For $n = 4$ the recurrence equation gives

$$54a_4 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -3a_0$$

For $n = 5$ the recurrence equation gives

$$77a_5 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{77a_1}{16}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1x - a_0x^2 - \frac{3}{2}a_1x^3 + \frac{5}{3}a_0x^4 + \frac{21}{8}a_1x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - x^2 + \frac{5}{3}x^4\right)a_0 + \left(x - \frac{3}{2}x^3 + \frac{21}{8}x^5\right)a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - x^2 + \frac{5}{3}x^4\right)c_1 + \left(x - \frac{3}{2}x^3 + \frac{21}{8}x^5\right)c_2 + O(x^6)$$

Summary

The solution(s) found are the following

$$y = \left(1 - x^2 + \frac{5}{3}x^4 - 3x^6\right)y(0) + \left(x - \frac{3}{2}x^3 + \frac{21}{8}x^5\right)y'(0) + O(x^6) \tag{1}$$

$$y = \left(1 - x^2 + \frac{5}{3}x^4\right)c_1 + \left(x - \frac{3}{2}x^3 + \frac{21}{8}x^5\right)c_2 + O(x^6) \tag{2}$$

Verification of solutions

$$y = \left(1 - x^2 + \frac{5}{3}x^4 - 3x^6\right) y(0) + \left(x - \frac{3}{2}x^3 + \frac{21}{8}x^5\right) y'(0) + O(x^6)$$

Verified OK.

$$y = \left(1 - x^2 + \frac{5}{3}x^4\right) c_1 + \left(x - \frac{3}{2}x^3 + \frac{21}{8}x^5\right) c_2 + O(x^6)$$

Verified OK.

Problem number: 6.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{\left(x^{2}+1\right) y''+2y'x+\frac{y}{4}=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y_0'$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0)+(x-x_0)\,y'(x_0)+\frac{(x-x_0)^2}{2}y''(x_0)+\frac{(x-x_0)^3}{3!}y'''(x_0)+\cdots \\
&= y_0+xy_0'+\frac{x^2}{2}f|_{x_0,y_0,y_0'}+\frac{x^3}{3!}f'|_{x_0,y_0,y_0'}+\cdots \\
&= y_0+xy_0'+\sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}\frac{d^nf}{dx^n}\bigg|_{x_0,y_0,y_0'}
\end{aligned}$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' && (833)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (834)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f && (3)\\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{align}
F_0 &= f(x, y, y') \tag{4}\\
F_1 &= \frac{df}{dx} \nonumber\\
&= \frac{dF_0}{dx} \nonumber\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' \nonumber\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \tag{5}\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \nonumber\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right) \nonumber\\
&= \frac{d}{dx}(F_1) \nonumber\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y'' \nonumber\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0 \nonumber\\
&\vdots \nonumber\\
F_n &= \frac{d}{dx}(F_{n-1}) \nonumber\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y'' \nonumber\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \tag{6}
\end{align}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{8y'x + y}{4\left(x^2+1\right)} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{23y'x^2 + 4yx - 9y'}{4\left(x^2+1\right)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{-352x^3y' - 71x^2y + 416y'x + 25y}{16\left(x^2+1\right)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{\left(1689x^4 - 4014x^2 + 441\right) y' + \left(372x^3 - 396x\right) y}{16\left(x^2+1\right)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{\left(-39048x^5 + 155376x^3 - 51336x\right) y' + \left(-9129x^4 + 19566x^2 - 2025\right) y}{64\left(x^2+1\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= -\frac{y(0)}{4} \\
F_1 &= -\frac{9y'(0)}{4} \\
F_2 &= \frac{25y(0)}{16} \\
F_3 &= \frac{441y'(0)}{16} \\
F_4 &= -\frac{2025y(0)}{64}
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y = \left(1-\frac{1}{8}x^2+\frac{25}{384}x^4-\frac{45}{1024}x^6\right)y(0)+\left(x-\frac{3}{8}x^3+\frac{147}{640}x^5\right)y'(0)+O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(x^2+1\right)y''+2y'x+\frac{y}{4}=0$$

Let the solution be represented as power series of the form

$$y=\sum_{n=0}^{\infty}a_n x^n$$

Then

$$y'=\sum_{n=1}^{\infty}n a_n x^{n-1}$$
$$y''=\sum_{n=2}^{\infty}n(n-1)\,a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\left(x^2+1\right)\left(\sum_{n=2}^{\infty}n(n-1)\,a_n x^{n-2}\right)+2\left(\sum_{n=1}^{\infty}n a_n x^{n-1}\right)x+\frac{\left(\sum_{n=0}^{\infty}a_n x^n\right)}{4}=0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty}x^n a_n n(n-1)\right)+\left(\sum_{n=2}^{\infty}n(n-1)\,a_n x^{n-2}\right)+\left(\sum_{n=1}^{\infty}2n a_n x^n\right)+\left(\sum_{n=0}^{\infty}\frac{a_n x^n}{4}\right)=0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty}n(n-1)\,a_n x^{n-2}=\sum_{n=0}^{\infty}(n+2)\,a_{n+2}(n+1)\,x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} x^n a_n n(n-1)\right)+\left(\sum_{n=0}^{\infty}(n+2)\, a_{n+2}(n+1)\, x^n\right)+\left(\sum_{n=1}^{\infty} 2n a_n x^n\right)+\left(\sum_{n=0}^{\infty}\frac{a_n x^n}{4}\right)=0 \tag{3}$$

$n = 0$ gives

$$2a_2 + \frac{a_0}{4} = 0$$

$$a_2 = -\frac{a_0}{8}$$

$n = 1$ gives

$$6a_3 + \frac{9a_1}{4} = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{3a_1}{8}$$

For $2 \leq n$, the recurrence equation is

$$n a_n(n-1) + (n+2)\, a_{n+2}(n+1) + 2n a_n + \frac{a_n}{4} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{a_n(4n^2+4n+1)}{4\,(n+2)\,(n+1)} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$\frac{25a_2}{4} + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{25a_0}{384}$$

For $n = 3$ the recurrence equation gives

$$\frac{49a_3}{4} + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{147a_1}{640}$$

For $n = 4$ the recurrence equation gives

$$\frac{81a_4}{4} + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{45a_0}{1024}$$

For $n = 5$ the recurrence equation gives

$$\frac{121a_5}{4} + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{847a_1}{5120}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1x - \frac{1}{8}a_0x^2 - \frac{3}{8}a_1x^3 + \frac{25}{384}a_0x^4 + \frac{147}{640}a_1x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{1}{8}x^2 + \frac{25}{384}x^4\right)a_0 + \left(x - \frac{3}{8}x^3 + \frac{147}{640}x^5\right)a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1-\frac{1}{8}x^2+\frac{25}{384}x^4\right)c_1+\left(x-\frac{3}{8}x^3+\frac{147}{640}x^5\right)c_2+O\left(x^6\right)$$

Summary

The solution(s) found are the following

$$y = \left(1-\frac{1}{8}x^2+\frac{25}{384}x^4-\frac{45}{1024}x^6\right)y(0)+\left(x-\frac{3}{8}x^3+\frac{147}{640}x^5\right)y'(0)+O\left(x^6\right) \quad (1)$$

$$y = \left(1-\frac{1}{8}x^2+\frac{25}{384}x^4\right)c_1+\left(x-\frac{3}{8}x^3+\frac{147}{640}x^5\right)c_2+O\left(x^6\right) \quad (2)$$

Verification of solutions

$$y = \left(1-\frac{1}{8}x^2+\frac{25}{384}x^4-\frac{45}{1024}x^6\right)y(0)+\left(x-\frac{3}{8}x^3+\frac{147}{640}x^5\right)y'(0)+O\left(x^6\right)$$

Verified OK.

$$y = \left(1-\frac{1}{8}x^2+\frac{25}{384}x^4\right)c_1+\left(x-\frac{3}{8}x^3+\frac{147}{640}x^5\right)c_2+O\left(x^6\right)$$

Verified OK.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[_Gegenbauer]
```

$$\boxed{\left(-x^2+1\right) y''-5y'x-4y=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0)+(x-x_0)\,y'(x_0)+\frac{(x-x_0)^2}{2}y''(x_0)+\frac{(x-x_0)^3}{3!}y'''(x_0)+\cdots \\
&= y_0+xy'_0+\frac{x^2}{2}\,f|_{x_0,y_0,y'_0}+\frac{x^3}{3!}\,f'|_{x_0,y_0,y'_0}+\cdots \\
&= y_0+xy'_0+\sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}\,\frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{836}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{837}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{5y'x+4y}{x^2-1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{26y'x^2+28yx+9y'}{(x^2-1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{-154x^3y'-188x^2y-161y'x-64y}{(x^2-1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(1044x^4+2196x^2+225)\,y'+(1368x^3+1404x)\,y}{(x^2-1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-8028x^5-28296x^3-8721x)\,y'+(-11016x^4-22716x^2-2304)\,y}{(x^2-1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= 4y(0) \\
F_1 &= 9y'(0) \\
F_2 &= 64y(0) \\
F_3 &= 225y'(0) \\
F_4 &= 2304y(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = \left(1+2x^2+\frac{8}{3}x^4+\frac{16}{5}x^6\right) y(0) + \left(x+\frac{3}{2}x^3+\frac{15}{8}x^5\right) y'(0) + O(x^6)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(-x^2 + 1)\, y'' - 5y'x - 4y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(-x^2 + 1) \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) - 5\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x - 4\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \quad (1)$$

Which simplifies to

$$\sum_{n=2}^{\infty} (-x^n a_n n(n-1)) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \sum_{n=1}^{\infty} (-5n a_n x^n) + \sum_{n=0}^{\infty} (-4a_n x^n) = 0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\sum_{n=2}^{\infty} (-x^n a_n n(n-1)) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \sum_{n=1}^{\infty} (-5n a_n x^n) + \sum_{n=0}^{\infty} (-4a_n x^n) = 0 \quad (3)$$

$n = 0$ gives

$$2a_2 - 4a_0 = 0$$

$$a_2 = 2a_0$$

$n = 1$ gives

$$6a_3 - 9a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{3a_1}{2}$$

For $2 \leq n$, the recurrence equation is

$$-na_n(n-1) + (n+2)\,a_{n+2}(n+1) - 5na_n - 4a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = \frac{(n+2)\,a_n}{n+1} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$-16a_2 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{8a_0}{3}$$

For $n = 3$ the recurrence equation gives

$$-25a_3 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{15a_1}{8}$$

For $n = 4$ the recurrence equation gives

$$-36a_4 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{16a_0}{5}$$

For $n = 5$ the recurrence equation gives

$$-49a_5 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{35a_1}{16}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x + 2a_0 x^2 + \frac{3}{2} a_1 x^3 + \frac{8}{3} a_0 x^4 + \frac{15}{8} a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 + 2x^2 + \frac{8}{3}x^4\right) a_0 + \left(x + \frac{3}{2}x^3 + \frac{15}{8}x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 + 2x^2 + \frac{8}{3}x^4\right) c_1 + \left(x + \frac{3}{2}x^3 + \frac{15}{8}x^5\right) c_2 + O(x^6)$$

Summary

The solution(s) found are the following

$$y = \left(1 + 2x^2 + \frac{8}{3}x^4 + \frac{16}{5}x^6\right) y(0) + \left(x + \frac{3}{2}x^3 + \frac{15}{8}x^5\right) y'(0) + O(x^6) \tag{1}$$

$$y = \left(1 + 2x^2 + \frac{8}{3}x^4\right) c_1 + \left(x + \frac{3}{2}x^3 + \frac{15}{8}x^5\right) c_2 + O(x^6) \tag{2}$$

Verification of solutions

$$y = \left(1+2x^2+\frac{8}{3}x^4+\frac{16}{5}x^6\right)y(0)+\left(x+\frac{3}{2}x^3+\frac{15}{8}x^5\right)y'(0)+O(x^6)$$

Verified OK.

$$y = \left(1+2x^2+\frac{8}{3}x^4\right)c_1+\left(x+\frac{3}{2}x^3+\frac{15}{8}x^5\right)c_2+O(x^6)$$

Verified OK.

12.7.1 Maple step by step solution

Let's solve

$(-x^2+1)\,y''-5y'x-4y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{5xy'}{x^2-1}-\frac{4y}{x^2-1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{5xy'}{x^2-1}+\frac{4y}{x^2-1}=0$

☐ Check to see if x_0 is a regular singular point

- ○ Define functions

  $\left[P_2(x)=\frac{5x}{x^2-1}, P_3(x)=\frac{4}{x^2-1}\right]$

- ○ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

  $\left((x+1)\cdot P_2(x)\right)\Big|_{x=-1}=\frac{5}{2}$

- ○ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

  $\left((x+1)^2\cdot P_3(x)\right)\Big|_{x=-1}=0$

- ○ $x=-1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-1$

- Multiply by denominators

$$(x^2-1)\,y''+5y'x+4y=0$$

- Change variables using $x=u-1$ so that the regular singular point is at $u=0$

$$(u^2-2u)\left(\frac{d^2}{du^2}y(u)\right)+(5u-5)\left(\frac{d}{du}y(u)\right)+4y(u)=0$$

- Assume series solution for $y(u)$

$$y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$$

☐ Rewrite ODE with series expansions

  - Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..1$

$$u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$$

  - Shift index using $k->k+1-m$

$$u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,u^{k+r}$$

  - Convert $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m=1..2$

$$u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,u^{k+r-2+m}$$

  - Shift index using $k->k+2-m$

$$u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$$

Rewrite ODE with series expansions

$$-a_0r(3+2r)\,u^{-1+r}+\left(\sum_{k=0}^{\infty}\left(-a_{k+1}(k+1+r)\,(2k+5+2r)+a_k(k+r+2)^2\right)u^{k+r}\right)=0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-r(3+2r)=0$$

- Values of r that satisfy the indicial equation

$$r\in\left\{0,-\frac{3}{2}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$a_k(k+r+2)^2-2(k+1+r)\left(k+\frac{5}{2}+r\right)a_{k+1}=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1}=\frac{a_k(k+r+2)^2}{(k+1+r)(2k+5+2r)}$$

- Recursion relation for $r=0$

$$a_{k+1} = \frac{a_k (k+2)^2}{(k+1)(2k+5)}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+1} = \frac{a_k (k+2)^2}{(k+1)(2k+5)}\right]$$

- Revert the change of variables $u = x + 1$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^k, a_{k+1} = \frac{a_k (k+2)^2}{(k+1)(2k+5)}\right]$$

- Recursion relation for $r = -\frac{3}{2}$

$$a_{k+1} = \frac{a_k \left(k+\frac{1}{2}\right)^2}{\left(k-\frac{1}{2}\right)(2k+2)}$$

- Solution for $r = -\frac{3}{2}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{3}{2}}, a_{k+1} = \frac{a_k \left(k+\frac{1}{2}\right)^2}{\left(k-\frac{1}{2}\right)(2k+2)}\right]$$

- Revert the change of variables $u = x + 1$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^{k-\frac{3}{2}}, a_{k+1} = \frac{a_k \left(k+\frac{1}{2}\right)^2}{\left(k-\frac{1}{2}\right)(2k+2)}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k (x+1)^k\right) + \left(\sum_{k=0}^{\infty} b_k (x+1)^{k-\frac{3}{2}}\right), a_{1+k} = \frac{a_k (k+2)^2}{(1+k)(2k+5)}, b_{1+k} = \frac{b_k \left(k+\frac{1}{2}\right)^2}{\left(k-\frac{1}{2}\right)(2k+2)}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 8.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(x^2+1)\,y''-10y'x+28y=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0)+(x-x_0)\,y'(x_0)+\frac{(x-x_0)^2}{2}y''(x_0)+\frac{(x-x_0)^3}{3!}y'''(x_0)+\cdots \\
&= y_0+xy'_0+\frac{x^2}{2}\,f|_{x_0,y_0,y'_0}+\frac{x^3}{3!}\,f'|_{x_0,y_0,y'_0}+\cdots \\
&= y_0+xy'_0+\sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}\,\frac{d^nf}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{839}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{840}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} F_n|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= \frac{10y'x - 28y}{x^2+1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{62y'x^2 - 224yx - 18y'}{\left(x^2+1\right)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{272x^3y' - 1064x^2y - 208y'x + 280y}{\left(x^2+1\right)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{\left(840x^4 - 1008x^2 + 72\right) y' - 3360\left(x^2 - \frac{3}{5}\right) xy}{\left(x^2+1\right)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{\left(1680x^5 - 2016x^3 + 144x\right) y' - 6720\left(x^2 - \frac{3}{5}\right) x^2 y}{\left(x^2+1\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= -28y(0) \\
F_1 &= -18y'(0) \\
F_2 &= 280y(0) \\
F_3 &= 72y'(0) \\
F_4 &= 0
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = \left(1 - 14x^2 + \frac{35}{3}x^4\right) y(0) + \left(x - 3x^3 + \frac{3}{5}x^5\right) y'(0) + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(x^2 + 1)\, y'' - 10y'x + 28y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(x^2 + 1)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) - 10\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x + 28\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} x^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \sum_{n=1}^{\infty} (-10 n a_n x^n) + \left(\sum_{n=0}^{\infty} 28 a_n x^n\right) = 0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} x^n a_n n(n-1)\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \sum_{n=1}^{\infty} (-10 n a_n x^n) + \left(\sum_{n=0}^{\infty} 28 a_n x^n\right) = 0 \quad (3)$$

$n = 0$ gives

$$2a_2 + 28a_0 = 0$$

$$a_2 = -14a_0$$

$n = 1$ gives

$$6a_3 + 18a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -3a_1$$

For $2 \leq n$, the recurrence equation is

$$na_n(n-1) + (n+2)\,a_{n+2}(n+1) - 10na_n + 28a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{a_n(n^2 - 11n + 28)}{(n+2)\,(n+1)} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$10a_2 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{35a_0}{3}$$

For $n = 3$ the recurrence equation gives

$$4a_3 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{3a_1}{5}$$

For $n = 4$ the recurrence equation gives

$$30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = 0$$

For $n = 5$ the recurrence equation gives

$$-2a_5 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{a_1}{35}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - 14a_0 x^2 - 3a_1 x^3 + \frac{35}{3} a_0 x^4 + \frac{3}{5} a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - 14x^2 + \frac{35}{3}x^4\right) a_0 + \left(x - 3x^3 + \frac{3}{5}x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - 14x^2 + \frac{35}{3}x^4\right) c_1 + \left(x - 3x^3 + \frac{3}{5}x^5\right) c_2 + O(x^6)$$

Summary

The solution(s) found are the following

$$y = \left(1 - 14x^2 + \frac{35}{3}x^4\right) y(0) + \left(x - 3x^3 + \frac{3}{5}x^5\right) y'(0) + O(x^6) \tag{1}$$

$$y = \left(1 - 14x^2 + \frac{35}{3}x^4\right) c_1 + \left(x - 3x^3 + \frac{3}{5}x^5\right) c_2 + O(x^6) \tag{2}$$

Verification of solutions

$$y = \left(1 - 14x^2 + \frac{35}{3}x^4\right) y(0) + \left(x - 3x^3 + \frac{3}{5}x^5\right) y'(0) + O(x^6)$$

Verified OK.

$$y = \left(1 - 14x^2 + \frac{35}{3}x^4\right) c_1 + \left(x - 3x^3 + \frac{3}{5}x^5\right) c_2 + O(x^6)$$

Verified OK.

ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' + y'x + 2y = 0}$$

With the expansion point for the power series method at $x = 0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned} y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\ &= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\ &= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0} \end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' && (842)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (843)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f && (3)\\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') &(4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f &(5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 &(6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} F_n|_{x_0, y_0, y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -y'x - 2y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= y'x^2 + 2yx - 3y' \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= -x^3y' - 2x^2y + 7y'x + 8y \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \left(x^4 - 12x^2 + 15\right) y' + 2\left(x^3 - 9x\right) y \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \left(-x^5 + 18x^3 - 57x\right) y' - 2y\left(x^4 - 15x^2 + 24\right)
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= -2y(0) \\
F_1 &= -3y'(0) \\
F_2 &= 8y(0) \\
F_3 &= 15y'(0) \\
F_4 &= -48y(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = \left(1 - x^2 + \frac{1}{3}x^4 - \frac{1}{15}x^6\right) y(0) + \left(x - \frac{1}{2}x^3 + \frac{1}{8}x^5\right) y'(0) + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard

power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = -\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x - 2\left(\sum_{n=0}^{\infty} a_n x^n\right) \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} n\, x^n a_n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=1}^{\infty} n\, x^n a_n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 2a_0 = 0$$

$$a_2 = -a_0$$

For $1 \leq n$, the recurrence equation is

$$(n+2) a_{n+2}(n+1) + n a_n + 2 a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{a_n}{n+1} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$6a_3 + 3a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = -\frac{a_1}{2}$$

For $n = 2$ the recurrence equation gives

$$12a_4 + 4a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{3}$$

For $n = 3$ the recurrence equation gives

$$20a_5 + 5a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_1}{8}$$

For $n = 4$ the recurrence equation gives

$$30a_6 + 6a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{a_0}{15}$$

For $n = 5$ the recurrence equation gives

$$42a_7 + 7a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{a_1}{48}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - a_0 x^2 - \frac{1}{2} a_1 x^3 + \frac{1}{3} a_0 x^4 + \frac{1}{8} a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - x^2 + \frac{1}{3}x^4\right) a_0 + \left(x - \frac{1}{2}x^3 + \frac{1}{8}x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - x^2 + \frac{1}{3}x^4\right) c_1 + \left(x - \frac{1}{2}x^3 + \frac{1}{8}x^5\right) c_2 + O(x^6)$$

Summary

The solution(s) found are the following

$$y = \left(1 - x^2 + \frac{1}{3}x^4 - \frac{1}{15}x^6\right) y(0) + \left(x - \frac{1}{2}x^3 + \frac{1}{8}x^5\right) y'(0) + O(x^6) \tag{1}$$

$$y = \left(1 - x^2 + \frac{1}{3}x^4\right) c_1 + \left(x - \frac{1}{2}x^3 + \frac{1}{8}x^5\right) c_2 + O(x^6) \tag{2}$$

Verification of solutions

$$y = \left(1 - x^2 + \frac{1}{3}x^4 - \frac{1}{15}x^6\right) y(0) + \left(x - \frac{1}{2}x^3 + \frac{1}{8}x^5\right) y'(0) + O(x^6)$$

Verified OK.

$$y = \left(1 - x^2 + \frac{1}{3}x^4\right) c_1 + \left(x - \frac{1}{2}x^3 + \frac{1}{8}x^5\right) c_2 + O(x^6)$$

Verified OK.

12.9.1 Maple step by step solution

Let's solve

$y'' = -y'x - 2y$

- Highest derivative means the order of the ODE is 2

  y''

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + y'x + 2y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite DE with series expansions

  ◦ Convert $x \cdot y'$ to series expansion

  $x \cdot y' = \sum_{k=0}^{\infty} a_k k\, x^k$

  ◦ Convert y'' to series expansion

  $y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$

  ◦ Shift index using $k- >k+2$

  $y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$

  Rewrite DE with series expansions

  $\sum_{k=0}^{\infty} \left(a_{k+2}(k+2)\,(k+1) + a_k(k+2)\right) x^k = 0$

- Each term in the series must be 0, giving the recursion relation

  $(k+2)\,(k a_{k+2} + a_k + a_{k+2}) = 0$

- Recursion relation that defines the series solution to the ODE

  $\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+2} = -\frac{a_k}{k+1}\right]$

Problem number: 10.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' + 2y'x + 3y = 0}$$

With the expansion point for the power series method at $x = 0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + xy'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\
&= y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \left.\frac{d^n f}{dx^n}\right|_{x_0,y_0,y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{845}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{846}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}F_n|_{x_0,y_0,y_0'} \qquad (7)$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -2y'x - 3y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \\
&= 4y'x^2 + 6yx - 5y' \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y}y' + \frac{\partial F_1}{\partial y'}F_1 \\
&= -8x^3y' - 12x^2y + 24y'x + 21y \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y}y' + \frac{\partial F_2}{\partial y'}F_2 \\
&= \left(16x^4 - 84x^2 + 45\right)y' + 24\left(x^3 - 4x\right)y \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y}y' + \frac{\partial F_3}{\partial y'}F_3 \\
&= \left(-32x^5 + 256x^3 - 354x\right)y' + \left(-48x^4 + 324x^2 - 231\right)y
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=y(0)$ and $y'(0)=y'(0)$ gives

$$
\begin{aligned}
F_0 &= -3y(0) \\
F_1 &= -5y'(0) \\
F_2 &= 21y(0) \\
F_3 &= 45y'(0) \\
F_4 &= -231y(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = \left(1 - \frac{3}{2}x^2 + \frac{7}{8}x^4 - \frac{77}{240}x^6\right)y(0) + \left(x - \frac{5}{6}x^3 + \frac{3}{8}x^5\right)y'(0) + O\left(x^6\right)
$$

Since the expansion point $x=0$ is an ordinary, we can also solve this using standard

power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = -2\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x - 3\left(\sum_{n=0}^{\infty} a_n x^n\right) \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 2n\, x^n a_n\right) + \left(\sum_{n=0}^{\infty} 3 a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2} (n+1)\, x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=1}^{\infty} 2n\, x^n a_n\right) + \left(\sum_{n=0}^{\infty} 3 a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 3a_0 = 0$$

$$a_2 = -\frac{3a_0}{2}$$

For $1 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) + 2n a_n + 3a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{a_n(2n+3)}{(n+2)\,(n+1)} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$6a_3 + 5a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = -\frac{5a_1}{6}$$

For $n = 2$ the recurrence equation gives

$$12a_4 + 7a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{7a_0}{8}$$

For $n = 3$ the recurrence equation gives

$$20a_5 + 9a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{3a_1}{8}$$

For $n = 4$ the recurrence equation gives

$$30a_6 + 11a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{77a_0}{240}$$

For $n = 5$ the recurrence equation gives

$$42a_7 + 13a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{13a_1}{112}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - \frac{3}{2} a_0 x^2 - \frac{5}{6} a_1 x^3 + \frac{7}{8} a_0 x^4 + \frac{3}{8} a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{3}{2}x^2 + \frac{7}{8}x^4\right) a_0 + \left(x - \frac{5}{6}x^3 + \frac{3}{8}x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{3}{2}x^2 + \frac{7}{8}x^4\right) c_1 + \left(x - \frac{5}{6}x^3 + \frac{3}{8}x^5\right) c_2 + O(x^6)$$

Summary

The solution(s) found are the following

$$y = \left(1 - \frac{3}{2}x^2 + \frac{7}{8}x^4 - \frac{77}{240}x^6\right) y(0) + \left(x - \frac{5}{6}x^3 + \frac{3}{8}x^5\right) y'(0) + O(x^6) \tag{1}$$

$$y = \left(1 - \frac{3}{2}x^2 + \frac{7}{8}x^4\right) c_1 + \left(x - \frac{5}{6}x^3 + \frac{3}{8}x^5\right) c_2 + O(x^6) \tag{2}$$

Verification of solutions

$$y = \left(1 - \frac{3}{2}x^2 + \frac{7}{8}x^4 - \frac{77}{240}x^6\right) y(0) + \left(x - \frac{5}{6}x^3 + \frac{3}{8}x^5\right) y'(0) + O(x^6)$$

Verified OK.

$$y = \left(1 - \frac{3}{2}x^2 + \frac{7}{8}x^4\right) c_1 + \left(x - \frac{5}{6}x^3 + \frac{3}{8}x^5\right) c_2 + O(x^6)$$

Verified OK.

12.10.1 Maple step by step solution

Let's solve

$y'' = -2y'x - 3y$

- Highest derivative means the order of the ODE is 2

  y''

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + 2y'x + 3y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite DE with series expansions

  ◦ Convert $x \cdot y'$ to series expansion

    $x \cdot y' = \sum_{k=0}^{\infty} a_k k\, x^k$

  ◦ Convert y'' to series expansion

    $y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$

  ◦ Shift index using $k- >k+2$

    $y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$

  Rewrite DE with series expansions

  $\sum_{k=0}^{\infty} \left(a_{k+2}(k+2)\,(k+1) + a_k(2k+3)\right) x^k = 0$

- Each term in the series must be 0, giving the recursion relation

  $(k^2+3k+2)\, a_{k+2} + 2a_k k + 3a_k = 0$

- Recursion relation that defines the series solution to the ODE

  $\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+2} = -\frac{a_k(2k+3)}{k^2+3k+2}\right]$

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second_order_change_of_variable_on_x_method_1", "second_order_change_of_variable_on_x_method_2", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries], [_2nd_order, _linear, `
   _with_symmetry_[0,F(x)]`]]
```

$$\boxed{(x^2+1)\,y''+y'x+y=0}$$

With initial conditions

$$[y(0)=2, y'(0)=-1]$$

With the expansion point for the power series method at $x=0$.

12.11.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$
\begin{aligned}
p(x) &= \frac{x}{x^2+1} \\
q(x) &= \frac{1}{x^2+1} \\
F &= 0
\end{aligned}
$$

Hence the ode is

$$
y'' + \frac{x y'}{x^2+1} + \frac{y}{x^2+1} = 0
$$

The domain of $p(x) = \frac{x}{x^2+1}$ is

$$
\{-\infty < x < \infty\}
$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{1}{x^2+1}$ is

$$
\{-\infty < x < \infty\}
$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$
y'' = f(x, y, y')
$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}
$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{848}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{849}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n\big|_{x_0, y_0, y'_0} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{y' x + y}{x^2 + 1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{y' x^2 + 3yx - 2y'}{\left(x^2 + 1\right)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{-10x^2 y + 15y' x + 5y}{\left(x^2 + 1\right)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{\left(-10x^4 - 95x^2 + 20\right) y' + \left(40x^3 - 65x\right) y}{\left(x^2 + 1\right)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{\left(90x^5 + 600x^3 - 435x\right) y' + \left(-190x^4 + 670x^2 - 85\right) y}{\left(x^2 + 1\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 2$ and $y'(0) = -1$ gives

$$
\begin{aligned}
F_0 &= -2 \\
F_1 &= 2 \\
F_2 &= 10 \\
F_3 &= -20 \\
F_4 &= -170
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = -x^2 - x + 2 + \frac{x^3}{3} + \frac{5x^4}{12} - \frac{x^5}{6} - \frac{17x^6}{72} + O\left(x^6\right)
$$

$$y = -x^2 - x + 2 + \frac{x^3}{3} + \frac{5x^4}{12} - \frac{x^5}{6} - \frac{17x^6}{72} + O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(x^2 + 1) y'' + y'x + y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(x^2 + 1) \left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x + \left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} x^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} n a_n x^n\right) + \left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} x^n a_n n(n-1)\right) + \left(\sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n\right) + \left(\sum_{n=1}^{\infty} n a_n x^n\right) + \left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + a_0 = 0$$

$$a_2 = -\frac{a_0}{2}$$

$n = 1$ gives

$$6a_3 + 2a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{a_1}{3}$$

For $2 \leq n$, the recurrence equation is

$$na_n(n-1) + (n+2)\,a_{n+2}(n+1) + na_n + a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{a_n(n^2+1)}{(n+2)\,(n+1)} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$5a_2 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{5a_0}{24}$$

For $n = 3$ the recurrence equation gives

$$10a_3 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_1}{6}$$

For $n = 4$ the recurrence equation gives

$$17a_4 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{17a_0}{144}$$

For $n = 5$ the recurrence equation gives

$$26a_5 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{13a_1}{126}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - \frac{1}{2}a_0 x^2 - \frac{1}{3}a_1 x^3 + \frac{5}{24}a_0 x^4 + \frac{1}{6}a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{1}{2}x^2 + \frac{5}{24}x^4\right) a_0 + \left(x - \frac{1}{3}x^3 + \frac{1}{6}x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{1}{2}x^2 + \frac{5}{24}x^4\right) c_1 + \left(x - \frac{1}{3}x^3 + \frac{1}{6}x^5\right) c_2 + O(x^6)$$

$$y = 2 - x^2 + \frac{5x^4}{12} - x + \frac{x^3}{3} - \frac{x^5}{6} + O(x^6)$$

Summary
The solution(s) found are the following

$$y = -x^2 - x + 2 + \frac{x^3}{3} + \frac{5x^4}{12} - \frac{x^5}{6} - \frac{17x^6}{72} + O(x^6) \tag{1}$$

$$y = 2 - x^2 + \frac{5x^4}{12} - x + \frac{x^3}{3} - \frac{x^5}{6} + O(x^6) \tag{2}$$

Verification of solutions

$$y = -x^2 - x + 2 + \frac{x^3}{3} + \frac{5x^4}{12} - \frac{x^5}{6} - \frac{17x^6}{72} + O(x^6)$$

Verified OK.

$$y = 2 - x^2 + \frac{5x^4}{12} - x + \frac{x^3}{3} - \frac{x^5}{6} + O(x^6)$$

Verified OK.

ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(2x^2+1)\, y'' - 9y'x - 6y = 0}$$

With initial conditions

$$[y(0) = 1, y'(0) = -1]$$

With the expansion point for the power series method at $x = 0$.

12.12.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= -\frac{9x}{2x^2+1} \\ q(x) &= -\frac{6}{2x^2+1} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' - \frac{9xy'}{2x^2+1} - \frac{6y}{2x^2+1} = 0$$

The domain of $p(x) = -\frac{9x}{2x^2+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = -\frac{6}{2x^2+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{851}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{852}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{align}
F_0 &= f(x,y,y') \tag{4}\\
F_1 &= \frac{df}{dx} \nonumber\\
&= \frac{dF_0}{dx} \nonumber\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \nonumber\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{5}\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \nonumber\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right) \nonumber\\
&= \frac{d}{dx}(F_1) \nonumber\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y'' \nonumber\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0 \nonumber\\
&\vdots \nonumber\\
F_n &= \frac{d}{dx}(F_{n-1}) \nonumber\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y'' \nonumber\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \tag{6}
\end{align}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y'_0} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= \frac{9y'x + 6y}{2x^2 + 1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \\
&= \frac{75y'x^2 + 30yx + 15y'}{(2x^2 + 1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y}y' + \frac{\partial F_1}{\partial y'}F_1 \\
&= \frac{435x^3y' + 270x^2y + 195y'x + 120y}{(2x^2 + 1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y}y' + \frac{\partial F_2}{\partial y'}F_2 \\
&= \frac{(1845x^4 + 1620x^2 + 315)\,y' + (450x^3 + 270x)\,y}{(2x^2 + 1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y}y' + \frac{\partial F_3}{\partial y'}F_3 \\
&= \frac{(2745x^5 + 3510x^3 + 1305x)\,y' + (6570x^4 + 7290x^2 + 2160)\,y}{(2x^2 + 1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 1$ and $y'(0) = -1$ gives

$$
\begin{aligned}
F_0 &= 6 \\
F_1 &= -15 \\
F_2 &= 120 \\
F_3 &= -315 \\
F_4 &= 2160
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = 3x^2 - x + 1 - \frac{5x^3}{2} + 5x^4 - \frac{21x^5}{8} + 3x^6 + O(x^6)
$$

$$
y = 3x^2 - x + 1 - \frac{5x^3}{2} + 5x^4 - \frac{21x^5}{8} + 3x^6 + O(x^6)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$
(2x^2 + 1)\, y'' - 9y'x - 6y = 0
$$

Let the solution be represented as power series of the form

$$
y = \sum_{n=0}^{\infty} a_n x^n
$$

Then

$$
y' = \sum_{n=1}^{\infty} n a_n x^{n-1}
$$

$$
y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}
$$

Substituting the above back into the ode gives

$$
(2x^2 + 1) \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) - 9\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x - 6\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}
$$

Which simplifies to

$$
\left(\sum_{n=2}^{\infty} 2x^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \sum_{n=1}^{\infty} (-9n a_n x^n) + \sum_{n=0}^{\infty} (-6a_n x^n) = 0 \tag{2}
$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$
\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n
$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$
\left(\sum_{n=2}^{\infty} 2x^n a_n n(n-1)\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \sum_{n=1}^{\infty} (-9n a_n x^n) + \sum_{n=0}^{\infty} (-6a_n x^n) = 0 \tag{3}
$$

$n = 0$ gives

$$2a_2 - 6a_0 = 0$$

$$a_2 = 3a_0$$

$n = 1$ gives

$$6a_3 - 15a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{5a_1}{2}$$

For $2 \leq n$, the recurrence equation is

$$2na_n(n-1) + (n+2)\,a_{n+2}(n+1) - 9na_n - 6a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{a_n(2n^2 - 11n - 6)}{(n+2)\,(n+1)} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$-20a_2 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = 5a_0$$

For $n = 3$ the recurrence equation gives

$$-21a_3 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{21a_1}{8}$$

For $n = 4$ the recurrence equation gives

$$-18a_4 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = 3a_0$$

For $n = 5$ the recurrence equation gives

$$-11a_5 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{11a_1}{16}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1x + 3a_0x^2 + \frac{5}{2}a_1x^3 + 5a_0x^4 + \frac{21}{8}a_1x^5 + \dots$$

Collecting terms, the solution becomes

$$y = (5x^4 + 3x^2 + 1)\, a_0 + \left(x + \frac{5}{2}x^3 + \frac{21}{8}x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = (5x^4 + 3x^2 + 1)\, c_1 + \left(x + \frac{5}{2}x^3 + \frac{21}{8}x^5\right) c_2 + O(x^6)$$

$$y = 5x^4 + 3x^2 + 1 - x - \frac{5x^3}{2} - \frac{21x^5}{8} + O(x^6)$$

Summary
The solution(s) found are the following

$$y = 3x^2 - x + 1 - \frac{5x^3}{2} + 5x^4 - \frac{21x^5}{8} + 3x^6 + O(x^6) \tag{1}$$

$$y = 5x^4 + 3x^2 + 1 - x - \frac{5x^3}{2} - \frac{21x^5}{8} + O(x^6) \tag{2}$$

Verification of solutions

$$y = 3x^2 - x + 1 - \frac{5x^3}{2} + 5x^4 - \frac{21x^5}{8} + 3x^6 + O(x^6)$$

Verified OK.

$$y = 5x^4 + 3x^2 + 1 - x - \frac{5x^3}{2} - \frac{21x^5}{8} + O(x^6)$$

Verified OK.

Maple gives the following as the ode type

```
[[_Emden, _Fowler]]
```

$$\boxed{(8x^2+1)\,y''+2y=0}$$

With initial conditions

$$[y(0)=2, y'(0)=-1]$$

With the expansion point for the power series method at $x=0$.

12.13.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned} p(x) &= 0 \\ q(x) &= \frac{2}{8x^2+1} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{2y}{8x^2 + 1} = 0$$

The domain of $p(x) = 0$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{2}{8x^2+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} &(1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' &(854)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f &(855)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f &(2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f &(3)\\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$\begin{aligned}
F_0 &= -\frac{2y}{8x^2+1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{-16y'x^2 + 32yx - 2y'}{(8x^2+1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{512x^3y' - 736x^2y + 64y'x + 36y}{(8x^2+1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(-18176x^4 - 1472x^2 + 100)\, y' + (22528x^3 - 3328x)\, y}{(8x^2+1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(761856x^5 - 6144x^3 - 12672x)\, y' + (-864768x^4 + 256896x^2 - 3528)\, y}{(8x^2+1)^5}
\end{aligned}$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 2$ and $y'(0) = -1$ gives

$$\begin{aligned}
F_0 &= -4 \\
F_1 &= 2 \\
F_2 &= 72 \\
F_3 &= -100 \\
F_4 &= -7056
\end{aligned}$$

Substituting all the above in (7) and simplifying gives the solution as

$$y = -2x^2 - x + 2 + \frac{x^3}{3} + 3x^4 - \frac{5x^5}{6} - \frac{49x^6}{5} + O(x^6)$$

$$y = -2x^2 - x + 2 + \frac{x^3}{3} + 3x^4 - \frac{5x^5}{6} - \frac{49x^6}{5} + O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(8x^2 + 1)\, y'' + 2y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(8x^2 + 1)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + 2\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 8x^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 8x^n a_n n(n-1)\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 2a_0 = 0$$

$$a_2 = -a_0$$

$n = 1$ gives

$$6a_3 + 2a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{a_1}{3}$$

For $2 \leq n$, the recurrence equation is

$$8na_n(n-1) + (n+2)\,a_{n+2}(n+1) + 2a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{2a_n(4n^2 - 4n + 1)}{(n+2)\,(n+1)} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$18a_2 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{3a_0}{2}$$

For $n = 3$ the recurrence equation gives

$$50a_3 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{5a_1}{6}$$

For $n = 4$ the recurrence equation gives

$$98a_4 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{49a_0}{10}$$

For $n = 5$ the recurrence equation gives

$$162a_5 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{45a_1}{14}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - a_0 x^2 - \frac{1}{3} a_1 x^3 + \frac{3}{2} a_0 x^4 + \frac{5}{6} a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - x^2 + \frac{3}{2}x^4\right) a_0 + \left(x - \frac{1}{3}x^3 + \frac{5}{6}x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - x^2 + \frac{3}{2}x^4\right) c_1 + \left(x - \frac{1}{3}x^3 + \frac{5}{6}x^5\right) c_2 + O(x^6)$$

$$y = 3x^4 - 2x^2 + 2 - x + \frac{x^3}{3} - \frac{5x^5}{6} + O(x^6)$$

Summary

The solution(s) found are the following

$$y = -2x^2 - x + 2 + \frac{x^3}{3} + 3x^4 - \frac{5x^5}{6} - \frac{49x^6}{5} + O(x^6) \tag{1}$$

$$y = 3x^4 - 2x^2 + 2 - x + \frac{x^3}{3} - \frac{5x^5}{6} + O(x^6) \tag{2}$$

Verification of solutions

$$y = -2x^2 - x + 2 + \frac{x^3}{3} + 3x^4 - \frac{5x^5}{6} - \frac{49x^6}{5} + O(x^6)$$

Verified OK.

$$y = 3x^4 - 2x^2 + 2 - x + \frac{x^3}{3} - \frac{5x^5}{6} + O(x^6)$$

Verified OK.

