{32x^5}{21} + \frac{16x^6}{21} - \frac{256x^{10}}{21} + O(x^{11})
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1y_1(x) + c_2y_2(x) \\
&= c_1x^{10}\big(1 - 8x + 40x^2 - 160x^3 + 560x^4 - 1792x^5 + 5376x^6 - 15360x^7 + 42240x^8 \\
&\quad - 112640x^9 + 292864x^{10} + O(x^{11})\big) \\
&\quad + c_2\left(1 - \frac{4x}{3} + \frac{5x^2}{3} - \frac{40x^3}{21} + \frac{40x^4}{21} - \frac{32x^5}{21} + \frac{16x^6}{21} - \frac{256x^{10}}{21} + O(x^{11})\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1x^{10}\big(1 - 8x + 40x^2 - 160x^3 + 560x^4 - 1792x^5 + 5376x^6 - 15360x^7 + 42240x^8 \\
&\quad - 112640x^9 + 292864x^{10} + O(x^{11})\big) \\
&\quad + c_2\left(1 - \frac{4x}{3} + \frac{5x^2}{3} - \frac{40x^3}{21} + \frac{40x^4}{21} - \frac{32x^5}{21} + \frac{16x^6}{21} - \frac{256x^{10}}{21} + O(x^{11})\right)
\end{aligned}
$$

Summary
The solution(s) found are the following

$$y = c_1 x^{10}\left(1-8x+40x^2-160x^3+560x^4-1792x^5+5376x^6-15360x^7+42240x^8-112640x^9+292864x^{10}+O\left(x^{11}\right)\right) + c_2\left(1-\frac{4x}{3}+\frac{5x^2}{3}-\frac{40x^3}{21}+\frac{40x^4}{21}-\frac{32x^5}{21}+\frac{16x^6}{21}-\frac{256x^{10}}{21}+O\left(x^{11}\right)\right) \tag{1}$$

Verification of solutions

$$y = c_1 x^{10}\left(1-8x+40x^2-160x^3+560x^4-1792x^5+5376x^6-15360x^7+42240x^8-112640x^9+292864x^{10}+O\left(x^{11}\right)\right) + c_2\left(1-\frac{4x}{3}+\frac{5x^2}{3}-\frac{40x^3}{21}+\frac{40x^4}{21}-\frac{32x^5}{21}+\frac{16x^6}{21}-\frac{256x^{10}}{21}+O\left(x^{11}\right)\right)$$

Verified OK.

16.26.1 Maple step by step solution

Let's solve

$x^2(1+2x)\,y''+\left(-8x^2-9x\right)y'-12yx=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{12y}{x(1+2x)}+\frac{(9+8x)y'}{x(1+2x)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{(9+8x)y'}{x(1+2x)}-\frac{12y}{x(1+2x)}=0$

☐ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=-\frac{9+8x}{(1+2x)x}, P_3(x)=-\frac{12}{x(1+2x)}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left(x\cdot P_2(x)\right)\Big|_{x=0}=-9$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left(x^2\cdot P_3(x)\right)\Big|_{x=0}=0$

- $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $x(1+2x)\,y''+(-8x-9)\,y'-12y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

- Convert $x^m\cdot y'$ to series expansion for $m=0..1$

  $x^m\cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^m\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$

- Convert $x^m\cdot y''$ to series expansion for $m=1..2$

  $x^m\cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^m\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$

  Rewrite ODE with series expansions

  $a_0r(-10+r)\,x^{-1+r}+\left(\sum_{k=0}^{\infty}\left(a_{k+1}(k+r+1)\,(k-9+r)+2a_k(k+r+1)\,(k+r-6)\right)x^{k+r}\right)=0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $r(-10+r)=0$

- Values of r that satisfy the indicial equation

  $r\in\{0,10\}$

- Each term in the series must be 0, giving the recursion relation

  $2(k+r+1)\left(\frac{a_{k+1}(k-9+r)}{2}+a_k(k+r-6)\right)=0$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = -\frac{2a_k(k+r-6)}{k-9+r}$$

- Recursion relation for $r = 0$; series terminates at $k = 6$

$$a_{k+1} = -\frac{2a_k(k-6)}{k-9}$$

- Recursion relation that defines the terminating series solution of the ODE for $r = 0$

$$\left[y = \sum_{k=0}^{5} a_k x^k, a_{k+1} = -\frac{2a_k(k-6)}{k-9}\right]$$

- Recursion relation for $r = 10$

$$a_{k+1} = -\frac{2a_k(k+4)}{k+1}$$

- Solution for $r = 10$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+10}, a_{k+1} = -\frac{2a_k(k+4)}{k+1}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{5} a_k x^k\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+10}\right), a_{1+k} = -\frac{2a_k(k-6)}{k-9}, b_{1+k} = -\frac{2b_k(4+k)}{1+k}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 23.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2+1)\,y''-x(-2x^2+7)\,y'+12y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+x^2)\,y''+(2x^3-7x)\,y'+12y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{2x^2-7}{x\,(x^2+1)}$$
$$q(x)=\frac{12}{x^2\,(x^2+1)}$$

Table 824: Table $p(x), q(x)$ singularites.

$p(x) = \frac{2x^2-7}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{12}{x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+1)\,y'' + (2x^3-7x)\,y' + 12y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (2x^3-7x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + 12\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n(n+r)\right) + \sum_{n=0}^{\infty} \left(-7x^{n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} 12a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n(n+r)(n+r-1) = \sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n(n+r) = \sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-7x^{n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} 12a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n(n+r)(n+r-1) - 7x^{n+r} a_n(n+r) + 12a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - 7x^r a_0 r + 12a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - 7x^r r + 12x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r-2)(r-6)x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r-2)(r-6) = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 6$$
$$r_2 = 2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r-2)(r-6)x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x)\ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^6\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x)\ln(x) + x^2\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+6}$$
$$y_2(x) = C y_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+2}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots

of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$a_{n-2}(n+r-2)(n-3+r) + a_n(n+r)(n+r-1) + 2a_{n-2}(n+r-2) - 7a_n(n+r) + 12a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r-1)\, a_{n-2}}{n+r-6} \tag{4}$$

Which for the root $r = 6$ becomes

$$a_n = -\frac{(n+5)\, a_{n-2}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 6$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-1-r}{-4+r}$$

Which for the root $r = 6$ becomes

$$a_2 = -\frac{7}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{-4+r}$	$-\frac{7}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{-4+r}$	$-\frac{7}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(3 + r)(1 + r)}{(-4 + r)(r - 2)}$$

Which for the root $r = 6$ becomes

$$a_4 = \frac{63}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{-4+r}$	$-\frac{7}{2}$
a_3	0	0
a_4	$\frac{(3+r)(1+r)}{(-4+r)(r-2)}$	$\frac{63}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{-4+r}$	$-\frac{7}{2}$
a_3	0	0
a_4	$\frac{(3+r)(1+r)}{(-4+r)(r-2)}$	$\frac{63}{8}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^6 \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^6 \left(1 - \frac{7x^2}{2} + \frac{63x^4}{8} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Let

$$
r_1 - r_2 = N
$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r \rightarrow r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$
\begin{aligned}
a_N &= a_4 \\
&= \frac{(3+r)(1+r)}{(-4+r)(r-2)}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\lim_{r \rightarrow r_2} \frac{(3+r)(1+r)}{(-4+r)(r-2)} &= \lim_{r \rightarrow 2} \frac{(3+r)(1+r)}{(-4+r)(r-2)} \\
&= \textit{undefined}
\end{aligned}
$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$
y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)
$$

Therefore

$$\frac{d}{dx}y_2(x) = Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right)$$

$$= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n+r_2)\right)$$

$$\frac{d^2}{dx^2}y_2(x) = Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)$$

$$= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n+r_2)(-1+n+r_2)\right)$$

Substituting these back into the given ode $x^2(x^2+1)\,y'' + (2x^3-7x)\,y' + 12y = 0$ gives

$$x^2(x^2+1)\left(Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) + (2x^3-7x)\left(Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right) + 12Cy_1(x)\ln(x) + 12\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0$$

Which can be written as

$$\left(\left(x^2(x^2+1)\,y_1''(x) + (2x^3-7x)\,y_1'(x) + 12y_1(x)\right)\ln(x) + x^2(x^2+1)\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) + \frac{(2x^3-7x)\,y_1(x)}{x}\right)C + x^2(x^2+1)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) + (2x^3-7x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right) + 12\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$x^2(x^2+1)\,y_1''(x)+(2x^3-7x)\,y_1'(x)+12y_1(x)=0$$

Eq (7) simplifes to

$$\begin{aligned}&\left(x^2(x^2+1)\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{(2x^3-7x)\,y_1(x)}{x}\right)C\\&+x^2(x^2+1)\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\&+(2x^3-7x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+12\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0\end{aligned}\tag{8}$$

Substituting $y_1=\sum_{n=0}^{\infty}a_n x^{n+r_1}$ into the above gives

$$\begin{aligned}&\left(2x(x^2+1)\left(\sum_{n=0}^{\infty}x^{-1+n+r_1}a_n(n+r_1)\right)+(x^2-8)\left(\sum_{n=0}^{\infty}a_n x^{n+r_1}\right)\right)C\\&+(x^4+x^2)\left(\sum_{n=0}^{\infty}x^{-2+n+r_2}b_n(n+r_2)(-1+n+r_2)\right)\\&+(2x^3-7x)\left(\sum_{n=0}^{\infty}x^{-1+n+r_2}b_n(n+r_2)\right)+12\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0\end{aligned}\tag{9}$$

Since $r_1=6$ and $r_2=2$ then the above becomes

$$\begin{aligned}&\left(2x(x^2+1)\left(\sum_{n=0}^{\infty}x^{n+5}a_n(n+6)\right)+(x^2-8)\left(\sum_{n=0}^{\infty}a_n x^{n+6}\right)\right)C\\&+(x^4+x^2)\left(\sum_{n=0}^{\infty}x^{n}b_n(n+2)(1+n)\right)\\&+(2x^3-7x)\left(\sum_{n=0}^{\infty}x^{1+n}b_n(n+2)\right)+12\left(\sum_{n=0}^{\infty}b_n x^{n+2}\right)=0\end{aligned}\tag{10}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 2C\, x^{n+8} a_n (n+6)\right)+\left(\sum_{n=0}^{\infty} 2C\, x^{n+6} a_n (n+6)\right) \\
&+\left(\sum_{n=0}^{\infty} C\, x^{n+8} a_n\right)+\sum_{n\,=0}^{\infty}\left(-8C\, x^{n+6} a_n\right)+\left(\sum_{n=0}^{\infty} x^{n+4} b_n \left(n^2+3n+2\right)\right) \\
&+\left(\sum_{n=0}^{\infty} x^{n+2} b_n \left(n^2+3n+2\right)\right)+\left(\sum_{n=0}^{\infty} 2x^{n+4} b_n (n+2)\right) \\
&+\sum_{n\,=0}^{\infty}\left(-7x^{n+2} b_n (n+2)\right)+\left(\sum_{n=0}^{\infty} 12 b_n x^{n+2}\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+2$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+2} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n\,=0}^{\infty} 2C\, x^{n+8} a_n (n+6) &= \sum_{n=6}^{\infty} 2C a_{n-6} n\, x^{n+2} \\
\sum_{n\,=0}^{\infty} 2C\, x^{n+6} a_n (n+6) &= \sum_{n=4}^{\infty} 2C a_{n-4} (n+2)\, x^{n+2} \\
\sum_{n\,=0}^{\infty} C\, x^{n+8} a_n &= \sum_{n=6}^{\infty} C a_{n-6} x^{n+2} \\
\sum_{n\,=0}^{\infty} \left(-8C\, x^{n+6} a_n\right) &= \sum_{n=4}^{\infty} \left(-8C a_{n-4} x^{n+2}\right) \\
\sum_{n\,=0}^{\infty} x^{n+4} b_n \left(n^2+3n+2\right) &= \sum_{n=2}^{\infty} b_{n-2} \left((n-2)^2+3n-4\right) x^{n+2} \\
\sum_{n\,=0}^{\infty} 2x^{n+4} b_n (n+2) &= \sum_{n=2}^{\infty} 2 b_{n-2} n\, x^{n+2}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+2$.

$$\left(\sum_{n=6}^{\infty} 2C a_{n-6} n\, x^{n+2}\right) + \left(\sum_{n=4}^{\infty} 2C a_{n-4}(n+2)\, x^{n+2}\right) + \left(\sum_{n=6}^{\infty} C a_{n-6} x^{n+2}\right) + \sum_{n=4}^{\infty} \left(-8C a_{n-4} x^{n+2}\right) + \left(\sum_{n=2}^{\infty} b_{n-2}\left((n-2)^2+3n-4\right) x^{n+2}\right) + \left(\sum_{n=0}^{\infty} x^{n+2} b_n \left(n^2+3n+2\right)\right) + \left(\sum_{n=2}^{\infty} 2b_{n-2} n\, x^{n+2}\right) + \sum_{n=0}^{\infty} \left(-7x^{n+2} b_n (n+2)\right) + \left(\sum_{n=0}^{\infty} 12 b_n x^{n+2}\right) = 0 \tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0=1$. For $n=1$, Eq (2B) gives

$$-3b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_1 = 0$$

Solving the above for b_1 gives

$$b_1 = 0$$

For $n=2$, Eq (2B) gives

$$6b_0 - 4b_2 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$6 - 4b_2 = 0$$

Solving the above for b_2 gives

$$b_2 = \frac{3}{2}$$

For $n=3$, Eq (2B) gives

$$12b_1 - 3b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 0$$

For $n = N$, where $N = 4$ which is the difference between the two roots, we are free to choose $b_4 = 0$. Hence for $n = 4$, Eq (2B) gives

$$4C + 30 = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{15}{2}$$

For $n = 5$, Eq (2B) gives

$$6Ca_1 + 30b_3 + 5b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$5b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = 0$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{15}{2}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{15}{2}\left(x^6\left(1 - \frac{7x^2}{2} + \frac{63x^4}{8} + O(x^6)\right)\right)\ln(x) + x^2\left(1 + \frac{3x^2}{2} + O(x^6)\right)$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^6\left(1 - \frac{7x^2}{2} + \frac{63x^4}{8} + O(x^6)\right) \\
&\quad + c_2\left(-\frac{15}{2}\left(x^6\left(1 - \frac{7x^2}{2} + \frac{63x^4}{8} + O(x^6)\right)\right)\ln(x) + x^2\left(1 + \frac{3x^2}{2} + O(x^6)\right)\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x^6\left(1 - \frac{7x^2}{2} + \frac{63x^4}{8} + O(x^6)\right) \\
&\quad + c_2\left(-\frac{15x^6\left(1 - \frac{7x^2}{2} + \frac{63x^4}{8} + O(x^6)\right)\ln(x)}{2} + x^2\left(1 + \frac{3x^2}{2} + O(x^6)\right)\right)
\end{aligned}$$

Summary
The solution(s) found are the following

$$
\begin{aligned}
y = {} & c_1 x^6 \left(1-\frac{7x^2}{2}+\frac{63x^4}{8}+O(x^6)\right) \\
& + c_2\left(-\frac{15x^6\left(1-\frac{7x^2}{2}+\frac{63x^4}{8}+O(x^6)\right)\ln(x)}{2}+x^2\left(1+\frac{3x^2}{2}+O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y = {} & c_1 x^6 \left(1-\frac{7x^2}{2}+\frac{63x^4}{8}+O(x^6)\right) \\
& + c_2\left(-\frac{15x^6\left(1-\frac{7x^2}{2}+\frac{63x^4}{8}+O(x^6)\right)\ln(x)}{2}+x^2\left(1+\frac{3x^2}{2}+O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

16.27.1 Maple step by step solution

Let's solve

$x^2(x^2+1)\,y''+(2x^3-7x)\,y'+12y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{12y}{x^2(x^2+1)}-\frac{(2x^2-7)y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(2x^2-7)y'}{x(x^2+1)}+\frac{12y}{x^2(x^2+1)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x)=\frac{2x^2-7}{x(x^2+1)}, P_3(x)=\frac{12}{x^2(x^2+1)}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

    $(x\cdot P_2(x))\Big|_{x=0}=-7$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

$$\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = 12$$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2(x^2+1)\, y'' + x(2x^2-7)\, y' + 12y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(-2+r)\,(-6+r)\, x^r + a_1(-1+r)\,(-5+r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(k+r-2)\,(k+r-6) + a_{k-2}(k +\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(-2+r)\,(-6+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{2, 6\}$

- Each term must be 0

  $a_1(-1+r)\,(-5+r) = 0$

- Solve for the dependent coefficient(s)

  $a_1 = 0$

- Each term in the series must be 0, giving the recursion relation

  $(k+r-2)\left(a_k(k+r-6)+a_{k-2}(k+r-1)\right)=0$

- Shift index using $k->k+2$

  $(k+r)\left(a_{k+2}(k-4+r)+a_k(k+r+1)\right)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{a_k(k+r+1)}{k-4+r}$

- Recursion relation for $r=2$

  $a_{k+2}=-\frac{a_k(k+3)}{k-2}$

- Series not valid for $r=2$, division by 0 in the recursion relation at $k=2$

  $a_{k+2}=-\frac{a_k(k+3)}{k-2}$

- Recursion relation for $r=6$

  $a_{k+2}=-\frac{a_k(k+7)}{k+2}$

- Solution for $r=6$

  $\left[y=\sum_{k=0}^{\infty} a_k x^{k+6}, a_{k+2}=-\frac{a_k(k+7)}{k+2}, a_1=0\right]$

Problem number: 24.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' - x\left(-x^2+7\right)y' + 12y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + \left(x^3-7x\right)y' + 12y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$\begin{aligned} p(x) &= \frac{x^2-7}{x} \\ q(x) &= \frac{12}{x^2} \end{aligned}$$

Table 826: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x^2-7}{x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{12}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2 y'' + \left(x^3 - 7x\right) y' + 12y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}\right) + \left(x^3 - 7x\right) \left(\sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}\right) + 12 \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-7 x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 12 a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} a_{n-2} (n+r-2)\, x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} a_{n-2} (n+r-2)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-7 x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 12 a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - 7 x^{n+r} a_n (n+r) + 12 a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - 7 x^r a_0 r + 12 a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - 7 x^r r + 12 x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r-2)(r-6)\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r-2)(r-6) = 0$$

Solving for r gives the roots of the indicial equation as

$$
\begin{aligned}
r_1 &= 6 \\
r_2 &= 2
\end{aligned}
$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$
(r-2)(r-6)x^r = 0
$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$
\begin{aligned}
y_1(x) &= x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right) \\
y_2(x) &= C y_1(x) \ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)
\end{aligned}
$$

Or

$$
\begin{aligned}
y_1(x) &= x^6\left(\sum_{n=0}^{\infty} a_n x^n\right) \\
y_2(x) &= C y_1(x) \ln(x) + x^2\left(\sum_{n=0}^{\infty} b_n x^n\right)
\end{aligned}
$$

Or

$$
\begin{aligned}
y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+6} \\
y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+2}\right)
\end{aligned}
$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
a_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
a_n(n+r)(n+r-1) + a_{n-2}(n+r-2) - 7a_n(n+r) + 12a_n = 0 \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}}{n + r - 6} \tag{4}$$

Which for the root $r = 6$ becomes

$$a_n = -\frac{a_{n-2}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 6$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{1}{-4 + r}$$

Which for the root $r = 6$ becomes

$$a_2 = -\frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{-4+r}$	$-\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{-4+r}$	$-\frac{1}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{(-4+r)(r-2)}$$

Which for the root $r = 6$ becomes

$$a_4 = \frac{1}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{-4+r}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{1}{(-4+r)(r-2)}$	$\frac{1}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{-4+r}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{1}{(-4+r)(r-2)}$	$\frac{1}{8}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^6 \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^6 \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_4 \\ &= \frac{1}{(-4+r)(r-2)} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} \frac{1}{(-4+r)(r-2)} &= \lim_{r\to 2} \frac{1}{(-4+r)(r-2)} \\ &= \textit{undefined} \end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned} \frac{d}{dx}y_2(x) &= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\ &= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n+r_2)\right) \\ \frac{d^2}{dx^2}y_2(x) &= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} \\ &\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\ &= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n+r_2)(-1+n+r_2)\right) \end{aligned}$$

Substituting these back into the given ode $x^2y'' + (x^3 - 7x)\,y' + 12y = 0$ gives

$$x^2\left(Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) + (x^3 - 7x)\left(Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right) + 12Cy_1(x)\ln(x) + 12\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0$$

Which can be written as

$$\left(\left(x^2y_1''(x) + (x^3 - 7x)\,y_1'(x) + 12y_1(x)\right)\ln(x) + x^2\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) + \frac{(x^3 - 7x)\,y_1(x)}{x}\right)C + x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) + (x^3 - 7x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right) + 12\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$x^2y_1''(x) + (x^3 - 7x)\,y_1'(x) + 12y_1(x) = 0$$

Eq (7) simplifes to

$$\left(x^2\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) + \frac{(x^3 - 7x)\,y_1(x)}{x}\right)C + x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) + (x^3 - 7x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right) + 12\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{8}$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$
\begin{aligned}
&\left(2\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) x + (x^2-8)\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)\right) C \\
&+ \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) x^2 \\
&+ (x^3-7x)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) + 12\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0
\end{aligned} \tag{9}
$$

Since $r_1 = 6$ and $r_2 = 2$ then the above becomes

$$
\begin{aligned}
&\left(2\left(\sum_{n=0}^{\infty} x^{5+n} a_n (n+6)\right) x + (x^2-8)\left(\sum_{n=0}^{\infty} a_n x^{n+6}\right)\right) C \\
&+ \left(\sum_{n=0}^{\infty} x^{n} b_n (n+2)(1+n)\right) x^2 \\
&+ (x^3-7x)\left(\sum_{n=0}^{\infty} x^{1+n} b_n (n+2)\right) + 12\left(\sum_{n=0}^{\infty} b_n x^{n+2}\right) = 0
\end{aligned} \tag{10}
$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 2C\, x^{n+6} a_n (n+6)\right) + \left(\sum_{n=0}^{\infty} C\, x^{n+8} a_n\right) + \sum_{n=0}^{\infty} \left(-8C\, x^{n+6} a_n\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n+2} b_n (n^2+3n+2)\right) + \left(\sum_{n=0}^{\infty} x^{n+4} b_n (n+2)\right) \\
&+ \sum_{n=0}^{\infty} \left(-7x^{n+2} b_n (n+2)\right) + \left(\sum_{n=0}^{\infty} 12 b_n x^{n+2}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+2$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+2} and

adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2C\,x^{n+6} a_n (n+6) = \sum_{n=4}^{\infty} 2C a_{n-4} (n+2)\,x^{n+2}$$

$$\sum_{n=0}^{\infty} C\,x^{n+8} a_n = \sum_{n=6}^{\infty} C a_{n-6} x^{n+2}$$

$$\sum_{n=0}^{\infty} \left(-8C\,x^{n+6} a_n\right) = \sum_{n=4}^{\infty} \left(-8C a_{n-4} x^{n+2}\right)$$

$$\sum_{n=0}^{\infty} x^{n+4} b_n (n+2) = \sum_{n=2}^{\infty} b_{n-2} n\,x^{n+2}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+2$.

$$\begin{aligned}\left(\sum_{n=4}^{\infty} 2C a_{n-4} (n+2)\,x^{n+2}\right) + \left(\sum_{n=6}^{\infty} C a_{n-6} x^{n+2}\right) + \sum_{n=4}^{\infty} \left(-8C a_{n-4} x^{n+2}\right) \\ + \left(\sum_{n=0}^{\infty} x^{n+2} b_n \left(n^2+3n+2\right)\right) + \left(\sum_{n=2}^{\infty} b_{n-2} n\,x^{n+2}\right) \\ + \sum_{n=0}^{\infty} \left(-7x^{n+2} b_n (n+2)\right) + \left(\sum_{n=0}^{\infty} 12 b_n x^{n+2}\right) = 0\end{aligned} \tag{2B}$$

For $n = 0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n = 1$, Eq (2B) gives

$$-3b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_1 = 0$$

Solving the above for b_1 gives

$$b_1 = 0$$

For $n = 2$, Eq (2B) gives

$$-4b_2 + 2b_0 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-4b_2 + 2 = 0$$

Solving the above for b_2 gives

$$b_2 = \frac{1}{2}$$

For $n = 3$, Eq (2B) gives

$$-3b_3 + 3b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 0$$

For $n = N$, where $N = 4$ which is the difference between the two roots, we are free to choose $b_4 = 0$. Hence for $n = 4$, Eq (2B) gives

$$4C + 2 = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{1}{2}$$

For $n = 5$, Eq (2B) gives

$$6Ca_1 + 5b_3 + 5b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$5b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = 0$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{1}{2}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{1}{2}\left(x^6\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)\right)\ln(x) + x^2\left(1 + \frac{x^2}{2} + O(x^6)\right)$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^6 \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \\
&\quad + c_2 \left(-\frac{1}{2}\left(x^6 \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)\right) \ln(x) + x^2 \left(1 + \frac{x^2}{2} + O(x^6)\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^6 \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \\
&\quad + c_2 \left(-\frac{x^6 \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \ln(x)}{2} + x^2 \left(1 + \frac{x^2}{2} + O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 x^6 \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \\
&\quad + c_2 \left(-\frac{x^6 \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \ln(x)}{2} + x^2 \left(1 + \frac{x^2}{2} + O(x^6)\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 x^6 \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \\
&\quad + c_2 \left(-\frac{x^6 \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \ln(x)}{2} + x^2 \left(1 + \frac{x^2}{2} + O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