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 16.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second_order_linear_constant_coeff", "second_order_ode_can_be_made_integrable", "second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _missing_x]]
```

$$\boxed{y'' - y = 0}$$

With the expansion point for the power series method at $x = 3$.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x - 3$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\frac{d^2}{dt^2}y(t) - y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left.\frac{d^n f}{dx^n}\right|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (857) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (858) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\ \vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= y(t) \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y(t)} F_0 \\
&= \frac{d}{dt}y(t) \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y(t)} F_1 \\
&= y(t) \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y(t)} F_2 \\
&= \frac{d}{dt}y(t) \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y(t)} F_3 \\
&= y(t)
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= y(0) \\
F_1 &= y'(0) \\
F_2 &= y(0) \\
F_3 &= y'(0) \\
F_4 &= y(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y(t) = \left(1 + \frac{1}{2}t^2 + \frac{1}{24}t^4 + \frac{1}{720}t^6\right) y(0) + \left(t + \frac{1}{6}t^3 + \frac{1}{120}t^5\right) y'(0) + O(t^6)
$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} a_n t^n \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right) + \sum_{n=0}^{\infty} (-a_n t^n) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, t^n\right) + \sum_{n=0}^{\infty} (-a_n t^n) = 0 \tag{3}$$

For $0 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) - a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = \frac{a_n}{(n+2)(n+1)} \tag{5}$$

For $n = 0$ the recurrence equation gives

$$2a_2 - a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_2 = \frac{a_0}{2}$$

For $n = 1$ the recurrence equation gives

$$6a_3 - a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = \frac{a_1}{6}$$

For $n = 2$ the recurrence equation gives

$$12a_4 - a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{24}$$

For $n = 3$ the recurrence equation gives

$$20a_5 - a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_1}{120}$$

For $n = 4$ the recurrence equation gives

$$30a_6 - a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{a_0}{720}$$

For $n = 5$ the recurrence equation gives

$$42a_7 - a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{a_1}{5040}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + \frac{1}{2} a_0 t^2 + \frac{1}{6} a_1 t^3 + \frac{1}{24} a_0 t^4 + \frac{1}{120} a_1 t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 + \frac{1}{2} t^2 + \frac{1}{24} t^4\right) a_0 + \left(t + \frac{1}{6} t^3 + \frac{1}{120} t^5\right) a_1 + O(t^6) \tag{3}$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 + \frac{1}{2} t^2 + \frac{1}{24} t^4\right) c_1 + \left(t + \frac{1}{6} t^3 + \frac{1}{120} t^5\right) c_2 + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x - 3$ results in

$$\begin{aligned} y = &\left(1 + \frac{(x-3)^2}{2} + \frac{(x-3)^4}{24} + \frac{(x-3)^6}{720}\right) y(3) \\ &+ \left(x - 3 + \frac{(x-3)^3}{6} + \frac{(x-3)^5}{120}\right) y'(3) + O\left((x-3)^6\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = \left(1 + \frac{(x-3)^2}{2} + \frac{(x-3)^4}{24} + \frac{(x-3)^6}{720}\right) y(3) + \left(x - 3 + \frac{(x-3)^3}{6} + \frac{(x-3)^5}{120}\right) y'(3) + O\left((x-3)^6\right) \tag{1}$$

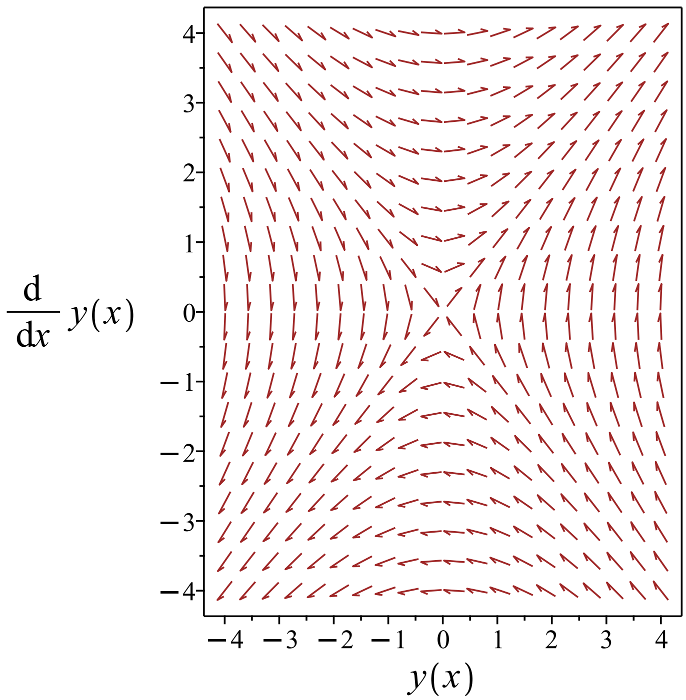

Figure 536: Slope field plot

Verification of solutions

$$y = \left(1 + \frac{(x-3)^2}{2} + \frac{(x-3)^4}{24} + \frac{(x-3)^6}{720}\right) y(3) + \left(x - 3 + \frac{(x-3)^3}{6} + \frac{(x-3)^5}{120}\right) y'(3) + O\left((x-3)^6\right)$$

Verified OK.

12.14.1 Maple step by step solution

Let's solve

$y'' - y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Characteristic polynomial of ODE

  $r^2 - 1 = 0$

- Factor the characteristic polynomial

  $(r - 1)(r + 1) = 0$

- Roots of the characteristic polynomial

  $r = (-1, 1)$

- 1st solution of the ODE

  $y_1(x) = \mathrm{e}^{-x}$

- 2nd solution of the ODE

  $y_2(x) = \mathrm{e}^{x}$

- General solution of the ODE

  $y = c_1 y_1(x) + c_2 y_2(x)$

- Substitute in solutions

  $y = c_1 \mathrm{e}^{-x} + c_2 \mathrm{e}^{x}$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 17.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{y'' - (x - 3)\, y' - y = 0}$$

With the expansion point for the power series method at $x = 3$.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x - 3$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\frac{d^2}{dt^2}y(t) - t\left(\frac{d}{dt}y(t)\right) - y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \left. \frac{d^n f}{dx^n} \right|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (860) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (861) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= t\left(\frac{d}{dt}y(t)\right) + y(t) \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y(t)}F_0 \\
&= \left(\frac{d}{dt}y(t)\right)t^2 + y(t)\,t + 2\frac{d}{dt}y(t) \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y(t)}F_1 \\
&= \left(t^3 + 5t\right)\left(\frac{d}{dt}y(t)\right) + y(t)\left(t^2 + 3\right) \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y(t)}F_2 \\
&= \left(t^4 + 9t^2 + 8\right)\left(\frac{d}{dt}y(t)\right) + ty(t)\left(t^2 + 7\right) \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y(t)}F_3 \\
&= \left(t^5 + 14t^3 + 33t\right)\left(\frac{d}{dt}y(t)\right) + y(t)\left(t^4 + 12t^2 + 15\right)
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= y(0) \\
F_1 &= 2y'(0) \\
F_2 &= 3y(0) \\
F_3 &= 8y'(0) \\
F_4 &= 15y(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y(t) = \left(1 + \frac{1}{2}t^2 + \frac{1}{8}t^4 + \frac{1}{48}t^6\right)y(0) + \left(t + \frac{1}{3}t^3 + \frac{1}{15}t^5\right)y'(0) + O\left(t^6\right)
$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt} y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2} y(t) = \sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1) a_n t^{n-2} = t\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + \left(\sum_{n=0}^{\infty} a_n t^n\right) \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}\right) + \sum_{n=1}^{\infty} (-n\, t^n a_n) + \sum_{n=0}^{\infty} (-a_n t^n) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1) a_n t^{n-2} = \sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) t^n\right) + \sum_{n=1}^{\infty} (-n\, t^n a_n) + \sum_{n=0}^{\infty} (-a_n t^n) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 - a_0 = 0$$

$$a_2 = \frac{a_0}{2}$$

For $1 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) - n a_n - a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = \frac{a_n}{n+2} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$6a_3 - 2a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = \frac{a_1}{3}$$

For $n = 2$ the recurrence equation gives

$$12a_4 - 3a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{8}$$

For $n = 3$ the recurrence equation gives

$$20a_5 - 4a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_1}{15}$$

For $n = 4$ the recurrence equation gives

$$30a_6 - 5a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{a_0}{48}$$

For $n = 5$ the recurrence equation gives

$$42a_7 - 6a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{a_1}{105}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + \frac{1}{2} a_0 t^2 + \frac{1}{3} a_1 t^3 + \frac{1}{8} a_0 t^4 + \frac{1}{15} a_1 t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 + \frac{1}{2}t^2 + \frac{1}{8}t^4\right) a_0 + \left(t + \frac{1}{3}t^3 + \frac{1}{15}t^5\right) a_1 + O(t^6) \tag{3}$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 + \frac{1}{2}t^2 + \frac{1}{8}t^4\right) c_1 + \left(t + \frac{1}{3}t^3 + \frac{1}{15}t^5\right) c_2 + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x - 3$ results in

$$\begin{aligned} y = &\left(1 + \frac{(x-3)^2}{2} + \frac{(x-3)^4}{8} + \frac{(x-3)^6}{48}\right) y(3) \\ &+ \left(x - 3 + \frac{(x-3)^3}{3} + \frac{(x-3)^5}{15}\right) y'(3) + O\left((x-3)^6\right) \end{aligned}$$

Summary
The solution(s) found are the following

$$y = \left(1+\frac{(x-3)^{2}}{2}+\frac{(x-3)^{4}}{8}+\frac{(x-3)^{6}}{48}\right) y(3) + \left(x-3+\frac{(x-3)^{3}}{3}+\frac{(x-3)^{5}}{15}\right) y'(3)+O\left((x-3)^{6}\right) \tag{1}$$

Verification of solutions

$$y = \left(1+\frac{(x-3)^{2}}{2}+\frac{(x-3)^{4}}{8}+\frac{(x-3)^{6}}{48}\right) y(3) + \left(x-3+\frac{(x-3)^{3}}{3}+\frac{(x-3)^{5}}{15}\right) y'(3)+O\left((x-3)^{6}\right)$$

Verified OK.

12.15.1 Maple step by step solution

Let's solve

$y''+(3-x)\,y'-y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^k$

- □ Rewrite DE with series expansions

  - Convert $x^m \cdot y'$ to series expansion for $m = 0..1$

    $x^m \cdot y' = \sum_{k=\max(0,1-m)}^{\infty} a_k k\, x^{k-1+m}$

  - Shift index using $k->k+1-m$

    $x^m \cdot y' = \sum_{k=\max(0,1-m)+m-1}^{\infty} a_{k+1-m}(k+1-m)\, x^k$

  - Convert y'' to series expansion

    $y''=\sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$

- Shift index using $k- >k+2$

  $$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)(k+1)\, x^k$$

  Rewrite DE with series expansions

  $$\sum_{k=0}^{\infty} \left(a_{k+2}(k+2)(k+1) + 3a_{k+1}(k+1) - a_k(k+1)\right) x^k = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$(k+1)\left(a_{k+2}(k+2) + 3a_{k+1} - a_k\right) = 0$$

- Recursion relation that defines the series solution to the ODE

  $$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+2} = \frac{-3a_{k+1}+a_k}{k+2}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 18.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{(2x^2-4x+1)\,y''+10(x-1)\,y'+6y=0}$$

With the expansion point for the power series method at $x=1$.

The ode does not have its expansion point at $x=0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t=x-1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(2(t+1)^2-4t-3\right)\left(\frac{d^2}{dt^2}y(t)\right)+10t\left(\frac{d}{dt}y(t)\right)+6y(t)=0$$

With its expansion point and initial conditions now at $t=0$. The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (863) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (864) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y'_0} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2\left(5t\left(\frac{d}{dt}y(t)\right) + 3y(t)\right)}{2t^2 - 1} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y(t)}F_0 \\
&= \frac{108\left(\frac{d}{dt}y(t)\right)t^2 + 84y(t)\,t + 16\frac{d}{dt}y(t)}{\left(2t^2 - 1\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y(t)}F_1 \\
&= \frac{-1344\left(\frac{d}{dt}y(t)\right)t^3 - 1152y(t)\,t^2 - 588t\left(\frac{d}{dt}y(t)\right) - 180y(t)}{\left(2t^2 - 1\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y(t)}F_2 \\
&= \frac{\left(19200t^4 + 16584t^2 + 768\right)\left(\frac{d}{dt}y(t)\right) + \left(17280t^3 + 7992t\right)y(t)}{\left(2t^2 - 1\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y(t)}F_3 \\
&= \frac{\left(-311040t^5 - 442944t^3 - 61128t\right)\left(\frac{d}{dt}y(t)\right) - 288000\left(t^4 + \frac{457}{500}t^2 + \frac{7}{160}\right)y(t)}{\left(2t^2 - 1\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= 6y(0) \\
F_1 &= 16y'(0) \\
F_2 &= 180y(0) \\
F_3 &= 768y'(0) \\
F_4 &= 12600y(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = \left(1+3t^2+\frac{15}{2}t^4+\frac{35}{2}t^6\right) y(0)+\left(t+\frac{8}{3}t^3+\frac{32}{5}t^5\right) y'(0)+O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right) (2t^2-1)+10t\left(\frac{d}{dt}y(t)\right)+6y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}\right) (2t^2-1)+10t\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right)+6\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right)+\sum_{n=2}^{\infty} \left(-n(n-1) a_n t^{n-2}\right)+\left(\sum_{n=1}^{\infty} 10n a_n t^n\right)+\left(\sum_{n=0}^{\infty} 6a_n t^n\right) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} \left(-n(n-1) a_n t^{n-2}\right) = \sum_{n=0}^{\infty} \left(-(n+2) a_{n+2}(n+1) t^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right) + \sum_{n=0}^{\infty} \left(-(n+2)\, a_{n+2}(n+1)\, t^n\right) + \left(\sum_{n=1}^{\infty} 10n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 6a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$-2a_2 + 6a_0 = 0$$

$$a_2 = 3a_0$$

$n = 1$ gives

$$-6a_3 + 16a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{8a_1}{3}$$

For $2 \leq n$, the recurrence equation is

$$2na_n(n-1) - (n+2)\, a_{n+2}(n+1) + 10na_n + 6a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = \frac{2(n+3)\, a_n}{n+2} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$30a_2 - 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{15a_0}{2}$$

For $n = 3$ the recurrence equation gives

$$48a_3 - 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{32a_1}{5}$$

For $n = 4$ the recurrence equation gives

$$70a_4 - 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{35a_0}{2}$$

For $n = 5$ the recurrence equation gives

$$96a_5 - 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{512a_1}{35}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + 3a_0 t^2 + \frac{8}{3} a_1 t^3 + \frac{15}{2} a_0 t^4 + \frac{32}{5} a_1 t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 + 3t^2 + \frac{15}{2} t^4\right) a_0 + \left(t + \frac{8}{3} t^3 + \frac{32}{5} t^5\right) a_1 + O(t^6) \tag{3}$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 + 3t^2 + \frac{15}{2}t^4\right) c_1 + \left(t + \frac{8}{3}t^3 + \frac{32}{5}t^5\right) c_2 + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x-1$ results in

$$\begin{aligned} y = &\left(1 + 3(x-1)^2 + \frac{15(x-1)^4}{2} + \frac{35(x-1)^6}{2}\right) y(1) \\ &+ \left(x - 1 + \frac{8(x-1)^3}{3} + \frac{32(x-1)^5}{5}\right) y'(1) + O\left((x-1)^6\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = &\left(1 + 3(x-1)^2 + \frac{15(x-1)^4}{2} + \frac{35(x-1)^6}{2}\right) y(1) \\ &+ \left(x - 1 + \frac{8(x-1)^3}{3} + \frac{32(x-1)^5}{5}\right) y'(1) + O\left((x-1)^6\right) \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y = &\left(1 + 3(x-1)^2 + \frac{15(x-1)^4}{2} + \frac{35(x-1)^6}{2}\right) y(1) \\ &+ \left(x - 1 + \frac{8(x-1)^3}{3} + \frac{32(x-1)^5}{5}\right) y'(1) + O\left((x-1)^6\right) \end{aligned}$$

Verified OK.

12.16.1 Maple step by step solution

Let's solve

$(2x^2 - 4x + 1) y'' + (10x - 10) y' + 6y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{6y}{2x^2-4x+1} - \frac{10(x-1)y'}{2x^2-4x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{10(x-1)y'}{2x^2-4x+1}+\frac{6y}{2x^2-4x+1}=0$

☐ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{10(x-1)}{2x^2-4x+1}, P_3(x)=\frac{6}{2x^2-4x+1}\right]$

  - $\left(x-1+\frac{\sqrt{2}}{2}\right)\cdot P_2(x)$ is analytic at $x=1-\frac{\sqrt{2}}{2}$

    $\left(\left(x-1+\frac{\sqrt{2}}{2}\right)\cdot P_2(x)\right)\Bigg|_{x=1-\frac{\sqrt{2}}{2}}=0$

  - $\left(x-1+\frac{\sqrt{2}}{2}\right)^2\cdot P_3(x)$ is analytic at $x=1-\frac{\sqrt{2}}{2}$

    $\left(\left(x-1+\frac{\sqrt{2}}{2}\right)^2\cdot P_3(x)\right)\Bigg|_{x=1-\frac{\sqrt{2}}{2}}=0$

  - $x=1-\frac{\sqrt{2}}{2}$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0=1-\frac{\sqrt{2}}{2}$

- Multiply by denominators

  $(2x^2-4x+1)\,y''+(10x-10)\,y'+6y=0$

- Change variables using $x=u+1-\frac{\sqrt{2}}{2}$ so that the regular singular point is at $u=0$

  $(2u^2-2u\sqrt{2})\left(\frac{d^2}{du^2}y(u)\right)+(10u-5\sqrt{2})\left(\frac{d}{du}y(u)\right)+6y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

☐ Rewrite ODE with series expansions

  - Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..1$

    $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,u^{k+r-1+m}$

  - Shift index using $k->k+1-m$

    $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,u^{k+r}$

  - Convert $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m=1..2$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, u^{k+r}$$

Rewrite ODE with series expansions

$$-\sqrt{2}\, r(2r+3)\, a_0 u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(-\sqrt{2}\,(k+r+1)(2k+5+2r)\, a_{k+1} + 2a_k(k+r+3)(k+r+1\right)\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-\sqrt{2}\, r(2r+3) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{0, -\frac{3}{2}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$2\left(-a_{k+1}\left(k+r+\frac{5}{2}\right)\sqrt{2} + a_k(k+r+3)\right)(k+r+1) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = \frac{a_k(k+r+3)\sqrt{2}}{2k+5+2r}$$

- Recursion relation for $r = 0$

$$a_{k+1} = \frac{a_k(k+3)\sqrt{2}}{2k+5}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+1} = \frac{a_k(k+3)\sqrt{2}}{2k+5}\right]$$

- Revert the change of variables $u = x - 1 + \frac{\sqrt{2}}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k\left(x - 1 + \frac{\sqrt{2}}{2}\right)^k, a_{k+1} = \frac{a_k(k+3)\sqrt{2}}{2k+5}\right]$$

- Recursion relation for $r = -\frac{3}{2}$

$$a_{k+1} = \frac{a_k\left(k+\frac{3}{2}\right)\sqrt{2}}{2k+2}$$

- Solution for $r = -\frac{3}{2}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{3}{2}}, a_{k+1} = \frac{a_k\left(k+\frac{3}{2}\right)\sqrt{2}}{2k+2}\right]$$

- Revert the change of variables $u = x - 1 + \frac{\sqrt{2}}{2}$

$$\left[y=\sum_{k=0}^{\infty} a_k \left(x-1+\frac{\sqrt{2}}{2}\right)^{k-\frac{3}{2}}, a_{k+1}=\frac{a_k\left(k+\frac{3}{2}\right)\sqrt{2}}{2k+2}\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k \left(x-1+\frac{\sqrt{2}}{2}\right)^{k}\right)+\left(\sum_{k=0}^{\infty} b_k \left(x-1+\frac{\sqrt{2}}{2}\right)^{k-\frac{3}{2}}\right), a_{1+k}=\frac{a_k(k+3)\sqrt{2}}{2k+5}, b_{1+k}=\frac{b_k\left(k+\frac{3}{2}\right)\sqrt{2}}{2k+2}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 19.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(2x^2 - 8x + 11)\, y'' - 16(-2 + x)\, y' + 36y = 0}$$

With the expansion point for the power series method at $x = 2$.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = -2 + x$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(2(2+t)^2 - 5 - 8t\right)\left(\frac{d^2}{dt^2}y(t)\right) - 16t\left(\frac{d}{dt}y(t)\right) + 36y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y_0'$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0, y_0, y_0'} + \frac{x^3}{3!} f'|_{x_0, y_0, y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y_0'}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (866) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (867) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4) \\
F_1 &= \frac{df}{dx} \\
&= \frac{dF_0}{dx} \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5) \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right) \\
&= \frac{d}{dx}(F_1) \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0 \\
&\vdots \\
F_n &= \frac{d}{dx}(F_{n-1}) \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= \frac{16t\left(\frac{d}{dt}y(t)\right) - 36y(t)}{2t^2+3} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y(t)}F_0 \\
&= \frac{152\left(\frac{d}{dt}y(t)\right)t^2 - 432y(t)\,t - 60\frac{d}{dt}y(t)}{\left(2t^2+3\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y(t)}F_1 \\
&= \frac{960\left(\frac{d}{dt}y(t)\right)t^3 - 2880y(t)\,t^2 - 864t\left(\frac{d}{dt}y(t)\right) + 864y(t)}{\left(2t^2+3\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y(t)}F_2 \\
&= \frac{384\left(10\left(\frac{d}{dt}y(t)\right)t^3 - 30y(t)\,t^2 - 9t\left(\frac{d}{dt}y(t)\right) + 9y(t)\right)t}{\left(2t^2+3\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y(t)}F_3 \\
&= \frac{3840\left(\frac{d}{dt}y(t)\right)t^3 - 11520y(t)\,t^2 - 3456t\left(\frac{d}{dt}y(t)\right) + 3456y(t)}{\left(2t^2+3\right)^4}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= -12y(0) \\
F_1 &= -\frac{20y'(0)}{3} \\
F_2 &= 32y(0) \\
F_3 &= 0 \\
F_4 &= \frac{128y(0)}{3}
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = \left(1 - 6t^2 + \frac{4}{3}t^4 + \frac{8}{135}t^6\right) y(0) + \left(t - \frac{10}{9}t^3\right) y'(0) + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(2t^2 + 3) - 16t\left(\frac{d}{dt}y(t)\right) + 36y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}\right)(2t^2 + 3) - 16t\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + 36\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} 3n(n-1) a_n t^{n-2}\right) + \sum_{n=1}^{\infty}(-16n a_n t^n) + \left(\sum_{n=0}^{\infty} 36a_n t^n\right) = 0 \quad (2)$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 3n(n-1) a_n t^{n-2} = \sum_{n=0}^{\infty} 3(n+2) a_{n+2}(n+1) t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right) + \left(\sum_{n=0}^{\infty} 3(n+2)\, a_{n+2}(n+1)\, t^n\right) + \sum_{n\,=1}^{\infty} (-16na_n t^n) + \left(\sum_{n=0}^{\infty} 36a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$6a_2 + 36a_0 = 0$$

$$a_2 = -6a_0$$

$n = 1$ gives

$$18a_3 + 20a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{10a_1}{9}$$

For $2 \leq n$, the recurrence equation is

$$2na_n(n-1) + 3(n+2)\, a_{n+2}(n+1) - 16na_n + 36a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{2a_n(n^2 - 9n + 18)}{3\,(n+2)\,(n+1)} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$8a_2 + 36a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{4a_0}{3}$$

For $n = 3$ the recurrence equation gives

$$60a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = 0$$

For $n = 4$ the recurrence equation gives

$$-4a_4 + 90a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{8a_0}{135}$$

For $n = 5$ the recurrence equation gives

$$-4a_5 + 126a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = 0$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t - 6a_0 t^2 - \frac{10}{9} a_1 t^3 + \frac{4}{3} a_0 t^4 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - 6t^2 + \frac{4}{3}t^4\right) a_0 + \left(t - \frac{10}{9}t^3\right) a_1 + O(t^6) \tag{3}$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - 6t^2 + \frac{4}{3}t^4\right) c_1 + \left(t - \frac{10}{9}t^3\right) c_2 + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = -2 + x$ results in

$$y = \left(1 - 6(-2+x)^2 + \frac{4(-2+x)^4}{3} + \frac{8(-2+x)^6}{135}\right) y(2) + \left(-2 + x - \frac{10(-2+x)^3}{9}\right) y'(2) + O\left((-2+x)^6\right)$$

Summary

The solution(s) found are the following

$$y = \left(1 - 6(-2+x)^2 + \frac{4(-2+x)^4}{3} + \frac{8(-2+x)^6}{135}\right) y(2) + \left(-2 + x - \frac{10(-2+x)^3}{9}\right) y'(2) + O\left((-2+x)^6\right) \quad (1)$$

Verification of solutions

$$y = \left(1 - 6(-2+x)^2 + \frac{4(-2+x)^4}{3} + \frac{8(-2+x)^6}{135}\right) y(2) + \left(-2 + x - \frac{10(-2+x)^3}{9}\right) y'(2) + O\left((-2+x)^6\right)$$

Verified OK.

12.17.1 Maple step by step solution

Let's solve

$(2x^2 - 8x + 11) y'' + (-16x + 32) y' + 36y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{36y}{2x^2-8x+11} + \frac{16(-2+x)y'}{2x^2-8x+11}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{16(-2+x)y'}{2x^2-8x+11} + \frac{36y}{2x^2-8x+11} = 0$

☐ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = -\frac{16(-2+x)}{2x^2-8x+11}, P_3(x) = \frac{36}{2x^2-8x+11}\right]$

  ◦ $\left(x - 2 + \frac{\mathrm{I}\sqrt{6}}{2}\right) \cdot P_2(x)$ is analytic at $x = 2 - \frac{\mathrm{I}\sqrt{6}}{2}$

  $\left(\left(x - 2 + \frac{\mathrm{I}\sqrt{6}}{2}\right) \cdot P_2(x)\right)\bigg|_{x=2-\frac{\mathrm{I}\sqrt{6}}{2}} = 0$

  ◦ $\left(x - 2 + \frac{\mathrm{I}\sqrt{6}}{2}\right)^2 \cdot P_3(x)$ is analytic at $x = 2 - \frac{\mathrm{I}\sqrt{6}}{2}$

  $\left(\left(x - 2 + \frac{\mathrm{I}\sqrt{6}}{2}\right)^2 \cdot P_3(x)\right)\bigg|_{x=2-\frac{\mathrm{I}\sqrt{6}}{2}} = 0$

  ◦ $x = 2 - \frac{\mathrm{I}\sqrt{6}}{2}$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 2 - \frac{\mathrm{I}\sqrt{6}}{2}$

- Multiply by denominators

  $(2x^2 - 8x + 11)\, y'' + (-16x + 32)\, y' + 36y = 0$

- Change variables using $x = u + 2 - \frac{\mathrm{I}\sqrt{6}}{2}$ so that the regular singular point is at $u = 0$

  $(2u^2 - 2\,\mathrm{I}u\sqrt{6}) \left(\frac{d^2}{du^2}y(u)\right) + (-16u + 8\,\mathrm{I}\sqrt{6}) \left(\frac{d}{du}y(u)\right) + 36y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

  ◦ Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$

  ◦ Shift index using $k- >k + 1 - m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k + 1 - m + r)\, u^{k+r}$

  ◦ Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\,u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\,u^{k+r}$$

Rewrite ODE with series expansions

$$-2\,\mathrm{I}\sqrt{6}\,r(r-5)\,a_0 u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(-2\,\mathrm{I}\sqrt{6}\,(k+1+r)(k-4+r)\,a_{k+1} + 2a_k(k+r-3)(k+r-\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-2\,\mathrm{I}\sqrt{6}\,r(r-5) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{0, 5\}$$

- Each term in the series must be 0, giving the recursion relation

$$-2\,\mathrm{I}\sqrt{6}\,(k+1+r)(k-4+r)\,a_{k+1} + 2a_k(k+r-3)(k+r-6) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = \frac{-\frac{\mathrm{I}}{6}a_k\left(k^2+2kr+r^2-9k-9r+18\right)\sqrt{6}}{k^2+2kr+r^2-3k-3r-4}$$

- Recursion relation for $r=0$; series terminates at $k=3$

$$a_{k+1} = \frac{-\frac{\mathrm{I}}{6}a_k\left(k^2-9k+18\right)\sqrt{6}}{k^2-3k-4}$$

- Apply recursion relation for $k=0$

$$a_1 = \frac{3\,\mathrm{I}}{4}a_0\sqrt{6}$$

- Apply recursion relation for $k=1$

$$a_2 = \frac{5\,\mathrm{I}}{18}a_1\sqrt{6}$$

- Express in terms of a_0

$$a_2 = -\frac{5a_0}{4}$$

- Apply recursion relation for $k=2$

$$a_3 = \frac{\mathrm{I}}{9}a_2\sqrt{6}$$

- Express in terms of a_0

$$a_3 = -\frac{5\,\mathrm{I}}{36}a_0\sqrt{6}$$

- Terminating series solution of the ODE for $r=0$. Use reduction of order to find the second li

$$y(u) = a_0 \cdot \left(1 + \frac{3\,\mathrm{I}\sqrt{6}\,u}{4} - \frac{5u^2}{4} - \frac{5\,\mathrm{I}\sqrt{6}\,u^3}{36}\right)$$

- Revert the change of variables $u = x - 2 + \frac{\mathrm{I}\sqrt{6}}{2}$

  $\left[y = -\frac{\mathrm{I}}{72} a_0 \sqrt{6}\, (10x^3 - 60x^2 + 111x - 62)\right]$

- Recursion relation for $r = 5$; series terminates at $k = 1$

  $a_{k+1} = \frac{-\frac{\mathrm{I}}{6} a_k (k^2+k-2)\sqrt{6}}{k^2+7k+6}$

- Apply recursion relation for $k = 0$

  $a_1 = \frac{\mathrm{I}}{18} a_0 \sqrt{6}$

- Terminating series solution of the ODE for $r = 5$. Use reduction of order to find the second li

  $y(u) = a_0 \cdot \left(1 + \frac{\mathrm{I}\sqrt{6}\, u}{18}\right)$

- Revert the change of variables $u = x - 2 + \frac{\mathrm{I}\sqrt{6}}{2}$

  $\left[y = a_0 \left(\frac{5}{6} + \frac{\mathrm{I}(-2+x)\sqrt{6}}{18}\right)\right]$

- Combine solutions and rename parameters

  $\left[y = -\frac{\mathrm{I} a_0 \sqrt{6}\, (10x^3-60x^2+111x-62)}{72} + b_0 \left(\frac{5}{6} + \frac{\mathrm{I}(-2+x)\sqrt{6}}{18}\right)\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 20.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{(3x^2+6x+5)\,y''+9(x+1)\,y'+3y=0}$$

With the expansion point for the power series method at $x=-1$.

The ode does not have its expansion point at $x=0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t=x+1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(3(-1+t)^2-1+6t\right)\left(\frac{d^2}{dt^2}y(t)\right)+9t\left(\frac{d}{dt}y(t)\right)+3y(t)=0$$

With its expansion point and initial conditions now at $t=0$. The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \left. \frac{d^n f}{dx^n} \right|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} & (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' & (869) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f & (870) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f & (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f & (3) \\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y'_0} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{3\left(3t\left(\frac{d}{dt}y(t)\right) + y(t)\right)}{3t^2 + 2} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y(t)}F_0 \\
&= \frac{99\left(\frac{d}{dt}y(t)\right)t^2 + 45y(t)\,t - 24\frac{d}{dt}y(t)}{\left(3t^2 + 2\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y(t)}F_1 \\
&= -\frac{18\left(75\left(\frac{d}{dt}y(t)\right)t^3 + 39y(t)\,t^2 - 55t\left(\frac{d}{dt}y(t)\right) - 9y(t)\right)}{\left(3t^2 + 2\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y(t)}F_2 \\
&= \frac{\left(22194t^4 - 32778t^2 + 2304\right)\left(\frac{d}{dt}y(t)\right) + \left(12474t^3 - 8694t\right)y(t)}{\left(3t^2 + 2\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y(t)}F_3 \\
&= \frac{\left(-428652t^5 + 1061424t^3 - 224532t\right)\left(\frac{d}{dt}y(t)\right) - 253692y(t)\left(t^4 - \frac{122}{87}t^2 + \frac{25}{261}\right)}{\left(3t^2 + 2\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= -\frac{3y(0)}{2} \\
F_1 &= -6y'(0) \\
F_2 &= \frac{81y(0)}{4} \\
F_3 &= 144y'(0) \\
F_4 &= -\frac{6075y(0)}{8}
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = \left(1 - \frac{3}{4}t^2 + \frac{27}{32}t^4 - \frac{135}{128}t^6\right) y(0) + \left(t - t^3 + \frac{6}{5}t^5\right) y'(0) + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(3t^2 + 2) + 9t\left(\frac{d}{dt}y(t)\right) + 3y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right)(3t^2 + 2) + 9t\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + 3\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 3t^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} 2n(n-1)\, a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} 9n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 3a_n t^n\right) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 2n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} 2(n+2)\, a_{n+2}(n+1)\, t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 3t^n a_n n(n-1)\right) + \left(\sum_{n=0}^{\infty} 2(n+2)\, a_{n+2}(n+1)\, t^n\right) + \left(\sum_{n=1}^{\infty} 9n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 3a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$4a_2 + 3a_0 = 0$$

$$a_2 = -\frac{3a_0}{4}$$

$n = 1$ gives

$$12a_3 + 12a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -a_1$$

For $2 \leq n$, the recurrence equation is

$$3n a_n(n-1) + 2(n+2)\, a_{n+2}(n+1) + 9n a_n + 3a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{3(n+1)\, a_n}{2\,(n+2)} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$27a_2 + 24a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{27a_0}{32}$$

For $n = 3$ the recurrence equation gives

$$48a_3 + 40a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{6a_1}{5}$$

For $n = 4$ the recurrence equation gives

$$75a_4 + 60a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{135a_0}{128}$$

For $n = 5$ the recurrence equation gives

$$108a_5 + 84a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{54a_1}{35}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t - \frac{3}{4} a_0 t^2 - a_1 t^3 + \frac{27}{32} a_0 t^4 + \frac{6}{5} a_1 t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - \frac{3}{4} t^2 + \frac{27}{32} t^4\right) a_0 + \left(t - t^3 + \frac{6}{5} t^5\right) a_1 + O(t^6) \tag{3}$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - \frac{3}{4}t^2 + \frac{27}{32}t^4\right) c_1 + \left(t - t^3 + \frac{6}{5}t^5\right) c_2 + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x+1$ results in

$$y = \left(1 - \frac{3(x+1)^2}{4} + \frac{27(x+1)^4}{32} - \frac{135(x+1)^6}{128}\right) y(-1) + \left(x + 1 - (x+1)^3 + \frac{6(x+1)^5}{5}\right) y'(-1) + O\left((x+1)^6\right)$$

Summary

The solution(s) found are the following

$$y = \left(1 - \frac{3(x+1)^2}{4} + \frac{27(x+1)^4}{32} - \frac{135(x+1)^6}{128}\right) y(-1) + \left(x + 1 - (x+1)^3 + \frac{6(x+1)^5}{5}\right) y'(-1) + O\left((x+1)^6\right) \tag{1}$$

Verification of solutions

$$y = \left(1 - \frac{3(x+1)^2}{4} + \frac{27(x+1)^4}{32} - \frac{135(x+1)^6}{128}\right) y(-1) + \left(x + 1 - (x+1)^3 + \frac{6(x+1)^5}{5}\right) y'(-1) + O\left((x+1)^6\right)$$

Verified OK.

12.18.1 Maple step by step solution

Let's solve

$(3x^2 + 6x + 5) y'' + (9x + 9) y' + 3y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{3y}{3x^2+6x+5} - \frac{9(x+1)y'}{3x^2+6x+5}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{9(x+1)y'}{3x^2+6x+5} + \frac{3y}{3x^2+6x+5} = 0$

☐ Check to see if x_0 is a regular singular point

  ○ Define functions

    $\left[P_2(x) = \frac{9(x+1)}{3x^2+6x+5}, P_3(x) = \frac{3}{3x^2+6x+5}\right]$

  ○ $\left(x+1+\frac{\mathrm{I}\sqrt{6}}{3}\right) \cdot P_2(x)$ is analytic at $x = -1-\frac{\mathrm{I}\sqrt{6}}{3}$

    $\left(\left(x+1+\frac{\mathrm{I}\sqrt{6}}{3}\right) \cdot P_2(x)\right)\bigg|_{x=-1-\frac{\mathrm{I}\sqrt{6}}{3}} = 0$

  ○ $\left(x+1+\frac{\mathrm{I}\sqrt{6}}{3}\right)^2 \cdot P_3(x)$ is analytic at $x = -1-\frac{\mathrm{I}\sqrt{6}}{3}$

    $\left(\left(x+1+\frac{\mathrm{I}\sqrt{6}}{3}\right)^2 \cdot P_3(x)\right)\bigg|_{x=-1-\frac{\mathrm{I}\sqrt{6}}{3}} = 0$

  ○ $x = -1-\frac{\mathrm{I}\sqrt{6}}{3}$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = -1-\frac{\mathrm{I}\sqrt{6}}{3}$

- Multiply by denominators

  $(3x^2+6x+5)\, y'' + (9x+9)\, y' + 3y = 0$

- Change variables using $x = u-1-\frac{\mathrm{I}\sqrt{6}}{3}$ so that the regular singular point is at $u = 0$

  $(3u^2 - 2\,\mathrm{I}u\sqrt{6})\left(\frac{d^2}{du^2}y(u)\right) + (9u - 3\,\mathrm{I}\sqrt{6})\left(\frac{d}{du}y(u)\right) + 3y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum\limits_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

  ○ Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum\limits_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$

  ○ Shift index using $k->k+1-m$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum\limits_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$

  ○ Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, u^{k+r}$$

Rewrite ODE with series expansions

$$-\mathrm{I}\sqrt{6}\,(2r+1)\, r a_0 u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(-\mathrm{I}\sqrt{6}\,(2k+3+2r)(k+r+1)\, a_{k+1} + 3a_k(k+r+1)^2\right) u^{k+r}\right)$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-\mathrm{I}\sqrt{6}\,(2r+1)\, r = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{0, -\frac{1}{2}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$-2\left(\mathrm{I}\left(k+r+\frac{3}{2}\right) a_{k+1}\sqrt{6} - \frac{3a_k(k+r+1)}{2}\right)(k+r+1) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = \frac{-\frac{\mathrm{I}}{2}a_k(k+r+1)\sqrt{6}}{2k+3+2r}$$

- Recursion relation for $r=0$

$$a_{k+1} = \frac{-\frac{\mathrm{I}}{2}a_k(k+1)\sqrt{6}}{2k+3}$$

- Solution for $r=0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+1} = \frac{-\frac{\mathrm{I}}{2}a_k(k+1)\sqrt{6}}{2k+3}\right]$$

- Revert the change of variables $u = x+1+\frac{\mathrm{I}\sqrt{6}}{3}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(x+1+\frac{\mathrm{I}\sqrt{6}}{3}\right)^k, a_{k+1} = \frac{-\frac{\mathrm{I}}{2}a_k(k+1)\sqrt{6}}{2k+3}\right]$$

- Recursion relation for $r=-\frac{1}{2}$

$$a_{k+1} = \frac{-\frac{\mathrm{I}}{2}a_k\left(k+\frac{1}{2}\right)\sqrt{6}}{2k+2}$$

- Solution for $r=-\frac{1}{2}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{1}{2}}, a_{k+1} = \frac{-\frac{\mathrm{I}}{2}a_k\left(k+\frac{1}{2}\right)\sqrt{6}}{2k+2}\right]$$

- Revert the change of variables $u = x+1+\frac{\mathrm{I}\sqrt{6}}{3}$

$$\left[y=\sum_{k=0}^{\infty} a_k \left(x+1+\frac{\mathrm{I}\sqrt{6}}{3}\right)^{k-\frac{1}{2}}, a_{k+1}=\frac{-\frac{\mathrm{I}}{2} a_k \left(k+\frac{1}{2}\right)\sqrt{6}}{2k+2}\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k \left(x+1+\frac{\mathrm{I}\sqrt{6}}{3}\right)^{k}\right)+\left(\sum_{k=0}^{\infty} b_k \left(x+1+\frac{\mathrm{I}\sqrt{6}}{3}\right)^{k-\frac{1}{2}}\right), a_{1+k}=\frac{-\frac{\mathrm{I}}{2} a_k (1+k)\sqrt{6}}{2k+3}, b_{1+k}=\frac{-\frac{\mathrm{I}}{2} b_k (k+\dots}{2k+\dots}\right.$$

Problem number: 21.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{\left(x^2-4\right) y''-y'x-3y=0}$$

With initial conditions

$$[y(0)=-1, y'(0)=2]$$

With the expansion point for the power series method at $x=0$.

12.19.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}
p(x) &= -\frac{x}{x^2-4} \\
q(x) &= -\frac{3}{x^2-4} \\
F &= 0
\end{aligned}$$

Hence the ode is

$$y'' - \frac{xy'}{x^2 - 4} - \frac{3y}{x^2 - 4} = 0$$

The domain of $p(x) = -\frac{x}{x^2-4}$ is

$$\{-\infty \leq x < -2, -2 < x < 2, 2 < x \leq \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = -\frac{3}{x^2-4}$ is

$$\{-\infty \leq x < -2, -2 < x < 2, 2 < x \leq \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{872}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{873}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y'_0} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= \frac{3y+y'x}{x^2-4} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \\
&= \frac{3y'x^2-3yx-16y'}{(x^2-4)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y}y' + \frac{\partial F_1}{\partial y'}F_1 \\
&= \frac{-6x^3y'+18x^2y+36y'x-36y}{(x^2-4)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y}y' + \frac{\partial F_2}{\partial y'}F_2 \\
&= \frac{30x((x^3-6x)\,y'+(-3x^2+6)\,y)}{(x^2-4)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y}y' + \frac{\partial F_3}{\partial y'}F_3 \\
&= -\frac{180\left(x^2+\frac{2}{3}\right)((x^3-6x)\,y'+(-3x^2+6)\,y)}{(x^2-4)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=-1$ and $y'(0)=2$ gives

$$
\begin{aligned}
F_0 &= \frac{3}{4} \\
F_1 &= -2 \\
F_2 &= -\frac{9}{16} \\
F_3 &= 0 \\
F_4 &= -\frac{45}{64}
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y = 2x - 1 + \frac{3x^2}{8} - \frac{x^3}{3} - \frac{3x^4}{128} - \frac{x^6}{1024} + O(x^6)$$

$$y = 2x - 1 + \frac{3x^2}{8} - \frac{x^3}{3} - \frac{3x^4}{128} - \frac{x^6}{1024} + O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(x^2 - 4)\, y'' - y'x - 3y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(x^2 - 4)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) - \left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x - 3\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} x^n a_n n(n-1)\right) + \sum_{n=2}^{\infty} \left(-4n(n-1)\, a_n x^{n-2}\right) + \sum_{n=1}^{\infty} (-n a_n x^n) + \sum_{n=0}^{\infty} (-3a_n x^n) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} \left(-4n(n-1)\, a_n x^{n-2}\right) = \sum_{n=0}^{\infty} \left(-4(n+2)\, a_{n+2}(n+1)\, x^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} x^n a_n n(n-1)\right) + \sum_{n=0}^{\infty} \left(-4(n+2)\, a_{n+2}(n+1)\, x^n\right) + \sum_{n=1}^{\infty} \left(-n a_n x^n\right) + \sum_{n=0}^{\infty} \left(-3 a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$-8a_2 - 3a_0 = 0$$

$$a_2 = -\frac{3a_0}{8}$$

$n = 1$ gives

$$-24a_3 - 4a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{a_1}{6}$$

For $2 \leq n$, the recurrence equation is

$$n a_n(n-1) - 4(n+2)\, a_{n+2}(n+1) - n a_n - 3a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = \frac{(n-3)\, a_n}{4n+8} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$-3a_2 - 48a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{3a_0}{128}$$

For $n = 3$ the recurrence equation gives

$$-80a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = 0$$

For $n = 4$ the recurrence equation gives

$$5a_4 - 120a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{a_0}{1024}$$

For $n = 5$ the recurrence equation gives

$$12a_5 - 168a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = 0$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - \frac{3}{8} a_0 x^2 - \frac{1}{6} a_1 x^3 + \frac{3}{128} a_0 x^4 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{3}{8}x^2 + \frac{3}{128}x^4\right) a_0 + \left(x - \frac{1}{6}x^3\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{3}{8}x^2 + \frac{3}{128}x^4\right)c_1 + \left(x - \frac{1}{6}x^3\right)c_2 + O(x^6)$$

$$y = -1 + \frac{3x^2}{8} - \frac{3x^4}{128} + 2x - \frac{x^3}{3} + O(x^6)$$

Summary

The solution(s) found are the following

$$y = 2x - 1 + \frac{3x^2}{8} - \frac{x^3}{3} - \frac{3x^4}{128} - \frac{x^6}{1024} + O(x^6) \tag{1}$$

$$y = -1 + \frac{3x^2}{8} - \frac{3x^4}{128} + 2x - \frac{x^3}{3} + O(x^6) \tag{2}$$

Verification of solutions

$$y = 2x - 1 + \frac{3x^2}{8} - \frac{x^3}{3} - \frac{3x^4}{128} - \frac{x^6}{1024} + O(x^6)$$

Verified OK.

$$y = -1 + \frac{3x^2}{8} - \frac{3x^4}{128} + 2x - \frac{x^3}{3} + O(x^6)$$

Verified OK.

12.19.2 Maple step by step solution

Let's solve

$$\left[(x^2 - 4)\,y'' - y'x - 3y = 0, y(0) = -1, y'\Big|_{\{x=0\}} = 2\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{xy'}{x^2-4} + \frac{3y}{x^2-4}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{xy'}{x^2-4} - \frac{3y}{x^2-4} = 0$

☐ Check to see if x_0 is a regular singular point

- Define functions

  $\left[P_2(x) = -\frac{x}{x^2-4}, P_3(x) = -\frac{3}{x^2-4}\right]$

- $(2+x)\cdot P_2(x)$ is analytic at $x=-2$

  $\left((2+x)\cdot P_2(x)\right)\Big|_{x=-2} = -\frac{1}{2}$

- $(2+x)^2\cdot P_3(x)$ is analytic at $x=-2$

  $\left((2+x)^2\cdot P_3(x)\right)\Big|_{x=-2} = 0$

- $x=-2$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = -2$

- Multiply by denominators

  $(x^2-4)\,y'' - y'x - 3y = 0$

- Change variables using $x = u-2$ so that the regular singular point is at $u=0$

  $(u^2-4u)\left(\frac{d^2}{du^2}y(u)\right) + (-u+2)\left(\frac{d}{du}y(u)\right) - 3y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

- □ Rewrite ODE with series expansions

  - Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..1$

    $u^m\cdot\left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$

  - Shift index using $k->k+1-m$

    $u^m\cdot\left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,u^{k+r}$

  - Convert $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m=1..2$

    $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,u^{k+r-2+m}$

  - Shift index using $k->k+2-m$

    $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$

Rewrite ODE with series expansions

$$-2a_0r(-3+2r)\,u^{-1+r}+\left(\sum_{k=0}^{\infty}\left(-2a_{k+1}(k+r+1)\,(2k-1+2r)+a_k(k+r+1)\,(k+r-3)\right)u^{k-}\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-2r(-3+2r)=0$
- Values of r that satisfy the indicial equation

  $r\in\left\{0,\frac{3}{2}\right\}$
- Each term in the series must be 0, giving the recursion relation

  $((-4k-4r+2)\,a_{k+1}+a_k(k+r-3))\,(k+r+1)=0$
- Recursion relation that defines series solution to ODE

  $a_{k+1}=\frac{a_k(k+r-3)}{2(2k-1+2r)}$
- Recursion relation for $r=0$; series terminates at $k=3$

  $a_{k+1}=\frac{a_k(k-3)}{2(2k-1)}$
- Apply recursion relation for $k=0$

  $a_1=\frac{3a_0}{2}$
- Apply recursion relation for $k=1$

  $a_2=-a_1$
- Express in terms of a_0

  $a_2=-\frac{3a_0}{2}$
- Apply recursion relation for $k=2$

  $a_3=-\frac{a_2}{6}$
- Express in terms of a_0

  $a_3=\frac{a_0}{4}$
- Terminating series solution of the ODE for $r=0$. Use reduction of order to find the second li

  $y(u)=a_0\cdot\left(1+\frac{3}{2}u-\frac{3}{2}u^2+\frac{1}{4}u^3\right)$
- Revert the change of variables $u=2+x$

  $\left[y=a_0\left(-\frac{3}{2}x+\frac{1}{4}x^3\right)\right]$
- Recursion relation for $r=\frac{3}{2}$

  $a_{k+1}=\frac{a_k\left(k-\frac{3}{2}\right)}{2(2k+2)}$

- Solution for $r=\frac{3}{2}$

  $\left[y(u)=\sum_{k=0}^{\infty} a_k u^{k+\frac{3}{2}}, a_{k+1}=\frac{a_k\left(k-\frac{3}{2}\right)}{2(2k+2)}\right]$

- Revert the change of variables $u=2+x$

  $\left[y=\sum_{k=0}^{\infty} a_k(2+x)^{k+\frac{3}{2}}, a_{k+1}=\frac{a_k\left(k-\frac{3}{2}\right)}{2(2k+2)}\right]$

- Combine solutions and rename parameters

  $\left[y=a_0\left(-\frac{3}{2}x+\frac{1}{4}x^3\right)+\left(\sum_{k=0}^{\infty} b_k(2+x)^{k+\frac{3}{2}}\right), b_{1+k}=\frac{b_k\left(k-\frac{3}{2}\right)}{2(2k+2)}\right]$

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' + (x-3)\,y' + 3y = 0}$$

With initial conditions

$$[y(3) = -2, y'(3) = 3]$$

With the expansion point for the power series method at $x = 3$.

12.20.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= x - 3 \\ q(x) &= 3 \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + (x - 3)\, y' + 3y = 0$$

The domain of $p(x) = x - 3$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 3$ is inside this domain. The domain of $q(x) = 3$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 3$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x - 3$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\frac{d^2}{dt^2}y(t) + t\left(\frac{d}{dt}y(t)\right) + 3y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = -2$$
$$y'(0) = 3$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (875) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (876) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{align}
F_0 &= f(x,y,y') \tag{4}\\
F_1 &= \frac{df}{dx} \nonumber\\
&= \frac{dF_0}{dx} \nonumber\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \nonumber\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{5}\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \nonumber\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right) \nonumber\\
&= \frac{d}{dx}(F_1) \nonumber\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y'' \nonumber\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0 \nonumber\\
&\vdots \nonumber\\
F_n &= \frac{d}{dx}(F_{n-1}) \nonumber\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y'' \nonumber\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \tag{6}
\end{align}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -t\left(\frac{d}{dt}y(t)\right) - 3y(t) \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y(t)}F_0 \\
&= \left(\frac{d}{dt}y(t)\right)t^2 + 3y(t)\,t - 4\frac{d}{dt}y(t) \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y(t)}F_1 \\
&= -\left(\frac{d}{dt}y(t)\right)t^3 - 3y(t)\,t^2 + 9t\left(\frac{d}{dt}y(t)\right) + 15y(t) \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y(t)}F_2 \\
&= \left(t^4 - 15t^2 + 24\right)\left(\frac{d}{dt}y(t)\right) + 3ty(t)\left(t^2 - 11\right) \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y(t)}F_3 \\
&= \left(-t^5 + 22t^3 - 87t\right)\left(\frac{d}{dt}y(t)\right) - 3y(t)\left(t^4 - 18t^2 + 35\right)
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = -2$ and $y'(0) = 3$ gives

$$
\begin{aligned}
F_0 &= 6 \\
F_1 &= -12 \\
F_2 &= -30 \\
F_3 &= 72 \\
F_4 &= 210
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y(t) = -2t^3 + 3t^2 + 3t - 2 - \frac{5t^4}{4} + \frac{3t^5}{5} + \frac{7t^6}{24} + O\left(t^6\right)
$$

$$y(t) = -2t^3 + 3t^2 + 3t - 2 - \frac{5t^4}{4} + \frac{3t^5}{5} + \frac{7t^6}{24} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} = -t\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) - 3\left(\sum_{n=0}^{\infty} a_n t^n\right) \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} n\, t^n a_n\right) + \left(\sum_{n=0}^{\infty} 3a_n t^n\right) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, t^n\right) + \left(\sum_{n=1}^{\infty} n\, t^n a_n\right) + \left(\sum_{n=0}^{\infty} 3a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 3a_0 = 0$$

$$a_2 = -\frac{3a_0}{2}$$

For $1 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) + n a_n + 3a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{a_n(n+3)}{(n+2)\,(n+1)} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$6a_3 + 4a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = -\frac{2a_1}{3}$$

For $n = 2$ the recurrence equation gives

$$12a_4 + 5a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{5a_0}{8}$$

For $n = 3$ the recurrence equation gives

$$20a_5 + 6a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_1}{5}$$

For $n = 4$ the recurrence equation gives

$$30a_6 + 7a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{7a_0}{48}$$

For $n = 5$ the recurrence equation gives

$$42a_7 + 8a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{4a_1}{105}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t - \frac{3}{2}a_0 t^2 - \frac{2}{3}a_1 t^3 + \frac{5}{8}a_0 t^4 + \frac{1}{5}a_1 t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - \frac{3}{2}t^2 + \frac{5}{8}t^4\right) a_0 + \left(t - \frac{2}{3}t^3 + \frac{1}{5}t^5\right) a_1 + O(t^6) \tag{3}$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - \frac{3}{2}t^2 + \frac{5}{8}t^4\right) c_1 + \left(t - \frac{2}{3}t^3 + \frac{1}{5}t^5\right) c_2 + O(t^6)$$

$$y(t) = -2 + 3t^2 - \frac{5t^4}{4} + 3t - 2t^3 + \frac{3t^5}{5} + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x - 3$ results in

$$y = -2(x-3)^3 + 3(x-3)^2 + 3x - 11 - \frac{5(x-3)^4}{4} + \frac{3(x-3)^5}{5} + \frac{7(x-3)^6}{24} + O\left((x-3)^6\right)$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = &-2(x-3)^3 + 3(x-3)^2 + 3x - 11 - \frac{5(x-3)^4}{4} \\
&+ \frac{3(x-3)^5}{5} + \frac{7(x-3)^6}{24} + O\left((x-3)^6\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
y = -2(x-3)^3 + 3(x-3)^2 + 3x - 11 - \frac{5(x-3)^4}{4} + \frac{3(x-3)^5}{5} + \frac{7(x-3)^6}{24} + O\left((x-3)^6\right)
$$

Verified OK.

12.20.2 Maple step by step solution

Let's solve

$\left[y'' + (x-3)\, y' + 3y = 0, y(3) = -2, y'\Big|_{\{x=3\}} = 3\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite DE with series expansions

  ∘ Convert $x^m \cdot y'$ to series expansion for $m = 0..1$

    $x^m \cdot y' = \sum_{k=\max(0,1-m)}^{\infty} a_k k\, x^{k-1+m}$

  ∘ Shift index using $k- >k+1-m$

    $x^m \cdot y' = \sum_{k=\max(0,1-m)+m-1}^{\infty} a_{k+1-m}(k+1-m)\, x^k$

  ∘ Convert y'' to series expansion

    $y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$

  ∘ Shift index using $k- >k+2$

    $y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$

Rewrite DE with series expansions

$$\sum_{k=0}^{\infty} \left(a_{k+2}(k+2)\left(k+1\right)-3a_{k+1}(k+1)+a_k(k+3)\right)x^k=0$$

- Each term in the series must be 0, giving the recursion relation

$$k^2a_{k+2}+\left(a_k-3a_{k+1}+3a_{k+2}\right)k+3a_k-3a_{k+1}+2a_{k+2}=0$$

- Recursion relation that defines the series solution to the ODE

$$\left[y=\sum_{k=0}^{\infty} a_k x^k, a_{k+2}=-\frac{a_k k-3a_{k+1}k+3a_k-3a_{k+1}}{k^2+3k+2}\right]$$

Problem number: 23.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(3x^2-6x+5)\,y''+(x-1)\,y'+12y=0}$$

With initial conditions

$$[y(1)=-1, y'(1)=1]$$

With the expansion point for the power series method at $x=1$.

12.21.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=\frac{x-1}{3x^2-6x+5}\\ q(x)&=\frac{12}{3x^2-6x+5}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' + \frac{(x-1)\,y'}{3x^2-6x+5} + \frac{12y}{3x^2-6x+5} = 0$$

The domain of $p(x) = \frac{x-1}{3x^2-6x+5}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 1$ is inside this domain. The domain of $q(x) = \frac{12}{3x^2-6x+5}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x - 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(3(t+1)^2 - 6t - 1\right)\left(\frac{d^2}{dt^2}y(t)\right) + t\left(\frac{d}{dt}y(t)\right) + 12y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$\begin{aligned} y(0) &= -1 \\ y'(0) &= 1 \end{aligned}$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left. \frac{d^n f}{dx^n} \right|_{x_0, y_0, y'_0}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (878) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (879) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\ \vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{t\left(\frac{d}{dt}y(t)\right) + 12y(t)}{3t^2 + 2} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0 \\
&= \frac{-32\left(\frac{d}{dt}y(t)\right)t^2 + 84y(t)\,t - 26\frac{d}{dt}y(t)}{\left(3t^2 + 2\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1 \\
&= \frac{476\left(\frac{d}{dt}y(t)\right)t^3 - 372y(t)\,t^2 + 378t\left(\frac{d}{dt}y(t)\right) + 480y(t)}{\left(3t^2 + 2\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2 \\
&= \frac{\left(-5876t^4 - 2496t^2 + 1716\right)\left(\frac{d}{dt}y(t)\right) - 1248ty(t)\left(t^2 + \frac{47}{4}\right)}{\left(3t^2 + 2\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3 \\
&= \frac{\left(72644t^5 - 46072t^3 - 82212t\right)\left(\frac{d}{dt}y(t)\right) + \left(89232t^4 + 330408t^2 - 49920\right)y(t)}{\left(3t^2 + 2\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = -1$ and $y'(0) = 1$ gives

$$
\begin{aligned}
F_0 &= 6 \\
F_1 &= -\frac{13}{2} \\
F_2 &= -60 \\
F_3 &= \frac{429}{4} \\
F_4 &= 1560
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = 3t^2 + t - 1 - \frac{13t^3}{12} - \frac{5t^4}{2} + \frac{143t^5}{160} + \frac{13t^6}{6} + O(t^6)$$

$$y(t) = 3t^2 + t - 1 - \frac{13t^3}{12} - \frac{5t^4}{2} + \frac{143t^5}{160} + \frac{13t^6}{6} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(3t^2+2) + t\left(\frac{d}{dt}y(t)\right) + 12y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right)(3t^2+2) + t\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + 12\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 3t^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} 2n(n-1)\,a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 12 a_n t^n\right) = 0 \quad (2)$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 2n(n-1)\,a_n t^{n-2} = \sum_{n=0}^{\infty} 2(n+2)\,a_{n+2}(n+1)\,t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 3t^n a_n n(n-1)\right) + \left(\sum_{n=0}^{\infty} 2(n+2)\, a_{n+2}(n+1)\, t^n\right) + \left(\sum_{n=1}^{\infty} n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 12 a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$4a_2 + 12a_0 = 0$$

$$a_2 = -3a_0$$

$n = 1$ gives

$$12a_3 + 13a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{13a_1}{12}$$

For $2 \le n$, the recurrence equation is

$$3na_n(n-1) + 2(n+2)\, a_{n+2}(n+1) + na_n + 12a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{a_n(3n^2 - 2n + 12)}{2\,(n+2)\,(n+1)} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$20a_2 + 24a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{5a_0}{2}$$

For $n = 3$ the recurrence equation gives

$$33a_3 + 40a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{143a_1}{160}$$

For $n = 4$ the recurrence equation gives

$$52a_4 + 60a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{13a_0}{6}$$

For $n = 5$ the recurrence equation gives

$$77a_5 + 84a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{1573a_1}{1920}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t - 3a_0 t^2 - \frac{13}{12} a_1 t^3 + \frac{5}{2} a_0 t^4 + \frac{143}{160} a_1 t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - 3t^2 + \frac{5}{2}t^4\right) a_0 + \left(t - \frac{13}{12}t^3 + \frac{143}{160}t^5\right) a_1 + O(t^6) \tag{3}$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - 3t^2 + \frac{5}{2}t^4\right)c_1 + \left(t - \frac{13}{12}t^3 + \frac{143}{160}t^5\right)c_2 + O(t^6)$$

$$y(t) = -1 + 3t^2 - \frac{5t^4}{2} + t - \frac{13t^3}{12} + \frac{143t^5}{160} + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x-1$ results in

$$y = 3(x-1)^2 + x - 2 - \frac{13(x-1)^3}{12} - \frac{5(x-1)^4}{2} + \frac{143(x-1)^5}{160} + \frac{13(x-1)^6}{6} + O\left((x-1)^6\right)$$

Summary

The solution(s) found are the following

$$y = 3(x-1)^2 + x - 2 - \frac{13(x-1)^3}{12} - \frac{5(x-1)^4}{2} + \frac{143(x-1)^5}{160} + \frac{13(x-1)^6}{6} + O\left((x-1)^6\right) \tag{1}$$

Verification of solutions

$$y = 3(x-1)^2 + x - 2 - \frac{13(x-1)^3}{12} - \frac{5(x-1)^4}{2} + \frac{143(x-1)^5}{160} + \frac{13(x-1)^6}{6} + O\left((x-1)^6\right)$$

Verified OK.

12.21.2 Maple step by step solution

Let's solve

$$\left[(3x^2 - 6x + 5)y'' + (x-1)y' + 12y = 0, y(1) = -1, y'\Big|_{\{x=1\}} = 1\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{12y}{3x^2-6x+5} - \frac{(x-1)y'}{3x^2-6x+5}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y'' + \frac{(x-1)y'}{3x^2-6x+5} + \frac{12y}{3x^2-6x+5} = 0$

☐ Check to see if x_0 is a regular singular point

- Define functions

  $\left[P_2(x) = \frac{x-1}{3x^2-6x+5}, P_3(x) = \frac{12}{3x^2-6x+5}\right]$

- $\left(x - 1 + \frac{I\sqrt{6}}{3}\right) \cdot P_2(x)$ is analytic at $x = 1 - \frac{I\sqrt{6}}{3}$

  $\left(\left(x - 1 + \frac{I\sqrt{6}}{3}\right) \cdot P_2(x)\right)\bigg|_{x=1-\frac{I\sqrt{6}}{3}} = 0$

- $\left(x - 1 + \frac{I\sqrt{6}}{3}\right)^2 \cdot P_3(x)$ is analytic at $x = 1 - \frac{I\sqrt{6}}{3}$

  $\left(\left(x - 1 + \frac{I\sqrt{6}}{3}\right)^2 \cdot P_3(x)\right)\bigg|_{x=1-\frac{I\sqrt{6}}{3}} = 0$

- $x = 1 - \frac{I\sqrt{6}}{3}$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 1 - \frac{I\sqrt{6}}{3}$

- Multiply by denominators

  $(3x^2 - 6x + 5)\, y'' + (x - 1)\, y' + 12y = 0$

- Change variables using $x = u + 1 - \frac{I\sqrt{6}}{3}$ so that the regular singular point is at $u = 0$

  $(3u^2 - 2\,\mathrm{I}u\sqrt{6}) \left(\frac{d^2}{du^2}y(u)\right) + \left(u - \frac{I\sqrt{6}}{3}\right) \left(\frac{d}{du}y(u)\right) + 12y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k + r)\, u^{k+r-1+m}$

- Shift index using $k- >k + 1 - m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k + 1 - m + r)\, u^{k+r}$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k + r)\,(k + r - 1)\, u^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $$u^{m}\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)=\sum_{k=-2+m}^{\infty}a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$$

  Rewrite ODE with series expansions

  $$-\frac{\mathrm{I}\sqrt{6}\,r(6r-5)a_{0}u^{-1+r}}{3}+\left(\sum_{k=0}^{\infty}\left(-\frac{\mathrm{I}\sqrt{6}\,(k+1+r)(6k+1+6r)a_{k+1}}{3}+a_{k}(3k^{2}+6kr+3r^{2}-2k-2r+12)\right)u^{k+r}$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$-\frac{\mathrm{I}}{3}\sqrt{6}\,r(6r-5)=0$$

- Values of r that satisfy the indicial equation

  $$r\in\left\{0,\frac{5}{6}\right\}$$

- Each term in the series must be 0, giving the recursion relation

  $$-2\,\mathrm{I}\left(k+r+\frac{1}{6}\right)(k+1+r)\,a_{k+1}\sqrt{6}+3\left(k^{2}+\left(2r-\frac{2}{3}\right)k+r^{2}-\frac{2r}{3}+4\right)a_{k}=0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+1}=\frac{-\frac{\mathrm{I}}{2}a_{k}\left(3k^{2}+6kr+3r^{2}-2k-2r+12\right)\sqrt{6}}{6k^{2}+12kr+6r^{2}+7k+7r+1}$$

- Recursion relation for $r=0$

  $$a_{k+1}=\frac{-\frac{\mathrm{I}}{2}a_{k}\left(3k^{2}-2k+12\right)\sqrt{6}}{6k^{2}+7k+1}$$

- Solution for $r=0$

  $$\left[y(u)=\sum_{k=0}^{\infty}a_{k}u^{k},a_{k+1}=\frac{-\frac{\mathrm{I}}{2}a_{k}\left(3k^{2}-2k+12\right)\sqrt{6}}{6k^{2}+7k+1}\right]$$

- Revert the change of variables $u=x-1+\frac{\mathrm{I}\sqrt{6}}{3}$

  $$\left[y=\sum_{k=0}^{\infty}a_{k}\left(x-1+\frac{\mathrm{I}\sqrt{6}}{3}\right)^{k},a_{k+1}=\frac{-\frac{\mathrm{I}}{2}a_{k}\left(3k^{2}-2k+12\right)\sqrt{6}}{6k^{2}+7k+1}\right]$$

- Recursion relation for $r=\frac{5}{6}$

  $$a_{k+1}=\frac{-\frac{\mathrm{I}}{2}a_{k}\left(3k^{2}+3k+\frac{149}{12}\right)\sqrt{6}}{6k^{2}+17k+11}$$

- Solution for $r=\frac{5}{6}$

  $$\left[y(u)=\sum_{k=0}^{\infty}a_{k}u^{k+\frac{5}{6}},a_{k+1}=\frac{-\frac{\mathrm{I}}{2}a_{k}\left(3k^{2}+3k+\frac{149}{12}\right)\sqrt{6}}{6k^{2}+17k+11}\right]$$

- Revert the change of variables $u=x-1+\frac{\mathrm{I}\sqrt{6}}{3}$

  $$\left[y=\sum_{k=0}^{\infty}a_{k}\left(x-1+\frac{\mathrm{I}\sqrt{6}}{3}\right)^{k+\frac{5}{6}},a_{k+1}=\frac{-\frac{\mathrm{I}}{2}a_{k}\left(3k^{2}+3k+\frac{149}{12}\right)\sqrt{6}}{6k^{2}+17k+11}\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k\left(x-1+\frac{\mathrm{I}\sqrt{6}}{3}\right)^{k}\right)+\left(\sum_{k=0}^{\infty} b_k\left(x-1+\frac{\mathrm{I}\sqrt{6}}{3}\right)^{k+\frac{5}{6}}\right), a_{1+k}=\frac{-\frac{\mathrm{I}}{2}a_k(3k^2-2k+12)\sqrt{6}}{6k^2+7k+1}, b_{1+k}=\right.$$

Problem number: 24.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_Emden, _Fowler]]
```

$$\boxed{(4x^2 - 24x + 37)\, y'' + y = 0}$$

With initial conditions

$$[y(3) = 4, y'(3) = -6]$$

With the expansion point for the power series method at $x = 3$.

12.22.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= 0 \\ q(x) &= \frac{1}{4x^2 - 24x + 37} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{y}{4x^2 - 24x + 37} = 0$$

The domain of $p(x) = 0$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 3$ is inside this domain. The domain of $q(x) = \frac{1}{4x^2-24x+37}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 3$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x - 3$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(4(t+3)^2 - 24t - 35\right)\left(\frac{d^2}{dt^2}y(t)\right) + y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = 4$$
$$y'(0) = -6$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (881) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (882) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y'_0} \tag{7}
$$

To find $y(x)$ series solution around $x=0$. Hence

$$\begin{aligned}
F_0 &= -\frac{y(t)}{4t^2+1}\\
F_1 &= \frac{dF_0}{dt}\\
&= \frac{\partial F_0}{\partial t}+\frac{\partial F_0}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0\\
&= \frac{-4\left(\frac{d}{dt}y(t)\right)t^2+8y(t)\,t-\frac{d}{dt}y(t)}{\left(4t^2+1\right)^2}\\
F_2 &= \frac{dF_1}{dt}\\
&= \frac{\partial F_1}{\partial t}+\frac{\partial F_1}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1\\
&= \frac{16(4t^3+t)\left(\frac{d}{dt}y(t)\right)+\left(-92t^2+9\right)y(t)}{\left(4t^2+1\right)^3}\\
F_3 &= \frac{dF_2}{dt}\\
&= \frac{\partial F_2}{\partial t}+\frac{\partial F_2}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2\\
&= \frac{\left(-1136t^4-184t^2+25\right)\left(\frac{d}{dt}y(t)\right)+\left(1408t^3-416t\right)y(t)}{\left(4t^2+1\right)^4}\\
F_4 &= \frac{dF_3}{dt}\\
&= \frac{\partial F_3}{\partial t}+\frac{\partial F_3}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3\\
&= \frac{\left(23808t^5-384t^3-1584t\right)\left(\frac{d}{dt}y(t)\right)+\left(-27024t^4+16056t^2-441\right)y(t)}{\left(4t^2+1\right)^5}
\end{aligned}$$

And so on. Evaluating all the above at initial conditions $t=0$ and $y(0)=4$ and $y'(0)=-6$ gives

$$\begin{aligned}
F_0 &= -4\\
F_1 &= 6\\
F_2 &= 36\\
F_3 &= -150\\
F_4 &= -1764
\end{aligned}$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = t^3 - 2t^2 - 6t + 4 + \frac{3t^4}{2} - \frac{5t^5}{4} - \frac{49t^6}{20} + O(t^6)$$

$$y(t) = t^3 - 2t^2 - 6t + 4 + \frac{3t^4}{2} - \frac{5t^5}{4} - \frac{49t^6}{20} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(4t^2 + 1) + y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\begin{aligned}
\frac{d}{dt}y(t) &= \sum_{n=1}^{\infty} n a_n t^{n-1} \\
\frac{d^2}{dt^2}y(t) &= \sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}
\end{aligned}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right)(4t^2 + 1) + \left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 4t^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right) + \left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 4t^n a_n n(n-1)\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, t^n\right) + \left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + a_0 = 0$$

$$a_2 = -\frac{a_0}{2}$$

$n = 1$ gives

$$6a_3 + a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{a_1}{6}$$

For $2 \leq n$, the recurrence equation is

$$4na_n(n-1) + (n+2)\, a_{n+2}(n+1) + a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{a_n(4n^2 - 4n + 1)}{(n+2)\,(n+1)} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$9a_2 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{3a_0}{8}$$

For $n = 3$ the recurrence equation gives

$$25a_3 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{5a_1}{24}$$

For $n = 4$ the recurrence equation gives

$$49a_4 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{49a_0}{80}$$

For $n = 5$ the recurrence equation gives

$$81a_5 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{45a_1}{112}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t - \frac{1}{2} a_0 t^2 - \frac{1}{6} a_1 t^3 + \frac{3}{8} a_0 t^4 + \frac{5}{24} a_1 t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - \frac{1}{2}t^2 + \frac{3}{8}t^4\right) a_0 + \left(t - \frac{1}{6}t^3 + \frac{5}{24}t^5\right) a_1 + O(t^6) \tag{3}$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - \frac{1}{2}t^2 + \frac{3}{8}t^4\right) c_1 + \left(t - \frac{1}{6}t^3 + \frac{5}{24}t^5\right) c_2 + O(t^6)$$

$$y(t) = 4 - 2t^2 + \frac{3t^4}{2} - 6t + t^3 - \frac{5t^5}{4} + O(t^6)$$

Replacing t in the above with the original independent variable $x$using $t = x - 3$ results in

$$y = (x-3)^3 - 2(x-3)^2 - 6x + 22 + \frac{3(x-3)^4}{2} - \frac{5(x-3)^5}{4} - \frac{49(x-3)^6}{20} + O\left((x-3)^6\right)$$

Summary

The solution(s) found are the following

$$y = (x-3)^3 - 2(x-3)^2 - 6x + 22 + \frac{3(x-3)^4}{2} - \frac{5(x-3)^5}{4} - \frac{49(x-3)^6}{20} + O\left((x-3)^6\right) \tag{1}$$

Verification of solutions

$$y = (x-3)^3 - 2(x-3)^2 - 6x + 22 + \frac{3(x-3)^4}{2} - \frac{5(x-3)^5}{4} - \frac{49(x-3)^6}{20} + O\left((x-3)^6\right)$$

Verified OK.

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 25.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(x^2 - 8x + 14)\, y'' - 8(x - 4)\, y' + 20y = 0}$$

With initial conditions

$$[y(4) = 3, y'(4) = -4]$$

With the expansion point for the power series method at $x = 4$.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x - 4$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left((t + 4)^2 - 8t - 18\right) \left(\frac{d^2}{dt^2} y(t)\right) - 8t\left(\frac{d}{dt} y(t)\right) + 20y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$
\begin{aligned}
y(0) &= 3 \\
y'(0) &= -4
\end{aligned}
$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$
y'' = f(x, y, y')
$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (884) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (885) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y'_0} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= \frac{8t\left(\frac{d}{dt}y(t)\right) - 20y(t)}{t^2 - 2} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y(t)}F_0 \\
&= \frac{36\left(\frac{d}{dt}y(t)\right)t^2 - 120y(t)\,t + 24\frac{d}{dt}y(t)}{\left(t^2 - 2\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y(t)}F_1 \\
&= \frac{96\left(\frac{d}{dt}y(t)\right)t^3 - 360y(t)\,t^2 + 192t\left(\frac{d}{dt}y(t)\right) - 240y(t)}{\left(t^2 - 2\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y(t)}F_2 \\
&= \frac{\left(120t^4 + 480t^2 + 96\right)\left(\frac{d}{dt}y(t)\right) - 480ty(t)\left(t^2 + 2\right)}{\left(t^2 - 2\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y(t)}F_3 \\
&= 0
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = 3$ and $y'(0) = -4$ gives

$$
\begin{aligned}
F_0 &= 30 \\
F_1 &= -24 \\
F_2 &= 90 \\
F_3 &= -24 \\
F_4 &= 0
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y(t) = -4t^3 + 15t^2 - 4t + 3 + \frac{15t^4}{4} - \frac{t^5}{5} + O\left(t^6\right)
$$

$$y(t) = -4t^3 + 15t^2 - 4t + 3 + \frac{15t^4}{4} - \frac{t^5}{5} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(t^2 - 2) - 8t\left(\frac{d}{dt}y(t)\right) + 20y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right)(t^2 - 2) - 8t\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + 20\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} t^n a_n n(n-1)\right) + \sum_{n=2}^{\infty}\left(-2n(n-1)\, a_n t^{n-2}\right) + \sum_{n=1}^{\infty}\left(-8n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 20 a_n t^n\right) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty}\left(-2n(n-1)\, a_n t^{n-2}\right) = \sum_{n=0}^{\infty}\left(-2(n+2)\, a_{n+2}(n+1)\, t^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} t^n a_n n(n-1)\right) + \sum_{n=0}^{\infty} \left(-2(n+2) a_{n+2}(n+1) t^n\right) + \sum_{n=1}^{\infty} \left(-8n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 20 a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$-4a_2 + 20a_0 = 0$$

$$a_2 = 5a_0$$

$n = 1$ gives

$$-12a_3 + 12a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = a_1$$

For $2 \leq n$, the recurrence equation is

$$n a_n(n-1) - 2(n+2) a_{n+2}(n+1) - 8n a_n + 20a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = \frac{a_n(n^2 - 9n + 20)}{2(n+2)(n+1)} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$6a_2 - 24a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{5a_0}{4}$$

For $n = 3$ the recurrence equation gives

$$2a_3 - 40a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_1}{20}$$

For $n = 4$ the recurrence equation gives

$$-60a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = 0$$

For $n = 5$ the recurrence equation gives

$$-84a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = 0$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + 5a_0 t^2 + a_1 t^3 + \frac{5}{4} a_0 t^4 + \frac{1}{20} a_1 t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 + 5t^2 + \frac{5}{4} t^4\right) a_0 + \left(t + t^3 + \frac{1}{20} t^5\right) a_1 + O(t^6) \tag{3}$$

At $t=0$ the solution above becomes

$$y(t) = \left(1+5t^2+\frac{5}{4}t^4\right)c_1 + \left(t+t^3+\frac{1}{20}t^5\right)c_2 + O(t^6)$$

$$y(t) = -4t^3+15t^2-4t+3+\frac{15t^4}{4}-\frac{t^5}{5}+O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x-4$ results in

$$y = -4(x-4)^3+15(x-4)^2-4x+19+\frac{15(x-4)^4}{4}-\frac{(x-4)^5}{5}+O\left((x-4)^6\right)$$

Summary

The solution(s) found are the following

$$y = -4(x-4)^3+15(x-4)^2-4x+19+\frac{15(x-4)^4}{4}-\frac{(x-4)^5}{5}+O\left((x-4)^6\right) \quad (1)$$

Verification of solutions

$$y = -4(x-4)^3+15(x-4)^2-4x+19+\frac{15(x-4)^4}{4}-\frac{(x-4)^5}{5}+O\left((x-4)^6\right)$$

Verified OK.

12.23.1 Maple step by step solution

Let's solve

$$\left[(x^2-8x+14)\,y''+(-8x+32)\,y'+20y=0, y(4)=3, y'\Big|_{\{x=4\}}=-4\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{20y}{x^2-8x+14}+\frac{8(x-4)y'}{x^2-8x+14}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{8(x-4)y'}{x^2-8x+14}+\frac{20y}{x^2-8x+14}=0$

- ☐ Check to see if x_0 is a regular singular point
  - Define functions

    $\left[P_2(x) = -\frac{8(x-4)}{x^2-8x+14}, P_3(x) = \frac{20}{x^2-8x+14}\right]$
  - $(x-4+\sqrt{2}) \cdot P_2(x)$ is analytic at $x = 4-\sqrt{2}$

    $$\left((x-4+\sqrt{2}) \cdot P_2(x)\right)\bigg|_{x=4-\sqrt{2}} = 0$$
  - $(x-4+\sqrt{2})^2 \cdot P_3(x)$ is analytic at $x = 4-\sqrt{2}$

    $$\left((x-4+\sqrt{2})^2 \cdot P_3(x)\right)\bigg|_{x=4-\sqrt{2}} = 0$$
  - $x = 4-\sqrt{2}$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = 4-\sqrt{2}$
- Multiply by denominators

  $$(x^2-8x+14)\, y'' + (-8x+32)\, y' + 20y = 0$$
- Change variables using $x = u+4-\sqrt{2}$ so that the regular singular point is at $u = 0$

  $$(u^2-2u\sqrt{2})\left(\frac{d^2}{du^2}y(u)\right) + (-8u+8\sqrt{2})\left(\frac{d}{du}y(u)\right) + 20y(u) = 0$$
- Assume series solution for $y(u)$

  $$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$$
- ☐ Rewrite ODE with series expansions
  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

    $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$$
  - Shift index using $k->k+1-m$

    $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$
  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

    $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\, u^{k+r-2+m}$$
  - Shift index using $k->k+2-m$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\,u^{k+r}$$

Rewrite ODE with series expansions

$$-2\sqrt{2}\,r(r-5)\,a_0 u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(-2\sqrt{2}\,(k+1+r)(k+r-4)\,a_{k+1} + a_k(k+r-4)(k+r-5)\right)\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-2\sqrt{2}\,r(r-5) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{0, 5\}$

- Each term in the series must be 0, giving the recursion relation

  $(k+r-4)\left(-2a_{k+1}(k+1+r)\sqrt{2} + a_k(k+r-5)\right) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+1} = \frac{a_k(k+r-5)\sqrt{2}}{4(k+1+r)}$

- Recursion relation for $r = 0$; series terminates at $k = 5$

  $a_{k+1} = \frac{a_k(k-5)\sqrt{2}}{4(k+1)}$

- Apply recursion relation for $k = 0$

  $a_1 = -\frac{5a_0\sqrt{2}}{4}$

- Apply recursion relation for $k = 1$

  $a_2 = -\frac{a_1\sqrt{2}}{2}$

- Express in terms of a_0

  $a_2 = \frac{5a_0}{4}$

- Apply recursion relation for $k = 2$

  $a_3 = -\frac{a_2\sqrt{2}}{4}$

- Express in terms of a_0

  $a_3 = -\frac{5a_0\sqrt{2}}{16}$

- Apply recursion relation for $k = 3$

  $a_4 = -\frac{a_3\sqrt{2}}{8}$

- Express in terms of a_0

  $a_4 = \frac{5a_0}{64}$

- Apply recursion relation for $k = 4$

  $a_5 = -\frac{a_4\sqrt{2}}{20}$
- Express in terms of a_0

  $a_5 = -\frac{a_0\sqrt{2}}{256}$
- Terminating series solution of the ODE for $r = 0$. Use reduction of order to find the second li

  $y(u) = a_0 \cdot \left(1 - \frac{5u\sqrt{2}}{4} + \frac{5u^2}{4} - \frac{5\sqrt{2}\,u^3}{16} + \frac{5u^4}{64} - \frac{\sqrt{2}\,u^5}{256}\right)$
- Revert the change of variables $u = x - 4 + \sqrt{2}$

  $\left[y = a_0\left(\frac{(-x^5+20x^4-180x^3+880x^2-2260x+2384)\sqrt{2}}{256} + \frac{5x^4}{128} - \frac{5x^3}{8} + \frac{125x^2}{32} - \frac{45x}{4} + \frac{401}{32}\right)\right]$
- Recursion relation for $r = 5$

  $a_{k+1} = \frac{a_k k\sqrt{2}}{4(k+6)}$
- Solution for $r = 5$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+5}, a_{k+1} = \frac{a_k k\sqrt{2}}{4(k+6)}\right]$
- Revert the change of variables $u = x - 4 + \sqrt{2}$

  $\left[y = \sum_{k=0}^{\infty} a_k\left(x - 4 + \sqrt{2}\right)^{k+5}, a_{k+1} = \frac{a_k k\sqrt{2}}{4(k+6)}\right]$
- Combine solutions and rename parameters

  $\left[y = a_0\left(\frac{(-x^5+20x^4-180x^3+880x^2-2260x+2384)\sqrt{2}}{256} + \frac{5x^4}{128} - \frac{5x^3}{8} + \frac{125x^2}{32} - \frac{45x}{4} + \frac{401}{32}\right) + \left(\sum_{k=0}^{\infty} b_k\left(x - 4 + \right.\right.\right.$

Problem number: 26.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(2x^2+4x+5)\, y''-20(x+1)\, y'+60y=0}$$

With initial conditions

$$[y(-1)=3, y'(-1)=-3]$$

With the expansion point for the power series method at $x=-1$.

12.24.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=\frac{-20x-20}{2x^2+4x+5}\\ q(x)&=\frac{60}{2x^2+4x+5}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' + \frac{(-20x - 20)\, y'}{2x^2 + 4x + 5} + \frac{60y}{2x^2 + 4x + 5} = 0$$

The domain of $p(x) = \frac{-20x-20}{2x^2+4x+5}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = -1$ is inside this domain. The domain of $q(x) = \frac{60}{2x^2+4x+5}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = -1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x + 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(2(-1+t)^2 + 1 + 4t\right)\left(\frac{d^2}{dt^2}y(t)\right) - 20t\left(\frac{d}{dt}y(t)\right) + 60y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$\begin{aligned} y(0) &= 3 \\ y'(0) &= -3 \end{aligned}$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y_0'$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0,y_0,y_0'} + \frac{x^3}{3!} f'|_{x_0,y_0,y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left.\frac{d^n f}{dx^n}\right|_{x_0,y_0,y_0'}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (887) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (888) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y_0'} \qquad (7)$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= \frac{20t\left(\frac{d}{dt}y(t)\right) - 60y(t)}{2t^2+3} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y(t)}F_0 \\
&= \frac{240\left(\frac{d}{dt}y(t)\right)t^2 - 960y(t)\,t - 120\frac{d}{dt}y(t)}{\left(2t^2+3\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y(t)}F_1 \\
&= \frac{1920\left(\frac{d}{dt}y(t)\right)t^3 - 8640y(t)\,t^2 - 2880t\left(\frac{d}{dt}y(t)\right) + 4320y(t)}{\left(2t^2+3\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y(t)}F_2 \\
&= \frac{\left(9600t^4 - 28800t^2 + 4320\right)\left(\frac{d}{dt}y(t)\right) - 46080\left(t^2 - \frac{3}{2}\right)ty(t)}{\left(2t^2+3\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y(t)}F_3 \\
&= \frac{\left(23040t^5 - 115200t^3 + 51840t\right)\left(\frac{d}{dt}y(t)\right) - 115200\left(t^4 - 3t^2 + \frac{9}{20}\right)y(t)}{\left(2t^2+3\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = 3$ and $y'(0) = -3$ gives

$$
\begin{aligned}
F_0 &= -60 \\
F_1 &= 40 \\
F_2 &= 480 \\
F_3 &= -160 \\
F_4 &= -640
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = -30t^2 - 3t + 3 + \frac{20t^3}{3} + 20t^4 - \frac{4t^5}{3} - \frac{8t^6}{9} + O(t^6)$$

$$y(t) = -30t^2 - 3t + 3 + \frac{20t^3}{3} + 20t^4 - \frac{4t^5}{3} - \frac{8t^6}{9} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(2t^2+3) - 20t\left(\frac{d}{dt}y(t)\right) + 60y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right)(2t^2+3) - 20t\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + 60\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} 3n(n-1)\, a_n t^{n-2}\right) + \sum_{n=1}^{\infty} (-20n a_n t^n) + \left(\sum_{n=0}^{\infty} 60 a_n t^n\right) = 0 \quad (2)$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 3n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} 3(n+2)\, a_{n+2}(n+1)\, t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right) + \left(\sum_{n=0}^{\infty} 3(n+2)\, a_{n+2}(n+1)\, t^n\right) + \sum_{n=1}^{\infty} (-20 n a_n t^n) + \left(\sum_{n=0}^{\infty} 60 a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$6a_2 + 60a_0 = 0$$

$$a_2 = -10a_0$$

$n = 1$ gives

$$18a_3 + 40a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{20a_1}{9}$$

For $2 \leq n$, the recurrence equation is

$$2na_n(n-1) + 3(n+2)\, a_{n+2}(n+1) - 20na_n + 60a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{2a_n(n^2 - 11n + 30)}{3\,(n+2)\,(n+1)} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$24a_2 + 36a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{20a_0}{3}$$

For $n = 3$ the recurrence equation gives

$$12a_3 + 60a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{4a_1}{9}$$

For $n = 4$ the recurrence equation gives

$$4a_4 + 90a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{8a_0}{27}$$

For $n = 5$ the recurrence equation gives

$$126a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = 0$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t - 10a_0 t^2 - \frac{20}{9} a_1 t^3 + \frac{20}{3} a_0 t^4 + \frac{4}{9} a_1 t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - 10t^2 + \frac{20}{3} t^4\right) a_0 + \left(t - \frac{20}{9} t^3 + \frac{4}{9} t^5\right) a_1 + O(t^6) \tag{3}$$

At $t=0$ the solution above becomes

$$y(t) = \left(1-10t^2+\frac{20}{3}t^4\right)c_1+\left(t-\frac{20}{9}t^3+\frac{4}{9}t^5\right)c_2+O\left(t^6\right)$$

$$y(t) = 20t^4-30t^2+3-3t+\frac{20t^3}{3}-\frac{4t^5}{3}+O\left(t^6\right)$$

Replacing t in the above with the original independent variable $x$susing $t=x+1$ results in

$$y = -30(x+1)^2-3x+\frac{20(x+1)^3}{3}+20(x+1)^4-\frac{4(x+1)^5}{3}-\frac{8(x+1)^6}{9}+O\left((x+1)^6\right)$$

Summary

The solution(s) found are the following

$$y = -30(x+1)^2-3x+\frac{20(x+1)^3}{3}+20(x+1)^4-\frac{4(x+1)^5}{3}-\frac{8(x+1)^6}{9}+O\left((x+1)^6\right) \tag{1}$$

Verification of solutions

$$y = -30(x+1)^2-3x+\frac{20(x+1)^3}{3}+20(x+1)^4-\frac{4(x+1)^5}{3}-\frac{8(x+1)^6}{9}+O\left((x+1)^6\right)$$

Verified OK.

12.24.2 Maple step by step solution

Let's solve

$$\left[\left(2x^2+4x+5\right)y''+(-20x-20)\,y'+60y=0, y(-1)=3, y'\Big|_{\{x=-1\}}=-3\right]$$

- Highest derivative means the order of the ODE is 2

  y''
- Isolate 2nd derivative

  $y''=-\frac{60y}{2x^2+4x+5}+\frac{20(x+1)y'}{2x^2+4x+5}$
- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y'' - \frac{20(x+1)y'}{2x^2+4x+5} + \frac{60y}{2x^2+4x+5} = 0$

- ☐ Check to see if x_0 is a regular singular point
  - Define functions

    $\left[P_2(x) = -\frac{20(x+1)}{2x^2+4x+5}, P_3(x) = \frac{60}{2x^2+4x+5}\right]$
  - $\left(x+1+\frac{I\sqrt{6}}{2}\right) \cdot P_2(x)$ is analytic at $x = -1 - \frac{I\sqrt{6}}{2}$

    $\left(\left(x+1+\frac{I\sqrt{6}}{2}\right) \cdot P_2(x)\right)\Bigg|_{x=-1-\frac{I\sqrt{6}}{2}} = 0$
  - $\left(x+1+\frac{I\sqrt{6}}{2}\right)^2 \cdot P_3(x)$ is analytic at $x = -1 - \frac{I\sqrt{6}}{2}$

    $\left(\left(x+1+\frac{I\sqrt{6}}{2}\right)^2 \cdot P_3(x)\right)\Bigg|_{x=-1-\frac{I\sqrt{6}}{2}} = 0$
  - $x = -1 - \frac{I\sqrt{6}}{2}$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = -1 - \frac{I\sqrt{6}}{2}$
- Multiply by denominators

  $(2x^2+4x+5)\, y'' + (-20x-20)\, y' + 60y = 0$
- Change variables using $x = u - 1 - \frac{I\sqrt{6}}{2}$ so that the regular singular point is at $u = 0$

  $(2u^2 - 2\,\mathrm{I}u\sqrt{6})\left(\frac{d^2}{du^2}y(u)\right) + \left(-20u + 10\,\mathrm{I}\sqrt{6}\right)\left(\frac{d}{du}y(u)\right) + 60y(u) = 0$
- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$
- ☐ Rewrite ODE with series expansions
  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\, u^{k+r-1+m}$
  - Shift index using $k->k+1-m$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$
  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, u^{k+r}$$

Rewrite ODE with series expansions

$$-2\,\mathrm{I}\sqrt{6}\,(r-6)\, r a_0 u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(-2\,\mathrm{I}\sqrt{6}\,(k+r-5)(k+1+r)\, a_{k+1} + 2a_k(k+r-5)(k+r-\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-2\,\mathrm{I}\sqrt{6}\,(r-6)\, r = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{0, 6\}$$

- Each term in the series must be 0, giving the recursion relation

$$-2\left(\mathrm{I}(k+1+r)\, a_{k+1}\sqrt{6} - a_k(k+r-6)\right)(k+r-5) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = \frac{-\frac{\mathrm{I}}{6} a_k(k+r-6)\sqrt{6}}{k+1+r}$$

- Recursion relation for $r = 0$; series terminates at $k = 6$

$$a_{k+1} = \frac{-\frac{\mathrm{I}}{6} a_k(k-6)\sqrt{6}}{k+1}$$

- Recursion relation that defines the terminating series solution of the ODE for $r = 0$

$$\left[y(u) = \sum_{k=0}^{5} a_k u^k, a_{k+1} = \frac{-\frac{\mathrm{I}}{6} a_k(k-6)\sqrt{6}}{k+1}\right]$$

- Revert the change of variables $u = x + 1 + \frac{\mathrm{I}\sqrt{6}}{2}$

$$\left[y = \sum_{k=0}^{5} a_k \left(x + 1 + \frac{\mathrm{I}\sqrt{6}}{2}\right)^k, a_{k+1} = \frac{-\frac{\mathrm{I}}{6} a_k(k-6)\sqrt{6}}{k+1}\right]$$

- Recursion relation for $r = 6$

$$a_{k+1} = \frac{-\frac{\mathrm{I}}{6} a_k k\sqrt{6}}{k+7}$$

- Solution for $r = 6$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+6}, a_{k+1} = \frac{-\frac{\mathrm{I}}{6} a_k k\sqrt{6}}{k+7}\right]$$

- Revert the change of variables $u = x + 1 + \frac{\mathrm{I}\sqrt{6}}{2}$

$$\left[y=\sum_{k=0}^{\infty} a_k \left(x+1+\frac{\mathrm{I}\sqrt{6}}{2}\right)^{k+6}, a_{k+1}=\frac{-\frac{\mathrm{I}}{6}a_k k\sqrt{6}}{k+7}\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{5} a_k \left(x+1+\frac{\mathrm{I}\sqrt{6}}{2}\right)^{k}\right)+\left(\sum_{k=0}^{\infty} b_k \left(x+1+\frac{\mathrm{I}\sqrt{6}}{2}\right)^{k+6}\right), a_{1+k}=\frac{-\frac{\mathrm{I}}{6}a_k(k-6)\sqrt{6}}{1+k}, b_{1+k}=\frac{-\frac{\mathrm{I}}{6}b_k k\sqrt{6}}{k+7}\right.$$

Problem number: 27.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second_order_change_of_variable_on_y_method_1", "linear_second_order_ode_solved_by_an_integrating_factor", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{(x^2+1)\, y''+4y'x+2y=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using

Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0, y_0, y_0'} + \frac{x^3}{3!} f'|_{x_0, y_0, y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y_0'}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' \tag{890}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \tag{891}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y'_0} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2(y + 2y'x)}{x^2 + 1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{18y'x^2 + 12yx - 6y'}{(x^2 + 1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{-96x^3y' - 72x^2y + 96y'x + 24y}{(x^2 + 1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{120(5x^4 - 10x^2 + 1)\, y' + 480(x^3 - x)\, y}{(x^2 + 1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-4320x^5 + 14400x^3 - 4320x)\, y' - 3600y\left(x^4 - 2x^2 + \frac{1}{5}\right)}{(x^2 + 1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= -2y(0) \\
F_1 &= -6y'(0) \\
F_2 &= 24y(0) \\
F_3 &= 120y'(0) \\
F_4 &= -720y(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = \left(-x^6 + x^4 - x^2 + 1\right) y(0) + \left(x^5 - x^3 + x\right) y'(0) + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(x^2+1)\,y''+4y'x+2y=0$$

Let the solution be represented as power series of the form

$$y=\sum_{n=0}^{\infty}a_n x^n$$

Then

$$\begin{aligned}y' &= \sum_{n=1}^{\infty}n a_n x^{n-1}\\ y'' &= \sum_{n=2}^{\infty}n(n-1)\,a_n x^{n-2}\end{aligned}$$

Substituting the above back into the ode gives

$$(x^2+1)\left(\sum_{n=2}^{\infty}n(n-1)\,a_n x^{n-2}\right)+4\left(\sum_{n=1}^{\infty}n a_n x^{n-1}\right)x+2\left(\sum_{n=0}^{\infty}a_n x^n\right)=0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty}x^n a_n n(n-1)\right)+\left(\sum_{n=2}^{\infty}n(n-1)\,a_n x^{n-2}\right)+\left(\sum_{n=1}^{\infty}4n a_n x^n\right)+\left(\sum_{n=0}^{\infty}2a_n x^n\right)=0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty}n(n-1)\,a_n x^{n-2}=\sum_{n=0}^{\infty}(n+2)\,a_{n+2}(n+1)\,x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\begin{aligned}&\left(\sum_{n=2}^{\infty}x^n a_n n(n-1)\right)+\left(\sum_{n=0}^{\infty}(n+2)\,a_{n+2}(n+1)\,x^n\right)\\&+\left(\sum_{n=1}^{\infty}4n a_n x^n\right)+\left(\sum_{n=0}^{\infty}2a_n x^n\right)=0\end{aligned} \tag{3}$$

$n = 0$ gives

$$2a_2 + 2a_0 = 0$$

$$a_2 = -a_0$$

$n = 1$ gives

$$6a_3 + 6a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -a_1$$

For $2 \leq n$, the recurrence equation is

$$na_n(n-1) + (n+2)\, a_{n+2}(n+1) + 4na_n + 2a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -a_n \tag{5}$$

For $n = 2$ the recurrence equation gives

$$12a_2 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = a_0$$

For $n = 3$ the recurrence equation gives

$$20a_3 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = a_1$$

For $n = 4$ the recurrence equation gives

$$30a_4 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -a_0$$

For $n = 5$ the recurrence equation gives

$$42a_5 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -a_1$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_1 x^5 + a_0 x^4 - a_1 x^3 - a_0 x^2 + a_1 x + a_0 + \dots$$

Collecting terms, the solution becomes

$$y = (x^4 - x^2 + 1) a_0 + (x^5 - x^3 + x) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = (x^4 - x^2 + 1) c_1 + (x^5 - x^3 + x) c_2 + O(x^6)$$

Summary

The solution(s) found are the following

$$y = (-x^6 + x^4 - x^2 + 1) y(0) + (x^5 - x^3 + x) y'(0) + O(x^6) \tag{1}$$

$$y = (x^4 - x^2 + 1) c_1 + (x^5 - x^3 + x) c_2 + O(x^6) \tag{2}$$

Verification of solutions

$$y = (-x^6 + x^4 - x^2 + 1) y(0) + (x^5 - x^3 + x) y'(0) + O(x^6)$$

Verified OK.

$$y = (x^4 - x^2 + 1) c_1 + (x^5 - x^3 + x) c_2 + O(x^6)$$

Verified OK.

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 31.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' - 2y'x + 2\alpha y = 0}$$

With the expansion point for the power series method at $x = 0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned} y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\ &= y_0 + xy'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\ &= y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0} \end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{893}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{894}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y'_0} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= 2y'x - 2\alpha y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \left(4x^2 - 2\alpha + 2\right) y' - 4y\alpha x \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \left(8x^3 - 8\alpha x + 12x\right) y' - 8\left(x^2 - \frac{\alpha}{2} + 1\right) \alpha y \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= 4\left(3 + \alpha^2 + 2\left(-3x^2 - 2\right) \alpha + 4x^4 + 12x^2\right) y' - 16\left(x^2 - \alpha + \frac{5}{2}\right) x\alpha y \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= 32\left(\frac{3\alpha^2}{4} + \left(-2x^2 - \frac{15}{4}\right) \alpha + x^4 + 5x^2 + \frac{15}{4}\right) xy' - 32\alpha y\left(2 + \frac{\alpha^2}{4} + \frac{3(-x^2 - 1)\alpha}{2} + x^4 + \frac{9x^2}{2}\right)
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= -2y(0)\,\alpha \\
F_1 &= -2y'(0)\,\alpha + 2y'(0) \\
F_2 &= 4y(0)\,\alpha^2 - 8y(0)\,\alpha \\
F_3 &= 4y'(0)\,\alpha^2 - 16y'(0)\,\alpha + 12y'(0) \\
F_4 &= -8y(0)\,\alpha^3 + 48y(0)\,\alpha^2 - 64y(0)\,\alpha
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
\begin{aligned}
y = &\left(1 - \alpha x^2 + \frac{1}{6}x^4\alpha^2 - \frac{1}{3}x^4\alpha - \frac{1}{90}x^6\alpha^3 + \frac{1}{15}x^6\alpha^2 - \frac{4}{45}x^6\alpha\right) y(0) \\
&+ \left(x - \frac{1}{3}x^3\alpha + \frac{1}{3}x^3 + \frac{1}{30}x^5\alpha^2 - \frac{2}{15}x^5\alpha + \frac{1}{10}x^5\right) y'(0) + O\left(x^6\right)
\end{aligned}
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = 2\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x - 2\alpha\left(\sum_{n=0}^{\infty} a_n x^n\right) \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + \sum_{n=1}^{\infty} (-2n\, x^n a_n) + \left(\sum_{n=0}^{\infty} 2\alpha a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n\right) + \sum_{n=1}^{\infty} (-2n\, x^n a_n) + \left(\sum_{n=0}^{\infty} 2\alpha a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2\alpha a_0 + 2a_2 = 0$$

$$a_2 = -\alpha a_0$$

For $1 \leq n$, the recurrence equation is

$$(n+2) a_{n+2}(n+1) - 2na_n + 2\alpha a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{2a_n(\alpha - n)}{(n+2)(n+1)} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$2\alpha a_1 - 2a_1 + 6a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = -\frac{1}{3}\alpha a_1 + \frac{1}{3}a_1$$

For $n = 2$ the recurrence equation gives

$$2\alpha a_2 - 4a_2 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{1}{6}\alpha^2 a_0 - \frac{1}{3}\alpha a_0$$

For $n = 3$ the recurrence equation gives

$$2\alpha a_3 - 6a_3 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{1}{30}\alpha^2 a_1 - \frac{2}{15}\alpha a_1 + \frac{1}{10}a_1$$

For $n = 4$ the recurrence equation gives

$$2\alpha a_4 - 8a_4 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{1}{90}\alpha^3 a_0 + \frac{1}{15}\alpha^2 a_0 - \frac{4}{45}\alpha a_0$$

For $n = 5$ the recurrence equation gives

$$2\alpha a_5 - 10a_5 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{1}{630}\alpha^3 a_1 + \frac{1}{70}\alpha^2 a_1 - \frac{23}{630}\alpha a_1 + \frac{1}{42}a_1$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$\begin{aligned} y = a_0 + a_1 x - \alpha a_0 x^2 + \left(-\frac{1}{3}\alpha a_1 + \frac{1}{3}a_1\right) x^3 \\ + \left(\frac{1}{6}\alpha^2 a_0 - \frac{1}{3}\alpha a_0\right) x^4 + \left(\frac{1}{30}\alpha^2 a_1 - \frac{2}{15}\alpha a_1 + \frac{1}{10}a_1\right) x^5 + \dots \end{aligned}$$

Collecting terms, the solution becomes

$$\begin{aligned} y = \left(1 - \alpha x^2 + \left(\frac{1}{6}\alpha^2 - \frac{1}{3}\alpha\right) x^4\right) a_0 \\ + \left(x + \left(-\frac{\alpha}{3} + \frac{1}{3}\right) x^3 + \left(\frac{1}{30}\alpha^2 - \frac{2}{15}\alpha + \frac{1}{10}\right) x^5\right) a_1 + O(x^6) \end{aligned} \tag{3}$$

At $x = 0$ the solution above becomes

$$\begin{aligned} y = \left(1 - \alpha x^2 + \left(\frac{1}{6}\alpha^2 - \frac{1}{3}\alpha\right) x^4\right) c_1 \\ + \left(x + \left(-\frac{\alpha}{3} + \frac{1}{3}\right) x^3 + \left(\frac{1}{30}\alpha^2 - \frac{2}{15}\alpha + \frac{1}{10}\right) x^5\right) c_2 + O(x^6) \end{aligned}$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = &\left(1-\alpha \,x^{2}+\frac{1}{6}x^{4} \alpha^{2}-\frac{1}{3}x^{4} \alpha -\frac{1}{90}x^{6} \alpha^{3}+\frac{1}{15}x^{6} \alpha^{2}-\frac{4}{45}x^{6} \alpha \right) y(0) \\
&+\left(x -\frac{1}{3}x^{3} \alpha +\frac{1}{3}x^{3}+\frac{1}{30}x^{5} \alpha^{2}-\frac{2}{15}x^{5} \alpha +\frac{1}{10}x^{5}\right) y^{\prime}(0)+O\left(x^{6}\right)
\end{aligned} \tag{1}
$$

$$
\begin{aligned}
y = &\left(1-\alpha \,x^{2}+\left(\frac{1}{6}\alpha^{2}-\frac{1}{3}\alpha \right) x^{4}\right) c_{1} \\
&+\left(x +\left(-\frac{\alpha}{3}+\frac{1}{3}\right) x^{3}+\left(\frac{1}{30}\alpha^{2}-\frac{2}{15}\alpha +\frac{1}{10}\right) x^{5}\right) c_{2}+O\left(x^{6}\right)
\end{aligned} \tag{2}
$$

Verification of solutions

$$
\begin{aligned}
y = &\left(1-\alpha \,x^{2}+\frac{1}{6}x^{4} \alpha^{2}-\frac{1}{3}x^{4} \alpha -\frac{1}{90}x^{6} \alpha^{3}+\frac{1}{15}x^{6} \alpha^{2}-\frac{4}{45}x^{6} \alpha \right) y(0) \\
&+\left(x -\frac{1}{3}x^{3} \alpha +\frac{1}{3}x^{3}+\frac{1}{30}x^{5} \alpha^{2}-\frac{2}{15}x^{5} \alpha +\frac{1}{10}x^{5}\right) y^{\prime}(0)+O\left(x^{6}\right)
\end{aligned}
$$

Verified OK.

$$
\begin{aligned}
y = &\left(1-\alpha \,x^{2}+\left(\frac{1}{6}\alpha^{2}-\frac{1}{3}\alpha \right) x^{4}\right) c_{1} \\
&+\left(x +\left(-\frac{\alpha}{3}+\frac{1}{3}\right) x^{3}+\left(\frac{1}{30}\alpha^{2}-\frac{2}{15}\alpha +\frac{1}{10}\right) x^{5}\right) c_{2}+O\left(x^{6}\right)
\end{aligned}
$$

Verified OK.

12.26.1 Maple step by step solution

Let's solve

$y'' = 2y'x - 2\alpha y$

- Highest derivative means the order of the ODE is 2

  y''

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - 2y'x + 2\alpha y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite DE with series expansions

- Convert $x \cdot y'$ to series expansion

  $$x \cdot y' = \sum_{k=0}^{\infty} a_k k \, x^k$$

- Convert y'' to series expansion

  $$y'' = \sum_{k=2}^{\infty} a_k k(k-1) \, x^{k-2}$$

- Shift index using $k- >k+2$

  $$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\,x^k$$

  Rewrite DE with series expansions

  $$\sum_{k=0}^{\infty} \left(a_{k+2}(k+2)\,(k+1) + 2a_k(\alpha - k)\right) x^k = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$(k^2 + 3k + 2)\, a_{k+2} - 2a_k(k - \alpha) = 0$$

- Recursion relation that defines the series solution to the ODE

  $$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+2} = -\frac{2a_k(\alpha-k)}{k^2+3k+2}\right]$$

Problem number: 33.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second_order_airy", "second_order_bessel_ode", "second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_Emden, _Fowler]]
```

$$\boxed{y'' - yx = 0}$$

With the expansion point for the power series method at $x = 0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using

Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0,y_0,y_0'} + \frac{x^3}{3!} f'|_{x_0,y_0,y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y_0'}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (896) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (897) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= yx \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= y'x + y \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= x^2 y + 2y' \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= x(y'x + 4y) \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= yx^3 + 6y'x + 4y
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=y(0)$ and $y'(0)=y'(0)$ gives

$$
\begin{aligned}
F_0 &= 0 \\
F_1 &= y(0) \\
F_2 &= 2y'(0) \\
F_3 &= 0 \\
F_4 &= 4y(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = \left(1 + \frac{1}{6}x^3 + \frac{1}{180}x^6\right) y(0) + \left(x + \frac{1}{12}x^4\right) y'(0) + O(x^6)
$$

Since the expansion point $x=0$ is an ordinary, we can also solve this using standard

power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \left(\sum_{n=0}^{\infty} a_n x^n\right) x \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \sum_{n=0}^{\infty} \left(-x^{1+n} a_n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, x^n$$
$$\sum_{n=0}^{\infty} \left(-x^{1+n} a_n\right) = \sum_{n=1}^{\infty} \left(-a_{n-1} x^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, x^n\right) + \sum_{n=1}^{\infty} \left(-a_{n-1} x^n\right) = 0 \tag{3}$$

For $1 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(1+n) - a_{n-1} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = \frac{a_{n-1}}{(n+2)(1+n)} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$6a_3 - a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = \frac{a_0}{6}$$

For $n = 2$ the recurrence equation gives

$$12a_4 - a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_1}{12}$$

For $n = 3$ the recurrence equation gives

$$20a_5 - a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = 0$$

For $n = 4$ the recurrence equation gives

$$30a_6 - a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{a_0}{180}$$

For $n = 5$ the recurrence equation gives

$$42a_7 - a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{a_1}{504}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x + \frac{1}{6} a_0 x^3 + \frac{1}{12} a_1 x^4 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 + \frac{x^3}{6}\right) a_0 + \left(x + \frac{1}{12} x^4\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 + \frac{x^3}{6}\right) c_1 + \left(x + \frac{1}{12} x^4\right) c_2 + O(x^6)$$

Summary
The solution(s) found are the following

$$y = \left(1 + \frac{1}{6} x^3 + \frac{1}{180} x^6\right) y(0) + \left(x + \frac{1}{12} x^4\right) y'(0) + O(x^6) \tag{1}$$

$$y = \left(1 + \frac{x^3}{6}\right) c_1 + \left(x + \frac{1}{12} x^4\right) c_2 + O(x^6) \tag{2}$$

Verification of solutions

$$y = \left(1 + \frac{1}{6} x^3 + \frac{1}{180} x^6\right) y(0) + \left(x + \frac{1}{12} x^4\right) y'(0) + O(x^6)$$

Verified OK.

$$y = \left(1 + \frac{x^3}{6}\right) c_1 + \left(x + \frac{1}{12} x^4\right) c_2 + O(x^6)$$

Verified OK.

12.27.1 Maple step by step solution

Let's solve

$y'' = yx$

- Highest derivative means the order of the ODE is 2

  y''

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - yx = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

- □ Rewrite ODE with series expansions

  - Convert $x \cdot y$ to series expansion

    $x \cdot y = \sum_{k=0}^{\infty} a_k x^{k+1}$

  - Shift index using $k- >k - 1$

    $x \cdot y = \sum_{k=1}^{\infty} a_{k-1} x^k$

  - Convert y'' to series expansion

    $y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$

  - Shift index using $k- >k + 2$

    $y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$

  Rewrite ODE with series expansions

  $2a_2 + \left(\sum_{k=1}^{\infty} \left(a_{k+2}(k+2)\,(k+1) - a_{k-1}\right) x^k\right) = 0$

- Each term must be 0

  $2a_2 = 0$

- Each term in the series must be 0, giving the recursion relation

  $(k^2 + 3k + 2)\, a_{k+2} - a_{k-1} = 0$

- Shift index using $k- >k + 1$

$$\left((k+1)^2+3k+5\right)a_{k+3}-a_k=0$$

- Recursion relation that defines the series solution to the ODE

$$\left[y=\sum_{k=0}^{\infty}a_k x^k, a_{k+3}=\frac{a_k}{k^2+5k+6}, 2a_2=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 34.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{\left(-2x^{3}+1\right)y''-10y'x^{2}-8yx=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using

Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0,y_0,y_0'} + \frac{x^3}{3!} f'|_{x_0,y_0,y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y_0'}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (899) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (900) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n\big|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2x(5y'x + 4y)}{2x^3 - 1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \\
&= \frac{104y'x^4 + 112yx^3 + 28y'x + 8y}{(2x^3 - 1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y}y' + \frac{\partial F_1}{\partial y'}F_1 \\
&= \frac{-1232y'x^6 - 1504yx^5 - 1072x^3y' - 656x^2y - 36y'}{(2x^3 - 1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y}y' + \frac{\partial F_2}{\partial y'}F_2 \\
&= \frac{(16704x^8 + 31168x^5 + 4880x^2)\,y' + 21888xy\left(x^6 + \frac{395}{342}x^3 + \frac{25}{342}\right)}{(2x^3 - 1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y}y' + \frac{\partial F_3}{\partial y'}F_3 \\
&= \frac{(-256896x^{10} - 852992x^7 - 324320x^4 - 11360x)\,y' + (-352512x^9 - 807040x^6 - 175360x^3 - 1600)\,y}{(2x^3 - 1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= 0 \\
F_1 &= 8y(0) \\
F_2 &= 36y'(0) \\
F_3 &= 0 \\
F_4 &= 1600y(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = \left(1 + \frac{4}{3}x^3 + \frac{20}{9}x^6\right) y(0) + \left(x + \frac{3}{2}x^4\right) y'(0) + O(x^6)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(-2x^3+1\right) y'' - 10y'x^2 - 8yx = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\left(-2x^3+1\right)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) - 10\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x^2 - 8\left(\sum_{n=0}^{\infty} a_n x^n\right) x = 0 \quad (1)$$

Which simplifies to

$$\sum_{n=2}^{\infty}\left(-2n\, x^{1+n} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \sum_{n=1}^{\infty}\left(-10n\, x^{1+n} a_n\right) + \sum_{n=0}^{\infty}\left(-8x^{1+n} a_n\right) = 0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty}\left(-2n\, x^{1+n} a_n (n-1)\right) = \sum_{n=3}^{\infty}\left(-2(n-1)\, a_{n-1}(n-2)\, x^n\right)$$

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, x^n$$

$$\sum_{n=1}^{\infty}\left(-10n\, x^{1+n} a_n\right) = \sum_{n=2}^{\infty}\left(-10(n-1)\, a_{n-1} x^n\right)$$

$$\sum_{n=0}^{\infty}\left(-8x^{1+n} a_n\right) = \sum_{n=1}^{\infty}\left(-8a_{n-1} x^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\sum_{n=3}^{\infty} \left(-2(n-1)\, a_{n-1}(n-2)\, x^{n}\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, x^{n}\right) + \sum_{n=2}^{\infty} \left(-10(n-1)\, a_{n-1} x^{n}\right) + \sum_{n=1}^{\infty} \left(-8 a_{n-1} x^{n}\right) = 0 \tag{3}$$

$n = 1$ gives

$$6a_3 - 8a_0 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{4a_0}{3}$$

$n = 2$ gives

$$12a_4 - 18a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_4 = \frac{3a_1}{2}$$

For $3 \leq n$, the recurrence equation is

$$-2(n-1)\, a_{n-1}(n-2) + (n+2)\, a_{n+2}(1+n) - 10(n-1)\, a_{n-1} - 8a_{n-1} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = \frac{2(1+n)\, a_{n-1}}{n+2} \tag{5}$$

For $n = 3$ the recurrence equation gives

$$-32a_2 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = 0$$

For $n = 4$ the recurrence equation gives

$$-50a_3 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{20a_0}{9}$$

For $n = 5$ the recurrence equation gives

$$-72a_4 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{18a_1}{7}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1x + \frac{4}{3}a_0x^3 + \frac{3}{2}a_1x^4 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 + \frac{4x^3}{3}\right)a_0 + \left(x + \frac{3}{2}x^4\right)a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 + \frac{4x^3}{3}\right)c_1 + \left(x + \frac{3}{2}x^4\right)c_2 + O(x^6)$$

Summary

The solution(s) found are the following

$$y = \left(1 + \frac{4}{3}x^3 + \frac{20}{9}x^6\right)y(0) + \left(x + \frac{3}{2}x^4\right)y'(0) + O(x^6) \tag{1}$$

$$y = \left(1 + \frac{4x^3}{3}\right)c_1 + \left(x + \frac{3}{2}x^4\right)c_2 + O(x^6) \tag{2}$$

Verification of solutions

$$y = \left(1+\frac{4}{3}x^3+\frac{20}{9}x^6\right)y(0)+\left(x+\frac{3}{2}x^4\right)y'(0)+O(x^6)$$

Verified OK.

$$y = \left(1+\frac{4x^3}{3}\right)c_1+\left(x+\frac{3}{2}x^4\right)c_2+O(x^6)$$

Verified OK.

12.28.1 Maple step by step solution

Let's solve

$(-2x^3+1)\,y''-10y'x^2-8yx=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{10x^2y'}{2x^3-1}-\frac{8xy}{2x^3-1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{10x^2y'}{2x^3-1}+\frac{8xy}{2x^3-1}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{10x^2}{2x^3-1}, P_3(x)=\frac{8x}{2x^3-1}\right]$

  ◦ $\left(x+\frac{2^{\frac{2}{3}}}{4}+\frac{I\sqrt{3}\,2^{\frac{2}{3}}}{4}\right)\cdot P_2(x)$ is analytic at $x=-\frac{2^{\frac{2}{3}}}{4}-\frac{I\sqrt{3}\,2^{\frac{2}{3}}}{4}$

  $\left(\left(x+\frac{2^{\frac{2}{3}}}{4}+\frac{I\sqrt{3}\,2^{\frac{2}{3}}}{4}\right)\cdot P_2(x)\right)\Bigg|_{x=-\frac{2^{\frac{2}{3}}}{4}-\frac{I\sqrt{3}\,2^{\frac{2}{3}}}{4}}=0$

  ◦ $\left(x+\frac{2^{\frac{2}{3}}}{4}+\frac{I\sqrt{3}\,2^{\frac{2}{3}}}{4}\right)^2\cdot P_3(x)$ is analytic at $x=-\frac{2^{\frac{2}{3}}}{4}-\frac{I\sqrt{3}\,2^{\frac{2}{3}}}{4}$

  $\left(\left(x+\frac{2^{\frac{2}{3}}}{4}+\frac{I\sqrt{3}\,2^{\frac{2}{3}}}{4}\right)^2\cdot P_3(x)\right)\Bigg|_{x=-\frac{2^{\frac{2}{3}}}{4}-\frac{I\sqrt{3}\,2^{\frac{2}{3}}}{4}}=0$

  ◦ $x=-\frac{2^{\frac{2}{3}}}{4}-\frac{I\sqrt{3}\,2^{\frac{2}{3}}}{4}$ is a regular singular point

  Check to see if x_0 is a regular singular point

$x_0 = -\frac{2^{\frac{2}{3}}}{4} - \frac{\mathrm{I}\sqrt{3}\, 2^{\frac{2}{3}}}{4}$

- Multiply by denominators

$y''(2x^3-1)+10y'x^2+8yx=0$

- Change variables using $x = u - \frac{2^{\frac{2}{3}}}{4} - \frac{\mathrm{I}\sqrt{3}\, 2^{\frac{2}{3}}}{4}$ so that the regular singular point is at $u = 0$

$\left(2u^3 - \frac{3u^2 2^{\frac{2}{3}}}{2} - \frac{3\,\mathrm{I}u^2\sqrt{3}\, 2^{\frac{2}{3}}}{2} - \frac{3u 2^{\frac{1}{3}}}{2} + \frac{3\,\mathrm{I}u\sqrt{3}\, 2^{\frac{1}{3}}}{2}\right)\left(\frac{d^2}{du^2}y(u)\right) + \left(10u^2 - 5u2^{\frac{2}{3}} - 5\,\mathrm{I}u\sqrt{3}\, 2^{\frac{2}{3}} - \frac{5\, 2^{\frac{1}{3}}}{2} + \frac{5\,\mathrm{I}}{}\right.$

- Assume series solution for $y(u)$

$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

  - Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

  $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$

  - Shift index using $k- > k-m$

  $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$

  - Shift index using $k- > k+1-m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$

  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$

  - Shift index using $k- > k+2-m$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$

Rewrite ODE with series expansions

$\frac{2^{\frac{1}{3}}\left(\mathrm{I}\sqrt{3}-1\right)(3r+2)r a_0 u^{-1+r}}{2} + \left(\frac{2^{\frac{1}{3}}\left(\mathrm{I}\sqrt{3}-1\right)(5+3r)(r+1)a_1}{2} - \frac{2^{\frac{2}{3}}\left(1+\mathrm{I}\sqrt{3}\right)(r+1)(4+3r)a_0}{2}\right)u^r + \left(\sum_{k=1}^{\infty}\left(\frac{2^{\frac{1}{3}}\left(\mathrm{I}\sqrt{3}-1\right)(}{}\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$\frac{2^{\frac{1}{3}}\left(\mathrm{I}\sqrt{3}-1\right)(3r+2)r}{2} = 0$$

- Values of r that satisfy the indicial equation

$r \in \left\{0, -\frac{2}{3}\right\}$

- Each term must be 0

$$\frac{2^{\frac{1}{3}}\left(\mathrm{I}\sqrt{3}-1\right)(5+3r)(r+1)a_1}{2} - \frac{2^{\frac{2}{3}}\left(1+\mathrm{I}\sqrt{3}\right)(r+1)(4+3r)a_0}{2} = 0$$

- Each term in the series must be 0, giving the recursion relation

$$-\frac{3(k+1+r)\left(-\left(k+r+\frac{5}{3}\right)a_{k+1}\left(\mathrm{I}\sqrt{3}-1\right)2^{\frac{1}{3}}+\left(k+\frac{4}{3}+r\right)a_k\left(1+\mathrm{I}\sqrt{3}\right)2^{\frac{2}{3}}-\frac{4a_{k-1}(k+1+r)}{3}\right)}{2} = 0$$

- Shift index using $k->k+1$

$$-\frac{3(k+r+2)\left(-\left(k+\frac{8}{3}+r\right)a_{k+2}\left(\mathrm{I}\sqrt{3}-1\right)2^{\frac{1}{3}}+\left(k+\frac{7}{3}+r\right)a_{k+1}\left(1+\mathrm{I}\sqrt{3}\right)2^{\frac{2}{3}}-\frac{4a_k(k+r+2)}{3}\right)}{2} = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = \frac{\left(3\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}k\sqrt{3}+3\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}r\sqrt{3}+7\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}\sqrt{3}+3a_{k+1}2^{\frac{2}{3}}k+3a_{k+1}2^{\frac{2}{3}}r+7a_{k+1}2^{\frac{2}{3}}-4ka_k-4ra_k-8a_k\right)2^{\frac{2}{3}}}{2\left(3\,\mathrm{I}k\sqrt{3}+3\,\mathrm{I}r\sqrt{3}+8\,\mathrm{I}\sqrt{3}-3k-3r-8\right)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = \frac{\left(3\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}k\sqrt{3}+7\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}\sqrt{3}+3a_{k+1}2^{\frac{2}{3}}k+7a_{k+1}2^{\frac{2}{3}}-4ka_k-8a_k\right)2^{\frac{2}{3}}}{2\left(3\,\mathrm{I}k\sqrt{3}-8+8\,\mathrm{I}\sqrt{3}-3k\right)}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = \frac{\left(3\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}k\sqrt{3}+7\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}\sqrt{3}+3a_{k+1}2^{\frac{2}{3}}k+7a_{k+1}2^{\frac{2}{3}}-4ka_k-8a_k\right)2^{\frac{2}{3}}}{2\left(3\,\mathrm{I}k\sqrt{3}-8+8\,\mathrm{I}\sqrt{3}-3k\right)}, \frac{5\,2^{\frac{1}{3}}\left(\mathrm{I}\sqrt{3}-1\right)a_1}{2} - 2\right.$$

- Revert the change of variables $u = x + \frac{2^{\frac{2}{3}}}{4} + \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(x + \frac{2^{\frac{2}{3}}}{4} + \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}\right)^k, a_{k+2} = \frac{\left(3\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}k\sqrt{3}+7\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}\sqrt{3}+3a_{k+1}2^{\frac{2}{3}}k+7a_{k+1}2^{\frac{2}{3}}-4ka_k-8a_k\right)2^{\frac{2}{3}}}{2\left(3\,\mathrm{I}k\sqrt{3}-8+8\,\mathrm{I}\sqrt{3}-3k\right)}, \frac{5\,2^{\frac{1}{3}}\right.$$

- Recursion relation for $r = -\frac{2}{3}$

$$a_{k+2} = \frac{\left(3\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}k\sqrt{3}+5\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}\sqrt{3}+3a_{k+1}2^{\frac{2}{3}}k+5a_{k+1}2^{\frac{2}{3}}-4ka_k-\frac{16a_k}{3}\right)2^{\frac{2}{3}}}{2\left(3\,\mathrm{I}k\sqrt{3}+6\,\mathrm{I}\sqrt{3}-3k-6\right)}$$

- Solution for $r = -\frac{2}{3}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{2}{3}}, a_{k+2} = \frac{\left(3\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}k\sqrt{3}+5\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}\sqrt{3}+3a_{k+1}2^{\frac{2}{3}}k+5a_{k+1}2^{\frac{2}{3}}-4ka_k-\frac{16a_k}{3}\right)2^{\frac{2}{3}}}{2\left(3\,\mathrm{I}k\sqrt{3}+6\,\mathrm{I}\sqrt{3}-3k-6\right)}, \frac{2^{\frac{1}{3}}\left(\mathrm{I}\sqrt{3}-1\right)a_1}{2} - \right.$$

- Revert the change of variables $u = x + \frac{2^{\frac{2}{3}}}{4} + \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(x + \frac{2^{\frac{2}{3}}}{4} + \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}\right)^{k-\frac{2}{3}}, a_{k+2} = \frac{\left(3\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}k\sqrt{3}+5\,\mathrm{I}a_{k+1}2^{\frac{2}{3}}\sqrt{3}+3a_{k+1}2^{\frac{2}{3}}k+5a_{k+1}2^{\frac{2}{3}}-4ka_k-\frac{16a_k}{3}\right)2^{\frac{2}{3}}}{2\left(3\,\mathrm{I}k\sqrt{3}+6\,\mathrm{I}\sqrt{3}-3k-6\right)},\right.$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k \left(x + \frac{2^{\frac{2}{3}}}{4} + \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}\right)^{k}\right) + \left(\sum_{k=0}^{\infty} b_k \left(x + \frac{2^{\frac{2}{3}}}{4} + \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}\right)^{k-\frac{2}{3}}\right), a_{k+2} = \frac{\left(3\,\mathrm{I}a_{1+k}2^{\frac{2}{3}}k\sqrt{3}+7\,\mathrm{I}a_{1+k}\right.}{2\left(\right.}\right.$$

Problem number: 35.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(x^3+1)\,y''+7y'x^2+9yx=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y_0'$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0)+(x-x_0)\,y'(x_0)+\frac{(x-x_0)^2}{2}y''(x_0)+\frac{(x-x_0)^3}{3!}y'''(x_0)+\cdots\\
&= y_0+xy_0'+\frac{x^2}{2}f|_{x_0,y_0,y_0'}+\frac{x^3}{3!}f'|_{x_0,y_0,y_0'}+\cdots\\
&= y_0+xy_0'+\sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}\,\frac{d^nf}{dx^n}\bigg|_{x_0,y_0,y_0'}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{902}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{903}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n\big|_{x_0,y_0,y_0'} \qquad (7)$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{x(7y'x+9y)}{x^3+1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{47y'x^4 + 81yx^3 - 23y'x - 9y}{(x^3+1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{-342y'x^6 - 666yx^5 + 536x^3y' + 504x^2y - 32y'}{(x^3+1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(2754x^8 - 9182x^5 + 2624x^2)\, y' + 5742\left(x^6 - \frac{59}{29}x^3 + \frac{72}{319}\right) xy}{(x^3+1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-24552x^{10} + 144640x^7 - 100904x^4 + 6544x)\, y' - 53496\left(x^9 - \frac{3004}{743}x^6 + \frac{1175}{743}x^3 - \frac{18}{743}\right) y}{(x^3+1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=y(0)$ and $y'(0)=y'(0)$ gives

$$
\begin{aligned}
F_0 &= 0 \\
F_1 &= -9y(0) \\
F_2 &= -32y'(0) \\
F_3 &= 0 \\
F_4 &= 1296y(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = \left(1 - \frac{3}{2}x^3 + \frac{9}{5}x^6\right) y(0) + \left(x - \frac{4}{3}x^4\right) y'(0) + O(x^6)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(x^3+1\right) y''+7y' x^2+9yx = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\left(x^3+1\right)\left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right)+7\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x^2+9\left(\sum_{n=0}^{\infty} a_n x^n\right) x = 0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n\, x^{1+n} a_n (n-1)\right)+\left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 7n\, x^{1+n} a_n\right)+\left(\sum_{n=0}^{\infty} 9x^{1+n} a_n\right) = 0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n\, x^{1+n} a_n (n-1) = \sum_{n=3}^{\infty} (n-1) a_{n-1} (n-2)\, x^n$$

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2) a_{n+2} (1+n)\, x^n$$

$$\sum_{n=1}^{\infty} 7n\, x^{1+n} a_n = \sum_{n=2}^{\infty} 7(n-1) a_{n-1} x^n$$

$$\sum_{n=0}^{\infty} 9x^{1+n} a_n = \sum_{n=1}^{\infty} 9a_{n-1} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$
\left(\sum_{n=3}^{\infty} (n-1)\, a_{n-1}(n-2)\, x^{n}\right)+\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, x^{n}\right) \\
+\left(\sum_{n=2}^{\infty} 7(n-1)\, a_{n-1} x^{n}\right)+\left(\sum_{n=1}^{\infty} 9 a_{n-1} x^{n}\right) = 0 \tag{3}
$$

$n = 1$ gives

$$
6a_3 + 9a_0 = 0
$$

Which after substituting earlier equations, simplifies to

$$
a_3 = -\frac{3a_0}{2}
$$

$n = 2$ gives

$$
12a_4 + 16a_1 = 0
$$

Which after substituting earlier equations, simplifies to

$$
a_4 = -\frac{4a_1}{3}
$$

For $3 \leq n$, the recurrence equation is

$$
(n-1)\, a_{n-1}(n-2) + (n+2)\, a_{n+2}(1+n) + 7(n-1)\, a_{n-1} + 9a_{n-1} = 0 \tag{4}
$$

Solving for a_{n+2}, gives

$$
a_{n+2} = -\frac{(n+2)\, a_{n-1}}{1+n} \tag{5}
$$

For $n = 3$ the recurrence equation gives

$$
25a_2 + 20a_5 = 0
$$

Which after substituting the earlier terms found becomes

$$
a_5 = 0
$$

For $n = 4$ the recurrence equation gives

$$36a_3 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{9a_0}{5}$$

For $n = 5$ the recurrence equation gives

$$49a_4 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{14a_1}{9}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - \frac{3}{2} a_0 x^3 - \frac{4}{3} a_1 x^4 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{3x^3}{2}\right) a_0 + \left(x - \frac{4}{3}x^4\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{3x^3}{2}\right) c_1 + \left(x - \frac{4}{3}x^4\right) c_2 + O(x^6)$$

<u>Summary</u>

The solution(s) found are the following

$$y = \left(1 - \frac{3}{2}x^3 + \frac{9}{5}x^6\right) y(0) + \left(x - \frac{4}{3}x^4\right) y'(0) + O(x^6) \tag{1}$$

$$y = \left(1 - \frac{3x^3}{2}\right) c_1 + \left(x - \frac{4}{3}x^4\right) c_2 + O(x^6) \tag{2}$$

Verification of solutions

$$y = \left(1-\frac{3}{2}x^{3}+\frac{9}{5}x^{6}\right) y(0)+\left(x-\frac{4}{3}x^{4}\right) y'(0)+O\left(x^{6}\right)$$

Verified OK.

$$y = \left(1-\frac{3x^{3}}{2}\right) c_{1}+\left(x-\frac{4}{3}x^{4}\right) c_{2}+O\left(x^{6}\right)$$

Verified OK.

12.29.1 Maple step by step solution

Let's solve

$\left(x^{3}+1\right) y''+7y'x^{2}+9yx=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{7x^{2}y'}{x^{3}+1}-\frac{9xy}{x^{3}+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{7x^{2}y'}{x^{3}+1}+\frac{9xy}{x^{3}+1}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_{2}(x)=\frac{7x^{2}}{x^{3}+1}, P_{3}(x)=\frac{9x}{x^{3}+1}\right]$

  ◦ $(x+1)\cdot P_{2}(x)$ is analytic at $x=-1$

    $\left((x+1)\cdot P_{2}(x)\right)\bigg|_{x=-1}=\frac{7}{3}$

  ◦ $(x+1)^{2}\cdot P_{3}(x)$ is analytic at $x=-1$

    $\left((x+1)^{2}\cdot P_{3}(x)\right)\bigg|_{x=-1}=0$

  ◦ $x=-1$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_{0}=-1$

- Multiply by denominators

$\left(x^{3}+1\right) y''+7 y' x^{2}+9 y x=0$

- Change variables using $x=u-1$ so that the regular singular point is at $u=0$

$\left(u^{3}-3 u^{2}+3 u\right)\left(\frac{d^{2}}{d u^{2}} y(u)\right)+\left(7 u^{2}-14 u+7\right)\left(\frac{d}{d u} y(u)\right)+(9 u-9) y(u)=0$

- Assume series solution for $y(u)$

$y(u)=\sum_{k=0}^{\infty} a_{k} u^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $u^{m} \cdot y(u)$ to series expansion for $m=0..1$

  $u^{m} \cdot y(u)=\sum_{k=0}^{\infty} a_{k} u^{k+r+m}$

  - Shift index using $k->k-m$

  $u^{m} \cdot y(u)=\sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

  - Convert $u^{m} \cdot\left(\frac{d}{d u} y(u)\right)$ to series expansion for $m=0..2$

  $u^{m} \cdot\left(\frac{d}{d u} y(u)\right)=\sum_{k=0}^{\infty} a_{k}(k+r) u^{k+r-1+m}$

  - Shift index using $k->k+1-m$

  $u^{m} \cdot\left(\frac{d}{d u} y(u)\right)=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r) u^{k+r}$

  - Convert $u^{m} \cdot\left(\frac{d^{2}}{d u^{2}} y(u)\right)$ to series expansion for $m=1..3$

  $u^{m} \cdot\left(\frac{d^{2}}{d u^{2}} y(u)\right)=\sum_{k=0}^{\infty} a_{k}(k+r)(k+r-1) u^{k+r-2+m}$

  - Shift index using $k->k+2-m$

  $u^{m} \cdot\left(\frac{d^{2}}{d u^{2}} y(u)\right)=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r) u^{k+r}$

Rewrite ODE with series expansions

$a_{0} r(4+3 r) u^{-1+r}+\left(a_{1}(1+r)(7+3 r)-a_{0}\left(3 r^{2}+11 r+9\right)\right) u^{r}+\left(\sum_{k=1}^{\infty}\left(a_{k+1}(k+1+r)(3 k+7\right.\right.$

- a_{0}cannot be 0 by assumption, giving the indicial equation

$r(4+3 r)=0$

- Values of r that satisfy the indicial equation

$r \in\left\{0,-\frac{4}{3}\right\}$

- Each term must be 0

  $a_1(1+r)(7+3r) - a_0(3r^2+11r+9) = 0$
- Each term in the series must be 0, giving the recursion relation

  $a_{k+1}(k+1+r)(3k+7+3r) - a_k(3k^2+6kr+3r^2+11k+11r+9) + a_{k-1}(k+2+r)^2 = 0$
- Shift index using $k- >k+1$

  $a_{k+2}(k+2+r)(3k+10+3r) - a_{k+1}\left(3(k+1)^2+6(k+1)r+3r^2+11k+20+11r\right) + a_k(k+$
- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{k^2a_k-3k^2a_{k+1}+2kra_k-6kra_{k+1}+r^2a_k-3r^2a_{k+1}+6ka_k-17ka_{k+1}+6ra_k-17ra_{k+1}+9a_k-23a_{k+1}}{(k+2+r)(3k+10+3r)}$
- Recursion relation for $r = 0$

  $a_{k+2} = -\frac{k^2a_k-3k^2a_{k+1}+6ka_k-17ka_{k+1}+9a_k-23a_{k+1}}{(k+2)(3k+10)}$
- Solution for $r = 0$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{k^2a_k-3k^2a_{k+1}+6ka_k-17ka_{k+1}+9a_k-23a_{k+1}}{(k+2)(3k+10)}, 7a_1-9a_0 = 0\right]$
- Revert the change of variables $u = x+1$

  $\left[y = \sum_{k=0}^{\infty} a_k(x+1)^k, a_{k+2} = -\frac{k^2a_k-3k^2a_{k+1}+6ka_k-17ka_{k+1}+9a_k-23a_{k+1}}{(k+2)(3k+10)}, 7a_1-9a_0 = 0\right]$
- Recursion relation for $r = -\frac{4}{3}$

  $a_{k+2} = -\frac{k^2a_k-3k^2a_{k+1}+\frac{10}{3}ka_k-9ka_{k+1}+\frac{25}{9}a_k-\frac{17}{3}a_{k+1}}{\left(k+\frac{2}{3}\right)(3k+6)}$
- Solution for $r = -\frac{4}{3}$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{4}{3}}, a_{k+2} = -\frac{k^2a_k-3k^2a_{k+1}+\frac{10}{3}ka_k-9ka_{k+1}+\frac{25}{9}a_k-\frac{17}{3}a_{k+1}}{\left(k+\frac{2}{3}\right)(3k+6)}, -a_1+\frac{a_0}{3} = 0\right]$
- Revert the change of variables $u = x+1$

  $\left[y = \sum_{k=0}^{\infty} a_k(x+1)^{k-\frac{4}{3}}, a_{k+2} = -\frac{k^2a_k-3k^2a_{k+1}+\frac{10}{3}ka_k-9ka_{k+1}+\frac{25}{9}a_k-\frac{17}{3}a_{k+1}}{\left(k+\frac{2}{3}\right)(3k+6)}, -a_1+\frac{a_0}{3} = 0\right]$
- Combine solutions and rename parameters

  $\left[y = \left(\sum_{k=0}^{\infty} a_k(x+1)^k\right) + \left(\sum_{k=0}^{\infty} b_k(x+1)^{k-\frac{4}{3}}\right), a_{k+2} = -\frac{k^2a_k-3k^2a_{1+k}+6ka_k-17ka_{1+k}+9a_k-23a_{1+k}}{(k+2)(3k+10)}, 7a_1\right.$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 36.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{\left(-2x^3+1\right)y''+6y'x^2+24yx=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using

Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0, y_0, y_0'} + \frac{x^3}{3!} f'|_{x_0, y_0, y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left.\frac{d^n f}{dx^n}\right|_{x_0, y_0, y_0'}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (905) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (906) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$\begin{aligned}
F_0 &= \frac{6x(y'x+4y)}{2x^3-1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \\
&= \frac{36y'x+24y}{2x^3-1} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y}y' + \frac{\partial F_1}{\partial y'}F_1 \\
&= \frac{120x^3y'+720x^2y-60y'}{(2x^3-1)^2} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y}y' + \frac{\partial F_2}{\partial y'}F_2 \\
&= \frac{1440\left(x^3-\frac{1}{2}\right)x^2y' + \left(-2880x^4-2880x\right)y}{(2x^3-1)^3} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y}y' + \frac{\partial F_3}{\partial y'}F_3 \\
&= \frac{4320(-2x^7-x^4+x)\,y' + 63360\left(x^6+\frac{7}{11}x^3+\frac{1}{22}\right)y}{(2x^3-1)^4}
\end{aligned}$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=y(0)$ and $y'(0)=y'(0)$ gives

$$\begin{aligned}
F_0 &= 0 \\
F_1 &= -24y(0) \\
F_2 &= -60y'(0) \\
F_3 &= 0 \\
F_4 &= 2880y(0)
\end{aligned}$$

Substituting all the above in (7) and simplifying gives the solution as

$$y = \left(4x^6-4x^3+1\right)y(0) + \left(x-\frac{5}{2}x^4\right)y'(0) + O\left(x^6\right)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(-2x^3+1\right) y'' + 6y'x^2 + 24yx = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\left(-2x^3+1\right)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + 6\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x^2 + 24\left(\sum_{n=0}^{\infty} a_n x^n\right) x = 0 \quad (1)$$

Which simplifies to

$$\sum_{n=2}^{\infty}\left(-2n\, x^{1+n} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 6n\, x^{1+n} a_n\right) + \left(\sum_{n=0}^{\infty} 24x^{1+n} a_n\right) = 0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty}\left(-2n\, x^{1+n} a_n (n-1)\right) = \sum_{n=3}^{\infty}\left(-2(n-1)\, a_{n-1}(n-2)\, x^n\right)$$
$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, x^n$$
$$\sum_{n=1}^{\infty} 6n\, x^{1+n} a_n = \sum_{n=2}^{\infty} 6(n-1)\, a_{n-1} x^n$$
$$\sum_{n=0}^{\infty} 24x^{1+n} a_n = \sum_{n=1}^{\infty} 24 a_{n-1} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\sum_{n=3}^{\infty} \left(-2(n-1)\, a_{n-1}(n-2)\, x^{n}\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, x^{n}\right) + \left(\sum_{n=2}^{\infty} 6(n-1)\, a_{n-1} x^{n}\right) + \left(\sum_{n=1}^{\infty} 24 a_{n-1} x^{n}\right) = 0 \tag{3}$$

$n = 1$ gives

$$6a_3 + 24a_0 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -4a_0$$

$n = 2$ gives

$$12a_4 + 30a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_4 = -\frac{5a_1}{2}$$

For $3 \le n$, the recurrence equation is

$$-2(n-1)\, a_{n-1}(n-2) + (n+2)\, a_{n+2}(1+n) + 6(n-1)\, a_{n-1} + 24a_{n-1} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = \frac{2(n-7)\, a_{n-1}}{n+2} \tag{5}$$

For $n = 3$ the recurrence equation gives

$$32a_2 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = 0$$

For $n = 4$ the recurrence equation gives

$$30a_3 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = 4a_0$$

For $n = 5$ the recurrence equation gives

$$24a_4 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{10a_1}{7}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - 4a_0 x^3 - \frac{5}{2} a_1 x^4 + \dots$$

Collecting terms, the solution becomes

$$y = \left(-4x^3 + 1\right) a_0 + \left(x - \frac{5}{2}x^4\right) a_1 + O\left(x^6\right) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(-4x^3 + 1\right) c_1 + \left(x - \frac{5}{2}x^4\right) c_2 + O\left(x^6\right)$$

Summary

The solution(s) found are the following

$$y = \left(4x^6 - 4x^3 + 1\right) y(0) + \left(x - \frac{5}{2}x^4\right) y'(0) + O\left(x^6\right) \tag{1}$$

$$y = \left(-4x^3 + 1\right) c_1 + \left(x - \frac{5}{2}x^4\right) c_2 + O\left(x^6\right) \tag{2}$$

Verification of solutions

$$y = \left(4x^6 - 4x^3 + 1\right) y(0) + \left(x - \frac{5}{2}x^4\right) y'(0) + O\left(x^6\right)$$

Verified OK.

$$y = \left(-4x^3 + 1\right) c_1 + \left(x - \frac{5}{2}x^4\right) c_2 + O\left(x^6\right)$$

Verified OK.

12.30.1 Maple step by step solution

Let's solve

$\left(-2x^3 + 1\right) y'' + 6y'x^2 + 24yx = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{6x^2y'}{2x^3-1} + \frac{24xy}{2x^3-1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{6x^2y'}{2x^3-1} - \frac{24xy}{2x^3-1} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = -\frac{6x^2}{2x^3-1}, P_3(x) = -\frac{24x}{2x^3-1}\right]$

  ◦ $\left(x + \frac{2^{\frac{2}{3}}}{4} + \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}\right) \cdot P_2(x)$ is analytic at $x = -\frac{2^{\frac{2}{3}}}{4} - \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}$

  $\left(\left(x + \frac{2^{\frac{2}{3}}}{4} + \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}\right) \cdot P_2(x)\right)\Bigg|_{x=-\frac{2^{\frac{2}{3}}}{4}-\frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}} = 0$

  ◦ $\left(x + \frac{2^{\frac{2}{3}}}{4} + \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}\right)^2 \cdot P_3(x)$ is analytic at $x = -\frac{2^{\frac{2}{3}}}{4} - \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}$

  $\left(\left(x + \frac{2^{\frac{2}{3}}}{4} + \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}\right)^2 \cdot P_3(x)\right)\Bigg|_{x=-\frac{2^{\frac{2}{3}}}{4}-\frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}} = 0$

  ◦ $x = -\frac{2^{\frac{2}{3}}}{4} - \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}$ is a regular singular point

  Check to see if x_0 is a regular singular point

$x_0 = -\frac{2^{\frac{2}{3}}}{4} - \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}$

- Multiply by denominators

  $y''(2x^3 - 1) - 6y'x^2 - 24yx = 0$

- Change variables using $x = u - \frac{2^{\frac{2}{3}}}{4} - \frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}$ so that the regular singular point is at $u = 0$

  $\left(2u^3 - \frac{3u^2 2^{\frac{2}{3}}}{2} - \frac{3\,\mathrm{I}u^2\sqrt{3}\,2^{\frac{2}{3}}}{2} - \frac{3u2^{\frac{1}{3}}}{2} + \frac{3\,\mathrm{I}u\sqrt{3}\,2^{\frac{1}{3}}}{2}\right)\left(\frac{d^2}{du^2}y(u)\right) + \left(-6u^2 + 3u2^{\frac{2}{3}} + 3\,\mathrm{I}u\sqrt{3}\,2^{\frac{2}{3}} + \frac{3\,2^{\frac{1}{3}}}{2} - 3\right.$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

  - Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

    $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$

  - Shift index using $k- >k - m$

    $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$

  - Shift index using $k- >k + 1 - m$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,u^{k+r}$

  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

    $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,u^{k+r-2+m}$

  - Shift index using $k- >k + 2 - m$

    $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$

  Rewrite ODE with series expansions

  $\frac{3\,2^{\frac{1}{3}}\left(\mathrm{I}\sqrt{3}-1\right)(r-2)ra_0u^{r-1}}{2} + \left(\frac{3\,2^{\frac{1}{3}}\left(\mathrm{I}\sqrt{3}-1\right)(r-1)(1+r)a_1}{2} - \frac{3\,2^{\frac{2}{3}}\left(1+\mathrm{I}\sqrt{3}\right)(1+r)(-4+r)a_0}{2}\right)u^r + \left(\sum_{k=1}^{\infty}\left(\frac{3\,2^{\frac{1}{3}}\left(\mathrm{I}\sqrt{3}-1\right.}{}\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$\frac{3\,2^{\frac{1}{3}}\left(\mathrm{I}\sqrt{3}-1\right)(r-2)r}{2} = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{0, 2\}$$

- Each term must be 0

$$\frac{3\,2^{\frac{1}{3}}\left(\mathrm{I}\sqrt{3}-1\right)(r-1)(1+r)a_1}{2} - \frac{3\,2^{\frac{2}{3}}\left(1+\mathrm{I}\sqrt{3}\right)(1+r)(-4+r)a_0}{2} = 0$$

- Each term in the series must be 0, giving the recursion relation

$$-\frac{3(k+1+r)\left(-(k+r-1)a_{k+1}\left(\mathrm{I}\sqrt{3}-1\right)2^{\frac{1}{3}}+\left(1+\mathrm{I}\sqrt{3}\right)a_k(k-4+r)2^{\frac{2}{3}}-\frac{4a_{k-1}(k-7+r)}{3}\right)}{2} = 0$$

- Shift index using $k->k+1$

$$-\frac{3(k+r+2)\left(-(k+r)a_{k+2}\left(\mathrm{I}\sqrt{3}-1\right)2^{\frac{1}{3}}+\left(1+\mathrm{I}\sqrt{3}\right)a_{k+1}(k-3+r)2^{\frac{2}{3}}-\frac{4a_k(k+r-6)}{3}\right)}{2} = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = \frac{\left(3\,\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}\,k a_{k+1}+3\,\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}\,r a_{k+1}-9\,\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}\,a_{k+1}+3\,2^{\frac{2}{3}}\,k a_{k+1}+3\,2^{\frac{2}{3}}\,r a_{k+1}-9a_{k+1}2^{\frac{2}{3}}-4ka_k-4ra_k+24a_k\right)2^{\frac{2}{3}}}{6\left(\mathrm{I}\sqrt{3}\,k+\mathrm{I}\sqrt{3}\,r-k-r\right)}$$

- Recursion relation for $r=0$

$$a_{k+2} = \frac{\left(3\,\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}\,k a_{k+1}-9\,\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}\,a_{k+1}+3\,2^{\frac{2}{3}}\,k a_{k+1}-9a_{k+1}2^{\frac{2}{3}}-4ka_k+24a_k\right)2^{\frac{2}{3}}}{6\left(\mathrm{I}\sqrt{3}\,k-k\right)}$$

- Series not valid for $r=0$, division by 0 in the recursion relation at $k=0$

$$a_{k+2} = \frac{\left(3\,\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}\,k a_{k+1}-9\,\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}\,a_{k+1}+3\,2^{\frac{2}{3}}\,k a_{k+1}-9a_{k+1}2^{\frac{2}{3}}-4ka_k+24a_k\right)2^{\frac{2}{3}}}{6\left(\mathrm{I}\sqrt{3}\,k-k\right)}$$

- Recursion relation for $r=2$

$$a_{k+2} = \frac{\left(3\,\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}\,k a_{k+1}-3\,\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}\,a_{k+1}+3\,2^{\frac{2}{3}}\,k a_{k+1}-3a_{k+1}2^{\frac{2}{3}}-4ka_k+16a_k\right)2^{\frac{2}{3}}}{6\left(\mathrm{I}\sqrt{3}\,k+2\,\mathrm{I}\sqrt{3}-k-2\right)}$$

- Solution for $r=2$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+2}, a_{k+2} = \frac{\left(3\,\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}\,k a_{k+1}-3\,\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}\,a_{k+1}+3\,2^{\frac{2}{3}}\,k a_{k+1}-3a_{k+1}2^{\frac{2}{3}}-4ka_k+16a_k\right)2^{\frac{2}{3}}}{6\left(\mathrm{I}\sqrt{3}\,k+2\,\mathrm{I}\sqrt{3}-k-2\right)}, \frac{9\,2^{\frac{1}{3}}\left(\mathrm{I}\sqrt{3}-1\right)a_1}{2}\right.$$

- Revert the change of variables $u = x+\frac{2^{\frac{2}{3}}}{4}+\frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}$

$$\left[y = \sum_{k=0}^{\infty} a_k\left(x+\frac{2^{\frac{2}{3}}}{4}+\frac{\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}}{4}\right)^{k+2}, a_{k+2} = \frac{\left(3\,\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}\,k a_{k+1}-3\,\mathrm{I}\sqrt{3}\,2^{\frac{2}{3}}\,a_{k+1}+3\,2^{\frac{2}{3}}\,k a_{k+1}-3a_{k+1}2^{\frac{2}{3}}-4ka_k+16a_k\right)2^{\frac{2}{3}}}{6\left(\mathrm{I}\sqrt{3}\,k+2\,\mathrm{I}\sqrt{3}-k-2\right)}\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 37.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{\left(-x^{3}+1\right) y''+15y'x^{2}-36yx=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using Taylor series gives

$$\begin{aligned} y(x) &= y(x_0)+(x-x_0)\,y'(x_0)+\frac{(x-x_0)^2}{2}y''(x_0)+\frac{(x-x_0)^3}{3!}y'''(x_0)+\cdots \\ &= y_0+xy'_0+\frac{x^2}{2}\,f|_{x_0,y_0,y'_0}+\frac{x^3}{3!}\,f'|_{x_0,y_0,y'_0}+\cdots \\ &= y_0+xy'_0+\sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}\,\frac{d^nf}{dx^n}\bigg|_{x_0,y_0,y'_0} \end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{908}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{909}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= \frac{3x(5y'x - 12y)}{x^3 - 1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{174y'x^4 - 468yx^3 + 6y'x + 36y}{(x^3 - 1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{6(299x^6 - 22x^3 - 7)\, y' + 972(-5x^5 + x^2)\, y}{(x^3 - 1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(16668x^8 - 6120x^5 - 828x^2)\, y' - 45144xy\left(x^6 - \frac{103}{209}x^3 + \frac{2}{209}\right)}{(x^3 - 1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(138204x^{10} - 114912x^7 + 3780x^4 + 2088x)\, y' + (-374328x^9 + 358344x^6 - 54432x^3 + 432)\, y}{(x^3 - 1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= 0 \\
F_1 &= 36y(0) \\
F_2 &= 42y'(0) \\
F_3 &= 0 \\
F_4 &= -432y(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = \left(1 + 6x^3 - \frac{3}{5}x^6\right) y(0) + \left(x + \frac{7}{4}x^4\right) y'(0) + O(x^6)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(-x^3+1\right) y'' + 15y'x^2 - 36yx = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\left(-x^3+1\right)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + 15\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x^2 - 36\left(\sum_{n=0}^{\infty} a_n x^n\right) x = 0 \quad (1)$$

Which simplifies to

$$\sum_{n=2}^{\infty}\left(-n\, x^{1+n} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 15n\, x^{1+n} a_n\right) + \sum_{n=0}^{\infty}\left(-36 x^{1+n} a_n\right) = 0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty}\left(-n\, x^{1+n} a_n (n-1)\right) = \sum_{n=3}^{\infty}\left(-(n-1)\, a_{n-1}(n-2)\, x^n\right)$$

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, x^n$$

$$\sum_{n=1}^{\infty} 15n\, x^{1+n} a_n = \sum_{n=2}^{\infty} 15(n-1)\, a_{n-1} x^n$$

$$\sum_{n=0}^{\infty}\left(-36 x^{1+n} a_n\right) = \sum_{n=1}^{\infty}\left(-36 a_{n-1} x^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\sum_{n=3}^{\infty} \left(-(n-1)\, a_{n-1}(n-2)\, x^{n}\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, x^{n}\right) + \left(\sum_{n=2}^{\infty} 15(n-1)\, a_{n-1} x^{n}\right) + \sum_{n=1}^{\infty} \left(-36 a_{n-1} x^{n}\right) = 0 \tag{3}$$

$n = 1$ gives

$$6a_3 - 36a_0 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = 6a_0$$

$n = 2$ gives

$$12a_4 - 21a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_4 = \frac{7a_1}{4}$$

For $3 \le n$, the recurrence equation is

$$-(n-1)\, a_{n-1}(n-2) + (n+2)\, a_{n+2}(1+n) + 15(n-1)\, a_{n-1} - 36a_{n-1} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = \frac{a_{n-1}(n^2 - 18n + 53)}{(n+2)\,(1+n)} \tag{5}$$

For $n = 3$ the recurrence equation gives

$$-8a_2 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = 0$$

For $n = 4$ the recurrence equation gives

$$3a_3 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{3a_0}{5}$$

For $n = 5$ the recurrence equation gives

$$12a_4 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{a_1}{2}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x + 6a_0 x^3 + \frac{7}{4} a_1 x^4 + \dots$$

Collecting terms, the solution becomes

$$y = (6x^3 + 1) a_0 + \left(x + \frac{7}{4} x^4\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = (6x^3 + 1) c_1 + \left(x + \frac{7}{4} x^4\right) c_2 + O(x^6)$$

<u>Summary</u>
The solution(s) found are the following

$$y = \left(1 + 6x^3 - \frac{3}{5} x^6\right) y(0) + \left(x + \frac{7}{4} x^4\right) y'(0) + O(x^6) \tag{1}$$

$$y = (6x^3 + 1) c_1 + \left(x + \frac{7}{4} x^4\right) c_2 + O(x^6) \tag{2}$$

Verification of solutions

$$y = \left(1+6x^3-\frac{3}{5}x^6\right) y(0)+\left(x+\frac{7}{4}x^4\right) y'(0)+O\left(x^6\right)$$

Verified OK.

$$y = \left(6x^3+1\right) c_1+\left(x+\frac{7}{4}x^4\right) c_2+O\left(x^6\right)$$

Verified OK.

12.31.1 Maple step by step solution

Let's solve

$\left(-x^3+1\right) y''+15y'x^2-36yx=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{15x^2y'}{x^3-1}-\frac{36xy}{x^3-1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{15x^2y'}{x^3-1}+\frac{36xy}{x^3-1}=0$

- ☐ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=-\frac{15x^2}{x^3-1}, P_3(x)=\frac{36x}{x^3-1}\right]$

  - $(x-1)\cdot P_2(x)$ is analytic at $x=1$

    $\left((x-1)\cdot P_2(x)\right)\Big|_{x=1}=-5$

  - $(x-1)^2\cdot P_3(x)$ is analytic at $x=1$

    $\left((x-1)^2\cdot P_3(x)\right)\Big|_{x=1}=0$

  - $x=1$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0=1$

- Multiply by denominators

$y''(x^3-1)-15y'x^2+36yx=0$

- Change variables using $x=u+1$ so that the regular singular point is at $u=0$

$(u^3+3u^2+3u)\left(\frac{d^2}{du^2}y(u)\right)+(-15u^2-30u-15)\left(\frac{d}{du}y(u)\right)+(36u+36)\,y(u)=0$

- Assume series solution for $y(u)$

$y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $u^m\cdot y(u)$ to series expansion for $m=0..1$

    $u^m\cdot y(u)=\sum_{k=0}^{\infty} a_k u^{k+r+m}$

  - Shift index using $k->k-m$

    $u^m\cdot y(u)=\sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

  - Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..2$

    $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$

  - Shift index using $k->k+1-m$

    $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,u^{k+r}$

  - Convert $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m=1..3$

    $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,u^{k+r-2+m}$

  - Shift index using $k->k+2-m$

    $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$

  Rewrite ODE with series expansions

  $3a_0r(-6+r)\,u^{-1+r}+(3a_1(1+r)\,(-5+r)+3a_0(r^2-11r+12))\,u^r+\left(\sum_{k=1}^{\infty}\left(3a_{k+1}(k+1+r)\,(k\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $3r(-6+r)=0$

- Values of r that satisfy the indicial equation

  $r\in\{0,6\}$

- Each term must be 0

  $3a_1(1+r)(-5+r)+3a_0(r^2-11r+12)=0$

- Each term in the series must be 0, giving the recursion relation

  $(3a_k+a_{k-1}+3a_{k+1})k^2+(2(3a_k+a_{k-1}+3a_{k+1})r-33a_k-18a_{k-1}-12a_{k+1})k+(3a_k+a_{k-1}$

- Shift index using $k->k+1$

  $(3a_{k+1}+a_k+3a_{k+2})(k+1)^2+(2(3a_{k+1}+a_k+3a_{k+2})r-33a_{k+1}-18a_k-12a_{k+2})(k+1)+($

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{k^2a_k+3k^2a_{k+1}+2kra_k+6kra_{k+1}+r^2a_k+3r^2a_{k+1}-16ka_k-27ka_{k+1}-16ra_k-27ra_{k+1}+36a_k+6a_{k+1}}{3(k^2+2kr+r^2-2k-2r-8)}$

- Recursion relation for $r=0$

  $a_{k+2}=-\frac{k^2a_k+3k^2a_{k+1}-16ka_k-27ka_{k+1}+36a_k+6a_{k+1}}{3(k^2-2k-8)}$

- Series not valid for $r=0$, division by 0 in the recursion relation at $k=4$

  $a_{k+2}=-\frac{k^2a_k+3k^2a_{k+1}-16ka_k-27ka_{k+1}+36a_k+6a_{k+1}}{3(k^2-2k-8)}$

- Recursion relation for $r=6$

  $a_{k+2}=-\frac{k^2a_k+3k^2a_{k+1}-4ka_k+9ka_{k+1}-24a_k-48a_{k+1}}{3(k^2+10k+16)}$

- Solution for $r=6$

  $$\left[y(u)=\sum_{k=0}^{\infty}a_ku^{k+6}, a_{k+2}=-\frac{k^2a_k+3k^2a_{k+1}-4ka_k+9ka_{k+1}-24a_k-48a_{k+1}}{3(k^2+10k+16)}, 21a_1-54a_0=0\right]$$

- Revert the change of variables $u=x-1$

  $$\left[y=\sum_{k=0}^{\infty}a_k(x-1)^{k+6}, a_{k+2}=-\frac{k^2a_k+3k^2a_{k+1}-4ka_k+9ka_{k+1}-24a_k-48a_{k+1}}{3(k^2+10k+16)}, 21a_1-54a_0=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 39.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(2x^5+1)\, y''+14y'x^4+10yx^3=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0)+(x-x_0)\, y'(x_0)+\frac{(x-x_0)^2}{2}y''(x_0)+\frac{(x-x_0)^3}{3!}y'''(x_0)+\cdots \\
&= y_0+xy'_0+\frac{x^2}{2}\, f|_{x_0,y_0,y'_0}+\frac{x^3}{3!}\, f'|_{x_0,y_0,y'_0}+\cdots \\
&= y_0+xy'_0+\sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}\, \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{911}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{912}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2x^3(7y'x + 5y)}{2x^5 + 1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{(204x^8 - 66x^3)\, y' + 180x^2\left(x^5 - \frac{1}{6}\right) y}{(2x^5 + 1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(-3312x^{12} + 3600x^7 - 228x^2)\, y' - 3120xy\left(x^{10} - \frac{10}{13}x^5 + \frac{1}{52}\right)}{(2x^5 + 1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(60000x^{16} - 146064x^{11} + 36600x^6 - 516x)\, y' + 58080\left(x^{15} - \frac{43}{22}x^{10} + \frac{153}{484}x^5 - \frac{1}{968}\right) y}{(2x^5 + 1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-1203840x^{20} + 5465088x^{15} - 3220704x^{10} + 264672x^5 - 576)\, y' - 1180800\left(x^{15} - \frac{799}{205}x^{10} + \frac{285}{164}x^5 -\right.}{(2x^5 + 1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= 0 \\
F_1 &= 0 \\
F_2 &= 0 \\
F_3 &= -60y(0) \\
F_4 &= -576y'(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = \left(1 - \frac{x^5}{2}\right) y(0) + \left(x - \frac{4}{5}x^6\right) y'(0) + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(2x^5+1\right)y''+14y'x^4+10yx^3=0$$

Let the solution be represented as power series of the form

$$y=\sum_{n=0}^{\infty}a_nx^n$$

Then

$$y'=\sum_{n=1}^{\infty}na_nx^{n-1}$$
$$y''=\sum_{n=2}^{\infty}n(n-1)\,a_nx^{n-2}$$

Substituting the above back into the ode gives

$$\left(2x^5+1\right)\left(\sum_{n=2}^{\infty}n(n-1)\,a_nx^{n-2}\right)+14\left(\sum_{n=1}^{\infty}na_nx^{n-1}\right)x^4+10\left(\sum_{n=0}^{\infty}a_nx^n\right)x^3=0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty}2n\,x^{n+3}a_n(n-1)\right)+\left(\sum_{n=2}^{\infty}n(n-1)\,a_nx^{n-2}\right)+\left(\sum_{n=1}^{\infty}14n\,x^{n+3}a_n\right)+\left(\sum_{n=0}^{\infty}10x^{n+3}a_n\right)=0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty}2n\,x^{n+3}a_n(n-1)=\sum_{n=5}^{\infty}2(n-3)\,a_{n-3}(n-4)\,x^n$$

$$\sum_{n=2}^{\infty}n(n-1)\,a_nx^{n-2}=\sum_{n=0}^{\infty}(n+2)\,a_{n+2}(n+1)\,x^n$$

$$\sum_{n=1}^{\infty}14n\,x^{n+3}a_n=\sum_{n=4}^{\infty}14(n-3)\,a_{n-3}x^n$$

$$\sum_{n=0}^{\infty}10x^{n+3}a_n=\sum_{n=3}^{\infty}10a_{n-3}x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=5}^{\infty} 2(n-3)\, a_{n-3}(n-4)\, x^{n}\right)+\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^{n}\right) + \left(\sum_{n=4}^{\infty} 14(n-3)\, a_{n-3} x^{n}\right)+\left(\sum_{n=3}^{\infty} 10 a_{n-3} x^{n}\right) = 0 \tag{3}$$

$n=3$ gives

$$20 a_5 + 10 a_0 = 0$$

Which after substituting earlier equations, simplifies to

$$a_5 = -\frac{a_0}{2}$$

$n=4$ gives

$$30 a_6 + 24 a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_6 = -\frac{4 a_1}{5}$$

For $5 \leq n$, the recurrence equation is

$$2(n-3)\, a_{n-3}(n-4)+(n+2)\, a_{n+2}(n+1)+14(n-3)\, a_{n-3}+10 a_{n-3} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{2(n-2)\, a_{n-3}}{n+1} \tag{5}$$

For $n=5$ the recurrence equation gives

$$42 a_2 + 42 a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = 0$$

And so on. Therefore the solution is

$$
\begin{aligned}
y &= \sum_{n=0}^{\infty} a_n x^n \\
&= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots
\end{aligned}
$$

Substituting the values for a_n found above, the solution becomes

$$
y = a_0 + a_1 x - \frac{1}{2} a_0 x^5 + \dots
$$

Collecting terms, the solution becomes

$$
y = \left(1 - \frac{x^5}{2}\right) a_0 + a_1 x + O(x^6) \tag{3}
$$

At $x = 0$ the solution above becomes

$$
y = \left(1 - \frac{x^5}{2}\right) c_1 + c_2 x + O(x^6)
$$

Summary

The solution(s) found are the following

$$
y = \left(1 - \frac{x^5}{2}\right) y(0) + \left(x - \frac{4}{5} x^6\right) y'(0) + O(x^6) \tag{1}
$$

$$
y = \left(1 - \frac{x^5}{2}\right) c_1 + c_2 x + O(x^6) \tag{2}
$$

Verification of solutions

$$
y = \left(1 - \frac{x^5}{2}\right) y(0) + \left(x - \frac{4}{5} x^6\right) y'(0) + O(x^6)
$$

Verified OK.

$$
y = \left(1 - \frac{x^5}{2}\right) c_1 + c_2 x + O(x^6)
$$

Verified OK.

12.32.1 Maple step by step solution

Let's solve

$(2x^5+1)y''+14y'x^4+10yx^3=0$

- Highest derivative means the order of the ODE is 2

  y''

The type(s) of ODE detected by this program : **"second_order_bessel_ode", "second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_Emden, _Fowler]]
```

$$\boxed{y'' + x^2y = 0}$$

With the expansion point for the power series method at $x = 0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using

Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0,y_0,y_0'} + \frac{x^3}{3!} f'|_{x_0,y_0,y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y_0'}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (914)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (915)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3)\\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -x^2 y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= -x(2y + y'x) \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= yx^4 - 4y'x - 2y \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= y'x^4 + 8yx^3 - 6y' \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= 12x^3 y' - x^2 y\left(x^4 - 30\right)
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= 0 \\
F_1 &= 0 \\
F_2 &= -2y(0) \\
F_3 &= -6y'(0) \\
F_4 &= 0
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = \left(1 - \frac{x^4}{12}\right) y(0) + \left(x - \frac{1}{20} x^5\right) y'(0) + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard

power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = -x^2 \left(\sum_{n=0}^{\infty} a_n x^n\right) \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=0}^{\infty} x^{n+2} a_n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n$$
$$\sum_{n=0}^{\infty} x^{n+2} a_n = \sum_{n=2}^{\infty} a_{n-2} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=2}^{\infty} a_{n-2} x^n\right) = 0 \tag{3}$$

For $2 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) + a_{n-2} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{a_{n-2}}{(n+2)(n+1)} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$12a_4 + a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{a_0}{12}$$

For $n = 3$ the recurrence equation gives

$$20a_5 + a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{a_1}{20}$$

For $n = 4$ the recurrence equation gives

$$30a_6 + a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = 0$$

For $n = 5$ the recurrence equation gives

$$42a_7 + a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = 0$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - \frac{1}{12} a_0 x^4 - \frac{1}{20} a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{x^4}{12}\right) a_0 + \left(x - \frac{1}{20} x^5\right) a_1 + O\left(x^6\right) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{x^4}{12}\right) c_1 + \left(x - \frac{1}{20} x^5\right) c_2 + O\left(x^6\right)$$

Summary

The solution(s) found are the following

$$y = \left(1 - \frac{x^4}{12}\right) y(0) + \left(x - \frac{1}{20} x^5\right) y'(0) + O\left(x^6\right) \tag{1}$$

$$y = \left(1 - \frac{x^4}{12}\right) c_1 + \left(x - \frac{1}{20} x^5\right) c_2 + O\left(x^6\right) \tag{2}$$

Verification of solutions

$$y = \left(1 - \frac{x^4}{12}\right) y(0) + \left(x - \frac{1}{20} x^5\right) y'(0) + O\left(x^6\right)$$

Verified OK.

$$y = \left(1 - \frac{x^4}{12}\right) c_1 + \left(x - \frac{1}{20} x^5\right) c_2 + O\left(x^6\right)$$

Verified OK.

12.33.1 Maple step by step solution

Let's solve

$y'' = -x^2 y$

- Highest derivative means the order of the ODE is 2

  y''

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y'' + x^2 y = 0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^k$$

☐ Rewrite ODE with series expansions

- ○ Convert $x^2 \cdot y$ to series expansion

$$x^2 \cdot y = \sum_{k=0}^{\infty} a_k x^{k+2}$$

- ○ Shift index using $k- > k-2$

$$x^2 \cdot y = \sum_{k=2}^{\infty} a_{k-2} x^k$$

- ○ Convert y'' to series expansion

$$y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$$

- ○ Shift index using $k- > k+2$

$$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$$

Rewrite ODE with series expansions

$$6a_3 x + 2a_2 + \left(\sum_{k=2}^{\infty} \left(a_{k+2}(k+2)\,(k+1) + a_{k-2}\right) x^k\right) = 0$$

- The coefficients of each power of x must be 0

$$[2a_2 = 0, 6a_3 = 0]$$

- Solve for the dependent coefficient(s)

$$\{a_2 = 0, a_3 = 0\}$$

- Each term in the series must be 0, giving the recursion relation

$$(k^2 + 3k + 2)\, a_{k+2} + a_{k-2} = 0$$

- Shift index using $k- > k+2$

$$\left((k+2)^2 + 3k + 8\right) a_{k+4} + a_k = 0$$

- Recursion relation that defines the series solution to the ODE

$$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+4} = -\frac{a_k}{k^2+7k+12}, a_2 = 0, a_3 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 41.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' + y'x^6 + 7yx^5 = 0}$$

With the expansion point for the power series method at $x = 0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{917}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{918}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}\,F_n|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -y' x^6 - 7 y x^5 \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= x^4 \left(\left(x^8 - 13x \right) y' + 7y \left(x^7 - 5 \right) \right) \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= -\left(\left(x^{15} - 32x^8 + 100x \right) y' + 7y \left(x^{14} - 24x^7 + 20 \right) \right) x^3 \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \left(\left(x^{22} - 57x^{15} + 620x^8 - 540x \right) y' + 7y \left(x^{21} - 49x^{14} + 340x^7 - 60 \right) \right) x^2 \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= -x \left(\left(x^{29} - 88x^{22} + 1932x^{15} - 9120x^8 + 2040x \right) y' + 7y \left(x^{28} - 80x^{21} + 1404x^{14} - 3600x^7 + 120 \right) \right)
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= 0 \\
F_1 &= 0 \\
F_2 &= 0 \\
F_3 &= 0 \\
F_4 &= 0
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = y(0) + y'(0)\, x + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$
y = \sum_{n=0}^{\infty} a_n x^n
$$

Then

$$
\begin{aligned}
y' &= \sum_{n=1}^{\infty} n a_n x^{n-1} \\
y'' &= \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}
\end{aligned}
$$

Substituting the above back into the ode gives

$$
\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = -\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x^6 - 7\left(\sum_{n=0}^{\infty} a_n x^n\right) x^5 \tag{1}
$$

Which simplifies to

$$
\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} n\, x^{5+n} a_n\right) + \left(\sum_{n=0}^{\infty} 7 x^{5+n} a_n\right) = 0 \tag{2}
$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} &= \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n \\
\sum_{n=1}^{\infty} n\, x^{5+n} a_n &= \sum_{n=6}^{\infty} (n-5)\, a_{n-5} x^n \\
\sum_{n=0}^{\infty} 7 x^{5+n} a_n &= \sum_{n=5}^{\infty} 7 a_{n-5} x^n
\end{aligned}
$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$
\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=6}^{\infty} (n-5)\, a_{n-5} x^n\right) + \left(\sum_{n=5}^{\infty} 7 a_{n-5} x^n\right) = 0 \tag{3}
$$

$n = 5$ gives

$$
42 a_7 + 7 a_0 = 0
$$

Which after substituting earlier equations, simplifies to

$$a_7 = -\frac{a_0}{6}$$

For $6 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) + (n-5)\, a_{n-5} + 7a_{n-5} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{a_{n-5}}{n+1} \tag{5}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_1x + a_0 + \dots$$

Collecting terms, the solution becomes

$$y = a_1x + a_0 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = c_2x + c_1 + O(x^6)$$

Summary

The solution(s) found are the following

$$y = y(0) + y'(0)\, x + O(x^6) \tag{1}$$
$$y = c_2x + c_1 + O(x^6) \tag{2}$$

Verification of solutions

$$y = y(0) + y'(0)\, x + O(x^6)$$

Verified OK.

$$y = c_2x + c_1 + O(x^6)$$

Verified OK.

12.34.1 Maple step by step solution

Let's solve

$y'' = -y' x^6 - 7y x^5$

- Highest derivative means the order of the ODE is 2

  y''

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + y' x^6 + 7y x^5 = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite ODE with series expansions

  ◦ Convert $x^5 \cdot y$ to series expansion

  $x^5 \cdot y = \sum_{k=0}^{\infty} a_k x^{k+5}$

  ◦ Shift index using $k- > k-5$

  $x^5 \cdot y = \sum_{k=5}^{\infty} a_{k-5} x^k$

  ◦ Convert $x^6 \cdot y'$ to series expansion

  $x^6 \cdot y' = \sum_{k=0}^{\infty} a_k k\, x^{k+5}$

  ◦ Shift index using $k- > k-5$

  $x^6 \cdot y' = \sum_{k=5}^{\infty} a_{k-5}(k-5)\, x^k$

  ◦ Convert y'' to series expansion

  $y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$

  ◦ Shift index using $k- > k+2$

  $y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$

  Rewrite ODE with series expansions

  $30a_6x^4 + 20a_5x^3 + 12a_4x^2 + 6a_3x + 2a_2 + \left(\sum_{k=5}^{\infty} \left(a_{k+2}(k+2)\,(k+1) + a_{k-5}(k+2)\right) x^k\right) = 0$

- The coefficients of each power of x must be 0

  $$\left[2a_2 = 0, 6a_3 = 0, 12a_4 = 0, 20a_5 = 0, 30a_6 = 0\right]$$

- Solve for the dependent coefficient(s)

  $$\{a_2 = 0, a_3 = 0, a_4 = 0, a_5 = 0, a_6 = 0\}$$

- Each term in the series must be 0, giving the recursion relation

  $$(k+2)\left(k a_{k+2} + a_{k-5} + a_{k+2}\right) = 0$$

- Shift index using $k- > k+5$

  $$(k+7)\left((k+5)\, a_{k+7} + a_k + a_{k+7}\right) = 0$$

- Recursion relation that defines the series solution to the ODE

  $$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+7} = -\frac{a_k}{k+6}, a_2 = 0, a_3 = 0, a_4 = 0, a_5 = 0, a_6 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 42.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(x^8+1)\, y''-16y' x^7+72y x^6=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y_0'$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0)+(x-x_0)\, y'(x_0)+\frac{(x-x_0)^2}{2} y''(x_0)+\frac{(x-x_0)^3}{3!} y'''(x_0)+\cdots \\
&= y_0+x y_0'+\frac{x^2}{2} f|_{x_0,y_0,y_0'}+\frac{x^3}{3!} f'|_{x_0,y_0,y_0'}+\cdots \\
&= y_0+x y_0'+\sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}\frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y_0'}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' && (920)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (921)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f && (3)\\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$\begin{aligned} F_0 &= f(x, y, y') \qquad (4) \\ F_1 &= \frac{df}{dx} \\ &= \frac{dF_0}{dx} \\ &= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' \\ &= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5) \\ &= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\ F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right) \\ &= \frac{d}{dx}(F_1) \\ &= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y'' \\ &= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0 \\ &\vdots \\ F_n &= \frac{d}{dx}(F_{n-1}) \\ &= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y'' \\ &= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6) \end{aligned}$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \qquad (7)$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= \frac{8x^6(2y'x - 9y)}{x^8 + 1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{(168x^{14} + 40x^6)\, y' - 1008\left(x^8 + \frac{3}{7}\right) x^5 y}{(x^8 + 1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{48x^4(28y'x^9 - 189yx^8 - 4y'x - 45y)}{(x^8 + 1)^2} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{240x^3(35y'x^9 - 252yx^8 - 13y'x - 36y)}{(x^8 + 1)^2} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{960x^2(42y'x^9 - 315yx^8 - 22y'x - 27y)}{(x^8 + 1)^2}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= 0 \\
F_1 &= 0 \\
F_2 &= 0 \\
F_3 &= 0 \\
F_4 &= 0
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = y(0) + y'(0)\, x + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(x^8 + 1)\, y'' - 16y'x^7 + 72yx^6 = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(x^8 + 1) \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) - 16\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x^7 + 72\left(\sum_{n=0}^{\infty} a_n x^n\right) x^6 = 0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n\, x^{n+6} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \sum_{n=1}^{\infty} \left(-16n\, x^{n+6} a_n\right) + \left(\sum_{n=0}^{\infty} 72x^{n+6} a_n\right) = 0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n\, x^{n+6} a_n (n-1) = \sum_{n=8}^{\infty} (n-6)\, a_{n-6}(n-7)\, x^n$$

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n$$

$$\sum_{n=1}^{\infty} \left(-16n\, x^{n+6} a_n\right) = \sum_{n=7}^{\infty} \left(-16(n-6)\, a_{n-6} x^n\right)$$

$$\sum_{n=0}^{\infty} 72x^{n+6} a_n = \sum_{n=6}^{\infty} 72a_{n-6} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=8}^{\infty} (n-6)\, a_{n-6}(n-7)\, x^{n}\right)+\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^{n}\right) \\ +\sum_{n=7}^{\infty} \left(-16(n-6)\, a_{n-6} x^{n}\right)+\left(\sum_{n=6}^{\infty} 72 a_{n-6} x^{n}\right) = 0 \tag{3}$$

For $8 \leq n$, the recurrence equation is

$$(n-6)\, a_{n-6}(n-7)+(n+2)\, a_{n+2}(n+1)-16(n-6)\, a_{n-6}+72 a_{n-6} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{a_{n-6}\left(n^{2}-29n+210\right)}{(n+2)\,(n+1)} \tag{5}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_{n} x^{n} \\ &= a_{3} x^{3}+a_{2} x^{2}+a_{1} x+a_{0}+\dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_{1} x+a_{0}+\dots$$

Collecting terms, the solution becomes

$$y = a_{1} x+a_{0}+O\left(x^{6}\right) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = c_{2} x+c_{1}+O\left(x^{6}\right)$$

Summary

The solution(s) found are the following

$$y = y(0)+y'(0)\, x+O\left(x^{6}\right) \tag{1}$$
$$y = c_{2} x+c_{1}+O\left(x^{6}\right) \tag{2}$$

Verification of solutions

$$y = y(0) + y'(0)\,x + O(x^6)$$

Verified OK.

$$y = c_2x + c_1 + O(x^6)$$

Verified OK.