16.28.1 Maple step by step solution

Let's solve

$x^2y'' + (x^3 - 7x)\,y' + 12y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{12y}{x^2} - \frac{(x^2-7)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x^2-7)y'}{x} + \frac{12y}{x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

- ◦ Define functions

  $\left[P_2(x) = \frac{x^2-7}{x}, P_3(x) = \frac{12}{x^2}\right]$

- ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\Big|_{x=0} = -7$

- ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\Big|_{x=0} = 12$

- ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2y'' + x(x^2 - 7)\,y' + 12y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

- ◦ Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k + r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

  $$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(-2+r)\,(-6+r)\, x^r + a_1(-1+r)\,(-5+r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(k+r-2)\,(k+r-6) + a_{k-2}(k+$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(-2+r)\,(-6+r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \{2, 6\}$$

- Each term must be 0

  $$a_1(-1+r)\,(-5+r) = 0$$

- Solve for the dependent coefficient(s)

  $$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$(k+r-2)\,(a_k(k+r-6) + a_{k-2}) = 0$$

- Shift index using $k->k+2$

  $$(k+r)\,(a_{k+2}(k-4+r) + a_k) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2} = -\frac{a_k}{k-4+r}$$

- Recursion relation for $r=2$

  $$a_{k+2} = -\frac{a_k}{k-2}$$

- Series not valid for $r=2$, division by 0 in the recursion relation at $k=2$

  $$a_{k+2} = -\frac{a_k}{k-2}$$

- Recursion relation for $r=6$

  $$a_{k+2} = -\frac{a_k}{k+2}$$

- Solution for $r=6$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k+6}, a_{k+2}=-\frac{a_k}{k+2}, a_1=0\right]$$