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 43.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second_order_change_of_variable_on_y_method_1", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{\left(-x^{6}+1\right) y''-12y' x^{5}-30y x^{4}=0}$$

With the expansion point for the power series method at $x = 0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using

Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0, y_0, y_0'} + \frac{x^3}{3!} f'|_{x_0, y_0, y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y_0'}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (923) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (924) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \qquad (7)$$

To find $y(x)$ series solution around $x = 0$. Hence

$$F_0 = -\frac{6x^4(2y'x+5y)}{x^6-1}$$

$$\begin{aligned}
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \\
&= \frac{6x^3(21y'x^7+70yx^6+15y'x+20y)}{(x^6-1)^2}
\end{aligned}$$

$$\begin{aligned}
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y}y' + \frac{\partial F_1}{\partial y'}F_1 \\
&= -\frac{1344\left(\left(x^{13}+\frac{5}{2}x^7+\frac{5}{14}x\right)y' + \frac{15\left(x^{12}+\frac{3}{2}x^6+\frac{1}{14}\right)y}{4}\right)x^2}{(x^6-1)^3}
\end{aligned}$$

$$\begin{aligned}
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y}y' + \frac{\partial F_2}{\partial y'}F_2 \\
&= \frac{15120x\left(\left(x^{19}+\frac{35}{6}x^{13}+\frac{10}{3}x^7+\frac{5}{42}x\right)y' + 4\left(x^{18}+\frac{49}{12}x^{12}+\frac{4}{3}x^6+\frac{1}{84}\right)y\right)}{(x^6-1)^4}
\end{aligned}$$

$$\begin{aligned}
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y}y' + \frac{\partial F_3}{\partial y'}F_3 \\
&= \frac{-181440\left(x^{24}+\frac{34}{3}x^{18}+\frac{31}{2}x^{12}+3x^6+\frac{1}{42}\right)xy' - 756000y\left(x^{24}+\frac{646}{75}x^{18}+\frac{403}{50}x^{12}+\frac{21}{25}x^6+\frac{1}{1050}\right)}{(x^6-1)^5}
\end{aligned}$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$\begin{aligned}
F_0 &= 0 \\
F_1 &= 0 \\
F_2 &= 0 \\
F_3 &= 0 \\
F_4 &= 720y(0)
\end{aligned}$$

Substituting all the above in (7) and simplifying gives the solution as

$$y = \left(x^6+1\right)y(0) + y'(0)\,x + O\left(x^6\right)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(-x^6+1\right) y'' - 12y' x^5 - 30y x^4 = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\left(-x^6+1\right)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) - 12\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x^5 - 30\left(\sum_{n=0}^{\infty} a_n x^n\right) x^4 = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=2}^{\infty} \left(-n\, x^{n+4} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \sum_{n=1}^{\infty} \left(-12n\, x^{n+4} a_n\right) + \sum_{n=0}^{\infty} \left(-30 x^{n+4} a_n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} \left(-n\, x^{n+4} a_n (n-1)\right) = \sum_{n=6}^{\infty} \left(-(n-4)\, a_{n-4}(n-5)\, x^n\right)$$

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n$$

$$\sum_{n=1}^{\infty}\left(-12n\,x^{n+4}a_n\right) = \sum_{n=5}^{\infty}\left(-12(n-4)\,a_{n-4}x^n\right)$$

$$\sum_{n=0}^{\infty}\left(-30x^{n+4}a_n\right) = \sum_{n=4}^{\infty}\left(-30a_{n-4}x^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\sum_{n=6}^{\infty}\left(-(n-4)\,a_{n-4}(n-5)\,x^n\right) + \left(\sum_{n=0}^{\infty}(n+2)\,a_{n+2}(n+1)\,x^n\right) + \sum_{n=5}^{\infty}\left(-12(n-4)\,a_{n-4}x^n\right) + \sum_{n=4}^{\infty}\left(-30a_{n-4}x^n\right) = 0 \tag{3}$$

$n = 4$ gives

$$30a_6 - 30a_0 = 0$$

Which after substituting earlier equations, simplifies to

$$a_6 = a_0$$

$n = 5$ gives

$$42a_7 - 42a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_7 = a_1$$

For $6 \leq n$, the recurrence equation is

$$-(n-4)\,a_{n-4}(n-5) + (n+2)\,a_{n+2}(n+1) - 12(n-4)\,a_{n-4} - 30a_{n-4} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = a_{n-4} \tag{5}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_1 x + a_0 + \dots$$

Collecting terms, the solution becomes

$$y = a_1 x + a_0 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = c_2 x + c_1 + O(x^6)$$

Summary

The solution(s) found are the following

$$y = (x^6 + 1)\, y(0) + y'(0)\, x + O(x^6) \tag{1}$$

$$y = c_2 x + c_1 + O(x^6) \tag{2}$$

Verification of solutions

$$y = (x^6 + 1)\, y(0) + y'(0)\, x + O(x^6)$$

Verified OK.

$$y = c_2 x + c_1 + O(x^6)$$

Verified OK.

12.36.1 Maple step by step solution

Let's solve

$(-x^6 + 1)\, y'' - 12y'x^5 - 30yx^4 = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{12x^5 y'}{x^6-1} - \frac{30x^4 y}{x^6-1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{12x^5 y'}{x^6-1} + \frac{30x^4 y}{x^6-1} = 0$

□ Check to see if x_0 is a regular singular point

- Define functions

  $\left[P_2(x)=\frac{12x^5}{x^6-1}, P_3(x)=\frac{30x^4}{x^6-1}\right]$

- $\left(x+\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}\right)\cdot P_2(x)$ is analytic at $x=-\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}$

  $\left(\left(x+\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}\right)\cdot P_2(x)\right)\bigg|_{x=-\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}}=0$

- $\left(x+\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}\right)^2\cdot P_3(x)$ is analytic at $x=-\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}$

  $\left(\left(x+\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}\right)^2\cdot P_3(x)\right)\bigg|_{x=-\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}}=0$

- $x=-\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}$ is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}$

- Multiply by denominators

  $y''(x^6-1)+12y'x^5+30yx^4=0$

- Change variables using $x=u-\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}$ so that the regular singular point is at $u=0$

  $\left(u^6-3u^5\sqrt{-2\,\mathrm{I}\sqrt{3}-2}-\frac{15\,\mathrm{I}u^4\sqrt{3}}{2}-\frac{15u^4}{2}+\frac{15\,\mathrm{I}u^2\sqrt{3}}{2}+5u^3\sqrt{-2\,\mathrm{I}\sqrt{3}-2}-\frac{15u^2}{2}-\frac{3\,\mathrm{I}\sqrt{-2\,\mathrm{I}\sqrt{3}-2}\,u\sqrt{3}}{2}\right.$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $u^m\cdot y(u)$ to series expansion for $m=0..4$

  $u^m\cdot y(u)=\sum_{k=0}^{\infty} a_k u^{k+r+m}$

- Shift index using $k->k-m$

  $u^m\cdot y(u)=\sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

- Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..5$

  $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$

- Shift index using $k->k+1-m$

$$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..6$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

Rewrite ODE with series expansions

$$-3\left(1+\mathrm{I}\sqrt{3}\right) r(1+r)\, a_0 u^{-1+r} + \left(-3\left(1+\mathrm{I}\sqrt{3}\right)(1+r)\,(2+r)\, a_1 + \frac{15\left(\mathrm{I}\sqrt{3}-1\right)(1+r)(2+r)a_0}{2}\right) u^r + \left(\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-3\left(1+\mathrm{I}\sqrt{3}\right) r(1+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{-1, 0\}$$

- The coefficients of each power of u must be 0

$$\left[-3\left(1+\mathrm{I}\sqrt{3}\right)(1+r)\,(2+r)\, a_1 + \frac{15\left(\mathrm{I}\sqrt{3}-1\right)(1+r)(2+r)a_0}{2} = 0, -3\left(1+\mathrm{I}\sqrt{3}\right)(2+r)\,(3+r)\, a_2 + \frac{15(}{}\right.$$

- Solve for the dependent coefficient(s)

$$\left\{a_1 = \frac{5a_0\left(\mathrm{I}\sqrt{3}-1\right)}{2\left(1+\mathrm{I}\sqrt{3}\right)}, a_2 = \frac{5a_0\left(-14-14\,\mathrm{I}\sqrt{3}\right)}{12\left(2\,\mathrm{I}\sqrt{3}-2\right)}, a_3 = -\frac{35a_0}{24}, a_4 = \frac{\left(952-952\,\mathrm{I}\sqrt{3}\right)a_0}{144\left(-8-8\,\mathrm{I}\sqrt{3}\right)}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$\frac{15\left(\mathrm{I}\left(a_k+\frac{2a_{k-3}}{5}-a_{k-2}-\frac{2a_{k+1}}{5}\right)\sqrt{3}-a_k+\frac{2a_{k-4}}{15}-\frac{2a_{k-3}}{5}-a_{k-2}+\frac{8a_{k-1}}{3}-\frac{2a_{k+1}}{5}\right)(k+2+r)(k+1+r)}{2} = 0$$

- Shift index using $k->k+4$

$$\frac{15\left(\mathrm{I}\left(a_{k+4}+\frac{2a_{k+1}}{5}-a_{k+2}-\frac{2a_{k+5}}{5}\right)\sqrt{3}-a_{k+4}+\frac{2a_k}{15}-\frac{2a_{k+1}}{5}-a_{k+2}+\frac{8a_{k+3}}{3}-\frac{2a_{k+5}}{5}\right)(k+r+6)(k+r+5)}{2} = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+5} = \frac{6\,\mathrm{I}\sqrt{3}\,a_{k+1}-15\,\mathrm{I}\sqrt{3}\,a_{k+2}+15\,\mathrm{I}\sqrt{3}\,a_{k+4}+2a_k-6a_{k+1}-15a_{k+2}+40a_{k+3}-15a_{k+4}}{6\left(1+\mathrm{I}\sqrt{3}\right)}$$

- Recursion relation for $r = -1$

$$a_{k+5} = \frac{6\,\mathrm{I}\sqrt{3}\,a_{k+1}-15\,\mathrm{I}\sqrt{3}\,a_{k+2}+15\,\mathrm{I}\sqrt{3}\,a_{k+4}+2a_k-6a_{k+1}-15a_{k+2}+40a_{k+3}-15a_{k+4}}{6\left(1+\mathrm{I}\sqrt{3}\right)}$$

- Solution for $r=-1$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^{k-1}, a_{k+5}=\frac{6\,\mathrm{I}\sqrt{3}\,a_{k+1}-15\,\mathrm{I}\sqrt{3}\,a_{k+2}+15\,\mathrm{I}\sqrt{3}\,a_{k+4}+2a_k-6a_{k+1}-15a_{k+2}+40a_{k+3}-15a_{k+4}}{6\left(1+\mathrm{I}\sqrt{3}\right)}, a_1=\frac{5a_0\left(\right.}{2\left(1\right.}\right.$$

- Revert the change of variables $u=x+\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}$

$$\left[y=\sum_{k=0}^{\infty} a_k\left(x+\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}\right)^{k-1}, a_{k+5}=\frac{6\,\mathrm{I}\sqrt{3}\,a_{k+1}-15\,\mathrm{I}\sqrt{3}\,a_{k+2}+15\,\mathrm{I}\sqrt{3}\,a_{k+4}+2a_k-6a_{k+1}-15a_{k+2}+40a_{k+3}-15a_{k}}{6\left(1+\mathrm{I}\sqrt{3}\right)}\right.$$

- Recursion relation for $r=0$

$$a_{k+5}=\frac{6\,\mathrm{I}\sqrt{3}\,a_{k+1}-15\,\mathrm{I}\sqrt{3}\,a_{k+2}+15\,\mathrm{I}\sqrt{3}\,a_{k+4}+2a_k-6a_{k+1}-15a_{k+2}+40a_{k+3}-15a_{k+4}}{6\left(1+\mathrm{I}\sqrt{3}\right)}$$

- Solution for $r=0$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^{k}, a_{k+5}=\frac{6\,\mathrm{I}\sqrt{3}\,a_{k+1}-15\,\mathrm{I}\sqrt{3}\,a_{k+2}+15\,\mathrm{I}\sqrt{3}\,a_{k+4}+2a_k-6a_{k+1}-15a_{k+2}+40a_{k+3}-15a_{k+4}}{6\left(1+\mathrm{I}\sqrt{3}\right)}, a_1=\frac{5a_0\left(\mathrm{I}\sqrt{\right.}}{2\left(1+\mathrm{I}\right.}\right.$$

- Revert the change of variables $u=x+\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}$

$$\left[y=\sum_{k=0}^{\infty} a_k\left(x+\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}\right)^{k}, a_{k+5}=\frac{6\,\mathrm{I}\sqrt{3}\,a_{k+1}-15\,\mathrm{I}\sqrt{3}\,a_{k+2}+15\,\mathrm{I}\sqrt{3}\,a_{k+4}+2a_k-6a_{k+1}-15a_{k+2}+40a_{k+3}-15a_{k+4}}{6\left(1+\mathrm{I}\sqrt{3}\right)}\right.$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k\left(x+\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}\right)^{k-1}\right)+\left(\sum_{k=0}^{\infty} b_k\left(x+\frac{\sqrt{-2\,\mathrm{I}\sqrt{3}-2}}{2}\right)^{k}\right), a_{5+k}=\frac{6\,\mathrm{I}\sqrt{3}\,a_{1+k}-15\,\mathrm{I}\sqrt{3}\,a_{k+2}+15\,\mathrm{I}}{}\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.2 SERIES SOLUTIONS NEAR AN ORDINARY POINT I. Exercises 7.2. Page 329
Problem number: 44.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' + y'x^5 + 6yx^4 = 0}$$

With the expansion point for the power series method at $x = 0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned} y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\ &= y_0 + xy'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\ &= y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left.\frac{d^n f}{dx^n}\right|_{x_0,y_0,y'_0} \end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' && (926)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (927)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f && (3)\\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -y' x^5 - 6y x^4 \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \left(\left(x^7 - 11x\right) y' + 6y\left(x^6 - 4\right)\right) x^3 \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= -\left(\left(x^{13} - 27x^7 + 68x\right) y' + 6y\left(x^{12} - 20x^6 + 12\right)\right) x^2 \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \left(\left(x^{19} - 48x^{13} + 431x^7 - 276x\right) y' + 6y\left(x^{18} - 41x^{12} + 228x^6 - 24\right)\right) x \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \left(-x^{25} + 74x^{19} - 1349x^{13} + 5092x^7 - 696x\right) y' - 6y\left(x^{24} - 67x^{18} + 964x^{12} - 1872x^6 + 24\right)
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= 0 \\
F_1 &= 0 \\
F_2 &= 0 \\
F_3 &= 0 \\
F_4 &= -144y(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = \left(1 - \frac{x^6}{5}\right) y(0) + y'(0)\, x + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard

power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = -\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x^5 - 6\left(\sum_{n=0}^{\infty} a_n x^n\right) x^4 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} n\, x^{4+n} a_n\right) + \left(\sum_{n=0}^{\infty} 6x^{4+n} a_n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n$$

$$\sum_{n=1}^{\infty} n\, x^{4+n} a_n = \sum_{n=5}^{\infty} (n-4) a_{n-4} x^n$$

$$\sum_{n=0}^{\infty} 6x^{4+n} a_n = \sum_{n=4}^{\infty} 6a_{n-4} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n\right) + \left(\sum_{n=5}^{\infty} (n-4) a_{n-4} x^n\right) + \left(\sum_{n=4}^{\infty} 6a_{n-4} x^n\right) = 0 \tag{3}$$

$n = 4$ gives

$$30a_6 + 6a_0 = 0$$

Which after substituting earlier equations, simplifies to

$$a_6 = -\frac{a_0}{5}$$

For $5 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) + (n-4)\, a_{n-4} + 6a_{n-4} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{a_{n-4}}{n+1} \tag{5}$$

For $n = 5$ the recurrence equation gives

$$42a_7 + 7a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{a_1}{6}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_1 x + a_0 + \dots$$

Collecting terms, the solution becomes

$$y = a_1 x + a_0 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = c_2 x + c_1 + O(x^6)$$

Summary

The solution(s) found are the following

$$y = \left(1-\frac{x^6}{5}\right) y(0)+y'(0)\, x+O\left(x^6\right) \tag{1}$$

$$y = c_2 x+c_1+O\left(x^6\right) \tag{2}$$

Verification of solutions

$$y = \left(1-\frac{x^6}{5}\right) y(0)+y'(0)\, x+O\left(x^6\right)$$

Verified OK.

$$y = c_2 x+c_1+O\left(x^6\right)$$

Verified OK.

12.37.1 Maple step by step solution

Let's solve

$y'' = -y' x^5-6 y x^4$

- Highest derivative means the order of the ODE is 2

  y''

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+y' x^5+6 y x^4 = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite ODE with series expansions

  ◦ Convert $x^4 \cdot y$ to series expansion

    $x^4 \cdot y = \sum_{k=0}^{\infty} a_k x^{k+4}$

  ◦ Shift index using $k- >k-4$

    $x^4 \cdot y = \sum_{k=4}^{\infty} a_{k-4} x^k$

  ◦ Convert $x^5 \cdot y'$ to series expansion

    $x^5 \cdot y' = \sum_{k=0}^{\infty} a_k k\, x^{k+4}$

- Shift index using $k->k-4$

  $$x^5 \cdot y' = \sum_{k=4}^{\infty} a_{k-4}(k-4)\, x^k$$

- Convert y'' to series expansion

  $$y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$$

- Shift index using $k->k+2$

  $$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$$

  Rewrite ODE with series expansions

  $$20a_5x^3 + 12a_4x^2 + 6a_3x + 2a_2 + \left(\sum_{k=4}^{\infty} (a_{k+2}(k+2)\,(k+1) + a_{k-4}(k+2))\, x^k\right) = 0$$

- The coefficients of each power of x must be 0

  $$[2a_2 = 0, 6a_3 = 0, 12a_4 = 0, 20a_5 = 0]$$

- Solve for the dependent coefficient(s)

  $$\{a_2 = 0, a_3 = 0, a_4 = 0, a_5 = 0\}$$

- Each term in the series must be 0, giving the recursion relation

  $$(k+2)\,(ka_{k+2} + a_{k-4} + a_{k+2}) = 0$$

- Shift index using $k->k+4$

  $$(k+6)\,((k+4)\, a_{k+6} + a_k + a_{k+6}) = 0$$

- Recursion relation that defines the series solution to the ODE

  $$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+6} = -\frac{a_k}{k+5}, a_2 = 0, a_3 = 0, a_4 = 0, a_5 = 0\right]$$

Problem number: 1.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(3x+1)\,y''+y'x+2y=0}$$

With initial conditions

$$[y(0)=2,y'(0)=-3]$$

With the expansion point for the power series method at $x=0$.

13.1.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=\frac{x}{3x+1}\\q(x)&=\frac{2}{3x+1}\\F&=0\end{aligned}$$

Hence the ode is

$$y'' + \frac{xy'}{3x+1} + \frac{2y}{3x+1} = 0$$

The domain of $p(x) = \frac{x}{3x+1}$ is

$$\left\{x < -\frac{1}{3} \vee -\frac{1}{3} < x\right\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{2}{3x+1}$ is

$$\left\{x < -\frac{1}{3} \vee -\frac{1}{3} < x\right\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y_0'$. Using Taylor series gives

$$\begin{aligned} y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\ &= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0, y_0, y_0'} + \frac{x^3}{3!} f'|_{x_0, y_0, y_0'} + \cdots \\ &= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y_0'} \end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' && (929)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (930)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f && (3)\\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n \big|_{x_0, y_0, y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2y + y'x}{3x+1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{(x^2 - 6x - 3)\, y' + 2y(x+3)}{(3x+1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(-x^3 + 12x^2 + 43x + 18)\, y' - 2y(x^2 - 3x + 14)}{(3x+1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(x^4 - 18x^3 - 66x^2 - 330x - 147)\, y' + 2y(x^3 - 9x^2 - 63x + 111)}{(3x+1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-x^5 + 24x^4 + 72x^3 + 276x^2 + 3525x + 1656)\, y' - 2y(x^4 - 15x^3 - 123x^2 - 879x + 1248)}{(3x+1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 2$ and $y'(0) = -3$ gives

$$
\begin{aligned}
F_0 &= -4 \\
F_1 &= 21 \\
F_2 &= -110 \\
F_3 &= 885 \\
F_4 &= -9960
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = -2x^2 - 3x + 2 + \frac{7x^3}{2} - \frac{55x^4}{12} + \frac{59x^5}{8} - \frac{83x^6}{6} + O(x^6)
$$

$$y = -2x^2 - 3x + 2 + \frac{7x^3}{2} - \frac{55x^4}{12} + \frac{59x^5}{8} - \frac{83x^6}{6} + O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(3x+1)\, y'' + y'x + 2y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(3x+1)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x + 2\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 3n\, x^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} n a_n x^n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 3n\, x^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} 3(n+1)\, a_{n+1} n\, x^n$$
$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2} (n+1)\, x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$
\left(\sum_{n=1}^{\infty} 3(n+1)\, a_{n+1} n\, x^{n}\right)+\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^{n}\right) \\
+\left(\sum_{n=1}^{\infty} n a_{n} x^{n}\right)+\left(\sum_{n=0}^{\infty} 2 a_{n} x^{n}\right)=0 \tag{3}
$$

$n=0$ gives

$$
2a_{2}+2a_{0}=0
$$

$$
a_{2}=-a_{0}
$$

For $1 \leq n$, the recurrence equation is

$$
3(n+1)\, a_{n+1} n+(n+2)\, a_{n+2}(n+1)+n a_{n}+2 a_{n}=0 \tag{4}
$$

Solving for a_{n+2}, gives

$$
\begin{aligned}
a_{n+2} &= -\frac{3n^{2} a_{n+1}+n a_{n}+3n a_{n+1}+2 a_{n}}{(n+2)\,(n+1)} \\
&= -\frac{a_{n}}{n+1}-\frac{\left(3n^{2}+3n\right) a_{n+1}}{(n+2)\,(n+1)}
\end{aligned} \tag{5}
$$

For $n=1$ the recurrence equation gives

$$
6a_{2}+6a_{3}+3a_{1}=0
$$

Which after substituting the earlier terms found becomes

$$
a_{3}=a_{0}-\frac{a_{1}}{2}
$$

For $n=2$ the recurrence equation gives

$$
18a_{3}+12a_{4}+4a_{2}=0
$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{7a_0}{6} + \frac{3a_1}{4}$$

For $n = 3$ the recurrence equation gives

$$36a_4 + 20a_5 + 5a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{37a_0}{20} - \frac{49a_1}{40}$$

For $n = 4$ the recurrence equation gives

$$60a_5 + 30a_6 + 6a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{52a_0}{15} + \frac{23a_1}{10}$$

For $n = 5$ the recurrence equation gives

$$90a_6 + 42a_7 + 7a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{5981a_0}{840} - \frac{7937a_1}{1680}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1x - a_0x^2 + \left(a_0 - \frac{a_1}{2}\right)x^3 + \left(-\frac{7a_0}{6} + \frac{3a_1}{4}\right)x^4 + \left(\frac{37a_0}{20} - \frac{49a_1}{40}\right)x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - x^2 + x^3 - \frac{7}{6}x^4 + \frac{37}{20}x^5\right) a_0 + \left(x - \frac{1}{2}x^3 + \frac{3}{4}x^4 - \frac{49}{40}x^5\right) a_1 + O(x^6) \quad (3)$$

At $x = 0$ the solution above becomes

$$y = \left(1 - x^2 + x^3 - \frac{7}{6}x^4 + \frac{37}{20}x^5\right) c_1 + \left(x - \frac{1}{2}x^3 + \frac{3}{4}x^4 - \frac{49}{40}x^5\right) c_2 + O(x^6)$$

$$y = 2 - 2x^2 + \frac{7x^3}{2} - \frac{55x^4}{12} + \frac{59x^5}{8} - 3x + O(x^6)$$

Summary

The solution(s) found are the following

$$y = -2x^2 - 3x + 2 + \frac{7x^3}{2} - \frac{55x^4}{12} + \frac{59x^5}{8} - \frac{83x^6}{6} + O(x^6) \quad (1)$$

$$y = 2 - 2x^2 + \frac{7x^3}{2} - \frac{55x^4}{12} + \frac{59x^5}{8} - 3x + O(x^6) \quad (2)$$

Verification of solutions

$$y = -2x^2 - 3x + 2 + \frac{7x^3}{2} - \frac{55x^4}{12} + \frac{59x^5}{8} - \frac{83x^6}{6} + O(x^6)$$

Verified OK.

$$y = 2 - 2x^2 + \frac{7x^3}{2} - \frac{55x^4}{12} + \frac{59x^5}{8} - 3x + O(x^6)$$

Verified OK.

13.1.2 Maple step by step solution

Let's solve

$$\left[(3x+1)\, y'' + y'x + 2y = 0, y(0) = 2, y'\Big|_{\{x=0\}} = -3\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

$y'' = -\frac{2y}{3x+1} - \frac{xy'}{3x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y'' + \frac{xy'}{3x+1} + \frac{2y}{3x+1} = 0$

□ Check to see if $x_0 = -\frac{1}{3}$ is a regular singular point

◦ Define functions

$\left[P_2(x) = \frac{x}{3x+1}, P_3(x) = \frac{2}{3x+1}\right]$

◦ $\left(x+\frac{1}{3}\right) \cdot P_2(x)$ is analytic at $x = -\frac{1}{3}$

$\left(\left(x+\frac{1}{3}\right) \cdot P_2(x)\right)\Bigg|_{x=-\frac{1}{3}} = -\frac{1}{9}$

◦ $\left(x+\frac{1}{3}\right)^2 \cdot P_3(x)$ is analytic at $x = -\frac{1}{3}$

$\left(\left(x+\frac{1}{3}\right)^2 \cdot P_3(x)\right)\Bigg|_{x=-\frac{1}{3}} = 0$

◦ $x = -\frac{1}{3}$is a regular singular point

Check to see if $x_0 = -\frac{1}{3}$ is a regular singular point

$x_0 = -\frac{1}{3}$

- Multiply by denominators

$(3x+1)\,y'' + y'x + 2y = 0$

- Change variables using $x = u - \frac{1}{3}$ so that the regular singular point is at $u = 0$

$3u\left(\frac{d^2}{du^2}y(u)\right) + \left(u - \frac{1}{3}\right)\left(\frac{d}{du}y(u)\right) + 2y(u) = 0$

- Assume series solution for $y(u)$

$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

◦ Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$

◦ Shift index using $k->k+1-m$

$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,u^{k+r}$

◦ Convert $u \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

$$u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)(k+r-1)\, u^{k+r-1}$$

- Shift index using $k- > k+1$

$$u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)(k+r)\, u^{k+r}$$

Rewrite ODE with series expansions

$$\frac{a_0 r(-10+9r)u^{-1+r}}{3} + \left(\sum_{k=0}^{\infty} \left(\frac{a_{k+1}(k+1+r)(9k-1+9r)}{3} + a_k(k+r+2)\right) u^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$\frac{r(-10+9r)}{3} = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{0, \frac{10}{9}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$3\left(k - \frac{1}{9} + r\right)(k+1+r)\, a_{k+1} + a_k(k+r+2) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = -\frac{3a_k(k+r+2)}{(9k-1+9r)(k+1+r)}$$

- Recursion relation for $r = 0$

$$a_{k+1} = -\frac{3a_k(k+2)}{(9k-1)(k+1)}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+1} = -\frac{3a_k(k+2)}{(9k-1)(k+1)}\right]$$

- Revert the change of variables $u = x + \frac{1}{3}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(x + \frac{1}{3}\right)^k, a_{k+1} = -\frac{3a_k(k+2)}{(9k-1)(k+1)}\right]$$

- Recursion relation for $r = \frac{10}{9}$

$$a_{k+1} = -\frac{3a_k\left(k+\frac{28}{9}\right)}{(9k+9)\left(k+\frac{19}{9}\right)}$$

- Solution for $r = \frac{10}{9}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+\frac{10}{9}}, a_{k+1} = -\frac{3a_k\left(k+\frac{28}{9}\right)}{(9k+9)\left(k+\frac{19}{9}\right)}\right]$$

- Revert the change of variables $u = x + \frac{1}{3}$

$$\left[y=\sum_{k=0}^{\infty} a_{k} \left(x+\frac{1}{3}\right)^{k+\frac{10}{9}}, a_{k+1}=-\frac{3 a_{k} \left(k+\frac{28}{9}\right)}{\left(9 k+9\right) \left(k+\frac{19}{9}\right)}\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_{k} \left(x+\frac{1}{3}\right)^{k}\right)+\left(\sum_{k=0}^{\infty} b_{k} \left(x+\frac{1}{3}\right)^{k+\frac{10}{9}}\right), a_{1+k}=-\frac{3 a_{k} \left(k+2\right)}{\left(9 k-1\right) \left(1+k\right)}, b_{1+k}=-\frac{3 b_{k} \left(k+\frac{28}{9}\right)}{\left(9 k+9\right) \left(k+\frac{19}{9}\right)}\right]$$

Problem number: 2.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second_order_change_of_variable_on_y_method_1", "linear_second_order_ode_solved_by_an_integrating_factor", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{(2x^2 + x + 1)\, y'' + (2 + 8x)\, y' + 4y = 0}$$

With initial conditions

$$[y(0) = -1, y'(0) = 2]$$

With the expansion point for the power series method at $x = 0$.

13.2.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= \frac{2+8x}{2x^2+x+1} \\ q(x) &= \frac{4}{2x^2+x+1} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{(2+8x)\, y'}{2x^2+x+1} + \frac{4y}{2x^2+x+1} = 0$$

The domain of $p(x) = \frac{2+8x}{2x^2+x+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{4}{2x^2+x+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned} y(x) &= y(x_0) + (x-x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\ &= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\ &= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0} \end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' && (932)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (933)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f && (3)\\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx} \\
&= \frac{dF_0}{dx} \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right) \\
&= \frac{d}{dx}(F_1) \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0 \\
&\vdots \\
F_n &= \frac{d}{dx}(F_{n-1}) \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n |_{x_0, y_0, y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2(4y'x + y' + 2y)}{2x^2 + x + 1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{(72x^2 + 36x - 6)\, y' + (48x + 12)\, y}{(2x^2 + x + 1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(-768x^3 - 576x^2 + 192x + 72)\, y' - 576\left(x^2 + \frac{1}{2}x - \frac{1}{12}\right) y}{(2x^2 + x + 1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(9600x^4 + 9600x^3 - 4800x^2 - 3600x - 120)\, y' + 7680\left(x + \frac{1}{4}\right)\left(x^2 + \frac{1}{2}x - \frac{3}{8}\right) y}{(2x^2 + x + 1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-138240x^5 - 172800x^4 + 115200x^3 + 129600x^2 + 8640x - 3600)\, y' - 115200y\left(x^4 + x^3 - \frac{1}{2}x^2 - \frac{3}{8}\right.}{(2x^2 + x + 1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = -1$ and $y'(0) = 2$ gives

$$
\begin{aligned}
F_0 &= 0 \\
F_1 &= -24 \\
F_2 &= 96 \\
F_3 &= 480 \\
F_4 &= -8640
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = -12x^6 + 4x^5 + 4x^4 - 4x^3 + 2x - 1 + O(x^6)
$$

$$y = -12x^6 + 4x^5 + 4x^4 - 4x^3 + 2x - 1 + O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(2x^2 + x + 1)\, y'' + (2 + 8x)\, y' + 4y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(2x^2 + x + 1)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + (2 + 8x)\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) + 4\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 2x^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} n\, x^{n-1} a_n(n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 2n a_n x^{n-1}\right) + \left(\sum_{n=1}^{\infty} 8n a_n x^n\right) + \left(\sum_{n=0}^{\infty} 4a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n\, x^{n-1} a_n(n-1) = \sum_{n=1}^{\infty} (n+1)\, a_{n+1} n\, x^n$$

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n$$

$$\sum_{n=1}^{\infty} 2n a_n x^{n-1} = \sum_{n=0}^{\infty} 2(n+1)\, a_{n+1} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 2x^n a_n n(n-1)\right)+\left(\sum_{n=1}^{\infty} (n+1) a_{n+1} n\, x^n\right)+\left(\sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1)\, x^n\right) \\ +\left(\sum_{n=0}^{\infty} 2(n+1) a_{n+1} x^n\right)+\left(\sum_{n=1}^{\infty} 8n a_n x^n\right)+\left(\sum_{n=0}^{\infty} 4a_n x^n\right)=0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 2a_1 + 4a_0 = 0$$

$$a_2 = -2a_0 - a_1$$

$n = 1$ gives

$$6a_2 + 6a_3 + 12a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = 2a_0 - a_1$$

For $2 \leq n$, the recurrence equation is

$$2na_n(n-1) + (n+1) a_{n+1}n + (n+2) a_{n+2}(n+1) + 2(n+1) a_{n+1} + 8na_n + 4a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -2a_n - a_{n+1} \\ &= -2a_n - a_{n+1} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$24a_2 + 12a_3 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = 2a_0 + 3a_1$$

For $n = 3$ the recurrence equation gives

$$40a_3 + 20a_4 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -6a_0 - a_1$$

For $n = 4$ the recurrence equation gives

$$60a_4 + 30a_5 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = 2a_0 - 5a_1$$

For $n = 5$ the recurrence equation gives

$$84a_5 + 42a_6 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = 10a_0 + 7a_1$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x + (-2a_0 - a_1) x^2 + (2a_0 - a_1) x^3 + (2a_0 + 3a_1) x^4 + (-6a_0 - a_1) x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(-6x^5 + 2x^4 + 2x^3 - 2x^2 + 1\right) a_0 + \left(-x^5 + 3x^4 - x^3 - x^2 + x\right) a_1 + O\left(x^6\right) \quad (3)$$

At $x = 0$ the solution above becomes

$$y = \left(-6x^5 + 2x^4 + 2x^3 - 2x^2 + 1\right) c_1 + \left(-x^5 + 3x^4 - x^3 - x^2 + x\right) c_2 + O\left(x^6\right)$$

$$y = 4x^5 + 4x^4 - 4x^3 - 1 + 2x + O(x^6)$$

Summary

The solution(s) found are the following

$$y = -12x^6 + 4x^5 + 4x^4 - 4x^3 + 2x - 1 + O(x^6) \tag{1}$$
$$y = 4x^5 + 4x^4 - 4x^3 - 1 + 2x + O(x^6) \tag{2}$$

Verification of solutions

$$y = -12x^6 + 4x^5 + 4x^4 - 4x^3 + 2x - 1 + O(x^6)$$

Verified OK.

$$y = 4x^5 + 4x^4 - 4x^3 - 1 + 2x + O(x^6)$$

Verified OK.

13.2.2 Maple step by step solution

Let's solve

$\left[(2x^2 + x + 1)\, y'' + (2 + 8x)\, y' + 4y = 0, y(0) = -1, y'\Big|_{\{x=0\}} = 2\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{4y}{2x^2+x+1} - \frac{2(4x+1)y'}{2x^2+x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{2(4x+1)y'}{2x^2+x+1} + \frac{4y}{2x^2+x+1} = 0$

□ Check to see if x_0 is a regular singular point

- ◦ Define functions

  $\left[P_2(x) = \frac{2(4x+1)}{2x^2+x+1}, P_3(x) = \frac{4}{2x^2+x+1}\right]$

- ◦ $\left(\frac{I\sqrt{7}}{4} + x + \frac{1}{4}\right) \cdot P_2(x)$ is analytic at $x = -\frac{I\sqrt{7}}{4} - \frac{1}{4}$

  $\left(\left(\frac{I\sqrt{7}}{4} + x + \frac{1}{4}\right) \cdot P_2(x)\right)\Bigg|_{x=-\frac{I\sqrt{7}}{4}-\frac{1}{4}} = 0$

- ◦ $\left(\frac{I\sqrt{7}}{4} + x + \frac{1}{4}\right)^2 \cdot P_3(x)$ is analytic at $x = -\frac{I\sqrt{7}}{4} - \frac{1}{4}$

$$\left(\left(\frac{I\sqrt{7}}{4}+x+\frac{1}{4}\right)^{2}\cdot P_{3}(x)\right)\Bigg|_{x=-\frac{I\sqrt{7}}{4}-\frac{1}{4}}=0$$

- $x=-\frac{I\sqrt{7}}{4}-\frac{1}{4}$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-\frac{I\sqrt{7}}{4}-\frac{1}{4}$

- Multiply by denominators

  $(2x^2+x+1)\,y''+(2+8x)\,y'+4y=0$

- Change variables using $x=u-\frac{I\sqrt{7}}{4}-\frac{1}{4}$ so that the regular singular point is at $u=0$

  $(2u^2-Iu\sqrt{7})\left(\frac{d^2}{du^2}y(u)\right)+(8u-2\,I\sqrt{7})\left(\frac{d}{du}y(u)\right)+4y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..1$

  $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,u^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,u^{k+r}$

- Convert $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m=1..2$

  $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,(k+r-1)\,u^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=-2+m}^{\infty}a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$

  Rewrite ODE with series expansions

  $-I\sqrt{7}\,r(r+1)\,a_0u^{-1+r}+\left(\sum_{k=0}^{\infty}\left(-I\sqrt{7}\,(k+r+1)\,(k+r+2)\,a_{k+1}+2a_k(k+r+2)\,(k+r+1)\right)\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-I\sqrt{7}\,r(r+1)=0$

- Values of r that satisfy the indicial equation

$r \in \{-1, 0\}$

- Each term in the series must be 0, giving the recursion relation

  $-\left(\mathrm{I}\sqrt{7}\, a_{k+1} - 2a_k\right)(k+r+2)(k+r+1) = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+1} = -\frac{2\,\mathrm{I}}{7} a_k \sqrt{7}$
- Recursion relation for $r = -1$

  $a_{k+1} = -\frac{2\,\mathrm{I}}{7} a_k \sqrt{7}$
- Solution for $r = -1$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-1}, a_{k+1} = -\frac{2\,\mathrm{I}}{7} a_k \sqrt{7}\right]$
- Revert the change of variables $u = \frac{\mathrm{I}\sqrt{7}}{4} + x + \frac{1}{4}$

  $\left[y = \sum_{k=0}^{\infty} a_k \left(\frac{\mathrm{I}\sqrt{7}}{4} + x + \frac{1}{4}\right)^{k-1}, a_{k+1} = -\frac{2\,\mathrm{I}}{7} a_k \sqrt{7}\right]$
- Recursion relation for $r = 0$

  $a_{k+1} = -\frac{2\,\mathrm{I}}{7} a_k \sqrt{7}$
- Solution for $r = 0$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k}, a_{k+1} = -\frac{2\,\mathrm{I}}{7} a_k \sqrt{7}\right]$
- Revert the change of variables $u = \frac{\mathrm{I}\sqrt{7}}{4} + x + \frac{1}{4}$

  $\left[y = \sum_{k=0}^{\infty} a_k \left(\frac{\mathrm{I}\sqrt{7}}{4} + x + \frac{1}{4}\right)^{k}, a_{k+1} = -\frac{2\,\mathrm{I}}{7} a_k \sqrt{7}\right]$
- Combine solutions and rename parameters

  $\left[y = \left(\sum_{k=0}^{\infty} a_k \left(\frac{\mathrm{I}\sqrt{7}}{4} + x + \frac{1}{4}\right)^{k-1}\right) + \left(\sum_{k=0}^{\infty} b_k \left(\frac{\mathrm{I}\sqrt{7}}{4} + x + \frac{1}{4}\right)^{k}\right), a_{1+k} = -\frac{2\,\mathrm{I}}{7} a_k \sqrt{7}, b_{1+k} = -\frac{2\,\mathrm{I}}{7} b_k \sqrt{7}\right.$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 3.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{(-2x^2+1)\,y''+(2-6x)\,y'-2y=0}$$

With initial conditions

$$[y(0)=1, y'(0)=0]$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using

Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0,y_0,y_0'} + \frac{x^3}{3!} f'|_{x_0,y_0,y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left.\frac{d^n f}{dx^n}\right|_{x_0,y_0,y_0'}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (935) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (936) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2(3y'x - y' + y)}{2x^2 - 1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{(44x^2 - 32x + 12)\, y' + (20x - 4)\, y}{(2x^2 - 1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(-400x^3 + 464x^2 - 340x + 60)\, y' + (-208x^2 + 96x - 44)\, y}{(2x^2 - 1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(4384x^4 - 7104x^3 + 7688x^2 - 2784x + 504)\, y' + 2464y\left(x^3 - \frac{59}{77}x^2 + \frac{29}{44}x - \frac{27}{308}\right)}{(2x^2 - 1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-56448x^5 + 118656x^4 - 169344x^3 + 93824x^2 - 33656x + 4008)\, y' - 33408y\left(x^4 - \frac{32}{29}x^3 + \frac{79}{58}x^2 - \cdots\right.}{(2x^2 - 1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 1$ and $y'(0) = 0$ gives

$$
\begin{aligned}
F_0 &= 2 \\
F_1 &= -4 \\
F_2 &= 44 \\
F_3 &= -216 \\
F_4 &= 2632
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = x^2 + 1 - \frac{2x^3}{3} + \frac{11x^4}{6} - \frac{9x^5}{5} + \frac{329x^6}{90} + O(x^6)
$$

$$y = x^2 + 1 - \frac{2x^3}{3} + \frac{11x^4}{6} - \frac{9x^5}{5} + \frac{329x^6}{90} + O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(-2x^2 + 1) y'' + (2 - 6x) y' - 2y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(-2x^2 + 1) \left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} \right) + (2 - 6x) \left(\sum_{n=1}^{\infty} n a_n x^{n-1} \right) - 2 \left(\sum_{n=0}^{\infty} a_n x^n \right) = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=2}^{\infty} (-2x^n a_n n(n-1)) + \left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} \right) + \left(\sum_{n=1}^{\infty} 2n a_n x^{n-1} \right) + \sum_{n=1}^{\infty} (-6n a_n x^n) + \sum_{n=0}^{\infty} (-2a_n x^n) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n$$

$$\sum_{n=1}^{\infty} 2n a_n x^{n-1} = \sum_{n=0}^{\infty} 2(n+1) a_{n+1} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\sum_{n=2}^{\infty}\left(-2x^{n} a_{n} n(n-1)\right)+\left(\sum_{n=0}^{\infty}(n+2) a_{n+2}(n+1) x^{n}\right) + \left(\sum_{n=0}^{\infty} 2(n+1) a_{n+1} x^{n}\right)+\sum_{n=1}^{\infty}\left(-6 n a_{n} x^{n}\right)+\sum_{n=0}^{\infty}\left(-2 a_{n} x^{n}\right)=0 \tag{3}$$

$n=0$ gives

$$2a_2+2a_1-2a_0=0$$

$$a_2=a_0-a_1$$

$n=1$ gives

$$6a_3+4a_2-8a_1=0$$

Which after substituting earlier equations, simplifies to

$$a_3=-\frac{2a_0}{3}+2a_1$$

For $2\leq n$, the recurrence equation is

$$-2na_n(n-1)+(n+2)\,a_{n+2}(n+1)+2(n+1)\,a_{n+1}-6na_n-2a_n=0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= \frac{2na_n+2a_n-2a_{n+1}}{n+2} \\ &= \frac{2(n+1)\,a_n}{n+2}-\frac{2a_{n+1}}{n+2} \end{aligned} \tag{5}$$

For $n=2$ the recurrence equation gives

$$-18a_2+12a_4+6a_3=0$$

Which after substituting the earlier terms found becomes

$$a_4=\frac{11a_0}{6}-\frac{5a_1}{2}$$

For $n = 3$ the recurrence equation gives

$$-32a_3 + 20a_5 + 8a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{9a_0}{5} + \frac{21a_1}{5}$$

For $n = 4$ the recurrence equation gives

$$-50a_4 + 30a_6 + 10a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{329a_0}{90} - \frac{167a_1}{30}$$

For $n = 5$ the recurrence equation gives

$$-72a_5 + 42a_7 + 12a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{1301a_0}{315} + \frac{923a_1}{105}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$\begin{aligned} y = a_0 + a_1x + (a_0 - a_1)x^2 + \left(-\frac{2a_0}{3} + 2a_1\right)x^3 \\ + \left(\frac{11a_0}{6} - \frac{5a_1}{2}\right)x^4 + \left(-\frac{9a_0}{5} + \frac{21a_1}{5}\right)x^5 + \dots \end{aligned}$$

Collecting terms, the solution becomes

$$y = \left(x^2 + 1 - \frac{2}{3}x^3 + \frac{11}{6}x^4 - \frac{9}{5}x^5\right) a_0 + \left(x - x^2 + 2x^3 - \frac{5}{2}x^4 + \frac{21}{5}x^5\right) a_1 + O(x^6) \quad (3)$$

At $x = 0$ the solution above becomes

$$y = \left(x^2 + 1 - \frac{2}{3}x^3 + \frac{11}{6}x^4 - \frac{9}{5}x^5\right) c_1 + \left(x - x^2 + 2x^3 - \frac{5}{2}x^4 + \frac{21}{5}x^5\right) c_2 + O(x^6)$$

$$y = x^2 + 1 - \frac{2x^3}{3} + \frac{11x^4}{6} - \frac{9x^5}{5} + O(x^6)$$

<u>Summary</u>
The solution(s) found are the following

$$y = x^2 + 1 - \frac{2x^3}{3} + \frac{11x^4}{6} - \frac{9x^5}{5} + \frac{329x^6}{90} + O(x^6) \quad (1)$$

$$y = x^2 + 1 - \frac{2x^3}{3} + \frac{11x^4}{6} - \frac{9x^5}{5} + O(x^6) \quad (2)$$

<u>Verification of solutions</u>

$$y = x^2 + 1 - \frac{2x^3}{3} + \frac{11x^4}{6} - \frac{9x^5}{5} + \frac{329x^6}{90} + O(x^6)$$

Verified OK.

$$y = x^2 + 1 - \frac{2x^3}{3} + \frac{11x^4}{6} - \frac{9x^5}{5} + O(x^6)$$

Verified OK.

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 4.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(3x^2 + x + 1)\, y'' + (2 + 15x)\, y' + 12y = 0}$$

With initial conditions

$$[y(0) = 0, y'(0) = 1]$$

With the expansion point for the power series method at $x = 0$.

13.4.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= \frac{2 + 15x}{3x^2 + x + 1} \\ q(x) &= \frac{12}{3x^2 + x + 1} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{(2+15x)\,y'}{3x^2+x+1} + \frac{12y}{3x^2+x+1} = 0$$

The domain of $p(x) = \frac{2+15x}{3x^2+x+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{12}{3x^2+x+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned} y(x) &= y(x_0) + (x-x_0)\,y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\ &= y_0 + xy'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\ &= y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left.\frac{d^n f}{dx^n}\right|_{x_0,y_0,y'_0} \end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{938}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{939}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{15y'x + 2y' + 12y}{3x^2 + x + 1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{(234x^2 + 60x - 21)\, y' + (252x + 36)\, y}{(3x^2 + x + 1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(-4158x^3 - 1548x^2 + 1143x + 180)\, y' - 5076y\left(x^2 + \frac{13}{47}x - \frac{4}{47}\right)}{(3x^2 + x + 1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(84564x^4 + 40824x^3 - 47304x^2 - 14580x + 675)\, y' + 110808\left(x^3 + \frac{23}{57}x^2 - \frac{89}{342}x - \frac{5}{114}\right) y}{(3x^2 + x + 1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-1950804x^5 - 1148904x^4 + 1845828x^3 + 837864x^2 - 81729x - 23490)\, y' - 2676888\left(x^4 + \frac{241}{459}x^3 - \right.}{(3x^2 + x + 1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 0$ and $y'(0) = 1$ gives

$$
\begin{aligned}
F_0 &= -2 \\
F_1 &= -21 \\
F_2 &= 180 \\
F_3 &= 675 \\
F_4 &= -23490
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = -x^2 + x - \frac{7x^3}{2} + \frac{15x^4}{2} + \frac{45x^5}{8} - \frac{261x^6}{8} + O(x^6)
$$

$$
y = -x^{2}+x -\frac{7 x^{3}}{2}+\frac{15 x^{4}}{2}+\frac{45 x^{5}}{8}-\frac{261 x^{6}}{8}+O\left(x^{6}\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$
\left(3x^{2}+x +1\right) y''+\left(2+15 x \right) y'+12 y = 0
$$

Let the solution be represented as power series of the form

$$
y = \sum_{n =0}^{\infty} a_{n} x^{n}
$$

Then

$$
\begin{aligned}
y' &= \sum_{n =1}^{\infty} n a_{n} x^{n -1} \\
y'' &= \sum_{n =2}^{\infty} n \left(n -1\right) a_{n} x^{n -2}
\end{aligned}
$$

Substituting the above back into the ode gives

$$
\left(3x^{2}+x +1\right) \left(\sum_{n =2}^{\infty} n \left(n -1\right) a_{n} x^{n -2}\right)+\left(2+15 x \right) \left(\sum_{n =1}^{\infty} n a_{n} x^{n -1}\right)+12\left(\sum_{n =0}^{\infty} a_{n} x^{n}\right) = 0 \tag{1}
$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n =2}^{\infty} 3 x^{n} a_{n} n \left(n -1\right)\right)+\left(\sum_{n =2}^{\infty} n \,x^{n -1} a_{n} \left(n -1\right)\right)+\left(\sum_{n =2}^{\infty} n \left(n -1\right) a_{n} x^{n -2}\right) \\
&+\left(\sum_{n =1}^{\infty} 2 n a_{n} x^{n -1}\right)+\left(\sum_{n =1}^{\infty} 15 n a_{n} x^{n}\right)+\left(\sum_{n =0}^{\infty} 12 a_{n} x^{n}\right) = 0
\end{aligned} \tag{2}
$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^{n} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n =2}^{\infty} n \,x^{n -1} a_{n} \left(n -1\right) &= \sum_{n =1}^{\infty} \left(n +1\right) a_{n +1} n \,x^{n} \\
\sum_{n =2}^{\infty} n \left(n -1\right) a_{n} x^{n -2} &= \sum_{n =0}^{\infty} \left(n +2\right) a_{n +2} \left(n +1\right) x^{n} \\
\sum_{n =1}^{\infty} 2 n a_{n} x^{n -1} &= \sum_{n =0}^{\infty} 2 \left(n +1\right) a_{n +1} x^{n}
\end{aligned}
$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 3x^n a_n n(n-1)\right)+\left(\sum_{n=1}^{\infty} (n+1)\, a_{n+1} n\, x^n\right)+\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) \\ +\left(\sum_{n=0}^{\infty} 2(n+1)\, a_{n+1} x^n\right)+\left(\sum_{n=1}^{\infty} 15 n a_n x^n\right)+\left(\sum_{n=0}^{\infty} 12 a_n x^n\right)=0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 2a_1 + 12a_0 = 0$$

$$a_2 = -6a_0 - a_1$$

$n = 1$ gives

$$6a_2 + 6a_3 + 27a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = 6a_0 - \frac{7a_1}{2}$$

For $2 \leq n$, the recurrence equation is

$$3na_n(n-1)+(n+1)\, a_{n+1}n+(n+2)\, a_{n+2}(n+1)+2(n+1)\, a_{n+1}+15na_n+12a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{3na_n + na_{n+1} + 6a_n + a_{n+1}}{n+1} \\ &= -\frac{(3n+6)\, a_n}{n+1} - a_{n+1} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$48a_2 + 12a_3 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = 18a_0 + \frac{15a_1}{2}$$

For $n = 3$ the recurrence equation gives

$$75a_3 + 20a_4 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{81a_0}{2} + \frac{45a_1}{8}$$

For $n = 4$ the recurrence equation gives

$$108a_4 + 30a_5 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{243a_0}{10} - \frac{261a_1}{8}$$

For $n = 5$ the recurrence equation gives

$$147a_5 + 42a_6 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{3321a_0}{20} + \frac{207a_1}{16}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$\begin{aligned} y = a_0 + a_1 x + (-6a_0 - a_1)\, x^2 + \left(6a_0 - \frac{7a_1}{2}\right) x^3 \\ + \left(18a_0 + \frac{15a_1}{2}\right) x^4 + \left(-\frac{81a_0}{2} + \frac{45a_1}{8}\right) x^5 + \dots \end{aligned}$$

Collecting terms, the solution becomes

$$y = \left(1-6x^2+6x^3+18x^4-\frac{81}{2}x^5\right)a_0+\left(-x^2+x-\frac{7}{2}x^3+\frac{15}{2}x^4+\frac{45}{8}x^5\right)a_1+O\left(x^6\right) \quad (3)$$

At $x = 0$ the solution above becomes

$$y = \left(1-6x^2+6x^3+18x^4-\frac{81}{2}x^5\right)c_1+\left(-x^2+x-\frac{7}{2}x^3+\frac{15}{2}x^4+\frac{45}{8}x^5\right)c_2+O\left(x^6\right)$$

$$y = -x^2+x-\frac{7x^3}{2}+\frac{15x^4}{2}+\frac{45x^5}{8}+O\left(x^6\right)$$

Summary

The solution(s) found are the following

$$y = -x^2+x-\frac{7x^3}{2}+\frac{15x^4}{2}+\frac{45x^5}{8}-\frac{261x^6}{8}+O\left(x^6\right) \quad (1)$$

$$y = -x^2+x-\frac{7x^3}{2}+\frac{15x^4}{2}+\frac{45x^5}{8}+O\left(x^6\right) \quad (2)$$

Verification of solutions

$$y = -x^2+x-\frac{7x^3}{2}+\frac{15x^4}{2}+\frac{45x^5}{8}-\frac{261x^6}{8}+O\left(x^6\right)$$

Verified OK.

$$y = -x^2+x-\frac{7x^3}{2}+\frac{15x^4}{2}+\frac{45x^5}{8}+O\left(x^6\right)$$

Verified OK.

13.4.2 Maple step by step solution

Let's solve

$$\left[(3x^2+x+1)\,y''+(2+15x)\,y'+12y=0, y(0)=0, y'\Big|_{\{x=0\}}=1\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

$y'' = -\frac{12y}{3x^2+x+1} - \frac{(2+15x)y'}{3x^2+x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(2+15x)y'}{3x^2+x+1} + \frac{12y}{3x^2+x+1} = 0$

□ Check to see if x_0 is a regular singular point

- ○ Define functions

  $\left[P_2(x) = \frac{2+15x}{3x^2+x+1}, P_3(x) = \frac{12}{3x^2+x+1}\right]$

- ○ $\left(\frac{I\sqrt{11}}{6} + x + \frac{1}{6}\right) \cdot P_2(x)$ is analytic at $x = -\frac{I\sqrt{11}}{6} - \frac{1}{6}$

  $\left(\left(\frac{I\sqrt{11}}{6} + x + \frac{1}{6}\right) \cdot P_2(x)\right)\bigg|_{x=-\frac{I\sqrt{11}}{6}-\frac{1}{6}} = 0$

- ○ $\left(\frac{I\sqrt{11}}{6} + x + \frac{1}{6}\right)^2 \cdot P_3(x)$ is analytic at $x = -\frac{I\sqrt{11}}{6} - \frac{1}{6}$

  $\left(\left(\frac{I\sqrt{11}}{6} + x + \frac{1}{6}\right)^2 \cdot P_3(x)\right)\bigg|_{x=-\frac{I\sqrt{11}}{6}-\frac{1}{6}} = 0$

- ○ $x = -\frac{I\sqrt{11}}{6} - \frac{1}{6}$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = -\frac{I\sqrt{11}}{6} - \frac{1}{6}$

- Multiply by denominators

  $(3x^2 + x + 1)\, y'' + (2 + 15x)\, y' + 12y = 0$

- Change variables using $x = u - \frac{I\sqrt{11}}{6} - \frac{1}{6}$ so that the regular singular point is at $u = 0$

  $(3u^2 - Iu\sqrt{11})\left(\frac{d^2}{du^2}y(u)\right) + \left(-\frac{1}{2} + 15u - \frac{5\,I\sqrt{11}}{2}\right)\left(\frac{d}{du}y(u)\right) + 12y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

- ○ Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k (k + r)\, u^{k+r-1+m}$

- ○ Shift index using $k- > k + 1 - m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k + 1 - m + r)\, u^{k+r}$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k- >k+2-m$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$\frac{\mathrm{I}\sqrt{11}\left(\mathrm{I}\sqrt{11}-33-22r\right)r a_0 u^{-1+r}}{22} + \left(\sum_{k=0}^{\infty}\left(\frac{\mathrm{I}\sqrt{11}\left(\mathrm{I}\sqrt{11}-22k-55-22r\right)(k+1+r)a_{k+1}}{22} + 3a_k(k+r+2)^2\right)u^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$\frac{\mathrm{I}}{22}\sqrt{11}\left(\mathrm{I}\sqrt{11}-33-22r\right)r = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{0, -\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right\}$$

- Each term in the series must be 0, giving the recursion relation

  $$3a_k(k+r+2)^2 - (k+1+r)\,a_{k+1}\left(\frac{1}{2}+\mathrm{I}\left(k+r+\frac{5}{2}\right)\sqrt{11}\right) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+1} = \frac{6a_k\left(k^2+2kr+r^2+4k+4r+4\right)}{2\,\mathrm{I}\sqrt{11}\,k^2+4\,\mathrm{I}kr\sqrt{11}+2\,\mathrm{I}\sqrt{11}\,r^2+7\,\mathrm{I}k\sqrt{11}+7\,\mathrm{I}r\sqrt{11}+5\,\mathrm{I}\sqrt{11}+k+r+1}$$

- Recursion relation for $r = 0$

  $$a_{k+1} = \frac{6a_k\left(k^2+4k+4\right)}{2\,\mathrm{I}\sqrt{11}\,k^2+1+7\,\mathrm{I}k\sqrt{11}+5\,\mathrm{I}\sqrt{11}+k}$$

- Solution for $r = 0$

  $$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+1} = \frac{6a_k\left(k^2+4k+4\right)}{2\,\mathrm{I}\sqrt{11}\,k^2+1+7\,\mathrm{I}k\sqrt{11}+5\,\mathrm{I}\sqrt{11}+k}\right]$$

- Revert the change of variables $u = \frac{\mathrm{I}\sqrt{11}}{6}+x+\frac{1}{6}$

  $$\left[y = \sum_{k=0}^{\infty} a_k\left(\frac{\mathrm{I}\sqrt{11}}{6}+x+\frac{1}{6}\right)^k, a_{k+1} = \frac{6a_k\left(k^2+4k+4\right)}{2\,\mathrm{I}\sqrt{11}\,k^2+1+7\,\mathrm{I}k\sqrt{11}+5\,\mathrm{I}\sqrt{11}+k}\right]$$

- Recursion relation for $r = -\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}$

  $$a_{k+1} = \frac{6a_k\left(k^2+2k\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)+\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)^2+4k-2+\frac{2\,\mathrm{I}\sqrt{11}}{11}\right)}{2\,\mathrm{I}\sqrt{11}\,k^2+4\,\mathrm{I}k\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)\sqrt{11}+2\,\mathrm{I}\sqrt{11}\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)^2+7\,\mathrm{I}k\sqrt{11}+7\,\mathrm{I}\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)\sqrt{11}+\frac{111\,\mathrm{I}\sqrt{11}}{22}+k-\frac{1}{2}}$$

- Solution for $r = -\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^{k-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}}, a_{k+1}=\frac{6a_k\left(k^2+2k\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)+\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)^2+4k-2+\frac{2\,\mathrm{I}\sqrt{11}}{11}\right)}{2\,\mathrm{I}\sqrt{11}\,k^2+4\,\mathrm{I}k\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)\sqrt{11}+2\,\mathrm{I}\sqrt{11}\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)^2+7\,\mathrm{I}k\sqrt{11}+7\,\mathrm{I}\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)\sqrt{11}\right.$$

- Revert the change of variables $u=\frac{\mathrm{I}\sqrt{11}}{6}+x+\frac{1}{6}$

$$\left[y=\sum_{k=0}^{\infty} a_k\left(\frac{\mathrm{I}\sqrt{11}}{6}+x+\frac{1}{6}\right)^{k-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}}, a_{k+1}=\frac{6a_k\left(k^2+2k\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)+\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)^2+4k-2\right.}{2\,\mathrm{I}\sqrt{11}\,k^2+4\,\mathrm{I}k\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)\sqrt{11}+2\,\mathrm{I}\sqrt{11}\left(-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}\right)^2+7\,\mathrm{I}k\sqrt{11}+7\,\mathrm{I}\left(\right.}\right.$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k\left(\frac{\mathrm{I}\sqrt{11}}{6}+x+\frac{1}{6}\right)^{k}\right)+\left(\sum_{k=0}^{\infty} b_k\left(\frac{\mathrm{I}\sqrt{11}}{6}+x+\frac{1}{6}\right)^{k-\frac{3}{2}+\frac{\mathrm{I}\sqrt{11}}{22}}\right), a_{1+k}=\frac{6a_k\left(k^2+4k+4\right)}{2\,\mathrm{I}\sqrt{11}\,k^2+1+7\,\mathrm{I}k\sqrt{11}+5\,\mathrm{I}}\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 5.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(2+x)\,y'' + (x+1)\,y' + 3y = 0}$$

With initial conditions

$$[y(0) = 4, y'(0) = 3]$$

With the expansion point for the power series method at $x = 0$.

13.5.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= \frac{x+1}{2+x} \\ q(x) &= \frac{3}{2+x} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{(x+1)\,y'}{2+x} + \frac{3y}{2+x} = 0$$

The domain of $p(x) = \frac{x+1}{2+x}$ is

$$\{x < -2 \lor -2 < x\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{3}{2+x}$ is

$$\{x < -2 \lor -2 < x\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\,y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{941}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{942}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y_0'} \qquad (7)$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{y'x + y' + 3y}{2 + x} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{(x - 3)\, y' + 3y}{2 + x} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(-x^2 + 5x + 14)\, y' - 3(-2 + x)\, y}{(2 + x)^2} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(x^3 - 7x^2 - 28x - 20)\, y' + 3y(x^2 - 4x - 20)}{(2 + x)^3} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-x^4 + 9x^3 + 42x^2 - 8x - 96)\, y' - 3y(x^3 - 6x^2 - 40x - 72)}{(2 + x)^4}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 4$ and $y'(0) = 3$ gives

$$
\begin{aligned}
F_0 &= -\frac{15}{2} \\
F_1 &= \frac{3}{2} \\
F_2 &= \frac{33}{2} \\
F_3 &= -\frac{75}{2} \\
F_4 &= 36
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y = 3x + 4 - \frac{15x^2}{4} + \frac{x^3}{4} + \frac{11x^4}{16} - \frac{5x^5}{16} + \frac{x^6}{20} + O(x^6)$$

$$y = 3x + 4 - \frac{15x^2}{4} + \frac{x^3}{4} + \frac{11x^4}{16} - \frac{5x^5}{16} + \frac{x^6}{20} + O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(2 + x) y'' + (x + 1) y' + 3y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(2 + x) \left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + (x + 1) \left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) + 3\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n\, x^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} 2n(n-1) a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} n a_n x^n\right) + \left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) + \left(\sum_{n=0}^{\infty} 3a_n x^n\right) = 0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the

power and the corresponding index gives

$$\sum_{n=2}^{\infty} n\, x^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} (n+1)\, a_{n+1} n\, x^n$$

$$\sum_{n=2}^{\infty} 2n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} 2(n+2)\, a_{n+2} (n+1)\, x^n$$

$$\sum_{n=1}^{\infty} n a_n x^{n-1} = \sum_{n=0}^{\infty} (n+1)\, a_{n+1} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=1}^{\infty} (n+1)\, a_{n+1} n\, x^n\right) + \left(\sum_{n=0}^{\infty} 2(n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=1}^{\infty} n a_n x^n\right) + \left(\sum_{n=0}^{\infty} (n+1)\, a_{n+1} x^n\right) + \left(\sum_{n=0}^{\infty} 3 a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$4a_2 + a_1 + 3a_0 = 0$$

$$a_2 = -\frac{3a_0}{4} - \frac{a_1}{4}$$

For $1 \leq n$, the recurrence equation is

$$(n+1)\, a_{n+1} n + 2(n+2)\, a_{n+2}(n+1) + n a_n + (n+1)\, a_{n+1} + 3a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{n^2 a_{n+1} + n a_n + 2n a_{n+1} + 3a_n + a_{n+1}}{2\,(n+2)\,(n+1)} \\ &= -\frac{(n+3)\, a_n}{2\,(n+2)\,(n+1)} - \frac{(n^2+2n+1)\, a_{n+1}}{2\,(n+2)\,(n+1)} \end{aligned} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$4a_2 + 12a_3 + 4a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = \frac{a_0}{4} - \frac{a_1}{4}$$

For $n = 2$ the recurrence equation gives

$$9a_3 + 24a_4 + 5a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{16} + \frac{7a_1}{48}$$

For $n = 3$ the recurrence equation gives

$$16a_4 + 40a_5 + 6a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{a_0}{16} - \frac{a_1}{48}$$

For $n = 4$ the recurrence equation gives

$$25a_5 + 60a_6 + 7a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{3a_0}{160} - \frac{a_1}{120}$$

For $n = 5$ the recurrence equation gives

$$36a_6 + 84a_7 + 8a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{a_0}{480} + \frac{a_1}{180}$$

And so on. Therefore the solution is

$$y = \sum_{n=0}^{\infty} a_n x^n$$
$$= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1x + \left(-\frac{3a_0}{4} - \frac{a_1}{4}\right)x^2 + \left(\frac{a_0}{4} - \frac{a_1}{4}\right)x^3 + \left(\frac{a_0}{16} + \frac{7a_1}{48}\right)x^4 + \left(-\frac{a_0}{16} - \frac{a_1}{48}\right)x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{3}{4}x^2 + \frac{1}{4}x^3 + \frac{1}{16}x^4 - \frac{1}{16}x^5\right)a_0 + \left(x - \frac{1}{4}x^2 - \frac{1}{4}x^3 + \frac{7}{48}x^4 - \frac{1}{48}x^5\right)a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{3}{4}x^2 + \frac{1}{4}x^3 + \frac{1}{16}x^4 - \frac{1}{16}x^5\right)c_1 + \left(x - \frac{1}{4}x^2 - \frac{1}{4}x^3 + \frac{7}{48}x^4 - \frac{1}{48}x^5\right)c_2 + O(x^6)$$

$$y = 4 - \frac{15x^2}{4} + \frac{x^3}{4} + \frac{11x^4}{16} - \frac{5x^5}{16} + 3x + O(x^6)$$

Summary

The solution(s) found are the following

$$y = 3x + 4 - \frac{15x^2}{4} + \frac{x^3}{4} + \frac{11x^4}{16} - \frac{5x^5}{16} + \frac{x^6}{20} + O(x^6) \tag{1}$$
$$y = 4 - \frac{15x^2}{4} + \frac{x^3}{4} + \frac{11x^4}{16} - \frac{5x^5}{16} + 3x + O(x^6) \tag{2}$$

Verification of solutions

$$y = 3x + 4 - \frac{15x^2}{4} + \frac{x^3}{4} + \frac{11x^4}{16} - \frac{5x^5}{16} + \frac{x^6}{20} + O(x^6)$$

Verified OK.

$$y = 4 - \frac{15x^2}{4} + \frac{x^3}{4} + \frac{11x^4}{16} - \frac{5x^5}{16} + 3x + O(x^6)$$

Verified OK.

13.5.2 Maple step by step solution

Let's solve

$$\left[(2+x)\, y''+(x+1)\, y'+3y=0, y(0)=4, y'\bigg|_{\{x=0\}}=3\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{3y}{2+x}-\frac{(x+1)y'}{2+x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(x+1)y'}{2+x}+\frac{3y}{2+x}=0$

□ Check to see if $x_0=-2$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{x+1}{2+x}, P_3(x)=\frac{3}{2+x}\right]$

  ◦ $(2+x)\cdot P_2(x)$ is analytic at $x=-2$

  $\left((2+x)\cdot P_2(x)\right)\bigg|_{x=-2}=-1$

  ◦ $(2+x)^2\cdot P_3(x)$ is analytic at $x=-2$

  $\left((2+x)^2\cdot P_3(x)\right)\bigg|_{x=-2}=0$

  ◦ $x=-2$is a regular singular point

  Check to see if $x_0=-2$ is a regular singular point

  $x_0=-2$

- Multiply by denominators

  $(2+x)\, y''+(x+1)\, y'+3y=0$

- Change variables using $x=u-2$ so that the regular singular point is at $u=0$

  $u\left(\frac{d^2}{du^2}y(u)\right)+(u-1)\left(\frac{d}{du}y(u)\right)+3y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\, u^{k+r-1+m}$

- Shift index using $k- > k+1-m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$

- Convert $u \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

  $u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)(k+r-1)\, u^{k+r-1}$

- Shift index using $k- > k+1$

  $u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)(k+r)\, u^{k+r}$

  Rewrite ODE with series expansions

  $a_0 r(-2+r)\, u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(a_{k+1}(k+1+r)(k+r-1) + a_k(k+r+3)\right) u^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $r(-2+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{0, 2\}$

- Each term in the series must be 0, giving the recursion relation

  $a_{k+1}(k+1+r)(k+r-1) + a_k(k+r+3) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+1} = -\frac{a_k(k+r+3)}{(k+1+r)(k+r-1)}$

- Recursion relation for $r = 0$

  $a_{k+1} = -\frac{a_k(k+3)}{(k+1)(k-1)}$

- Series not valid for $r = 0$, division by 0 in the recursion relation at $k = 1$

  $a_{k+1} = -\frac{a_k(k+3)}{(k+1)(k-1)}$

- Recursion relation for $r = 2$

  $a_{k+1} = -\frac{a_k(k+5)}{(k+3)(k+1)}$

- Solution for $r = 2$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+2}, a_{k+1} = -\frac{a_k(k+5)}{(k+3)(k+1)}\right]$$

- Revert the change of variables $u = 2 + x$

$$\left[y = \sum_{k=0}^{\infty} a_k (2+x)^{k+2}, a_{k+1} = -\frac{a_k(k+5)}{(k+3)(k+1)}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 6.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second_order_change_of_variable_on_y_method_1", "linear_second_order_ode_solved_by_an_integrating_factor", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{\left(x^{2}+3x+3\right) y''+\left(6+4x\right) y'+2y=0}$$

With initial conditions

$$[y(0)=7, y'(0)=3]$$

With the expansion point for the power series method at $x=0$.