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[_Lienard]
```

$$\boxed{xy'' - 5y' + yx = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$xy'' - 5y' + yx = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = -\frac{5}{x}$$
$$q(x) = 1$$

Table 828: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{5}{x}$	
singularity	type
$x = 0$	"regular"

$q(x) = 1$	
singularity	type

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : [∞]

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$xy'' - 5y' + yx = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}\right) x - 5\left(\sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) x = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r-1} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-5(n+r) a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r-1} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=2}^{\infty} a_{n-2} x^{n+r-1}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r-1$.

$$\left(\sum_{n=0}^{\infty} x^{n+r-1} a_n(n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-5(n+r) a_n x^{n+r-1}\right) + \left(\sum_{n=2}^{\infty} a_{n-2} x^{n+r-1}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r-1} a_n(n+r)(n+r-1) - 5(n+r) a_n x^{n+r-1} = 0$$

When $n=0$ the above becomes

$$x^{-1+r} a_0 r(-1+r) - 5r a_0 x^{-1+r} = 0$$

Or

$$\left(x^{-1+r} r(-1+r) - 5r\, x^{-1+r}\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$r\, x^{-1+r}(-6+r) = 0$$

Since the above is true for all x then the indicial equation becomes

$$r(-6+r) = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 6$$
$$r_2 = 0$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$r\, x^{-1+r}(-6+r) = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 6$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^6\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+6}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) - 5a_n(n+r) + a_{n-2} = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}}{n^2 + 2nr + r^2 - 6n - 6r} \tag{4}$$

Which for the root $r = 6$ becomes

$$a_n = -\frac{a_{n-2}}{n(n+6)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 6$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{1}{r^2 - 2r - 8}$$

Which for the root $r = 6$ becomes

$$a_2 = -\frac{1}{16}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{r^2-2r-8}$	$-\frac{1}{16}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{r^2-2r-8}$	$-\frac{1}{16}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{r^4 - 20r^2 + 64}$$

Which for the root $r = 6$ becomes

$$a_4 = \frac{1}{640}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{r^2-2r-8}$	$-\frac{1}{16}$
a_3	0	0
a_4	$\frac{1}{r^4-20r^2+64}$	$\frac{1}{640}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{r^2-2r-8}$	$-\frac{1}{16}$
a_3	0	0
a_4	$\frac{1}{r^4-20r^2+64}$	$\frac{1}{640}$
a_5	0	0

For $n = 6$, using the above recursive equation gives

$$a_6 = -\frac{1}{(r^4 - 20r^2 + 64)\, r\, (r + 6)}$$

Which for the root $r = 6$ becomes

$$a_6 = -\frac{1}{46080}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{r^2-2r-8}$	$-\frac{1}{16}$
a_3	0	0
a_4	$\frac{1}{r^4-20r^2+64}$	$\frac{1}{640}$
a_5	0	0
a_6	$-\frac{1}{(r^4-20r^2+64)r(r+6)}$	$-\frac{1}{46080}$

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^6\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 \dots\right) \\
&= x^6\left(1 - \frac{x^2}{16} + \frac{x^4}{640} - \frac{x^6}{46080} + O(x^7)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Let

$$
r_1 - r_2 = N
$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 6$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\rightarrow r_2} a_6(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$
\begin{aligned}
a_N &= a_6 \\
&= -\frac{1}{(r^4 - 20r^2 + 64)\, r\, (r + 6)}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\lim_{r\rightarrow r_2} -\frac{1}{(r^4 - 20r^2 + 64)\, r\, (r + 6)} &= \lim_{r\rightarrow 0} -\frac{1}{(r^4 - 20r^2 + 64)\, r\, (r + 6)} \\
&= \textit{undefined}
\end{aligned}
$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$
y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)
$$

Therefore

$$\begin{aligned}
\frac{d}{dx}y_2(x) &= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\
&= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n+r_2)\right) \\
\frac{d^2}{dx^2}y_2(x) &= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\
&= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n+r_2)(-1+n+r_2)\right)
\end{aligned}$$

Substituting these back into the given ode $xy'' - 5y' + yx = 0$ gives

$$\begin{aligned}
&\left(Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2}\right. \\
&\left. + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) x - 5Cy_1'(x)\ln(x) - \frac{5Cy_1(x)}{x} \\
&- 5\left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) + \left(Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)\right) x = 0
\end{aligned}$$

Which can be written as

$$\begin{aligned}
&\left(\left(y_1''(x)\,x + y_1(x)\,x - 5y_1'(x)\right)\ln(x) + \left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right)x - \frac{5y_1(x)}{x}\right)C \\
&+ \left(\sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)x \\
&+ \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)x - 5\left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) = 0
\end{aligned} \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$y_1''(x)\,x + y_1(x)\,x - 5y_1'(x) = 0$$

Eq (7) simplifes to

$$\left(\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)x-\frac{5y_1(x)}{x}\right)C \\ +\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)x \\ +\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)x-5\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)=0 \tag{8}$$

Substituting $y_1=\sum_{n=0}^{\infty}a_n x^{n+r_1}$ into the above gives

$$\frac{\left(2\left(\sum_{n=0}^{\infty}x^{-1+n+r_1}a_n(n+r_1)\right)x-6\left(\sum_{n=0}^{\infty}a_n x^{n+r_1}\right)\right)C}{x} \\ +\frac{\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)x^2+\left(\sum_{n=0}^{\infty}x^{-2+n+r_2}b_n(n+r_2)(-1+n+r_2)\right)x^2-5\left(\sum_{n=0}^{\infty}x^{-1+n+r_2}b_n(n+r_2)\right)x}{x} \\ =0 \tag{9}$$

Since $r_1=6$ and $r_2=0$ then the above becomes

$$\frac{\left(2\left(\sum_{n=0}^{\infty}x^{5+n}a_n(n+6)\right)x-6\left(\sum_{n=0}^{\infty}a_n x^{n+6}\right)\right)C}{x} \\ +\frac{\left(\sum_{n=0}^{\infty}b_n x^{n}\right)x^2+\left(\sum_{n=0}^{\infty}x^{n-2}b_n n(-1+n)\right)x^2-5\left(\sum_{n=0}^{\infty}x^{-1+n}b_n n\right)x}{x}=0 \tag{10}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty}2C\,x^{5+n}a_n(n+6)\right)+\sum_{n=0}^{\infty}\left(-6C\,x^{5+n}a_n\right)+\left(\sum_{n=0}^{\infty}x^{1+n}b_n\right) \\ +\left(\sum_{n=0}^{\infty}n\,x^{-1+n}b_n(-1+n)\right)+\sum_{n=0}^{\infty}\left(-5x^{-1+n}b_n n\right)=0 \tag{2A}$$

The next step is to make all powers of x be $-1+n$ in each summation term. Going over each summation term above with power of x in it which is not already x^{-1+n} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2C\, x^{5+n} a_n (n+6) = \sum_{n=6}^{\infty} 2C a_{-6+n} n\, x^{-1+n}$$

$$\sum_{n=0}^{\infty} \left(-6C\, x^{5+n} a_n\right) = \sum_{n=6}^{\infty} \left(-6C a_{-6+n} x^{-1+n}\right)$$

$$\sum_{n=0}^{\infty} x^{1+n} b_n = \sum_{n=2}^{\infty} b_{n-2} x^{-1+n}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $-1+n$.

$$\left(\sum_{n=6}^{\infty} 2C a_{-6+n} n\, x^{-1+n}\right) + \sum_{n=6}^{\infty} \left(-6C a_{-6+n} x^{-1+n}\right) + \left(\sum_{n=2}^{\infty} b_{n-2} x^{-1+n}\right) + \left(\sum_{n=0}^{\infty} n\, x^{-1+n} b_n (-1+n)\right) + \sum_{n=0}^{\infty} \left(-5x^{-1+n} b_n n\right) = 0 \tag{2B}$$

For $n = 0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n = 1$, Eq (2B) gives

$$-5b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-5b_1 = 0$$

Solving the above for b_1 gives

$$b_1 = 0$$

For $n = 2$, Eq (2B) gives

$$b_0 - 8b_2 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$1 - 8b_2 = 0$$

Solving the above for b_2 gives

$$b_2 = \frac{1}{8}$$

For $n = 3$, Eq (2B) gives

$$b_1 - 9b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-9b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 0$$

For $n = 4$, Eq (2B) gives

$$b_2 - 8b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$\frac{1}{8} - 8b_4 = 0$$

Solving the above for b_4 gives

$$b_4 = \frac{1}{64}$$

For $n = 5$, Eq (2B) gives

$$b_3 - 5b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-5b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = 0$$

For $n = N$, where $N = 6$ which is the difference between the two roots, we are free to choose $b_6 = 0$. Hence for $n = 6$, Eq (2B) gives

$$6C + \frac{1}{64} = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{1}{384}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{1}{384}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{1}{384}\left(x^6\left(1-\frac{x^2}{16}+\frac{x^4}{640}-\frac{x^6}{46080}+O(x^7)\right)\right)\ln(x)+1+\frac{x^2}{8}+\frac{x^4}{64}+O(x^7)$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^6\left(1-\frac{x^2}{16}+\frac{x^4}{640}-\frac{x^6}{46080}+O(x^7)\right) \\
&\quad + c_2\left(-\frac{1}{384}\left(x^6\left(1-\frac{x^2}{16}+\frac{x^4}{640}-\frac{x^6}{46080}+O(x^7)\right)\right)\ln(x)+1+\frac{x^2}{8}+\frac{x^4}{64}+O(x^7)\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x^6\left(1-\frac{x^2}{16}+\frac{x^4}{640}-\frac{x^6}{46080}+O(x^7)\right) \\
&\quad + c_2\left(-\frac{x^6\left(1-\frac{x^2}{16}+\frac{x^4}{640}-\frac{x^6}{46080}+O(x^7)\right)\ln(x)}{384}+1+\frac{x^2}{8}+\frac{x^4}{64}+O(x^7)\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y &= c_1 x^6\left(1-\frac{x^2}{16}+\frac{x^4}{640}-\frac{x^6}{46080}+O(x^7)\right) \\
&\quad + c_2\left(-\frac{x^6\left(1-\frac{x^2}{16}+\frac{x^4}{640}-\frac{x^6}{46080}+O(x^7)\right)\ln(x)}{384}+1+\frac{x^2}{8}+\frac{x^4}{64}+O(x^7)\right)
\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}
y &= c_1 x^6\left(1-\frac{x^2}{16}+\frac{x^4}{640}-\frac{x^6}{46080}+O(x^7)\right) \\
&\quad + c_2\left(-\frac{x^6\left(1-\frac{x^2}{16}+\frac{x^4}{640}-\frac{x^6}{46080}+O(x^7)\right)\ln(x)}{384}+1+\frac{x^2}{8}+\frac{x^4}{64}+O(x^7)\right)
\end{aligned}$$

Verified OK.

16.29.1 Maple step by step solution

Let's solve

$y''x - 5y' + yx = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{5y'}{x} - y$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{5y'}{x} + y = 0$

- Simplify ODE

  $x^2y'' - 5y'x + x^2y = 0$

- Make a change of variables

  $y = x^3u(x)$

- Compute y'

  $y' = 3x^2u(x) + x^3u'(x)$

- Compute y''

  $y'' = 6xu(x) + 6x^2u'(x) + x^3u''(x)$

- Apply change of variables to the ODE

  $x^2u(x) + u''(x)\,x^2 + u'(x)\,x - 9u(x) = 0$

- ODE is now of the Bessel form
- Solution to Bessel ODE

  $u(x) = c_1 \mathit{BesselJ}(3, x) + c_2 \mathit{BesselY}(3, x)$

- Make the change from y back to y

  $y = (c_1 \mathit{BesselJ}(3, x) + c_2 \mathit{BesselY}(3, x))\,x^3$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 26.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' + x(2x^2 + 1)\, y' - (-10x^2 + 1)\, y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + (2x^3 + x)\, y' + (10x^2 - 1)\, y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{2x^2 + 1}{x}$$
$$q(x) = \frac{10x^2 - 1}{x^2}$$

Table 830: Table $p(x), q(x)$ singularites.

$p(x) = \frac{2x^2+1}{x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{10x^2-1}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2y'' + (2x^3 + x)\, y' + (10x^2 - 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}\right) + (2x^3 + x) \left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) + (10x^2 - 1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 10x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 10x^{n+r+2} a_n = \sum_{n=2}^{\infty} 10a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 10a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + x^{n+r} a_n (n+r) - a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) + x^r a_0 r - a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + x^r r - x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2-1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 1 \\ r_2 &= -1 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r^2 - 1)\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 2$ is an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right) \\ y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= x \left(\sum_{n=0}^{\infty} a_n x^n\right) \\ y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x} \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+1} \\ y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-1}\right) \end{aligned}$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) + 2a_{n-2}(n+r-2) + a_n(n+r) + 10a_{n-2} - a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{2a_{n-2}(n+r+3)}{n^2 + 2nr + r^2 - 1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{2a_{n-2}(n+4)}{n(n+2)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-10 - 2r}{r^2 + 4r + 3}$$

Which for the root $r = 1$ becomes

$$a_2 = -\frac{3}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-10-2r}{r^2+4r+3}$	$-\frac{3}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-10-2r}{r^2+4r+3}$	$-\frac{3}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{28 + 4r}{(r + 3)^2 (1 + r)}$$

Which for the root $r = 1$ becomes

$$a_4 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-10-2r}{r^2+4r+3}$	$-\frac{3}{2}$
a_3	0	0
a_4	$\frac{28+4r}{(r+3)^2(1+r)}$	1

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-10-2r}{r^2+4r+3}$	$-\frac{3}{2}$
a_3	0	0
a_4	$\frac{28+4r}{(r+3)^2(1+r)}$	1
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\
&= x\left(1 - \frac{3x^2}{2} + x^4 + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Let

$$
r_1 - r_2 = N
$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 2$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_2(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$
\begin{aligned}
a_N &= a_2 \\
&= \frac{-10 - 2r}{r^2 + 4r + 3}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\lim_{r\to r_2} \frac{-10 - 2r}{r^2 + 4r + 3} &= \lim_{r\to -1} \frac{-10 - 2r}{r^2 + 4r + 3} \\
&= \textit{undefined}
\end{aligned}
$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$
y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)
$$

Therefore

$$
\begin{aligned}
\frac{d}{dx}y_2(x) &= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n + r_2)}{x}\right) \\
&= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n + r_2)\right) \\
\frac{d^2}{dx^2}y_2(x) &= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n + r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n + r_2)}{x^2}\right) \\
&= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n + r_2)(-1 + n + r_2)\right)
\end{aligned}
$$

Substituting these back into the given ode $x^2y''+(2x^3+x)\,y'+(10x^2-1)\,y=0$ gives

$$x^2\left(Cy_1''(x)\ln(x)+\frac{2Cy_1'(x)}{x}-\frac{Cy_1(x)}{x^2}+\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+(2x^3+x)\left(Cy_1'(x)\ln(x)+\frac{Cy_1(x)}{x}+\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)+(10x^2-1)\left(Cy_1(x)\ln(x)+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)\right)=0$$

Which can be written as

$$\left(\left(x^2y_1''(x)+(2x^3+x)\,y_1'(x)+(10x^2-1)\,y_1(x)\right)\ln(x)+x^2\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{(2x^3+x)\,y_1(x)}{x}\right)C+x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+(2x^3+x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(10x^2-1)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0 \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$x^2y_1''(x)+(2x^3+x)\,y_1'(x)+(10x^2-1)\,y_1(x)=0$$

Eq (7) simplifes to

$$\left(x^2\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{(2x^3+x)\,y_1(x)}{x}\right)C+x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+(2x^3+x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(10x^2-1)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0 \tag{8}$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\begin{aligned}&\left(2\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right) x^2 + 2\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) x\right) C \\ &+ \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) x^2 \\ &+ (2x^3+x)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) \\ &+ 10\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) x^2 - \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0\end{aligned} \tag{9}$$

Since $r_1 = 1$ and $r_2 = -1$ then the above becomes

$$\begin{aligned}&\left(2\left(\sum_{n=0}^{\infty} a_n x^{n+1}\right) x^2 + 2\left(\sum_{n=0}^{\infty} x^{n} a_n (n+1)\right) x\right) C \\ &+ \left(\sum_{n=0}^{\infty} x^{-3+n} b_n (n-1)(n-2)\right) x^2 + (2x^3+x)\left(\sum_{n=0}^{\infty} x^{n-2} b_n (n-1)\right) \\ &+ 10\left(\sum_{n=0}^{\infty} b_n x^{n-1}\right) x^2 - \left(\sum_{n=0}^{\infty} b_n x^{n-1}\right) = 0\end{aligned} \tag{10}$$

Which simplifies to

$$\begin{aligned}&\left(\sum_{n=0}^{\infty} 2C\, x^{3+n} a_n\right) + \left(\sum_{n=0}^{\infty} 2C\, x^{n+1} a_n (n+1)\right) \\ &+ \left(\sum_{n=0}^{\infty} x^{n-1} b_n (n^2-3n+2)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+1} b_n (n-1)\right) \\ &+ \left(\sum_{n=0}^{\infty} x^{n-1} b_n (n-1)\right) + \left(\sum_{n=0}^{\infty} 10x^{n+1} b_n\right) + \sum_{n=0}^{\infty} \left(-b_n x^{n-1}\right) = 0\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n-1} and

adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2C\, x^{3+n} a_n = \sum_{n=4}^{\infty} 2C a_{n-4} x^{n-1}$$

$$\sum_{n=0}^{\infty} 2C\, x^{n+1} a_n (n+1) = \sum_{n=2}^{\infty} 2C a_{n-2} (n-1)\, x^{n-1}$$

$$\sum_{n=0}^{\infty} 2x^{n+1} b_n (n-1) = \sum_{n=2}^{\infty} 2b_{n-2} (-3+n)\, x^{n-1}$$

$$\sum_{n=0}^{\infty} 10x^{n+1} b_n = \sum_{n=2}^{\infty} 10 b_{n-2} x^{n-1}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-1$.

$$\begin{aligned}&\left(\sum_{n=4}^{\infty} 2C a_{n-4} x^{n-1}\right) + \left(\sum_{n=2}^{\infty} 2C a_{n-2}(n-1)\, x^{n-1}\right) \\ &+ \left(\sum_{n=0}^{\infty} x^{n-1} b_n \left(n^2-3n+2\right)\right) + \left(\sum_{n=2}^{\infty} 2b_{n-2}(-3+n)\, x^{n-1}\right) \\ &+ \left(\sum_{n=0}^{\infty} x^{n-1} b_n (n-1)\right) + \left(\sum_{n=2}^{\infty} 10 b_{n-2} x^{n-1}\right) + \sum_{n=0}^{\infty} \left(-b_n x^{n-1}\right) = 0\end{aligned} \tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0=1$. For $n=1$, Eq (2B) gives

$$-b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-b_1 = 0$$

Solving the above for b_1 gives

$$b_1 = 0$$

For $n=N$, where $N=2$ which is the difference between the two roots, we are free to choose $b_2=0$. Hence for $n=2$, Eq (2B) gives

$$2C + 8 = 0$$

Which is solved for C. Solving for C gives

$$C = -4$$

For $n = 3$, Eq (2B) gives

$$4Ca_1 + 10b_1 + 3b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$3b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 0$$

For $n = 4$, Eq (2B) gives

$$(2a_0 + 6a_2) C + 12b_2 + 8b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$28 + 8b_4 = 0$$

Solving the above for b_4 gives

$$b_4 = -\frac{7}{2}$$

For $n = 5$, Eq (2B) gives

$$(2a_1 + 8a_3) C + 14b_3 + 15b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$15b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = 0$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -4$ and all b_n, then the second solution becomes

$$y_2(x) = (-4) \left(x\left(1 - \frac{3x^2}{2} + x^4 + O(x^6)\right)\right) \ln(x) + \frac{1 - \frac{7x^4}{2} + O(x^6)}{x}$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x) &= c_1 y_1(x) + c_2 y_2(x)\\ &= c_1 x\left(1-\frac{3x^2}{2}+x^4+O\left(x^6\right)\right)\\ &+ c_2\left((-4)\left(x\left(1-\frac{3x^2}{2}+x^4+O\left(x^6\right)\right)\right)\ln\left(x\right)+\frac{1-\frac{7x^4}{2}+O(x^6)}{x}\right)\end{aligned}$$

Hence the final solution is

$$\begin{aligned}y &= y_h\\ &= c_1 x\left(1-\frac{3x^2}{2}+x^4+O\left(x^6\right)\right)\\ &+ c_2\left(-4x\left(1-\frac{3x^2}{2}+x^4+O\left(x^6\right)\right)\ln\left(x\right)+\frac{1-\frac{7x^4}{2}+O(x^6)}{x}\right)\end{aligned}$$

Summary
The solution(s) found are the following

$$\begin{aligned}y &= c_1 x\left(1-\frac{3x^2}{2}+x^4+O\left(x^6\right)\right)\\ &+ c_2\left(-4x\left(1-\frac{3x^2}{2}+x^4+O\left(x^6\right)\right)\ln\left(x\right)+\frac{1-\frac{7x^4}{2}+O(x^6)}{x}\right)\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}y &= c_1 x\left(1-\frac{3x^2}{2}+x^4+O\left(x^6\right)\right)\\ &+ c_2\left(-4x\left(1-\frac{3x^2}{2}+x^4+O\left(x^6\right)\right)\ln\left(x\right)+\frac{1-\frac{7x^4}{2}+O(x^6)}{x}\right)\end{aligned}$$

Verified OK.

16.30.1 Maple step by step solution

Let's solve

$x^2y'' + (2x^3 + x)\,y' + (10x^2 - 1)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(10x^2-1)y}{x^2} - \frac{(2x^2+1)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(2x^2+1)y'}{x} + \frac{(10x^2-1)y}{x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{2x^2+1}{x}, P_3(x) = \frac{10x^2-1}{x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left.(x \cdot P_2(x))\right|_{x=0} = 1$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left.(x^2 \cdot P_3(x))\right|_{x=0} = -1$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2y'' + x(2x^2 + 1)\,y' + (10x^2 - 1)\,y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $$x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..3$

  $$x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\, x^{k+r-1+m}$$

- Shift index using $k->k+1-m$

  $$x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^{2}\cdot y''$ to series expansion

  $$x^{2}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_{0}(1+r)\,(-1+r)\, x^{r}+a_{1}(2+r)\, r\, x^{1+r}+\left(\sum_{k=2}^{\infty} \left(a_{k}(k+r+1)\,(k+r-1)+2a_{k-2}(k+3+r)\right) x^{k}\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(1+r)\,(-1+r)=0$$

- Values of r that satisfy the indicial equation

  $$r\in\{-1,1\}$$

- Each term must be 0

  $$a_{1}(2+r)\, r=0$$

- Solve for the dependent coefficient(s)

  $$a_{1}=0$$

- Each term in the series must be 0, giving the recursion relation

  $$a_{k}(k+r+1)\,(k+r-1)+2a_{k-2}(k+3+r)=0$$

- Shift index using $k->k+2$

  $$a_{k+2}(k+3+r)\,(k+r+1)+2a_{k}(k+r+5)=0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2}=-\frac{2a_{k}(k+r+5)}{(k+3+r)(k+r+1)}$$

- Recursion relation for $r=-1$

  $$a_{k+2}=-\frac{2a_{k}(k+4)}{(k+2)k}$$

- Solution for $r = -1$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+2} = -\frac{2a_k(k+4)}{(k+2)k}, a_1 = 0\right]$$

- Recursion relation for $r = 1$

$$a_{k+2} = -\frac{2a_k(k+6)}{(k+4)(k+2)}$$

- Solution for $r = 1$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+2} = -\frac{2a_k(k+6)}{(k+4)(k+2)}, a_1 = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-1}\right) + \left(\sum_{k=0}^{\infty} b_k x^{1+k}\right), a_{k+2} = -\frac{2a_k(4+k)}{(k+2)k}, a_1 = 0, b_{k+2} = -\frac{2b_k(k+6)}{(4+k)(k+2)}, b_1 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 27.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' - y'x - (-x^2 + 3)\, y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' - y'x + (x^2 - 3)\, y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = -\frac{1}{x}$$
$$q(x) = \frac{x^2 - 3}{x^2}$$

Table 832: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{1}{x}$	
singularity	type
$x = 0$	"regular"

$q(x) = \frac{x^2-3}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2y'' - y'x + (x^2 - 3)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) - \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) x + (x^2 - 3) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-3 a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n = \sum_{n=2}^{\infty} a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-3 a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - x^{n+r} a_n (n+r) - 3 a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - x^r a_0 r - 3 a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - x^r r - 3 x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2 - 2r - 3\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 2r - 3 = 0$$

Solving for r gives the roots of the indicial equation as

$$
\begin{aligned}
r_1 &= 3 \\
r_2 &= -1
\end{aligned}
$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$
\left(r^2 - 2r - 3\right) x^r = 0
$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$
\begin{aligned}
y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right) \\
y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right)
\end{aligned}
$$

Or

$$
\begin{aligned}
y_1(x) &= x^3 \left(\sum_{n=0}^{\infty} a_n x^n \right) \\
y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x}
\end{aligned}
$$

Or

$$
\begin{aligned}
y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+3} \\
y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-1} \right)
\end{aligned}
$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
a_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
a_n(n+r)(n+r-1) - a_n(n+r) + a_{n-2} - 3a_n = 0 \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}}{n^2 + 2nr + r^2 - 2n - 2r - 3} \tag{4}$$

Which for the root $r = 3$ becomes

$$a_n = -\frac{a_{n-2}}{n(n+4)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 3$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{1}{r^2 + 2r - 3}$$

Which for the root $r = 3$ becomes

$$a_2 = -\frac{1}{12}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{r^2+2r-3}$	$-\frac{1}{12}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{r^2+2r-3}$	$-\frac{1}{12}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{r^4 + 8r^3 + 14r^2 - 8r - 15}$$

Which for the root $r = 3$ becomes

$$a_4 = \frac{1}{384}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{r^2+2r-3}$	$-\frac{1}{12}$
a_3	0	0
a_4	$\frac{1}{r^4+8r^3+14r^2-8r-15}$	$\frac{1}{384}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{r^2+2r-3}$	$-\frac{1}{12}$
a_3	0	0
a_4	$\frac{1}{r^4+8r^3+14r^2-8r-15}$	$\frac{1}{384}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^3 \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^3 \left(1 - \frac{x^2}{12} + \frac{x^4}{384} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_4 \\ &= \frac{1}{r^4 + 8r^3 + 14r^2 - 8r - 15} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} \frac{1}{r^4 + 8r^3 + 14r^2 - 8r - 15} &= \lim_{r\to -1} \frac{1}{r^4 + 8r^3 + 14r^2 - 8r - 15} \\ &= \textit{undefined} \end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned} \frac{d}{dx} y_2(x) &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\ &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) \\ \frac{d^2}{dx^2} y_2(x) &= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \\ &\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\ &= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) \end{aligned}$$

Substituting these back into the given ode $x^2y'' - y'x + (x^2-3)\,y = 0$ gives

$$x^2\left(Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) - \left(Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)x + (x^2-3)\left(Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)\right) = 0$$

Which can be written as

$$\left(\left(x^2y_1''(x) - y_1'(x)\,x + (x^2-3)\,y_1(x)\right)\ln(x) + x^2\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) - y_1(x)\right)C + x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) - \left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)x + (x^2-3)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$x^2y_1''(x) - y_1'(x)\,x + (x^2-3)\,y_1(x) = 0$$

Eq (7) simplifes to

$$\left(x^2\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) - y_1(x)\right)C + x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) - \left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)x + (x^2-3)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{8}$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\left(2\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) x - 2\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)\right) C + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) x^2 + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) x^2 - \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) x - 3\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{9}$$

Since $r_1 = 3$ and $r_2 = -1$ then the above becomes

$$\left(2\left(\sum_{n=0}^{\infty} x^{2+n} a_n (n+3)\right) x - 2\left(\sum_{n=0}^{\infty} a_n x^{n+3}\right)\right) C + \left(\sum_{n=0}^{\infty} x^{-3+n} b_n (n-1)(n-2)\right) x^2 + \left(\sum_{n=0}^{\infty} b_n x^{n-1}\right) x^2 - \left(\sum_{n=0}^{\infty} x^{n-2} b_n (n-1)\right) x - 3\left(\sum_{n=0}^{\infty} b_n x^{n-1}\right) = 0 \tag{10}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2C\, x^{n+3} a_n (n+3)\right) + \sum_{n=0}^{\infty} \left(-2C a_n x^{n+3}\right) + \left(\sum_{n=0}^{\infty} x^{n-1} b_n \left(n^2 - 3n + 2\right)\right) + \left(\sum_{n=0}^{\infty} x^{1+n} b_n\right) + \sum_{n=0}^{\infty} \left(-x^{n-1} b_n (n-1)\right) + \sum_{n=0}^{\infty} \left(-3 b_n x^{n-1}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n-1} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2C\, x^{n+3} a_n (n+3) = \sum_{n=4}^{\infty} 2C a_{n-4} (n-1)\, x^{n-1}$$

$$\sum_{n=0}^{\infty} \left(-2C a_n x^{n+3}\right) = \sum_{n=4}^{\infty} \left(-2C a_{n-4} x^{n-1}\right)$$

$$\sum_{n=0}^{\infty} x^{1+n} b_n = \sum_{n=2}^{\infty} b_{n-2} x^{n-1}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-1$.

$$
\begin{aligned}
&\left(\sum_{n=4}^{\infty} 2C a_{n-4}(n-1)\, x^{n-1}\right)+\sum_{n\,=4}^{\infty}\left(-2C a_{n-4} x^{n-1}\right) \\
&+\left(\sum_{n=0}^{\infty} x^{n-1} b_{n}\left(n^{2}-3n+2\right)\right)+\left(\sum_{n=2}^{\infty} b_{n-2} x^{n-1}\right) \\
&+\sum_{n\,=0}^{\infty}\left(-x^{n-1} b_{n}(n-1)\right)+\sum_{n\,=0}^{\infty}\left(-3 b_{n} x^{n-1}\right)=0
\end{aligned}
\tag{2B}
$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0=1$. For $n=1$, Eq (2B) gives

$$-3b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_1 = 0$$

Solving the above for b_1 gives

$$b_1 = 0$$

For $n=2$, Eq (2B) gives

$$b_0 - 4b_2 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$1 - 4b_2 = 0$$

Solving the above for b_2 gives

$$b_2 = \frac{1}{4}$$

For $n=3$, Eq (2B) gives

$$b_1 - 3b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 0$$

For $n = N$, where $N = 4$ which is the difference between the two roots, we are free to choose $b_4 = 0$. Hence for $n = 4$, Eq (2B) gives

$$4C + \frac{1}{4} = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{1}{16}$$

For $n = 5$, Eq (2B) gives

$$6Ca_1 + b_3 + 5b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$5b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = 0$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{1}{16}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{1}{16}\left(x^3\left(1 - \frac{x^2}{12} + \frac{x^4}{384} + O(x^6)\right)\right)\ln(x) + \frac{1 + \frac{x^2}{4} + O(x^6)}{x}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^3\left(1 - \frac{x^2}{12} + \frac{x^4}{384} + O(x^6)\right) \\
&\quad + c_2\left(-\frac{1}{16}\left(x^3\left(1 - \frac{x^2}{12} + \frac{x^4}{384} + O(x^6)\right)\right)\ln(x) + \frac{1 + \frac{x^2}{4} + O(x^6)}{x}\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x^3\left(1 - \frac{x^2}{12} + \frac{x^4}{384} + O(x^6)\right) \\
&\quad + c_2\left(-\frac{x^3\left(1 - \frac{x^2}{12} + \frac{x^4}{384} + O(x^6)\right)\ln(x)}{16} + \frac{1 + \frac{x^2}{4} + O(x^6)}{x}\right)
\end{aligned}$$

Summary
The solution(s) found are the following

$$
\begin{align*}
y &= c_1 x^3 \left(1-\frac{x^2}{12}+\frac{x^4}{384}+O\left(x^6\right)\right) \\
&+ c_2 \left(-\frac{x^3 \left(1-\frac{x^2}{12}+\frac{x^4}{384}+O\left(x^6\right)\right) \ln\left(x\right)}{16}+\frac{1+\frac{x^2}{4}+O\left(x^6\right)}{x}\right) \tag{1}
\end{align*}
$$

Verification of solutions

$$
\begin{align*}
y &= c_1 x^3 \left(1-\frac{x^2}{12}+\frac{x^4}{384}+O\left(x^6\right)\right) \\
&+ c_2 \left(-\frac{x^3 \left(1-\frac{x^2}{12}+\frac{x^4}{384}+O\left(x^6\right)\right) \ln\left(x\right)}{16}+\frac{1+\frac{x^2}{4}+O\left(x^6\right)}{x}\right)
\end{align*}
$$

Verified OK.

16.31.1 Maple step by step solution

Let's solve

$x^2 y'' - y' x + \left(x^2-3\right) y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{\left(x^2-3\right) y}{x^2}+\frac{y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{y'}{x}+\frac{\left(x^2-3\right) y}{x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = -\frac{1}{x}, P_3(x) = \frac{x^2-3}{x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\Big|_{x=0} = -1$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

$$\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = -3$$

- $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2y'' - y'x + (x^2 - 3)\, y = 0$

- Assume series solution for y

  $$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k - m$

  $$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x \cdot y'$ to series expansion

  $$x \cdot y' = \sum_{k=0}^{\infty} a_k (k + r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

  $$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k + r)\, (k + r - 1)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(1 + r)\, (-3 + r)\, x^r + a_1(2 + r)\, (-2 + r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(k + r + 1)\, (k + r - 3) + a_{k-2}\right) x^{k+r}\right)$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(1 + r)\, (-3 + r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{-1, 3\}$

- Each term must be 0

  $a_1(2 + r)\, (-2 + r) = 0$

- Solve for the dependent coefficient(s)

  $a_1 = 0$
- Each term in the series must be 0, giving the recursion relation

  $a_k(k+r+1)(k+r-3) + a_{k-2} = 0$
- Shift index using $k- >k+2$

  $a_{k+2}(k+3+r)(k+r-1) + a_k = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{a_k}{(k+3+r)(k+r-1)}$
- Recursion relation for $r = -1$

  $a_{k+2} = -\frac{a_k}{(k+2)(k-2)}$
- Series not valid for $r = -1$, division by 0 in the recursion relation at $k = 2$

  $a_{k+2} = -\frac{a_k}{(k+2)(k-2)}$
- Recursion relation for $r = 3$

  $a_{k+2} = -\frac{a_k}{(k+6)(k+2)}$
- Solution for $r = 3$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+3}, a_{k+2} = -\frac{a_k}{(k+6)(k+2)}, a_1 = 0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 28.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2y'' + 2x(x^2+8)\,y' + (3x^2+5)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$4x^2y'' + (2x^3+16x)\,y' + (3x^2+5)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{x^2+8}{2x}$$
$$q(x) = \frac{3x^2+5}{4x^2}$$

Table 834: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x^2+8}{2x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{3x^2+5}{4x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2y'' + (2x^3 + 16x)\, y' + (3x^2 + 5)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2 \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (2x^3 + 16x) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (3x^2 + 5) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 16x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 5a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{n+r+2} a_n = \sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 16x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 5a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r)(n+r-1) + 16x^{n+r} a_n (n+r) + 5a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$4x^r a_0 r(-1+r) + 16x^r a_0 r + 5a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) + 16x^r r + 5x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(4r^2 + 12r + 5)\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 + 12r + 5 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -\frac{1}{2}$$
$$r_2 = -\frac{5}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 + 12r + 5\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 2$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \frac{\sum_{n=0}^{\infty} a_n x^n}{\sqrt{x}}$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^{\frac{5}{2}}}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-\frac{1}{2}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{5}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$4a_n(n+r)(n+r-1)+2a_{n-2}(n+r-2)+16a_n(n+r)+3a_{n-2}+5a_n=0 \quad (3)$$

Solving for a_n from recursive equation (4) gives

$$a_n=-\frac{a_{n-2}(2n+2r-1)}{4n^2+8nr+4r^2+12n+12r+5} \quad (4)$$

Which for the root $r=-\frac{1}{2}$ becomes

$$a_n=-\frac{a_{n-2}(n-1)}{2n(n+2)} \quad (5)$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r=-\frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n=2$, using the above recursive equation gives

$$a_2=\frac{-3-2r}{4r^2+28r+45}$$

Which for the root $r=-\frac{1}{2}$ becomes

$$a_2=-\frac{1}{16}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-3-2r}{4r^2+28r+45}$	$-\frac{1}{16}$

For $n=3$, using the above recursive equation gives

$$a_3=0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-3-2r}{4r^2+28r+45}$	$-\frac{1}{16}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4r^2 + 20r + 21}{(4r^2 + 28r + 45)(4r^2 + 44r + 117)}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_4 = \frac{1}{256}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-3-2r}{4r^2+28r+45}$	$-\frac{1}{16}$
a_3	0	0
a_4	$\frac{4r^2+20r+21}{(4r^2+28r+45)(4r^2+44r+117)}$	$\frac{1}{256}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-3-2r}{4r^2+28r+45}$	$-\frac{1}{16}$
a_3	0	0
a_4	$\frac{4r^2+20r+21}{(4r^2+28r+45)(4r^2+44r+117)}$	$\frac{1}{256}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$y_1(x) = \frac{1}{\sqrt{x}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right)$$
$$= \frac{1 - \frac{x^2}{16} + \frac{x^4}{256} + O(x^6)}{\sqrt{x}}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 2$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_2(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$a_N = a_2$$
$$= \frac{-3 - 2r}{4r^2 + 28r + 45}$$

Therefore

$$\lim_{r\to r_2} \frac{-3 - 2r}{4r^2 + 28r + 45} = \lim_{r\to -\frac{5}{2}} \frac{-3 - 2r}{4r^2 + 28r + 45}$$
$$= \textit{undefined}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\frac{d}{dx} y_2(x) = C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n + r_2)}{x}\right)$$
$$= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n + r_2)\right)$$
$$\frac{d^2}{dx^2} y_2(x) = C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n + r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n + r_2)}{x^2}\right)$$
$$= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n + r_2)(-1 + n + r_2)\right)$$

Substituting these back into the given ode $4x^2y''+(2x^3+16x)\,y'+(3x^2+5)\,y=0$ gives

$$
\begin{aligned}
&4x^2\left(Cy_1''(x)\ln(x)+\frac{2Cy_1'(x)}{x}-\frac{Cy_1(x)}{x^2}\right.\\
&\left.+\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+(2x^3+16x)\left(Cy_1'(x)\ln(x)+\frac{Cy_1(x)}{x}+\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)\\
&+(3x^2+5)\left(Cy_1(x)\ln(x)+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)\right)=0
\end{aligned}
$$

Which can be written as

$$
\begin{aligned}
&\left(\left(4x^2y_1''(x)+(2x^3+16x)\,y_1'(x)+(3x^2+5)\,y_1(x)\right)\ln(x)\right.\\
&\left.+4x^2\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{(2x^3+16x)\,y_1(x)}{x}\right)C\\
&+4x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+(2x^3+16x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(3x^2+5)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0
\end{aligned}
\tag{7}
$$

But since $y_1(x)$ is a solution to the ode, then

$$
4x^2y_1''(x)+(2x^3+16x)\,y_1'(x)+(3x^2+5)\,y_1(x)=0
$$

Eq (7) simplifes to

$$
\begin{aligned}
&\left(4x^2\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{(2x^3+16x)\,y_1(x)}{x}\right)C\\
&+4x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+(2x^3+16x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(3x^2+5)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0
\end{aligned}
\tag{8}
$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\left(8\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) x + 2(x^2+6)\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)\right) C$$
$$+ 4\left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) x^2 \tag{9}$$
$$+ 2(x^3+8x)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) + (3x^2+5)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0$$

Since $r_1 = -\frac{1}{2}$ and $r_2 = -\frac{5}{2}$ then the above becomes

$$\left(8\left(\sum_{n=0}^{\infty} x^{-\frac{3}{2}+n} a_n \left(n-\frac{1}{2}\right)\right) x + 2(x^2+6)\left(\sum_{n=0}^{\infty} a_n x^{n-\frac{1}{2}}\right)\right) C$$
$$+ 4\left(\sum_{n=0}^{\infty} x^{-\frac{9}{2}+n} b_n \left(n-\frac{5}{2}\right)\left(-\frac{7}{2}+n\right)\right) x^2 \tag{10}$$
$$+ 2(x^3+8x)\left(\sum_{n=0}^{\infty} x^{-\frac{7}{2}+n} b_n \left(n-\frac{5}{2}\right)\right) + (3x^2+5)\left(\sum_{n=0}^{\infty} b_n x^{n-\frac{5}{2}}\right) = 0$$

Expanding $2C\,x^{\frac{3}{2}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned} 2C\,x^{\frac{3}{2}} &= 2C\,x^{\frac{3}{2}} + \dots \\ &= 2C\,x^{\frac{3}{2}} \end{aligned}$$

Expanding $\frac{12C}{\sqrt{x}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned} \frac{12C}{\sqrt{x}} &= \frac{12C}{\sqrt{x}} + \dots \\ &= \frac{12C}{\sqrt{x}} \end{aligned}$$

Expanding $\frac{1}{\sqrt{x}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned} \frac{1}{\sqrt{x}} &= \frac{1}{\sqrt{x}} + \dots \\ &= \frac{1}{\sqrt{x}} \end{aligned}$$

Expanding $\frac{8}{x^{\frac{5}{2}}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{8}{x^{\frac{5}{2}}} &= \frac{8}{x^{\frac{5}{2}}} + \dots \\ &= \frac{8}{x^{\frac{5}{2}}}\end{aligned}$$

Expanding $\frac{3}{\sqrt{x}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{3}{\sqrt{x}} &= \frac{3}{\sqrt{x}} + \dots \\ &= \frac{3}{\sqrt{x}}\end{aligned}$$

Expanding $\frac{5}{x^{\frac{5}{2}}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$\begin{aligned}\frac{5}{x^{\frac{5}{2}}} &= \frac{5}{x^{\frac{5}{2}}} + \dots \\ &= \frac{5}{x^{\frac{5}{2}}}\end{aligned}$$

Which simplifies to

$$\begin{aligned}&\left(\sum_{n=0}^{\infty} \left(8n-4\right) C a_n x^{n-\frac{1}{2}}\right) + \left(\sum_{n=0}^{\infty} 2C\, x^{n+\frac{3}{2}} a_n\right) + \left(\sum_{n=0}^{\infty} 12C\, x^{n-\frac{1}{2}} a_n\right) \\ &+ \left(\sum_{n=0}^{\infty} x^{n-\frac{5}{2}} b_n \left(4n^2-24n+35\right)\right) + \left(\sum_{n=0}^{\infty} x^{n-\frac{1}{2}} b_n (2n-5)\right) \\ &+ \left(\sum_{n=0}^{\infty} \left(16n-40\right) b_n x^{n-\frac{5}{2}}\right) + \left(\sum_{n=0}^{\infty} 3x^{n-\frac{1}{2}} b_n\right) + \left(\sum_{n=0}^{\infty} 5b_n x^{n-\frac{5}{2}}\right) = 0\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n-\frac{5}{2}$ in each summation term. Going over each summation term above with power of x in it which is not already $x^{n-\frac{5}{2}}$ and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(8n-4\right) C a_n x^{n-\frac{1}{2}} = \sum_{n=2}^{\infty} C a_{n-2} (8n-20)\, x^{n-\frac{5}{2}}$$

$$\sum_{n=0}^{\infty} 2C\, x^{n+\frac{3}{2}} a_n = \sum_{n=4}^{\infty} 2C a_{n-4} x^{n-\frac{5}{2}}$$

$$\sum_{n=0}^{\infty} 12C\, x^{n-\frac{1}{2}} a_n = \sum_{n=2}^{\infty} 12C a_{n-2} x^{n-\frac{5}{2}}$$

$$\sum_{n=0}^{\infty} x^{n-\frac{1}{2}} b_n (2n-5) = \sum_{n=2}^{\infty} b_{n-2}(-9+2n)\, x^{n-\frac{5}{2}}$$

$$\sum_{n=0}^{\infty} 3x^{n-\frac{1}{2}} b_n = \sum_{n=2}^{\infty} 3b_{n-2} x^{n-\frac{5}{2}}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-\frac{5}{2}$.

$$\begin{aligned}
&\left(\sum_{n=2}^{\infty} C a_{n-2}(8n-20)\, x^{n-\frac{5}{2}}\right) + \left(\sum_{n=4}^{\infty} 2C a_{n-4} x^{n-\frac{5}{2}}\right) + \left(\sum_{n=2}^{\infty} 12C a_{n-2} x^{n-\frac{5}{2}}\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n-\frac{5}{2}} b_n \left(4n^2-24n+35\right)\right) + \left(\sum_{n=2}^{\infty} b_{n-2}(-9+2n)\, x^{n-\frac{5}{2}}\right) \\
&+ \left(\sum_{n=0}^{\infty} (16n-40)\, b_n x^{n-\frac{5}{2}}\right) + \left(\sum_{n=2}^{\infty} 3b_{n-2} x^{n-\frac{5}{2}}\right) + \left(\sum_{n=0}^{\infty} 5b_n x^{n-\frac{5}{2}}\right) = 0
\end{aligned} \tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0=1$. For $n=1$, Eq (2B) gives

$$-4b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-4b_1 = 0$$

Solving the above for b_1 gives

$$b_1 = 0$$

For $n=N$, where $N=2$ which is the difference between the two roots, we are free to choose $b_2=0$. Hence for $n=2$, Eq (2B) gives

$$8C - 2 = 0$$

Which is solved for C. Solving for C gives

$$C = \frac{1}{4}$$

For $n=3$, Eq (2B) gives

$$16C a_1 + 12b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$12b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 0$$

For $n = 4$, Eq (2B) gives

$$(2a_0 + 24a_2) C + 2b_2 + 32b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$\frac{1}{8} + 32b_4 = 0$$

Solving the above for b_4 gives

$$b_4 = -\frac{1}{256}$$

For $n = 5$, Eq (2B) gives

$$(2a_1 + 32a_3) C + 4b_3 + 60b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$60b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = 0$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = \frac{1}{4}$ and all b_n, then the second solution becomes

$$y_2(x) = \frac{1}{4}\left(\frac{1 - \frac{x^2}{16} + \frac{x^4}{256} + O(x^6)}{\sqrt{x}}\right) \ln(x) + \frac{1 - \frac{x^4}{256} + O(x^6)}{x^{\frac{5}{2}}}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 y_1(x) + c_2 y_2(x)$$

$$= \frac{c_1\left(1 - \frac{x^2}{16} + \frac{x^4}{256} + O(x^6)\right)}{\sqrt{x}} + c_2\left(\frac{1}{4}\left(\frac{1 - \frac{x^2}{16} + \frac{x^4}{256} + O(x^6)}{\sqrt{x}}\right) \ln(x) + \frac{1 - \frac{x^4}{256} + O(x^6)}{x^{\frac{5}{2}}}\right)$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(1-\frac{x^2}{16}+\frac{x^4}{256}+O(x^6)\right)}{\sqrt{x}} + c_2\left(\frac{\left(1-\frac{x^2}{16}+\frac{x^4}{256}+O(x^6)\right)\ln(x)}{4\sqrt{x}} + \frac{1-\frac{x^4}{256}+O(x^6)}{x^{\frac{5}{2}}}\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = {} & \frac{c_1\left(1-\frac{x^2}{16}+\frac{x^4}{256}+O(x^6)\right)}{\sqrt{x}} \\
& + c_2\left(\frac{\left(1-\frac{x^2}{16}+\frac{x^4}{256}+O(x^6)\right)\ln(x)}{4\sqrt{x}} + \frac{1-\frac{x^4}{256}+O(x^6)}{x^{\frac{5}{2}}}\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
y = \frac{c_1\left(1-\frac{x^2}{16}+\frac{x^4}{256}+O(x^6)\right)}{\sqrt{x}} + c_2\left(\frac{\left(1-\frac{x^2}{16}+\frac{x^4}{256}+O(x^6)\right)\ln(x)}{4\sqrt{x}} + \frac{1-\frac{x^4}{256}+O(x^6)}{x^{\frac{5}{2}}}\right)
$$

Verified OK.

16.32.1 Maple step by step solution

Let's solve

$4x^2y'' + (2x^3+16x)\, y' + (3x^2+5)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(3x^2+5)y}{4x^2} - \frac{(x^2+8)y'}{2x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x^2+8)y'}{2x} + \frac{(3x^2+5)y}{4x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

- ◦ Define functions

  $\left[P_2(x) = \frac{x^2+8}{2x}, P_3(x) = \frac{3x^2+5}{4x^2}\right]$

- $x \cdot P_2(x)$ is analytic at $x = 0$

  $$\left(x \cdot P_2(x)\right)\bigg|_{x=0} = 4$$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $$\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = \frac{5}{4}$$

- $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $$4x^2 y'' + 2x(x^2 + 8)\, y' + (3x^2 + 5)\, y = 0$$

- Assume series solution for y

  $$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k - m$

  $$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k + r)\, x^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

  $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k + 1 - m + r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

  $$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k + r)\,(k + r - 1)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0 (5 + 2r)\,(1 + 2r)\, x^r + a_1 (7 + 2r)\,(3 + 2r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k (2k + 2r + 5)\,(2k + 2r + 1) + a_{k-2}(2\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(5+2r)(1+2r) = 0$
- Values of r that satisfy the indicial equation

  $r \in \left\{-\frac{5}{2}, -\frac{1}{2}\right\}$
- Each term must be 0

  $a_1(7+2r)(3+2r) = 0$
- Solve for the dependent coefficient(s)

  $a_1 = 0$
- Each term in the series must be 0, giving the recursion relation

  $4\left(k+r+\frac{1}{2}\right)\left(k+r+\frac{5}{2}\right)a_k + 2\left(k-\frac{1}{2}+r\right)a_{k-2} = 0$
- Shift index using $k- >k+2$

  $4\left(k+r+\frac{5}{2}\right)\left(k+\frac{9}{2}+r\right)a_{k+2} + 2\left(k+\frac{3}{2}+r\right)a_k = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{(2k+2r+3)a_k}{(2k+2r+5)(2k+9+2r)}$
- Recursion relation for $r = -\frac{5}{2}$

  $a_{k+2} = -\frac{(2k-2)a_k}{2k(2k+4)}$
- Solution for $r = -\frac{5}{2}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{5}{2}}, a_{k+2} = -\frac{(2k-2)a_k}{2k(2k+4)}, a_1 = 0\right]$
- Recursion relation for $r = -\frac{1}{2}$

  $a_{k+2} = -\frac{(2k+2)a_k}{(2k+4)(2k+8)}$
- Solution for $r = -\frac{1}{2}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{1}{2}}, a_{k+2} = -\frac{(2k+2)a_k}{(2k+4)(2k+8)}, a_1 = 0\right]$
- Combine solutions and rename parameters

  $\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-\frac{5}{2}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k-\frac{1}{2}}\right), a_{k+2} = -\frac{(2k-2)a_k}{2k(2k+4)}, a_1 = 0, b_{k+2} = -\frac{(2k+2)b_k}{(2k+4)(2k+8)}, b_1 = 0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 29.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x^2y'' + x(x^2+1)\,y' - (-3x^2+1)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + (x^3+x)\,y' + (3x^2-1)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{x^2+1}{x}$$
$$q(x) = \frac{3x^2-1}{x^2}$$

Table 836: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x^2+1}{x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{3x^2-1}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2 y'' + (x^3 + x) y' + (3x^2 - 1) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}\right) + (x^3 + x) \left(\sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}\right) + (3x^2 - 1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{n+r+2} a_n = \sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + x^{n+r} a_n (n+r) - a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) + x^r a_0 r - a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + x^r r - x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2-1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 1 \\ r_2 &= -1 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r^2 - 1)\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 2$ is an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right) \\ y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= x \left(\sum_{n=0}^{\infty} a_n x^n\right) \\ y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x} \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+1} \\ y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-1}\right) \end{aligned}$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) + a_{n-2}(n+r-2) + a_n(n+r) + 3a_{n-2} - a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}}{n+r-1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{a_{n-2}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{1}{1+r}$$

Which for the root $r = 1$ becomes