13.6.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned}p(x) &= \frac{6+4x}{x^2+3x+3}\\ q(x) &= \frac{2}{x^2+3x+3}\\ F &= 0\end{aligned}$$

Hence the ode is

$$y'' + \frac{(6+4x)\,y'}{x^2+3x+3} + \frac{2y}{x^2+3x+3} = 0$$

The domain of $p(x) = \frac{6+4x}{x^2+3x+3}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{2}{x^2+3x+3}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}y(x) &= y(x_0) + (x-x_0)\,y'(x_0) + \frac{(x-x_0)^2}{2}y''(x_0) + \frac{(x-x_0)^3}{3!}y'''(x_0) + \cdots\\ &= y_0 + xy'_0 + \frac{x^2}{2}f|_{x_0,y_0,y'_0} + \frac{x^3}{3!}f'|_{x_0,y_0,y'_0} + \cdots\\ &= y_0 + xy'_0 + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}\,\frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0}\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' && (944)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (945)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f && (3)\\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2(2y'x + 3y' + y)}{x^2 + 3x + 3} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{18(x^2 + 3x + 2)\, y' + 6(2x + 3)\, y}{(x^2 + 3x + 3)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(-96x^3 - 432x^2 - 576x - 216)\, y' - 72(2 + x)\, y(x + 1)}{(x^2 + 3x + 3)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(600x^4 + 3600x^3 + 7200x^2 + 5400x + 1080)\, y' + 480\left(x^2 + 3x + \frac{3}{2}\right)\left(x + \frac{3}{2}\right) y}{(x^2 + 3x + 3)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-4320x^5 - 32400x^4 - 86400x^3 - 97200x^2 - 38880x)\, y' - 3600\left(x^4 + 6x^3 + 12x^2 + 9x + \frac{9}{5}\right) y}{(x^2 + 3x + 3)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 7$ and $y'(0) = 3$ gives

$$
\begin{aligned}
F_0 &= -\frac{32}{3} \\
F_1 &= 26 \\
F_2 &= -\frac{184}{3} \\
F_3 &= \frac{400}{3} \\
F_4 &= -\frac{560}{3}
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y = 7 + 3x - \frac{16x^2}{3} + \frac{13x^3}{3} - \frac{23x^4}{9} + \frac{10x^5}{9} - \frac{7x^6}{27} + O(x^6)$$

$$y = 7 + 3x - \frac{16x^2}{3} + \frac{13x^3}{3} - \frac{23x^4}{9} + \frac{10x^5}{9} - \frac{7x^6}{27} + O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(x^2 + 3x + 3)\, y'' + (6 + 4x)\, y' + 2y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(x^2 + 3x + 3)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + (6 + 4x)\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) + 2\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} x^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} 3n\, x^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} 3n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 6n a_n x^{n-1}\right) + \left(\sum_{n=1}^{\infty} 4n a_n x^n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 3n\, x^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} 3(n+1)\, a_{n+1} n\, x^n$$

$$\sum_{n=2}^{\infty} 3n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} 3(n+2)\, a_{n+2}(n+1)\, x^n$$

$$\sum_{n=1}^{\infty} 6n a_n x^{n-1} = \sum_{n=0}^{\infty} 6(n+1)\, a_{n+1} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\begin{aligned}&\left(\sum_{n=2}^{\infty} x^n a_n n(n-1)\right) + \left(\sum_{n=1}^{\infty} 3(n+1)\, a_{n+1} n\, x^n\right)\\&+\left(\sum_{n=0}^{\infty} 3(n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=0}^{\infty} 6(n+1)\, a_{n+1} x^n\right)\\&+\left(\sum_{n=1}^{\infty} 4n a_n x^n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0\end{aligned} \tag{3}$$

$n = 0$ gives

$$6a_2 + 6a_1 + 2a_0 = 0$$

$$a_2 = -\frac{a_0}{3} - a_1$$

$n = 1$ gives

$$18a_2 + 18a_3 + 6a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{a_0}{3} + \frac{2a_1}{3}$$

For $2 \leq n$, the recurrence equation is

$$n a_n (n-1) + 3(n+1) a_{n+1} n + 3(n+2) a_{n+2} (n+1) + 6(n+1) a_{n+1} + 4 n a_n + 2 a_n = 0 \quad (4)$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{a_n}{3} - a_{n+1} \\ &= -\frac{a_n}{3} - a_{n+1} \end{aligned} \quad (5)$$

For $n = 2$ the recurrence equation gives

$$12 a_2 + 36 a_3 + 36 a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{2 a_0}{9} - \frac{a_1}{3}$$

For $n = 3$ the recurrence equation gives

$$20 a_3 + 60 a_4 + 60 a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_0}{9} + \frac{a_1}{9}$$

For $n = 4$ the recurrence equation gives

$$30 a_4 + 90 a_5 + 90 a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{a_0}{27}$$

For $n = 5$ the recurrence equation gives

$$42 a_5 + 126 a_6 + 126 a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{a_1}{27}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x + \left(-\frac{a_0}{3} - a_1\right) x^2 + \left(\frac{a_0}{3} + \frac{2a_1}{3}\right) x^3 + \left(-\frac{2a_0}{9} - \frac{a_1}{3}\right) x^4 + \left(\frac{a_0}{9} + \frac{a_1}{9}\right) x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{1}{3}x^2 + \frac{1}{3}x^3 - \frac{2}{9}x^4 + \frac{1}{9}x^5\right) a_0 + \left(x - x^2 + \frac{2}{3}x^3 - \frac{1}{3}x^4 + \frac{1}{9}x^5\right) a_1 + O(x^6) \quad (3)$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{1}{3}x^2 + \frac{1}{3}x^3 - \frac{2}{9}x^4 + \frac{1}{9}x^5\right) c_1 + \left(x - x^2 + \frac{2}{3}x^3 - \frac{1}{3}x^4 + \frac{1}{9}x^5\right) c_2 + O(x^6)$$

$$y = 7 - \frac{16x^2}{3} + \frac{13x^3}{3} - \frac{23x^4}{9} + \frac{10x^5}{9} + 3x + O(x^6)$$

Summary

The solution(s) found are the following

$$y = 7 + 3x - \frac{16x^2}{3} + \frac{13x^3}{3} - \frac{23x^4}{9} + \frac{10x^5}{9} - \frac{7x^6}{27} + O(x^6) \quad (1)$$

$$y = 7 - \frac{16x^2}{3} + \frac{13x^3}{3} - \frac{23x^4}{9} + \frac{10x^5}{9} + 3x + O(x^6) \quad (2)$$

Verification of solutions

$$y = 7 + 3x - \frac{16x^2}{3} + \frac{13x^3}{3} - \frac{23x^4}{9} + \frac{10x^5}{9} - \frac{7x^6}{27} + O(x^6)$$

Verified OK.

$$y = 7 - \frac{16x^2}{3} + \frac{13x^3}{3} - \frac{23x^4}{9} + \frac{10x^5}{9} + 3x + O(x^6)$$

Verified OK.

13.6.2 Maple step by step solution

Let's solve

$$\left[\left(x^2+3x+3\right)y''+\left(6+4x\right)y'+2y=0, y(0)=7, y'\Big|_{\{x=0\}}=3\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{2y}{x^2+3x+3}-\frac{2(2x+3)y'}{x^2+3x+3}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{2(2x+3)y'}{x^2+3x+3}+\frac{2y}{x^2+3x+3}=0$

☐ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{2(2x+3)}{x^2+3x+3}, P_3(x)=\frac{2}{x^2+3x+3}\right]$

  ◦ $\left(\frac{I\sqrt{3}}{2}+x+\frac{3}{2}\right)\cdot P_2(x)$ is analytic at $x=-\frac{I\sqrt{3}}{2}-\frac{3}{2}$

  $\left(\left(\frac{I\sqrt{3}}{2}+x+\frac{3}{2}\right)\cdot P_2(x)\right)\Bigg|_{x=-\frac{I\sqrt{3}}{2}-\frac{3}{2}}=0$

  ◦ $\left(\frac{I\sqrt{3}}{2}+x+\frac{3}{2}\right)^2\cdot P_3(x)$ is analytic at $x=-\frac{I\sqrt{3}}{2}-\frac{3}{2}$

  $\left(\left(\frac{I\sqrt{3}}{2}+x+\frac{3}{2}\right)^2\cdot P_3(x)\right)\Bigg|_{x=-\frac{I\sqrt{3}}{2}-\frac{3}{2}}=0$

  ◦ $x=-\frac{I\sqrt{3}}{2}-\frac{3}{2}$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-\frac{I\sqrt{3}}{2}-\frac{3}{2}$

- Multiply by denominators

  $\left(x^2+3x+3\right)y''+\left(6+4x\right)y'+2y=0$

- Change variables using $x=u-\frac{I\sqrt{3}}{2}-\frac{3}{2}$ so that the regular singular point is at $u=0$

  $\left(u^2-Iu\sqrt{3}\right)\left(\frac{d^2}{du^2}y(u)\right)+\left(4u-2I\sqrt{3}\right)\left(\frac{d}{du}y(u)\right)+2y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

- ☐ Rewrite ODE with series expansions
  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$
  - Shift index using $k->k+1-m$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$
  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

    $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$
  - Shift index using $k->k+2-m$

    $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$

  Rewrite ODE with series expansions

  $-\mathrm{I}\sqrt{3}\, r(r+1)\, a_0 u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(-\mathrm{I}\sqrt{3}\,(k+r+1)\,(k+r+2)\, a_{k+1} + a_k(k+r+2)\,(k+r+1)\right) u$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-\mathrm{I}\sqrt{3}\, r(r+1) = 0$
- Values of r that satisfy the indicial equation

  $r \in \{-1, 0\}$
- Each term in the series must be 0, giving the recursion relation

  $\left(-\mathrm{I}\sqrt{3}\, a_{k+1} + a_k\right)(k+r+2)\,(k+r+1) = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+1} = -\frac{\mathrm{I}}{3} a_k \sqrt{3}$
- Recursion relation for $r = -1$

  $a_{k+1} = -\frac{\mathrm{I}}{3} a_k \sqrt{3}$
- Solution for $r = -1$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-1}, a_{k+1} = -\frac{\mathrm{I}}{3} a_k \sqrt{3}\right]$
- Revert the change of variables $u = \frac{\mathrm{I}\sqrt{3}}{2} + x + \frac{3}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(\frac{I\sqrt{3}}{2} + x + \frac{3}{2}\right)^{k-1}, a_{k+1} = -\frac{I}{3} a_k \sqrt{3}\right]$$

- Recursion relation for $r = 0$

$$a_{k+1} = -\frac{I}{3} a_k \sqrt{3}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+1} = -\frac{I}{3} a_k \sqrt{3}\right]$$

- Revert the change of variables $u = \frac{I\sqrt{3}}{2} + x + \frac{3}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(\frac{I\sqrt{3}}{2} + x + \frac{3}{2}\right)^{k}, a_{k+1} = -\frac{I}{3} a_k \sqrt{3}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k \left(\frac{I\sqrt{3}}{2} + x + \frac{3}{2}\right)^{k-1}\right) + \left(\sum_{k=0}^{\infty} b_k \left(\frac{I\sqrt{3}}{2} + x + \frac{3}{2}\right)^{k}\right), a_{1+k} = -\frac{I}{3} a_k \sqrt{3}, b_{1+k} = -\frac{I}{3} b_k \sqrt{3}\right]$$

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(x+4)\,y''+(2+x)\,y'+2y=0}$$

With initial conditions

$$[y(0)=2,y'(0)=5]$$

With the expansion point for the power series method at $x=0$.

13.7.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=\frac{2+x}{x+4}\\ q(x)&=\frac{2}{x+4}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' + \frac{(2+x)\,y'}{x+4} + \frac{2y}{x+4} = 0$$

The domain of $p(x) = \frac{2+x}{x+4}$ is

$$\{x < -4 \lor -4 < x\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{2}{x+4}$ is

$$\{x < -4 \lor -4 < x\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\,y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{947}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{948}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{y'x+2y'+2y}{x+4} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x}+\frac{\partial F_0}{\partial y}y'+\frac{\partial F_0}{\partial y'}F_0 \\
&= \frac{(x^2+2x-6)\,y'+2y(x+3)}{(x+4)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x}+\frac{\partial F_1}{\partial y}y'+\frac{\partial F_1}{\partial y'}F_1 \\
&= \frac{(-x^2+2x+14)\,y'-2y(x-1)}{(x+4)^2} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x}+\frac{\partial F_2}{\partial y}y'+\frac{\partial F_2}{\partial y'}F_2 \\
&= \frac{(x^2-6x-10)\,y'+2y(x-5)}{(x+4)^2} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x}+\frac{\partial F_3}{\partial y}y'+\frac{\partial F_3}{\partial y'}F_3 \\
&= \frac{(-x^3+6x^2+34x-24)\,y'-2y(x+3)\,(x-8)}{(x+4)^3}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=2$ and $y'(0)=5$ gives

$$
\begin{aligned}
F_0 &= -\frac{7}{2} \\
F_1 &= -\frac{9}{8} \\
F_2 &= \frac{37}{8} \\
F_3 &= -\frac{35}{8} \\
F_4 &= -\frac{3}{8}
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y = 5x + 2 - \frac{7x^2}{4} - \frac{3x^3}{16} + \frac{37x^4}{192} - \frac{7x^5}{192} - \frac{x^6}{1920} + O(x^6)$$

$$y = 5x + 2 - \frac{7x^2}{4} - \frac{3x^3}{16} + \frac{37x^4}{192} - \frac{7x^5}{192} - \frac{x^6}{1920} + O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(x+4)\, y'' + (2+x)\, y' + 2y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(x+4)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + (2+x)\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) + 2\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n\, x^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} 4n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 2n a_n x^{n-1}\right) + \left(\sum_{n=1}^{\infty} n a_n x^n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the

power and the corresponding index gives

$$\sum_{n=2}^{\infty} n\, x^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} (n+1)\, a_{n+1} n\, x^{n}$$

$$\sum_{n=2}^{\infty} 4n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} 4(n+2)\, a_{n+2} (n+1)\, x^{n}$$

$$\sum_{n=1}^{\infty} 2n a_n x^{n-1} = \sum_{n=0}^{\infty} 2(n+1)\, a_{n+1} x^{n}$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=1}^{\infty} (n+1)\, a_{n+1} n\, x^{n}\right) + \left(\sum_{n=0}^{\infty} 4(n+2)\, a_{n+2} (n+1)\, x^{n}\right) + \left(\sum_{n=0}^{\infty} 2(n+1)\, a_{n+1} x^{n}\right) + \left(\sum_{n=1}^{\infty} n a_n x^{n}\right) + \left(\sum_{n=0}^{\infty} 2 a_n x^{n}\right) = 0 \tag{3}$$

$n = 0$ gives

$$8a_2 + 2a_1 + 2a_0 = 0$$

$$a_2 = -\frac{a_0}{4} - \frac{a_1}{4}$$

For $1 \leq n$, the recurrence equation is

$$(n+1)\, a_{n+1} n + 4(n+2)\, a_{n+2} (n+1) + 2(n+1)\, a_{n+1} + n a_n + 2a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{n a_{n+1} + a_n + a_{n+1}}{4\,(n+1)} \\ &= -\frac{a_n}{4\,(n+1)} - \frac{a_{n+1}}{4} \end{aligned} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$6a_2 + 24a_3 + 3a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = \frac{a_0}{16} - \frac{a_1}{16}$$

For $n = 2$ the recurrence equation gives

$$12a_3 + 48a_4 + 4a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{192} + \frac{7a_1}{192}$$

For $n = 3$ the recurrence equation gives

$$20a_4 + 80a_5 + 5a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{a_0}{192} - \frac{a_1}{192}$$

For $n = 4$ the recurrence equation gives

$$30a_5 + 120a_6 + 6a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{a_0}{960} - \frac{a_1}{1920}$$

For $n = 5$ the recurrence equation gives

$$42a_6 + 168a_7 + 7a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{a_0}{23040} + \frac{a_1}{2880}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x + \left(-\frac{a_0}{4} - \frac{a_1}{4}\right) x^2 + \left(\frac{a_0}{16} - \frac{a_1}{16}\right) x^3 + \left(\frac{a_0}{192} + \frac{7a_1}{192}\right) x^4 + \left(-\frac{a_0}{192} - \frac{a_1}{192}\right) x^5 + \dots$$

Collecting terms, the solution becomes

$$\begin{aligned} y = &\left(1 - \frac{1}{4}x^2 + \frac{1}{16}x^3 + \frac{1}{192}x^4 - \frac{1}{192}x^5\right) a_0 \\ &+ \left(x - \frac{1}{4}x^2 - \frac{1}{16}x^3 + \frac{7}{192}x^4 - \frac{1}{192}x^5\right) a_1 + O(x^6) \end{aligned} \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{1}{4}x^2 + \frac{1}{16}x^3 + \frac{1}{192}x^4 - \frac{1}{192}x^5\right) c_1 + \left(x - \frac{1}{4}x^2 - \frac{1}{16}x^3 + \frac{7}{192}x^4 - \frac{1}{192}x^5\right) c_2 + O(x^6)$$

$$y = 2 - \frac{7x^2}{4} - \frac{3x^3}{16} + \frac{37x^4}{192} - \frac{7x^5}{192} + 5x + O(x^6)$$

Summary

The solution(s) found are the following

$$y = 5x + 2 - \frac{7x^2}{4} - \frac{3x^3}{16} + \frac{37x^4}{192} - \frac{7x^5}{192} - \frac{x^6}{1920} + O(x^6) \tag{1}$$

$$y = 2 - \frac{7x^2}{4} - \frac{3x^3}{16} + \frac{37x^4}{192} - \frac{7x^5}{192} + 5x + O(x^6) \tag{2}$$

Verification of solutions

$$y = 5x + 2 - \frac{7x^2}{4} - \frac{3x^3}{16} + \frac{37x^4}{192} - \frac{7x^5}{192} - \frac{x^6}{1920} + O(x^6)$$

Verified OK.

$$y = 2 - \frac{7x^2}{4} - \frac{3x^3}{16} + \frac{37x^4}{192} - \frac{7x^5}{192} + 5x + O(x^6)$$

Verified OK.

13.7.2 Maple step by step solution

Let's solve

$$\left[(x+4)\,y''+(2+x)\,y'+2y=0, y(0)=2, y'\Big|_{\{x=0\}}=5\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{2y}{x+4}-\frac{(2+x)y'}{x+4}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(2+x)y'}{x+4}+\frac{2y}{x+4}=0$

☐ Check to see if $x_0=-4$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{2+x}{x+4}, P_3(x)=\frac{2}{x+4}\right]$

  ◦ $(x+4)\cdot P_2(x)$ is analytic at $x=-4$

  $\left((x+4)\cdot P_2(x)\right)\Big|_{x=-4}=-2$

  ◦ $(x+4)^2\cdot P_3(x)$ is analytic at $x=-4$

  $\left((x+4)^2\cdot P_3(x)\right)\Big|_{x=-4}=0$

  ◦ $x=-4$is a regular singular point

  Check to see if $x_0=-4$ is a regular singular point

  $x_0=-4$

- Multiply by denominators

  $(x+4)\,y''+(2+x)\,y'+2y=0$

- Change variables using $x=u-4$ so that the regular singular point is at $u=0$

  $u\left(\frac{d^2}{du^2}y(u)\right)+(-2+u)\left(\frac{d}{du}y(u)\right)+2y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$
- Shift index using $k->k+1-m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$
- Convert $u \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

  $u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-1}$
- Shift index using $k->k+1$

  $u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\,(k+r)\, u^{k+r}$

  Rewrite ODE with series expansions

  $a_0 r(-3+r)\, u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(a_{k+1}(k+1+r)\,(k-2+r) + a_k(k+r+2)\right) u^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $r(-3+r) = 0$
- Values of r that satisfy the indicial equation

  $r \in \{0, 3\}$
- Each term in the series must be 0, giving the recursion relation

  $a_{k+1}(k+1+r)\,(k-2+r) + a_k(k+r+2) = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+1} = -\frac{a_k(k+r+2)}{(k+1+r)(k-2+r)}$
- Recursion relation for $r = 0$

  $a_{k+1} = -\frac{a_k(k+2)}{(k+1)(k-2)}$
- Series not valid for $r = 0$, division by 0 in the recursion relation at $k = 2$

  $a_{k+1} = -\frac{a_k(k+2)}{(k+1)(k-2)}$
- Recursion relation for $r = 3$

  $a_{k+1} = -\frac{a_k(k+5)}{(k+4)(k+1)}$
- Solution for $r = 3$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^{k+3}, a_{k+1}=-\frac{a_k(k+5)}{(k+4)(k+1)}\right]$$

- Revert the change of variables $u=x+4$

$$\left[y=\sum_{k=0}^{\infty} a_k (x+4)^{k+3}, a_{k+1}=-\frac{a_k(k+5)}{(k+4)(k+1)}\right]$$

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{(2x^2 - 3x + 2)\, y'' - (4 - 6x)\, y' + 2y = 0}$$

With initial conditions

$$[y(1) = 1, y'(1) = -1]$$

With the expansion point for the power series method at $x = 1$.

13.8.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= \frac{6x - 4}{2x^2 - 3x + 2} \\ q(x) &= \frac{2}{2x^2 - 3x + 2} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{(6x-4)\, y'}{2x^2-3x+2} + \frac{2y}{2x^2-3x+2} = 0$$

The domain of $p(x) = \frac{6x-4}{2x^2-3x+2}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 1$ is inside this domain. The domain of $q(x) = \frac{2}{2x^2-3x+2}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x - 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(2(t+1)^2 - 3t - 1\right)\left(\frac{d^2}{dt^2}y(t)\right) + (6t+2)\left(\frac{d}{dt}y(t)\right) + 2y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = 1$$
$$y'(0) = -1$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (950) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (951) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2\left(3t\left(\frac{d}{dt}y(t)\right) + \frac{d}{dt}y(t) + y(t)\right)}{2t^2 + t + 1} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0 \\
&= \frac{\left(44t^2 + 30t - 2\right)\left(\frac{d}{dt}y(t)\right) + \left(20t + 6\right)y(t)}{\left(2t^2 + t + 1\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1 \\
&= \frac{\left(-400t^3 - 416t^2 + 52t + 44\right)\left(\frac{d}{dt}y(t)\right) - 208\left(t^2 + \frac{8}{13}t - \frac{3}{52}\right)y(t)}{\left(2t^2 + t + 1\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2 \\
&= \frac{\left(4384t^4 + 6160t^3 - 1096t^2 - 1948t - 156\right)\left(\frac{d}{dt}y(t)\right) + 2464\left(t^3 + \frac{145}{154}t^2 - \frac{51}{308}t - \frac{9}{88}\right)y(t)}{\left(2t^2 + t + 1\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3 \\
&= \frac{\left(-56448t^5 - 100224t^4 + 22752t^3 + 63232t^2 + 10320t - 1264\right)\left(\frac{d}{dt}y(t)\right) - 33408y(t)\left(t^4 + \frac{37}{29}t^3 - \frac{37}{116}t\right.}{\left(2t^2 + t + 1\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = 1$ and $y'(0) = -1$ gives

$$
\begin{aligned}
F_0 &= 0 \\
F_1 &= 8 \\
F_2 &= -32 \\
F_3 &= -96 \\
F_4 &= 2176
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = 1 - t + \frac{4t^3}{3} - \frac{4t^4}{3} - \frac{4t^5}{5} + \frac{136t^6}{45} + O(t^6)$$

$$y(t) = 1 - t + \frac{4t^3}{3} - \frac{4t^4}{3} - \frac{4t^5}{5} + \frac{136t^6}{45} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(2t^2 + t + 1) + (6t + 2)\left(\frac{d}{dt}y(t)\right) + 2y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\begin{aligned}\frac{d}{dt}y(t) &= \sum_{n=1}^{\infty} n a_n t^{n-1} \\ \frac{d^2}{dt^2}y(t) &= \sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}\end{aligned}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}\right)(2t^2 + t + 1) + (6t + 2)\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + 2\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}&\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} n\, t^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}\right) \\ &+ \left(\sum_{n=1}^{\infty} 6n a_n t^n\right) + \left(\sum_{n=1}^{\infty} 2n a_n t^{n-1}\right) + \left(\sum_{n=0}^{\infty} 2a_n t^n\right) = 0\end{aligned} \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n\, t^{n-1} a_n(n-1) = \sum_{n=1}^{\infty} (n+1)\, a_{n+1} n\, t^n$$

$$\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, t^n$$

$$\sum_{n=1}^{\infty} 2n a_n t^{n-1} = \sum_{n=0}^{\infty} 2(n+1)\, a_{n+1} t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right) + \left(\sum_{n=1}^{\infty} (n+1)\, a_{n+1} n\, t^n\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, t^n\right) + \left(\sum_{n=1}^{\infty} 6n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 2(n+1)\, a_{n+1} t^n\right) + \left(\sum_{n=0}^{\infty} 2a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 2a_1 + 2a_0 = 0$$

$$a_2 = -a_0 - a_1$$

$n = 1$ gives

$$6a_2 + 6a_3 + 8a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = a_0 - \frac{a_1}{3}$$

For $2 \leq n$, the recurrence equation is

$$2n a_n(n-1) + (n+1)\, a_{n+1} n + (n+2)\, a_{n+2}(n+1) + 6n a_n + 2(n+1)\, a_{n+1} + 2a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$
\begin{aligned}
a_{n+2} &= -\frac{2na_n + na_{n+1} + 2a_n + 2a_{n+1}}{n+2} \\
&= -\frac{(2n+2)\, a_n}{n+2} - a_{n+1}
\end{aligned} \tag{5}
$$

For $n = 2$ the recurrence equation gives

$$18a_2 + 12a_3 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{2} + \frac{11a_1}{6}$$

For $n = 3$ the recurrence equation gives

$$32a_3 + 20a_4 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{21a_0}{10} - \frac{13a_1}{10}$$

For $n = 4$ the recurrence equation gives

$$50a_4 + 30a_5 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{19a_0}{15} - \frac{79a_1}{45}$$

For $n = 5$ the recurrence equation gives

$$72a_5 + 42a_6 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{7a_0}{3} + \frac{251a_1}{63}$$

And so on. Therefore the solution is

$$\begin{aligned}y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots\end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + (-a_0 - a_1) t^2 + \left(a_0 - \frac{a_1}{3}\right) t^3 + \left(\frac{a_0}{2} + \frac{11 a_1}{6}\right) t^4 + \left(-\frac{21 a_0}{10} - \frac{13 a_1}{10}\right) t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - t^2 + t^3 + \frac{1}{2} t^4 - \frac{21}{10} t^5\right) a_0 + \left(t - t^2 - \frac{1}{3} t^3 + \frac{11}{6} t^4 - \frac{13}{10} t^5\right) a_1 + O(t^6) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - t^2 + t^3 + \frac{1}{2} t^4 - \frac{21}{10} t^5\right) c_1 + \left(t - t^2 - \frac{1}{3} t^3 + \frac{11}{6} t^4 - \frac{13}{10} t^5\right) c_2 + O(t^6)$$

$$y(t) = 1 + \frac{4t^3}{3} - \frac{4t^4}{3} - \frac{4t^5}{5} - t + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x - 1$ results in

$$y = 2 - x + \frac{4(x-1)^3}{3} - \frac{4(x-1)^4}{3} - \frac{4(x-1)^5}{5} + \frac{136(x-1)^6}{45} + O\left((x-1)^6\right)$$

Summary

The solution(s) found are the following

$$y = 2 - x + \frac{4(x-1)^3}{3} - \frac{4(x-1)^4}{3} - \frac{4(x-1)^5}{5} + \frac{136(x-1)^6}{45} + O\left((x-1)^6\right) \quad (1)$$

Verification of solutions

$$y = 2 - x + \frac{4(x-1)^3}{3} - \frac{4(x-1)^4}{3} - \frac{4(x-1)^5}{5} + \frac{136(x-1)^6}{45} + O\left((x-1)^6\right)$$

Verified OK.

13.8.2 Maple step by step solution

Let's solve

$$\left[\left(2x^2-3x+2\right)y''+\left(6x-4\right)y'+2y=0, y(1)=1, y'\Big|_{\{x=1\}}=-1\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{2y}{2x^2-3x+2}-\frac{2(3x-2)y'}{2x^2-3x+2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{2(3x-2)y'}{2x^2-3x+2}+\frac{2y}{2x^2-3x+2}=0$

☐ Check to see if x_0 is a regular singular point

- ○ Define functions

  $\left[P_2(x)=\frac{2(3x-2)}{2x^2-3x+2}, P_3(x)=\frac{2}{2x^2-3x+2}\right]$

- ○ $\left(\frac{\mathrm{I}\sqrt{7}}{4}+x-\frac{3}{4}\right)\cdot P_2(x)$ is analytic at $x=-\frac{\mathrm{I}\sqrt{7}}{4}+\frac{3}{4}$

  $\left(\left(\frac{\mathrm{I}\sqrt{7}}{4}+x-\frac{3}{4}\right)\cdot P_2(x)\right)\Bigg|_{x=-\frac{\mathrm{I}\sqrt{7}}{4}+\frac{3}{4}}=0$

- ○ $\left(\frac{\mathrm{I}\sqrt{7}}{4}+x-\frac{3}{4}\right)^2\cdot P_3(x)$ is analytic at $x=-\frac{\mathrm{I}\sqrt{7}}{4}+\frac{3}{4}$

  $\left(\left(\frac{\mathrm{I}\sqrt{7}}{4}+x-\frac{3}{4}\right)^2\cdot P_3(x)\right)\Bigg|_{x=-\frac{\mathrm{I}\sqrt{7}}{4}+\frac{3}{4}}=0$

- ○ $x=-\frac{\mathrm{I}\sqrt{7}}{4}+\frac{3}{4}$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-\frac{\mathrm{I}\sqrt{7}}{4}+\frac{3}{4}$

- Multiply by denominators

  $\left(2x^2-3x+2\right)y''+\left(6x-4\right)y'+2y=0$

- Change variables using $x=u-\frac{\mathrm{I}\sqrt{7}}{4}+\frac{3}{4}$ so that the regular singular point is at $u=0$

  $\left(2u^2-\mathrm{I}u\sqrt{7}\right)\left(\frac{d^2}{du^2}y(u)\right)+\left(6u-\frac{3\,\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}\right)\left(\frac{d}{du}y(u)\right)+2y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$

- ☐ Rewrite ODE with series expansions
  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

    $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$$
  - Shift index using $k->k+1-m$

    $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$
  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

    $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$$
  - Shift index using $k->k+2-m$

    $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$-\frac{\mathrm{I}\sqrt{7}\, r\left(\mathrm{I}\sqrt{7}+7+14r\right) a_0 u^{-1+r}}{14} + \left(\sum_{k=0}^{\infty}\left(-\frac{\mathrm{I}\sqrt{7}\,(k+r+1)\left(\mathrm{I}\sqrt{7}+14k+21+14r\right) a_{k+1}}{14} + 2a_k(k+r+1)^2\right) u^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$-\frac{\mathrm{I}}{14}\sqrt{7}\, r\left(\mathrm{I}\sqrt{7}+7+14r\right) = 0$$
- Values of r that satisfy the indicial equation

  $$r \in \left\{0, -\frac{1}{2}-\frac{\mathrm{I}\sqrt{7}}{14}\right\}$$
- Each term in the series must be 0, giving the recursion relation

  $$-(k+r+1)\left(\mathrm{I}\left(k+r+\frac{3}{2}\right) a_{k+1}\sqrt{7} - \frac{a_{k+1}}{2} + (-2k-2r-2)\, a_k\right) = 0$$
- Recursion relation that defines series solution to ODE

  $$a_{k+1} = \frac{4a_k(k+r+1)}{-1+2\,\mathrm{I}\sqrt{7}\,k+2\,\mathrm{I}\sqrt{7}\,r+3\,\mathrm{I}\sqrt{7}}$$
- Recursion relation for $r = 0$

  $$a_{k+1} = \frac{4a_k(k+1)}{-1+2\,\mathrm{I}\sqrt{7}\,k+3\,\mathrm{I}\sqrt{7}}$$
- Solution for $r = 0$

  $$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+1} = \frac{4a_k(k+1)}{-1+2\,\mathrm{I}\sqrt{7}\,k+3\,\mathrm{I}\sqrt{7}}\right]$$
- Revert the change of variables $u = \frac{\mathrm{I}\sqrt{7}}{4} + x - \frac{3}{4}$

$$\left[y=\sum_{k=0}^{\infty} a_k \left(\frac{I\sqrt{7}}{4}+x-\frac{3}{4}\right)^k, a_{k+1}=\frac{4a_k(k+1)}{-1+2I\sqrt{7}\,k+3I\sqrt{7}}\right]$$

- Recursion relation for $r=-\frac{1}{2}-\frac{I\sqrt{7}}{14}$

$$a_{k+1}=\frac{4a_k\left(k+\frac{1}{2}-\frac{I\sqrt{7}}{14}\right)}{-1+2I\sqrt{7}\,k+2I\sqrt{7}\left(-\frac{1}{2}-\frac{I\sqrt{7}}{14}\right)+3I\sqrt{7}}$$

- Solution for $r=-\frac{1}{2}-\frac{I\sqrt{7}}{14}$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^{k-\frac{1}{2}-\frac{I\sqrt{7}}{14}}, a_{k+1}=\frac{4a_k\left(k+\frac{1}{2}-\frac{I\sqrt{7}}{14}\right)}{-1+2I\sqrt{7}\,k+2I\sqrt{7}\left(-\frac{1}{2}-\frac{I\sqrt{7}}{14}\right)+3I\sqrt{7}}\right]$$

- Revert the change of variables $u=\frac{I\sqrt{7}}{4}+x-\frac{3}{4}$

$$\left[y=\sum_{k=0}^{\infty} a_k \left(\frac{I\sqrt{7}}{4}+x-\frac{3}{4}\right)^{k-\frac{1}{2}-\frac{I\sqrt{7}}{14}}, a_{k+1}=\frac{4a_k\left(k+\frac{1}{2}-\frac{I\sqrt{7}}{14}\right)}{-1+2I\sqrt{7}\,k+2I\sqrt{7}\left(-\frac{1}{2}-\frac{I\sqrt{7}}{14}\right)+3I\sqrt{7}}\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k \left(\frac{I\sqrt{7}}{4}+x-\frac{3}{4}\right)^k\right)+\left(\sum_{k=0}^{\infty} b_k \left(\frac{I\sqrt{7}}{4}+x-\frac{3}{4}\right)^{k-\frac{1}{2}-\frac{I\sqrt{7}}{14}}\right), a_{1+k}=\frac{4a_k(1+k)}{-1+2I\sqrt{7}\,k+3I\sqrt{7}}, b_{1+k}=$$

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(2x^2+3x)\, y''+10(x+1)\, y'+8y=0}$$

With initial conditions

$$[y(-1)=1, y'(-1)=-1]$$

With the expansion point for the power series method at $x=-1$.

13.9.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned} p(x) &= \frac{10x+10}{2x^2+3x} \\ q(x) &= \frac{8}{2x^2+3x} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{(10x + 10)\, y'}{2x^2 + 3x} + \frac{8y}{2x^2 + 3x} = 0$$

The domain of $p(x) = \frac{10x+10}{2x^2+3x}$ is

$$\left\{-\infty \le x < 0, 0 < x < -\frac{3}{2}, -\frac{3}{2} < x \le \infty\right\}$$

And the point $x_0 = -1$ is inside this domain. The domain of $q(x) = \frac{8}{2x^2+3x}$ is

$$\left\{-\infty \le x < 0, 0 < x < -\frac{3}{2}, -\frac{3}{2} < x \le \infty\right\}$$

And the point $x_0 = -1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x + 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(2(-1 + t)^2 - 3 + 3t\right) \left(\frac{d^2}{dt^2} y(t)\right) + 10t \left(\frac{d}{dt} y(t)\right) + 8y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = 1$$
$$y'(0) = -1$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (953) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (954) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{align}
F_0 &= f(x,y,y') \tag{4}\\
F_1 &= \frac{df}{dx} \nonumber\\
&= \frac{dF_0}{dx} \nonumber\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \nonumber\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{5}\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \nonumber\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right) \nonumber\\
&= \frac{d}{dx}(F_1) \nonumber\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y'' \nonumber\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0 \nonumber\\
&\vdots \nonumber\\
F_n &= \frac{d}{dx}(F_{n-1}) \nonumber\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y'' \nonumber\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \tag{6}
\end{align}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2\left(5t\left(\frac{d}{dt}y(t)\right) + 4y(t)\right)}{2t^2 - t - 1} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0 \\
&= \frac{\left(104t^2 + 8t + 18\right)\left(\frac{d}{dt}y(t)\right) + \left(112t - 8\right)y(t)}{\left(2t^2 - t - 1\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1 \\
&= \frac{\left(-1232t^3 - 256t^2 - 628t + 36\right)\left(\frac{d}{dt}y(t)\right) - 1504\left(t^2 - \frac{7}{94}t + \frac{17}{94}\right)y(t)}{\left(2t^2 - t - 1\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2 \\
&= \frac{\left(16704t^4 + 6336t^3 + 16848t^2 - 1376t + 1008\right)\left(\frac{d}{dt}y(t)\right) + 21888\left(t^3 - \frac{1}{38}t^2 + \frac{10}{19}t - \frac{1}{18}\right)y(t)}{\left(2t^2 - t - 1\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3 \\
&= \frac{\left(-256896t^5 - 149760t^4 - 429408t^3 + 34336t^2 - 74336t + 6624\right)\left(\frac{d}{dt}y(t)\right) - 352512\left(t^4 + \frac{19}{306}t^3 + \frac{35}{34}t^2 \right.}{\left(2t^2 - t - 1\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = 1$ and $y'(0) = -1$ gives

$$
\begin{aligned}
F_0 &= 8 \\
F_1 &= -26 \\
F_2 &= 308 \\
F_3 &= -2224 \\
F_4 &= 31072
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = 4t^2 - t + 1 - \frac{13t^3}{3} + \frac{77t^4}{6} - \frac{278t^5}{15} + \frac{1942t^6}{45} + O(t^6)$$

$$y(t) = 4t^2 - t + 1 - \frac{13t^3}{3} + \frac{77t^4}{6} - \frac{278t^5}{15} + \frac{1942t^6}{45} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(2t^2 - t - 1) + 10t\left(\frac{d}{dt}y(t)\right) + 8y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right)(2t^2 - t - 1) + 10t\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + 8\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right) + \sum_{n=2}^{\infty} \left(-n\, t^{n-1} a_n (n-1)\right) + \sum_{n=2}^{\infty} \left(-n(n-1)\, a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} 10 n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 8 a_n t^n\right) = 0 \quad (2)$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} \left(-n\, t^{n-1} a_n (n-1)\right) = \sum_{n=1}^{\infty} \left(-(n+1)\, a_{n+1} n\, t^n\right)$$

$$\sum_{n=2}^{\infty} \left(-n(n-1)\, a_n t^{n-2}\right) = \sum_{n=0}^{\infty} \left(-(n+2)\, a_{n+2} (n+1)\, t^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right) + \sum_{n=1}^{\infty} \left(-(n+1)\, a_{n+1} n\, t^n\right) + \sum_{n=0}^{\infty} \left(-(n+2)\, a_{n+2}(n+1)\, t^n\right) + \left(\sum_{n=1}^{\infty} 10 n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 8 a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$-2a_2 + 8a_0 = 0$$

$$a_2 = 4a_0$$

$n = 1$ gives

$$-2a_2 - 6a_3 + 18a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{4a_0}{3} + 3a_1$$

For $2 \leq n$, the recurrence equation is

$$2na_n(n-1) - (n+1)\, a_{n+1} n - (n+2)\, a_{n+2}(n+1) + 10na_n + 8a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$
\begin{aligned}
a_{n+2} &= \frac{2n^2 a_n - n^2 a_{n+1} + 8n a_n - n a_{n+1} + 8a_n}{(n+2)(n+1)} \\
&= \frac{(2n^2 + 8n + 8) a_n}{(n+2)(n+1)} + \frac{(-n^2 - n) a_{n+1}}{(n+2)(n+1)}
\end{aligned} \tag{5}
$$

For $n = 2$ the recurrence equation gives

$$32a_2 - 6a_3 - 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{34a_0}{3} - \frac{3a_1}{2}$$

For $n = 3$ the recurrence equation gives

$$50a_3 - 12a_4 - 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{152a_0}{15} + \frac{42a_1}{5}$$

For $n = 4$ the recurrence equation gives

$$72a_4 - 20a_5 - 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{1528a_0}{45} - \frac{46a_1}{5}$$

For $n = 5$ the recurrence equation gives

$$98a_5 - 30a_6 - 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{15088a_0}{315} + \frac{916a_1}{35}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + 4a_0 t^2 + \left(-\frac{4a_0}{3} + 3a_1\right) t^3 + \left(\frac{34a_0}{3} - \frac{3a_1}{2}\right) t^4 + \left(-\frac{152a_0}{15} + \frac{42a_1}{5}\right) t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 + 4t^2 - \frac{4}{3}t^3 + \frac{34}{3}t^4 - \frac{152}{15}t^5\right) a_0 + \left(t + 3t^3 - \frac{3}{2}t^4 + \frac{42}{5}t^5\right) a_1 + O(t^6) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 + 4t^2 - \frac{4}{3}t^3 + \frac{34}{3}t^4 - \frac{152}{15}t^5\right) c_1 + \left(t + 3t^3 - \frac{3}{2}t^4 + \frac{42}{5}t^5\right) c_2 + O(t^6)$$

$$y(t) = 1 + 4t^2 - \frac{13t^3}{3} + \frac{77t^4}{6} - \frac{278t^5}{15} - t + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x+1$ results in

$$y = 4(x+1)^2 - x - \frac{13(x+1)^3}{3} + \frac{77(x+1)^4}{6} - \frac{278(x+1)^5}{15} + \frac{1942(x+1)^6}{45} + O\left((x+1)^6\right)$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = 4(x+1)^2 - x - \frac{13(x+1)^3}{3} + \frac{77(x+1)^4}{6} \\ - \frac{278(x+1)^5}{15} + \frac{1942(x+1)^6}{45} + O\left((x+1)^6\right) \end{aligned} \quad (1)$$

Verification of solutions

$$y = 4(x+1)^2 - x - \frac{13(x+1)^3}{3} + \frac{77(x+1)^4}{6} - \frac{278(x+1)^5}{15} + \frac{1942(x+1)^6}{45} + O\left((x+1)^6\right)$$

Verified OK.

13.9.2 Maple step by step solution

Let's solve

$$\left[\left(2x^2+3x\right)y''+\left(10x+10\right)y'+8y=0, y(-1)=1, y'\Big|_{\{x=-1\}}=-1\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{8y}{x(2x+3)}-\frac{10(x+1)y'}{x(2x+3)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{10(x+1)y'}{x(2x+3)}+\frac{8y}{x(2x+3)}=0$

☐ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{10(x+1)}{x(2x+3)}, P_3(x)=\frac{8}{x(2x+3)}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $(x\cdot P_2(x))\Big|_{x=0}=\frac{10}{3}$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $(x^2\cdot P_3(x))\Big|_{x=0}=0$

  ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $y''x(2x+3)+(10x+10)y'+8y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

  ◦ Convert $x^m\cdot y'$ to series expansion for $m=0..1$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k+1-m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 1..2$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k- >k+2-m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0 r(7+3r)\, x^{-1+r} + \left(\sum_{k=0}^{\infty} \left(a_{k+1}(k+1+r)\,(3k+10+3r) + 2a_k(k+r+2)^2\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$r(7+3r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{0, -\frac{7}{3}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$a_{k+1}(k+1+r)\,(3k+10+3r) + 2a_k(k+r+2)^2 = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = -\frac{2a_k(k+r+2)^2}{(k+1+r)(3k+10+3r)}$$

- Recursion relation for $r = 0$

$$a_{k+1} = -\frac{2a_k(k+2)^2}{(k+1)(3k+10)}$$

- Solution for $r = 0$

$$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+1} = -\frac{2a_k(k+2)^2}{(k+1)(3k+10)}\right]$$

- Recursion relation for $r = -\frac{7}{3}$

$$a_{k+1} = -\frac{2a_k\left(k-\frac{1}{3}\right)^2}{\left(k-\frac{4}{3}\right)(3k+3)}$$

- Solution for $r = -\frac{7}{3}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{7}{3}}, a_{k+1} = -\frac{2a_k \left(k-\frac{1}{3}\right)^2}{\left(k-\frac{4}{3}\right)(3k+3)}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^k\right) + \left(\sum_{k=0}^{\infty} b_k x^{k-\frac{7}{3}}\right), a_{1+k} = -\frac{2a_k (k+2)^2}{(1+k)(3k+10)}, b_{1+k} = -\frac{2b_k \left(k-\frac{1}{3}\right)^2}{\left(k-\frac{4}{3}\right)(3k+3)}\right]$$

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{(x^2 - x + 1)\, y'' - (-4x + 1)\, y' + 2y = 0}$$

With initial conditions

$$[y(1) = 2, y'(1) = -1]$$

With the expansion point for the power series method at $x = 1$.

13.10.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$p(x) = \frac{4x - 1}{x^2 - x + 1}$$
$$q(x) = \frac{2}{x^2 - x + 1}$$
$$F = 0$$

Hence the ode is

$$y'' + \frac{(4x-1)\, y'}{x^2 - x + 1} + \frac{2y}{x^2 - x + 1} = 0$$

The domain of $p(x) = \frac{4x-1}{x^2-x+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 1$ is inside this domain. The domain of $q(x) = \frac{2}{x^2-x+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x - 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left((t+1)^2 - t\right)\left(\frac{d^2}{dt^2} y(t)\right) + (4t+3)\left(\frac{d}{dt} y(t)\right) + 2y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$\begin{aligned} y(0) &= 2 \\ y'(0) &= -1 \end{aligned}$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (956) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (957) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{4t\left(\frac{d}{dt}y(t)\right) + 3\frac{d}{dt}y(t) + 2y(t)}{t^2+t+1} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0 \\
&= \frac{\left(18t^2+28t+6\right)\left(\frac{d}{dt}y(t)\right) + \left(12t+8\right)y(t)}{\left(t^2+t+1\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1 \\
&= \frac{\left(-96t^3-230t^2-104t+6\right)\left(\frac{d}{dt}y(t)\right) - 72y(t)\left(t^2+\frac{25}{18}t+\frac{2}{9}\right)}{\left(t^2+t+1\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2 \\
&= \frac{\left(600t^4+1956t^3+1380t^2-116t-156\right)\left(\frac{d}{dt}y(t)\right) + 480\left(t^3+\frac{43}{20}t^2+\frac{3}{4}t-\frac{2}{15}\right)y(t)}{\left(t^2+t+1\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3 \\
&= \frac{\left(-4320t^5-17892t^4-17352t^3+1572t^2+5624t+912\right)\left(\frac{d}{dt}y(t)\right) - 3600\left(t^4+\frac{147}{50}t^3+\frac{41}{25}t^2-\frac{12}{25}t-\frac{5}{22}\right.}{\left(t^2+t+1\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t=0$ and $y(0)=2$ and $y'(0)=-1$ gives

$$
\begin{aligned}
F_0 &= -1 \\
F_1 &= 10 \\
F_2 &= -38 \\
F_3 &= 28 \\
F_4 &= 944
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = -t + 2 - \frac{t^2}{2} + \frac{5t^3}{3} - \frac{19t^4}{12} + \frac{7t^5}{30} + \frac{59t^6}{45} + O(t^6)$$

$$y(t) = -t + 2 - \frac{t^2}{2} + \frac{5t^3}{3} - \frac{19t^4}{12} + \frac{7t^5}{30} + \frac{59t^6}{45} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(t^2 + t + 1) + (4t + 3)\left(\frac{d}{dt}y(t)\right) + 2y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right)(t^2 + t + 1) + (4t + 3)\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + 2\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} t^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} n\, t^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} 4n a_n t^n\right) + \left(\sum_{n=1}^{\infty} 3n a_n t^{n-1}\right) + \left(\sum_{n=0}^{\infty} 2a_n t^n\right) = 0 \quad (2)$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n\, t^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} (n+1)\, a_{n+1} n\, t^n$$

$$\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2} (n+1)\, t^n$$

$$\sum_{n=1}^{\infty} 3n a_n t^{n-1} = \sum_{n=0}^{\infty} 3(n+1)\, a_{n+1} t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} t^n a_n n(n-1)\right) + \left(\sum_{n=1}^{\infty} (n+1)\, a_{n+1} n\, t^n\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2} (n+1)\, t^n\right) + \left(\sum_{n=1}^{\infty} 4n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 3(n+1)\, a_{n+1} t^n\right) + \left(\sum_{n=0}^{\infty} 2 a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 3a_1 + 2a_0 = 0$$

$$a_2 = -a_0 - \frac{3a_1}{2}$$

$n = 1$ gives

$$8a_2 + 6a_3 + 6a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{4a_0}{3} + a_1$$

For $2 \leq n$, the recurrence equation is

$$n a_n (n-1) + (n+1)\, a_{n+1} n + (n+2)\, a_{n+2} (n+1) + 4n a_n + 3(n+1)\, a_{n+1} + 2a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$a_{n+2} = -\frac{na_n + na_{n+1} + 2a_n + 3a_{n+1}}{n+2}$$

(5)

$$= -a_n - \frac{(n+3)\, a_{n+1}}{n+2}$$

For $n = 2$ the recurrence equation gives

$$12a_2 + 15a_3 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{2a_0}{3} + \frac{a_1}{4}$$

For $n = 3$ the recurrence equation gives

$$20a_3 + 24a_4 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{8a_0}{15} - \frac{13a_1}{10}$$

For $n = 4$ the recurrence equation gives

$$30a_4 + 35a_5 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{58a_0}{45} + \frac{19a_1}{15}$$

For $n = 5$ the recurrence equation gives

$$42a_5 + 48a_6 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{296a_0}{315} - \frac{31a_1}{210}$$

And so on. Therefore the solution is

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$
$$= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + \left(-a_0 - \frac{3a_1}{2}\right) t^2 + \left(\frac{4a_0}{3} + a_1\right) t^3 + \left(-\frac{2a_0}{3} + \frac{a_1}{4}\right) t^4 + \left(-\frac{8a_0}{15} - \frac{13a_1}{10}\right) t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - t^2 + \frac{4}{3}t^3 - \frac{2}{3}t^4 - \frac{8}{15}t^5\right) a_0 + \left(t - \frac{3}{2}t^2 + t^3 + \frac{1}{4}t^4 - \frac{13}{10}t^5\right) a_1 + O(t^6) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - t^2 + \frac{4}{3}t^3 - \frac{2}{3}t^4 - \frac{8}{15}t^5\right) c_1 + \left(t - \frac{3}{2}t^2 + t^3 + \frac{1}{4}t^4 - \frac{13}{10}t^5\right) c_2 + O(t^6)$$

$$y(t) = 2 - \frac{t^2}{2} + \frac{5t^3}{3} - \frac{19t^4}{12} + \frac{7t^5}{30} - t + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x - 1$ results in

$$y = -x + 3 - \frac{(x-1)^2}{2} + \frac{5(x-1)^3}{3} - \frac{19(x-1)^4}{12} + \frac{7(x-1)^5}{30} + \frac{59(x-1)^6}{45} + O\left((x-1)^6\right)$$

Summary

The solution(s) found are the following

$$y = -x + 3 - \frac{(x-1)^2}{2} + \frac{5(x-1)^3}{3} - \frac{19(x-1)^4}{12} + \frac{7(x-1)^5}{30} + \frac{59(x-1)^6}{45} + O\left((x-1)^6\right) \quad (1)$$

Verification of solutions

$$y = -x + 3 - \frac{(x-1)^2}{2} + \frac{5(x-1)^3}{3} - \frac{19(x-1)^4}{12} + \frac{7(x-1)^5}{30} + \frac{59(x-1)^6}{45} + O\left((x-1)^6\right)$$

Verified OK.

13.10.2 Maple step by step solution

Let's solve

$$\left[\left(x^2-x+1\right)y''+\left(4x-1\right)y'+2y=0, y(1)=2, y'\Big|_{\{x=1\}}=-1\right]$$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y''=-\frac{2y}{x^2-x+1}-\frac{(4x-1)y'}{x^2-x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''+\frac{(4x-1)y'}{x^2-x+1}+\frac{2y}{x^2-x+1}=0$

☐ Check to see if x_0 is a regular singular point

◦ Define functions

$\left[P_2(x)=\frac{4x-1}{x^2-x+1}, P_3(x)=\frac{2}{x^2-x+1}\right]$

◦ $\left(\frac{\mathrm{I}\sqrt{3}}{2}+x-\frac{1}{2}\right)\cdot P_2(x)$ is analytic at $x=\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}$

$\left(\left(\frac{\mathrm{I}\sqrt{3}}{2}+x-\frac{1}{2}\right)\cdot P_2(x)\right)\Big|_{x=\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}}=0$

◦ $\left(\frac{\mathrm{I}\sqrt{3}}{2}+x-\frac{1}{2}\right)^2\cdot P_3(x)$ is analytic at $x=\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}$

$\left(\left(\frac{\mathrm{I}\sqrt{3}}{2}+x-\frac{1}{2}\right)^2\cdot P_3(x)\right)\Big|_{x=\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}}=0$

◦ $x=\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0=\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}$

- Multiply by denominators

$\left(x^2-x+1\right)y''+\left(4x-1\right)y'+2y=0$

- Change variables using $x=u+\frac{1}{2}-\frac{\mathrm{I}\sqrt{3}}{2}$ so that the regular singular point is at $u=0$

$\left(u^2-\mathrm{I}u\sqrt{3}\right)\left(\frac{d^2}{du^2}y(u)\right)+\left(4u+1-2\,\mathrm{I}\sqrt{3}\right)\left(\frac{d}{du}y(u)\right)+2y(u)=0$

- Assume series solution for $y(u)$

$y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

- □ Rewrite ODE with series expansions
  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

    $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$$
  - Shift index using $k->k+1-m$

    $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$
  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

    $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$$
  - Shift index using $k->k+2-m$

    $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$-\frac{\mathrm{I}\sqrt{3}\, r\left(\mathrm{I}\sqrt{3}+3+3r\right) a_0 u^{-1+r}}{3} + \left(\sum_{k=0}^{\infty}\left(-\frac{\mathrm{I}\sqrt{3}\,(k+r+1)\left(\mathrm{I}\sqrt{3}+3k+6+3r\right) a_{k+1}}{3} + a_k(k+r+2)\,(k+r+1)\right) u^{k+r}$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$-\frac{\mathrm{I}}{3}\sqrt{3}\, r\left(\mathrm{I}\sqrt{3}+3+3r\right) = 0$$
- Values of r that satisfy the indicial equation

  $$r \in \left\{0, -1-\frac{\mathrm{I}\sqrt{3}}{3}\right\}$$
- Each term in the series must be 0, giving the recursion relation

  $$\left(-\mathrm{I}(k+r+2)\, a_{k+1}\sqrt{3} + a_{k+1} - (-k-2-r)\, a_k\right)(k+r+1) = 0$$
- Recursion relation that defines series solution to ODE

  $$a_{k+1} = \frac{a_k(k+r+2)}{-1+\mathrm{I}\sqrt{3}\, k+\mathrm{I}r\sqrt{3}+2\,\mathrm{I}\sqrt{3}}$$
- Recursion relation for $r = 0$

  $$a_{k+1} = \frac{a_k(k+2)}{-1+\mathrm{I}\sqrt{3}\, k+2\,\mathrm{I}\sqrt{3}}$$
- Solution for $r = 0$

  $$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+1} = \frac{a_k(k+2)}{-1+\mathrm{I}\sqrt{3}\, k+2\,\mathrm{I}\sqrt{3}}\right]$$
- Revert the change of variables $u = \frac{\mathrm{I}\sqrt{3}}{2} + x - \frac{1}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(\frac{I\sqrt{3}}{2} + x - \frac{1}{2}\right)^k, a_{k+1} = \frac{a_k(k+2)}{-1 + I\sqrt{3}\,k + 2I\sqrt{3}}\right]$$

- Recursion relation for $r = -1 - \frac{I\sqrt{3}}{3}$

$$a_{k+1} = \frac{a_k\left(k+1-\frac{I\sqrt{3}}{3}\right)}{-1 + I\sqrt{3}\,k + I\left(-1 - \frac{I\sqrt{3}}{3}\right)\sqrt{3} + 2I\sqrt{3}}$$

- Solution for $r = -1 - \frac{I\sqrt{3}}{3}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-1-\frac{I\sqrt{3}}{3}}, a_{k+1} = \frac{a_k\left(k+1-\frac{I\sqrt{3}}{3}\right)}{-1 + I\sqrt{3}\,k + I\left(-1 - \frac{I\sqrt{3}}{3}\right)\sqrt{3} + 2I\sqrt{3}}\right]$$

- Revert the change of variables $u = \frac{I\sqrt{3}}{2} + x - \frac{1}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(\frac{I\sqrt{3}}{2} + x - \frac{1}{2}\right)^{k-1-\frac{I\sqrt{3}}{3}}, a_{k+1} = \frac{a_k\left(k+1-\frac{I\sqrt{3}}{3}\right)}{-1 + I\sqrt{3}\,k + I\left(-1 - \frac{I\sqrt{3}}{3}\right)\sqrt{3} + 2I\sqrt{3}}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k \left(\frac{I\sqrt{3}}{2} + x - \frac{1}{2}\right)^k\right) + \left(\sum_{k=0}^{\infty} b_k \left(\frac{I\sqrt{3}}{2} + x - \frac{1}{2}\right)^{k-1-\frac{I\sqrt{3}}{3}}\right), a_{1+k} = \frac{a_k(k+2)}{-1 + I\sqrt{3}\,k + 2I\sqrt{3}}, b_{1+k} = \right.$$

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{(2+x)\,y''+(2+x)\,y'+y=0}$$

With initial conditions

$$[y(-1)=-2, y'(-1)=3]$$

With the expansion point for the power series method at $x=-1$.

13.11.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=1\\ q(x)&=\frac{1}{2+x}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' + y' + \frac{y}{2+x} = 0$$

The domain of $p(x) = 1$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = -1$ is inside this domain. The domain of $q(x) = \frac{1}{2+x}$ is

$$\{x < -2 \lor -2 < x\}$$

And the point $x_0 = -1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x + 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(\frac{d^2}{dt^2}y(t)\right)(t+1) + (t+1)\left(\frac{d}{dt}y(t)\right) + y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$\begin{aligned} y(0) &= -2 \\ y'(0) &= 3 \end{aligned}$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left.\frac{d^n f}{dx^n}\right|_{x_0,y_0,y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (959)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (960)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3)\\
&\;\;\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy'_0 + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y'_0} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{t\left(\frac{d}{dt}y(t)\right) + \frac{d}{dt}y(t) + y(t)}{t+1} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y(t)}F_0 \\
&= \frac{(t^2+t)\left(\frac{d}{dt}y(t)\right) + (2+t)\,y(t)}{(t+1)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y(t)}F_1 \\
&= \frac{(-t^3 - t^2 + 3t + 3)\left(\frac{d}{dt}y(t)\right) - y(t)\,(t^2+2t+3)}{(t+1)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y(t)}F_2 \\
&= \frac{(t+1)\,(t^3 - 7t - 12)\left(\frac{d}{dt}y(t)\right) + y(t)\,(t^3+2t^2-t+4)}{(t+1)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y(t)}F_3 \\
&= \frac{-(t+1)\,(t^4 - 12t^2 - 32t - 45)\left(\frac{d}{dt}y(t)\right) - y(t)\,(t^4+2t^3-6t^2-26t+5)}{(t+1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = -2$ and $y'(0) = 3$ gives

$$
\begin{aligned}
F_0 &= -1 \\
F_1 &= -4 \\
F_2 &= 15 \\
F_3 &= -44 \\
F_4 &= 145
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = -2 + 3t - \frac{t^2}{2} - \frac{2t^3}{3} + \frac{5t^4}{8} - \frac{11t^5}{30} + \frac{29t^6}{144} + O(t^6)$$

$$y(t) = -2 + 3t - \frac{t^2}{2} - \frac{2t^3}{3} + \frac{5t^4}{8} - \frac{11t^5}{30} + \frac{29t^6}{144} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(t+1) + (t+1)\left(\frac{d}{dt}y(t)\right) + y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right)(t+1) + (t+1)\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + \left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \qquad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n\,t^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} n a_n t^n\right) + \left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + \left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \qquad (2)$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=2}^{\infty} n\, t^{n-1} a_n(n-1) &= \sum_{n=1}^{\infty} (n+1)\, a_{n+1} n\, t^n \\
\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} &= \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, t^n \\
\sum_{n=1}^{\infty} n a_n t^{n-1} &= \sum_{n=0}^{\infty} (n+1)\, a_{n+1} t^n
\end{aligned}
$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$
\left(\sum_{n=1}^{\infty} (n+1)\, a_{n+1} n\, t^n\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, t^n\right) + \left(\sum_{n=1}^{\infty} n a_n t^n\right) + \left(\sum_{n=0}^{\infty} (n+1)\, a_{n+1} t^n\right) + \left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{3}
$$

$n = 0$ gives

$$
2a_2 + a_1 + a_0 = 0
$$

$$
a_2 = -\frac{a_0}{2} - \frac{a_1}{2}
$$

For $1 \leq n$, the recurrence equation is

$$
(n+1)\, a_{n+1} n + (n+2)\, a_{n+2}(n+1) + n a_n + (n+1)\, a_{n+1} + a_n = 0 \tag{4}
$$

Solving for a_{n+2}, gives

$$
\begin{aligned}
a_{n+2} &= -\frac{n a_{n+1} + a_n + a_{n+1}}{n+2} \\
&= -\frac{a_n}{n+2} - \frac{(n+1)\, a_{n+1}}{n+2}
\end{aligned} \tag{5}
$$

For $n = 1$ the recurrence equation gives

$$4a_2 + 6a_3 + 2a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = \frac{a_0}{3}$$

For $n = 2$ the recurrence equation gives

$$9a_3 + 12a_4 + 3a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{a_0}{8} + \frac{a_1}{8}$$

For $n = 3$ the recurrence equation gives

$$16a_4 + 20a_5 + 4a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_0}{30} - \frac{a_1}{10}$$

For $n = 4$ the recurrence equation gives

$$25a_5 + 30a_6 + 5a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{a_0}{144} + \frac{a_1}{16}$$

For $n = 5$ the recurrence equation gives

$$36a_6 + 42a_7 + 6a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{a_0}{840} - \frac{11a_1}{280}$$

And so on. Therefore the solution is

$$\begin{aligned}y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots\end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + \left(-\frac{a_0}{2} - \frac{a_1}{2}\right) t^2 + \frac{a_0 t^3}{3} + \left(-\frac{a_0}{8} + \frac{a_1}{8}\right) t^4 + \left(\frac{a_0}{30} - \frac{a_1}{10}\right) t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - \frac{1}{2}t^2 + \frac{1}{3}t^3 - \frac{1}{8}t^4 + \frac{1}{30}t^5\right) a_0 + \left(t - \frac{1}{2}t^2 + \frac{1}{8}t^4 - \frac{1}{10}t^5\right) a_1 + O(t^6) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - \frac{1}{2}t^2 + \frac{1}{3}t^3 - \frac{1}{8}t^4 + \frac{1}{30}t^5\right) c_1 + \left(t - \frac{1}{2}t^2 + \frac{1}{8}t^4 - \frac{1}{10}t^5\right) c_2 + O(t^6)$$

$$y(t) = -2 - \frac{t^2}{2} - \frac{2t^3}{3} + \frac{5t^4}{8} - \frac{11t^5}{30} + 3t + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x+1$ results in

$$y = 1 + 3x - \frac{(x+1)^2}{2} - \frac{2(x+1)^3}{3} + \frac{5(x+1)^4}{8} - \frac{11(x+1)^5}{30} + \frac{29(x+1)^6}{144} + O\left((x+1)^6\right)$$

Summary

The solution(s) found are the following

$$\begin{aligned}y = 1 + 3x - \frac{(x+1)^2}{2} - \frac{2(x+1)^3}{3} + \frac{5(x+1)^4}{8} \\ - \frac{11(x+1)^5}{30} + \frac{29(x+1)^6}{144} + O\left((x+1)^6\right)\end{aligned} \quad (1)$$

Verification of solutions

$$y = 1 + 3x - \frac{(x+1)^2}{2} - \frac{2(x+1)^3}{3} + \frac{5(x+1)^4}{8} - \frac{11(x+1)^5}{30} + \frac{29(x+1)^6}{144} + O\left((x+1)^6\right)$$

Verified OK.

13.11.2 Maple step by step solution

Let's solve

$$\left[(2+x)\,y''+(2+x)\,y'+y=0, y(-1)=-2, y'\Big|_{\{x=-1\}}=3\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-y'-\frac{y}{2+x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+y'+\frac{y}{2+x}=0$

☐ Check to see if $x_0=-2$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=1, P_3(x)=\frac{1}{2+x}\right]$

  ◦ $(2+x)\cdot P_2(x)$ is analytic at $x=-2$

  $\left((2+x)\cdot P_2(x)\right)\Big|_{x=-2}=0$

  ◦ $(2+x)^2\cdot P_3(x)$ is analytic at $x=-2$

  $\left((2+x)^2\cdot P_3(x)\right)\Big|_{x=-2}=0$

  ◦ $x=-2$is a regular singular point

  Check to see if $x_0=-2$ is a regular singular point

  $x_0=-2$

- Multiply by denominators

  $(2+x)\,y''+(2+x)\,y'+y=0$

- Change variables using $x=u-2$ so that the regular singular point is at $u=0$

  $u\left(\frac{d^2}{du^2}y(u)\right)+u\left(\frac{d}{du}y(u)\right)+y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $u \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion

  $$u \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r}$$

- Convert $u \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

  $$u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-1}$$

- Shift index using $k->k+1$

  $$u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\,(k+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0 r(-1+r)\, u^{-1+r} + \left(\sum_{k=0}^{\infty} \left(a_{k+1}(k+1+r)\,(k+r) + a_k(k+1+r)\right) u^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$r(-1+r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \{0, 1\}$$

- Each term in the series must be 0, giving the recursion relation

  $$(k+1+r)\,(a_{k+1}(k+r) + a_k) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+1} = -\frac{a_k}{k+r}$$

- Recursion relation for $r=0$

  $$a_{k+1} = -\frac{a_k}{k}$$

- Solution for $r=0$

  $$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+1} = -\frac{a_k}{k}\right]$$

- Revert the change of variables $u = 2+x$

  $$\left[y = \sum_{k=0}^{\infty} a_k(2+x)^k, a_{k+1} = -\frac{a_k}{k}\right]$$

- Recursion relation for $r=1$

  $$a_{k+1} = -\frac{a_k}{k+1}$$

- Solution for $r=1$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+1}, a_{k+1} = -\frac{a_k}{k+1}\right]$$

- Revert the change of variables $u = 2+x$

$$\left[y = \sum_{k=0}^{\infty} a_k (2+x)^{k+1}, a_{k+1} = -\frac{a_k}{k+1}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k (2+x)^k\right) + \left(\sum_{k=0}^{\infty} b_k (2+x)^{1+k}\right), a_{1+k} = -\frac{a_k}{k}, b_{1+k} = -\frac{b_k}{1+k}\right]$$

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2 y'' - (6 - 7x) y' + 8y = 0}$$

With initial conditions

$$[y(1) = 1, y'(1) = -2]$$

With the expansion point for the power series method at $x = 1$.

13.12.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$p(x) = \frac{-6 + 7x}{x^2}$$
$$q(x) = \frac{8}{x^2}$$
$$F = 0$$

Hence the ode is

$$y'' + \frac{(-6+7x)\,y'}{x^2} + \frac{8y}{x^2} = 0$$

The domain of $p(x) = \frac{-6+7x}{x^2}$ is

$$\{x < 0 \lor 0 < x\}$$

And the point $x_0 = 1$ is inside this domain. The domain of $q(x) = \frac{8}{x^2}$ is

$$\{x < 0 \lor 0 < x\}$$

And the point $x_0 = 1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x - 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$(t+1)^2 \left(\frac{d^2}{dt^2}y(t)\right) + (7t+1)\left(\frac{d}{dt}y(t)\right) + 8y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = 1$$
$$y'(0) = -2$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned} y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\ &= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\ &= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left.\frac{d^n f}{dx^n}\right|_{x_0,y_0,y'_0} \end{aligned}$$

But

$$\begin{aligned} \frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\ &= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (962) \\ &= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (963) \\ \frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\ &= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\ \frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\ &= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\ &\vdots \end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') &\quad (4)\\
F_1 &= \frac{df}{dx} \\
&= \frac{dF_0}{dx} \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f &\quad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right) \\
&= \frac{d}{dx}(F_1) \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0 \\
&\vdots \\
F_n &= \frac{d}{dx}(F_{n-1}) \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 &\quad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{7t\left(\frac{d}{dt}y(t)\right)+\frac{d}{dt}y(t)+8y(t)}{(t+1)^2}\\
F_1 &= \frac{dF_0}{dt}\\
&= \frac{\partial F_0}{\partial t}+\frac{\partial F_0}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0\\
&= \frac{48\left(\frac{d}{dt}y(t)\right)t^2+72y(t)\,t-12\frac{d}{dt}y(t)+24y(t)}{(t+1)^4}\\
F_2 &= \frac{dF_1}{dt}\\
&= \frac{\partial F_1}{\partial t}+\frac{\partial F_1}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1\\
&= \frac{(-360t^3+120t^2+348t+84)\left(\frac{d}{dt}y(t)\right)+(-600t^2-240t+72)\,y(t)}{(t+1)^6}\\
F_3 &= \frac{dF_2}{dt}\\
&= \frac{\partial F_2}{\partial t}+\frac{\partial F_2}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2\\
&= \frac{(3000t^4-2400t^3-6624t^2-2688t-168)\left(\frac{d}{dt}y(t)\right)+5280\left(t^3+\frac{3}{11}t^2-\frac{36}{55}t-\frac{14}{55}\right)y(t)}{(t+1)^8}\\
F_4 &= \frac{dF_3}{dt}\\
&= \frac{\partial F_3}{\partial t}+\frac{\partial F_3}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3\\
&= \frac{(-27720t^5+37800t^4+110016t^3+56736t^2+1944t-2520)\left(\frac{d}{dt}y(t)\right)+(-50400t^4+87264t^2+5587}{(t+1)^{10}}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t=0$ and $y(0)=1$ and $y'(0)=-2$ gives

$$
\begin{aligned}
F_0 &= -6\\
F_1 &= 48\\
F_2 &= -96\\
F_3 &= -1008\\
F_4 &= 13680
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = -4t^4 + 8t^3 - 3t^2 - 2t + 1 - \frac{42t^5}{5} + 19t^6 + O(t^6)$$

$$y(t) = -4t^4 + 8t^3 - 3t^2 - 2t + 1 - \frac{42t^5}{5} + 19t^6 + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(t^2 + 2t + 1) \left(\frac{d^2}{dt^2}y(t)\right) + (7t + 1) \left(\frac{d}{dt}y(t)\right) + 8y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}$$

Substituting the above back into the ode gives

$$(t^2 + 2t + 1) \left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right) + (7t + 1) \left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + 8\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} t^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} 2n\, t^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} 7n a_n t^n\right) + \left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + \left(\sum_{n=0}^{\infty} 8a_n t^n\right) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 2n\, t^{n-1} a_n(n-1) = \sum_{n=1}^{\infty} 2(n+1)\, a_{n+1} n\, t^n$$

$$\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, t^n$$

$$\sum_{n=1}^{\infty} n a_n t^{n-1} = \sum_{n=0}^{\infty} (n+1)\, a_{n+1} t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} t^n a_n n(n-1)\right) + \left(\sum_{n=1}^{\infty} 2(n+1)\, a_{n+1} n\, t^n\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, t^n\right) + \left(\sum_{n=1}^{\infty} 7n a_n t^n\right) + \left(\sum_{n=0}^{\infty} (n+1)\, a_{n+1} t^n\right) + \left(\sum_{n=0}^{\infty} 8a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + a_1 + 8a_0 = 0$$

$$a_2 = -4a_0 - \frac{a_1}{2}$$

$n = 1$ gives

$$6a_2 + 6a_3 + 15a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = 4a_0 - 2a_1$$

For $2 \leq n$, the recurrence equation is

$$n a_n(n-1) + 2(n+1)\, a_{n+1} n + (n+2)\, a_{n+2}(n+1) + 7n a_n + (n+1)\, a_{n+1} + 8a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$
\begin{aligned}
a_{n+2} &= -\frac{n^2 a_n + 2n^2 a_{n+1} + 6n a_n + 3n a_{n+1} + 8a_n + a_{n+1}}{(n+2)(n+1)} \\
&= -\frac{(n^2+6n+8)\, a_n}{(n+2)(n+1)} - \frac{(2n^2+3n+1)\, a_{n+1}}{(n+2)(n+1)}
\end{aligned} \tag{5}
$$

For $n = 2$ the recurrence equation gives

$$
24a_2 + 15a_3 + 12a_4 = 0
$$

Which after substituting the earlier terms found becomes

$$
a_4 = 3a_0 + \frac{7a_1}{2}
$$

For $n = 3$ the recurrence equation gives

$$
35a_3 + 28a_4 + 20a_5 = 0
$$

Which after substituting the earlier terms found becomes

$$
a_5 = -\frac{56a_0}{5} - \frac{7a_1}{5}
$$

For $n = 4$ the recurrence equation gives

$$
48a_4 + 45a_5 + 30a_6 = 0
$$

Which after substituting the earlier terms found becomes

$$
a_6 = 12a_0 - \frac{7a_1}{2}
$$

For $n = 5$ the recurrence equation gives

$$
63a_5 + 66a_6 + 42a_7 = 0
$$

Which after substituting the earlier terms found becomes

$$
a_7 = -\frac{72a_0}{35} + \frac{38a_1}{5}
$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + \left(-4a_0 - \frac{a_1}{2}\right) t^2 + (4a_0 - 2a_1)\, t^3 + \left(3a_0 + \frac{7a_1}{2}\right) t^4 + \left(-\frac{56a_0}{5} - \frac{7a_1}{5}\right) t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - 4t^2 + 4t^3 + 3t^4 - \frac{56}{5}t^5\right) a_0 + \left(t - \frac{1}{2}t^2 - 2t^3 + \frac{7}{2}t^4 - \frac{7}{5}t^5\right) a_1 + O(t^6) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - 4t^2 + 4t^3 + 3t^4 - \frac{56}{5}t^5\right) c_1 + \left(t - \frac{1}{2}t^2 - 2t^3 + \frac{7}{2}t^4 - \frac{7}{5}t^5\right) c_2 + O(t^6)$$

$$y(t) = 1 - 3t^2 + 8t^3 - 4t^4 - \frac{42t^5}{5} - 2t + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x - 1$ results in

$$y = -4(x-1)^4 + 8(x-1)^3 - 3(x-1)^2 - 2x + 3 - \frac{42(x-1)^5}{5} + 19(x-1)^6 + O\left((x-1)^6\right)$$

Summary

The solution(s) found are the following

$$y = -4(x-1)^4 + 8(x-1)^3 - 3(x-1)^2 - 2x + 3 - \frac{42(x-1)^5}{5} + 19(x-1)^6 + O\left((x-1)^6\right) \quad (1)$$

Verification of solutions

$$y = -4(x-1)^4 + 8(x-1)^3 - 3(x-1)^2 - 2x + 3 - \frac{42(x-1)^5}{5} + 19(x-1)^6 + O\left((x-1)^6\right)$$

Verified OK.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(2x^2 + x + 1)\, y'' + (1 + 7x)\, y' + 2y = 0}$$

With initial conditions

$$[y(1) = 1, y'(1) = 0]$$

With the expansion point for the power series method at $x = 1$.