$$a_2 = -\frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{(1+r)(3+r)}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{1}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{1}{(1+r)(3+r)}$	$\frac{1}{8}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{1+r}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{1}{(1+r)(3+r)}$	$\frac{1}{8}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}y_1(x) &= x\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right)\\ &= x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)\end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 2$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_2(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned}a_N &= a_2\\ &= -\frac{1}{1+r}\end{aligned}$$

Therefore

$$\begin{aligned}\lim_{r\to r_2} -\frac{1}{1+r} &= \lim_{r\to -1} -\frac{1}{1+r}\\ &= \textit{undefined}\end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned}\frac{d}{dx}y_2(x) &= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\\ &= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n+r_2)\right)\end{aligned}$$

$$\begin{aligned}\frac{d^2}{dx^2}y_2(x) &= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2}\\ &\quad + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\\ &= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n+r_2)(-1+n+r_2)\right)\end{aligned}$$

Substituting these back into the given ode $x^2 y'' + (x^3 + x) y' + (3x^2 - 1) y = 0$ gives

$$
\begin{aligned}
&x^2 \left(C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \right. \\
&\left. + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2} (n + r_2)^2}{x^2} - \frac{b_n x^{n+r_2} (n + r_2)}{x^2} \right) \right) \\
&+ (x^3 + x) \left(C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2} (n + r_2)}{x} \right) \right) \\
&+ (3x^2 - 1) \left(C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2} \right) \right) = 0
\end{aligned}
$$

Which can be written as

$$
\begin{aligned}
&\left(\left(x^2 y_1''(x) + (x^3 + x) y_1'(x) + (3x^2 - 1) y_1(x) \right) \ln(x) + x^2 \left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2} \right) \right. \\
&\left. + \frac{(x^3 + x) y_1(x)}{x} \right) C + x^2 \left(\sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2} (n + r_2)^2}{x^2} - \frac{b_n x^{n+r_2} (n + r_2)}{x^2} \right) \right) \\
&+ (x^3 + x) \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2} (n + r_2)}{x} \right) + (3x^2 - 1) \left(\sum_{n=0}^{\infty} b_n x^{n+r_2} \right) = 0
\end{aligned}
\tag{7}
$$

But since $y_1(x)$ is a solution to the ode, then

$$
x^2 y_1''(x) + (x^3 + x) y_1'(x) + (3x^2 - 1) y_1(x) = 0
$$

Eq (7) simplifes to

$$
\begin{aligned}
&\left(x^2 \left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2} \right) + \frac{(x^3 + x) y_1(x)}{x} \right) C \\
&+ x^2 \left(\sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2} (n + r_2)^2}{x^2} - \frac{b_n x^{n+r_2} (n + r_2)}{x^2} \right) \right) \\
&+ (x^3 + x) \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2} (n + r_2)}{x} \right) + (3x^2 - 1) \left(\sum_{n=0}^{\infty} b_n x^{n+r_2} \right) = 0
\end{aligned}
\tag{8}
$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\left(\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right) x^2 + 2\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) x\right) C$$
$$+ \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) x^2$$
$$+ (x^3+x)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right)$$
$$+ 3\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) x^2 - \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{9}$$

Since $r_1 = 1$ and $r_2 = -1$ then the above becomes

$$\left(\left(\sum_{n=0}^{\infty} a_n x^{n+1}\right) x^2 + 2\left(\sum_{n=0}^{\infty} x^{n} a_n (n+1)\right) x\right) C$$
$$+ \left(\sum_{n=0}^{\infty} x^{-3+n} b_n (n-1)(n-2)\right) x^2 + (x^3+x)\left(\sum_{n=0}^{\infty} x^{n-2} b_n (n-1)\right)$$
$$+ 3\left(\sum_{n=0}^{\infty} b_n x^{n-1}\right) x^2 - \left(\sum_{n=0}^{\infty} b_n x^{n-1}\right) = 0 \tag{10}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} C\, x^{3+n} a_n\right) + \left(\sum_{n=0}^{\infty} 2C\, x^{n+1} a_n (n+1)\right)$$
$$+ \left(\sum_{n=0}^{\infty} x^{n-1} b_n (n^2-3n+2)\right) + \left(\sum_{n=0}^{\infty} x^{n+1} b_n (n-1)\right)$$
$$+ \left(\sum_{n=0}^{\infty} x^{n-1} b_n (n-1)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+1} b_n\right) + \sum_{n=0}^{\infty} \left(-b_n x^{n-1}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n-1} and

adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} C\,x^{3+n} a_n = \sum_{n=4}^{\infty} C a_{n-4} x^{n-1}$$

$$\sum_{n=0}^{\infty} 2C\,x^{n+1} a_n (n+1) = \sum_{n=2}^{\infty} 2C a_{n-2}(n-1)\,x^{n-1}$$

$$\sum_{n=0}^{\infty} x^{n+1} b_n (n-1) = \sum_{n=2}^{\infty} b_{n-2}(-3+n)\,x^{n-1}$$

$$\sum_{n=0}^{\infty} 3x^{n+1} b_n = \sum_{n=2}^{\infty} 3b_{n-2} x^{n-1}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-1$.

$$\begin{aligned}
&\left(\sum_{n=4}^{\infty} C a_{n-4} x^{n-1}\right) + \left(\sum_{n=2}^{\infty} 2C a_{n-2}(n-1)\,x^{n-1}\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n-1} b_n \left(n^2-3n+2\right)\right) + \left(\sum_{n=2}^{\infty} b_{n-2}(-3+n)\,x^{n-1}\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n-1} b_n (n-1)\right) + \left(\sum_{n=2}^{\infty} 3b_{n-2} x^{n-1}\right) + \sum_{n=0}^{\infty} \left(-b_n x^{n-1}\right) = 0
\end{aligned} \tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n=1$, Eq (2B) gives

$$-b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-b_1 = 0$$

Solving the above for b_1 gives

$$b_1 = 0$$

For $n = N$, where $N = 2$ which is the difference between the two roots, we are free to choose $b_2 = 0$. Hence for $n = 2$, Eq (2B) gives

$$2C + 2 = 0$$

Which is solved for C. Solving for C gives

$$C = -1$$

For $n = 3$, Eq (2B) gives

$$4Ca_1 + 3b_1 + 3b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$3b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 0$$

For $n = 4$, Eq (2B) gives

$$(a_0 + 6a_2)\, C + 4b_2 + 8b_4 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$2 + 8b_4 = 0$$

Solving the above for b_4 gives

$$b_4 = -\frac{1}{4}$$

For $n = 5$, Eq (2B) gives

$$(a_1 + 8a_3)\, C + 5b_3 + 15b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$15b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = 0$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -1$ and all b_n, then the second solution becomes

$$y_2(x) = (-1) \left(x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)\right) \ln(x) + \frac{1 - \frac{x^4}{4} + O(x^6)}{x}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \\
&\quad + c_2 \left((-1)\left(x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)\right)\ln(x) + \frac{1 - \frac{x^4}{4} + O(x^6)}{x}\right)
\end{aligned}
$$

Hence the final solution is

$$y = y_h$$

$$= c_1 x \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) + c_2 \left(-x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)\ln(x) + \frac{1 - \frac{x^4}{4} + O(x^6)}{x}\right)$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = c_1 x \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) \\
+ c_2 \left(-x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)\ln(x) + \frac{1 - \frac{x^4}{4} + O(x^6)}{x}\right)
\end{aligned}
\tag{1}
$$

Verification of solutions

$$y = c_1 x \left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right) + c_2 \left(-x\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O(x^6)\right)\ln(x) + \frac{1 - \frac{x^4}{4} + O(x^6)}{x}\right)$$

Verified OK.

16.33.1 Maple step by step solution

Let's solve

$x^2 y'' + (x^3 + x) y' + (3x^2 - 1) y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(3x^2-1)y}{x^2} - \frac{(x^2+1)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x^2+1)y'}{x} + \frac{(3x^2-1)y}{x^2} = 0$

- ☐ Check to see if $x_0 = 0$ is a regular singular point
  - Define functions

    $\left[P_2(x) = \frac{x^2+1}{x}, P_3(x) = \frac{3x^2-1}{x^2}\right]$
  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $(x \cdot P_2(x))\bigg|_{x=0} = 1$
  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $(x^2 \cdot P_3(x))\bigg|_{x=0} = -1$
  - $x = 0$is a regular singular point

    Check to see if $x_0 = 0$ is a regular singular point

    $x_0 = 0$
- Multiply by denominators

  $x^2y'' + x(x^2+1)\, y' + (3x^2-1)\, y = 0$
- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$
- ☐ Rewrite ODE with series expansions
  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$
  - Shift index using $k->k-m$

    $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$
  - Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$
  - Shift index using $k->k+1-m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^2 \cdot y''$ to series expansion

  $x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(1+r)(-1+r)\, x^r + a_1(2+r)\, r\, x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(k+r+1)(k+r-1) + a_{k-2}(k+r+1))\, x^{k-}\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(1+r)(-1+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{-1, 1\}$

- Each term must be 0

  $a_1(2+r)\, r = 0$

- Solve for the dependent coefficient(s)

  $a_1 = 0$

- Each term in the series must be 0, giving the recursion relation

  $(k+r+1)(a_k(k+r-1) + a_{k-2}) = 0$

- Shift index using $k- >k+2$

  $(k+r+3)(a_{k+2}(k+r+1) + a_k) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{a_k}{k+r+1}$

- Recursion relation for $r = -1$

  $a_{k+2} = -\frac{a_k}{k}$

- Solution for $r = -1$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+2} = -\frac{a_k}{k}, a_1 = 0\right]$

- Recursion relation for $r = 1$

  $a_{k+2} = -\frac{a_k}{k+2}$

- Solution for $r = 1$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+2} = -\frac{a_k}{k+2}, a_1 = 0\right]$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-1}\right) + \left(\sum_{k=0}^{\infty} b_k x^{1+k}\right), a_{k+2} = -\frac{a_k}{k}, a_1 = 0, b_{k+2} = -\frac{b_k}{k+2}, b_1 = 0\right]$$

Problem number: 30.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' + x\left(-2x^2+1\right)y' - 4y\left(2x^2+1\right) = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + \left(-2x^3+x\right)y' + \left(-8x^2-4\right)y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = -\frac{2x^2-1}{x}$$
$$q(x) = -\frac{4(2x^2+1)}{x^2}$$

Table 838: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{2x^2-1}{x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = -\frac{4(2x^2+1)}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2y'' + \left(-2x^3 + x\right) y' + \left(-8x^2 - 4\right) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}\right) + \left(-2x^3 + x\right) \left(\sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}\right) + \left(-8x^2 - 4\right) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-2x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-8x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-4a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-2x^{n+r+2} a_n (n+r)\right) = \sum_{n=2}^{\infty} \left(-2a_{n-2}(n+r-2)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} \left(-8x^{n+r+2} a_n\right) = \sum_{n=2}^{\infty} \left(-8a_{n-2} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=2}^{\infty} \left(-2a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \sum_{n=2}^{\infty} \left(-8a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-4a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + x^{n+r} a_n (n+r) - 4a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) + x^r a_0 r - 4a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + x^r r - 4x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2 - 4\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 4 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 2 \\ r_2 &= -2 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r^2 - 4)\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right) \\ y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= x^2 \left(\sum_{n=0}^{\infty} a_n x^n\right) \\ y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^2} \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+2} \\ y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-2}\right) \end{aligned}$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) - 2a_{n-2}(n+r-2) + a_n(n+r) - 8a_{n-2} - 4a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{2a_{n-2}}{n+r-2} \tag{4}$$

Which for the root $r = 2$ becomes

$$a_n = \frac{2a_{n-2}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{2}{r}$$

Which for the root $r = 2$ becomes

$$a_2 = 1$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2}{r}$	1

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2}{r}$	1
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4}{r(r+2)}$$

Which for the root $r = 2$ becomes

$$a_4 = \frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2}{r}$	1
a_3	0	0
a_4	$\frac{4}{r(r+2)}$	$\frac{1}{2}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2}{r}$	1
a_3	0	0
a_4	$\frac{4}{r(r+2)}$	$\frac{1}{2}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^2\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^2\left(1 + x^2 + \frac{x^4}{2} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_4 \\ &= \frac{4}{r\,(r+2)} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} \frac{4}{r\,(r+2)} &= \lim_{r\to -2} \frac{4}{r\,(r+2)} \\ &= \textit{undefined} \end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned} \frac{d}{dx} y_2(x) &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right) \\ &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) \\ \frac{d^2}{dx^2} y_2(x) &= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \\ &\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right) \\ &= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) \end{aligned}$$

Substituting these back into the given ode $x^2y'' + (-2x^3 + x)\,y' + (-8x^2 - 4)\,y = 0$ gives

$$x^2\left(Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) + (-2x^3 + x)\left(Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right) + (-8x^2 - 4)\left(Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)\right) = 0$$

Which can be written as

$$\left(\left(x^2y_1''(x) + (-2x^3 + x)\,y_1'(x) + (-8x^2 - 4)\,y_1(x)\right)\ln(x) + x^2\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) + \frac{(-2x^3 + x)\,y_1(x)}{x}\right)C + x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) + (-2x^3 + x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right) + (-8x^2 - 4)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$x^2y_1''(x) + (-2x^3 + x)\,y_1'(x) + (-8x^2 - 4)\,y_1(x) = 0$$

Eq (7) simplifes to

$$\left(x^2\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) + \frac{(-2x^3 + x)\,y_1(x)}{x}\right)C + x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right) + (-2x^3 + x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right) + (-8x^2 - 4)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{8}$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\begin{aligned} & \left(-2\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right) x^2 + 2\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) x\right) C \\ & + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) x^2 \\ & + (-2x^3+x)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) \\ & - 8\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) x^2 - 4\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \end{aligned} \tag{9}$$

Since $r_1 = 2$ and $r_2 = -2$ then the above becomes

$$\begin{aligned} & \left(-2\left(\sum_{n=0}^{\infty} a_n x^{n+2}\right) x^2 + 2\left(\sum_{n=0}^{\infty} x^{1+n} a_n (n+2)\right) x\right) C \\ & + \left(\sum_{n=0}^{\infty} x^{-4+n} b_n (n-2)(-3+n)\right) x^2 + (-2x^3+x)\left(\sum_{n=0}^{\infty} x^{-3+n} b_n (n-2)\right) \\ & - 8\left(\sum_{n=0}^{\infty} b_n x^{n-2}\right) x^2 - 4\left(\sum_{n=0}^{\infty} b_n x^{n-2}\right) = 0 \end{aligned} \tag{10}$$

Which simplifies to

$$\begin{aligned} & \sum_{n=0}^{\infty} \left(-2C\, x^{4+n} a_n\right) + \left(\sum_{n=0}^{\infty} 2C\, x^{n+2} a_n (n+2)\right) \\ & + \left(\sum_{n=0}^{\infty} x^{n-2} b_n (n^2-5n+6)\right) + \sum_{n=0}^{\infty} \left(-2x^n b_n (n-2)\right) \\ & + \left(\sum_{n=0}^{\infty} x^{n-2} b_n (n-2)\right) + \sum_{n=0}^{\infty} \left(-8 b_n x^n\right) + \sum_{n=0}^{\infty} \left(-4 b_n x^{n-2}\right) = 0 \end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n-2$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n-2} and

adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-2C\, x^{4+n} a_n\right) = \sum_{n=6}^{\infty} \left(-2C a_{n-6} x^{n-2}\right)$$

$$\sum_{n=0}^{\infty} 2C\, x^{n+2} a_n (n+2) = \sum_{n=4}^{\infty} 2C a_{-4+n} (n-2)\, x^{n-2}$$

$$\sum_{n=0}^{\infty} \left(-2x^n b_n (n-2)\right) = \sum_{n=2}^{\infty} \left(-2b_{n-2}(-4+n)\, x^{n-2}\right)$$

$$\sum_{n=0}^{\infty} \left(-8b_n x^n\right) = \sum_{n=2}^{\infty} \left(-8b_{n-2} x^{n-2}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-2$.

$$\begin{aligned}\sum_{n=6}^{\infty} \left(-2C a_{n-6} x^{n-2}\right) + \left(\sum_{n=4}^{\infty} 2C a_{-4+n}(n-2)\, x^{n-2}\right) \\ + \left(\sum_{n=0}^{\infty} x^{n-2} b_n \left(n^2-5n+6\right)\right) + \sum_{n=2}^{\infty} \left(-2b_{n-2}(-4+n)\, x^{n-2}\right) \\ + \left(\sum_{n=0}^{\infty} x^{n-2} b_n (n-2)\right) + \sum_{n=2}^{\infty} \left(-8b_{n-2} x^{n-2}\right) + \sum_{n=0}^{\infty} \left(-4b_n x^{n-2}\right) = 0\end{aligned} \tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n=1$, Eq (2B) gives

$$-3b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_1 = 0$$

Solving the above for b_1 gives

$$b_1 = 0$$

For $n=2$, Eq (2B) gives

$$-4b_0 - 4b_2 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-4 - 4b_2 = 0$$

Solving the above for b_2 gives

$$b_2 = -1$$

For $n = 3$, Eq (2B) gives

$$-6b_1 - 3b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 0$$

For $n = N$, where $N = 4$ which is the difference between the two roots, we are free to choose $b_4 = 0$. Hence for $n = 4$, Eq (2B) gives

$$4C + 8 = 0$$

Which is solved for C. Solving for C gives

$$C = -2$$

For $n = 5$, Eq (2B) gives

$$6Ca_1 - 10b_3 + 5b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$5b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = 0$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -2$ and all b_n, then the second solution becomes

$$y_2(x) = (-2)\left(x^2\left(1 + x^2 + \frac{x^4}{2} + O(x^6)\right)\right)\ln(x) + \frac{1 - x^2 + O(x^6)}{x^2}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^2\left(1 + x^2 + \frac{x^4}{2} + O(x^6)\right) \\
&\quad + c_2\left((-2)\left(x^2\left(1 + x^2 + \frac{x^4}{2} + O(x^6)\right)\right)\ln(x) + \frac{1 - x^2 + O(x^6)}{x^2}\right)
\end{aligned}$$

Hence the final solution is

$$y = y_h$$
$$= c_1 x^2 \left(1+x^2+\frac{x^4}{2}+O(x^6)\right)+c_2\left(-2x^2\left(1+x^2+\frac{x^4}{2}+O(x^6)\right)\ln(x)+\frac{1-x^2+O(x^6)}{x^2}\right)$$

Summary
The solution(s) found are the following

$$y = c_1 x^2 \left(1+x^2+\frac{x^4}{2}+O(x^6)\right) + c_2\left(-2x^2\left(1+x^2+\frac{x^4}{2}+O(x^6)\right)\ln(x)+\frac{1-x^2+O(x^6)}{x^2}\right) \tag{1}$$

Verification of solutions

$$y = c_1 x^2 \left(1+x^2+\frac{x^4}{2}+O(x^6)\right) + c_2\left(-2x^2\left(1+x^2+\frac{x^4}{2}+O(x^6)\right)\ln(x)+\frac{1-x^2+O(x^6)}{x^2}\right)$$

Verified OK.

16.34.1 Maple step by step solution

Let's solve

$x^2 y'' + (-2x^3 + x) y' + (-8x^2 - 4) y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{4(2x^2+1)y}{x^2} + \frac{(2x^2-1)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{(2x^2-1)y'}{x} - \frac{4(2x^2+1)y}{x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

    $\left[P_2(x) = -\frac{2x^2-1}{x}, P_3(x) = -\frac{4(2x^2+1)}{x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

$\left(x \cdot P_2(x)\right)\bigg|_{x=0} = 1$

- $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = -4$

- $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2 y'' - x(2x^2 - 1)\, y' + (-8x^2 - 4)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k- > k - m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k + r)\, x^{k+r-1+m}$

- Shift index using $k- > k + 1 - m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k + 1 - m + r)\, x^{k+r}$

- Convert $x^2 \cdot y''$ to series expansion

  $x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k + r)\,(k + r - 1)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(2 + r)\,(-2 + r)\, x^r + a_1(3 + r)\,(-1 + r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(k + r + 2)\,(k + r - 2) - 2a_{k-2}(k + r\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$(2+r)(-2+r)=0$

- Values of r that satisfy the indicial equation

  $r \in \{-2, 2\}$

- Each term must be 0

  $a_1(3+r)(-1+r)=0$

- Solve for the dependent coefficient(s)

  $a_1 = 0$

- Each term in the series must be 0, giving the recursion relation

  $(k+r+2)(a_k(k+r-2)-2a_{k-2})=0$

- Shift index using $k->k+2$

  $(k+r+4)(a_{k+2}(k+r)-2a_k)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = \frac{2a_k}{k+r}$

- Recursion relation for $r=-2$

  $a_{k+2} = \frac{2a_k}{k-2}$

- Series not valid for $r=-2$, division by 0 in the recursion relation at $k=2$

  $a_{k+2} = \frac{2a_k}{k-2}$

- Recursion relation for $r=2$

  $a_{k+2} = \frac{2a_k}{k+2}$

- Solution for $r=2$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+2}, a_{k+2} = \frac{2a_k}{k+2}, a_1 = 0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 31.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2y'' + 8y'x - (-x^2 + 35)\, y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$4x^2y'' + 8y'x + (x^2 - 35)\, y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{2}{x}$$
$$q(x) = \frac{x^2 - 35}{4x^2}$$

Table 840: Table $p(x), q(x)$ singularites.

$p(x) = \frac{2}{x}$	
singularity	type
$x = 0$	"regular"

$q(x) = \frac{x^2-35}{4x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : [∞]

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2y'' + 8y'x + \left(x^2 - 35\right) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2 \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + 8\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) x + \left(x^2 - 35\right) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 8x^{n+r} a_n(n+r)\right) \\
+\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n\right)+\sum_{n=0}^{\infty}\left(-35 a_n x^{n+r}\right)=0 \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty} x^{n+r+2} a_n=\sum_{n=2}^{\infty} a_{n-2} x^{n+r}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 8x^{n+r} a_n(n+r)\right) \\
+\left(\sum_{n=2}^{\infty} a_{n-2} x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-35 a_n x^{n+r}\right)=0 \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
4x^{n+r} a_n(n+r)(n+r-1)+8x^{n+r} a_n(n+r)-35 a_n x^{n+r}=0
$$

When $n=0$ the above becomes

$$
4x^r a_0 r(-1+r)+8x^r a_0 r-35 a_0 x^r=0
$$

Or

$$
\left(4x^r r(-1+r)+8x^r r-35x^r\right) a_0=0
$$

Since $a_0 \neq 0$ then the above simplifies to

$$
\left(4r^2+4r-35\right) x^r=0
$$

Since the above is true for all x then the indicial equation becomes

$$
4r^2+4r-35=0
$$

Solving for r gives the roots of the indicial equation as

$$
\begin{aligned}
r_1 &= \frac{5}{2} \\
r_2 &= -\frac{7}{2}
\end{aligned}
$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$
(4r^2 + 4r - 35)\, x^r = 0
$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 6$ is an integer, then we can construct two linearly independent solutions

$$
\begin{aligned}
y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right) \\
y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)
\end{aligned}
$$

Or

$$
\begin{aligned}
y_1(x) &= x^{\frac{5}{2}} \left(\sum_{n=0}^{\infty} a_n x^n\right) \\
y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^{\frac{7}{2}}}
\end{aligned}
$$

Or

$$
\begin{aligned}
y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+\frac{5}{2}} \\
y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{7}{2}}\right)
\end{aligned}
$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
a_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
4a_n(n+r)(n+r-1) + 8a_n(n+r) + a_{n-2} - 35a_n = 0 \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}}{4n^2 + 8nr + 4r^2 + 4n + 4r - 35} \tag{4}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_n = -\frac{a_{n-2}}{4n\,(n+6)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{5}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{1}{4r^2 + 20r - 11}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_2 = -\frac{1}{64}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{4r^2+20r-11}$	$-\frac{1}{64}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{4r^2+20r-11}$	$-\frac{1}{64}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{16r^4 + 224r^3 + 856r^2 + 504r - 495}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_4 = \frac{1}{10240}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{4r^2+20r-11}$	$-\frac{1}{64}$
a_3	0	0
a_4	$\frac{1}{16r^4+224r^3+856r^2+504r-495}$	$\frac{1}{10240}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{4r^2+20r-11}$	$-\frac{1}{64}$
a_3	0	0
a_4	$\frac{1}{16r^4+224r^3+856r^2+504r-495}$	$\frac{1}{10240}$
a_5	0	0

For $n = 6$, using the above recursive equation gives

$$a_6 = -\frac{1}{64r^6 + 1728r^5 + 17200r^4 + 76320r^3 + 138076r^2 + 41292r - 65835}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_6 = -\frac{1}{2949120}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{4r^2+20r-11}$	$-\frac{1}{64}$
a_3	0	0
a_4	$\frac{1}{16r^4+224r^3+856r^2+504r-495}$	$\frac{1}{10240}$
a_5	0	0
a_6	$-\frac{1}{64r^6+1728r^5+17200r^4+76320r^3+138076r^2+41292r-65835}$	$-\frac{1}{2949120}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{5}{2}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 \dots\right) \\ &= x^{\frac{5}{2}}\left(1 - \frac{x^2}{64} + \frac{x^4}{10240} - \frac{x^6}{2949120} + O(x^7)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 6$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r \to r_2} a_6(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_6 \\ &= -\frac{1}{64r^6 + 1728r^5 + 17200r^4 + 76320r^3 + 138076r^2 + 41292r - 65835} \end{aligned}$$

Therefore

$$\lim_{r\to r_2} -\frac{1}{64r^6+1728r^5+17200r^4+76320r^3+138076r^2+41292r-65835} = \lim_{r\to -\frac{7}{2}} -\frac{}{64r^6+1728r^5+1720}$$
$$= undefined$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned}
\frac{d}{dx}y_2(x) &= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\\
&= Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n(n+r_2)\right)\\
\frac{d^2}{dx^2}y_2(x) &= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2}\\
&\quad + \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\\
&= Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n(n+r_2)(-1+n+r_2)\right)
\end{aligned}$$

Substituting these back into the given ode $4x^2y''+8y'x+(x^2-35)\,y=0$ gives

$$\begin{aligned}
&4x^2\left(Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2}\right.\\
&\left.+ \sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+ 8\left(Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)x\\
&+ (x^2-35)\left(Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)\right) = 0
\end{aligned}$$

Which can be written as

$$\begin{gathered}\left(\left(\left(4x^2y_1''(x)+8y_1'(x)\,x+\left(x^2-35\right)y_1(x)\right)\ln\left(x\right)+4x^2\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)\right.\right.\\ \left.+8y_1(x)\right)C+4x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\ +8\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)x+\left(x^2-35\right)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0\end{gathered} \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$4x^2y_1''(x)+8y_1'(x)\,x+\left(x^2-35\right)y_1(x)=0$$

Eq (7) simplifes to

$$\begin{gathered}\left(4x^2\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+8y_1(x)\right)C\\ +4x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\ +8\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)x+\left(x^2-35\right)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0\end{gathered} \tag{8}$$

Substituting $y_1=\sum_{n=0}^{\infty}a_n x^{n+r_1}$ into the above gives

$$\begin{gathered}\left(8\left(\sum_{n=0}^{\infty}x^{-1+n+r_1}a_n(n+r_1)\right)x+4\left(\sum_{n=0}^{\infty}a_n x^{n+r_1}\right)\right)C\\ +4\left(\sum_{n=0}^{\infty}x^{-2+n+r_2}b_n(n+r_2)\left(-1+n+r_2\right)\right)x^2+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)x^2\\ +8\left(\sum_{n=0}^{\infty}x^{-1+n+r_2}b_n(n+r_2)\right)x-35\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0\end{gathered} \tag{9}$$

Since $r_1 = \frac{5}{2}$ and $r_2 = -\frac{7}{2}$ then the above becomes

$$\left(8\left(\sum_{n=0}^{\infty} x^{\frac{3}{2}+n} a_n \left(n+\frac{5}{2}\right)\right) x + 4\left(\sum_{n=0}^{\infty} a_n x^{n+\frac{5}{2}}\right)\right) C$$
$$+ 4\left(\sum_{n=0}^{\infty} x^{-\frac{11}{2}+n} b_n \left(n-\frac{7}{2}\right)\left(-\frac{9}{2}+n\right)\right) x^2 + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{7}{2}}\right) x^2 \tag{10}$$
$$+ 8\left(\sum_{n=0}^{\infty} x^{-\frac{9}{2}+n} b_n \left(n-\frac{7}{2}\right)\right) x - 35\left(\sum_{n=0}^{\infty} b_n x^{n-\frac{7}{2}}\right) = 0$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} (8n+20)\, C a_n x^{n+\frac{5}{2}}\right) + \left(\sum_{n=0}^{\infty} 4C a_n x^{n+\frac{5}{2}}\right)$$
$$+ \left(\sum_{n=0}^{\infty} x^{n-\frac{7}{2}} b_n (4n^2 - 32n + 63)\right) + \left(\sum_{n=0}^{\infty} x^{-\frac{3}{2}+n} b_n\right) \tag{2A}$$
$$+ \left(\sum_{n=0}^{\infty} (8n-28)\, b_n x^{n-\frac{7}{2}}\right) + \sum_{n=0}^{\infty} \left(-35 b_n x^{n-\frac{7}{2}}\right) = 0$$

The next step is to make all powers of x be $n-\frac{7}{2}$ in each summation term. Going over each summation term above with power of x in it which is not already $x^{n-\frac{7}{2}}$ and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} (8n+20)\, C a_n x^{n+\frac{5}{2}} = \sum_{n=6}^{\infty} C a_{n-6} (8n-28)\, x^{n-\frac{7}{2}}$$

$$\sum_{n=0}^{\infty} 4C a_n x^{n+\frac{5}{2}} = \sum_{n=6}^{\infty} 4C a_{n-6} x^{n-\frac{7}{2}}$$

$$\sum_{n=0}^{\infty} x^{-\frac{3}{2}+n} b_n = \sum_{n=2}^{\infty} b_{n-2} x^{n-\frac{7}{2}}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n-\frac{7}{2}$.

$$\left(\sum_{n=6}^{\infty} C a_{n-6}(8n-28)\, x^{n-\frac{7}{2}}\right)+\left(\sum_{n=6}^{\infty} 4C a_{n-6} x^{n-\frac{7}{2}}\right)$$
$$+\left(\sum_{n=0}^{\infty} x^{n-\frac{7}{2}} b_n \left(4n^2-32n+63\right)\right)+\left(\sum_{n=2}^{\infty} b_{n-2} x^{n-\frac{7}{2}}\right) \tag{2B}$$
$$+\left(\sum_{n=0}^{\infty} (8n-28)\, b_n x^{n-\frac{7}{2}}\right)+\sum_{n=0}^{\infty}\left(-35 b_n x^{n-\frac{7}{2}}\right)=0$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0=1$. For $n=1$, Eq (2B) gives

$$-20b_1=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-20b_1=0$$

Solving the above for b_1 gives

$$b_1=0$$

For $n=2$, Eq (2B) gives

$$-32b_2+b_0=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-32b_2+1=0$$

Solving the above for b_2 gives

$$b_2=\frac{1}{32}$$

For $n=3$, Eq (2B) gives

$$-36b_3+b_1=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-36b_3=0$$

Solving the above for b_3 gives

$$b_3=0$$

For $n=4$, Eq (2B) gives

$$-32b_4+b_2=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-32b_4 + \frac{1}{32} = 0$$

Solving the above for b_4 gives

$$b_4 = \frac{1}{1024}$$

For $n = 5$, Eq (2B) gives

$$-20b_5 + b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-20b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = 0$$

For $n = N$, where $N = 6$ which is the difference between the two roots, we are free to choose $b_6 = 0$. Hence for $n = 6$, Eq (2B) gives

$$24C + \frac{1}{1024} = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{1}{24576}$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{1}{24576}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{1}{24576}\left(x^{\frac{5}{2}}\left(1 - \frac{x^2}{64} + \frac{x^4}{10240} - \frac{x^6}{2949120} + O(x^7)\right)\right)\ln(x) + \frac{1 + \frac{x^2}{32} + \frac{x^4}{1024} + O(x^7)}{x^{\frac{7}{2}}}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{5}{2}} \left(1 - \frac{x^2}{64} + \frac{x^4}{10240} - \frac{x^6}{2949120} + O(x^7)\right) \\
&\quad + c_2 \left(-\frac{1}{24576} \left(x^{\frac{5}{2}} \left(1 - \frac{x^2}{64} + \frac{x^4}{10240} - \frac{x^6}{2949120} + O(x^7)\right)\right) \ln(x) \right. \\
&\quad \left. + \frac{1 + \frac{x^2}{32} + \frac{x^4}{1024} + O(x^7)}{x^{\frac{7}{2}}}\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{5}{2}} \left(1 - \frac{x^2}{64} + \frac{x^4}{10240} - \frac{x^6}{2949120} + O(x^7)\right) \\
&\quad + c_2 \left(-\frac{x^{\frac{5}{2}} \left(1 - \frac{x^2}{64} + \frac{x^4}{10240} - \frac{x^6}{2949120} + O(x^7)\right) \ln(x)}{24576} + \frac{1 + \frac{x^2}{32} + \frac{x^4}{1024} + O(x^7)}{x^{\frac{7}{2}}}\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y &= c_1 x^{\frac{5}{2}} \left(1 - \frac{x^2}{64} + \frac{x^4}{10240} - \frac{x^6}{2949120} + O(x^7)\right) \\
&\quad + c_2 \left(-\frac{x^{\frac{5}{2}} \left(1 - \frac{x^2}{64} + \frac{x^4}{10240} - \frac{x^6}{2949120} + O(x^7)\right) \ln(x)}{24576} + \frac{1 + \frac{x^2}{32} + \frac{x^4}{1024} + O(x^7)}{x^{\frac{7}{2}}}\right)
\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}
y &= c_1 x^{\frac{5}{2}} \left(1 - \frac{x^2}{64} + \frac{x^4}{10240} - \frac{x^6}{2949120} + O(x^7)\right) \\
&\quad + c_2 \left(-\frac{x^{\frac{5}{2}} \left(1 - \frac{x^2}{64} + \frac{x^4}{10240} - \frac{x^6}{2949120} + O(x^7)\right) \ln(x)}{24576} + \frac{1 + \frac{x^2}{32} + \frac{x^4}{1024} + O(x^7)}{x^{\frac{7}{2}}}\right)
\end{aligned}$$

Verified OK.

16.35.1 Maple step by step solution

Let's solve

$4x^2y'' + 8y'x + (x^2 - 35)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(x^2-35)y}{4x^2} - \frac{2y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{2y'}{x} + \frac{(x^2-35)y}{4x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{2}{x}, P_3(x) = \frac{x^2-35}{4x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left.(x \cdot P_2(x))\right|_{x=0} = 2$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left.(x^2 \cdot P_3(x))\right|_{x=0} = -\frac{35}{4}$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $4x^2y'' + 8y'x + (x^2 - 35)\,y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m}x^{k+r}$

- Convert $x\cdot y'$ to series expansion

  $x\cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r}$

- Convert $x^{2}\cdot y''$ to series expansion

  $x^{2}\cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(7+2r)\,(-5+2r)\,x^{r}+a_1(9+2r)\,(-3+2r)\,x^{1+r}+\left(\sum_{k=2}^{\infty} (a_k(2k+2r+7)\,(2k+2r-5)+a_{k-}\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(7+2r)\,(-5+2r)=0$

- Values of r that satisfy the indicial equation

  $r\in\left\{-\frac{7}{2},\frac{5}{2}\right\}$

- Each term must be 0

  $a_1(9+2r)\,(-3+2r)=0$

- Solve for the dependent coefficient(s)

  $a_1=0$

- Each term in the series must be 0, giving the recursion relation

  $4\left(k+r+\frac{7}{2}\right)\left(k+r-\frac{5}{2}\right)a_k+a_{k-2}=0$

- Shift index using $k->k+2$

  $4\left(k+\frac{11}{2}+r\right)\left(k-\frac{1}{2}+r\right)a_{k+2}+a_k=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{a_k}{(2k+11+2r)(2k-1+2r)}$

- Recursion relation for $r=-\frac{7}{2}$

  $a_{k+2}=-\frac{a_k}{(2k+4)(2k-8)}$

- Series not valid for $r=-\frac{7}{2}$, division by 0 in the recursion relation at $k=4$

  $a_{k+2}=-\frac{a_k}{(2k+4)(2k-8)}$

- Recursion relation for $r = \frac{5}{2}$

  $a_{k+2} = -\frac{a_k}{(2k+16)(2k+4)}$

- Solution for $r = \frac{5}{2}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{5}{2}}, a_{k+2} = -\frac{a_k}{(2k+16)(2k+4)}, a_1 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 32.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{9x^2y'' - 3x\left(2x^2+11\right)y' + \left(10x^2+13\right)y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$9x^2y'' + \left(-6x^3 - 33x\right)y' + \left(10x^2+13\right)y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$\begin{aligned}p(x) &= -\frac{2x^2+11}{3x}\\ q(x) &= \frac{10x^2+13}{9x^2}\end{aligned}$$

Table 842: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{2x^2+11}{3x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{10x^2+13}{9x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$9x^2y'' + \left(-6x^3 - 33x\right) y' + \left(10x^2 + 13\right) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$9x^2 \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(-6x^3 - 33x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(10x^2 + 13\right) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-6x^{n+r+2} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-33x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 10x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 13a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-6x^{n+r+2} a_n (n+r)\right) = \sum_{n=2}^{\infty} \left(-6a_{n-2}(n+r-2)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} 10x^{n+r+2} a_n = \sum_{n=2}^{\infty} 10a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=2}^{\infty} \left(-6a_{n-2}(n+r-2)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-33x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 10a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 13a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$9x^{n+r} a_n (n+r)(n+r-1) - 33x^{n+r} a_n (n+r) + 13a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$9x^r a_0 r(-1+r) - 33x^r a_0 r + 13a_0 x^r = 0$$

Or

$$\left(9x^r r(-1+r) - 33x^r r + 13x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(9r^2 - 42r + 13\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$9r^2 - 42r + 13 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{13}{3}$$
$$r_2 = \frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(9r^2 - 42r + 13\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^{\frac{13}{3}} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{\frac{1}{3}} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{13}{3}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+\frac{1}{3}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$9a_n(n+r)(n+r-1) - 6a_{n-2}(n+r-2) - 33a_n(n+r) + 10a_{n-2} + 13a_n = 0 \quad (3)$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{2a_{n-2}(3n+3r-11)}{9n^2+18nr+9r^2-42n-42r+13} \quad (4)$$

Which for the root $r = \frac{13}{3}$ becomes

$$a_n = \frac{2a_{n-2}(3n+2)}{9n(n+4)} \quad (5)$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{13}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-10+6r}{9r^2-6r-35}$$

Which for the root $r = \frac{13}{3}$ becomes

$$a_2 = \frac{4}{27}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-10+6r}{9r^2-6r-35}$	$\frac{4}{27}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-10+6r}{9r^2-6r-35}$	$\frac{4}{27}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{36r^2 - 48r - 20}{(9r^2 - 6r - 35)(9r^2 + 30r - 11)}$$

Which for the root $r = \frac{13}{3}$ becomes

$$a_4 = \frac{7}{486}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-10+6r}{9r^2-6r-35}$	$\frac{4}{27}$
a_3	0	0
a_4	$\frac{36r^2-48r-20}{(9r^2-6r-35)(9r^2+30r-11)}$	$\frac{7}{486}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-10+6r}{9r^2-6r-35}$	$\frac{4}{27}$
a_3	0	0
a_4	$\frac{36r^2-48r-20}{(9r^2-6r-35)(9r^2+30r-11)}$	$\frac{7}{486}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^{\frac{13}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^{\frac{13}{3}}\left(1 + \frac{4x^2}{27} + \frac{7x^4}{486} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Let

$$
r_1 - r_2 = N
$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$
\begin{aligned}
a_N &= a_4 \\
&= \frac{36r^2 - 48r - 20}{(9r^2 - 6r - 35)(9r^2 + 30r - 11)}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\lim_{r\to r_2} \frac{36r^2 - 48r - 20}{(9r^2 - 6r - 35)(9r^2 + 30r - 11)} &= \lim_{r\to \frac{1}{3}} \frac{36r^2 - 48r - 20}{(9r^2 - 6r - 35)(9r^2 + 30r - 11)} \\
&= \textit{undefined}
\end{aligned}
$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$
y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)
$$

Therefore

$$
\begin{aligned}
\frac{d}{dx} y_2(x) &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n + r_2)}{x}\right) \\
&= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n + r_2)\right) \\
\frac{d^2}{dx^2} y_2(x) &= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n + r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n + r_2)}{x^2}\right) \\
&= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n + r_2)(-1 + n + r_2)\right)
\end{aligned}
$$

Substituting these back into the given ode $9x^2y'' + (-6x^3 - 33x)\,y' + (10x^2 + 13)\,y = 0$ gives

$$\begin{aligned}
&9x^2\left(Cy_1''(x)\ln(x) + \frac{2Cy_1'(x)}{x} - \frac{Cy_1(x)}{x^2}\right.\\
&\left.+\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+(-6x^3-33x)\left(Cy_1'(x)\ln(x) + \frac{Cy_1(x)}{x} + \left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)\\
&+(10x^2+13)\left(Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)\right) = 0
\end{aligned}$$

Which can be written as

$$\begin{aligned}
&\left(\left(9x^2y_1''(x) + (-6x^3-33x)\,y_1'(x) + (10x^2+13)\,y_1(x)\right)\ln(x)\right.\\
&\left.+9x^2\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) + \frac{(-6x^3-33x)\,y_1(x)}{x}\right)C\\
&+9x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+(-6x^3-33x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right) + (10x^2+13)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0
\end{aligned} \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$9x^2y_1''(x) + (-6x^3-33x)\,y_1'(x) + (10x^2+13)\,y_1(x) = 0$$

Eq (7) simplifes to

$$\begin{aligned}
&\left(9x^2\left(\frac{2y_1'(x)}{x} - \frac{y_1(x)}{x^2}\right) + \frac{(-6x^3-33x)\,y_1(x)}{x}\right)C\\
&+9x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)\\
&+(-6x^3-33x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right) + (10x^2+13)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0
\end{aligned} \tag{8}$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$
\begin{aligned}
&\left(18\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) x + 6(-x^2-7)\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right)\right) C \\
&+ 9\left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) x^2 \\
&+ 3(-2x^3-11x)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) + (10x^2+13)\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0
\end{aligned} \tag{9}
$$

Since $r_1 = \frac{13}{3}$ and $r_2 = \frac{1}{3}$ then the above becomes

$$
\begin{aligned}
&\left(18\left(\sum_{n=0}^{\infty} x^{\frac{10}{3}+n} a_n \left(n+\frac{13}{3}\right)\right) x + 6(-x^2-7)\left(\sum_{n=0}^{\infty} a_n x^{n+\frac{13}{3}}\right)\right) C \\
&+ 9\left(\sum_{n=0}^{\infty} x^{-\frac{5}{3}+n} b_n \left(n+\frac{1}{3}\right)\left(-\frac{2}{3}+n\right)\right) x^2 \\
&+ 3(-2x^3-11x)\left(\sum_{n=0}^{\infty} x^{-\frac{2}{3}+n} b_n \left(n+\frac{1}{3}\right)\right) + (10x^2+13)\left(\sum_{n=0}^{\infty} b_n x^{n+\frac{1}{3}}\right) = 0
\end{aligned} \tag{10}
$$

Expanding $-6C\,x^{\frac{19}{3}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$
\begin{aligned}
-6C\,x^{\frac{19}{3}} &= -6C\,x^{\frac{19}{3}} + \dots \\
&= -6C\,x^{\frac{19}{3}}
\end{aligned}
$$

Expanding $-42C\,x^{\frac{13}{3}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$
\begin{aligned}
-42C\,x^{\frac{13}{3}} &= -42C\,x^{\frac{13}{3}} + \dots \\
&= -42C\,x^{\frac{13}{3}}
\end{aligned}
$$

Expanding $-2x^{\frac{7}{3}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$
\begin{aligned}
-2x^{\frac{7}{3}} &= -2x^{\frac{7}{3}} + \dots \\
&= -2x^{\frac{7}{3}}
\end{aligned}
$$

Expanding $-11x^{\frac{1}{3}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$
\begin{aligned}
-11x^{\frac{1}{3}} &= -11x^{\frac{1}{3}} + \dots \\
&= -11x^{\frac{1}{3}}
\end{aligned}
$$

Expanding $10x^{\frac{7}{3}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$
\begin{aligned}
10x^{\frac{7}{3}} &= 10x^{\frac{7}{3}} + \dots \\
&= 10x^{\frac{7}{3}}
\end{aligned}
$$

Expanding $13x^{\frac{1}{3}}$ as Taylor series around $x = 0$ and keeping only the first 6 terms gives

$$
\begin{aligned}
13x^{\frac{1}{3}} &= 13x^{\frac{1}{3}} + \dots \\
&= 13x^{\frac{1}{3}}
\end{aligned}
$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} (18n+78)\, C a_n x^{n+\frac{13}{3}}\right) + \sum_{n=0}^{\infty} \left(-6C\, x^{n+\frac{19}{3}} a_n\right) + \sum_{n=0}^{\infty} \left(-42C\, x^{n+\frac{13}{3}} a_n\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n+\frac{1}{3}} b_n \left(9n^2-3n-2\right)\right) + \left(\sum_{n=0}^{\infty} (-6n-2)\, b_n x^{n+\frac{7}{3}}\right) \\
&+ \left(\sum_{n=0}^{\infty} (-33n-11)\, b_n x^{n+\frac{1}{3}}\right) + \left(\sum_{n=0}^{\infty} 10x^{n+\frac{7}{3}} b_n\right) + \left(\sum_{n=0}^{\infty} 13 b_n x^{n+\frac{1}{3}}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n + \frac{1}{3}$ in each summation term. Going over each summation term above with power of x in it which is not already $x^{n+\frac{1}{3}}$ and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} (18n+78)\, C a_n x^{n+\frac{13}{3}} &= \sum_{n=4}^{\infty} C a_{n-4} (18n+6)\, x^{n+\frac{1}{3}} \\
\sum_{n=0}^{\infty} \left(-6C\, x^{n+\frac{19}{3}} a_n\right) &= \sum_{n=6}^{\infty} \left(-6C a_{n-6} x^{n+\frac{1}{3}}\right) \\
\sum_{n=0}^{\infty} \left(-42C\, x^{n+\frac{13}{3}} a_n\right) &= \sum_{n=4}^{\infty} \left(-42C a_{n-4} x^{n+\frac{1}{3}}\right)
\end{aligned}
$$

$$\sum_{n=0}^{\infty} \left(-6n -2\right) b_{n} x^{n +\frac{7}{3}} = \sum_{n=2}^{\infty} b_{n -2} \left(-6n +10\right) x^{n +\frac{1}{3}}$$

$$\sum_{n=0}^{\infty} 10 x^{n +\frac{7}{3}} b_{n} = \sum_{n=2}^{\infty} 10 b_{n -2} x^{n +\frac{1}{3}}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n +\frac{1}{3}$.

$$\begin{aligned}
&\left(\sum_{n=4}^{\infty} C a_{n -4} \left(18 n +6\right) x^{n +\frac{1}{3}}\right)+\sum_{n=6}^{\infty} \left(-6 C a_{n -6} x^{n +\frac{1}{3}}\right) \\
&+\sum_{n=4}^{\infty} \left(-42 C a_{n -4} x^{n +\frac{1}{3}}\right)+\left(\sum_{n=0}^{\infty} x^{n +\frac{1}{3}} b_{n} \left(9 n^{2}-3 n -2\right)\right) \\
&+\left(\sum_{n=2}^{\infty} b_{n -2} \left(-6 n +10\right) x^{n +\frac{1}{3}}\right)+\left(\sum_{n=0}^{\infty} \left(-33 n -11\right) b_{n} x^{n +\frac{1}{3}}\right) \\
&+\left(\sum_{n=2}^{\infty} 10 b_{n -2} x^{n +\frac{1}{3}}\right)+\left(\sum_{n=0}^{\infty} 13 b_{n} x^{n +\frac{1}{3}}\right) = 0
\end{aligned} \tag{2B}$$

For $n = 0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n = 1$, Eq (2B) gives

$$-27 b_{1} = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-27 b_{1} = 0$$

Solving the above for b_1 gives

$$b_{1} = 0$$

For $n = 2$, Eq (2B) gives

$$-36 b_{2}+8 b_{0} = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-36 b_{2}+8 = 0$$

Solving the above for b_2 gives

$$b_{2} = \frac{2}{9}$$

For $n = 3$, Eq (2B) gives

$$-27b_3 + 2b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-27b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 0$$

For $n = N$, where $N = 4$ which is the difference between the two roots, we are free to choose $b_4 = 0$. Hence for $n = 4$, Eq (2B) gives

$$36C - \frac{8}{9} = 0$$

Which is solved for C. Solving for C gives

$$C = \frac{2}{81}$$

For $n = 5$, Eq (2B) gives

$$54Ca_1 - 10b_3 + 45b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$45b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = 0$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = \frac{2}{81}$ and all b_n, then the second solution becomes

$$y_2(x) = \frac{2}{81}\left(x^{\frac{13}{3}}\left(1 + \frac{4x^2}{27} + \frac{7x^4}{486} + O(x^6)\right)\right)\ln(x) + x^{\frac{1}{3}}\left(1 + \frac{2x^2}{9} + O(x^6)\right)$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1y_1(x) + c_2y_2(x) \\
&= c_1x^{\frac{13}{3}}\left(1 + \frac{4x^2}{27} + \frac{7x^4}{486} + O(x^6)\right) \\
&\quad + c_2\left(\frac{2}{81}\left(x^{\frac{13}{3}}\left(1 + \frac{4x^2}{27} + \frac{7x^4}{486} + O(x^6)\right)\right)\ln(x) + x^{\frac{1}{3}}\left(1 + \frac{2x^2}{9} + O(x^6)\right)\right)
\end{aligned}$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{13}{3}} \left(1+\frac{4x^2}{27}+\frac{7x^4}{486}+O(x^6)\right) \\
&+ c_2 \left(\frac{2x^{\frac{13}{3}} \left(1+\frac{4x^2}{27}+\frac{7x^4}{486}+O(x^6)\right) \ln(x)}{81} + x^{\frac{1}{3}} \left(1+\frac{2x^2}{9}+O(x^6)\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = c_1 x^{\frac{13}{3}} \left(1+\frac{4x^2}{27}+\frac{7x^4}{486}+O(x^6)\right) \\
+ c_2 \left(\frac{2x^{\frac{13}{3}} \left(1+\frac{4x^2}{27}+\frac{7x^4}{486}+O(x^6)\right) \ln(x)}{81} + x^{\frac{1}{3}} \left(1+\frac{2x^2}{9}+O(x^6)\right)\right)
\end{aligned}
\tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y = c_1 x^{\frac{13}{3}} \left(1+\frac{4x^2}{27}+\frac{7x^4}{486}+O(x^6)\right) \\
+ c_2 \left(\frac{2x^{\frac{13}{3}} \left(1+\frac{4x^2}{27}+\frac{7x^4}{486}+O(x^6)\right) \ln(x)}{81} + x^{\frac{1}{3}} \left(1+\frac{2x^2}{9}+O(x^6)\right)\right)
\end{aligned}
$$

Verified OK.

16.36.1 Maple step by step solution

Let's solve

$9x^2 y'' + (-6x^3 - 33x) y' + (10x^2 + 13) y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(10x^2+13)y}{9x^2} + \frac{(2x^2+11)y'}{3x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{(2x^2+11)y'}{3x} + \frac{(10x^2+13)y}{9x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

- ○ Define functions

  $\left[P_2(x) = -\frac{2x^2+11}{3x}, P_3(x) = \frac{10x^2+13}{9x^2}\right]$

- ○ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\Big|_{x=0} = -\frac{11}{3}$

- ○ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\Big|_{x=0} = \frac{13}{9}$

- ○ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $9x^2 y'' - 3x(2x^2 + 11)\, y' + (10x^2 + 13)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

- ○ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- ○ Shift index using $k- >k - m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- ○ Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k + r)\, x^{k+r-1+m}$

- ○ Shift index using $k- >k + 1 - m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k + 1 - m + r)\, x^{k+r}$

- ○ Convert $x^2 \cdot y''$ to series expansion

$$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(-1+3r)(-13+3r)\, x^r + a_1(2+3r)(-10+3r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(3k+3r-1)(3k+3r-13)\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(-1+3r)(-13+3r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{\frac{1}{3}, \frac{13}{3}\right\}$$

- Each term must be 0

  $$a_1(2+3r)(-10+3r) = 0$$

- Solve for the dependent coefficient(s)

  $$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$9\left(k+r-\frac{1}{3}\right)\left(k+r-\frac{13}{3}\right) a_k - 6\left(k-\frac{11}{3}+r\right) a_{k-2} = 0$$

- Shift index using $k->k+2$

  $$9\left(k+\frac{5}{3}+r\right)\left(k-\frac{7}{3}+r\right) a_{k+2} - 6\left(k-\frac{5}{3}+r\right) a_k = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2} = \frac{2(3k+3r-5)a_k}{(3k+5+3r)(3k-7+3r)}$$

- Recursion relation for $r = \frac{1}{3}$

  $$a_{k+2} = \frac{2(3k-4)a_k}{(3k+6)(3k-6)}$$

- Series not valid for $r = \frac{1}{3}$, division by 0 in the recursion relation at $k = 2$

  $$a_{k+2} = \frac{2(3k-4)a_k}{(3k+6)(3k-6)}$$

- Recursion relation for $r = \frac{13}{3}$

  $$a_{k+2} = \frac{2(3k+8)a_k}{(3k+18)(3k+6)}$$

- Solution for $r = \frac{13}{3}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{13}{3}}, a_{k+2} = \frac{2(3k+8)a_k}{(3k+18)(3k+6)}, a_1 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 33.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries], [_2nd_order, _linear, `
   _with_symmetry_[0,F(x)]`]]
```

$$\boxed{x^2y'' + x(-2x^2 + 1)\,y' - 4(1 - x^2)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + (-2x^3 + x)\,y' + (4x^2 - 4)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = -\frac{2x^2 - 1}{x}$$
$$q(x) = \frac{4x^2 - 4}{x^2}$$

Table 844: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{2x^2-1}{x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{4x^2-4}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2y'' + \left(-2x^3 + x\right) y' + \left(4x^2 - 4\right) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2 \left(\sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}\right) + \left(-2x^3 + x\right) \left(\sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}\right) + \left(4x^2 - 4\right) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-2x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-4a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-2x^{n+r+2} a_n (n+r)\right) = \sum_{n=2}^{\infty} \left(-2a_{n-2}(n+r-2)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} 4x^{n+r+2} a_n = \sum_{n=2}^{\infty} 4a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=2}^{\infty} \left(-2a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 4a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-4a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + x^{n+r} a_n (n+r) - 4a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) + x^r a_0 r - 4a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + x^r r - 4x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2-4\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 4 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 2 \\ r_2 &= -2 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r^2 - 4) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= x^2 \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^2} \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+2} \\ y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-2} \right) \end{aligned}$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) - 2a_{n-2}(n+r-2) + a_n(n+r) + 4a_{n-2} - 4a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{2a_{n-2}(n+r-4)}{n^2+2nr+r^2-4} \tag{4}$$