13.13.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= \frac{1 + 7x}{2x^2 + x + 1} \\ q(x) &= \frac{2}{2x^2 + x + 1} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{(1+7x)\, y'}{2x^2+x+1} + \frac{2y}{2x^2+x+1} = 0$$

The domain of $p(x) = \frac{1+7x}{2x^2+x+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 1$ is inside this domain. The domain of $q(x) = \frac{2}{2x^2+x+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x - 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(2(t+1)^2 + t + 2\right)\left(\frac{d^2}{dt^2}y(t)\right) + (8+7t)\left(\frac{d}{dt}y(t)\right) + 2y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = 1$$
$$y'(0) = 0$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y_0'$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0,y_0,y_0'} + \frac{x^3}{3!} f'|_{x_0,y_0,y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left.\frac{d^n f}{dx^n}\right|_{x_0,y_0,y_0'}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \qquad (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' \qquad (965)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (966)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f \qquad (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f \qquad (3)\\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{7t\left(\frac{d}{dt}y(t)\right)+8\frac{d}{dt}y(t)+2y(t)}{2t^2+5t+4}\\
F_1 &= \frac{dF_0}{dt}\\
&= \frac{\partial F_0}{\partial t}+\frac{\partial F_0}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_0}{\partial \frac{d}{dt}y(t)}F_0\\
&= \frac{\left(59t^2+134t+68\right)\left(\frac{d}{dt}y(t)\right)+\left(22t+26\right)y(t)}{\left(2t^2+5t+4\right)^2}\\
F_2 &= \frac{dF_1}{dt}\\
&= \frac{\partial F_1}{\partial t}+\frac{\partial F_1}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_1}{\partial \frac{d}{dt}y(t)}F_1\\
&= \frac{\left(-605t^3-2052t^2-2072t-584\right)\left(\frac{d}{dt}y(t)\right)+\left(-250t^2-586t-308\right)y(t)}{\left(2t^2+5t+4\right)^3}\\
F_3 &= \frac{dF_2}{dt}\\
&= \frac{\partial F_2}{\partial t}+\frac{\partial F_2}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_2}{\partial \frac{d}{dt}y(t)}F_2\\
&= \frac{\left(7365t^4+33198t^3+50094t^2+28092t+3912\right)\left(\frac{d}{dt}y(t)\right)+3210\left(t^3+\frac{1869}{535}t^2+\frac{390}{107}t+\frac{574}{535}\right)y(t)}{\left(2t^2+5t+4\right)^4}\\
F_4 &= \frac{dF_3}{dt}\\
&= \frac{\partial F_3}{\partial t}+\frac{\partial F_3}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_3}{\partial \frac{d}{dt}y(t)}F_3\\
&= \frac{\left(-104055t^5-584808t^4-1173210t^3-983004t^2-271320t+16608\right)\left(\frac{d}{dt}y(t)\right)-46830\left(t^4+\frac{5167}{1115}t^3+\right.}{\left(2t^2+5t+4\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t=0$ and $y(0)=1$ and $y'(0)=0$ gives

$$
\begin{aligned}
F_0 &= -\frac{1}{2}\\
F_1 &= \frac{13}{8}\\
F_2 &= -\frac{77}{16}\\
F_3 &= \frac{861}{64}\\
F_4 &= -\frac{1869}{64}
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = 1 - \frac{t^2}{4} + \frac{13t^3}{48} - \frac{77t^4}{384} + \frac{287t^5}{2560} - \frac{623t^6}{15360} + O(t^6)$$

$$y(t) = 1 - \frac{t^2}{4} + \frac{13t^3}{48} - \frac{77t^4}{384} + \frac{287t^5}{2560} - \frac{623t^6}{15360} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(2t^2 + 5t + 4) + (8 + 7t)\left(\frac{d}{dt}y(t)\right) + 2y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}\right)(2t^2 + 5t + 4) + (8 + 7t)\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + 2\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} 5n\, t^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} 4n(n-1) a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} 8n a_n t^{n-1}\right) + \left(\sum_{n=1}^{\infty} 7n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 2a_n t^n\right) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 5n\,t^{n-1} a_n(n-1) = \sum_{n=1}^{\infty} 5(n+1)\,a_{n+1} n\,t^n$$

$$\sum_{n=2}^{\infty} 4n(n-1)\,a_n t^{n-2} = \sum_{n=0}^{\infty} 4(n+2)\,a_{n+2}(n+1)\,t^n$$

$$\sum_{n=1}^{\infty} 8n a_n t^{n-1} = \sum_{n=0}^{\infty} 8(n+1)\,a_{n+1} t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right) + \left(\sum_{n=1}^{\infty} 5(n+1)\,a_{n+1} n\,t^n\right) + \left(\sum_{n=0}^{\infty} 4(n+2)\,a_{n+2}(n+1)\,t^n\right) + \left(\sum_{n=0}^{\infty} 8(n+1)\,a_{n+1} t^n\right) + \left(\sum_{n=1}^{\infty} 7n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 2a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$8a_2 + 8a_1 + 2a_0 = 0$$

$$a_2 = -\frac{a_0}{4} - a_1$$

$n = 1$ gives

$$26a_2 + 24a_3 + 9a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{13a_0}{48} + \frac{17a_1}{24}$$

For $2 \leq n$, the recurrence equation is

$$2na_n(n-1)+5(n+1)\, a_{n+1}n+4(n+2)\, a_{n+2}(n+1)+8(n+1)\, a_{n+1}+7na_n+2a_n=0 \quad (4)$$

Solving for a_{n+2}, gives

$$
\begin{aligned}
a_{n+2} &= -\frac{2n^2a_n+5n^2a_{n+1}+5na_n+13na_{n+1}+2a_n+8a_{n+1}}{4\,(n+2)\,(n+1)} \\
&= -\frac{(2n^2+5n+2)\, a_n}{4\,(n+2)\,(n+1)}-\frac{(5n^2+13n+8)\, a_{n+1}}{4\,(n+2)\,(n+1)}
\end{aligned} \quad (5)
$$

For $n = 2$ the recurrence equation gives

$$20a_2+54a_3+48a_4=0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{77a_0}{384}-\frac{73a_1}{192}$$

For $n = 3$ the recurrence equation gives

$$35a_3+92a_4+80a_5=0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{287a_0}{2560}+\frac{163a_1}{1280}$$

For $n = 4$ the recurrence equation gives

$$54a_4+140a_5+120a_6=0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{623a_0}{15360}+\frac{173a_1}{7680}$$

For $n = 5$ the recurrence equation gives

$$77a_5+198a_6+168a_7=0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{11a_0}{3072} - \frac{913a_1}{10752}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$\begin{aligned} y(t) = a_0 + a_1 t + \left(-\frac{a_0}{4} - a_1\right) t^2 + \left(\frac{13a_0}{48} + \frac{17a_1}{24}\right) t^3 \\ + \left(-\frac{77a_0}{384} - \frac{73a_1}{192}\right) t^4 + \left(\frac{287a_0}{2560} + \frac{163a_1}{1280}\right) t^5 + \dots \end{aligned}$$

Collecting terms, the solution becomes

$$\begin{aligned} y(t) = \left(1 - \frac{1}{4}t^2 + \frac{13}{48}t^3 - \frac{77}{384}t^4 + \frac{287}{2560}t^5\right) a_0 \\ + \left(t - t^2 + \frac{17}{24}t^3 - \frac{73}{192}t^4 + \frac{163}{1280}t^5\right) a_1 + O(t^6) \end{aligned} \tag{3}$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - \frac{1}{4}t^2 + \frac{13}{48}t^3 - \frac{77}{384}t^4 + \frac{287}{2560}t^5\right) c_1 + \left(t - t^2 + \frac{17}{24}t^3 - \frac{73}{192}t^4 + \frac{163}{1280}t^5\right) c_2 + O(t^6)$$

$$y(t) = 1 - \frac{t^2}{4} + \frac{13t^3}{48} - \frac{77t^4}{384} + \frac{287t^5}{2560} + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x - 1$ results in

$$y = 1 - \frac{(x-1)^2}{4} + \frac{13(x-1)^3}{48} - \frac{77(x-1)^4}{384} + \frac{287(x-1)^5}{2560} - \frac{623(x-1)^6}{15360} + O\left((x-1)^6\right)$$

Summary
The solution(s) found are the following

$$y = 1-\frac{(x-1)^{2}}{4}+\frac{13(x-1)^{3}}{48}-\frac{77(x-1)^{4}}{384}+\frac{287(x-1)^{5}}{2560}-\frac{623(x-1)^{6}}{15360}+O\left((x-1)^{6}\right) \tag{1}$$

Verification of solutions

$$y = 1-\frac{(x-1)^{2}}{4}+\frac{13(x-1)^{3}}{48}-\frac{77(x-1)^{4}}{384}+\frac{287(x-1)^{5}}{2560}-\frac{623(x-1)^{6}}{15360}+O\left((x-1)^{6}\right)$$

Verified OK.

13.13.2 Maple step by step solution

Let's solve

$$\left[\left(2x^{2}+x+1\right)y''+(1+7x)\,y'+2y=0, y(1)=1, y'\Big|_{\{x=1\}}=0\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{2y}{2x^{2}+x+1}-\frac{(1+7x)y'}{2x^{2}+x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(1+7x)y'}{2x^{2}+x+1}+\frac{2y}{2x^{2}+x+1}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{1+7x}{2x^{2}+x+1}, P_3(x)=\frac{2}{2x^{2}+x+1}\right]$

  - $\left(\frac{I\sqrt{7}}{4}+x+\frac{1}{4}\right)\cdot P_2(x)$ is analytic at $x=-\frac{I\sqrt{7}}{4}-\frac{1}{4}$

    $$\left(\left(\frac{I\sqrt{7}}{4}+x+\frac{1}{4}\right)\cdot P_2(x)\right)\Bigg|_{x=-\frac{I\sqrt{7}}{4}-\frac{1}{4}}=0$$

  - $\left(\frac{I\sqrt{7}}{4}+x+\frac{1}{4}\right)^{2}\cdot P_3(x)$ is analytic at $x=-\frac{I\sqrt{7}}{4}-\frac{1}{4}$

    $$\left(\left(\frac{I\sqrt{7}}{4}+x+\frac{1}{4}\right)^{2}\cdot P_3(x)\right)\Bigg|_{x=-\frac{I\sqrt{7}}{4}-\frac{1}{4}}=0$$

- $x = -\frac{\mathrm{I}\sqrt{7}}{4} - \frac{1}{4}$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = -\frac{\mathrm{I}\sqrt{7}}{4} - \frac{1}{4}$

- Multiply by denominators

  $(2x^2 + x + 1) y'' + (1 + 7x) y' + 2y = 0$

- Change variables using $x = u - \frac{\mathrm{I}\sqrt{7}}{4} - \frac{1}{4}$ so that the regular singular point is at $u = 0$

  $\left(2u^2 - \mathrm{I}u\sqrt{7}\right)\left(\frac{d^2}{du^2}y(u)\right) + \left(-\frac{3}{4} + 7u - \frac{7\,\mathrm{I}\sqrt{7}}{4}\right)\left(\frac{d}{du}y(u)\right) + 2y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k + r)\, u^{k+r-1+m}$

- Shift index using $k- >k + 1 - m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k + 1 - m + r)\, u^{k+r}$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k + r)(k + r - 1)\, u^{k+r-2+m}$

- Shift index using $k- >k + 2 - m$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k + 2 - m + r)(k + 1 - m + r)\, u^{k+r}$

  Rewrite ODE with series expansions

  $\frac{\mathrm{I}\sqrt{7}\, r\left(3\,\mathrm{I}\sqrt{7} - 21 - 28r\right) a_0 u^{-1+r}}{28} + \left(\sum_{k=0}^{\infty}\left(\frac{\mathrm{I}\sqrt{7}\,(k+1+r)\left(3\,\mathrm{I}\sqrt{7} - 28k - 49 - 28r\right) a_{k+1}}{28} + a_k(k + r + 2)(2k + 2r + 1)\right)\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $\frac{\mathrm{I}}{28}\sqrt{7}\, r\left(3\,\mathrm{I}\sqrt{7} - 21 - 28r\right) = 0$

- Values of r that satisfy the indicial equation

  $r \in \left\{0, \frac{3\,\mathrm{I}\sqrt{7}}{28} - \frac{3}{4}\right\}$

- Each term in the series must be 0, giving the recursion relation

$$-\mathrm{I}\left(k+r+\frac{7}{4}\right)(k+1+r)\,a_{k+1}\sqrt{7}+\frac{(-3k-3r-3)a_{k+1}}{4}+2(k+r+2)\left(k+r+\frac{1}{2}\right)a_k=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1}=\frac{4a_k\left(2k^2+4kr+2r^2+5k+5r+2\right)}{3+4\mathrm{I}\sqrt{7}\,k^2+8\mathrm{I}\sqrt{7}\,kr+4\mathrm{I}\sqrt{7}\,r^2+11\mathrm{I}\sqrt{7}\,k+11\mathrm{I}\sqrt{7}\,r+7\mathrm{I}\sqrt{7}+3k+3r}$$

- Recursion relation for $r=0$

$$a_{k+1}=\frac{4a_k\left(2k^2+5k+2\right)}{3+4\mathrm{I}\sqrt{7}\,k^2+11\mathrm{I}\sqrt{7}\,k+7\mathrm{I}\sqrt{7}+3k}$$

- Solution for $r=0$

$$\left[y(u)=\sum_{k=0}^{\infty}a_k u^k, a_{k+1}=\frac{4a_k\left(2k^2+5k+2\right)}{3+4\mathrm{I}\sqrt{7}\,k^2+11\mathrm{I}\sqrt{7}\,k+7\mathrm{I}\sqrt{7}+3k}\right]$$

- Revert the change of variables $u=\frac{\mathrm{I}\sqrt{7}}{4}+x+\frac{1}{4}$

$$\left[y=\sum_{k=0}^{\infty}a_k\left(\frac{\mathrm{I}\sqrt{7}}{4}+x+\frac{1}{4}\right)^k, a_{k+1}=\frac{4a_k\left(2k^2+5k+2\right)}{3+4\mathrm{I}\sqrt{7}\,k^2+11\mathrm{I}\sqrt{7}\,k+7\mathrm{I}\sqrt{7}+3k}\right]$$

- Recursion relation for $r=\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}$

$$a_{k+1}=\frac{4a_k\left(2k^2+4k\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)+2\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)^2+5k+\frac{15\mathrm{I}\sqrt{7}}{28}-\frac{7}{4}\right)}{\frac{3}{4}+4\mathrm{I}\sqrt{7}\,k^2+8\mathrm{I}\sqrt{7}\,k\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)+4\mathrm{I}\sqrt{7}\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)^2+11\mathrm{I}\sqrt{7}\,k+11\mathrm{I}\sqrt{7}\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)+\frac{205\mathrm{I}\sqrt{7}}{28}+3k}$$

- Solution for $r=\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}$

$$\left[y(u)=\sum_{k=0}^{\infty}a_k u^{k+\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}}, a_{k+1}=\frac{4a_k\left(2k^2+4k\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)+2\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)^2+5k+\frac{15\mathrm{I}\sqrt{7}}{28}-\frac{7}{4}\right)}{\frac{3}{4}+4\mathrm{I}\sqrt{7}\,k^2+8\mathrm{I}\sqrt{7}\,k\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)+4\mathrm{I}\sqrt{7}\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)^2+11\mathrm{I}\sqrt{7}\,k+11\mathrm{I}\sqrt{7}\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)+\right.$$

- Revert the change of variables $u=\frac{\mathrm{I}\sqrt{7}}{4}+x+\frac{1}{4}$

$$\left[y=\sum_{k=0}^{\infty}a_k\left(\frac{\mathrm{I}\sqrt{7}}{4}+x+\frac{1}{4}\right)^{k+\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}}, a_{k+1}=\frac{4a_k\left(2k^2+4k\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)+2\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)^2+5k+\frac{15\mathrm{I}\sqrt{7}}{28}\right.}{\frac{3}{4}+4\mathrm{I}\sqrt{7}\,k^2+8\mathrm{I}\sqrt{7}\,k\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)+4\mathrm{I}\sqrt{7}\left(\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}\right)^2+11\mathrm{I}\sqrt{7}\,k+11\mathrm{I}\sqrt{7}}\right.$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty}a_k\left(\frac{\mathrm{I}\sqrt{7}}{4}+x+\frac{1}{4}\right)^k\right)+\left(\sum_{k=0}^{\infty}b_k\left(\frac{\mathrm{I}\sqrt{7}}{4}+x+\frac{1}{4}\right)^{k+\frac{3\mathrm{I}\sqrt{7}}{28}-\frac{3}{4}}\right), a_{1+k}=\frac{4a_k\left(2k^2+5k+2\right)}{3+4\mathrm{I}\sqrt{7}\,k^2+11\mathrm{I}\sqrt{7}\,k+7\mathrm{I}\sqrt{7}}\right.$$

Problem number: 14.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(x+3)\,y''+(1+2x)\,y'-(2-x)\,y=0}$$

With initial conditions

$$[y(-1)=1, y'(-1)=0]$$

With the expansion point for the power series method at $x=-1$.

13.14.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=\frac{1+2x}{x+3}\\ q(x)&=\frac{-2+x}{x+3}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' + \frac{(1+2x)\, y'}{x+3} + \frac{(-2+x)\, y}{x+3} = 0$$

The domain of $p(x) = \frac{1+2x}{x+3}$ is

$$\{x < -3 \vee -3 < x\}$$

And the point $x_0 = -1$ is inside this domain. The domain of $q(x) = \frac{-2+x}{x+3}$ is

$$\{x < -3 \vee -3 < x\}$$

And the point $x_0 = -1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x + 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(\frac{d^2}{dt^2} y(t)\right)(2+t) + (2t-1)\left(\frac{d}{dt} y(t)\right) + (t-3)\, y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = 1$$
$$y'(0) = 0$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left. \frac{d^n f}{dx^n} \right|_{x_0, y_0, y'_0}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (968) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (969) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n\big|_{x_0, y_0, y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{y(t)\,t + 2t\left(\frac{d}{dt}y(t)\right) - 3y(t) - \frac{d}{dt}y(t)}{2+t} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0 \\
&= \frac{(3t^2 - 3t + 2)\left(\frac{d}{dt}y(t)\right) + 2\left(t^2 - \frac{7}{2}t - 1\right)y(t)}{\left(2+t\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1 \\
&= \frac{(-4t^3 + 6t^2 - 8t - 12)\left(\frac{d}{dt}y(t)\right) - 3y(t)\left(t^3 - 4t^2 - \frac{4}{3}t + \frac{4}{3}\right)}{\left(2+t\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2 \\
&= \frac{5(t^4 - 2t^3 + 4t^2 + 12t)\left(\frac{d}{dt}y(t)\right) + 4\left(t^4 - \frac{9}{2}t^3 - t^2 + 7t - 4\right)y(t)}{\left(2+t\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3 \\
&= \frac{(-6t^5 + 15t^4 - 40t^3 - 180t^2 + 88)\left(\frac{d}{dt}y(t)\right) - 5y(t)\left(t^5 - 5t^4 + 20t^2 - 16t - 24\right)}{\left(2+t\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = 1$ and $y'(0) = 0$ gives

$$
\begin{aligned}
F_0 &= \frac{3}{2} \\
F_1 &= -\frac{1}{2} \\
F_2 &= -\frac{1}{2} \\
F_3 &= -1 \\
F_4 &= \frac{15}{4}
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = 1 + \frac{3t^2}{4} - \frac{t^3}{12} - \frac{t^4}{48} - \frac{t^5}{120} + \frac{t^6}{192} + O(t^6)$$

$$y(t) = 1 + \frac{3t^2}{4} - \frac{t^3}{12} - \frac{t^4}{48} - \frac{t^5}{120} + \frac{t^6}{192} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(2+t) + (2t-1)\left(\frac{d}{dt}y(t)\right) + (t-3)\,y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right)(2+t) + (2t-1)\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + (t-3)\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n\,t^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} 2n(n-1)\,a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} 2n a_n t^n\right) \tag{2}$$
$$+ \sum_{n=1}^{\infty} (-n a_n t^{n-1}) + \left(\sum_{n=0}^{\infty} t^{1+n} a_n\right) + \sum_{n=0}^{\infty} (-3 a_n t^n) = 0$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n\,t^{n-1} a_n(n-1) = \sum_{n=1}^{\infty} (1+n)\,a_{1+n} n\,t^n$$

$$\sum_{n=2}^{\infty} 2n(n-1)\,a_n t^{n-2} = \sum_{n=0}^{\infty} 2(n+2)\,a_{n+2}(1+n)\,t^n$$

$$\sum_{n=1}^{\infty} \left(-n a_n t^{n-1}\right) = \sum_{n=0}^{\infty} \left(-(1+n)\,a_{1+n} t^n\right)$$

$$\sum_{n=0}^{\infty} t^{1+n} a_n = \sum_{n=1}^{\infty} a_{n-1} t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=1}^{\infty} (1+n)\,a_{1+n} n\,t^n\right) + \left(\sum_{n=0}^{\infty} 2(n+2)\,a_{n+2}(1+n)\,t^n\right) + \left(\sum_{n=1}^{\infty} 2n a_n t^n\right) + \sum_{n=0}^{\infty} \left(-(1+n)\,a_{1+n} t^n\right) + \left(\sum_{n=1}^{\infty} a_{n-1} t^n\right) + \sum_{n=0}^{\infty} \left(-3 a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$4a_2 - a_1 - 3a_0 = 0$$

$$a_2 = \frac{3a_0}{4} + \frac{a_1}{4}$$

For $1 \leq n$, the recurrence equation is

$$(1+n)\,a_{1+n} n + 2(n+2)\,a_{n+2}(1+n) + 2n a_n - (1+n)\,a_{1+n} + a_{n-1} - 3a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{n^2 a_{1+n} + 2n a_n - 3a_n - a_{1+n} + a_{n-1}}{2\,(n+2)\,(1+n)} \\ &= -\frac{(2n-3)\,a_n}{2\,(n+2)\,(1+n)} - \frac{(n^2-1)\,a_{1+n}}{2\,(n+2)\,(1+n)} - \frac{a_{n-1}}{2\,(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$12a_3 - a_1 + a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = \frac{a_1}{12} - \frac{a_0}{12}$$

For $n = 2$ the recurrence equation gives

$$3a_3 + 24a_4 + a_2 + a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{a_1}{16} - \frac{a_0}{48}$$

For $n = 3$ the recurrence equation gives

$$8a_4 + 40a_5 + 3a_3 + a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{a_0}{120}$$

For $n = 4$ the recurrence equation gives

$$15a_5 + 60a_6 + 5a_4 + a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{a_0}{192} + \frac{11a_1}{2880}$$

For $n = 5$ the recurrence equation gives

$$24a_6 + 84a_7 + 7a_5 + a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{11a_0}{20160} - \frac{a_1}{2880}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + \left(\frac{3a_0}{4} + \frac{a_1}{4}\right) t^2 + \left(\frac{a_1}{12} - \frac{a_0}{12}\right) t^3 + \left(-\frac{a_1}{16} - \frac{a_0}{48}\right) t^4 - \frac{a_0 t^5}{120} + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 + \frac{3}{4}t^2 - \frac{1}{12}t^3 - \frac{1}{48}t^4 - \frac{1}{120}t^5\right) a_0 + \left(t + \frac{1}{4}t^2 + \frac{1}{12}t^3 - \frac{1}{16}t^4\right) a_1 + O(t^6) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 + \frac{3}{4}t^2 - \frac{1}{12}t^3 - \frac{1}{48}t^4 - \frac{1}{120}t^5\right) c_1 + \left(t + \frac{1}{4}t^2 + \frac{1}{12}t^3 - \frac{1}{16}t^4\right) c_2 + O(t^6)$$

$$y(t) = 1 + \frac{3t^2}{4} - \frac{t^3}{12} - \frac{t^4}{48} - \frac{t^5}{120} + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x+1$ results in

$$y = 1 + \frac{3(x+1)^2}{4} - \frac{(x+1)^3}{12} - \frac{(x+1)^4}{48} - \frac{(x+1)^5}{120} + \frac{(x+1)^6}{192} + O\left((x+1)^6\right)$$

Summary

The solution(s) found are the following

$$y = 1 + \frac{3(x+1)^2}{4} - \frac{(x+1)^3}{12} - \frac{(x+1)^4}{48} - \frac{(x+1)^5}{120} + \frac{(x+1)^6}{192} + O\left((x+1)^6\right) \quad (1)$$

Verification of solutions

$$y = 1 + \frac{3(x+1)^2}{4} - \frac{(x+1)^3}{12} - \frac{(x+1)^4}{48} - \frac{(x+1)^5}{120} + \frac{(x+1)^6}{192} + O\left((x+1)^6\right)$$

Verified OK.

13.14.2 Maple step by step solution

Let's solve

$$\left[(x+3)\,y''+(1+2x)\,y'+(-2+x)\,y=0, y(-1)=1, y'\Big|_{\{x=-1\}}=0\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(-2+x)y}{x+3}-\frac{(1+2x)y'}{x+3}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(1+2x)y'}{x+3}+\frac{(-2+x)y}{x+3}=0$

□ Check to see if $x_0=-3$ is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{1+2x}{x+3}, P_3(x)=\frac{-2+x}{x+3}\right]$

  - $(x+3)\cdot P_2(x)$ is analytic at $x=-3$

    $\left((x+3)\cdot P_2(x)\right)\Big|_{x=-3}=-5$

  - $(x+3)^2\cdot P_3(x)$ is analytic at $x=-3$

    $\left((x+3)^2\cdot P_3(x)\right)\Big|_{x=-3}=0$

  - $x=-3$is a regular singular point

  Check to see if $x_0=-3$ is a regular singular point

  $x_0=-3$

- Multiply by denominators

  $(x+3)\,y''+(1+2x)\,y'+(-2+x)\,y=0$

- Change variables using $x=u-3$ so that the regular singular point is at $u=0$

  $u\left(\frac{d^2}{du^2}y(u)\right)+(-5+2u)\left(\frac{d}{du}y(u)\right)+(-5+u)\,y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

  $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$

- Shift index using $k- > k - m$

  $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$

- Shift index using $k- > k + 1 - m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$

- Convert $u \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

  $u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-1}$

- Shift index using $k- > k + 1$

  $u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\,(k+r)\, u^{k+r}$

  Rewrite ODE with series expansions

  $a_0 r(-6+r)\, u^{-1+r} + \left(a_1(1+r)\,(-5+r) + a_0(-5+2r)\right) u^r + \left(\sum_{k=1}^{\infty} \left(a_{k+1}(k+1+r)\,(k-5+r)\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $r(-6+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{0, 6\}$

- Each term must be 0

  $a_1(1+r)\,(-5+r) + a_0(-5+2r) = 0$

- Each term in the series must be 0, giving the recursion relation

  $a_{k+1}(k+1+r)\,(k-5+r) + 2a_k k + 2a_k r - 5a_k + a_{k-1} = 0$

- Shift index using $k- > k + 1$

  $a_{k+2}(k+2+r)\,(k-4+r) + 2a_{k+1}(k+1) + 2r a_{k+1} - 5a_{k+1} + a_k = 0$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{2ka_{k+1}+2ra_{k+1}+a_k-3a_{k+1}}{(k+2+r)(k-4+r)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{2ka_{k+1}+a_k-3a_{k+1}}{(k+2)(k-4)}$$

- Series not valid for $r = 0$, division by 0 in the recursion relation at $k = 4$

$$a_{k+2} = -\frac{2ka_{k+1}+a_k-3a_{k+1}}{(k+2)(k-4)}$$

- Recursion relation for $r = 6$

$$a_{k+2} = -\frac{2ka_{k+1}+a_k+9a_{k+1}}{(k+8)(k+2)}$$

- Solution for $r = 6$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+6}, a_{k+2} = -\frac{2ka_{k+1}+a_k+9a_{k+1}}{(k+8)(k+2)}, 7a_1 + 7a_0 = 0\right]$$

- Revert the change of variables $u = x + 3$

$$\left[y = \sum_{k=0}^{\infty} a_k(x+3)^{k+6}, a_{k+2} = -\frac{2ka_{k+1}+a_k+9a_{k+1}}{(k+8)(k+2)}, 7a_1 + 7a_0 = 0\right]$$

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' + 3y'x + (2x^2 + 4)\, y = 0}$$

With initial conditions

$$[y(0) = 1, y'(0) = 0]$$

With the expansion point for the power series method at $x = 0$.

13.15.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= 3x \\ q(x) &= 2x^2 + 4 \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + 3y'x + \left(2x^2 + 4\right) y = 0$$

The domain of $p(x) = 3x$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = 2x^2 + 4$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned} y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\ &= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\ &= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \left.\frac{d^n f}{dx^n}\right|_{x_0, y_0, y'_0} \end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{971}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{972}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -2x^2y - 3y'x - 4y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= 6yx^3 + 7y'x^2 + 8yx - 7y' \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \left(-15x^3 + 43x\right) y' + \left(-14x^4 + 4x^2 + 36\right) y \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \left(31x^4 - 170x^2 + 79\right) y' + 30\left(x^4 - \frac{41}{15}x^2 - \frac{82}{15}\right) xy \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \left(-63x^5 + 552x^3 - 741x\right) y' + \left(-62x^6 + 366x^4 + 276x^2 - 480\right) y
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 1$ and $y'(0) = 0$ gives

$$
\begin{aligned}
F_0 &= -4 \\
F_1 &= 0 \\
F_2 &= 36 \\
F_3 &= 0 \\
F_4 &= -480
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = -2x^2 + 1 + \frac{3x^4}{2} - \frac{2x^6}{3} + O\left(x^6\right)
$$

$$
y = -2x^2 + 1 + \frac{3x^4}{2} - \frac{2x^6}{3} + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = -2x^2 \left(\sum_{n=0}^{\infty} a_n x^n\right) - 3\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x - 4\left(\sum_{n=0}^{\infty} a_n x^n\right) \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 3n\, x^n a_n\right) + \left(\sum_{n=0}^{\infty} 2x^{n+2} a_n\right) + \left(\sum_{n=0}^{\infty} 4a_n x^n\right) = 0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n$$
$$\sum_{n=0}^{\infty} 2x^{n+2} a_n = \sum_{n=2}^{\infty} 2a_{n-2} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=1}^{\infty} 3n\, x^n a_n\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2} x^n\right) + \left(\sum_{n=0}^{\infty} 4a_n x^n\right) = 0 \quad (3)$$

$n = 0$ gives

$$2a_2 + 4a_0 = 0$$

$$a_2 = -2a_0$$

$n = 1$ gives

$$6a_3 + 7a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{7a_1}{6}$$

For $2 \leq n$, the recurrence equation is

$$(n+2)\,a_{n+2}(n+1) + 3na_n + 2a_{n-2} + 4a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{3na_n + 4a_n + 2a_{n-2}}{(n+2)\,(n+1)} \\ &= -\frac{(3n+4)\,a_n}{(n+2)\,(n+1)} - \frac{2a_{n-2}}{(n+2)\,(n+1)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$12a_4 + 10a_2 + 2a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{3a_0}{2}$$

For $n = 3$ the recurrence equation gives

$$20a_5 + 13a_3 + 2a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{79a_1}{120}$$

For $n = 4$ the recurrence equation gives

$$30a_6 + 16a_4 + 2a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{2a_0}{3}$$

For $n = 5$ the recurrence equation gives

$$42a_7 + 19a_5 + 2a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{407a_1}{1680}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1x - 2a_0x^2 - \frac{7}{6}a_1x^3 + \frac{3}{2}a_0x^4 + \frac{79}{120}a_1x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(-2x^2 + 1 + \frac{3}{2}x^4\right)a_0 + \left(x - \frac{7}{6}x^3 + \frac{79}{120}x^5\right)a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(-2x^2 + 1 + \frac{3}{2}x^4\right)c_1 + \left(x - \frac{7}{6}x^3 + \frac{79}{120}x^5\right)c_2 + O(x^6)$$

$$y = -2x^2 + 1 + \frac{3x^4}{2} + O(x^6)$$

Summary

The solution(s) found are the following

$$y = -2x^2 + 1 + \frac{3x^4}{2} - \frac{2x^6}{3} + O(x^6) \tag{1}$$

$$y = -2x^2 + 1 + \frac{3x^4}{2} + O(x^6) \tag{2}$$

Verification of solutions

$$y = -2x^2 + 1 + \frac{3x^4}{2} - \frac{2x^6}{3} + O(x^6)$$

Verified OK.

$$y = -2x^2 + 1 + \frac{3x^4}{2} + O(x^6)$$

Verified OK.

13.15.2 Maple step by step solution

Let's solve

$\left[y'' = -2x^2y - 3y'x - 4y, y(0) = 1, y'\Big|_{\{x=0\}} = 0\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = (-2x^2 - 4)\, y - 3y'x$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + 3y'x + (2x^2 + 4)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

☐ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=\max(0,-m)}^{\infty} a_k x^{k+m}$

  ◦ Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=\max(0,-m)+m}^{\infty} a_{k-m} x^k$$

- Convert $x \cdot y'$ to series expansion

$$x \cdot y' = \sum_{k=0}^{\infty} a_k k\, x^k$$

- Convert y'' to series expansion

$$y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$$

- Shift index using $k- >k+2$

$$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$$

Rewrite ODE with series expansions

$$2a_2 + 4a_0 + (6a_3 + 7a_1)\, x + \left(\sum_{k=2}^{\infty} (a_{k+2}(k+2)\,(k+1) + a_k(3k+4) + 2a_{k-2})\, x^k\right) = 0$$

- The coefficients of each power of x must be 0

$$[2a_2 + 4a_0 = 0, 6a_3 + 7a_1 = 0]$$

- Solve for the dependent coefficient(s)

$$\left\{a_2 = -2a_0, a_3 = -\frac{7a_1}{6}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$(k^2 + 3k + 2)\, a_{k+2} + 3a_k k + 4a_k + 2a_{k-2} = 0$$

- Shift index using $k- >k+2$

$$\left((k+2)^2 + 3k + 8\right) a_{k+4} + 3a_{k+2}(k+2) + 4a_{k+2} + 2a_k = 0$$

- Recursion relation that defines the series solution to the ODE

$$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+4} = -\frac{3k a_{k+2} + 2a_k + 10a_{k+2}}{k^2 + 7k + 12}, a_2 = -2a_0, a_3 = -\frac{7a_1}{6}\right]$$

ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(4x+2)\,y''-4y'-(6+4x)\,y=0}$$

With initial conditions

$$[y(0)=2,y'(0)=-7]$$

With the expansion point for the power series method at $x=0$.

13.16.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=-\frac{4}{4x+2}\\ q(x)&=\frac{-4x-6}{4x+2}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' - \frac{4y'}{4x+2} + \frac{(-4x-6)\, y}{4x+2} = 0$$

The domain of $p(x) = -\frac{4}{4x+2}$ is

$$\left\{x < -\frac{1}{2} \lor -\frac{1}{2} < x\right\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{-4x-6}{4x+2}$ is

$$\left\{x < -\frac{1}{2} \lor -\frac{1}{2} < x\right\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' && (974)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (975)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f && (3)\\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4) \\
F_1 &= \frac{df}{dx} \\
&= \frac{dF_0}{dx} \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5) \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right) \\
&= \frac{d}{dx}(F_1) \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0 \\
&\vdots \\
F_n &= \frac{d}{dx}(F_{n-1}) \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= \frac{2yx + 2y' + 3y}{1 + 2x} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{(2x + 3)\, y' + 2y}{1 + 2x} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{4y' + (2x + 5)\, y}{1 + 2x} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(2x + 5)\, y' + 4y}{1 + 2x} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{6y' + (2x + 7)\, y}{1 + 2x}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 2$ and $y'(0) = -7$ gives

$$
\begin{aligned}
F_0 &= -8 \\
F_1 &= -17 \\
F_2 &= -18 \\
F_3 &= -27 \\
F_4 &= -28
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = -4x^2 - 7x + 2 - \frac{17x^3}{6} - \frac{3x^4}{4} - \frac{9x^5}{40} - \frac{7x^6}{180} + O(x^6)
$$

$$y = -4x^2 - 7x + 2 - \frac{17x^3}{6} - \frac{3x^4}{4} - \frac{9x^5}{40} - \frac{7x^6}{180} + O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(4x + 2) y'' - 4y' + (-4x - 6) y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(4x + 2) \left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) - 4\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) + (-4x - 6) \left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 4n\, x^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} 2n(n-1) a_n x^{n-2}\right) + \sum_{n=1}^{\infty} (-4n a_n x^{n-1}) + \sum_{n=0}^{\infty} (-4x^{1+n} a_n) + \sum_{n=0}^{\infty} (-6 a_n x^n) = 0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 4n\, x^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} 4(1+n) a_{1+n} n\, x^n$$

$$\sum_{n=2}^{\infty} 2n(n-1) a_n x^{n-2} = \sum_{n=0}^{\infty} 2(n+2) a_{n+2} (1+n)\, x^n$$

$$\sum_{n=1}^{\infty}\left(-4n a_n x^{n-1}\right) = \sum_{n=0}^{\infty}\left(-4(1+n)\, a_{1+n} x^n\right)$$

$$\sum_{n=0}^{\infty}\left(-4x^{1+n} a_n\right) = \sum_{n=1}^{\infty}\left(-4a_{n-1} x^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=1}^{\infty} 4(1+n)\, a_{1+n} n\, x^n\right) + \left(\sum_{n=0}^{\infty} 2(n+2)\, a_{n+2}(1+n)\, x^n\right) \\ + \sum_{n=0}^{\infty}\left(-4(1+n)\, a_{1+n} x^n\right) + \sum_{n=1}^{\infty}\left(-4a_{n-1} x^n\right) + \sum_{n=0}^{\infty}\left(-6a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$4a_2 - 4a_1 - 6a_0 = 0$$

$$a_2 = \frac{3a_0}{2} + a_1$$

For $1 \leq n$, the recurrence equation is

$$4(1+n)\, a_{1+n} n + 2(n+2)\, a_{n+2}(1+n) - 4(1+n)\, a_{1+n} - 4a_{n-1} - 6a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{2n^2 a_{1+n} - 3a_n - 2a_{1+n} - 2a_{n-1}}{(n+2)\,(1+n)} \\ &= \frac{3a_n}{(n+2)\,(1+n)} - \frac{(2n^2-2)\, a_{1+n}}{(n+2)\,(1+n)} + \frac{2a_{n-1}}{(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$12a_3 - 4a_0 - 6a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = \frac{a_0}{3} + \frac{a_1}{2}$$

For $n = 2$ the recurrence equation gives

$$12a_3 + 24a_4 - 4a_1 - 6a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{5a_0}{24} + \frac{a_1}{6}$$

For $n = 3$ the recurrence equation gives

$$32a_4 + 40a_5 - 4a_2 - 6a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_0}{30} + \frac{a_1}{24}$$

For $n = 4$ the recurrence equation gives

$$60a_5 + 60a_6 - 4a_3 - 6a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{7a_0}{720} + \frac{a_1}{120}$$

For $n = 5$ the recurrence equation gives

$$96a_6 + 84a_7 - 4a_4 - 6a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{a_0}{840} + \frac{a_1}{720}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x + \left(\frac{3a_0}{2} + a_1\right) x^2 + \left(\frac{a_0}{3} + \frac{a_1}{2}\right) x^3 + \left(\frac{5a_0}{24} + \frac{a_1}{6}\right) x^4 + \left(\frac{a_0}{30} + \frac{a_1}{24}\right) x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 + \frac{3}{2}x^2 + \frac{1}{3}x^3 + \frac{5}{24}x^4 + \frac{1}{30}x^5\right) a_0 + \left(x + x^2 + \frac{1}{2}x^3 + \frac{1}{6}x^4 + \frac{1}{24}x^5\right) a_1 + O(x^6) \quad (3)$$

At $x = 0$ the solution above becomes

$$y = \left(1 + \frac{3}{2}x^2 + \frac{1}{3}x^3 + \frac{5}{24}x^4 + \frac{1}{30}x^5\right) c_1 + \left(x + x^2 + \frac{1}{2}x^3 + \frac{1}{6}x^4 + \frac{1}{24}x^5\right) c_2 + O(x^6)$$

$$y = 2 - 4x^2 - \frac{17x^3}{6} - \frac{3x^4}{4} - \frac{9x^5}{40} - 7x + O(x^6)$$

Summary

The solution(s) found are the following

$$y = -4x^2 - 7x + 2 - \frac{17x^3}{6} - \frac{3x^4}{4} - \frac{9x^5}{40} - \frac{7x^6}{180} + O(x^6) \quad (1)$$

$$y = 2 - 4x^2 - \frac{17x^3}{6} - \frac{3x^4}{4} - \frac{9x^5}{40} - 7x + O(x^6) \quad (2)$$

Verification of solutions

$$y = -4x^2 - 7x + 2 - \frac{17x^3}{6} - \frac{3x^4}{4} - \frac{9x^5}{40} - \frac{7x^6}{180} + O(x^6)$$

Verified OK.

$$y = 2 - 4x^2 - \frac{17x^3}{6} - \frac{3x^4}{4} - \frac{9x^5}{40} - 7x + O(x^6)$$

Verified OK.

13.16.2 Maple step by step solution

Let's solve

$$\left[(4x+2)\, y'' - 4y' + (-4x-6)\, y = 0, y(0) = 2, y'\Big|_{\{x=0\}} = -7\right]$$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y'' = \frac{(2x+3)y}{1+2x} + \frac{2y'}{1+2x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y'' - \frac{2y'}{1+2x} - \frac{(2x+3)y}{1+2x} = 0$

□ Check to see if $x_0 = -\frac{1}{2}$ is a regular singular point

◦ Define functions

$\left[P_2(x) = -\frac{2}{1+2x}, P_3(x) = -\frac{2x+3}{1+2x}\right]$

◦ $\left(x+\frac{1}{2}\right) \cdot P_2(x)$ is analytic at $x = -\frac{1}{2}$

$\left(\left(x+\frac{1}{2}\right) \cdot P_2(x)\right)\Big|_{x=-\frac{1}{2}} = -1$

◦ $\left(x+\frac{1}{2}\right)^2 \cdot P_3(x)$ is analytic at $x = -\frac{1}{2}$

$\left(\left(x+\frac{1}{2}\right)^2 \cdot P_3(x)\right)\Big|_{x=-\frac{1}{2}} = 0$

◦ $x = -\frac{1}{2}$is a regular singular point

Check to see if $x_0 = -\frac{1}{2}$ is a regular singular point

$x_0 = -\frac{1}{2}$

- Multiply by denominators

$(1+2x)\, y'' - 2y' + (-3-2x)\, y = 0$

- Change variables using $x = u - \frac{1}{2}$ so that the regular singular point is at $u = 0$

$2u\left(\frac{d^2}{du^2}y(u)\right) - 2\frac{d}{du}y(u) + (-2-2u)\, y(u) = 0$

- Assume series solution for $y(u)$

$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

  $$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

- Shift index using $k->k-m$

  $$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

- Convert $\frac{d}{du}y(u)$ to series expansion

  $$\frac{d}{du}y(u) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1}$$

- Shift index using $k->k+1$

  $$\frac{d}{du}y(u) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\, u^{k+r}$$

- Convert $u \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

  $$u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-1}$$

- Shift index using $k->k+1$

  $$u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\,(k+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$2a_0 r(-2+r)\, u^{-1+r} + \left(2a_1(1+r)\,(-1+r) - 2a_0\right) u^r + \left(\sum_{k=1}^{\infty} \left(2a_{k+1}(k+1+r)\,(k+r-1) - 2a_k\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$2r(-2+r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \{0, 2\}$$

- Each term must be 0

  $$2a_1(1+r)\,(-1+r) - 2a_0 = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$2a_{k+1}(k+1+r)\,(k+r-1) - 2a_k - 2a_{k-1} = 0$$

- Shift index using $k->k+1$

  $$2a_{k+2}(k+2+r)\,(k+r) - 2a_{k+1} - 2a_k = 0$$

- Recursion relation that defines series solution to ODE

$a_{k+2} = \frac{a_{k+1}+a_k}{(k+2+r)(k+r)}$

- Recursion relation for $r = 0$

  $a_{k+2} = \frac{a_{k+1}+a_k}{(k+2)k}$

- Series not valid for $r = 0$, division by 0 in the recursion relation at $k = 0$

  $a_{k+2} = \frac{a_{k+1}+a_k}{(k+2)k}$

- Recursion relation for $r = 2$

  $a_{k+2} = \frac{a_{k+1}+a_k}{(k+4)(k+2)}$

- Solution for $r = 2$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+2}, a_{k+2} = \frac{a_{k+1}+a_k}{(k+4)(k+2)}, 6a_1 - 2a_0 = 0\right]$

- Revert the change of variables $u = x + \frac{1}{2}$

  $\left[y = \sum_{k=0}^{\infty} a_k \left(x+\frac{1}{2}\right)^{k+2}, a_{k+2} = \frac{a_{k+1}+a_k}{(k+4)(k+2)}, 6a_1 - 2a_0 = 0\right]$

Problem number: 20.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(1+2x)\,y''-(1-2x)\,y'-(-2x+3)\,y=0}$$

With initial conditions

$$[y(1)=1, y'(1)=-2]$$

With the expansion point for the power series method at $x=1$.

13.17.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=\frac{2x-1}{1+2x}\\ q(x)&=\frac{-3+2x}{1+2x}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' + \frac{(2x-1)\,y'}{1+2x} + \frac{(-3+2x)\,y}{1+2x} = 0$$

The domain of $p(x) = \frac{2x-1}{1+2x}$ is

$$\left\{x < -\frac{1}{2} \lor -\frac{1}{2} < x\right\}$$

And the point $x_0 = 1$ is inside this domain. The domain of $q(x) = \frac{-3+2x}{1+2x}$ is

$$\left\{x < -\frac{1}{2} \lor -\frac{1}{2} < x\right\}$$

And the point $x_0 = 1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x - 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$(2t+3)\left(\frac{d^2}{dt^2}y(t)\right) + (1+2t)\left(\frac{d}{dt}y(t)\right) + (2t-1)\,y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = 1$$
$$y'(0) = -2$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (977)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (978)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3)\\
&\ \vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n \big|_{x_0, y_0, y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2y(t)\,t + 2t\left(\frac{d}{dt}y(t)\right) - y(t) + \frac{d}{dt}y(t)}{2t+3} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0 \\
&= \frac{y(t)\left(-3+2t\right)}{2t+3} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1 \\
&= \frac{4\left(\frac{d}{dt}y(t)\right)t^2 + 12y(t) - 9\frac{d}{dt}y(t)}{\left(2t+3\right)^2} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2 \\
&= \frac{\left(-8t^3 - 4t^2 + 66t + 81\right)\left(\frac{d}{dt}y(t)\right) - 8\left(t^3 - \frac{1}{2}t^2 - \frac{9}{4}t + \frac{57}{8}\right)y(t)}{\left(2t+3\right)^3} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3 \\
&= \frac{\left(-144t^2 - 576t - 540\right)\left(\frac{d}{dt}y(t)\right) + 16\left(t^4 - \frac{27}{2}t^2 - 9t + \frac{477}{16}\right)y(t)}{\left(2t+3\right)^4}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = 1$ and $y'(0) = -2$ gives

$$
\begin{aligned}
F_0 &= 1 \\
F_1 &= -1 \\
F_2 &= \frac{10}{3} \\
F_3 &= -\frac{73}{9} \\
F_4 &= \frac{173}{9}
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = 1 + \frac{t^2}{2} - 2t - \frac{t^3}{6} + \frac{5t^4}{36} - \frac{73t^5}{1080} + \frac{173t^6}{6480} + O(t^6)$$

$$y(t) = 1 + \frac{t^2}{2} - 2t - \frac{t^3}{6} + \frac{5t^4}{36} - \frac{73t^5}{1080} + \frac{173t^6}{6480} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(2t+3)\left(\frac{d^2}{dt^2}y(t)\right) + (1+2t)\left(\frac{d}{dt}y(t)\right) + (2t-1)\,y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}$$

Substituting the above back into the ode gives

$$(2t+3)\left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right) + (1+2t)\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + (2t-1)\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 2n\, t^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} 3n(n-1)\,a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + \left(\sum_{n=1}^{\infty} 2n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 2t^{1+n} a_n\right) + \sum_{n=0}^{\infty} (-a_n t^n) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 2n\, t^{n-1} a_n(n-1) = \sum_{n=1}^{\infty} 2(1+n)\, a_{1+n} n\, t^n$$

$$\sum_{n=2}^{\infty} 3n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} 3(n+2)\, a_{n+2}(1+n)\, t^n$$

$$\sum_{n=1}^{\infty} n a_n t^{n-1} = \sum_{n=0}^{\infty} (1+n)\, a_{1+n} t^n$$

$$\sum_{n=0}^{\infty} 2t^{1+n} a_n = \sum_{n=1}^{\infty} 2a_{n-1} t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\begin{aligned}&\left(\sum_{n=1}^{\infty} 2(1+n)\, a_{1+n} n\, t^n\right) + \left(\sum_{n=0}^{\infty} 3(n+2)\, a_{n+2}(1+n)\, t^n\right) \\ &+ \left(\sum_{n=0}^{\infty} (1+n)\, a_{1+n} t^n\right) + \left(\sum_{n=1}^{\infty} 2n a_n t^n\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1} t^n\right) + \sum_{n=0}^{\infty} (-a_n t^n) = 0\end{aligned} \tag{3}$$

$n = 0$ gives

$$6a_2 + a_1 - a_0 = 0$$

$$a_2 = \frac{a_0}{6} - \frac{a_1}{6}$$

For $1 \leq n$, the recurrence equation is

$$2(1+n)\, a_{1+n} n + 3(n+2)\, a_{n+2}(1+n) + (1+n)\, a_{1+n} + 2n a_n + 2a_{n-1} - a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{2n^2 a_{1+n} + 2n a_n + 3n a_{1+n} - a_n + a_{1+n} + 2a_{n-1}}{3\,(n+2)\,(1+n)} \\ &= -\frac{(2n-1)\, a_n}{3\,(n+2)\,(1+n)} - \frac{(2n^2+3n+1)\, a_{1+n}}{3\,(n+2)\,(1+n)} - \frac{2a_{n-1}}{3\,(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$6a_2 + 18a_3 + a_1 + 2a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = -\frac{a_0}{6}$$

For $n = 2$ the recurrence equation gives

$$15a_3 + 36a_4 + 3a_2 + 2a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{18} - \frac{a_1}{24}$$

For $n = 3$ the recurrence equation gives

$$28a_4 + 60a_5 + 5a_3 + 2a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{19a_0}{1080} + \frac{a_1}{40}$$

For $n = 4$ the recurrence equation gives

$$45a_5 + 90a_6 + 7a_4 + 2a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{53a_0}{6480} - \frac{a_1}{108}$$

For $n = 5$ the recurrence equation gives

$$66a_6 + 126a_7 + 9a_5 + 2a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{19a_0}{4860} + \frac{169a_1}{45360}$$

And so on. Therefore the solution is

$$
\begin{aligned}
y(t) &= \sum_{n=0}^{\infty} a_n t^n \\
&= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots
\end{aligned}
$$

Substituting the values for a_n found above, the solution becomes

$$
y(t) = a_0 + a_1 t + \left(\frac{a_0}{6} - \frac{a_1}{6}\right) t^2 - \frac{a_0 t^3}{6} + \left(\frac{a_0}{18} - \frac{a_1}{24}\right) t^4 + \left(-\frac{19 a_0}{1080} + \frac{a_1}{40}\right) t^5 + \dots
$$

Collecting terms, the solution becomes

$$
y(t) = \left(1 + \frac{1}{6} t^2 - \frac{1}{6} t^3 + \frac{1}{18} t^4 - \frac{19}{1080} t^5\right) a_0 + \left(t - \frac{1}{6} t^2 - \frac{1}{24} t^4 + \frac{1}{40} t^5\right) a_1 + O(t^6) \quad (3)
$$

At $t = 0$ the solution above becomes

$$
y(t) = \left(1 + \frac{1}{6} t^2 - \frac{1}{6} t^3 + \frac{1}{18} t^4 - \frac{19}{1080} t^5\right) c_1 + \left(t - \frac{1}{6} t^2 - \frac{1}{24} t^4 + \frac{1}{40} t^5\right) c_2 + O(t^6)
$$

$$
y(t) = 1 + \frac{t^2}{2} - \frac{t^3}{6} + \frac{5 t^4}{36} - \frac{73 t^5}{1080} - 2t + O(t^6)
$$

Replacing t in the above with the original independent variable $x$susing $t = x - 1$ results in

$$
y = 3 + \frac{(x-1)^2}{2} - 2x - \frac{(x-1)^3}{6} + \frac{5(x-1)^4}{36} - \frac{73(x-1)^5}{1080} + \frac{173(x-1)^6}{6480} + O\left((x-1)^6\right)
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = 3 &+ \frac{(x-1)^2}{2} - 2x - \frac{(x-1)^3}{6} + \frac{5(x-1)^4}{36} \\
&- \frac{73(x-1)^5}{1080} + \frac{173(x-1)^6}{6480} + O\left((x-1)^6\right)
\end{aligned} \quad (1)
$$

Verification of solutions

$$
y = 3 + \frac{(x-1)^2}{2} - 2x - \frac{(x-1)^3}{6} + \frac{5(x-1)^4}{36} - \frac{73(x-1)^5}{1080} + \frac{173(x-1)^6}{6480} + O\left((x-1)^6\right)
$$

Verified OK.

13.17.2 Maple step by step solution

Let's solve

$$\left[(1+2x)\,y''+(2x-1)\,y'+(-3+2x)\,y=0, y(1)=1, y'\Big|_{\{x=1\}}=-2\right]$$

- Highest derivative means the order of the ODE is 2

$$y''$$

- Isolate 2nd derivative

$$y''=-\frac{(-3+2x)y}{1+2x}-\frac{(2x-1)y'}{1+2x}$$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$$y''+\frac{(2x-1)y'}{1+2x}+\frac{(-3+2x)y}{1+2x}=0$$

☐ Check to see if $x_0=-\frac{1}{2}$ is a regular singular point

  ◦ Define functions

$$\left[P_2(x)=\frac{2x-1}{1+2x}, P_3(x)=\frac{-3+2x}{1+2x}\right]$$

  ◦ $\left(x+\frac{1}{2}\right)\cdot P_2(x)$ is analytic at $x=-\frac{1}{2}$

$$\left(\left(x+\frac{1}{2}\right)\cdot P_2(x)\right)\Big|_{x=-\frac{1}{2}}=-1$$

  ◦ $\left(x+\frac{1}{2}\right)^2\cdot P_3(x)$ is analytic at $x=-\frac{1}{2}$

$$\left(\left(x+\frac{1}{2}\right)^2\cdot P_3(x)\right)\Big|_{x=-\frac{1}{2}}=0$$

  ◦ $x=-\frac{1}{2}$is a regular singular point

Check to see if $x_0=-\frac{1}{2}$ is a regular singular point

$$x_0=-\frac{1}{2}$$

- Multiply by denominators

$$(1+2x)\,y''+(2x-1)\,y'+(-3+2x)\,y=0$$

- Change variables using $x=u-\frac{1}{2}$ so that the regular singular point is at $u=0$

$$2u\left(\frac{d^2}{du^2}y(u)\right)+(2u-2)\left(\frac{d}{du}y(u)\right)+(-4+2u)\,y(u)=0$$

- Assume series solution for $y(u)$

$$y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

$$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

- Shift index using $k- >k - m$

$$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

$$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

$$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

$$u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-1}$$

- Shift index using $k- >k + 1$

$$u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\,(k+r)\, u^{k+r}$$

Rewrite ODE with series expansions

$$2a_0r(-2+r)\, u^{-1+r} + (2a_1(1+r)\,(-1+r) + 2a_0(-2+r))\, u^r + \left(\sum_{k=1}^{\infty} (2a_{k+1}(k+1+r)\,(k+r-\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$2r(-2+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{0, 2\}$$

- Each term must be 0

$$2a_1(1+r)\,(-1+r) + 2a_0(-2+r) = 0$$

- Each term in the series must be 0, giving the recursion relation

$$2a_{k+1}(k+1+r)\,(k+r-1) + a_k(2k+2r-4) + 2a_{k-1} = 0$$

- Shift index using $k- >k + 1$

$$2a_{k+2}(k+2+r)\,(k+r) + a_{k+1}(2k-2+2r) + 2a_k = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{k a_{k+1} + r a_{k+1} + a_k - a_{k+1}}{(k+2+r)(k+r)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{k a_{k+1} + a_k - a_{k+1}}{(k+2)k}$$

- Series not valid for $r = 0$, division by 0 in the recursion relation at $k = 0$

$$a_{k+2} = -\frac{k a_{k+1} + a_k - a_{k+1}}{(k+2)k}$$

- Recursion relation for $r = 2$

$$a_{k+2} = -\frac{k a_{k+1} + a_k + a_{k+1}}{(k+4)(k+2)}$$

- Solution for $r = 2$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+2}, a_{k+2} = -\frac{k a_{k+1} + a_k + a_{k+1}}{(k+4)(k+2)}, 6a_1 = 0\right]$$

- Revert the change of variables $u = x + \frac{1}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(x + \frac{1}{2}\right)^{k+2}, a_{k+2} = -\frac{k a_{k+1} + a_k + a_{k+1}}{(k+4)(k+2)}, 6a_1 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 21.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(2x+5)\,y''-y'+(x+5)\,y=0}$$

With initial conditions

$$[y(-2)=2, y'(-2)=-1]$$

With the expansion point for the power series method at $x=-2$.

13.18.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=-\frac{1}{2x+5}\\ q(x)&=\frac{x+5}{2x+5}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' - \frac{y'}{2x+5} + \frac{(x+5)\,y}{2x+5} = 0$$

The domain of $p(x) = -\frac{1}{2x+5}$ is

$$\left\{x < -\frac{5}{2} \lor -\frac{5}{2} < x\right\}$$

And the point $x_0 = -2$ is inside this domain. The domain of $q(x) = \frac{x+5}{2x+5}$ is

$$\left\{x < -\frac{5}{2} \lor -\frac{5}{2} < x\right\}$$

And the point $x_0 = -2$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = 2 + x$$

The ode is converted to be in terms of the new independent variable t. This results in

$$(1+2t)\left(\frac{d^2}{dt^2}y(t)\right) - \frac{d}{dt}y(t) + (t+3)\,y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = 2$$
$$y'(0) = -1$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (980) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (981) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \tag{7}$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{y(t)\,t + 3y(t) - \frac{d}{dt}y(t)}{1+2t} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0 \\
&= \frac{\left(-2t^2-7t-4\right)\left(\frac{d}{dt}y(t)\right) - y(t)\left(t-2\right)}{\left(1+2t\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1 \\
&= \frac{\left(-4t^2+6t+7\right)\left(\frac{d}{dt}y(t)\right) + 2y(t)\left(t^3+\frac{13}{2}t^2+\frac{27}{2}t+\frac{3}{2}\right)}{\left(1+2t\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2 \\
&= \frac{\left(4t^4+28t^3+71t^2+7t-26\right)\left(\frac{d}{dt}y(t)\right) + 4\left(t^3-\frac{7}{2}t^2-\frac{107}{4}t-3\right)y(t)}{\left(1+2t\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3 \\
&= \frac{\left(12t^4-36t^3-357t^2-24t+177\right)\left(\frac{d}{dt}y(t)\right) - 4y(t)\left(t^5+10t^4+\frac{163}{4}t^3+38t^2-\frac{619}{4}t-\frac{67}{4}\right)}{\left(1+2t\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = 2$ and $y'(0) = -1$ gives

$$
\begin{aligned}
F_0 &= -7 \\
F_1 &= 8 \\
F_2 &= -1 \\
F_3 &= 2 \\
F_4 &= -43
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = -t + 2 - \frac{7t^2}{2} + \frac{4t^3}{3} - \frac{t^4}{24} + \frac{t^5}{60} - \frac{43t^6}{720} + O(t^6)$$

$$y(t) = -t + 2 - \frac{7t^2}{2} + \frac{4t^3}{3} - \frac{t^4}{24} + \frac{t^5}{60} - \frac{43t^6}{720} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(1 + 2t) \left(\frac{d^2}{dt^2} y(t)\right) - \frac{d}{dt} y(t) + (t + 3)\, y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt} y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2} y(t) = \sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}$$

Substituting the above back into the ode gives

$$(1 + 2t) \left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right) - \left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + (t + 3) \left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 2n\, t^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right) + \sum_{n=1}^{\infty} \left(-n a_n t^{n-1}\right) + \left(\sum_{n=0}^{\infty} t^{1+n} a_n\right) + \left(\sum_{n=0}^{\infty} 3a_n t^n\right) = 0 \quad (2)$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 2n\, t^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} 2(1+n)\, a_{1+n} n\, t^n$$

$$\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, t^n$$

$$\sum_{n=1}^{\infty} \left(-n a_n t^{n-1}\right) = \sum_{n=0}^{\infty} \left(-(1+n)\, a_{1+n} t^n\right)$$

$$\sum_{n=0}^{\infty} t^{1+n} a_n = \sum_{n=1}^{\infty} a_{n-1} t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=1}^{\infty} 2(1+n)\, a_{1+n} n\, t^n\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, t^n\right) + \sum_{n=0}^{\infty} \left(-(1+n)\, a_{1+n} t^n\right) + \left(\sum_{n=1}^{\infty} a_{n-1} t^n\right) + \left(\sum_{n=0}^{\infty} 3 a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 - a_1 + 3a_0 = 0$$

$$a_2 = -\frac{3a_0}{2} + \frac{a_1}{2}$$

For $1 \leq n$, the recurrence equation is

$$2(1+n)\, a_{1+n} n + (n+2)\, a_{n+2}(1+n) - (1+n)\, a_{1+n} + a_{n-1} + 3a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{2n^2 a_{1+n} + n a_{1+n} + 3a_n - a_{1+n} + a_{n-1}}{(n+2)\,(1+n)} \\ &= -\frac{3a_n}{(n+2)\,(1+n)} - \frac{(2n^2+n-1)\, a_{1+n}}{(n+2)\,(1+n)} - \frac{a_{n-1}}{(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$2a_2 + 6a_3 + a_0 + 3a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = \frac{a_0}{3} - \frac{2a_1}{3}$$

For $n = 2$ the recurrence equation gives

$$9a_3 + 12a_4 + a_1 + 3a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{8} + \frac{7a_1}{24}$$

For $n = 3$ the recurrence equation gives

$$20a_4 + 20a_5 + a_2 + 3a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{a_0}{10} - \frac{13a_1}{60}$$

For $n = 4$ the recurrence equation gives

$$35a_5 + 30a_6 + a_3 + 3a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{67a_0}{720} + \frac{59a_1}{240}$$

For $n = 5$ the recurrence equation gives

$$54a_6 + 42a_7 + a_4 + 3a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{97a_0}{840} - \frac{155a_1}{504}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$\begin{aligned} y(t) = a_0 + a_1 t &+ \left(-\frac{3a_0}{2} + \frac{a_1}{2}\right) t^2 + \left(\frac{a_0}{3} - \frac{2a_1}{3}\right) t^3 \\ &+ \left(\frac{a_0}{8} + \frac{7a_1}{24}\right) t^4 + \left(-\frac{a_0}{10} - \frac{13a_1}{60}\right) t^5 + \dots \end{aligned}$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - \frac{3}{2}t^2 + \frac{1}{3}t^3 + \frac{1}{8}t^4 - \frac{1}{10}t^5\right) a_0 + \left(t + \frac{1}{2}t^2 - \frac{2}{3}t^3 + \frac{7}{24}t^4 - \frac{13}{60}t^5\right) a_1 + O(t^6) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - \frac{3}{2}t^2 + \frac{1}{3}t^3 + \frac{1}{8}t^4 - \frac{1}{10}t^5\right) c_1 + \left(t + \frac{1}{2}t^2 - \frac{2}{3}t^3 + \frac{7}{24}t^4 - \frac{13}{60}t^5\right) c_2 + O(t^6)$$

$$y(t) = 2 - \frac{7t^2}{2} + \frac{4t^3}{3} - \frac{t^4}{24} + \frac{t^5}{60} - t + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = 2 + x$ results in

$$y = -x - \frac{7(2+x)^2}{2} + \frac{4(2+x)^3}{3} - \frac{(2+x)^4}{24} + \frac{(2+x)^5}{60} - \frac{43(2+x)^6}{720} + O\left((2+x)^6\right)$$

Summary

The solution(s) found are the following

$$y = -x - \frac{7(2+x)^2}{2} + \frac{4(2+x)^3}{3} - \frac{(2+x)^4}{24} + \frac{(2+x)^5}{60} - \frac{43(2+x)^6}{720} + O\left((2+x)^6\right) \quad (1)$$

Verification of solutions

$$y=-x-\frac{7(2+x)^{2}}{2}+\frac{4(2+x)^{3}}{3}-\frac{(2+x)^{4}}{24}+\frac{(2+x)^{5}}{60}-\frac{43(2+x)^{6}}{720}+O\left((2+x)^{6}\right)$$

Verified OK.

13.18.2 Maple step by step solution

Let's solve

$\left[(2x+5)\, y''-y'+(x+5)\, y=0, y(-2)=2, y'\Big|_{\{x=-2\}}=-1\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(x+5)y}{2x+5}+\frac{y'}{2x+5}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{y'}{2x+5}+\frac{(x+5)y}{2x+5}=0$

- □ Check to see if $x_0=-\frac{5}{2}$ is a regular singular point

  - Define functions

    $\left[P_2(x)=-\frac{1}{2x+5}, P_3(x)=\frac{x+5}{2x+5}\right]$

  - $\left(x+\frac{5}{2}\right)\cdot P_2(x)$ is analytic at $x=-\frac{5}{2}$

    $\left(\left(x+\frac{5}{2}\right)\cdot P_2(x)\right)\Bigg|_{x=-\frac{5}{2}}=-\frac{1}{2}$

  - $\left(x+\frac{5}{2}\right)^{2}\cdot P_3(x)$ is analytic at $x=-\frac{5}{2}$

    $\left(\left(x+\frac{5}{2}\right)^{2}\cdot P_3(x)\right)\Bigg|_{x=-\frac{5}{2}}=0$

  - $x=-\frac{5}{2}$is a regular singular point

  Check to see if $x_0=-\frac{5}{2}$ is a regular singular point

  $x_0=-\frac{5}{2}$

- Multiply by denominators

  $(2x+5)\, y''-y'+(x+5)\, y=0$

- Change variables using $x=u-\frac{5}{2}$ so that the regular singular point is at $u=0$

$$2u\left(\frac{d^2}{du^2}y(u)\right) - \frac{d}{du}y(u) + \left(u + \frac{5}{2}\right)y(u) = 0$$

- Assume series solution for $y(u)$

$$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$$

□ Rewrite ODE with series expansions

- ○ Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

$$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

- ○ Shift index using $k- > k - m$

$$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

- ○ Convert $\frac{d}{du}y(u)$ to series expansion

$$\frac{d}{du}y(u) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1}$$

- ○ Shift index using $k- > k + 1$

$$\frac{d}{du}y(u) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\, u^{k+r}$$

- ○ Convert $u \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

$$u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-1}$$

- ○ Shift index using $k- > k + 1$

$$u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\,(k+r)\, u^{k+r}$$

Rewrite ODE with series expansions

$$a_0 r(-3+2r)\, u^{-1+r} + \left(a_1(1+r)\,(-1+2r) + \frac{5a_0}{2}\right) u^r + \left(\sum_{k=1}^{\infty} \left(a_{k+1}(k+1+r)\,(2k-1+2r) + \frac{5a}{2}\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$r(-3+2r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{0, \frac{3}{2}\right\}$$

- Each term must be 0

$$a_1(1+r)\,(-1+2r) + \frac{5a_0}{2} = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$2\left(k-\frac{1}{2}+r\right)(k+1+r)\,a_{k+1}+\frac{5a_k}{2}+a_{k-1}=0$$

- Shift index using $k->k+1$

  $$2\left(k+\frac{1}{2}+r\right)(k+2+r)\,a_{k+2}+\frac{5a_{k+1}}{2}+a_k=0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2}=-\frac{5a_{k+1}+2a_k}{2(2k+1+2r)(k+2+r)}$$

- Recursion relation for $r=0$

  $$a_{k+2}=-\frac{5a_{k+1}+2a_k}{2(2k+1)(k+2)}$$

- Solution for $r=0$

  $$\left[y(u)=\sum_{k=0}^{\infty}a_k u^k, a_{k+2}=-\frac{5a_{k+1}+2a_k}{2(2k+1)(k+2)}, -a_1+\frac{5a_0}{2}=0\right]$$

- Revert the change of variables $u=x+\frac{5}{2}$

  $$\left[y=\sum_{k=0}^{\infty}a_k\left(x+\frac{5}{2}\right)^k, a_{k+2}=-\frac{5a_{k+1}+2a_k}{2(2k+1)(k+2)}, -a_1+\frac{5a_0}{2}=0\right]$$

- Recursion relation for $r=\frac{3}{2}$

  $$a_{k+2}=-\frac{5a_{k+1}+2a_k}{2(2k+4)\left(k+\frac{7}{2}\right)}$$

- Solution for $r=\frac{3}{2}$

  $$\left[y(u)=\sum_{k=0}^{\infty}a_k u^{k+\frac{3}{2}}, a_{k+2}=-\frac{5a_{k+1}+2a_k}{2(2k+4)\left(k+\frac{7}{2}\right)}, 5a_1+\frac{5a_0}{2}=0\right]$$

- Revert the change of variables $u=x+\frac{5}{2}$

  $$\left[y=\sum_{k=0}^{\infty}a_k\left(x+\frac{5}{2}\right)^{k+\frac{3}{2}}, a_{k+2}=-\frac{5a_{k+1}+2a_k}{2(2k+4)\left(k+\frac{7}{2}\right)}, 5a_1+\frac{5a_0}{2}=0\right]$$

- Combine solutions and rename parameters

  $$\left[y=\left(\sum_{k=0}^{\infty}a_k\left(x+\frac{5}{2}\right)^k\right)+\left(\sum_{k=0}^{\infty}b_k\left(x+\frac{5}{2}\right)^{k+\frac{3}{2}}\right), a_{k+2}=-\frac{5a_{1+k}+2a_k}{2(2k+1)(k+2)}, -a_1+\frac{5a_0}{2}=0, b_{k+2}=-\frac{}{2(}\right.$$

Problem number: 22.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(x+4)\,y''-(2x+4)\,y'+(x+6)\,y=0}$$

With initial conditions

$$[y(-3)=2, y'(-3)=-2]$$

With the expansion point for the power series method at $x=-3$.

13.19.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned} p(x)&=\frac{-2x-4}{x+4}\\ q(x)&=\frac{x+6}{x+4}\\ F&=0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{(-2x-4)\,y'}{x+4} + \frac{(x+6)\,y}{x+4} = 0$$

The domain of $p(x) = \frac{-2x-4}{x+4}$ is

$$\{x < -4 \lor -4 < x\}$$

And the point $x_0 = -3$ is inside this domain. The domain of $q(x) = \frac{x+6}{x+4}$ is

$$\{x < -4 \lor -4 < x\}$$

And the point $x_0 = -3$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x + 3$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(\frac{d^2}{dt^2}y(t)\right)(t+1) + (-2t+2)\left(\frac{d}{dt}y(t)\right) + (t+3)\,y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = 2$$
$$y'(0) = -2$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0)+(x-x_0)\,y'(x_0)+\frac{(x-x_0)^2}{2}y''(x_0)+\frac{(x-x_0)^3}{3!}y'''(x_0)+\cdots\\
&= y_0+xy'_0+\frac{x^2}{2}\,f|_{x_0,y_0,y'_0}+\frac{x^3}{3!}\,f'|_{x_0,y_0,y'_0}+\cdots\\
&= y_0+xy'_0+\sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}\left.\frac{d^nf}{dx^n}\right|_{x_0,y_0,y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx}+\frac{\partial f}{\partial y}\frac{dy}{dx}+\frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x}+\frac{\partial f}{\partial y}y'+\frac{\partial f}{\partial y'}y'' && (983)\\
&= \frac{\partial f}{\partial x}+\frac{\partial f}{\partial y}y'+\frac{\partial f}{\partial y'}f && (984)\\
\frac{d^2f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right)+\frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y'+\frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f && (2)\\
\frac{d^3f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2f}{dx^2}\right)+\left(\frac{\partial}{\partial y}\frac{d^2f}{dx^2}\right)y'+\frac{\partial}{\partial y'}\left(\frac{d^2f}{dx^2}\right)f && (3)\\
&\ \vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{y(t)\,t - 2t\left(\frac{d}{dt}y(t)\right) + 3y(t) + 2\frac{d}{dt}y(t)}{t+1} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0 \\
&= \frac{\left(3t^2 - 12t + 5\right)\left(\frac{d}{dt}y(t)\right) - 2y(t)\left(t^2 + 2t - 4\right)}{\left(t+1\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1 \\
&= \frac{4\left(t^3 - 9t^2 + 14t - 6\right)\left(\frac{d}{dt}y(t)\right) - 3\left(t^3 - t^2 - \frac{31}{3}t + \frac{35}{3}\right)y(t)}{\left(t+1\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2 \\
&= \frac{\left(5t^4 - 80t^3 + 266t^2 - 348t + 141\right)\left(\frac{d}{dt}y(t)\right) - 4y(t)\left(t^4 - 6t^3 - 10t^2 + 50t - 52\right)}{\left(t+1\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3 \\
&= \frac{\left(6t^5 - 150t^4 + 856t^3 - 2160t^2 + 2562t - 986\right)\left(\frac{d}{dt}y(t)\right) - 5y(t)\left(t^5 - 13t^4 + \frac{66}{5}t^3 + \frac{458}{5}t^2 - \frac{1583}{5}t + 29\right.}{\left(t+1\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = 2$ and $y'(0) = -2$ gives

$$
\begin{aligned}
F_0 &= -2 \\
F_1 &= 6 \\
F_2 &= -22 \\
F_3 &= 134 \\
F_4 &= -938
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = t^3 - t^2 - 2t + 2 - \frac{11t^4}{12} + \frac{67t^5}{60} - \frac{469t^6}{360} + O(t^6)$$

$$y(t) = t^3 - t^2 - 2t + 2 - \frac{11t^4}{12} + \frac{67t^5}{60} - \frac{469t^6}{360} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(t+1) + (-2t+2)\left(\frac{d}{dt}y(t)\right) + (t+3)\,y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right)(t+1) + (-2t+2)\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + (t+3)\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}\left(\sum_{n=2}^{\infty} n\,t^{n-1} a_n(n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right) + \sum_{n=1}^{\infty}(-2n a_n t^n) \\ + \left(\sum_{n=1}^{\infty} 2n a_n t^{n-1}\right) + \left(\sum_{n=0}^{\infty} t^{1+n} a_n\right) + \left(\sum_{n=0}^{\infty} 3a_n t^n\right) = 0\end{aligned} \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n\, t^{n-1} a_n(n-1) = \sum_{n=1}^{\infty} (1+n)\, a_{1+n} n\, t^n$$

$$\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, t^n$$

$$\sum_{n=1}^{\infty} 2n a_n t^{n-1} = \sum_{n=0}^{\infty} 2(1+n)\, a_{1+n} t^n$$

$$\sum_{n=0}^{\infty} t^{1+n} a_n = \sum_{n=1}^{\infty} a_{n-1} t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=1}^{\infty} (1+n)\, a_{1+n} n\, t^n\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, t^n\right) + \sum_{n=1}^{\infty} (-2n a_n t^n) + \left(\sum_{n=0}^{\infty} 2(1+n)\, a_{1+n} t^n\right) + \left(\sum_{n=1}^{\infty} a_{n-1} t^n\right) + \left(\sum_{n=0}^{\infty} 3a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 2a_1 + 3a_0 = 0$$

$$a_2 = -\frac{3a_0}{2} - a_1$$

For $1 \leq n$, the recurrence equation is

$$(1+n)\, a_{1+n} n + (n+2)\, a_{n+2}(1+n) - 2n a_n + 2(1+n)\, a_{1+n} + a_{n-1} + 3a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{n^2 a_{1+n} - 2n a_n + 3n a_{1+n} + 3a_n + 2a_{1+n} + a_{n-1}}{(n+2)\,(1+n)} \\ &= -\frac{(-2n+3)\, a_n}{(n+2)\,(1+n)} - \frac{(n^2+3n+2)\, a_{1+n}}{(n+2)\,(1+n)} - \frac{a_{n-1}}{(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$6a_2 + 6a_3 + a_1 + a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = \frac{4a_0}{3} + \frac{5a_1}{6}$$

For $n = 2$ the recurrence equation gives

$$12a_3 + 12a_4 - a_2 + a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{35a_0}{24} - a_1$$

For $n = 3$ the recurrence equation gives

$$20a_4 + 20a_5 - 3a_3 + a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{26a_0}{15} + \frac{47a_1}{40}$$

For $n = 4$ the recurrence equation gives

$$30a_5 + 30a_6 - 5a_4 + a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{97a_0}{48} - \frac{493a_1}{360}$$

For $n = 5$ the recurrence equation gives

$$42a_6 + 42a_7 - 7a_5 + a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{211a_0}{90} + \frac{8009a_1}{5040}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + \left(-\frac{3a_0}{2} - a_1\right) t^2 + \left(\frac{4a_0}{3} + \frac{5a_1}{6}\right) t^3 + \left(-\frac{35a_0}{24} - a_1\right) t^4 + \left(\frac{26a_0}{15} + \frac{47a_1}{40}\right) t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - \frac{3}{2}t^2 + \frac{4}{3}t^3 - \frac{35}{24}t^4 + \frac{26}{15}t^5\right) a_0 + \left(t - t^2 + \frac{5}{6}t^3 - t^4 + \frac{47}{40}t^5\right) a_1 + O\left(t^6\right) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - \frac{3}{2}t^2 + \frac{4}{3}t^3 - \frac{35}{24}t^4 + \frac{26}{15}t^5\right) c_1 + \left(t - t^2 + \frac{5}{6}t^3 - t^4 + \frac{47}{40}t^5\right) c_2 + O\left(t^6\right)$$

$$y(t) = 2 - t^2 + t^3 - \frac{11t^4}{12} + \frac{67t^5}{60} - 2t + O\left(t^6\right)$$

Replacing t in the above with the original independent variable $x$susing $t = x + 3$ results in

$$y = (x+3)^3 - (x+3)^2 - 2x - 4 - \frac{11(x+3)^4}{12} + \frac{67(x+3)^5}{60} - \frac{469(x+3)^6}{360} + O\left((x+3)^6\right)$$

Summary
The solution(s) found are the following

$$y = (x+3)^3 - (x+3)^2 - 2x - 4 - \frac{11(x+3)^4}{12} + \frac{67(x+3)^5}{60} - \frac{469(x+3)^6}{360} + O\left((x+3)^6\right) \quad (1)$$

Verification of solutions

$$y = (x+3)^3 - (x+3)^2 - 2x - 4 - \frac{11(x+3)^4}{12} + \frac{67(x+3)^5}{60} - \frac{469(x+3)^6}{360} + O((x+3)^6)$$

Verified OK.