Which for the root $r = 2$ becomes

$$a_n = \frac{2a_{n-2}(n-2)}{n(n+4)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-4+2r}{r(r+4)}$$

Which for the root $r = 2$ becomes

$$a_2 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4+2r}{r(r+4)}$	0

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4+2r}{r(r+4)}$	0
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{-8+4r}{(r+4)(r+6)(r+2)}$$

Which for the root $r = 2$ becomes

$$a_4 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4+2r}{r(r+4)}$	0
a_3	0	0
a_4	$\frac{-8+4r}{(r+4)(r+6)(r+2)}$	0

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4+2r}{r(r+4)}$	0
a_3	0	0
a_4	$\frac{-8+4r}{(r+4)(r+6)(r+2)}$	0
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= x^2\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^2\left(1 + O(x^6)\right)
\end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r \to r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned}
a_N &= a_4 \\
&= \frac{-8 + 4r}{(r + 4)(r + 6)(r + 2)}
\end{aligned}$$

Therefore

$$\begin{aligned}
\lim_{r \to r_2} \frac{-8 + 4r}{(r + 4)(r + 6)(r + 2)} &= \lim_{r \to -2} \frac{-8 + 4r}{(r + 4)(r + 6)(r + 2)} \\
&= \textit{undefined}
\end{aligned}$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Therefore

$$\begin{aligned}
\frac{d}{dx} y_2(x) &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n+r_2}(n + r_2)}{x}\right) \\
&= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n + r_2)\right) \\
\frac{d^2}{dx^2} y_2(x) &= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n+r_2}(n + r_2)^2}{x^2} - \frac{b_n x^{n+r_2}(n + r_2)}{x^2}\right) \\
&= C y_1''(x) \ln(x) + \frac{2C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n + r_2)(-1 + n + r_2)\right)
\end{aligned}$$

Substituting these back into the given ode $x^2y''+(-2x^3+x)\,y'+(4x^2-4)\,y=0$ gives

$$x^2\left(Cy_1''(x)\ln(x)+\frac{2Cy_1'(x)}{x}-\frac{Cy_1(x)}{x^2}+\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+(-2x^3+x)\left(Cy_1'(x)\ln(x)+\frac{Cy_1(x)}{x}+\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)+(4x^2-4)\left(Cy_1(x)\ln(x)+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)\right)=0$$

Which can be written as

$$\left(\left(x^2y_1''(x)+(-2x^3+x)\,y_1'(x)+(4x^2-4)\,y_1(x)\right)\ln(x)+x^2\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{(-2x^3+x)\,y_1(x)}{x}\right)C+x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+(-2x^3+x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(4x^2-4)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0 \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$x^2y_1''(x)+(-2x^3+x)\,y_1'(x)+(4x^2-4)\,y_1(x)=0$$

Eq (7) simplifes to

$$\left(x^2\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{(-2x^3+x)\,y_1(x)}{x}\right)C+x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+(-2x^3+x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(4x^2-4)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0 \tag{8}$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$\left(-2\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right) x^2 + 2\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) x\right) C + \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) x^2 + (-2x^3+x)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) + 4\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) x^2 - 4\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0 \tag{9}$$

Since $r_1 = 2$ and $r_2 = -2$ then the above becomes

$$\left(-2\left(\sum_{n=0}^{\infty} a_n x^{n+2}\right) x^2 + 2\left(\sum_{n=0}^{\infty} x^{1+n} a_n (n+2)\right) x\right) C + \left(\sum_{n=0}^{\infty} x^{-4+n} b_n (n-2)(-3+n)\right) x^2 + (-2x^3+x)\left(\sum_{n=0}^{\infty} x^{-3+n} b_n (n-2)\right) + 4\left(\sum_{n=0}^{\infty} b_n x^{n-2}\right) x^2 - 4\left(\sum_{n=0}^{\infty} b_n x^{n-2}\right) = 0 \tag{10}$$

Which simplifies to

$$\sum_{n=0}^{\infty} \left(-2C\, x^{n+4} a_n\right) + \left(\sum_{n=0}^{\infty} 2C\, x^{n+2} a_n (n+2)\right) + \left(\sum_{n=0}^{\infty} x^{n-2} b_n \left(n^2-5n+6\right)\right) + \sum_{n=0}^{\infty} \left(-2x^n b_n (n-2)\right) + \left(\sum_{n=0}^{\infty} x^{n-2} b_n (n-2)\right) + \left(\sum_{n=0}^{\infty} 4 b_n x^n\right) + \sum_{n=0}^{\infty} \left(-4 b_n x^{n-2}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n-2$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n-2} and

adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty}\left(-2C\,x^{n+4}a_n\right)=\sum_{n=6}^{\infty}\left(-2Ca_{n-6}x^{n-2}\right)$$

$$\sum_{n=0}^{\infty}2C\,x^{n+2}a_n(n+2)=\sum_{n=4}^{\infty}2Ca_{-4+n}(n-2)\,x^{n-2}$$

$$\sum_{n=0}^{\infty}\left(-2x^n b_n(n-2)\right)=\sum_{n=2}^{\infty}\left(-2b_{n-2}(-4+n)\,x^{n-2}\right)$$

$$\sum_{n=0}^{\infty}4b_n x^n=\sum_{n=2}^{\infty}4b_{n-2}x^{n-2}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-2$.

$$\begin{aligned}&\sum_{n=6}^{\infty}\left(-2Ca_{n-6}x^{n-2}\right)+\left(\sum_{n=4}^{\infty}2Ca_{-4+n}(n-2)\,x^{n-2}\right)\\&+\left(\sum_{n=0}^{\infty}x^{n-2}b_n\left(n^2-5n+6\right)\right)+\sum_{n=2}^{\infty}\left(-2b_{n-2}(-4+n)\,x^{n-2}\right)\\&+\left(\sum_{n=0}^{\infty}x^{n-2}b_n(n-2)\right)+\left(\sum_{n=2}^{\infty}4b_{n-2}x^{n-2}\right)+\sum_{n=0}^{\infty}\left(-4b_n x^{n-2}\right)=0\end{aligned}\tag{2B}$$

For $n=0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0=1$. For $n=1$, Eq (2B) gives

$$-3b_1=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_1=0$$

Solving the above for b_1 gives

$$b_1=0$$

For $n=2$, Eq (2B) gives

$$8b_0-4b_2=0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$8-4b_2=0$$

Solving the above for b_2 gives

$$b_2 = 2$$

For $n = 3$, Eq (2B) gives

$$6b_1 - 3b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 0$$

For $n = N$, where $N = 4$ which is the difference between the two roots, we are free to choose $b_4 = 0$. Hence for $n = 4$, Eq (2B) gives

$$4C + 8 = 0$$

Which is solved for C. Solving for C gives

$$C = -2$$

For $n = 5$, Eq (2B) gives

$$6Ca_1 + 2b_3 + 5b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$5b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = 0$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -2$ and all b_n, then the second solution becomes

$$y_2(x) = (-2)\left(x^2\left(1 + O\left(x^6\right)\right)\right)\ln(x) + \frac{1 + 2x^2 + O(x^6)}{x^2}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^2\left(1 + O\left(x^6\right)\right) + c_2\left((-2)\left(x^2\left(1 + O\left(x^6\right)\right)\right)\ln(x) + \frac{1 + 2x^2 + O(x^6)}{x^2}\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^2 \left(1+O\left(x^6\right)\right)+c_2 \left(-2x^2 \left(1+O\left(x^6\right)\right) \ln \left(x \right)+\frac{1+2x^2+O\left(x^6\right)}{x^2}\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^2 \left(1+O\left(x^6\right)\right)+c_2 \left(-2x^2 \left(1+O\left(x^6\right)\right) \ln \left(x \right)+\frac{1+2x^2+O\left(x^6\right)}{x^2}\right) \tag{1}$$

Verification of solutions

$$y = c_1 x^2 \left(1+O\left(x^6\right)\right)+c_2 \left(-2x^2 \left(1+O\left(x^6\right)\right) \ln \left(x \right)+\frac{1+2x^2+O\left(x^6\right)}{x^2}\right)$$

Verified OK.

16.37.1 Maple step by step solution

Let's solve

$x^2 y''+\left(-2x^3+x\right) y'+\left(4x^2-4\right) y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{4\left(x^2-1\right) y}{x^2}+\frac{\left(2x^2-1\right) y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{\left(2x^2-1\right) y'}{x}+\frac{4\left(x^2-1\right) y}{x^2}=0$

□ Check to see if $x_0=0$ is a regular singular point

- ○ Define functions

  $\left[P_2(x)=-\frac{2x^2-1}{x}, P_3(x)=\frac{4\left(x^2-1\right)}{x^2}\right]$

- ○ $x \cdot P_2(x)$ is analytic at $x=0$

  $\left(x \cdot P_2(x)\right)\bigg|_{x=0}=1$

- ○ $x^2 \cdot P_3(x)$ is analytic at $x=0$

$$\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = -4$$

- $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2 y'' - x(2x^2 - 1) y' + (4x^2 - 4) y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k- >k - m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r) x^{k+r-1+m}$

- Shift index using $k- >k + 1 - m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r) x^{k+r}$

- Convert $x^2 \cdot y''$ to series expansion

  $x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)(k+r-1) x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(2+r)(-2+r) x^r + a_1(3+r)(-1+r) x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(k+r+2)(k+r-2) - 2a_{k-2}(k-4\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(2+r)(-2+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{-2, 2\}$

- Each term must be 0

  $a_1(3+r)(-1+r)=0$

- Solve for the dependent coefficient(s)

  $a_1=0$

- Each term in the series must be 0, giving the recursion relation

  $a_k(k+r+2)(k+r-2)-2a_{k-2}(k-4+r)=0$

- Shift index using $k->k+2$

  $a_{k+2}(k+4+r)(k+r)-2a_k(k+r-2)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=\frac{2a_k(k+r-2)}{(k+4+r)(k+r)}$

- Recursion relation for $r=-2$; series terminates at $k=4$

  $a_{k+2}=\frac{2a_k(k-4)}{(k+2)(k-2)}$

- Series not valid for $r=-2$, division by 0 in the recursion relation at $k=2$

  $a_{k+2}=\frac{2a_k(k-4)}{(k+2)(k-2)}$

- Recursion relation for $r=2$

  $a_{k+2}=\frac{2a_k k}{(k+6)(k+2)}$

- Solution for $r=2$

  $\left[y=\sum_{k=0}^{\infty} a_k x^{k+2}, a_{k+2}=\frac{2a_k k}{(k+6)(k+2)}, a_1=0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 34.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2y'' + x(-3x^2+1)\,y' - 4(-3x^2+1)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$x^2y'' + (-3x^3+x)\,y' + (12x^2-4)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = -\frac{3x^2-1}{x}$$
$$q(x) = \frac{12x^2-4}{x^2}$$

Table 846: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{3x^2-1}{x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{12x^2-4}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2y'' + (-3x^3 + x)\,y' + (12x^2 - 4)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (-3x^3 + x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (12x^2 - 4)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-3x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 12 x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-4 a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-3x^{n+r+2} a_n (n+r)\right) = \sum_{n=2}^{\infty} \left(-3a_{n-2}(n+r-2)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} 12 x^{n+r+2} a_n = \sum_{n=2}^{\infty} 12 a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=2}^{\infty} \left(-3a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 12 a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-4 a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + x^{n+r} a_n (n+r) - 4 a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + x^r a_0 r - 4 a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + x^r r - 4x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2 - 4\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 4 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 2$$
$$r_2 = -2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r^2 - 4)\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^2 \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^2}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+2}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-2}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$a_n(n+r)(n+r-1) - 3a_{n-2}(n+r-2) + a_n(n+r) + 12a_{n-2} - 4a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{3a_{n-2}(n+r-6)}{n^2+2nr+r^2-4} \tag{4}$$

Which for the root $r = 2$ becomes

$$a_n = \frac{3a_{n-2}(n-4)}{n(n+4)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-12+3r}{r(r+4)}$$

Which for the root $r = 2$ becomes

$$a_2 = -\frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-12+3r}{r(r+4)}$	$-\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-12+3r}{r(r+4)}$	$-\frac{1}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{9(-4+r)(-2+r)}{r(r+4)(r+6)(r+2)}$$

Which for the root $r = 2$ becomes

$$a_4 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-12+3r}{r(r+4)}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{9(-4+r)(-2+r)}{r(r+4)(r+6)(r+2)}$	0

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-12+3r}{r(r+4)}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{9(-4+r)(-2+r)}{r(r+4)(r+6)(r+2)}$	0
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^2 \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^2 \left(1 - \frac{x^2}{2} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Let

$$
r_1 - r_2 = N
$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r \to r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$
\begin{aligned}
a_N &= a_4 \\
&= \frac{9(-4 + r)(-2 + r)}{r(r + 4)(r + 6)(r + 2)}
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\lim_{r \to r_2} \frac{9(-4 + r)(-2 + r)}{r(r + 4)(r + 6)(r + 2)} &= \lim_{r \to -2} \frac{9(-4 + r)(-2 + r)}{r(r + 4)(r + 6)(r + 2)} \\
&= \textit{undefined}
\end{aligned}
$$

Since the limit does not exist then the log term is needed. Therefore the second solution has the form

$$
y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n + r_2}\right)
$$

Therefore

$$
\begin{aligned}
\frac{d}{dx} y_2(x) &= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} \frac{b_n x^{n + r_2}(n + r_2)}{x}\right) \\
&= C y_1'(x) \ln(x) + \frac{C y_1(x)}{x} + \left(\sum_{n=0}^{\infty} x^{-1 + n + r_2} b_n (n + r_2)\right) \\
\frac{d^2}{dx^2} y_2(x) &= C y_1''(x) \ln(x) + \frac{2 C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} \\
&\quad + \sum_{n=0}^{\infty} \left(\frac{b_n x^{n + r_2}(n + r_2)^2}{x^2} - \frac{b_n x^{n + r_2}(n + r_2)}{x^2}\right) \\
&= C y_1''(x) \ln(x) + \frac{2 C y_1'(x)}{x} - \frac{C y_1(x)}{x^2} + \left(\sum_{n=0}^{\infty} x^{-2 + n + r_2} b_n (n + r_2)(-1 + n + r_2)\right)
\end{aligned}
$$

Substituting these back into the given ode $x^2y''+(-3x^3+x)\,y'+(12x^2-4)\,y=0$ gives

$$x^2\left(Cy_1''(x)\ln(x)+\frac{2Cy_1'(x)}{x}-\frac{Cy_1(x)}{x^2}+\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+(-3x^3+x)\left(Cy_1'(x)\ln(x)+\frac{Cy_1(x)}{x}+\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)\right)+(12x^2-4)\left(Cy_1(x)\ln(x)+\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)\right)=0$$

Which can be written as

$$\left(\left(x^2y_1''(x)+(-3x^3+x)\,y_1'(x)+(12x^2-4)\,y_1(x)\right)\ln(x)+x^2\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{(-3x^3+x)\,y_1(x)}{x}\right)C+x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+(-3x^3+x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(12x^2-4)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0 \tag{7}$$

But since $y_1(x)$ is a solution to the ode, then

$$x^2y_1''(x)+(-3x^3+x)\,y_1'(x)+(12x^2-4)\,y_1(x)=0$$

Eq (7) simplifes to

$$\left(x^2\left(\frac{2y_1'(x)}{x}-\frac{y_1(x)}{x^2}\right)+\frac{(-3x^3+x)\,y_1(x)}{x}\right)C+x^2\left(\sum_{n=0}^{\infty}\left(\frac{b_n x^{n+r_2}(n+r_2)^2}{x^2}-\frac{b_n x^{n+r_2}(n+r_2)}{x^2}\right)\right)+(-3x^3+x)\left(\sum_{n=0}^{\infty}\frac{b_n x^{n+r_2}(n+r_2)}{x}\right)+(12x^2-4)\left(\sum_{n=0}^{\infty}b_n x^{n+r_2}\right)=0 \tag{8}$$

Substituting $y_1 = \sum_{n=0}^{\infty} a_n x^{n+r_1}$ into the above gives

$$
\begin{aligned}
&\left(-3\left(\sum_{n=0}^{\infty} a_n x^{n+r_1}\right) x^2 + 2\left(\sum_{n=0}^{\infty} x^{-1+n+r_1} a_n (n+r_1)\right) x\right) C \\
&+ \left(\sum_{n=0}^{\infty} x^{-2+n+r_2} b_n (n+r_2)(-1+n+r_2)\right) x^2 \\
&+ (-3x^3+x)\left(\sum_{n=0}^{\infty} x^{-1+n+r_2} b_n (n+r_2)\right) \\
&+ 12\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) x^2 - 4\left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right) = 0
\end{aligned}
\tag{9}
$$