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 23.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(3x+2)\,y''-y'x+2yx=0}$$

With initial conditions

$$[y(0)=-1, y'(0)=2]$$

With the expansion point for the power series method at $x=0$.

13.20.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=-\frac{x}{3x+2}\\ q(x)&=\frac{2x}{3x+2}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' - \frac{xy'}{3x+2} + \frac{2xy}{3x+2} = 0$$

The domain of $p(x) = -\frac{x}{3x+2}$ is

$$\left\{x < -\frac{2}{3} \lor -\frac{2}{3} < x\right\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{2x}{3x+2}$ is

$$\left\{x < -\frac{2}{3} \lor -\frac{2}{3} < x\right\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned} y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\ &= y_0 + xy'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\ &= y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0} \end{aligned}$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' && (986)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (987)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f && (3)\\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y_0'} \tag{7}$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{x(-y'+2y)}{3x+2} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{\left(-5x^2-4x+2\right) y' + \left(-2x^2-4\right) y}{\left(3x+2\right)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{\left(-11x^3-8x^2-18x-28\right) y' + 10(2+x)\left(x^2-\frac{6}{5}x+\frac{6}{5}\right) y}{\left(3x+2\right)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{\left(19x^4+36x^3-80x^2+96x+264\right) y' + 22\left(x^4+\frac{8}{11}x^3+\frac{36}{11}x^2+\frac{80}{11}x-\frac{120}{11}\right) y}{\left(3x+2\right)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{\left(85x^5+128x^4+212x^3+1416x^2-1320x-3456\right) y' - 38y\left(x^5+\frac{36}{19}x^4-\frac{144}{19}x^3+\frac{264}{19}x^2+\frac{840}{19}x-\frac{1600}{19}\right.}{\left(3x+2\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=-1$ and $y'(0)=2$ gives

$$
\begin{aligned}
F_0 &= 0 \\
F_1 &= 2 \\
F_2 &= -10 \\
F_3 &= 48 \\
F_4 &= -316
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = 2x - 1 + \frac{x^3}{3} - \frac{5x^4}{12} + \frac{2x^5}{5} - \frac{79x^6}{180} + O\left(x^6\right)
$$

$$
y = 2x - 1 + \frac{x^3}{3} - \frac{5x^4}{12} + \frac{2x^5}{5} - \frac{79x^6}{180} + O(x^6)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$
(3x+2)\,y'' - y'x + 2yx = 0
$$

Let the solution be represented as power series of the form

$$
y = \sum_{n=0}^{\infty} a_n x^n
$$

Then

$$
y' = \sum_{n=1}^{\infty} n a_n x^{n-1}
$$

$$
y'' = \sum_{n=2}^{\infty} n(n-1)\,a_n x^{n-2}
$$

Substituting the above back into the ode gives

$$
(3x+2)\left(\sum_{n=2}^{\infty} n(n-1)\,a_n x^{n-2}\right) - \left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x + 2\left(\sum_{n=0}^{\infty} a_n x^n\right) x = 0 \tag{1}
$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} 3n\, x^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} 2n(n-1)\,a_n x^{n-2}\right) \\
&+ \sum_{n=1}^{\infty} (-n a_n x^n) + \left(\sum_{n=0}^{\infty} 2x^{1+n} a_n\right) = 0
\end{aligned} \tag{2}
$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$
\sum_{n=2}^{\infty} 3n\, x^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} 3(1+n)\,a_{1+n} n\, x^n
$$

$$
\sum_{n=2}^{\infty} 2n(n-1)\,a_n x^{n-2} = \sum_{n=0}^{\infty} 2(n+2)\,a_{n+2}(1+n)\,x^n
$$

$$
\sum_{n=0}^{\infty} 2x^{1+n} a_n = \sum_{n=1}^{\infty} 2a_{n-1} x^n
$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=1}^{\infty} 3(1+n)\, a_{1+n} n\, x^{n}\right)+\left(\sum_{n=0}^{\infty} 2(n+2)\, a_{n+2}(1+n)\, x^{n}\right) + \sum_{n\,=1}^{\infty} \left(-n a_{n} x^{n}\right)+\left(\sum_{n=1}^{\infty} 2 a_{n-1} x^{n}\right) = 0 \tag{3}$$

For $1 \leq n$, the recurrence equation is

$$3(1+n)\, a_{1+n} n+2(n+2)\, a_{n+2}(1+n)-n a_{n}+2 a_{n-1} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{3 n^{2} a_{1+n}-n a_{n}+3 n a_{1+n}+2 a_{n-1}}{2\,(n+2)\,(1+n)} \\ &= \frac{n a_{n}}{2\,(n+2)\,(1+n)}-\frac{\left(3 n^{2}+3 n\right) a_{1+n}}{2\,(n+2)\,(1+n)}-\frac{a_{n-1}}{(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$6 a_{2}+12 a_{3}-a_{1}+2 a_{0} = 0$$

Which after substituting the earlier terms found becomes

$$a_{3} = \frac{a_{1}}{12}-\frac{a_{0}}{6}$$

For $n = 2$ the recurrence equation gives

$$18 a_{3}+24 a_{4}-2 a_{2}+2 a_{1} = 0$$

Which after substituting the earlier terms found becomes

$$a_{4} = -\frac{7 a_{1}}{48}+\frac{a_{0}}{8}$$

For $n = 3$ the recurrence equation gives

$$36 a_{4}+40 a_{5}-3 a_{3}+2 a_{2} = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{11a_1}{80} - \frac{a_0}{8}$$

For $n = 4$ the recurrence equation gives

$$60a_5 + 60a_6 - 4a_4 + 2a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{3a_1}{20} + \frac{5a_0}{36}$$

For $n = 5$ the recurrence equation gives

$$90a_6 + 84a_7 - 5a_5 + 2a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{695a_1}{4032} - \frac{107a_0}{672}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1x + \left(\frac{a_1}{12} - \frac{a_0}{6}\right)x^3 + \left(-\frac{7a_1}{48} + \frac{a_0}{8}\right)x^4 + \left(\frac{11a_1}{80} - \frac{a_0}{8}\right)x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{1}{6}x^3 + \frac{1}{8}x^4 - \frac{1}{8}x^5\right)a_0 + \left(x + \frac{1}{12}x^3 - \frac{7}{48}x^4 + \frac{11}{80}x^5\right)a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{1}{6}x^3 + \frac{1}{8}x^4 - \frac{1}{8}x^5\right)c_1 + \left(x + \frac{1}{12}x^3 - \frac{7}{48}x^4 + \frac{11}{80}x^5\right)c_2 + O(x^6)$$

$$y=-1+\frac{x^{3}}{3}-\frac{5x^{4}}{12}+\frac{2x^{5}}{5}+2x+O\left(x^{6}\right)$$

Summary

The solution(s) found are the following

$$y=2x-1+\frac{x^{3}}{3}-\frac{5x^{4}}{12}+\frac{2x^{5}}{5}-\frac{79x^{6}}{180}+O\left(x^{6}\right) \tag{1}$$

$$y=-1+\frac{x^{3}}{3}-\frac{5x^{4}}{12}+\frac{2x^{5}}{5}+2x+O\left(x^{6}\right) \tag{2}$$

Verification of solutions

$$y=2x-1+\frac{x^{3}}{3}-\frac{5x^{4}}{12}+\frac{2x^{5}}{5}-\frac{79x^{6}}{180}+O\left(x^{6}\right)$$

Verified OK.

$$y=-1+\frac{x^{3}}{3}-\frac{5x^{4}}{12}+\frac{2x^{5}}{5}+2x+O\left(x^{6}\right)$$

Verified OK.

13.20.2 Maple step by step solution

Let's solve

$\left[(3x+2)\,y''-y'x+2yx=0, y(0)=-1, y'\Big|_{\{x=0\}}=2\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{2xy}{3x+2}+\frac{xy'}{3x+2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{xy'}{3x+2}+\frac{2xy}{3x+2}=0$

□ Check to see if $x_0=-\frac{2}{3}$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=-\frac{x}{3x+2}, P_3(x)=\frac{2x}{3x+2}\right]$

  ◦ $\left(x+\frac{2}{3}\right)\cdot P_2(x)$ is analytic at $x=-\frac{2}{3}$

$$\left(\left(x+\frac{2}{3}\right)\cdot P_2(x)\right)\bigg|_{x=-\frac{2}{3}} = \frac{2}{9}$$

- ○ $\left(x+\frac{2}{3}\right)^2 \cdot P_3(x)$ is analytic at $x=-\frac{2}{3}$

  $$\left(\left(x+\frac{2}{3}\right)^2\cdot P_3(x)\right)\bigg|_{x=-\frac{2}{3}} = 0$$

- ○ $x=-\frac{2}{3}$is a regular singular point

  Check to see if $x_0=-\frac{2}{3}$ is a regular singular point

  $x_0=-\frac{2}{3}$

- • Multiply by denominators

  $(3x+2)\,y''-y'x+2yx=0$

- • Change variables using $x=u-\frac{2}{3}$ so that the regular singular point is at $u=0$

  $3u\left(\frac{d^2}{du^2}y(u)\right)+\left(-u+\frac{2}{3}\right)\left(\frac{d}{du}y(u)\right)+\left(2u-\frac{4}{3}\right)y(u)=0$

- • Assume series solution for $y(u)$

  $$y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$$

- □ Rewrite ODE with series expansions

  - ○ Convert $u^m\cdot y(u)$ to series expansion for $m=0..1$

    $$u^m\cdot y(u)=\sum_{k=0}^{\infty} a_k u^{k+r+m}$$

  - ○ Shift index using $k->k-m$

    $$u^m\cdot y(u)=\sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

  - ○ Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..1$

    $$u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$$

  - ○ Shift index using $k->k+1-m$

    $$u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,u^{k+r}$$

  - ○ Convert $u\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

    $$u\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,u^{k+r-1}$$

- Shift index using $k- >k+1$

  $u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)(k+r)\, u^{k+r}$

  Rewrite ODE with series expansions

  $\frac{a_0 r(-7+9r)u^{-1+r}}{3} + \left(\frac{a_1(1+r)(2+9r)}{3} - \frac{a_0(4+3r)}{3}\right)u^r + \left(\sum_{k=1}^{\infty}\left(\frac{a_{k+1}(k+1+r)(9k+2+9r)}{3} - \frac{a_k(3k+3r+4)}{3} + 2a_{k-1}\right)\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $\frac{r(-7+9r)}{3} = 0$

- Values of r that satisfy the indicial equation

  $r \in \left\{0, \frac{7}{9}\right\}$

- Each term must be 0

  $\frac{a_1(1+r)(2+9r)}{3} - \frac{a_0(4+3r)}{3} = 0$

- Each term in the series must be 0, giving the recursion relation

  $3(k+1+r)\left(k+\frac{2}{9}+r\right)a_{k+1} - a_k k - a_k r - \frac{4a_k}{3} + 2a_{k-1} = 0$

- Shift index using $k- >k+1$

  $3(k+2+r)\left(k+\frac{11}{9}+r\right)a_{k+2} - a_{k+1}(k+1) - ra_{k+1} - \frac{4a_{k+1}}{3} + 2a_k = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = \frac{3ka_{k+1}+3ra_{k+1}-6a_k+7a_{k+1}}{(k+2+r)(9k+11+9r)}$

- Recursion relation for $r=0$

  $a_{k+2} = \frac{3ka_{k+1}-6a_k+7a_{k+1}}{(k+2)(9k+11)}$

- Solution for $r=0$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = \frac{3ka_{k+1}-6a_k+7a_{k+1}}{(k+2)(9k+11)}, \frac{2a_1}{3} - \frac{4a_0}{3} = 0\right]$

- Revert the change of variables $u = x+\frac{2}{3}$

  $\left[y = \sum_{k=0}^{\infty} a_k \left(x+\frac{2}{3}\right)^k, a_{k+2} = \frac{3ka_{k+1}-6a_k+7a_{k+1}}{(k+2)(9k+11)}, \frac{2a_1}{3} - \frac{4a_0}{3} = 0\right]$

- Recursion relation for $r=\frac{7}{9}$

  $a_{k+2} = \frac{3ka_{k+1}-6a_k+\frac{28}{3}a_{k+1}}{\left(k+\frac{25}{9}\right)(9k+18)}$

- Solution for $r=\frac{7}{9}$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^{k+\frac{7}{9}}, a_{k+2}=\frac{3k a_{k+1}-6a_k+\frac{28}{3}a_{k+1}}{\left(k+\frac{25}{9}\right)(9k+18)}, \frac{16a_1}{3}-\frac{19a_0}{9}=0\right]$$

- Revert the change of variables $u=x+\frac{2}{3}$

$$\left[y=\sum_{k=0}^{\infty} a_k\left(x+\frac{2}{3}\right)^{k+\frac{7}{9}}, a_{k+2}=\frac{3k a_{k+1}-6a_k+\frac{28}{3}a_{k+1}}{\left(k+\frac{25}{9}\right)(9k+18)}, \frac{16a_1}{3}-\frac{19a_0}{9}=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k\left(x+\frac{2}{3}\right)^{k}\right)+\left(\sum_{k=0}^{\infty} b_k\left(x+\frac{2}{3}\right)^{k+\frac{7}{9}}\right), a_{k+2}=\frac{3k a_{1+k}-6a_k+7a_{1+k}}{(k+2)(9k+11)}, \frac{2a_1}{3}-\frac{4a_0}{3}=0, b_{k+2}=\frac{3k\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 24.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(2x+3)\,y''+3y'-yx=0}$$

With initial conditions

$$[y(-1)=2, y'(-1)=-3]$$

With the expansion point for the power series method at $x=-1$.

13.21.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned} p(x)&=\frac{3}{2x+3}\\ q(x)&=-\frac{x}{2x+3}\\ F&=0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{3y'}{2x+3} - \frac{xy}{2x+3} = 0$$

The domain of $p(x) = \frac{3}{2x+3}$ is

$$\left\{x < -\frac{3}{2} \lor -\frac{3}{2} < x\right\}$$

And the point $x_0 = -1$ is inside this domain. The domain of $q(x) = -\frac{x}{2x+3}$ is

$$\left\{x < -\frac{3}{2} \lor -\frac{3}{2} < x\right\}$$

And the point $x_0 = -1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x + 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$(1+2t)\left(\frac{d^2}{dt^2}y(t)\right) + 3\frac{d}{dt}y(t) - y(t)\,(-1+t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = 2$$
$$y'(0) = -3$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (989)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (990)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3)\\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= \frac{y(t)\,t - y(t) - 3\frac{d}{dt}y(t)}{1+2t} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0 \\
&= \frac{\left(2t^2-t+14\right)\left(\frac{d}{dt}y(t)\right) - 3y(t)\left(t-2\right)}{\left(1+2t\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1 \\
&= \frac{\left(-12t^2+18t-93\right)\left(\frac{d}{dt}y(t)\right) + 2\left(t^3-\frac{3}{2}t^2+\frac{21}{2}t-\frac{41}{2}\right)y(t)}{\left(1+2t\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2 \\
&= \frac{\left(4t^4-4t^3+99t^2-211t+814\right)\left(\frac{d}{dt}y(t)\right) - 12\left(t^3-\frac{7}{2}t^2+\frac{67}{4}t-30\right)y(t)}{\left(1+2t\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3 \\
&= \frac{\left(-36t^4+108t^3-1065t^2+2616t-8805\right)\left(\frac{d}{dt}y(t)\right) + 4\left(t^5-2t^4+\frac{127}{4}t^3-\frac{257}{2}t^2+\frac{2315}{4}t-\frac{3895}{4}\right)y(t)}{\left(1+2t\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t=0$ and $y(0)=2$ and $y'(0)=-3$ gives

$$
\begin{aligned}
F_0 &= 7 \\
F_1 &= -30 \\
F_2 &= 197 \\
F_3 &= -1722 \\
F_4 &= 18625
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = 2 - 3t + \frac{7t^2}{2} - 5t^3 + \frac{197t^4}{24} - \frac{287t^5}{20} + \frac{3725t^6}{144} + O(t^6)$$

$$y(t) = 2 - 3t + \frac{7t^2}{2} - 5t^3 + \frac{197t^4}{24} - \frac{287t^5}{20} + \frac{3725t^6}{144} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(1 + 2t) \left(\frac{d^2}{dt^2} y(t)\right) + 3 \frac{d}{dt} y(t) + (1 - t) y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt} y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$

$$\frac{d^2}{dt^2} y(t) = \sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}$$

Substituting the above back into the ode gives

$$(1 + 2t) \left(\sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}\right) + 3 \left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + (1 - t) \left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 2n\, t^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1) a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} 3n a_n t^{n-1}\right) + \left(\sum_{n=0}^{\infty} a_n t^n\right) + \sum_{n=0}^{\infty} \left(-t^{1+n} a_n\right) = 0 \quad (2)$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 2n\, t^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} 2(1+n)\, a_{1+n} n\, t^n$$

$$\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, t^n$$

$$\sum_{n=1}^{\infty} 3n a_n t^{n-1} = \sum_{n=0}^{\infty} 3(1+n)\, a_{1+n} t^n$$

$$\sum_{n=0}^{\infty} \left(-t^{1+n} a_n\right) = \sum_{n=1}^{\infty} \left(-a_{n-1} t^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=1}^{\infty} 2(1+n)\, a_{1+n} n\, t^n\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, t^n\right) + \left(\sum_{n=0}^{\infty} 3(1+n)\, a_{1+n} t^n\right) + \left(\sum_{n=0}^{\infty} a_n t^n\right) + \sum_{n=1}^{\infty} \left(-a_{n-1} t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 3a_1 + a_0 = 0$$

$$a_2 = -\frac{a_0}{2} - \frac{3a_1}{2}$$

For $1 \leq n$, the recurrence equation is

$$2(1+n)\, a_{1+n} n + (n+2)\, a_{n+2}(1+n) + 3(1+n)\, a_{1+n} + a_n - a_{n-1} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{2n^2 a_{1+n} + 5n a_{1+n} + a_n + 3a_{1+n} - a_{n-1}}{(n+2)\,(1+n)} \\ &= -\frac{a_n}{(n+2)\,(1+n)} - \frac{(2n^2+5n+3)\, a_{1+n}}{(n+2)\,(1+n)} + \frac{a_{n-1}}{(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$10a_2 + 6a_3 + a_1 - a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = a_0 + \frac{7a_1}{3}$$

For $n = 2$ the recurrence equation gives

$$21a_3 + 12a_4 + a_2 - a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{41a_0}{24} - \frac{31a_1}{8}$$

For $n = 3$ the recurrence equation gives

$$36a_4 + 20a_5 + a_3 - a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = 3a_0 + \frac{407a_1}{60}$$

For $n = 4$ the recurrence equation gives

$$55a_5 + 30a_6 + a_4 - a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{779a_0}{144} - \frac{587a_1}{48}$$

For $n = 5$ the recurrence equation gives

$$78a_6 + 42a_7 + a_5 - a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{1669a_0}{168} + \frac{56593a_1}{2520}$$

And so on. Therefore the solution is

$$\begin{aligned}y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots\end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$\begin{aligned}y(t) = a_0 + a_1 t + \left(-\frac{a_0}{2} - \frac{3a_1}{2}\right) t^2 + \left(a_0 + \frac{7a_1}{3}\right) t^3 \\ + \left(-\frac{41a_0}{24} - \frac{31a_1}{8}\right) t^4 + \left(3a_0 + \frac{407a_1}{60}\right) t^5 + \dots\end{aligned}$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - \frac{1}{2}t^2 + t^3 - \frac{41}{24}t^4 + 3t^5\right) a_0 + \left(t - \frac{3}{2}t^2 + \frac{7}{3}t^3 - \frac{31}{8}t^4 + \frac{407}{60}t^5\right) a_1 + O(t^6) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - \frac{1}{2}t^2 + t^3 - \frac{41}{24}t^4 + 3t^5\right) c_1 + \left(t - \frac{3}{2}t^2 + \frac{7}{3}t^3 - \frac{31}{8}t^4 + \frac{407}{60}t^5\right) c_2 + O(t^6)$$

$$y(t) = 2 + \frac{7t^2}{2} - 5t^3 + \frac{197t^4}{24} - \frac{287t^5}{20} - 3t + O(t^6)$$

Replacing t in the above with the original independent variable $x$using $t = x+1$ results in

$$\begin{aligned}y = -1 - 3x + \frac{7(x+1)^2}{2} - 5(x+1)^3 + \frac{197(x+1)^4}{24} \\ - \frac{287(x+1)^5}{20} + \frac{3725(x+1)^6}{144} + O\left((x+1)^6\right)\end{aligned}$$

Summary
The solution(s) found are the following

$$y = -1 - 3x + \frac{7(x+1)^2}{2} - 5(x+1)^3 + \frac{197(x+1)^4}{24} - \frac{287(x+1)^5}{20} + \frac{3725(x+1)^6}{144} + O\left((x+1)^6\right) \tag{1}$$

Verification of solutions

$$y = -1 - 3x + \frac{7(x+1)^2}{2} - 5(x+1)^3 + \frac{197(x+1)^4}{24} - \frac{287(x+1)^5}{20} + \frac{3725(x+1)^6}{144} + O\left((x+1)^6\right)$$

Verified OK.

13.21.2 Maple step by step solution

Let's solve

$\left[(2x+3)\, y'' + 3y' - yx = 0, y(-1) = 2, y'\Big|_{\{x=-1\}} = -3\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{xy}{2x+3} - \frac{3y'}{2x+3}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{3y'}{2x+3} - \frac{xy}{2x+3} = 0$

□ Check to see if $x_0 = -\frac{3}{2}$ is a regular singular point

  ◦ Define functions

    $\left[P_2(x) = \frac{3}{2x+3}, P_3(x) = -\frac{x}{2x+3}\right]$

  ◦ $\left(x+\frac{3}{2}\right) \cdot P_2(x)$ is analytic at $x = -\frac{3}{2}$

    $\left(\left(x+\frac{3}{2}\right) \cdot P_2(x)\right)\Big|_{x=-\frac{3}{2}} = \frac{3}{2}$

  ◦ $\left(x+\frac{3}{2}\right)^2 \cdot P_3(x)$ is analytic at $x = -\frac{3}{2}$

    $\left(\left(x+\frac{3}{2}\right)^2 \cdot P_3(x)\right)\Big|_{x=-\frac{3}{2}} = 0$

- $x=-\frac{3}{2}$is a regular singular point

  Check to see if $x_0=-\frac{3}{2}$ is a regular singular point

  $x_0=-\frac{3}{2}$

- Multiply by denominators

  $(2x+3)\,y''+3y'-yx=0$

- Change variables using $x=u-\frac{3}{2}$ so that the regular singular point is at $u=0$

  $2u\left(\frac{d^2}{du^2}y(u)\right)+3\frac{d}{du}y(u)+\left(-u+\frac{3}{2}\right)y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $u^m\cdot y(u)$ to series expansion for $m=0..1$

  $u^m\cdot y(u)=\sum_{k=0}^{\infty}a_k u^{k+r+m}$

- Shift index using $k->k-m$

  $u^m\cdot y(u)=\sum_{k=m}^{\infty}a_{k-m}u^{k+r}$

- Convert $\frac{d}{du}y(u)$ to series expansion

  $\frac{d}{du}y(u)=\sum_{k=0}^{\infty}a_k(k+r)\,u^{k+r-1}$

- Shift index using $k->k+1$

  $\frac{d}{du}y(u)=\sum_{k=-1}^{\infty}a_{k+1}(k+1+r)\,u^{k+r}$

- Convert $u\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

  $u\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,(k+r-1)\,u^{k+r-1}$

- Shift index using $k->k+1$

  $u\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=-1}^{\infty}a_{k+1}(k+1+r)\,(k+r)\,u^{k+r}$

  Rewrite ODE with series expansions

  $a_0r(1+2r)\,u^{-1+r}+\left(a_1(1+r)\,(3+2r)+\frac{3a_0}{2}\right)u^r+\left(\sum_{k=1}^{\infty}\left(a_{k+1}(k+1+r)\,(2k+3+2r)+\frac{3a_k}{2}-\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $r(1+2r) = 0$
- Values of r that satisfy the indicial equation

  $r \in \left\{0, -\frac{1}{2}\right\}$
- Each term must be 0

  $a_1(1+r)(3+2r) + \frac{3a_0}{2} = 0$
- Each term in the series must be 0, giving the recursion relation

  $2(k+1+r)\left(k+\frac{3}{2}+r\right)a_{k+1} + \frac{3a_k}{2} - a_{k-1} = 0$
- Shift index using $k->k+1$

  $2(k+2+r)\left(k+\frac{5}{2}+r\right)a_{k+2} + \frac{3a_{k+1}}{2} - a_k = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+2} = \frac{-3a_{k+1}+2a_k}{2(k+2+r)(2k+5+2r)}$
- Recursion relation for $r = 0$

  $a_{k+2} = \frac{-3a_{k+1}+2a_k}{2(k+2)(2k+5)}$
- Solution for $r = 0$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = \frac{-3a_{k+1}+2a_k}{2(k+2)(2k+5)}, 3a_1 + \frac{3a_0}{2} = 0\right]$
- Revert the change of variables $u = x+\frac{3}{2}$

  $\left[y = \sum_{k=0}^{\infty} a_k \left(x+\frac{3}{2}\right)^k, a_{k+2} = \frac{-3a_{k+1}+2a_k}{2(k+2)(2k+5)}, 3a_1 + \frac{3a_0}{2} = 0\right]$
- Recursion relation for $r = -\frac{1}{2}$

  $a_{k+2} = \frac{-3a_{k+1}+2a_k}{2\left(k+\frac{3}{2}\right)(2k+4)}$
- Solution for $r = -\frac{1}{2}$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{1}{2}}, a_{k+2} = \frac{-3a_{k+1}+2a_k}{2\left(k+\frac{3}{2}\right)(2k+4)}, a_1 + \frac{3a_0}{2} = 0\right]$
- Revert the change of variables $u = x+\frac{3}{2}$

  $\left[y = \sum_{k=0}^{\infty} a_k \left(x+\frac{3}{2}\right)^{k-\frac{1}{2}}, a_{k+2} = \frac{-3a_{k+1}+2a_k}{2\left(k+\frac{3}{2}\right)(2k+4)}, a_1 + \frac{3a_0}{2} = 0\right]$
- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k \left(x+\frac{3}{2}\right)^k\right)+\left(\sum_{k=0}^{\infty} b_k \left(x+\frac{3}{2}\right)^{k-\frac{1}{2}}\right), a_{k+2}=\frac{-3a_{1+k}+2a_k}{2(k+2)(2k+5)}, 3a_1+\frac{3a_0}{2}=0, b_{k+2}=\frac{-3b_{1+k}}{2(k+\frac{3}{2})}\right.$$

Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 25.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(2x+3)\,y''-3y'-(2+x)\,y=0}$$

With initial conditions

$$[y(-2)=-2, y'(-2)=3]$$

With the expansion point for the power series method at $x=-2$.

13.22.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=-\frac{3}{2x+3}\\ q(x)&=\frac{-x-2}{2x+3}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' - \frac{3y'}{2x+3} + \frac{(-x-2)\,y}{2x+3} = 0$$

The domain of $p(x) = -\frac{3}{2x+3}$ is

$$\left\{x < -\frac{3}{2} \lor -\frac{3}{2} < x\right\}$$

And the point $x_0 = -2$ is inside this domain. The domain of $q(x) = \frac{-x-2}{2x+3}$ is

$$\left\{x < -\frac{3}{2} \lor -\frac{3}{2} < x\right\}$$

And the point $x_0 = -2$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = 2 + x$$

The ode is converted to be in terms of the new independent variable t. This results in

$$(2t-1)\left(\frac{d^2}{dt^2}y(t)\right) - 3\frac{d}{dt}y(t) - y(t)\,t = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = -2$$
$$y'(0) = 3$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned} y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\ &= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\ &= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0} \end{aligned}$$

But

$$\begin{aligned} \frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\ &= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (992) \\ &= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (993) \\ \frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\ &= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\ \frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\ &= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\ &\vdots \end{aligned}$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} F_n\big|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= \frac{3\frac{d}{dt}y(t)+y(t)\,t}{2t-1}\\
F_1 &= \frac{dF_0}{dt}\\
&= \frac{\partial F_0}{\partial t}+\frac{\partial F_0}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0\\
&= \frac{(2t^2-t+3)\left(\frac{d}{dt}y(t)\right)+y(t)\left(-1+3t\right)}{\left(2t-1\right)^2}\\
F_2 &= \frac{dF_1}{dt}\\
&= \frac{\partial F_1}{\partial t}+\frac{\partial F_1}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1\\
&= \frac{(12t^2-10t-1)\left(\frac{d}{dt}y(t)\right)+2\left(t^3-\frac{1}{2}t^2-\frac{3}{2}t+\frac{1}{2}\right)y(t)}{\left(2t-1\right)^3}\\
F_3 &= \frac{dF_2}{dt}\\
&= \frac{\partial F_2}{\partial t}+\frac{\partial F_2}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2\\
&= \frac{(4t^4-4t^3+7t^2-9t+12)\left(\frac{d}{dt}y(t)\right)+12y(t)\left(t^3-\frac{7}{6}t^2+\frac{13}{12}t-\frac{1}{4}\right)}{\left(2t-1\right)^4}\\
F_4 &= \frac{dF_3}{dt}\\
&= \frac{\partial F_3}{\partial t}+\frac{\partial F_3}{\partial y}\frac{d}{dt}y(t)+\frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3\\
&= \frac{(36t^4-60t^3+45t^2-6t-48)\left(\frac{d}{dt}y(t)\right)+4\left(t^5-t^4-\frac{17}{4}t^3+\frac{11}{4}t^2-\frac{19}{2}t+\frac{11}{4}\right)y(t)}{\left(2t-1\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t=0$ and $y(0)=-2$ and $y'(0)=3$ gives

$$
\begin{aligned}
F_0 &= -9\\
F_1 &= 11\\
F_2 &= 5\\
F_3 &= 42\\
F_4 &= 166
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = -2+3t-\frac{9t^2}{2}+\frac{11t^3}{6}+\frac{5t^4}{24}+\frac{7t^5}{20}+\frac{83t^6}{360}+O(t^6)$$

$$y(t) = -2+3t-\frac{9t^2}{2}+\frac{11t^3}{6}+\frac{5t^4}{24}+\frac{7t^5}{20}+\frac{83t^6}{360}+O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(2t-1)\left(\frac{d^2}{dt^2}y(t)\right)-3\frac{d}{dt}y(t)-y(t)\,t = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}$$

Substituting the above back into the ode gives

$$(2t-1)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right)-3\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right)-\left(\sum_{n=0}^{\infty} a_n t^n\right)t = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 2n\, t^{n-1} a_n (n-1)\right)+\sum_{n=2}^{\infty}\left(-n(n-1)\, a_n t^{n-2}\right) + \sum_{n=1}^{\infty}\left(-3n a_n t^{n-1}\right)+\sum_{n=0}^{\infty}\left(-t^{1+n} a_n\right) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 2n\, t^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} 2(1+n)\, a_{1+n} n\, t^n$$

$$\sum_{n=2}^{\infty} \left(-n(n-1)\, a_n t^{n-2}\right) = \sum_{n=0}^{\infty} \left(-(n+2)\, a_{n+2}(1+n)\, t^n\right)$$

$$\sum_{n=1}^{\infty} \left(-3n a_n t^{n-1}\right) = \sum_{n=0}^{\infty} \left(-3(1+n)\, a_{1+n} t^n\right)$$

$$\sum_{n=0}^{\infty} \left(-t^{1+n} a_n\right) = \sum_{n=1}^{\infty} \left(-a_{n-1} t^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=1}^{\infty} 2(1+n)\, a_{1+n} n\, t^n\right) + \sum_{n=0}^{\infty} \left(-(n+2)\, a_{n+2}(1+n)\, t^n\right) + \sum_{n=0}^{\infty} \left(-3(1+n)\, a_{1+n} t^n\right) + \sum_{n=1}^{\infty} \left(-a_{n-1} t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$-2a_2 - 3a_1 = 0$$

$$a_2 = -\frac{3a_1}{2}$$

For $1 \leq n$, the recurrence equation is

$$2(1+n)\, a_{1+n} n - (n+2)\, a_{n+2}(1+n) - 3(1+n)\, a_{1+n} - a_{n-1} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= \frac{2n^2 a_{1+n} - n a_{1+n} - 3a_{1+n} - a_{n-1}}{(n+2)\,(1+n)} \\ &= \frac{(2n^2 - n - 3)\, a_{1+n}}{(n+2)\,(1+n)} - \frac{a_{n-1}}{(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$-2a_2 - 6a_3 - a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = \frac{a_1}{2} - \frac{a_0}{6}$$

For $n = 2$ the recurrence equation gives

$$3a_3 - 12a_4 - a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_1}{24} - \frac{a_0}{24}$$

For $n = 3$ the recurrence equation gives

$$12a_4 - 20a_5 - a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_1}{10} - \frac{a_0}{40}$$

For $n = 4$ the recurrence equation gives

$$25a_5 - 30a_6 - a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{a_1}{15} - \frac{11a_0}{720}$$

For $n = 5$ the recurrence equation gives

$$42a_6 - 42a_7 - a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{331a_1}{5040} - \frac{a_0}{70}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t - \frac{3a_1 t^2}{2} + \left(\frac{a_1}{2} - \frac{a_0}{6}\right) t^3 + \left(\frac{a_1}{24} - \frac{a_0}{24}\right) t^4 + \left(\frac{a_1}{10} - \frac{a_0}{40}\right) t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - \frac{1}{6}t^3 - \frac{1}{24}t^4 - \frac{1}{40}t^5\right) a_0 + \left(t - \frac{3}{2}t^2 + \frac{1}{2}t^3 + \frac{1}{24}t^4 + \frac{1}{10}t^5\right) a_1 + O(t^6) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - \frac{1}{6}t^3 - \frac{1}{24}t^4 - \frac{1}{40}t^5\right) c_1 + \left(t - \frac{3}{2}t^2 + \frac{1}{2}t^3 + \frac{1}{24}t^4 + \frac{1}{10}t^5\right) c_2 + O(t^6)$$

$$y(t) = -2 + \frac{11t^3}{6} + \frac{5t^4}{24} + \frac{7t^5}{20} + 3t - \frac{9t^2}{2} + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = 2 + x$ results in

$$y = 4 + 3x - \frac{9(2+x)^2}{2} + \frac{11(2+x)^3}{6} + \frac{5(2+x)^4}{24} + \frac{7(2+x)^5}{20} + \frac{83(2+x)^6}{360} + O\left((2+x)^6\right)$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = 4 + 3x - \frac{9(2+x)^2}{2} + \frac{11(2+x)^3}{6} + \frac{5(2+x)^4}{24} \\ + \frac{7(2+x)^5}{20} + \frac{83(2+x)^6}{360} + O\left((2+x)^6\right) \end{aligned} \quad (1)$$

Verification of solutions

$$y = 4 + 3x - \frac{9(2+x)^2}{2} + \frac{11(2+x)^3}{6} + \frac{5(2+x)^4}{24} + \frac{7(2+x)^5}{20} + \frac{83(2+x)^6}{360} + O\left((2+x)^6\right)$$

Verified OK.

13.22.2 Maple step by step solution

Let's solve

$$\left[(2x+3)\, y'' - 3y' + (-x-2)\, y = 0, y(-2) = -2, y'\Big|_{\{x=-2\}} = 3\right]$$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y'' = \frac{(2+x)y}{2x+3} + \frac{3y'}{2x+3}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y'' - \frac{3y'}{2x+3} - \frac{(2+x)y}{2x+3} = 0$

☐ Check to see if $x_0 = -\frac{3}{2}$ is a regular singular point

- ◦ Define functions

  $\left[P_2(x) = -\frac{3}{2x+3}, P_3(x) = -\frac{2+x}{2x+3}\right]$

- ◦ $\left(x+\frac{3}{2}\right) \cdot P_2(x)$ is analytic at $x = -\frac{3}{2}$

  $\left(\left(x+\frac{3}{2}\right) \cdot P_2(x)\right)\Bigg|_{x=-\frac{3}{2}} = -\frac{3}{2}$

- ◦ $\left(x+\frac{3}{2}\right)^2 \cdot P_3(x)$ is analytic at $x = -\frac{3}{2}$

  $\left(\left(x+\frac{3}{2}\right)^2 \cdot P_3(x)\right)\Bigg|_{x=-\frac{3}{2}} = 0$

- ◦ $x = -\frac{3}{2}$is a regular singular point

Check to see if $x_0 = -\frac{3}{2}$ is a regular singular point

$x_0 = -\frac{3}{2}$

- Multiply by denominators

$(2x+3)\, y'' - 3y' + (-x-2)\, y = 0$

- Change variables using $x = u - \frac{3}{2}$ so that the regular singular point is at $u = 0$

$2u\left(\frac{d^2}{du^2}y(u)\right) - 3\frac{d}{du}y(u) + \left(-u - \frac{1}{2}\right) y(u) = 0$

- Assume series solution for $y(u)$

$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $u^{m}\cdot y(u)$ to series expansion for $m=0..1$

  $u^{m}\cdot y(u)=\sum_{k=0}^{\infty} a_{k} u^{k+r+m}$

- Shift index using $k->k-m$

  $u^{m}\cdot y(u)=\sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

- Convert $\frac{d}{du}y(u)$ to series expansion

  $\frac{d}{du}y(u)=\sum_{k=0}^{\infty} a_{k}(k+r)\, u^{k+r-1}$

- Shift index using $k->k+1$

  $\frac{d}{du}y(u)=\sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\, u^{k+r}$

- Convert $u\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)$ to series expansion

  $u\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, u^{k+r-1}$

- Shift index using $k->k+1$

  $u\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)=\sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\,(k+r)\, u^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}r(-5+2r)\, u^{-1+r}+\left(a_{1}(1+r)\,(-3+2r)-\frac{a_{0}}{2}\right) u^{r}+\left(\sum_{k=1}^{\infty}\left(a_{k+1}(k+1+r)\,(2k-3+2r)-\frac{a_{k}}{2}\right.\right.$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $r(-5+2r)=0$

- Values of r that satisfy the indicial equation

  $r\in\left\{0,\frac{5}{2}\right\}$

- Each term must be 0

  $a_{1}(1+r)\,(-3+2r)-\frac{a_{0}}{2}=0$

- Each term in the series must be 0, giving the recursion relation

  $2\left(k-\frac{3}{2}+r\right)(k+1+r)\, a_{k+1}-\frac{a_{k}}{2}-a_{k-1}=0$

- Shift index using $k->k+1$

  $2\left(k-\frac{1}{2}+r\right)(k+2+r)\, a_{k+2}-\frac{a_{k+1}}{2}-a_{k}=0$

- Recursion relation that defines series solution to ODE

$a_{k+2} = \frac{a_{k+1}+2a_k}{2(2k-1+2r)(k+2+r)}$

- Recursion relation for $r = 0$

$a_{k+2} = \frac{a_{k+1}+2a_k}{2(2k-1)(k+2)}$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = \frac{a_{k+1}+2a_k}{2(2k-1)(k+2)}, -3a_1 - \frac{a_0}{2} = 0\right]$$

- Revert the change of variables $u = x + \frac{3}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(x + \frac{3}{2}\right)^k, a_{k+2} = \frac{a_{k+1}+2a_k}{2(2k-1)(k+2)}, -3a_1 - \frac{a_0}{2} = 0\right]$$

- Recursion relation for $r = \frac{5}{2}$

$a_{k+2} = \frac{a_{k+1}+2a_k}{2(2k+4)\left(k+\frac{9}{2}\right)}$

- Solution for $r = \frac{5}{2}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+\frac{5}{2}}, a_{k+2} = \frac{a_{k+1}+2a_k}{2(2k+4)\left(k+\frac{9}{2}\right)}, 7a_1 - \frac{a_0}{2} = 0\right]$$

- Revert the change of variables $u = x + \frac{3}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(x + \frac{3}{2}\right)^{k+\frac{5}{2}}, a_{k+2} = \frac{a_{k+1}+2a_k}{2(2k+4)\left(k+\frac{9}{2}\right)}, 7a_1 - \frac{a_0}{2} = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k \left(x + \frac{3}{2}\right)^k\right) + \left(\sum_{k=0}^{\infty} b_k \left(x + \frac{3}{2}\right)^{k+\frac{5}{2}}\right), a_{k+2} = \frac{a_{1+k}+2a_k}{2(2k-1)(k+2)}, -3a_1 - \frac{a_0}{2} = 0, b_{k+2} = \frac{b_{1+k}}{2(2k+4}\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 26.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(10-2x)\,y''+(x+1)\,y=0}$$

With initial conditions

$$[y(2)=2, y'(2)=-4]$$

With the expansion point for the power series method at $x=2$.

13.23.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=0\\q(x)&=\frac{x+1}{10-2x}\\F&=0\end{aligned}$$

Hence the ode is

$$y'' + \frac{(x+1)\, y}{10 - 2x} = 0$$

The domain of $p(x) = 0$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 2$ is inside this domain. The domain of $q(x) = \frac{x+1}{10-2x}$ is

$$\{x < 5 \lor 5 < x\}$$

And the point $x_0 = 2$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = -2 + x$$

The ode is converted to be in terms of the new independent variable t. This results in

$$(6 - 2t) \left(\frac{d^2}{dt^2} y(t)\right) + (t+3)\, y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = 2$$
$$y'(0) = -4$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y_0'$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0,y_0,y_0'} + \frac{x^3}{3!} f'|_{x_0,y_0,y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y_0'}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (995)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (996)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3)\\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + xy'_0 + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y'_0} \tag{7}$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= \frac{(t+3)\, y(t)}{2t-6} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\,(t)}F_0 \\
&= \frac{\left(\frac{d}{dt}y(t)\right)t^2 - 9\frac{d}{dt}y(t) - 6y(t)}{2\,(t-3)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\,(t)}F_1 \\
&= \frac{(-24t+72)\left(\frac{d}{dt}y(t)\right) + y(t)\,(t^3+3t^2-9t-3)}{4\,(t-3)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\,(t)}F_2 \\
&= \frac{(t^4-18t^2+72t-135)\left(\frac{d}{dt}y(t)\right) + (-24t^2+144)\,y(t)}{4\,(t-3)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\,(t)}F_3 \\
&= \frac{72(-t^3+3t^2+t-3)\left(\frac{d}{dt}y(t)\right) + y(t)\,(t^5+3t^4-18t^3+114t^2+369t-1557)}{8\,(t-3)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = 2$ and $y'(0) = -4$ gives

$$
\begin{aligned}
F_0 &= -1 \\
F_1 &= \frac{4}{3} \\
F_2 &= \frac{49}{18} \\
F_3 &= \frac{23}{9} \\
F_4 &= \frac{125}{108}
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = 2 - 4t - \frac{t^2}{2} + \frac{2t^3}{9} + \frac{49t^4}{432} + \frac{23t^5}{1080} + \frac{25t^6}{15552} + O(t^6)$$

$$y(t) = 2 - 4t - \frac{t^2}{2} + \frac{2t^3}{9} + \frac{49t^4}{432} + \frac{23t^5}{1080} + \frac{25t^6}{15552} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(6 - 2t)\left(\frac{d^2}{dt^2}y(t)\right) + (t+3)\,y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}$$

Substituting the above back into the ode gives

$$(6 - 2t)\left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right) + (t+3)\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=2}^{\infty}\left(-2n\,t^{n-1}a_n(n-1)\right) + \left(\sum_{n=2}^{\infty} 6n(n-1)\,a_n t^{n-2}\right) + \left(\sum_{n=0}^{\infty} t^{1+n}a_n\right) + \left(\sum_{n=0}^{\infty} 3a_n t^n\right) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the

power and the corresponding index gives

$$\sum_{n=2}^{\infty}\left(-2n\,t^{n-1}a_{n}(n-1)\right) = \sum_{n=1}^{\infty}\left(-2(1+n)\,a_{1+n} n\,t^{n}\right)$$

$$\sum_{n=2}^{\infty} 6n(n-1)\,a_{n} t^{n-2} = \sum_{n=0}^{\infty} 6(n+2)\,a_{n+2}(1+n)\,t^{n}$$

$$\sum_{n=0}^{\infty} t^{1+n} a_{n} = \sum_{n=1}^{\infty} a_{n-1} t^{n}$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\sum_{n=1}^{\infty}\left(-2(1+n)\,a_{1+n} n\,t^{n}\right) + \left(\sum_{n=0}^{\infty} 6(n+2)\,a_{n+2}(1+n)\,t^{n}\right) + \left(\sum_{n=1}^{\infty} a_{n-1} t^{n}\right) + \left(\sum_{n=0}^{\infty} 3a_{n} t^{n}\right) = 0 \tag{3}$$

$n = 0$ gives

$$12a_{2} + 3a_{0} = 0$$

$$a_{2} = -\frac{a_{0}}{4}$$

For $1 \leq n$, the recurrence equation is

$$-2(1+n)\,a_{1+n} n + 6(n+2)\,a_{n+2}(1+n) + a_{n-1} + 3a_{n} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= \frac{2n^{2}a_{1+n} + 2na_{1+n} - 3a_{n} - a_{n-1}}{6\,(n+2)\,(1+n)} \\ &= -\frac{a_{n}}{2\,(n+2)\,(1+n)} + \frac{(2n^{2}+2n)\,a_{1+n}}{6\,(n+2)\,(1+n)} - \frac{a_{n-1}}{6\,(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$-4a_2 + 36a_3 + a_0 + 3a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = -\frac{a_0}{18} - \frac{a_1}{12}$$

For $n = 2$ the recurrence equation gives

$$-12a_3 + 72a_4 + a_1 + 3a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{864} - \frac{a_1}{36}$$

For $n = 3$ the recurrence equation gives

$$-24a_4 + 120a_5 + a_2 + 3a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_0}{270} - \frac{a_1}{288}$$

For $n = 4$ the recurrence equation gives

$$-40a_5 + 180a_6 + a_3 + 3a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{173a_0}{155520} + \frac{a_1}{6480}$$

For $n = 5$ the recurrence equation gives

$$-60a_6 + 252a_7 + a_4 + 3a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{353a_0}{1632960} + \frac{41a_1}{217728}$$

And so on. Therefore the solution is

$$
\begin{aligned}
y(t) &= \sum_{n=0}^{\infty} a_n t^n \\
&= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots
\end{aligned}
$$

Substituting the values for a_n found above, the solution becomes

$$
y(t) = a_0 + a_1 t - \frac{a_0 t^2}{4} + \left(-\frac{a_0}{18} - \frac{a_1}{12}\right) t^3 + \left(\frac{a_0}{864} - \frac{a_1}{36}\right) t^4 + \left(\frac{a_0}{270} - \frac{a_1}{288}\right) t^5 + \dots
$$

Collecting terms, the solution becomes

$$
y(t) = \left(1 - \frac{1}{4}t^2 - \frac{1}{18}t^3 + \frac{1}{864}t^4 + \frac{1}{270}t^5\right) a_0 + \left(t - \frac{1}{12}t^3 - \frac{1}{36}t^4 - \frac{1}{288}t^5\right) a_1 + O(t^6) \quad (3)
$$

At $t = 0$ the solution above becomes

$$
y(t) = \left(1 - \frac{1}{4}t^2 - \frac{1}{18}t^3 + \frac{1}{864}t^4 + \frac{1}{270}t^5\right) c_1 + \left(t - \frac{1}{12}t^3 - \frac{1}{36}t^4 - \frac{1}{288}t^5\right) c_2 + O(t^6)
$$

$$
y(t) = 2 - \frac{t^2}{2} + \frac{2t^3}{9} + \frac{49t^4}{432} + \frac{23t^5}{1080} - 4t + O(t^6)
$$

Replacing t in the above with the original independent variable $x$susing $t = -2 + x$ results in

$$
\begin{aligned}
y = 10 - 4x &- \frac{(-2+x)^2}{2} + \frac{2(-2+x)^3}{9} + \frac{49(-2+x)^4}{432} \\
&+ \frac{23(-2+x)^5}{1080} + \frac{25(-2+x)^6}{15552} + O\left((-2+x)^6\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = 10 - 4x &- \frac{(-2+x)^2}{2} + \frac{2(-2+x)^3}{9} + \frac{49(-2+x)^4}{432} \\
&+ \frac{23(-2+x)^5}{1080} + \frac{25(-2+x)^6}{15552} + O\left((-2+x)^6\right)
\end{aligned} \quad (1)
$$

Verification of solutions

$$y = 10 - 4x - \frac{(-2+x)^2}{2} + \frac{2(-2+x)^3}{9} + \frac{49(-2+x)^4}{432} + \frac{23(-2+x)^5}{1080} + \frac{25(-2+x)^6}{15552} + O\left((-2+x)^6\right)$$

Verified OK.

13.23.2 Maple step by step solution

Let's solve

$\left[(10-2x)\, y'' + (x+1)\, y = 0, y(2) = 2, y'\Big|_{\{x=2\}} = -4\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(x+1)y}{2(x-5)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{(x+1)y}{2(x-5)} = 0$

□ Check to see if $x_0 = 5$ is a regular singular point

  - Define functions

    $\left[P_2(x) = 0, P_3(x) = -\frac{x+1}{2(x-5)}\right]$

  - $(x-5) \cdot P_2(x)$ is analytic at $x = 5$

    $\left((x-5) \cdot P_2(x)\right)\Big|_{x=5} = 0$

  - $(x-5)^2 \cdot P_3(x)$ is analytic at $x = 5$

    $\left((x-5)^2 \cdot P_3(x)\right)\Big|_{x=5} = 0$

  - $x = 5$is a regular singular point

  Check to see if $x_0 = 5$ is a regular singular point

  $x_0 = 5$

- Multiply by denominators

  $y''(2x-10) + (-x-1)\, y = 0$

- Change variables using $x = u + 5$ so that the regular singular point is at $u = 0$

  $2u\left(\frac{d^2}{du^2}y(u)\right) + (-u-6)\,y(u) = 0$
- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

  - Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

    $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$
  - Shift index using $k->k-m$

    $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$
  - Convert $u \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

    $u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,u^{k+r-1}$
  - Shift index using $k->k+1$

    $u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\,(k+r)\,u^{k+r}$

  Rewrite ODE with series expansions

  $2a_0r(-1+r)\,u^{-1+r} + (2a_1(1+r)\,r - 6a_0)\,u^r + \left(\sum_{k=1}^{\infty} (2a_{k+1}(k+1+r)\,(k+r) - 6a_k - a_{k-1})\,u^{k-}\right.$
- $a_0$cannot be 0 by assumption, giving the indicial equation

  $2r(-1+r) = 0$
- Values of r that satisfy the indicial equation

  $r \in \{0, 1\}$
- Each term must be 0

  $2a_1(1+r)\,r - 6a_0 = 0$
- Each term in the series must be 0, giving the recursion relation

  $2a_{k+1}(k+1+r)\,(k+r) - 6a_k - a_{k-1} = 0$
- Shift index using $k->k+1$

  $2a_{k+2}(k+2+r)\,(k+1+r) - 6a_{k+1} - a_k = 0$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = \frac{6a_{k+1}+a_k}{2(k+2+r)(k+1+r)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = \frac{6a_{k+1}+a_k}{2(k+2)(k+1)}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = \frac{6a_{k+1}+a_k}{2(k+2)(k+1)}, -6a_0 = 0\right]$$

Problem number: 27.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(7+x)\,y''+(2x+8)\,y'+(x+5)\,y=0}$$

With initial conditions

$$[y(-4)=1, y'(-4)=2]$$

With the expansion point for the power series method at $x=-4$.

13.24.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=\frac{2x+8}{7+x}\\ q(x)&=\frac{x+5}{7+x}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' + \frac{(2x+8)\,y'}{7+x} + \frac{(x+5)\,y}{7+x} = 0$$

The domain of $p(x) = \frac{2x+8}{7+x}$ is

$$\{x < -7 \vee -7 < x\}$$

And the point $x_0 = -4$ is inside this domain. The domain of $q(x) = \frac{x+5}{7+x}$ is

$$\{x < -7 \vee -7 < x\}$$

And the point $x_0 = -4$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x + 4$$

The ode is converted to be in terms of the new independent variable t. This results in

$$(t+3)\left(\frac{d^2}{dt^2}y(t)\right) + 2t\left(\frac{d}{dt}y(t)\right) + (t+1)\,y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$\begin{aligned} y(0) &= 1 \\ y'(0) &= 2 \end{aligned}$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y_0'$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0, y_0, y_0'} + \frac{x^3}{3!} f'|_{x_0, y_0, y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y_0'}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (998) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (999) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\ \vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$F_0 = -\frac{2t\left(\frac{d}{dt}y(t)\right) + y(t)\,t + y(t)}{t+3}$$

$$\begin{aligned}
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0 \\
&= \frac{\left(3t^2-4t-9\right)\left(\frac{d}{dt}y(t)\right) + 2y(t)\left(t^2+t-1\right)}{\left(t+3\right)^2}
\end{aligned}$$

$$\begin{aligned}
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1 \\
&= \frac{\left(-4t^3+16t^2+44t\right)\left(\frac{d}{dt}y(t)\right) - 3\left(t^2-\frac{4}{3}t-\frac{19}{3}\right)\left(t+1\right)y(t)}{\left(t+3\right)^3}
\end{aligned}$$

$$\begin{aligned}
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2 \\
&= \frac{\left(5t^4-40t^3-114t^2+96t+189\right)\left(\frac{d}{dt}y(t)\right) + 4y(t)\left(t^4-3t^3-22t^2-21t+3\right)}{\left(t+3\right)^4}
\end{aligned}$$

$$\begin{aligned}
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3 \\
&= \frac{\left(-6t^5+80t^4+204t^3-672t^2-1590t-432\right)\left(\frac{d}{dt}y(t)\right) - 5\left(t^5-7t^4-\frac{214}{5}t^3-\frac{86}{5}t^2+\frac{561}{5}t+\frac{489}{5}\right)y(t)}{\left(t+3\right)^5}
\end{aligned}$$

And so on. Evaluating all the above at initial conditions $t=0$ and $y(0)=1$ and $y'(0)=2$ gives

$$\begin{aligned}
F_0 &= -\frac{1}{3} \\
F_1 &= -\frac{20}{9} \\
F_2 &= \frac{19}{27} \\
F_3 &= \frac{130}{27} \\
F_4 &= -\frac{451}{81}
\end{aligned}$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = 1 + 2t - \frac{t^2}{6} - \frac{10t^3}{27} + \frac{19t^4}{648} + \frac{13t^5}{324} - \frac{451t^6}{58320} + O(t^6)$$

$$y(t) = 1 + 2t - \frac{t^2}{6} - \frac{10t^3}{27} + \frac{19t^4}{648} + \frac{13t^5}{324} - \frac{451t^6}{58320} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(t+3)\left(\frac{d^2}{dt^2}y(t)\right) + 2t\left(\frac{d}{dt}y(t)\right) + (t+1)\,y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\begin{aligned}
\frac{d}{dt}y(t) &= \sum_{n=1}^{\infty} n a_n t^{n-1} \\
\frac{d^2}{dt^2}y(t) &= \sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}
\end{aligned}$$

Substituting the above back into the ode gives

$$(t+3)\left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right) + 2t\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + (t+1)\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \quad (1)$$

Which simplifies to

$$\begin{aligned}
&\left(\sum_{n=2}^{\infty} n\,t^{n-1} a_n(n-1)\right) + \left(\sum_{n=2}^{\infty} 3n(n-1)\,a_n t^{n-2}\right) \\
&+ \left(\sum_{n=1}^{\infty} 2n a_n t^n\right) + \left(\sum_{n=0}^{\infty} t^{1+n} a_n\right) + \left(\sum_{n=0}^{\infty} a_n t^n\right) = 0
\end{aligned} \quad (2)$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n\, t^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} (1+n)\, a_{1+n} n\, t^n$$

$$\sum_{n=2}^{\infty} 3n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} 3(n+2)\, a_{n+2}(1+n)\, t^n$$

$$\sum_{n=0}^{\infty} t^{1+n} a_n = \sum_{n=1}^{\infty} a_{n-1} t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=1}^{\infty} (1+n)\, a_{1+n} n\, t^n\right) + \left(\sum_{n=0}^{\infty} 3(n+2)\, a_{n+2}(1+n)\, t^n\right) + \left(\sum_{n=1}^{\infty} 2n a_n t^n\right) + \left(\sum_{n=1}^{\infty} a_{n-1} t^n\right) + \left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$6a_2 + a_0 = 0$$

$$a_2 = -\frac{a_0}{6}$$

For $1 \leq n$, the recurrence equation is

$$(1+n)\, a_{1+n} n + 3(n+2)\, a_{n+2}(1+n) + 2n a_n + a_{n-1} + a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{n^2 a_{1+n} + 2n a_n + n a_{1+n} + a_n + a_{n-1}}{3\,(n+2)\,(1+n)} \\ &= -\frac{(2n+1)\, a_n}{3\,(n+2)\,(1+n)} - \frac{(n^2+n)\, a_{1+n}}{3\,(n+2)\,(1+n)} - \frac{a_{n-1}}{3\,(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$2a_2 + 18a_3 + 3a_1 + a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = -\frac{a_0}{27} - \frac{a_1}{6}$$

For $n = 2$ the recurrence equation gives

$$6a_3 + 36a_4 + 5a_2 + a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{19a_0}{648}$$

For $n = 3$ the recurrence equation gives

$$12a_4 + 60a_5 + 7a_3 + a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_0}{810} + \frac{7a_1}{360}$$

For $n = 4$ the recurrence equation gives

$$20a_5 + 90a_6 + 9a_4 + a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{163a_0}{58320} - \frac{a_1}{405}$$

For $n = 5$ the recurrence equation gives

$$30a_6 + 126a_7 + 11a_5 + a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{199a_0}{612360} - \frac{151a_1}{136080}$$

And so on. Therefore the solution is

$$
\begin{aligned}
y(t) &= \sum_{n=0}^{\infty} a_n t^n \\
&= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots
\end{aligned}
$$

Substituting the values for a_n found above, the solution becomes

$$
y(t) = a_0 + a_1 t - \frac{a_0 t^2}{6} + \left(-\frac{a_0}{27} - \frac{a_1}{6}\right) t^3 + \frac{19 a_0 t^4}{648} + \left(\frac{a_0}{810} + \frac{7 a_1}{360}\right) t^5 + \dots
$$

Collecting terms, the solution becomes

$$
y(t) = \left(1 - \frac{1}{6} t^2 - \frac{1}{27} t^3 + \frac{19}{648} t^4 + \frac{1}{810} t^5\right) a_0 + \left(t - \frac{1}{6} t^3 + \frac{7}{360} t^5\right) a_1 + O(t^6) \quad (3)
$$

At $t = 0$ the solution above becomes

$$
y(t) = \left(1 - \frac{1}{6} t^2 - \frac{1}{27} t^3 + \frac{19}{648} t^4 + \frac{1}{810} t^5\right) c_1 + \left(t - \frac{1}{6} t^3 + \frac{7}{360} t^5\right) c_2 + O(t^6)
$$

$$
y(t) = 1 - \frac{t^2}{6} - \frac{10 t^3}{27} + \frac{19 t^4}{648} + \frac{13 t^5}{324} + 2t + O(t^6)
$$

Replacing t in the above with the original independent variable $x$susing $t = x + 4$ results in

$$
y = 9 + 2x - \frac{(x+4)^2}{6} - \frac{10(x+4)^3}{27} + \frac{19(x+4)^4}{648} + \frac{13(x+4)^5}{324} - \frac{451(x+4)^6}{58320} + O\left((x+4)^6\right)
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = 9 + 2x - \frac{(x+4)^2}{6} - \frac{10(x+4)^3}{27} + \frac{19(x+4)^4}{648} \\
+ \frac{13(x+4)^5}{324} - \frac{451(x+4)^6}{58320} + O\left((x+4)^6\right)
\end{aligned} \quad (1)
$$

Verification of solutions

$$
y = 9 + 2x - \frac{(x+4)^2}{6} - \frac{10(x+4)^3}{27} + \frac{19(x+4)^4}{648} + \frac{13(x+4)^5}{324} - \frac{451(x+4)^6}{58320} + O\left((x+4)^6\right)
$$

Verified OK.

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(6+4x)\,y''+(1+2x)\,y=0}$$

With initial conditions

$$[y(-1)=-1, y'(-1)=2]$$

With the expansion point for the power series method at $x=-1$.

13.25.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned} p(x) &= 0 \\ q(x) &= \frac{1+2x}{6+4x} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{(1+2x)\,y}{6+4x} = 0$$

The domain of $p(x) = 0$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = -1$ is inside this domain. The domain of $q(x) = \frac{1+2x}{6+4x}$ is

$$\left\{x < -\frac{3}{2} \lor -\frac{3}{2} < x\right\}$$

And the point $x_0 = -1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x + 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$(4t+2)\left(\frac{d^2}{dt^2}y(t)\right) + (2t-1)\,y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = -1$$
$$y'(0) = 2$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left.\frac{d^n f}{dx^n}\right|_{x_0,y_0,y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (1001) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (1002) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y'_0} \tag{7}
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{(2t-1)\,y(t)}{2\,(1+2t)} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\,(t)}F_0 \\
&= \frac{-2\left(\frac{d}{dt}y(t)\right)t^2 - 2y(t) + \frac{\frac{d}{dt}y(t)}{2}}{(1+2t)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\,(t)}F_1 \\
&= \frac{4(-2t-1)\left(\frac{d}{dt}y(t)\right) + 2\left(t+\frac{3}{2}\right)\left(t^2-2t+\frac{11}{4}\right)y(t)}{(1+2t)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\,(t)}F_2 \\
&= \frac{(16t^4-8t^2+192t+97)\left(\frac{d}{dt}y(t)\right) + (64t^2-208)\,y(t)}{4\,(1+2t)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\,(t)}F_3 \\
&= \frac{(384t^3+192t^2-3168t-1584)\left(\frac{d}{dt}y(t)\right) - 32\left(t^5-\frac{1}{2}t^4-\frac{1}{2}t^3+\frac{113}{4}t^2-\frac{127}{16}t-\frac{3425}{32}\right)y(t)}{8\,(1+2t)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t=0$ and $y(0)=-1$ and $y'(0)=2$ gives

$$
\begin{aligned}
F_0 &= -\frac{1}{2} \\
F_1 &= 3 \\
F_2 &= -\frac{65}{4} \\
F_3 &= \frac{201}{2} \\
F_4 &= -\frac{6593}{8}
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = 2t - 1 - \frac{t^2}{4} + \frac{t^3}{2} - \frac{65t^4}{96} + \frac{67t^5}{80} - \frac{6593t^6}{5760} + O(t^6)$$

$$y(t) = 2t - 1 - \frac{t^2}{4} + \frac{t^3}{2} - \frac{65t^4}{96} + \frac{67t^5}{80} - \frac{6593t^6}{5760} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(4t+2)\left(\frac{d^2}{dt^2}y(t)\right) + (2t-1)\,y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}$$

Substituting the above back into the ode gives

$$(4t+2)\left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right) + (2t-1)\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 4n\,t^{n-1} a_n(n-1)\right) + \left(\sum_{n=2}^{\infty} 2n(n-1)\,a_n t^{n-2}\right) + \left(\sum_{n=0}^{\infty} 2t^{1+n} a_n\right) + \sum_{n=0}^{\infty}(-a_n t^n) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the

power and the corresponding index gives

$$\sum_{n=2}^{\infty} 4n\, t^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} 4(1+n)\, a_{1+n} n\, t^n$$

$$\sum_{n=2}^{\infty} 2n(n-1)\, a_n t^{n-2} = \sum_{n=0}^{\infty} 2(n+2)\, a_{n+2}(1+n)\, t^n$$

$$\sum_{n=0}^{\infty} 2t^{1+n} a_n = \sum_{n=1}^{\infty} 2a_{n-1} t^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=1}^{\infty} 4(1+n)\, a_{1+n} n\, t^n\right) + \left(\sum_{n=0}^{\infty} 2(n+2)\, a_{n+2}(1+n)\, t^n\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1} t^n\right) + \sum_{n=0}^{\infty} (-a_n t^n) = 0 \tag{3}$$

$n = 0$ gives

$$4a_2 - a_0 = 0$$

$$a_2 = \frac{a_0}{4}$$

For $1 \leq n$, the recurrence equation is

$$4(1+n)\, a_{1+n} n + 2(n+2)\, a_{n+2}(1+n) + 2a_{n-1} - a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{4n^2 a_{1+n} + 4n a_{1+n} - a_n + 2a_{n-1}}{2\,(n+2)\,(1+n)} \\ &= \frac{a_n}{2\,(n+2)\,(1+n)} - \frac{(4n^2+4n)\, a_{1+n}}{2\,(n+2)\,(1+n)} - \frac{a_{n-1}}{(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 1$ the recurrence equation gives

$$8a_2 + 12a_3 + 2a_0 - a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_3 = -\frac{a_0}{3} + \frac{a_1}{12}$$

For $n = 2$ the recurrence equation gives

$$24a_3 + 24a_4 + 2a_1 - a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{11a_0}{32} - \frac{a_1}{6}$$

For $n = 3$ the recurrence equation gives

$$48a_4 + 40a_5 + 2a_2 - a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{13a_0}{30} + \frac{97a_1}{480}$$

For $n = 4$ the recurrence equation gives

$$80a_5 + 60a_6 + 2a_3 - a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{685a_0}{1152} - \frac{11a_1}{40}$$

For $n = 5$ the recurrence equation gives

$$120a_6 + 84a_7 + 2a_4 - a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{2899a_0}{3360} + \frac{16097a_1}{40320}$$

And so on. Therefore the solution is

$$\begin{aligned}y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots\end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + \frac{a_0 t^2}{4} + \left(-\frac{a_0}{3} + \frac{a_1}{12}\right) t^3 + \left(\frac{11 a_0}{32} - \frac{a_1}{6}\right) t^4 + \left(-\frac{13 a_0}{30} + \frac{97 a_1}{480}\right) t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 + \frac{1}{4} t^2 - \frac{1}{3} t^3 + \frac{11}{32} t^4 - \frac{13}{30} t^5\right) a_0 + \left(t + \frac{1}{12} t^3 - \frac{1}{6} t^4 + \frac{97}{480} t^5\right) a_1 + O\left(t^6\right) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 + \frac{1}{4} t^2 - \frac{1}{3} t^3 + \frac{11}{32} t^4 - \frac{13}{30} t^5\right) c_1 + \left(t + \frac{1}{12} t^3 - \frac{1}{6} t^4 + \frac{97}{480} t^5\right) c_2 + O\left(t^6\right)$$

$$y(t) = -1 - \frac{t^2}{4} + \frac{t^3}{2} - \frac{65 t^4}{96} + \frac{67 t^5}{80} + 2t + O\left(t^6\right)$$

Replacing t in the above with the original independent variable $x$susing $t = x+1$ results in

$$y = 2x+1 - \frac{(x+1)^2}{4} + \frac{(x+1)^3}{2} - \frac{65(x+1)^4}{96} + \frac{67(x+1)^5}{80} - \frac{6593(x+1)^6}{5760} + O\left((x+1)^6\right)$$

Summary

The solution(s) found are the following

$$\begin{aligned}y = 2x + 1 - \frac{(x+1)^2}{4} + \frac{(x+1)^3}{2} - \frac{65(x+1)^4}{96} \\ + \frac{67(x+1)^5}{80} - \frac{6593(x+1)^6}{5760} + O\left((x+1)^6\right)\end{aligned} \quad (1)$$

Verification of solutions

$$y = 2x+1 - \frac{(x+1)^2}{4} + \frac{(x+1)^3}{2} - \frac{65(x+1)^4}{96} + \frac{67(x+1)^5}{80} - \frac{6593(x+1)^6}{5760} + O\left((x+1)^6\right)$$

Verified OK.