Since $r_1 = 2$ and $r_2 = -2$ then the above becomes

$$
\begin{aligned}
&\left(-3\left(\sum_{n=0}^{\infty} a_n x^{n+2}\right) x^2 + 2\left(\sum_{n=0}^{\infty} x^{1+n} a_n (n+2)\right) x\right) C \\
&+ \left(\sum_{n=0}^{\infty} x^{n-4} b_n (n-2)(-3+n)\right) x^2 + (-3x^3+x)\left(\sum_{n=0}^{\infty} x^{-3+n} b_n (n-2)\right) \\
&+ 12\left(\sum_{n=0}^{\infty} b_n x^{n-2}\right) x^2 - 4\left(\sum_{n=0}^{\infty} b_n x^{n-2}\right) = 0
\end{aligned}
\tag{10}
$$

Which simplifies to

$$
\begin{aligned}
&\sum_{n=0}^{\infty} \left(-3C\, x^{n+4} a_n\right) + \left(\sum_{n=0}^{\infty} 2C\, x^{n+2} a_n (n+2)\right) \\
&\quad + \left(\sum_{n=0}^{\infty} x^{n-2} b_n (n^2-5n+6)\right) + \sum_{n=0}^{\infty} \left(-3x^n b_n (n-2)\right) \\
&\quad + \left(\sum_{n=0}^{\infty} x^{n-2} b_n (n-2)\right) + \left(\sum_{n=0}^{\infty} 12 b_n x^n\right) + \sum_{n=0}^{\infty} \left(-4 b_n x^{n-2}\right) = 0
\end{aligned}
\tag{2A}
$$

The next step is to make all powers of x be $n-2$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n-2} and

adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-3C\, x^{n+4} a_n\right) = \sum_{n=6}^{\infty} \left(-3C a_{n-6} x^{n-2}\right)$$

$$\sum_{n=0}^{\infty} 2C\, x^{n+2} a_n (n+2) = \sum_{n=4}^{\infty} 2C a_{n-4} (n-2)\, x^{n-2}$$

$$\sum_{n=0}^{\infty} \left(-3x^n b_n (n-2)\right) = \sum_{n=2}^{\infty} \left(-3b_{n-2}(n-4)\, x^{n-2}\right)$$

$$\sum_{n=0}^{\infty} 12 b_n x^n = \sum_{n=2}^{\infty} 12 b_{n-2} x^{n-2}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n-2$.

$$\begin{aligned}
&\sum_{n=6}^{\infty} \left(-3C a_{n-6} x^{n-2}\right) + \left(\sum_{n=4}^{\infty} 2C a_{n-4}(n-2)\, x^{n-2}\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n-2} b_n \left(n^2 - 5n + 6\right)\right) + \sum_{n=2}^{\infty} \left(-3b_{n-2}(n-4)\, x^{n-2}\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n-2} b_n (n-2)\right) + \left(\sum_{n=2}^{\infty} 12 b_{n-2} x^{n-2}\right) + \sum_{n=0}^{\infty} \left(-4 b_n x^{n-2}\right) = 0
\end{aligned} \tag{2B}$$

For $n = 0$ in Eq. (2B), we choose arbitray value for b_0 as $b_0 = 1$. For $n = 1$, Eq (2B) gives

$$-3b_1 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_1 = 0$$

Solving the above for b_1 gives

$$b_1 = 0$$

For $n = 2$, Eq (2B) gives

$$18b_0 - 4b_2 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$18 - 4b_2 = 0$$

Solving the above for b_2 gives

$$b_2 = \frac{9}{2}$$

For $n = 3$, Eq (2B) gives

$$15b_1 - 3b_3 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$-3b_3 = 0$$

Solving the above for b_3 gives

$$b_3 = 0$$

For $n = N$, where $N = 4$ which is the difference between the two roots, we are free to choose $b_4 = 0$. Hence for $n = 4$, Eq (2B) gives

$$4C + 54 = 0$$

Which is solved for C. Solving for C gives

$$C = -\frac{27}{2}$$

For $n = 5$, Eq (2B) gives

$$6Ca_1 + 9b_3 + 5b_5 = 0$$

Which when replacing the above values found already for b_n and the values found earlier for a_n and for C, gives

$$5b_5 = 0$$

Solving the above for b_5 gives

$$b_5 = 0$$

Now that we found all b_n and C, we can calculate the second solution from

$$y_2(x) = Cy_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+r_2}\right)$$

Using the above value found for $C = -\frac{27}{2}$ and all b_n, then the second solution becomes

$$y_2(x) = -\frac{27}{2}\left(x^2\left(1 - \frac{x^2}{2} + O(x^6)\right)\right) \ln(x) + \frac{1 + \frac{9x^2}{2} + O(x^6)}{x^2}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^2 \left(1-\frac{x^2}{2}+O\left(x^6\right)\right)+c_2\left(-\frac{27}{2}\left(x^2\left(1-\frac{x^2}{2}+O\left(x^6\right)\right)\right)\ln\left(x\right)+\frac{1+\frac{9x^2}{2}+O(x^6)}{x^2}\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^2 \left(1-\frac{x^2}{2}+O\left(x^6\right)\right)+c_2\left(-\frac{27x^2\left(1-\frac{x^2}{2}+O(x^6)\right)\ln\left(x\right)}{2}+\frac{1+\frac{9x^2}{2}+O(x^6)}{x^2}\right)
\end{aligned}
$$

Summary
The solution(s) found are the following

$$
\begin{aligned}
y = {} & c_1 x^2 \left(1-\frac{x^2}{2}+O\left(x^6\right)\right) \\
& + c_2\left(-\frac{27x^2\left(1-\frac{x^2}{2}+O(x^6)\right)\ln\left(x\right)}{2}+\frac{1+\frac{9x^2}{2}+O(x^6)}{x^2}\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
y = c_1 x^2 \left(1-\frac{x^2}{2}+O\left(x^6\right)\right)+c_2\left(-\frac{27x^2\left(1-\frac{x^2}{2}+O(x^6)\right)\ln\left(x\right)}{2}+\frac{1+\frac{9x^2}{2}+O(x^6)}{x^2}\right)
$$

Verified OK.

16.38.1 Maple step by step solution

Let's solve

$x^2 y'' + \left(-3x^3+x\right) y' + \left(12x^2-4\right) y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{4(3x^2-1)y}{x^2} + \frac{(3x^2-1)y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$$y'' - \frac{(3x^2-1)y'}{x} + \frac{4(3x^2-1)y}{x^2} = 0$$

□ Check to see if $x_0 = 0$ is a regular singular point

  ○ Define functions

$$\left[P_2(x) = -\frac{3x^2-1}{x}, P_3(x) = \frac{4(3x^2-1)}{x^2}\right]$$

  ○ $x \cdot P_2(x)$ is analytic at $x = 0$

$$(x \cdot P_2(x))\bigg|_{x=0} = 1$$

  ○ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

$$(x^2 \cdot P_3(x))\bigg|_{x=0} = -4$$

  ○ $x = 0$is a regular singular point

Check to see if $x_0 = 0$ is a regular singular point

$$x_0 = 0$$

- Multiply by denominators

$$x^2y'' - x(3x^2 - 1)\, y' + (12x^2 - 4)\, y = 0$$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

□ Rewrite ODE with series expansions

  ○ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

  ○ Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

  ○ Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$$

  ○ Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k + 1 - m + r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

  $$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(2+r)\,(-2+r)\, x^r + a_1(3+r)\,(-1+r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(k+r+2)\,(k+r-2) - 3a_{k-2}(k-6$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(2+r)\,(-2+r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \{-2, 2\}$$

- Each term must be 0

  $$a_1(3+r)\,(-1+r) = 0$$

- Solve for the dependent coefficient(s)

  $$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$a_k(k+r+2)\,(k+r-2) - 3a_{k-2}(k-6+r) = 0$$

- Shift index using $k- >k+2$

  $$a_{k+2}(k+4+r)\,(k+r) - 3a_k(k+r-4) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2} = \frac{3a_k(k+r-4)}{(k+4+r)(k+r)}$$

- Recursion relation for $r = -2$; series terminates at $k = 6$

  $$a_{k+2} = \frac{3a_k(k-6)}{(k+2)(k-2)}$$

- Series not valid for $r = -2$, division by 0 in the recursion relation at $k = 2$

  $$a_{k+2} = \frac{3a_k(k-6)}{(k+2)(k-2)}$$

- Recursion relation for $r = 2$; series terminates at $k = 2$

  $$a_{k+2} = \frac{3a_k(k-2)}{(k+6)(k+2)}$$

- Solution for $r = 2$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+2}, a_{k+2} = \frac{3a_k(k-2)}{(k+6)(k+2)}, a_1 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 35.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2+1)\,y''+x(11x^2+5)\,y'+24x^2y=0}$$

With the expansion point for the power series method at $x=0$.

The ODE is

$$(x^4+x^2)\,y''+(11x^3+5x)\,y'+24x^2y=0$$

Or

$$x(y''x^3+11y'x^2+24yx+y''x+5y')=0$$

For $x\neq 0$ the above simplifies to

$$(x^3+x)\,y''+11y'x^2+24yx+5y'=0$$

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+x^2)\,y''+(11x^3+5x)\,y'+24x^2y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x) = \frac{11x^2+5}{x(x^2+1)}$$
$$q(x) = \frac{24}{x^2+1}$$

Table 848: Table $p(x), q(x)$ singularites.

$p(x) = \frac{11x^2+5}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{24}{x^2+1}$	
singularity	type
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+1)\, y'' + (11x^3+5x)\, y' + 24x^2 y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$
\begin{gathered}
x^{2}\left(x^{2}+1\right)\left(\sum_{n=0}^{\infty}(n+r)(n+r-1) a_{n} x^{n+r-2}\right) \\
+\left(11 x^{3}+5 x\right)\left(\sum_{n=0}^{\infty}(n+r) a_{n} x^{n+r-1}\right)+24 x^{2}\left(\sum_{n=0}^{\infty} a_{n} x^{n+r}\right)=0
\end{gathered} \tag{1}
$$

Which simplifies to

$$
\begin{gathered}
\left(\sum_{n=0}^{\infty} x^{n+r+2} a_{n}(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} x^{n+r} a_{n}(n+r)(n+r-1)\right) \\
+\left(\sum_{n=0}^{\infty} 11 x^{n+r+2} a_{n}(n+r)\right)+\left(\sum_{n=0}^{\infty} 5 x^{n+r} a_{n}(n+r)\right)+\left(\sum_{n=0}^{\infty} 24 x^{n+r+2} a_{n}\right)=0
\end{gathered} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} x^{n+r+2} a_{n}(n+r)(n+r-1) &= \sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r} \\
\sum_{n=0}^{\infty} 11 x^{n+r+2} a_{n}(n+r) &= \sum_{n=2}^{\infty} 11 a_{n-2}(n+r-2) x^{n+r} \\
\sum_{n=0}^{\infty} 24 x^{n+r+2} a_{n} &= \sum_{n=2}^{\infty} 24 a_{n-2} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{gathered}
\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r}\right) \\
+\left(\sum_{n=0}^{\infty} x^{n+r} a_{n}(n+r)(n+r-1)\right)+\left(\sum_{n=2}^{\infty} 11 a_{n-2}(n+r-2) x^{n+r}\right) \\
+\left(\sum_{n=0}^{\infty} 5 x^{n+r} a_{n}(n+r)\right)+\left(\sum_{n=2}^{\infty} 24 a_{n-2} x^{n+r}\right)=0
\end{gathered} \tag{2B}
$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + 5x^{n+r} a_n (n+r) = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + 5x^r a_0 r = 0$$

Or

$$(x^r r(-1+r) + 5x^r r) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^r r(4+r) = 0$$

Since the above is true for all x then the indicial equation becomes

$$r(4+r) = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 0 \\ r_2 &= -4 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^r r(4+r) = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 4$ is an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^n \\ y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^4} \end{aligned}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^n$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-4}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-2}(n+r-2)(n-3+r) + a_n(n+r)(n+r-1) \\ + 11a_{n-2}(n+r-2) + 5a_n(n+r) + 24a_{n-2} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r+2)\, a_{n-2}}{n+r} \tag{4}$$

Which for the root $r = 0$ becomes

$$a_n = -\frac{(n+2)\, a_{n-2}}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 0$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-4-r}{r+2}$$

Which for the root $r = 0$ becomes

$$a_2 = -2$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-r}{r+2}$	-2

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-r}{r+2}$	-2
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{6+r}{r+2}$$

Which for the root $r = 0$ becomes

$$a_4 = 3$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-r}{r+2}$	-2
a_3	0	0
a_4	$\frac{6+r}{r+2}$	3

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-r}{r+2}$	-2
a_3	0	0
a_4	$\frac{6+r}{r+2}$	3
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots \\ &= 1 - 2x^2 + 3x^4 + O(x^6) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 4$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r \to r_2} a_4(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_4 \\ &= \frac{6+r}{r+2} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r \to r_2} \frac{6+r}{r+2} &= \lim_{r \to -4} \frac{6+r}{r+2} \\ &= -1 \end{aligned}$$

The limit is -1. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^{n-4} \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq(3) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$b_{n-2}(n+r-2)(n-3+r) + b_n(n+r)(n+r-1) \\ + 11b_{n-2}(n+r-2) + 5b_n(n+r) + 24b_{n-2} = 0 \tag{4}$$

Which for for the root $r = -4$ becomes

$$b_{n-2}(n-6)(n-7) + b_n(n-4)(n-5) + 11b_{n-2}(n-6) + 5b_n(n-4) + 24b_{n-2} = 0 \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{(n+r+2)\, b_{n-2}}{n+r} \tag{5}$$

Which for the root $r = -4$ becomes

$$b_n = -\frac{(n-2)\, b_{n-2}}{n-4} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -4$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -\frac{4+r}{r+2}$$

Which for the root $r = -4$ becomes

$$b_2 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4-r}{r+2}$	0

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4-r}{r+2}$	0
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{6+r}{r+2}$$

Which for the root $r = -4$ becomes

$$b_4 = -1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4-r}{r+2}$	0
b_3	0	0
b_4	$\frac{6+r}{r+2}$	-1

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4-r}{r+2}$	0
b_3	0	0
b_4	$\frac{6+r}{r+2}$	-1
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= 1\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= \frac{1 - x^4 + O(x^6)}{x^4}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1\left(1 - 2x^2 + 3x^4 + O\left(x^6\right)\right) + \frac{c_2\left(1 - x^4 + O(x^6)\right)}{x^4}
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1\left(1 - 2x^2 + 3x^4 + O\left(x^6\right)\right) + \frac{c_2\left(1 - x^4 + O(x^6)\right)}{x^4}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
y = c_1\left(1 - 2x^2 + 3x^4 + O\left(x^6\right)\right) + \frac{c_2\left(1 - x^4 + O(x^6)\right)}{x^4} \tag{1}
$$

Verification of solutions

$$
y = c_1\left(1 - 2x^2 + 3x^4 + O\left(x^6\right)\right) + \frac{c_2\left(1 - x^4 + O(x^6)\right)}{x^4}
$$

Verified OK.

16.39.1 Maple step by step solution

Let's solve

$x^2(x^2+1)\,y''+(11x^3+5x)\,y'+24x^2y=0$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y''=-\frac{24y}{x^2+1}-\frac{(11x^2+5)y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''+\frac{(11x^2+5)y'}{x(x^2+1)}+\frac{24y}{x^2+1}=0$

☐ Check to see if x_0 is a regular singular point

  ◦ Define functions

$\left[P_2(x)=\frac{11x^2+5}{x(x^2+1)}, P_3(x)=\frac{24}{x^2+1}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

$\left.(x\cdot P_2(x))\right|_{x=0}=5$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

$\left.(x^2\cdot P_3(x))\right|_{x=0}=0$

  ◦ $x=0$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0=0$

- Multiply by denominators

$24yx+(11x^2+5)\,y'+x(x^2+1)\,y''=0$

- Assume series solution for y

$y=\sum_{k=0}^{\infty}a_kx^{k+r}$

☐ Rewrite ODE with series expansions

  ◦ Convert $x\cdot y$ to series expansion

$x\cdot y=\sum_{k=0}^{\infty}a_kx^{k+r+1}$

- Shift index using $k->k-1$

  $x\cdot y=\sum_{k=1}^{\infty} a_{k-1}x^{k+r}$

- Convert $x^m\cdot y'$ to series expansion for $m=0..2$

  $x^m\cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^m\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m\cdot y''$ to series expansion for $m=1..3$

  $x^m\cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^m\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0r(4+r)\, x^{-1+r}+a_1(1+r)\,(5+r)\, x^r+\left(\sum_{k=1}^{\infty} (a_{k+1}(k+r+1)\,(k+5+r)+a_{k-1}(k+5+r)\,(k$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $r(4+r)=0$

- Values of r that satisfy the indicial equation

  $r\in\{-4,0\}$

- Each term must be 0

  $a_1(1+r)\,(5+r)=0$

- Each term in the series must be 0, giving the recursion relation

  $(k+5+r)\,(a_{k+1}(k+r+1)+a_{k-1}(k+3+r))=0$

- Shift index using $k->k+1$

  $(k+r+6)\,(a_{k+2}(k+2+r)+a_k(k+r+4))=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{a_k(k+r+4)}{k+2+r}$

- Recursion relation for $r=-4$

  $a_{k+2}=-\frac{a_k k}{k-2}$

- Series not valid for $r=-4$, division by 0 in the recursion relation at $k=2$

  $a_{k+2}=-\frac{a_k k}{k-2}$
- Recursion relation for $r=0$

  $a_{k+2}=-\frac{a_k(k+4)}{k+2}$
- Solution for $r=0$

  $$\left[y=\sum_{k=0}^{\infty} a_k x^k, a_{k+2}=-\frac{a_k(k+4)}{k+2}, 5a_1=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 36.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2(x^2+1)\, y''+8y'x-(-x^2+35)\, y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(4x^4+4x^2)\, y''+8y'x+(x^2-35)\, y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned} p(x) &= \frac{2}{x\,(x^2+1)} \\ q(x) &= \frac{x^2-35}{4x^2\,(x^2+1)} \end{aligned}$$

Table 850: Table $p(x), q(x)$ singularites.

$p(x) = \frac{2}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{x^2-35}{4x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2(x^2+1)\,y'' + 8y'x + (x^2-35)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + 8\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) x + (x^2-35)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) \\ + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-35 a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n = \sum_{n=2}^{\infty} a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) \\ + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-35 a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r)(n+r-1) + 8x^{n+r} a_n (n+r) - 35 a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) + 8x^r a_0 r - 35 a_0 x^r = 0$$

Or

$$\left(4x^r r(-1+r) + 8x^r r - 35x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 + 4r - 35\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 + 4r - 35 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{5}{2}$$
$$r_2 = -\frac{7}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 + 4r - 35\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 6$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^{\frac{5}{2}} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^{\frac{7}{2}}}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{5}{2}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{7}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$4a_{n-2}(n+r-2)(n-3+r)+4a_n(n+r)(n+r-1)+8a_n(n+r)+a_{n-2}-35a_n=0 \quad (3)$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(-5+2n+2r)\, a_{n-2}}{2n+2r+7} \tag{4}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_n = -\frac{n a_{n-2}}{n+6} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{5}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1-2r}{11+2r}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_2 = -\frac{1}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-2r}{11+2r}$	$-\frac{1}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-2r}{11+2r}$	$-\frac{1}{4}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4r^2 + 4r - 3}{4r^2 + 52r + 165}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_4 = \frac{1}{10}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-2r}{11+2r}$	$-\frac{1}{4}$
a_3	0	0
a_4	$\frac{4r^2+4r-3}{4r^2+52r+165}$	$\frac{1}{10}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-2r}{11+2r}$	$-\frac{1}{4}$
a_3	0	0
a_4	$\frac{4r^2+4r-3}{4r^2+52r+165}$	$\frac{1}{10}$
a_5	0	0

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{-8r^3 - 36r^2 - 22r + 21}{8r^3 + 180r^2 + 1318r + 3135}$$

Which for the root $r = \frac{5}{2}$ becomes

$$a_6 = -\frac{1}{20}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1-2r}{11+2r}$	$-\frac{1}{4}$
a_3	0	0
a_4	$\frac{4r^2+4r-3}{4r^2+52r+165}$	$\frac{1}{10}$
a_5	0	0
a_6	$\frac{-8r^3-36r^2-22r+21}{8r^3+180r^2+1318r+3135}$	$-\frac{1}{20}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{5}{2}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 \dots\right) \\ &= x^{\frac{5}{2}}\left(1 - \frac{x^2}{4} + \frac{x^4}{10} - \frac{x^6}{20} + O(x^7)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 6$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r \to r_2} a_6(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_6 \\ &= \frac{-8r^3 - 36r^2 - 22r + 21}{8r^3 + 180r^2 + 1318r + 3135} \end{aligned}$$

Therefore

$$
\begin{aligned}
\lim_{r\rightarrow r_2} \frac{-8r^3-36r^2-22r+21}{8r^3+180r^2+1318r+3135} &= \lim_{r\rightarrow -\frac{7}{2}} \frac{-8r^3-36r^2-22r+21}{8r^3+180r^2+1318r+3135} \\
&= 0
\end{aligned}
$$

The limit is 0. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$
\begin{aligned}
y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\
&= \sum_{n=0}^{\infty} b_n x^{n-\frac{7}{2}}
\end{aligned}
$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq(3) gives

$$
b_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
4b_{n-2}(n+r-2)(n-3+r)+4b_n(n+r)(n+r-1)+8b_n(n+r)+b_{n-2}-35b_n = 0 \tag{4}
$$

Which for for the root $r = -\frac{7}{2}$ becomes

$$
4b_{n-2}\left(n-\frac{11}{2}\right)\left(n-\frac{13}{2}\right)+4b_n\left(n-\frac{7}{2}\right)\left(n-\frac{9}{2}\right)+8b_n\left(n-\frac{7}{2}\right)+b_{n-2}-35b_n = 0 \tag{4A}
$$

Solving for b_n from the recursive equation (4) gives

$$
b_n = -\frac{(-5+2n+2r)\, b_{n-2}}{2n+2r+7} \tag{5}
$$

Which for the root $r = -\frac{7}{2}$ becomes

$$
b_n = -\frac{(-12+2n)\, b_{n-2}}{2n} \tag{6}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{7}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -\frac{2r - 1}{11 + 2r}$$

Which for the root $r = -\frac{7}{2}$ becomes

$$b_2 = 2$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1-2r}{11+2r}$	2

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1-2r}{11+2r}$	2
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{4r^2 + 4r - 3}{(11 + 2r)(15 + 2r)}$$

Which for the root $r = -\frac{7}{2}$ becomes

$$b_4 = 1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1-2r}{11+2r}$	2
b_3	0	0
b_4	$\frac{4r^2+4r-3}{4r^2+52r+165}$	1

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1-2r}{11+2r}$	2
b_3	0	0
b_4	$\frac{4r^2+4r-3}{4r^2+52r+165}$	1
b_5	0	0

For $n = 6$, using the above recursive equation gives

$$b_6 = -\frac{8r^3 + 36r^2 + 22r - 21}{(11 + 2r)(15 + 2r)(19 + 2r)}$$

Which for the root $r = -\frac{7}{2}$ becomes

$$b_6 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1-2r}{11+2r}$	2
b_3	0	0
b_4	$\frac{4r^2+4r-3}{4r^2+52r+165}$	1
b_5	0	0
b_6	$\frac{-8r^3-36r^2-22r+21}{8r^3+180r^2+1318r+3135}$	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned}y_2(x) &= x^{\frac{5}{2}}(b_0 + b_1x + b_2x^2 + b_3x^3 + b_4x^4 + b_5x^5 + b_6x^6 + b_7x^7 \dots) \\ &= \frac{1 + 2x^2 + x^4 + O(x^7)}{x^{\frac{7}{2}}}\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x) &= c_1y_1(x) + c_2y_2(x) \\ &= c_1x^{\frac{5}{2}}\left(1 - \frac{x^2}{4} + \frac{x^4}{10} - \frac{x^6}{20} + O(x^7)\right) + \frac{c_2(1 + 2x^2 + x^4 + O(x^7))}{x^{\frac{7}{2}}}\end{aligned}$$

Hence the final solution is

$$\begin{aligned}y &= y_h \\ &= c_1x^{\frac{5}{2}}\left(1 - \frac{x^2}{4} + \frac{x^4}{10} - \frac{x^6}{20} + O(x^7)\right) + \frac{c_2(1 + 2x^2 + x^4 + O(x^7))}{x^{\frac{7}{2}}}\end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1x^{\frac{5}{2}}\left(1 - \frac{x^2}{4} + \frac{x^4}{10} - \frac{x^6}{20} + O(x^7)\right) + \frac{c_2(1 + 2x^2 + x^4 + O(x^7))}{x^{\frac{7}{2}}} \tag{1}$$

Verification of solutions

$$y = c_1x^{\frac{5}{2}}\left(1 - \frac{x^2}{4} + \frac{x^4}{10} - \frac{x^6}{20} + O(x^7)\right) + \frac{c_2(1 + 2x^2 + x^4 + O(x^7))}{x^{\frac{7}{2}}}$$

Verified OK.

16.40.1 Maple step by step solution

Let's solve

$4x^2(x^2+1)\,y''+8y'x+(x^2-35)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(x^2-35)y}{4x^2(x^2+1)}-\frac{2y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{2y'}{x(x^2+1)}+\frac{(x^2-35)y}{4x^2(x^2+1)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{2}{x(x^2+1)}, P_3(x)=\frac{x^2-35}{4x^2(x^2+1)}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $(x\cdot P_2(x))\Big|_{x=0}=2$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $(x^2\cdot P_3(x))\Big|_{x=0}=-\frac{35}{4}$

  - $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $4x^2(x^2+1)\,y''+8y'x+(x^2-35)\,y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m\cdot y$ to series expansion for $m=0..2$

    $x^m\cdot y=\sum_{k=0}^{\infty}a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$
- Convert $x \cdot y'$ to series expansion

  $x \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r}$
- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$
- Shift index using $k->k+2-m$

  $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(7+2r)\,(-5+2r)\, x^r + a_1(9+2r)\,(-3+2r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(2k+2r+7)\,(2k+2r-5) + a_k\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(7+2r)\,(-5+2r) = 0$
- Values of r that satisfy the indicial equation

  $r \in \left\{-\frac{7}{2}, \frac{5}{2}\right\}$
- Each term must be 0

  $a_1(9+2r)\,(-3+2r) = 0$
- Solve for the dependent coefficient(s)

  $a_1 = 0$
- Each term in the series must be 0, giving the recursion relation

  $4\left(\left(k+r-\frac{5}{2}\right) a_{k-2} + a_k\left(k+r+\frac{7}{2}\right)\right)\left(k+r-\frac{5}{2}\right) = 0$
- Shift index using $k->k+2$

  $4\left(\left(k-\frac{1}{2}+r\right) a_k + a_{k+2}\left(k+\frac{11}{2}+r\right)\right)\left(k-\frac{1}{2}+r\right) = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{(2k+2r-1)a_k}{2k+11+2r}$
- Recursion relation for $r = -\frac{7}{2}$; series terminates at $k = 4$

  $a_{k+2} = -\frac{(2k-8)a_k}{2k+4}$

- Solution for $r = -\frac{7}{2}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{7}{2}}, a_{k+2} = -\frac{(2k-8)a_k}{2k+4}, a_1 = 0\right]$$

- Recursion relation for $r = \frac{5}{2}$

  $$a_{k+2} = -\frac{(2k+4)a_k}{2k+16}$$

- Solution for $r = \frac{5}{2}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{5}{2}}, a_{k+2} = -\frac{(2k+4)a_k}{2k+16}, a_1 = 0\right]$$

- Combine solutions and rename parameters

  $$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-\frac{7}{2}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{5}{2}}\right), a_{k+2} = -\frac{(2k-8)a_k}{2k+4}, a_1 = 0, b_{k+2} = -\frac{(2k+4)b_k}{2k+16}, b_1 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 37.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2+1)\,y''-x(-x^2+5)\,y'-(25x^2+7)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+x^2)\,y''+(x^3-5x)\,y'+(-25x^2-7)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{x^2-5}{x\,(x^2+1)}$$
$$q(x)=-\frac{25x^2+7}{x^2\,(x^2+1)}$$

Table 852: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x^2-5}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = -\frac{25x^2+7}{x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+1)\,y'' + (x^3-5x)\,y' + (-25x^2-7)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (x^3-5x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (-25x^2-7)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-5x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-25x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-7a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r) x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} a_{n-2} (n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-25x^{n+r+2} a_n\right) = \sum_{n=2}^{\infty} \left(-25a_{n-2} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} a_{n-2} (n+r-2) x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-5x^{n+r} a_n (n+r)\right) + \sum_{n=2}^{\infty} \left(-25a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-7a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) - 5x^{n+r} a_n (n+r) - 7a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) - 5x^r a_0 r - 7a_0 x^r = 0$$

Or

$$(x^r r(-1+r) - 5x^r r - 7x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r^2 - 6r - 7)\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 6r - 7 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 7 \\ r_2 &= -1 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r^2 - 6r - 7)\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 8$ is an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right) \\ y_2(x) &= C y_1(x) \ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= x^7\left(\sum_{n=0}^{\infty} a_n x^n\right) \\ y_2(x) &= C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x} \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+7} \\ y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-1}\right) \end{aligned}$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-2}(n+r-2)(n-3+r) + a_n(n+r)(n+r-1) \\ + a_{n-2}(n+r-2) - 5a_n(n+r) - 25a_{n-2} - 7a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r+3)\, a_{n-2}}{n+1+r} \tag{4}$$

Which for the root $r = 7$ becomes

$$a_n = -\frac{(n+10)\, a_{n-2}}{n+8} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 7$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-5-r}{r+3}$$

Which for the root $r = 7$ becomes

$$a_2 = -\frac{6}{5}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-r}{r+3}$	$-\frac{6}{5}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-r}{r+3}$	$-\frac{6}{5}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{7+r}{r+3}$$

Which for the root $r = 7$ becomes

$$a_4 = \frac{7}{5}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-r}{r+3}$	$-\frac{6}{5}$
a_3	0	0
a_4	$\frac{7+r}{r+3}$	$\frac{7}{5}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-r}{r+3}$	$-\frac{6}{5}$
a_3	0	0
a_4	$\frac{7+r}{r+3}$	$\frac{7}{5}$
a_5	0	0

For $n = 6$, using the above recursive equation gives

$$a_6 = \frac{-9-r}{r+3}$$

Which for the root $r = 7$ becomes

$$a_6 = -\frac{8}{5}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-r}{r+3}$	$-\frac{6}{5}$
a_3	0	0
a_4	$\frac{7+r}{r+3}$	$\frac{7}{5}$
a_5	0	0
a_6	$\frac{-9-r}{r+3}$	$-\frac{8}{5}$

For $n = 7$, using the above recursive equation gives

$$a_7 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-r}{r+3}$	$-\frac{6}{5}$
a_3	0	0
a_4	$\frac{7+r}{r+3}$	$\frac{7}{5}$
a_5	0	0
a_6	$\frac{-9-r}{r+3}$	$-\frac{8}{5}$
a_7	0	0

For $n = 8$, using the above recursive equation gives

$$a_8 = \frac{11 + r}{r + 3}$$

Which for the root $r = 7$ becomes

$$a_8 = \frac{9}{5}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-5-r}{r+3}$	$-\frac{6}{5}$
a_3	0	0
a_4	$\frac{7+r}{r+3}$	$\frac{7}{5}$
a_5	0	0
a_6	$\frac{-9-r}{r+3}$	$-\frac{8}{5}$
a_7	0	0
a_8	$\frac{11+r}{r+3}$	$\frac{9}{5}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^7 \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 + a_9 x^9 \dots\right) \\ &= x^7 \left(1 - \frac{6x^2}{5} + \frac{7x^4}{5} - \frac{8x^6}{5} + \frac{9x^8}{5} + O(x^9)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 8$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_8(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_8 \\ &= \frac{11+r}{r+3} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r\to r_2} \frac{11+r}{r+3} &= \lim_{r\to -1} \frac{11+r}{r+3} \\ &= 5 \end{aligned}$$

The limit is 5. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^{n-1} \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq(3) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &b_{n-2}(n+r-2)(n-3+r) + b_n(n+r)(n+r-1) \\ &+ b_{n-2}(n+r-2) - 5b_n(n+r) - 25b_{n-2} - 7b_n = 0 \end{aligned} \tag{4}$$

Which for for the root $r = -1$ becomes

$$b_{n-2}(n-3)(n-4) + b_n(n-1)(n-2) + b_{n-2}(n-3) - 5b_n(n-1) - 25b_{n-2} - 7b_n = 0 \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{(n+r+3)\, b_{n-2}}{n+1+r} \tag{5}$$

Which for the root $r = -1$ becomes

$$b_n = -\frac{(n+2)\, b_{n-2}}{n} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -\frac{5+r}{r+3}$$

Which for the root $r = -1$ becomes

$$b_2 = -2$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-r}{r+3}$	-2

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-r}{r+3}$	-2
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{7+r}{r+3}$$

Which for the root $r = -1$ becomes

$$b_4 = 3$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-r}{r+3}$	-2
b_3	0	0
b_4	$\frac{7+r}{r+3}$	3

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-r}{r+3}$	-2
b_3	0	0
b_4	$\frac{7+r}{r+3}$	3
b_5	0	0

For $n = 6$, using the above recursive equation gives

$$b_6 = -\frac{9+r}{r+3}$$

Which for the root $r = -1$ becomes

$$b_6 = -4$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-r}{r+3}$	-2
b_3	0	0
b_4	$\frac{7+r}{r+3}$	3
b_5	0	0
b_6	$\frac{-9-r}{r+3}$	-4

For $n = 7$, using the above recursive equation gives

$$b_7 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-r}{r+3}$	-2
b_3	0	0
b_4	$\frac{7+r}{r+3}$	3
b_5	0	0
b_6	$\frac{-9-r}{r+3}$	-4
b_7	0	0

For $n = 8$, using the above recursive equation gives

$$b_8 = \frac{11 + r}{r + 3}$$

Which for the root $r = -1$ becomes

$$b_8 = 5$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-5-r}{r+3}$	-2
b_3	0	0
b_4	$\frac{7+r}{r+3}$	3
b_5	0	0
b_6	$\frac{-9-r}{r+3}$	-4
b_7	0	0
b_8	$\frac{11+r}{r+3}$	5

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned}
y_2(x) &= x^7\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 + b_9 x^9 \dots\right) \\
&= \frac{1 - 2x^2 + 3x^4 - 4x^6 + 5x^8 + O(x^9)}{x}
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^7 \left(1 - \frac{6x^2}{5} + \frac{7x^4}{5} - \frac{8x^6}{5} + \frac{9x^8}{5} + O(x^9)\right) + \frac{c_2(1 - 2x^2 + 3x^4 - 4x^6 + 5x^8 + O(x^9))}{x}
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x^7 \left(1 - \frac{6x^2}{5} + \frac{7x^4}{5} - \frac{8x^6}{5} + \frac{9x^8}{5} + O(x^9)\right) + \frac{c_2(1 - 2x^2 + 3x^4 - 4x^6 + 5x^8 + O(x^9))}{x}
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y = c_1 x^7 \left(1 - \frac{6x^2}{5} + \frac{7x^4}{5} - \frac{8x^6}{5} + \frac{9x^8}{5} + O(x^9)\right) \\
+ \frac{c_2(1 - 2x^2 + 3x^4 - 4x^6 + 5x^8 + O(x^9))}{x}
\end{aligned} \tag{1}$$

Verification of solutions

$$y = c_1 x^7 \left(1 - \frac{6x^2}{5} + \frac{7x^4}{5} - \frac{8x^6}{5} + \frac{9x^8}{5} + O(x^9)\right) + \frac{c_2(1 - 2x^2 + 3x^4 - 4x^6 + 5x^8 + O(x^9))}{x}$$

Verified OK.

16.41.1 Maple step by step solution

Let's solve

$x^2(x^2+1)\, y'' + (x^3-5x)\, y' + (-25x^2-7)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(25x^2+7)y}{x^2(x^2+1)} - \frac{(x^2-5)y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x^2-5)y'}{x(x^2+1)} - \frac{(25x^2+7)y}{x^2(x^2+1)} = 0$

- ☐ Check to see if x_0 is a regular singular point
  - Define functions

    $\left[P_2(x) = \frac{x^2-5}{x(x^2+1)}, P_3(x) = -\frac{25x^2+7}{x^2(x^2+1)}\right]$

  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $(x \cdot P_2(x))\bigg|_{x=0} = -5$

  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $(x^2 \cdot P_3(x))\bigg|_{x=0} = -7$

  - $x = 0$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = 0$

- Multiply by denominators

  $x^2(x^2+1)\, y'' + x(x^2-5)\, y' + (-25x^2-7)\, y = 0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

- Rewrite ODE with series expansions
  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

  - Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

  - Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

  - Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$$

  - Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$$

  - Shift index using $k- >k + 2 - m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m} (k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(1+r)\,(-7+r)\, x^r + a_1(2+r)\,(-6+r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(k+r+1)\,(k+r-7) + a_{k-2}(k+3-\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1+r)\,(-7+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{-1, 7\}$$

- Each term must be 0

$$a_1(2+r)\,(-6+r) = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

$$(k+r-7)\left(a_k(k+r+1)+a_{k-2}(k+3+r)\right)=0$$

- Shift index using $k->k+2$

$$(k+r-5)\left(a_{k+2}(k+3+r)+a_k(k+r+5)\right)=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{a_k(k+r+5)}{k+3+r}$$

- Recursion relation for $r=-1$

$$a_{k+2}=-\frac{a_k(k+4)}{k+2}$$

- Solution for $r=-1$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+2}=-\frac{a_k(k+4)}{k+2}, a_1=0\right]$$

- Recursion relation for $r=7$

$$a_{k+2}=-\frac{a_k(k+12)}{k+10}$$

- Solution for $r=7$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k+7}, a_{k+2}=-\frac{a_k(k+12)}{k+10}, a_1=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k x^{k-1}\right)+\left(\sum_{k=0}^{\infty} b_k x^{k+7}\right), a_{k+2}=-\frac{a_k(4+k)}{k+2}, a_1=0, b_{k+2}=-\frac{b_k(k+12)}{k+10}, b_1=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.6 THE METHOD OF FROBENIUS III. Exercises 7.7. Page 389
Problem number: 38.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2+1)\, y''+x(2x^2+5)\, y'-21y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+x^2)\, y''+(2x^3+5x)\, y'-21y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{2x^2+5}{x\,(x^2+1)}$$
$$q(x)=-\frac{21}{x^2\,(x^2+1)}$$

Table 854: Table $p(x), q(x)$ singularites.

$p(x) = \frac{2x^2+5}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = -\frac{21}{x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+1)\,y'' + (2x^3+5x)\,y' - 21y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (2x^3+5x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) - 21\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-21 a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 2a_{n-2} (n+r-2)\, x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2} (n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-21 a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$x^{n+r} a_n (n+r)(n+r-1) + 5x^{n+r} a_n (n+r) - 21 a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$x^r a_0 r(-1+r) + 5x^r a_0 r - 21 a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) + 5x^r r - 21 x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(r+7)(r-3)x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$(r+7)(r-3) = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 3$$
$$r_2 = -7$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(r+7)(r-3)x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 10$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x)\ln(x) + x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^3\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x)\ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{x^7}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+3}$$
$$y_2(x) = C y_1(x)\ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-7}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots

of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$a_{n-2}(n+r-2)(n-3+r) + a_n(n+r)(n+r-1) \\ + 2a_{n-2}(n+r-2) + 5a_n(n+r) - 21a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}(n^2+2nr+r^2-3n-3r+2)}{n^2+2nr+r^2+4n+4r-21} \tag{4}$$

Which for the root $r = 3$ becomes

$$a_n = -\frac{a_{n-2}(n^2+3n+2)}{n(n+10)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 3$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{r(1+r)}{r^2+8r-9}$$

Which for the root $r = 3$ becomes

$$a_2 = -\frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r(1+r)}{r^2+8r-9}$	$-\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r(1+r)}{r^2+8r-9}$	$-\frac{1}{2}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$$

Which for the root $r = 3$ becomes

$$a_4 = \frac{15}{56}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r(1+r)}{r^2+8r-9}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{15}{56}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r(1+r)}{r^2+8r-9}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{15}{56}$
a_5	0	0

For $n = 6$, using the above recursive equation gives

$$a_6 = -\frac{(r+5)(r+4)r(r+2)}{(r+13)(r+11)(r+9)(-1+r)}$$

Which for the root $r = 3$ becomes

$$a_6 = -\frac{5}{32}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r(1+r)}{r^2+8r-9}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{15}{56}$
a_5	0	0
a_6	$-\frac{(r+5)(r+4)r(r+2)}{(r+13)(r+11)(r+9)(-1+r)}$	$-\frac{5}{32}$

For $n = 7$, using the above recursive equation gives

$$a_7 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r(1+r)}{r^2+8r-9}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{15}{56}$
a_5	0	0
a_6	$-\frac{(r+5)(r+4)r(r+2)}{(r+13)(r+11)(r+9)(-1+r)}$	$-\frac{5}{32}$
a_7	0	0

For $n = 8$, using the above recursive equation gives

$$a_8 = \frac{(r+7)(r+6)(r+2)r(r+4)}{(r+15)(-1+r)(r+9)(r+11)(r+13)}$$

Which for the root $r = 3$ becomes

$$a_8 = \frac{25}{256}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r(1+r)}{r^2+8r-9}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{15}{56}$
a_5	0	0
a_6	$-\frac{(r+5)(r+4)r(r+2)}{(r+13)(r+11)(r+9)(-1+r)}$	$-\frac{5}{32}$
a_7	0	0
a_8	$\frac{(r+7)(r+6)(r+2)r(r+4)}{(r+15)(-1+r)(r+9)(r+11)(r+13)}$	$\frac{25}{256}$

For $n = 9$, using the above recursive equation gives

$$a_9 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r(1+r)}{r^2+8r-9}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{15}{56}$
a_5	0	0
a_6	$-\frac{(r+5)(r+4)r(r+2)}{(r+13)(r+11)(r+9)(-1+r)}$	$-\frac{5}{32}$
a_7	0	0
a_8	$\frac{(r+7)(r+6)(r+2)r(r+4)}{(r+15)(-1+r)(r+9)(r+11)(r+13)}$	$\frac{25}{256}$
a_9	0	0

For $n = 10$, using the above recursive equation gives

$$a_{10} = -\frac{(r+4)\,r(r+2)\,(r+6)\,(r+8)}{(r+17)\,(r+13)\,(r+11)\,(-1+r)\,(r+15)}$$

Which for the root $r = 3$ becomes

$$a_{10} = -\frac{33}{512}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r(1+r)}{r^2+8r-9}$	$-\frac{1}{2}$
a_3	0	0
a_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{15}{56}$
a_5	0	0
a_6	$-\frac{(r+5)(r+4)r(r+2)}{(r+13)(r+11)(r+9)(-1+r)}$	$-\frac{5}{32}$
a_7	0	0
a_8	$\frac{(r+7)(r+6)(r+2)r(r+4)}{(r+15)(-1+r)(r+9)(r+11)(r+13)}$	$\frac{25}{256}$
a_9	0	0
a_{10}	$-\frac{(r+4)r(r+2)(r+6)(r+8)}{(r+17)(r+13)(r+11)(-1+r)(r+15)}$	$-\frac{33}{512}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= x^3\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 + a_7 x^7 + a_8 x^8 + a_9 x^9 + a_{10} x^{10} + a_{11} x^{11} \dots\right) \\
&= x^3\left(1 - \frac{x^2}{2} + \frac{15x^4}{56} - \frac{5x^6}{32} + \frac{25x^8}{256} - \frac{33x^{10}}{512} + O(x^{11})\right)
\end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 10$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_{10}(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned}
a_N &= a_{10} \\
&= -\frac{(r+4)\, r(r+2)\,(r+6)\,(r+8)}{(r+17)\,(r+13)\,(r+11)\,(-1+r)\,(r+15)}
\end{aligned}$$

Therefore

$$\begin{aligned}
\lim_{r\to r_2} -\frac{(r+4)\, r(r+2)\,(r+6)\,(r+8)}{(r+17)\,(r+13)\,(r+11)\,(-1+r)\,(r+15)} &= \lim_{r\to -7} -\frac{(r+4)\, r(r+2)\,(r+6)\,(r+8)}{(r+17)\,(r+13)\,(r+11)\,(-1+r)\,(r+15)} \\
&= \frac{7}{1024}
\end{aligned}$$

The limit is $\frac{7}{1024}$. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$
\begin{aligned}
y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\
&= \sum_{n=0}^{\infty} b_n x^{n-7}
\end{aligned}
$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq(3) gives

$$
b_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&b_{n-2}(n+r-2)(n-3+r) + b_n(n+r)(n+r-1) \\
&+ 2b_{n-2}(n+r-2) + 5b_n(n+r) - 21b_n = 0
\end{aligned} \tag{4}
$$

Which for for the root $r = -7$ becomes

$$
b_{n-2}(n-9)(n-10) + b_n(n-7)(n-8) + 2b_{n-2}(n-9) + 5b_n(n-7) - 21b_n = 0 \tag{4A}
$$

Solving for b_n from the recursive equation (4) gives

$$
b_n = -\frac{b_{n-2}(n^2 + 2nr + r^2 - 3n - 3r + 2)}{n^2 + 2nr + r^2 + 4n + 4r - 21} \tag{5}
$$

Which for the root $r = -7$ becomes

$$
b_n = -\frac{b_{n-2}(n^2 - 17n + 72)}{n^2 - 10n} \tag{6}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -7$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$
b_2 = -\frac{r(1+r)}{r^2 + 8r - 9}
$$

Which for the root $r = -7$ becomes

$$b_2 = \frac{21}{8}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r(1+r)}{r^2+8r-9}$	$\frac{21}{8}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r(1+r)}{r^2+8r-9}$	$\frac{21}{8}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r(r^2 + 5r + 6)}{(r + 11)(r^2 + 8r - 9)}$$

Which for the root $r = -7$ becomes

$$b_4 = \frac{35}{16}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r(1+r)}{r^2+8r-9}$	$\frac{21}{8}$
b_3	0	0
b_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{35}{16}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r(1+r)}{r^2+8r-9}$	$\frac{21}{8}$
b_3	0	0
b_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{35}{16}$
b_5	0	0

For $n = 6$, using the above recursive equation gives

$$b_6 = -\frac{(r^2 + 9r + 20)\, r(r + 2)}{(r + 13)\,(r + 11)\,(r^2 + 8r - 9)}$$

Which for the root $r = -7$ becomes

$$b_6 = \frac{35}{64}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r(1+r)}{r^2+8r-9}$	$\frac{21}{8}$
b_3	0	0
b_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{35}{16}$
b_5	0	0
b_6	$-\frac{(r+5)(r+4)r(r+2)}{(r+13)(r+11)(r+9)(-1+r)}$	$\frac{35}{64}$

For $n = 7$, using the above recursive equation gives

$$b_7 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r(1+r)}{r^2+8r-9}$	$\frac{21}{8}$
b_3	0	0
b_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{35}{16}$
b_5	0	0
b_6	$-\frac{(r+5)(r+4)r(r+2)}{(r+13)(r+11)(r+9)(-1+r)}$	$\frac{35}{64}$
b_7	0	0

For $n = 8$, using the above recursive equation gives

$$b_8 = \frac{(r^2 + 13r + 42)(r + 2)r(r + 4)}{(r + 15)(r + 13)(r + 11)(r^2 + 8r - 9)}$$

Which for the root $r = -7$ becomes

$$b_8 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r(1+r)}{r^2+8r-9}$	$\frac{21}{8}$
b_3	0	0
b_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{35}{16}$
b_5	0	0
b_6	$-\frac{(r+5)(r+4)r(r+2)}{(r+13)(r+11)(r+9)(-1+r)}$	$\frac{35}{64}$
b_7	0	0
b_8	$\frac{(r+7)(r+6)(r+2)r(r+4)}{(r+15)(-1+r)(r+9)(r+11)(r+13)}$	0

For $n = 9$, using the above recursive equation gives

$$b_9 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r(1+r)}{r^2+8r-9}$	$\frac{21}{8}$
b_3	0	0
b_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{35}{16}$
b_5	0	0
b_6	$-\frac{(r+5)(r+4)r(r+2)}{(r+13)(r+11)(r+9)(-1+r)}$	$\frac{35}{64}$
b_7	0	0
b_8	$\frac{(r+7)(r+6)(r+2)r(r+4)}{(r+15)(-1+r)(r+9)(r+11)(r+13)}$	0
b_9	0	0

For $n = 10$, using the above recursive equation gives

$$b_{10} = -\frac{(r+4)\, r(r+2)\, (r+6)\, (r+8)}{(r+17)\, (r+13)\, (r+11)\, (-1+r)\, (r+15)}$$

Which for the root $r = -7$ becomes

$$b_{10} = \frac{7}{1024}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r(1+r)}{r^2+8r-9}$	$\frac{21}{8}$
b_3	0	0
b_4	$\frac{r(r^2+5r+6)}{(r+11)(r^2+8r-9)}$	$\frac{35}{16}$
b_5	0	0
b_6	$-\frac{(r+5)(r+4)r(r+2)}{(r+13)(r+11)(r+9)(-1+r)}$	$\frac{35}{64}$
b_7	0	0
b_8	$\frac{(r+7)(r+6)(r+2)r(r+4)}{(r+15)(-1+r)(r+9)(r+11)(r+13)}$	0
b_9	0	0
b_{10}	$-\frac{(r+4)r(r+2)(r+6)(r+8)}{(r+17)(r+13)(r+11)(-1+r)(r+15)}$	$\frac{7}{1024}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned}
y_2(x) &= x^3\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 + b_7 x^7 + b_8 x^8 + b_9 x^9 + b_{10} x^{10} + b_{11} x^{11} \dots\right) \\
&= \frac{1 + \frac{21x^2}{8} + \frac{35x^4}{16} + \frac{35x^6}{64} + \frac{7x^{10}}{1024} + O(x^{11})}{x^7}
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^3 \left(1 - \frac{x^2}{2} + \frac{15x^4}{56} - \frac{5x^6}{32} + \frac{25x^8}{256} - \frac{33x^{10}}{512} + O(x^{11})\right) \\