13.25.2 Maple step by step solution

Let's solve

$\left[(6+4x)\,y''+(1+2x)\,y=0, y(-1)=-1, y'\Big|_{\{x=-1\}}=2\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(1+2x)y}{2(2x+3)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(1+2x)y}{2(2x+3)}=0$

□ Check to see if $x_0=-\frac{3}{2}$ is a regular singular point

  ◦ Define functions

    $\left[P_2(x)=0, P_3(x)=\frac{1+2x}{2(2x+3)}\right]$

  ◦ $\left(x+\frac{3}{2}\right)\cdot P_2(x)$ is analytic at $x=-\frac{3}{2}$

    $\left(\left(x+\frac{3}{2}\right)\cdot P_2(x)\right)\Big|_{x=-\frac{3}{2}}=0$

  ◦ $\left(x+\frac{3}{2}\right)^2\cdot P_3(x)$ is analytic at $x=-\frac{3}{2}$

    $\left(\left(x+\frac{3}{2}\right)^2\cdot P_3(x)\right)\Big|_{x=-\frac{3}{2}}=0$

  ◦ $x=-\frac{3}{2}$is a regular singular point

  Check to see if $x_0=-\frac{3}{2}$ is a regular singular point

  $x_0=-\frac{3}{2}$

- Multiply by denominators

  $(6+4x)\,y''+(1+2x)\,y=0$

- Change variables using $x=u-\frac{3}{2}$ so that the regular singular point is at $u=0$

  $4u\left(\frac{d^2}{du^2}y(u)\right)+(-2+2u)\,y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$

- Rewrite ODE with series expansions
  - Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

    $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$
  - Shift index using $k->k-m$

    $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$
  - Convert $u \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

    $u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\,u^{k+r-1}$
  - Shift index using $k->k+1$

    $u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)(k+r)\,u^{k+r}$

  Rewrite ODE with series expansions

  $4a_0 r(-1+r)\,u^{-1+r} + (4a_1(1+r)\,r - 2a_0)\,u^r + \left(\sum_{k=1}^{\infty} (4a_{k+1}(k+1+r)(k+r) - 2a_k + 2a_{k-1})\,u^{k}\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $4r(-1+r) = 0$
- Values of r that satisfy the indicial equation

  $r \in \{0, 1\}$
- Each term must be 0

  $4a_1(1+r)\,r - 2a_0 = 0$
- Each term in the series must be 0, giving the recursion relation

  $4a_{k+1}(k+1+r)(k+r) - 2a_k + 2a_{k-1} = 0$
- Shift index using $k->k+1$

  $4a_{k+2}(k+2+r)(k+1+r) - 2a_{k+1} + 2a_k = 0$
- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{-a_{k+1}+a_k}{2(k+2+r)(k+1+r)}$
- Recursion relation for $r = 0$

  $a_{k+2} = -\frac{-a_{k+1}+a_k}{2(k+2)(k+1)}$
- Solution for $r = 0$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^k, a_{k+2}=-\frac{-a_{k+1}+a_k}{2(k+2)(k+1)}, -2a_0=0\right]$$

- Revert the change of variables $u=x+\frac{3}{2}$

$$\left[y=\sum_{k=0}^{\infty} a_k\left(x+\frac{3}{2}\right)^k, a_{k+2}=-\frac{-a_{k+1}+a_k}{2(k+2)(k+1)}, -2a_0=0\right]$$

- Recursion relation for $r=1$

$$a_{k+2}=-\frac{-a_{k+1}+a_k}{2(k+3)(k+2)}$$

- Solution for $r=1$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^{k+1}, a_{k+2}=-\frac{-a_{k+1}+a_k}{2(k+3)(k+2)}, 8a_1-2a_0=0\right]$$

- Revert the change of variables $u=x+\frac{3}{2}$

$$\left[y=\sum_{k=0}^{\infty} a_k\left(x+\frac{3}{2}\right)^{k+1}, a_{k+2}=-\frac{-a_{k+1}+a_k}{2(k+3)(k+2)}, 8a_1-2a_0=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k\left(x+\frac{3}{2}\right)^k\right)+\left(\sum_{k=0}^{\infty} b_k\left(x+\frac{3}{2}\right)^{1+k}\right), a_{k+2}=-\frac{-a_{1+k}+a_k}{2(k+2)(1+k)}, -2a_0=0, b_{k+2}=-\frac{-b_{1+k}+b}{2(k+3)(k+}\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 29.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{\left(\beta\,x^2+\alpha x+1\right)y''+\left(\delta x+\gamma\right)y'+\epsilon y=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x)&=y(x_0)+(x-x_0)\,y'(x_0)+\frac{(x-x_0)^2}{2}y''(x_0)+\frac{(x-x_0)^3}{3!}y'''(x_0)+\cdots\\
&=y_0+xy'_0+\frac{x^2}{2}\,f|_{x_0,y_0,y'_0}+\frac{x^3}{3!}\,f'|_{x_0,y_0,y'_0}+\cdots\\
&=y_0+xy'_0+\sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}\,\frac{d^nf}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{1004}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{1005}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$F_0 = -\frac{y'\delta x + y'\gamma + \epsilon y}{\beta\, x^2 + \alpha x + 1}$$

$$\begin{aligned} F_1 &= \frac{dF_0}{dx} \\ &= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\ &= \frac{\left(\left(-\beta\epsilon + \delta(\beta+\delta)\right) x^2 + \left(-\alpha\epsilon + 2\gamma(\beta+\delta)\right) x + \alpha\gamma + \gamma^2 - \delta - \epsilon\right) y' + 2\left(\left(\beta + \frac{\delta}{2}\right) x + \frac{\alpha}{2} + \frac{\gamma}{2}\right) y\epsilon}{\left(\beta\, x^2 + \alpha x + 1\right)^2} \end{aligned}$$

$$\begin{aligned} F_2 &= \frac{dF_1}{dx} \\ &= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\ &= \frac{\left(-2\left(\beta + \frac{\delta}{2}\right)\left(-2\beta\epsilon + \delta(\beta+\delta)\right) x^3 + \left(\left(\left(6\alpha + 2\gamma\right)\beta + 2\alpha\delta\right)\epsilon - 6\left(\beta + \frac{\delta}{2}\right)\gamma(\beta+\delta)\right) x^2 + \left(\left(2\alpha^2 + 2\alpha\gamma\right.\right.}{} \end{aligned}$$

$$\begin{aligned} F_3 &= \frac{dF_2}{dx} \\ &= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\ &= \frac{\left(\left(\beta^2\epsilon^2 + \left(-18\beta^3 - 14\delta\,\beta^2 - 3\beta\,\delta^2\right)\epsilon + 6\beta^3\delta + 11\beta^2\delta^2 + 6\beta\,\delta^3 + \delta^4\right) x^4 + \left(2\beta\alpha\,\epsilon^2 + \left(\left(-36\alpha - 18\gamma\right)\right.\right.\right.}{} \end{aligned}$$

$$\begin{aligned} F_4 &= \frac{dF_3}{dx} \\ &= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\ &= \text{Expression too large to display} \end{aligned}$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=y(0)$ and $y'(0)=y'(0)$ gives

$$F_0 = -y(0)\,\epsilon - y'(0)\,\gamma$$
$$F_1 = y(0)\,\alpha\epsilon + y(0)\,\epsilon\gamma + y'(0)\,\alpha\gamma + y'(0)\,\gamma^2 - y'(0)\,\delta - y'(0)\,\epsilon$$
$$F_2 = -2y(0)\,\alpha^2\epsilon - 3y(0)\,\alpha\epsilon\gamma - y(0)\,\epsilon\,\gamma^2 - 2y'(0)\,\alpha^2\gamma - 3y'(0)\,\alpha\,\gamma^2 - y'(0)\,\gamma^3 + 2y(0)\,\beta\epsilon + 2y(0)\,\epsilon\delta + \epsilon^2 y$$
$$F_3 = 11y(0)\,\alpha^2\epsilon\gamma + 6y(0)\,\alpha\epsilon\,\gamma^2 - 9y(0)\,\alpha\epsilon\delta - 8y(0)\,\beta\epsilon\gamma - 5y(0)\,\epsilon\delta\gamma - 14y'(0)\,\alpha\delta\gamma - 9y'(0)\,\alpha\epsilon\gamma - 12y(0)$$
$$F_4 = 80y(0)\,\alpha\beta\epsilon\gamma + 41y(0)\,\alpha\epsilon\delta\gamma + 44y(0)\,\alpha^2\epsilon\delta + 15\epsilon^2 y(0)\,\alpha\gamma + 20y(0)\,\beta\epsilon\,\gamma^2 + 9y(0)\,\epsilon\delta\,\gamma^2 - 32y(0)\,\beta\epsilon\delta -$$

Substituting all the above in (7) and simplifying gives the solution as

Expression too large to display

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\beta\,x^2+\alpha x+1\right) y''+\left(\delta x+\gamma\right) y'+\epsilon y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\left(\beta\,x^2+\alpha x+1\right)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right)+\left(\delta x+\gamma\right)\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right)+\epsilon\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} x^n a_n \beta n(n-1)\right)+\left(\sum_{n=2}^{\infty} n\alpha\, x^{n-1} a_n(n-1)\right)+\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) \\ +\left(\sum_{n=1}^{\infty} n a_n x^n \delta\right)+\left(\sum_{n=1}^{\infty} n\gamma\, x^{n-1} a_n\right)+\left(\sum_{n=0}^{\infty} \epsilon a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n\alpha\, x^{n-1} a_n(n-1) = \sum_{n=1}^{\infty} \alpha(n+1)\, a_{n+1} n\, x^n$$
$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n$$
$$\sum_{n=1}^{\infty} n\gamma\, x^{n-1} a_n = \sum_{n=0}^{\infty} \gamma(n+1)\, a_{n+1} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\begin{aligned}&\left(\sum_{n=2}^{\infty} x^{n} a_{n} \beta n(n-1)\right)+\left(\sum_{n=1}^{\infty} \alpha(n+1) a_{n+1} n\, x^{n}\right)\\&+\left(\sum_{n=0}^{\infty}(n+2) a_{n+2}(n+1) x^{n}\right)+\left(\sum_{n=1}^{\infty} n a_{n} x^{n} \delta\right)\\&+\left(\sum_{n=0}^{\infty} \gamma(n+1) a_{n+1} x^{n}\right)+\left(\sum_{n=0}^{\infty} \epsilon a_{n} x^{n}\right)=0\end{aligned} \tag{3}$$

$n=0$ gives

$$\epsilon a_{0}+\gamma a_{1}+2 a_{2}=0$$

$$a_{2}=-\frac{\epsilon a_{0}}{2}-\frac{\gamma a_{1}}{2}$$

$n=1$ gives

$$2 \alpha a_{2}+\delta a_{1}+\epsilon a_{1}+2 \gamma a_{2}+6 a_{3}=0$$

Which after substituting earlier equations, simplifies to

$$a_{3}=\frac{1}{6} \alpha \epsilon a_{0}+\frac{1}{6} \alpha \gamma a_{1}+\frac{1}{6} \gamma \epsilon a_{0}+\frac{1}{6} \gamma^{2} a_{1}-\frac{1}{6} \delta a_{1}-\frac{1}{6} \epsilon a_{1}$$

For $2 \leq n$, the recurrence equation is

$$\beta n a_{n}(n-1)+\alpha(n+1) a_{n+1} n+(n+2) a_{n+2}(n+1)+\delta n a_{n}+\gamma(n+1) a_{n+1}+\epsilon a_{n}=0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned}a_{n+2}&=-\frac{\alpha\, n^{2} a_{n+1}+\beta\, n^{2} a_{n}+\alpha n a_{n+1}-\beta n a_{n}+\delta n a_{n}+\gamma n a_{n+1}+\epsilon a_{n}+\gamma a_{n+1}}{(n+2)(n+1)}\\&=-\frac{\left(\beta\, n^{2}-\beta n+\delta n+\epsilon\right) a_{n}}{(n+2)(n+1)}-\frac{\left(\alpha\, n^{2}+\alpha n+\gamma n+\gamma\right) a_{n+1}}{(n+2)(n+1)}\end{aligned} \tag{5}$$

For $n=2$ the recurrence equation gives

$$6 \alpha a_{3}+2 \beta a_{2}+2 \delta a_{2}+\epsilon a_{2}+3 \gamma a_{3}+12 a_{4}=0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{1}{12}\alpha^2\epsilon a_0 - \frac{1}{12}\alpha^2\gamma a_1 - \frac{1}{8}\alpha\gamma\epsilon a_0 - \frac{1}{8}\alpha\,\gamma^2 a_1 + \frac{1}{12}\alpha\delta a_1 + \frac{1}{12}\alpha\epsilon a_1 + \frac{1}{12}\beta\epsilon a_0 + \frac{1}{12}\beta\gamma a_1 + \frac{1}{12}\delta\epsilon a_0 + \frac{1}{8}\delta\gamma a_1 + \frac{1}{24}\epsilon^2 a_0 + \frac{1}{12}\epsilon\gamma a_1 - \frac{1}{24}\gamma^2\epsilon a_0 - \frac{1}{24}\gamma^3 a_1$$

For $n = 3$ the recurrence equation gives

$$12\alpha a_4 + 6\beta a_3 + 3\delta a_3 + \epsilon a_3 + 4\gamma a_4 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{11}{120}\alpha^2\gamma\epsilon a_0 - \frac{1}{10}\alpha\beta\epsilon a_0 - \frac{1}{10}\alpha\beta\gamma a_1 - \frac{3}{40}\alpha\delta\epsilon a_0 - \frac{7}{60}\alpha\delta\gamma a_1 - \frac{3}{40}\alpha\epsilon\gamma a_1 + \frac{1}{20}\alpha\,\gamma^2\epsilon a_0 - \frac{1}{15}\beta\gamma\epsilon a_0 - \frac{1}{24}\delta\gamma\epsilon a_0 + \frac{1}{120}\gamma^3\epsilon a_0 + \frac{1}{20}\alpha^3\epsilon a_0 + \frac{1}{20}\alpha^3\gamma a_1 + \frac{11}{120}\alpha^2\gamma^2 a_1 - \frac{1}{20}\alpha^2\delta a_1 - \frac{1}{20}\alpha^2\epsilon a_1 - \frac{1}{30}\alpha\,\epsilon^2 a_0 + \frac{1}{20}\alpha\,\gamma^3 a_1 - \frac{1}{15}\beta\,\gamma^2 a_1 + \frac{1}{20}\beta\delta a_1 + \frac{1}{20}\beta\epsilon a_1 - \frac{1}{20}\delta\,\gamma^2 a_1 + \frac{1}{30}\delta\epsilon a_1 - \frac{1}{60}\gamma\,\epsilon^2 a_0 - \frac{1}{40}\epsilon\,\gamma^2 a_1 + \frac{1}{40}\delta^2 a_1 + \frac{1}{120}\epsilon^2 a_1 + \frac{1}{120}\gamma^4 a_1$$

For $n = 4$ the recurrence equation gives

$$20\alpha a_5 + 12\beta a_4 + 4\delta a_4 + \epsilon a_4 + 5\gamma a_5 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{1}{9}\alpha\beta\gamma\epsilon a_0 + \frac{41}{720}\alpha\delta\gamma\epsilon a_0 + \frac{1}{30}\alpha\epsilon\,\gamma^2 a_1 - \frac{2}{45}\beta\delta\epsilon a_0 - \frac{5}{72}\beta\delta\gamma a_1 - \frac{2}{45}\beta\epsilon\gamma a_1 + \frac{1}{36}\beta\,\gamma^2\epsilon a_0 - \frac{1}{48}\delta\epsilon\gamma a_1 + \frac{1}{80}\delta\,\gamma^2\epsilon a_0 - \frac{5}{72}\alpha^3\gamma\epsilon a_0 + \frac{1}{10}\alpha^2\beta\epsilon a_0 + \frac{1}{10}\alpha^2\beta\gamma a_1 + \frac{11}{180}\alpha^2\delta\epsilon a_0 + \frac{7}{72}\alpha^2\delta\gamma a_1 + \frac{11}{180}\alpha^2\epsilon\gamma a_1 - \frac{7}{144}\alpha^2\gamma^2\epsilon a_0 - \frac{1}{72}\alpha\,\gamma^3\epsilon a_0 + \frac{1}{9}\alpha\beta\,\gamma^2 a_1 - \frac{1}{15}\alpha\beta\delta a_1 - \frac{1}{15}\alpha\beta\epsilon a_1 + \frac{5}{72}\alpha\delta\,\gamma^2 a_1 - \frac{13}{360}\alpha\delta\epsilon a_1 + \frac{1}{48}\alpha\gamma\,\epsilon^2 a_0 - \frac{1}{720}\gamma^5 a_1 - \frac{1}{720}\epsilon^3 a_0 - \frac{1}{240}\epsilon^2\gamma a_1 + \frac{1}{240}\gamma^2\epsilon^2 a_0 + \frac{1}{180}\epsilon\,\gamma^3 a_1 - \frac{1}{720}\gamma^4\epsilon a_0 - \frac{1}{36}\alpha\,\delta^2 a_1 - \frac{1}{30}\alpha^4\epsilon a_0 - \frac{1}{30}\alpha^4\gamma a_1 - \frac{5}{72}\alpha^3\gamma^2 a_1 + \frac{1}{30}\alpha^3\delta a_1 + \frac{1}{30}\alpha^3\epsilon a_1 + \frac{1}{40}\alpha^2\epsilon^2 a_0 - \frac{7}{144}\alpha^2\gamma^3 a_1 - \frac{1}{120}\alpha\,\epsilon^2 a_1 - \frac{1}{72}\alpha\,\gamma^4 a_1 - \frac{1}{30}\beta^2\epsilon a_0 - \frac{1}{30}\beta^2\gamma a_1 - \frac{7}{360}\beta\,\epsilon^2 a_0 + \frac{1}{36}\beta\,\gamma^3 a_1 - \frac{1}{90}\delta^2\epsilon a_0 - \frac{1}{48}\delta^2\gamma a_1 - \frac{1}{120}\delta\,\epsilon^2 a_0 + \frac{1}{72}\delta\,\gamma^3 a_1$$

For $n = 5$ the recurrence equation gives

$$30\alpha a_6 + 20\beta a_5 + 5\delta a_5 + \epsilon a_5 + 6\gamma a_6 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

Expression too large to display

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$\begin{aligned} y = a_0 + a_1 x &+ \left(-\frac{\epsilon a_0}{2} - \frac{\gamma a_1}{2}\right) x^2 + \left(\frac{1}{6}\alpha\epsilon a_0 + \frac{1}{6}\alpha\gamma a_1 + \frac{1}{6}\gamma\epsilon a_0 + \frac{1}{6}\gamma^2 a_1 - \frac{1}{6}\delta a_1 - \frac{1}{6}\epsilon a_1\right) x^3 \\ &+ \left(-\frac{1}{12}\alpha^2\epsilon a_0 - \frac{1}{12}\alpha^2\gamma a_1 - \frac{1}{8}\alpha\gamma\epsilon a_0 - \frac{1}{8}\alpha\gamma^2 a_1 + \frac{1}{12}\alpha\delta a_1 + \frac{1}{12}\alpha\epsilon a_1 + \frac{1}{12}\beta\epsilon a_0 \right. \\ &\quad \left. + \frac{1}{12}\beta\gamma a_1 + \frac{1}{12}\delta\epsilon a_0 + \frac{1}{8}\delta\gamma a_1 + \frac{1}{24}\epsilon^2 a_0 + \frac{1}{12}\epsilon\gamma a_1 - \frac{1}{24}\gamma^2\epsilon a_0 - \frac{1}{24}\gamma^3 a_1\right) x^4 \\ &+ \left(\frac{11}{120}\alpha^2\gamma\epsilon a_0 - \frac{1}{10}\alpha\beta\epsilon a_0 - \frac{1}{10}\alpha\beta\gamma a_1 - \frac{3}{40}\alpha\delta\epsilon a_0 - \frac{7}{60}\alpha\delta\gamma a_1 - \frac{3}{40}\alpha\epsilon\gamma a_1 + \frac{1}{20}\alpha\gamma^2\epsilon a_0 \right. \\ &\quad - \frac{1}{15}\beta\gamma\epsilon a_0 - \frac{1}{24}\delta\gamma\epsilon a_0 + \frac{1}{120}\gamma^3\epsilon a_0 + \frac{1}{20}\alpha^3\epsilon a_0 + \frac{1}{20}\alpha^3\gamma a_1 + \frac{11}{120}\alpha^2\gamma^2 a_1 - \frac{1}{20}\alpha^2\delta a_1 \\ &\quad - \frac{1}{20}\alpha^2\epsilon a_1 - \frac{1}{30}\alpha\epsilon^2 a_0 + \frac{1}{20}\alpha\gamma^3 a_1 - \frac{1}{15}\beta\gamma^2 a_1 + \frac{1}{20}\beta\delta a_1 + \frac{1}{20}\beta\epsilon a_1 - \frac{1}{20}\delta\gamma^2 a_1 \\ &\quad \left. + \frac{1}{30}\delta\epsilon a_1 - \frac{1}{60}\gamma\epsilon^2 a_0 - \frac{1}{40}\epsilon\gamma^2 a_1 + \frac{1}{40}\delta^2 a_1 + \frac{1}{120}\epsilon^2 a_1 + \frac{1}{120}\gamma^4 a_1\right) x^5 + \dots \end{aligned}$$

Collecting terms, the solution becomes

$$y=\left(1-\frac{\epsilon\,x^{2}}{2}+\left(\frac{1}{6}\alpha\epsilon+\frac{1}{6}\epsilon\gamma\right)x^{3}+\left(-\frac{1}{12}\alpha^{2}\epsilon-\frac{1}{8}\alpha\gamma\epsilon+\frac{1}{12}\beta\epsilon+\frac{1}{12}\delta\epsilon+\frac{1}{24}\epsilon^{2}-\frac{1}{24}\gamma^{2}\epsilon\right)x^{4}+\left(\frac{11}{120}\alpha^{2}\gamma\epsilon-\frac{1}{10}\beta\alpha\epsilon-\frac{3}{40}\alpha\delta\epsilon+\frac{1}{20}\alpha\,\gamma^{2}\epsilon-\frac{1}{15}\beta\epsilon\gamma-\frac{1}{24}\delta\epsilon\gamma+\frac{1}{120}\gamma^{3}\epsilon+\frac{1}{20}\alpha^{3}\epsilon-\frac{1}{30}\alpha\,\epsilon^{2}-\frac{1}{60}\gamma\,\epsilon^{2}\right)x^{5}\right)a_{0}+\left(x-\frac{x^{2}\gamma}{2}+\left(\frac{1}{6}\alpha\gamma+\frac{1}{6}\gamma^{2}-\frac{1}{6}\delta-\frac{1}{6}\epsilon\right)x^{3}+\left(-\frac{1}{12}\alpha^{2}\gamma-\frac{1}{8}\alpha\,\gamma^{2}+\frac{1}{12}\alpha\delta+\frac{1}{12}\alpha\epsilon+\frac{1}{12}\beta\gamma+\frac{1}{8}\delta\gamma+\frac{1}{12}\epsilon\gamma-\frac{1}{24}\gamma^{3}\right)x^{4}+\left(-\frac{1}{10}\alpha\beta\gamma-\frac{7}{60}\alpha\delta\gamma-\frac{3}{40}\alpha\gamma\epsilon+\frac{1}{20}\alpha^{3}\gamma+\frac{11}{120}\alpha^{2}\gamma^{2}-\frac{1}{20}\alpha^{2}\delta-\frac{1}{20}\alpha^{2}\epsilon+\frac{1}{20}\alpha\,\gamma^{3}-\frac{1}{15}\beta\,\gamma^{2}+\frac{1}{20}\beta\delta+\frac{1}{20}\beta\epsilon-\frac{1}{20}\delta\,\gamma^{2}+\frac{1}{30}\delta\epsilon-\frac{1}{40}\gamma^{2}\epsilon+\frac{1}{40}\delta^{2}+\frac{1}{120}\epsilon^{2}+\frac{1}{120}\gamma^{4}\right)x^{5}\right)a_{1}+O\!\left(x^{6}\right) \tag{3}$$

At $x=0$ the solution above becomes

$$y=\left(1-\frac{\epsilon\,x^{2}}{2}+\left(\frac{1}{6}\alpha\epsilon+\frac{1}{6}\epsilon\gamma\right)x^{3}+\left(-\frac{1}{12}\alpha^{2}\epsilon-\frac{1}{8}\alpha\gamma\epsilon+\frac{1}{12}\beta\epsilon+\frac{1}{12}\delta\epsilon+\frac{1}{24}\epsilon^{2}-\frac{1}{24}\gamma^{2}\epsilon\right)x^{4}+\left(\frac{11}{120}\alpha^{2}\gamma\epsilon-\frac{1}{10}\beta\alpha\epsilon-\frac{3}{40}\alpha\delta\epsilon+\frac{1}{20}\alpha\,\gamma^{2}\epsilon-\frac{1}{15}\beta\epsilon\gamma-\frac{1}{24}\delta\epsilon\gamma+\frac{1}{120}\gamma^{3}\epsilon+\frac{1}{20}\alpha^{3}\epsilon-\frac{1}{30}\alpha\,\epsilon^{2}-\frac{1}{60}\gamma\,\epsilon^{2}\right)x^{5}\right)c_{1}+\left(x-\frac{x^{2}\gamma}{2}+\left(\frac{1}{6}\alpha\gamma+\frac{1}{6}\gamma^{2}-\frac{1}{6}\delta-\frac{1}{6}\epsilon\right)x^{3}+\left(-\frac{1}{12}\alpha^{2}\gamma-\frac{1}{8}\alpha\,\gamma^{2}+\frac{1}{12}\alpha\delta+\frac{1}{12}\alpha\epsilon+\frac{1}{12}\beta\gamma+\frac{1}{8}\delta\gamma+\frac{1}{12}\epsilon\gamma-\frac{1}{24}\gamma^{3}\right)x^{4}+\left(-\frac{1}{10}\alpha\beta\gamma-\frac{7}{60}\alpha\delta\gamma-\frac{3}{40}\alpha\gamma\epsilon+\frac{1}{20}\alpha^{3}\gamma+\frac{11}{120}\alpha^{2}\gamma^{2}-\frac{1}{20}\alpha^{2}\delta-\frac{1}{20}\alpha^{2}\epsilon+\frac{1}{20}\alpha\,\gamma^{3}-\frac{1}{15}\beta\,\gamma^{2}+\frac{1}{20}\beta\delta+\frac{1}{20}\beta\epsilon-\frac{1}{20}\delta\,\gamma^{2}+\frac{1}{30}\delta\epsilon-\frac{1}{40}\gamma^{2}\epsilon+\frac{1}{40}\delta^{2}+\frac{1}{120}\epsilon^{2}+\frac{1}{120}\gamma^{4}\right)x^{5}\right)c_{2}+O\!\left(x^{6}\right)$$

Summary
The solution(s) found are the following

$$\text{Expression too large to display} \tag{1}$$

$$y = \left(1-\frac{\epsilon x^{2}}{2}+\left(\frac{1}{6}\alpha\epsilon+\frac{1}{6}\epsilon\gamma\right)x^{3}+\left(-\frac{1}{12}\alpha^{2}\epsilon-\frac{1}{8}\alpha\gamma\epsilon+\frac{1}{12}\beta\epsilon+\frac{1}{12}\delta\epsilon+\frac{1}{24}\epsilon^{2}-\frac{1}{24}\gamma^{2}\epsilon\right)x^{4}+\left(\frac{11}{120}\alpha^{2}\gamma\epsilon-\frac{1}{10}\beta\alpha\epsilon-\frac{3}{40}\alpha\delta\epsilon+\frac{1}{20}\alpha\gamma^{2}\epsilon-\frac{1}{15}\beta\epsilon\gamma-\frac{1}{24}\delta\epsilon\gamma+\frac{1}{120}\gamma^{3}\epsilon+\frac{1}{20}\alpha^{3}\epsilon-\frac{1}{30}\alpha\epsilon^{2}-\frac{1}{60}\gamma\epsilon^{2}\right)x^{5}\right)c_{1}+\left(x-\frac{x^{2}\gamma}{2}+\left(\frac{1}{6}\alpha\gamma+\frac{1}{6}\gamma^{2}-\frac{1}{6}\delta-\frac{1}{6}\epsilon\right)x^{3}+\left(-\frac{1}{12}\alpha^{2}\gamma-\frac{1}{8}\alpha\gamma^{2}+\frac{1}{12}\alpha\delta+\frac{1}{12}\alpha\epsilon+\frac{1}{12}\beta\gamma+\frac{1}{8}\delta\gamma+\frac{1}{12}\epsilon\gamma-\frac{1}{24}\gamma^{3}\right)x^{4}+\left(-\frac{1}{10}\alpha\beta\gamma-\frac{7}{60}\alpha\delta\gamma-\frac{3}{40}\alpha\gamma\epsilon+\frac{1}{20}\alpha^{3}\gamma+\frac{11}{120}\alpha^{2}\gamma^{2}-\frac{1}{20}\alpha^{2}\delta-\frac{1}{20}\alpha^{2}\epsilon+\frac{1}{20}\alpha\gamma^{3}-\frac{1}{15}\beta\gamma^{2}+\frac{1}{20}\beta\delta+\frac{1}{20}\beta\epsilon-\frac{1}{20}\delta\gamma^{2}+\frac{1}{30}\delta\epsilon-\frac{1}{40}\gamma^{2}\epsilon+\frac{1}{40}\delta^{2}+\frac{1}{120}\epsilon^{2}+\frac{1}{120}\gamma^{4}\right)x^{5}\right)c_{2}+O\left(x^{6}\right) \tag{2}$$

Verification of solutions

$$\text{Expression too large to display}$$

Verified OK.

$$y = \left(1-\frac{\epsilon x^{2}}{2}+\left(\frac{1}{6}\alpha\epsilon+\frac{1}{6}\epsilon\gamma\right)x^{3}+\left(-\frac{1}{12}\alpha^{2}\epsilon-\frac{1}{8}\alpha\gamma\epsilon+\frac{1}{12}\beta\epsilon+\frac{1}{12}\delta\epsilon+\frac{1}{24}\epsilon^{2}-\frac{1}{24}\gamma^{2}\epsilon\right)x^{4}+\left(\frac{11}{120}\alpha^{2}\gamma\epsilon-\frac{1}{10}\beta\alpha\epsilon-\frac{3}{40}\alpha\delta\epsilon+\frac{1}{20}\alpha\gamma^{2}\epsilon-\frac{1}{15}\beta\epsilon\gamma-\frac{1}{24}\delta\epsilon\gamma+\frac{1}{120}\gamma^{3}\epsilon+\frac{1}{20}\alpha^{3}\epsilon-\frac{1}{30}\alpha\epsilon^{2}-\frac{1}{60}\gamma\epsilon^{2}\right)x^{5}\right)c_{1}+\left(x-\frac{x^{2}\gamma}{2}+\left(\frac{1}{6}\alpha\gamma+\frac{1}{6}\gamma^{2}-\frac{1}{6}\delta-\frac{1}{6}\epsilon\right)x^{3}+\left(-\frac{1}{12}\alpha^{2}\gamma-\frac{1}{8}\alpha\gamma^{2}+\frac{1}{12}\alpha\delta+\frac{1}{12}\alpha\epsilon+\frac{1}{12}\beta\gamma+\frac{1}{8}\delta\gamma+\frac{1}{12}\epsilon\gamma-\frac{1}{24}\gamma^{3}\right)x^{4}+\left(-\frac{1}{10}\alpha\beta\gamma-\frac{7}{60}\alpha\delta\gamma-\frac{3}{40}\alpha\gamma\epsilon+\frac{1}{20}\alpha^{3}\gamma+\frac{11}{120}\alpha^{2}\gamma^{2}-\frac{1}{20}\alpha^{2}\delta-\frac{1}{20}\alpha^{2}\epsilon+\frac{1}{20}\alpha\gamma^{3}-\frac{1}{15}\beta\gamma^{2}+\frac{1}{20}\beta\delta+\frac{1}{20}\beta\epsilon-\frac{1}{20}\delta\gamma^{2}+\frac{1}{30}\delta\epsilon-\frac{1}{40}\gamma^{2}\epsilon+\frac{1}{40}\delta^{2}+\frac{1}{120}\epsilon^{2}+\frac{1}{120}\gamma^{4}\right)x^{5}\right)c_{2}+O\left(x^{6}\right)$$

Verified OK.

13.26.1 Maple step by step solution

Let's solve

$(\beta x^2+\alpha x+1) y''+(\delta x+\gamma) y'+\epsilon y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{\epsilon y}{\beta x^2+\alpha x+1}-\frac{(\delta x+\gamma)y'}{\beta x^2+\alpha x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(\delta x+\gamma)y'}{\beta x^2+\alpha x+1}+\frac{\epsilon y}{\beta x^2+\alpha x+1}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{\delta x+\gamma}{\beta x^2+\alpha x+1}, P_3(x)=\frac{\epsilon}{\beta x^2+\alpha x+1}\right]$

  - $\left(x-\frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}\right)\cdot P_2(x)$ is analytic at $x=\frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}$

    $\left(\left(x-\frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}\right)\cdot P_2(x)\right)\bigg|_{x=\frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}}=0$

  - $\left(x-\frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}\right)^2\cdot P_3(x)$ is analytic at $x=\frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}$

    $\left(\left(x-\frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}\right)^2\cdot P_3(x)\right)\bigg|_{x=\frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}}=0$

  - $x=\frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}$ is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=\frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}$

- Multiply by denominators

  $(\beta x^2+\alpha x+1) y''+(\delta x+\gamma) y'+\epsilon y=0$

- Change variables using $x=u+\frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}$ so that the regular singular point is at $u=0$

  $(\beta u^2+u\sqrt{\alpha^2-4\beta})\left(\frac{d^2}{du^2}y(u)\right)+\left(\delta u-\frac{\delta\alpha}{2\beta}+\frac{\delta\sqrt{\alpha^2-4\beta}}{2\beta}+\gamma\right)\left(\frac{d}{du}y(u)\right)+\epsilon y(u)=0$

- Assume series solution for $y(u)$

$$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..1$

$$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$$

- Shift index using $k- >k+1-m$

$$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k- >k+2-m$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

Rewrite ODE with series expansions

$$\frac{a_0 r\left(2\sqrt{\alpha^2-4\beta}\,\beta r-2\sqrt{\alpha^2-4\beta}\,\beta+\delta\sqrt{\alpha^2-4\beta}-\alpha\delta+2\beta\gamma\right)u^{-1+r}}{2\beta} + \left(\sum_{k=0}^{\infty}\left(\frac{a_{k+1}(k+1+r)\left(2\sqrt{\alpha^2-4\beta}\,\beta(k+1)+2\sqrt{\alpha^2-4\beta}\,\beta r-2\sqrt{}\right.}{2\beta}\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$\frac{r\left(2\sqrt{\alpha^2-4\beta}\,\beta r-2\sqrt{\alpha^2-4\beta}\,\beta+\delta\sqrt{\alpha^2-4\beta}-\alpha\delta+2\beta\gamma\right)}{2\beta} = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{0, \frac{2\sqrt{\alpha^2-4\beta}\,\beta-\delta\sqrt{\alpha^2-4\beta}+\alpha\delta-2\beta\gamma}{2\sqrt{\alpha^2-4\beta}\,\beta}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$\frac{2\left((k+r)\beta+\frac{\delta}{2}\right)(k+1+r)a_{k+1}\sqrt{\alpha^2-4\beta}+2a_k(k+r)(k+r-1)\beta^2+(2\gamma(k+1+r)a_{k+1}+2a_k(\delta k+\delta r+\epsilon))\beta-a_{k+1}\alpha\delta(k+1+r)}{2\beta} = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = -\frac{2\beta a_k\left(\beta k^2+2\beta kr+\beta r^2-\beta k-\beta r+\delta k+\delta r+\epsilon\right)}{2\sqrt{\alpha^2-4\beta}\,\beta k^2+4\sqrt{\alpha^2-4\beta}\,\beta kr+2\sqrt{\alpha^2-4\beta}\,\beta r^2+2\sqrt{\alpha^2-4\beta}\,\beta k+2\sqrt{\alpha^2-4\beta}\,\beta r+\sqrt{\alpha^2-4\beta}\,\delta k+\sqrt{\alpha^2-4\beta}\,\delta r-\alpha\delta k-\alpha\delta r-}$$

- Recursion relation for $r = 0$

$$a_{k+1} = -\frac{2\beta a_k\left(\beta k^2-\beta k+\delta k+\epsilon\right)}{2\sqrt{\alpha^2-4\beta}\,\beta k^2+2\sqrt{\alpha^2-4\beta}\,\beta k+\sqrt{\alpha^2-4\beta}\,\delta k-\alpha\delta k+2\beta\gamma k+\delta\sqrt{\alpha^2-4\beta}-\alpha\delta+2\beta\gamma}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+1} = -\frac{2\beta a_k (\beta k^2 - \beta k + \delta k + \epsilon)}{2\sqrt{\alpha^2-4\beta}\,\beta k^2 + 2\sqrt{\alpha^2-4\beta}\,\beta k + \sqrt{\alpha^2-4\beta}\,\delta k - \alpha\delta k + 2\beta\gamma k + \delta\sqrt{\alpha^2-4\beta} - \alpha\delta + 2\beta\gamma}\right]$$

- Revert the change of variables $u = x - \frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(x - \frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}\right)^k, a_{k+1} = -\frac{2\beta a_k (\beta k^2 - \beta k + \delta k + \epsilon)}{2\sqrt{\alpha^2-4\beta}\,\beta k^2 + 2\sqrt{\alpha^2-4\beta}\,\beta k + \sqrt{\alpha^2-4\beta}\,\delta k - \alpha\delta k + 2\beta\gamma k + \delta\sqrt{\alpha^2-4\beta} - \alpha\delta +$$

- Recursion relation for $r = \frac{2\sqrt{\alpha^2-4\beta}\,\beta - \delta\sqrt{\alpha^2-4\beta} + \alpha\delta - 2\beta\gamma}{2\sqrt{\alpha^2-4\beta}\,\beta}$

$$a_{k+1} = -\frac{2\beta a_k \left(\beta k^2 + \frac{k\left(2\sqrt{\alpha^2-4\beta}\,\beta - \delta\sqrt{\alpha^2-4\beta} + \alpha\delta - 2\beta\gamma\right)}{\sqrt{\alpha^2-4\beta}} + \frac{\left(2\sqrt{\alpha^2-4\beta}\,\beta - \delta\sqrt{\alpha^2-4\right.}}{4\beta\left(\alpha^2-4\beta\right)}\right.}{2\sqrt{\alpha^2-4\beta}\,\beta k^2 + 2k\left(2\sqrt{\alpha^2-4\beta}\,\beta - \delta\sqrt{\alpha^2-4\beta} + \alpha\delta - 2\beta\gamma\right) + \frac{\left(2\sqrt{\alpha^2-4\beta}\,\beta - \delta\sqrt{\alpha^2-4\beta} + \alpha\delta - 2\beta\gamma\right)^2}{2\sqrt{\alpha^2-4\beta}\,\beta} + 2\sqrt{\alpha^2-4\beta}\,\beta k + 2\sqrt{\alpha^2-}}$$

- Solution for $r = \frac{2\sqrt{\alpha^2-4\beta}\,\beta - \delta\sqrt{\alpha^2-4\beta} + \alpha\delta - 2\beta\gamma}{2\sqrt{\alpha^2-4\beta}\,\beta}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k + \frac{2\sqrt{\alpha^2-4\beta}\,\beta - \delta\sqrt{\alpha^2-4\beta} + \alpha\delta - 2\beta\gamma}{2\sqrt{\alpha^2-4\beta}\,\beta}}, a_{k+1} = -\frac{2\beta a_k \left(\beta k^2 + \right.}{2\sqrt{\alpha^2-4\beta}\,\beta k^2 + 2k\left(2\sqrt{\alpha^2-4\beta}\,\beta - \delta\sqrt{\alpha^2-4\beta} + \alpha\delta - 2\beta\gamma\right) + }\right.$$

- Revert the change of variables $u = x - \frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(x - \frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}\right)^{k + \frac{2\sqrt{\alpha^2-4\beta}\,\beta - \delta\sqrt{\alpha^2-4\beta} + \alpha\delta - 2\beta\gamma}{2\sqrt{\alpha^2-4\beta}\,\beta}}, a_{k+1} = -\frac{}{2\sqrt{\alpha^2-4\beta}\,\beta k^2 + 2k\left(2\sqrt{\alpha^2-4\beta}\,\beta - \delta\sqrt{\alpha^2-\right.}}\right.$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k \left(x - \frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}\right)^k\right) + \left(\sum_{k=0}^{\infty} b_k \left(x - \frac{-\alpha+\sqrt{\alpha^2-4\beta}}{2\beta}\right)^{k + \frac{2\sqrt{\alpha^2-4\beta}\,\beta - \delta\sqrt{\alpha^2-4\beta} + \alpha\delta - 2\beta\gamma}{2\sqrt{\alpha^2-4\beta}\,\beta}}\right), a_{1+k}\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 31(a).
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second_order_change_of_variable_on_y_method_1", "linear_second_order_ode_solved_by_an_integrating_factor", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{(2x^2+3x+1)\,y''+(6+8x)\,y'+4y=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using

Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0,y_0,y_0'} + \frac{x^3}{3!} f'|_{x_0,y_0,y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y_0'}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (1007)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (1008)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3)\\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2(4y'x+3y'+2y)}{2x^2+3x+1}\\
F_1 &= \frac{dF_0}{dx}\\
&= \frac{\partial F_0}{\partial x}+\frac{\partial F_0}{\partial y}y'+\frac{\partial F_0}{\partial y'}F_0\\
&= \frac{(72x^2+108x+42)\,y'+(48x+36)\,y}{(2x^2+3x+1)^2}\\
F_2 &= \frac{dF_1}{dx}\\
&= \frac{\partial F_1}{\partial x}+\frac{\partial F_1}{\partial y}y'+\frac{\partial F_1}{\partial y'}F_1\\
&= \frac{(-768x^3-1728x^2-1344x-360)\,y'-576y\left(x^2+\frac{3}{2}x+\frac{7}{12}\right)}{(2x^2+3x+1)^3}\\
F_3 &= \frac{dF_2}{dx}\\
&= \frac{\partial F_2}{\partial x}+\frac{\partial F_2}{\partial y}y'+\frac{\partial F_2}{\partial y'}F_2\\
&= \frac{(9600x^4+28800x^3+33600x^2+18000x+3720)\,y'+7680\left(x^2+\frac{3}{2}x+\frac{5}{8}\right)y\left(\frac{3}{4}+x\right)}{(2x^2+3x+1)^4}\\
F_4 &= \frac{dF_3}{dx}\\
&= \frac{\partial F_3}{\partial x}+\frac{\partial F_3}{\partial y}y'+\frac{\partial F_3}{\partial y'}F_3\\
&= \frac{(-138240x^5-518400x^4-806400x^3-648000x^2-267840x-45360)\,y'-115200\left(x^4+3x^3+\frac{7}{2}x^2 -\right.}{(2x^2+3x+1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=y(0)$ and $y'(0)=y'(0)$ gives

$$
\begin{aligned}
F_0 &= -4y(0)-6y'(0)\\
F_1 &= 36y(0)+42y'(0)\\
F_2 &= -336y(0)-360y'(0)\\
F_3 &= 3600y(0)+3720y'(0)\\
F_4 &= -44640y(0)-45360y'(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
\begin{aligned}
y &= \left(-62x^6+30x^5-14x^4+6x^3-2x^2+1\right)y(0)\\
&\quad+\left(-63x^6+31x^5-15x^4+7x^3-3x^2+x\right)y'(0)+O\left(x^6\right)
\end{aligned}
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(2x^2 + 3x + 1) y'' + (6 + 8x) y' + 4y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(2x^2 + 3x + 1) \left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + (6 + 8x) \left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) + 4\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 2x^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} 3n\, x^{n-1} a_n(n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 6n a_n x^{n-1}\right) + \left(\sum_{n=1}^{\infty} 8n a_n x^n\right) + \left(\sum_{n=0}^{\infty} 4a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 3n\, x^{n-1} a_n(n-1) = \sum_{n=1}^{\infty} 3(n+1) a_{n+1} n\, x^n$$

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n$$

$$\sum_{n=1}^{\infty} 6n a_n x^{n-1} = \sum_{n=0}^{\infty} 6(n+1) a_{n+1} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 2x^n a_n n(n-1)\right) + \left(\sum_{n=1}^{\infty} 3(n+1)\, a_{n+1} n\, x^n\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=0}^{\infty} 6(n+1)\, a_{n+1} x^n\right) + \left(\sum_{n=1}^{\infty} 8n a_n x^n\right) + \left(\sum_{n=0}^{\infty} 4a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 6a_1 + 4a_0 = 0$$

$$a_2 = -2a_0 - 3a_1$$

$n = 1$ gives

$$18a_2 + 6a_3 + 12a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = 6a_0 + 7a_1$$

For $2 \leq n$, the recurrence equation is

$$2na_n(n-1) + 3(n+1)\, a_{n+1} n + (n+2)\, a_{n+2}(n+1) + 6(n+1)\, a_{n+1} + 8na_n + 4a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -2a_n - 3a_{n+1} \\ &= -2a_n - 3a_{n+1} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$24a_2 + 36a_3 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -14a_0 - 15a_1$$

For $n = 3$ the recurrence equation gives

$$40a_3 + 60a_4 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = 30a_0 + 31a_1$$

For $n = 4$ the recurrence equation gives

$$60a_4 + 90a_5 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -62a_0 - 63a_1$$

For $n = 5$ the recurrence equation gives

$$84a_5 + 126a_6 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = 126a_0 + 127a_1$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x + (-2a_0 - 3a_1) x^2 + (6a_0 + 7a_1) x^3 + (-14a_0 - 15a_1) x^4 + (30a_0 + 31a_1) x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(30x^5 - 14x^4 + 6x^3 - 2x^2 + 1\right) a_0 + \left(31x^5 - 15x^4 + 7x^3 - 3x^2 + x\right) a_1 + O\left(x^6\right) \quad (3)$$

At $x = 0$ the solution above becomes

$$y = \left(30x^5 - 14x^4 + 6x^3 - 2x^2 + 1\right) c_1 + \left(31x^5 - 15x^4 + 7x^3 - 3x^2 + x\right) c_2 + O\left(x^6\right)$$

Summary

The solution(s) found are the following

$$y = \left(-62x^6+30x^5-14x^4+6x^3-2x^2+1\right) y(0) + \left(-63x^6+31x^5-15x^4+7x^3-3x^2+x\right) y'(0)+O\left(x^6\right) \tag{1}$$

$$y = \left(30x^5-14x^4+6x^3-2x^2+1\right) c_1+\left(31x^5-15x^4+7x^3-3x^2+x\right) c_2+O\left(x^6\right) \tag{2}$$

Verification of solutions

$$y = \left(-62x^6+30x^5-14x^4+6x^3-2x^2+1\right) y(0) + \left(-63x^6+31x^5-15x^4+7x^3-3x^2+x\right) y'(0)+O\left(x^6\right)$$

Verified OK.

$$y = \left(30x^5-14x^4+6x^3-2x^2+1\right) c_1+\left(31x^5-15x^4+7x^3-3x^2+x\right) c_2+O\left(x^6\right)$$

Verified OK.

13.27.1 Maple step by step solution

Let's solve

$(2x^2+3x+1) y''+(6+8x) y'+4y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{4y}{2x^2+3x+1}-\frac{2(4x+3)y'}{2x^2+3x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{2(4x+3)y'}{2x^2+3x+1}+\frac{4y}{2x^2+3x+1}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{2(4x+3)}{2x^2+3x+1}, P_3(x)=\frac{4}{2x^2+3x+1}\right]$

  ◦ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

  $\left((x+1)\cdot P_2(x)\right)\bigg|_{x=-1}=2$

  ◦ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

  $\left((x+1)^2\cdot P_3(x)\right)\bigg|_{x=-1}=0$

- $x=-1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-1$

- Multiply by denominators

  $(2x^2+3x+1)\,y''+(6+8x)\,y'+4y=0$

- Change variables using $x=u-1$ so that the regular singular point is at $u=0$

  $(2u^2-u)\left(\frac{d^2}{du^2}y(u)\right)+(-2+8u)\left(\frac{d}{du}y(u)\right)+4y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..1$

  $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,u^{k+r}$

- Convert $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m=1..2$

  $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,u^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$

  Rewrite ODE with series expansions

  $-a_0r(1+r)\,u^{-1+r}+\left(\sum_{k=0}^{\infty}(-a_{k+1}(k+r+1)\,(k+r+2)+2a_k(k+r+2)\,(k+r+1))\,u^{k+r}\right)=$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-r(1+r)=0$

- Values of r that satisfy the indicial equation

  $r\in\{-1,0\}$

- Each term in the series must be 0, giving the recursion relation

$$(k+r+2)(k+r+1)(-a_{k+1}+2a_k)=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1}=2a_k$$

- Recursion relation for $r=-1$

$$a_{k+1}=2a_k$$

- Solution for $r=-1$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^{k-1}, a_{k+1}=2a_k\right]$$

- Revert the change of variables $u=x+1$

$$\left[y=\sum_{k=0}^{\infty} a_k(x+1)^{k-1}, a_{k+1}=2a_k\right]$$

- Recursion relation for $r=0$

$$a_{k+1}=2a_k$$

- Solution for $r=0$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^{k}, a_{k+1}=2a_k\right]$$

- Revert the change of variables $u=x+1$

$$\left[y=\sum_{k=0}^{\infty} a_k(x+1)^{k}, a_{k+1}=2a_k\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k(x+1)^{k-1}\right)+\left(\sum_{k=0}^{\infty} b_k(x+1)^{k}\right), a_{1+k}=2a_k, b_{1+k}=2b_k\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 31(b).
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second_order_change_of_variable_on_y_method_1", "linear_second_order_ode_solved_by_an_integrating_factor", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{(6x^2-5x+1)\,y''-(10-24x)\,y'+12y=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using

Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0, y_0, y_0'} + \frac{x^3}{3!} f'|_{x_0, y_0, y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y_0'}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (1010) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (1011) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2(12y'x - 5y' + 6y)}{6x^2 - 5x + 1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{(648x^2 - 540x + 114)\, y' + (432x - 180)\, y}{(6x^2 - 5x + 1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(-20736x^3 + 25920x^2 - 10944x + 1560)\, y' - 15552\left(x^2 - \frac{5}{6}x + \frac{19}{108}\right) y}{(6x^2 - 5x + 1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(777600x^4 - 1296000x^3 + 820800x^2 - 234000x + 25320)\, y' + 622080\left(x^2 - \frac{5}{6}x + \frac{13}{72}\right) y \left(x - \frac{5}{12}\right)}{(6x^2 - 5x + 1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-33592320x^5 + 69984000x^4 - 59097600x^3 + 25272000x^2 - 5469120x + 478800)\, y' - 27993600y(x}{(6x^2 - 5x + 1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = y(0)$ and $y'(0) = y'(0)$ gives

$$
\begin{aligned}
F_0 &= -12y(0) + 10y'(0) \\
F_1 &= -180y(0) + 114y'(0) \\
F_2 &= -2736y(0) + 1560y'(0) \\
F_3 &= -46800y(0) + 25320y'(0) \\
F_4 &= -911520y(0) + 478800y'(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
\begin{aligned}
y = &\left(-1266x^6 - 390x^5 - 114x^4 - 30x^3 - 6x^2 + 1\right) y(0) \\
&+ \left(665x^6 + 211x^5 + 65x^4 + 19x^3 + 5x^2 + x\right) y'(0) + O\left(x^6\right)
\end{aligned}
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(6x^2 - 5x + 1\right) y'' + (24x - 10)\, y' + 12y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\left(6x^2 - 5x + 1\right) \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + (24x - 10) \left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) + 12\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}\left(\sum_{n=2}^{\infty} 6x^n a_n n(n-1)\right) + \sum_{n=2}^{\infty} \left(-5n\, x^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) \\ + \left(\sum_{n=1}^{\infty} 24n a_n x^n\right) + \sum_{n=1}^{\infty} \left(-10n a_n x^{n-1}\right) + \left(\sum_{n=0}^{\infty} 12 a_n x^n\right) = 0\end{aligned} \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} \left(-5n\, x^{n-1} a_n (n-1)\right) = \sum_{n=1}^{\infty} \left(-5(n+1)\, a_{n+1} n\, x^n\right)$$

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2} (n+1)\, x^n$$

$$\sum_{n=1}^{\infty} \left(-10n a_n x^{n-1}\right) = \sum_{n=0}^{\infty} \left(-10(n+1)\, a_{n+1} x^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 6x^n a_n n(n-1)\right) + \sum_{n=1}^{\infty} \left(-5(n+1) a_{n+1} n x^n\right) + \left(\sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n\right) + \left(\sum_{n=1}^{\infty} 24 n a_n x^n\right) + \sum_{n=0}^{\infty} \left(-10(n+1) a_{n+1} x^n\right) + \left(\sum_{n=0}^{\infty} 12 a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 - 10a_1 + 12a_0 = 0$$

$$a_2 = -6a_0 + 5a_1$$

$n = 1$ gives

$$-30a_2 + 6a_3 + 36a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -30a_0 + 19a_1$$

For $2 \leq n$, the recurrence equation is

$$6na_n(n-1) - 5(n+1) a_{n+1} n + (n+2) a_{n+2}(n+1) + 24na_n - 10(n+1) a_{n+1} + 12a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -6a_n + 5a_{n+1} \\ &= -6a_n + 5a_{n+1} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$72a_2 - 60a_3 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -114a_0 + 65a_1$$

For $n = 3$ the recurrence equation gives

$$120a_3 - 100a_4 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -390a_0 + 211a_1$$

For $n = 4$ the recurrence equation gives

$$180a_4 - 150a_5 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -1266a_0 + 665a_1$$

For $n = 5$ the recurrence equation gives

$$252a_5 - 210a_6 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -3990a_0 + 2059a_1$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$\begin{aligned} y = a_0 + a_1 x + (-6a_0 + 5a_1) x^2 + (-30a_0 + 19a_1) x^3 \\ + (-114a_0 + 65a_1) x^4 + (-390a_0 + 211a_1) x^5 + \dots \end{aligned}$$

Collecting terms, the solution becomes

$$y = \left(-390x^5 - 114x^4 - 30x^3 - 6x^2 + 1\right) a_0 + \left(211x^5 + 65x^4 + 19x^3 + 5x^2 + x\right) a_1 + O\left(x^6\right) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = (-390x^5 - 114x^4 - 30x^3 - 6x^2 + 1) c_1 + (211x^5 + 65x^4 + 19x^3 + 5x^2 + x) c_2 + O(x^6)$$

Summary

The solution(s) found are the following

$$y = (-1266x^6 - 390x^5 - 114x^4 - 30x^3 - 6x^2 + 1) y(0) + (665x^6 + 211x^5 + 65x^4 + 19x^3 + 5x^2 + x) y'(0) + O(x^6) \tag{1}$$

$$y = (-390x^5 - 114x^4 - 30x^3 - 6x^2 + 1) c_1 + (211x^5 + 65x^4 + 19x^3 + 5x^2 + x) c_2 + O(x^6) \tag{2}$$

Verification of solutions

$$y = (-1266x^6 - 390x^5 - 114x^4 - 30x^3 - 6x^2 + 1) y(0) + (665x^6 + 211x^5 + 65x^4 + 19x^3 + 5x^2 + x) y'(0) + O(x^6)$$

Verified OK.

$$y = (-390x^5 - 114x^4 - 30x^3 - 6x^2 + 1) c_1 + (211x^5 + 65x^4 + 19x^3 + 5x^2 + x) c_2 + O(x^6)$$

Verified OK.

13.28.1 Maple step by step solution

Let's solve

$(6x^2 - 5x + 1) y'' + (24x - 10) y' + 12y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{12y}{6x^2-5x+1} - \frac{2(12x-5)y'}{6x^2-5x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{2(12x-5)y'}{6x^2-5x+1} + \frac{12y}{6x^2-5x+1} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{2(12x-5)}{6x^2-5x+1}, P_3(x) = \frac{12}{6x^2-5x+1}\right]$

  ◦ $\left(x - \frac{1}{2}\right) \cdot P_2(x)$ is analytic at $x = \frac{1}{2}$

$$\left(\left(x-\frac{1}{2}\right)\cdot P_2(x)\right)\bigg|_{x=\frac{1}{2}}=2$$

- $\left(x-\frac{1}{2}\right)^2\cdot P_3(x)$ is analytic at $x=\frac{1}{2}$

  $$\left(\left(x-\frac{1}{2}\right)^2\cdot P_3(x)\right)\bigg|_{x=\frac{1}{2}}=0$$

- $x=\frac{1}{2}$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=\frac{1}{2}$

- Multiply by denominators

  $$\left(6x^2-5x+1\right)y''+\left(24x-10\right)y'+12y=0$$

- Change variables using $x=u+\frac{1}{2}$ so that the regular singular point is at $u=0$

  $$\left(6u^2+u\right)\left(\frac{d^2}{du^2}y(u)\right)+\left(24u+2\right)\left(\frac{d}{du}y(u)\right)+12y(u)=0$$

- Assume series solution for $y(u)$

  $$y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..1$

  $$u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,u^{k+r-1+m}$$

- Shift index using $k->k+1-m$

  $$u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,u^{k+r}$$

- Convert $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m=1..2$

  $$u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,(k+r-1)\,u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

  $$u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=-2+m}^{\infty}a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0r(1+r)\,u^{-1+r}+\left(\sum_{k=0}^{\infty}\left(a_{k+1}(k+r+1)\,(k+r+2)+6a_k(k+r+2)\,(k+r+1)\right)u^{k+r}\right)=0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $r(1+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \{-1, 0\}$

- Each term in the series must be 0, giving the recursion relation

  $(k+r+2)(k+r+1)(a_{k+1}+6a_k) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+1} = -6a_k$

- Recursion relation for $r = -1$

  $a_{k+1} = -6a_k$

- Solution for $r = -1$

  $$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-1}, a_{k+1} = -6a_k\right]$$

- Revert the change of variables $u = x - \frac{1}{2}$

  $$\left[y = \sum_{k=0}^{\infty} a_k \left(x - \frac{1}{2}\right)^{k-1}, a_{k+1} = -6a_k\right]$$

- Recursion relation for $r = 0$

  $a_{k+1} = -6a_k$

- Solution for $r = 0$

  $$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k}, a_{k+1} = -6a_k\right]$$

- Revert the change of variables $u = x - \frac{1}{2}$

  $$\left[y = \sum_{k=0}^{\infty} a_k \left(x - \frac{1}{2}\right)^{k}, a_{k+1} = -6a_k\right]$$

- Combine solutions and rename parameters

  $$\left[y = \left(\sum_{k=0}^{\infty} a_k \left(x - \frac{1}{2}\right)^{k-1}\right) + \left(\sum_{k=0}^{\infty} b_k \left(x - \frac{1}{2}\right)^{k}\right), a_{1+k} = -6a_k, b_{1+k} = -6b_k\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 31(c).
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second_order_change_of_variable_on_x_method_2", "second_order_change_of_variable_on_y_method_1", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{\left(4x^2-4x+1\right) y''-(8-16x)\, y'+8y=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using

Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0, y_0, y_0'} + \frac{x^3}{3!} f'|_{x_0, y_0, y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left. \frac{d^n f}{dx^n} \right|_{x_0, y_0, y_0'}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (1013) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (1014) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{8(2y'x-y'+y)}{(2x-1)^2} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x}+\frac{\partial F_0}{\partial y}y'+\frac{\partial F_0}{\partial y'}F_0 \\
&= \frac{(144x-72)\,y'+96y}{(2x-1)^3} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x}+\frac{\partial F_1}{\partial y}y'+\frac{\partial F_1}{\partial y'}F_1 \\
&= \frac{(-1536x+768)\,y'-1152y}{(2x-1)^4} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x}+\frac{\partial F_2}{\partial y}y'+\frac{\partial F_2}{\partial y'}F_2 \\
&= \frac{(19200x-9600)\,y'+15360y}{(2x-1)^5} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x}+\frac{\partial F_3}{\partial y}y'+\frac{\partial F_3}{\partial y'}F_3 \\
&= \frac{(-276480x+138240)\,y'-230400y}{(2x-1)^6}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=y(0)$ and $y'(0)=y'(0)$ gives

$$
\begin{aligned}
F_0 &= -8y(0)+8y'(0) \\
F_1 &= -96y(0)+72y'(0) \\
F_2 &= -1152y(0)+768y'(0) \\
F_3 &= -15360y(0)+9600y'(0) \\
F_4 &= -230400y(0)+138240y'(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
\begin{aligned}
y = &\left(-320x^6-128x^5-48x^4-16x^3-4x^2+1\right)y(0) \\
&+\left(192x^6+80x^5+32x^4+12x^3+4x^2+x\right)y'(0)+O\left(x^6\right)
\end{aligned}
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(4x^2 - 4x + 1)\, y'' + (16x - 8)\, y' + 8y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(4x^2 - 4x + 1) \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + (16x - 8) \left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) + 8\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 4x^n a_n n(n-1)\right) + \sum_{n=2}^{\infty} \left(-4n\, x^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) \tag{2}$$
$$+ \left(\sum_{n=1}^{\infty} 16 n a_n x^n\right) + \sum_{n=1}^{\infty} \left(-8 n a_n x^{n-1}\right) + \left(\sum_{n=0}^{\infty} 8 a_n x^n\right) = 0$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} \left(-4n\, x^{n-1} a_n (n-1)\right) = \sum_{n=1}^{\infty} \left(-4(n+1)\, a_{n+1} n\, x^n\right)$$
$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2} (n+1)\, x^n$$
$$\sum_{n=1}^{\infty} \left(-8 n a_n x^{n-1}\right) = \sum_{n=0}^{\infty} \left(-8(n+1)\, a_{n+1} x^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} 4x^n a_n n(n-1)\right) + \sum_{n=1}^{\infty} \left(-4(n+1) a_{n+1} n\, x^n\right) + \left(\sum_{n=0}^{\infty} (n+2) a_{n+2} (n+1) x^n\right) + \left(\sum_{n=1}^{\infty} 16 n a_n x^n\right) + \sum_{n=0}^{\infty} \left(-8(n+1) a_{n+1} x^n\right) + \left(\sum_{n=0}^{\infty} 8 a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 - 8a_1 + 8a_0 = 0$$

$$a_2 = -4a_0 + 4a_1$$

$n = 1$ gives

$$-24a_2 + 6a_3 + 24a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -16a_0 + 12a_1$$

For $2 \leq n$, the recurrence equation is

$$4na_n(n-1) - 4(n+1) a_{n+1} n + (n+2) a_{n+2}(n+1) + 16na_n - 8(n+1) a_{n+1} + 8a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -4a_n + 4a_{n+1} \\ &= -4a_n + 4a_{n+1} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$48a_2 - 48a_3 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -48a_0 + 32a_1$$

For $n = 3$ the recurrence equation gives

$$80a_3 - 80a_4 + 20a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -128a_0 + 80a_1$$

For $n = 4$ the recurrence equation gives

$$120a_4 - 120a_5 + 30a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -320a_0 + 192a_1$$

For $n = 5$ the recurrence equation gives

$$168a_5 - 168a_6 + 42a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -768a_0 + 448a_1$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$\begin{aligned} y = a_0 + a_1 x + (-4a_0 + 4a_1) x^2 + (-16a_0 + 12a_1) x^3 \\ + (-48a_0 + 32a_1) x^4 + (-128a_0 + 80a_1) x^5 + \dots \end{aligned}$$

Collecting terms, the solution becomes

$$y = \left(-128x^5 - 48x^4 - 16x^3 - 4x^2 + 1\right) a_0 + \left(80x^5 + 32x^4 + 12x^3 + 4x^2 + x\right) a_1 + O\left(x^6\right) \quad (3)$$

At $x=0$ the solution above becomes

$$y = \left(-128x^5-48x^4-16x^3-4x^2+1\right) c_1+\left(80x^5+32x^4+12x^3+4x^2+x\right) c_2+O\left(x^6\right)$$

Summary

The solution(s) found are the following

$$y = \left(-320x^6-128x^5-48x^4-16x^3-4x^2+1\right) y(0) + \left(192x^6+80x^5+32x^4+12x^3+4x^2+x\right) y'(0)+O\left(x^6\right) \tag{1}$$

$$y = \left(-128x^5-48x^4-16x^3-4x^2+1\right) c_1+\left(80x^5+32x^4+12x^3+4x^2+x\right) c_2+O\left(x^6\right) \tag{2}$$

Verification of solutions

$$y = \left(-320x^6-128x^5-48x^4-16x^3-4x^2+1\right) y(0) + \left(192x^6+80x^5+32x^4+12x^3+4x^2+x\right) y'(0)+O\left(x^6\right)$$

Verified OK.

$$y = \left(-128x^5-48x^4-16x^3-4x^2+1\right) c_1+\left(80x^5+32x^4+12x^3+4x^2+x\right) c_2+O\left(x^6\right)$$

Verified OK.

13.29.1 Maple step by step solution

Let's solve

  $\left(\left(x-\frac{1}{2}\right)^2\cdot P_3(x)\right)\bigg|_{x=\frac{1}{2}} = 2$

- $x=\frac{1}{2}$is a regular singular point

  Check to see if $x_0=\frac{1}{2}$ is a regular singular point

  $x_0=\frac{1}{2}$

- Multiply by denominators

  $$(2x-1)\,y''(4x^2-4x+1)+(32x^2-32x+8)\,y'+(16x-8)\,y=0$$

- Change variables using $x=u+\frac{1}{2}$ so that the regular singular point is at $u=0$

  $$8u^3\left(\frac{d^2}{du^2}y(u)\right)+32u^2\left(\frac{d}{du}y(u)\right)+16uy(u)=0$$

- Assume series solution for $y(u)$

  $$y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$$

☐ Rewrite DE with series expansions

- Convert $u\cdot y(u)$ to series expansion

  $$u\cdot y(u)=\sum_{k=0}^{\infty}a_k u^{k+r+1}$$

- Shift index using $k->k-1$

  $$u\cdot y(u)=\sum_{k=1}^{\infty}a_{k-1}u^{k+r}$$

- Convert $u^2\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion

  $$u^2\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,u^{k+r+1}$$

- Shift index using $k->k-1$

  $$u^2\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=1}^{\infty}a_{k-1}(k-1+r)\,u^{k+r}$$

- Convert $u^3\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

  $$u^3\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,(k-1+r)\,u^{k+r+1}$$

- Shift index using $k->k-1$

$$u^3 \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=1}^{\infty} a_{k-1}(k-1+r)(k-2+r)\, u^{k+r}$$

Rewrite DE with series expansions

$$\sum_{k=1}^{\infty} 8a_{k-1}(k+r+1)(k+r)\, u^{k+r} = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$r = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$8a_{k-1}(k+1)\, k = 0$$

- Shift index using $k- >k+1$

  $$8a_k(k+2)(k+1) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_k = 0$$

- Recursion relation for $r = 0$

  $$a_k = 0$$

- Solution for $r = 0$

  $$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_k = 0\right]$$

- Revert the change of variables $u = x - \frac{1}{2}$

  $$\left[y = \sum_{k=0}^{\infty} a_k \left(x - \frac{1}{2}\right)^k, a_k = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 31(d).
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second_order_change_of_variable_on_x_method_1", "second_order_change_of_variable_on_x_method_2", "second_order_change_of_variable_on_y_method_1", "linear_second_order_ode_solved_by_an_integrating_factor", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{(x^2+4x+4)\,y''+(8+4x)\,y'+2y=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using

Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0,y_0,y_0'} + \frac{x^3}{3!} f'|_{x_0,y_0,y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left.\frac{d^n f}{dx^n}\right|_{x_0,y_0,y_0'}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (1016) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (1017) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2(2y'x+4y'+y)}{(2+x)^2} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{(18x+36)\, y' + 12y}{(2+x)^3} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(-96x-192)\, y' - 72y}{(2+x)^4} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{600(2+x)\, y' + 480y}{(2+x)^5} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-4320x-8640)\, y' - 3600y}{(2+x)^6}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=y(0)$ and $y'(0)=y'(0)$ gives

$$
\begin{aligned}
F_0 &= -\frac{y(0)}{2} - 2y'(0) \\
F_1 &= \frac{3y(0)}{2} + \frac{9y'(0)}{2} \\
F_2 &= -\frac{9y(0)}{2} - 12y'(0) \\
F_3 &= 15y(0) + \frac{75y'(0)}{2} \\
F_4 &= -\frac{225y(0)}{4} - 135y'(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$\begin{aligned} y = &\left(1-\frac{1}{4}x^{2}+\frac{1}{4}x^{3}-\frac{3}{16}x^{4}+\frac{1}{8}x^{5}-\frac{5}{64}x^{6}\right) y(0) \\ &+\left(x-x^{2}+\frac{3}{4}x^{3}-\frac{1}{2}x^{4}+\frac{5}{16}x^{5}-\frac{3}{16}x^{6}\right) y'(0)+O\left(x^{6}\right) \end{aligned}$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(x^{2}+4x+4\right) y''+\left(8+4x\right) y'+2y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_{n} x^{n}$$

Then

$$\begin{aligned} y' &= \sum_{n=1}^{\infty} n a_{n} x^{n-1} \\ y'' &= \sum_{n=2}^{\infty} n \left(n-1\right) a_{n} x^{n-2} \end{aligned}$$

Substituting the above back into the ode gives

$$\left(x^{2}+4x+4\right) \left(\sum_{n=2}^{\infty} n \left(n-1\right) a_{n} x^{n-2}\right)+\left(8+4x\right) \left(\sum_{n=1}^{\infty} n a_{n} x^{n-1}\right)+2\left(\sum_{n=0}^{\infty} a_{n} x^{n}\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned} &\left(\sum_{n=2}^{\infty} x^{n} a_{n} n \left(n-1\right)\right)+\left(\sum_{n=2}^{\infty} 4n\, x^{n-1} a_{n} \left(n-1\right)\right)+\left(\sum_{n=2}^{\infty} 4n \left(n-1\right) a_{n} x^{n-2}\right) \\ &+\left(\sum_{n=1}^{\infty} 8n a_{n} x^{n-1}\right)+\left(\sum_{n=1}^{\infty} 4n a_{n} x^{n}\right)+\left(\sum_{n=0}^{\infty} 2a_{n} x^{n}\right) = 0 \end{aligned} \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^{n} and adjusting the

power and the corresponding index gives

$$\sum_{n=2}^{\infty} 4n\, x^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} 4(n+1)\, a_{n+1} n\, x^n$$

$$\sum_{n=2}^{\infty} 4n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} 4(n+2)\, a_{n+2}(n+1)\, x^n$$

$$\sum_{n=1}^{\infty} 8n a_n x^{n-1} = \sum_{n=0}^{\infty} 8(n+1)\, a_{n+1} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} x^n a_n n(n-1)\right) + \left(\sum_{n=1}^{\infty} 4(n+1)\, a_{n+1} n\, x^n\right) + \left(\sum_{n=0}^{\infty} 4(n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=0}^{\infty} 8(n+1)\, a_{n+1} x^n\right) + \left(\sum_{n=1}^{\infty} 4n a_n x^n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$8a_2 + 8a_1 + 2a_0 = 0$$

$$a_2 = -\frac{a_0}{4} - a_1$$

$n = 1$ gives

$$24a_2 + 24a_3 + 6a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{a_0}{4} + \frac{3a_1}{4}$$

For $2 \leq n$, the recurrence equation is

$$n a_n (n-1) + 4(n+1)\, a_{n+1} n + 4(n+2)\, a_{n+2}(n+1) + 8(n+1)\, a_{n+1} + 4n a_n + 2a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$
\begin{aligned}
a_{n+2} &= -\frac{a_n}{4} - a_{n+1} \\
&= -\frac{a_n}{4} - a_{n+1}
\end{aligned} \tag{5}
$$

For $n = 2$ the recurrence equation gives

$$12a_2 + 48a_3 + 48a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{3a_0}{16} - \frac{a_1}{2}$$

For $n = 3$ the recurrence equation gives

$$20a_3 + 80a_4 + 80a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_0}{8} + \frac{5a_1}{16}$$

For $n = 4$ the recurrence equation gives

$$30a_4 + 120a_5 + 120a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{5a_0}{64} - \frac{3a_1}{16}$$

For $n = 5$ the recurrence equation gives

$$42a_5 + 168a_6 + 168a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{3a_0}{64} + \frac{7a_1}{64}$$

And so on. Therefore the solution is

$$
\begin{aligned}
y &= \sum_{n=0}^{\infty} a_n x^n \\
&= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots
\end{aligned}
$$

Substituting the values for a_n found above, the solution becomes

$$
y = a_0 + a_1 x + \left(-\frac{a_0}{4} - a_1\right) x^2 + \left(\frac{a_0}{4} + \frac{3a_1}{4}\right) x^3 + \left(-\frac{3a_0}{16} - \frac{a_1}{2}\right) x^4 + \left(\frac{a_0}{8} + \frac{5a_1}{16}\right) x^5 + \dots
$$

Collecting terms, the solution becomes

$$
y = \left(1 - \frac{1}{4}x^2 + \frac{1}{4}x^3 - \frac{3}{16}x^4 + \frac{1}{8}x^5\right) a_0 + \left(x - x^2 + \frac{3}{4}x^3 - \frac{1}{2}x^4 + \frac{5}{16}x^5\right) a_1 + O(x^6) \quad (3)
$$

At $x = 0$ the solution above becomes

$$
y = \left(1 - \frac{1}{4}x^2 + \frac{1}{4}x^3 - \frac{3}{16}x^4 + \frac{1}{8}x^5\right) c_1 + \left(x - x^2 + \frac{3}{4}x^3 - \frac{1}{2}x^4 + \frac{5}{16}x^5\right) c_2 + O(x^6)
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = {} & \left(1 - \frac{1}{4}x^2 + \frac{1}{4}x^3 - \frac{3}{16}x^4 + \frac{1}{8}x^5 - \frac{5}{64}x^6\right) y(0) \\
& + \left(x - x^2 + \frac{3}{4}x^3 - \frac{1}{2}x^4 + \frac{5}{16}x^5 - \frac{3}{16}x^6\right) y'(0) + O(x^6)
\end{aligned} \quad (1)
$$

$$
y = \left(1 - \frac{1}{4}x^2 + \frac{1}{4}x^3 - \frac{3}{16}x^4 + \frac{1}{8}x^5\right) c_1 + \left(x - x^2 + \frac{3}{4}x^3 - \frac{1}{2}x^4 + \frac{5}{16}x^5\right) c_2 + O(x^6) \quad (2)
$$

Verification of solutions

$$
\begin{aligned}
y = {} & \left(1 - \frac{1}{4}x^2 + \frac{1}{4}x^3 - \frac{3}{16}x^4 + \frac{1}{8}x^5 - \frac{5}{64}x^6\right) y(0) \\
& + \left(x - x^2 + \frac{3}{4}x^3 - \frac{1}{2}x^4 + \frac{5}{16}x^5 - \frac{3}{16}x^6\right) y'(0) + O(x^6)
\end{aligned}
$$

Verified OK.

$$
y = \left(1 - \frac{1}{4}x^2 + \frac{1}{4}x^3 - \frac{3}{16}x^4 + \frac{1}{8}x^5\right) c_1 + \left(x - x^2 + \frac{3}{4}x^3 - \frac{1}{2}x^4 + \frac{5}{16}x^5\right) c_2 + O(x^6)
$$

Verified OK.

13.30.1 Maple step by step solution

Let's solve

$(x^2+4x+4)\, y''+(8+4x)\, y'+2y=0$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y''=-\frac{2y}{x^2+4x+4}-\frac{4y'}{2+x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''+\frac{4y'}{2+x}+\frac{2y}{x^2+4x+4}=0$

□ Check to see if $x_0=-2$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{4}{2+x}, P_3(x)=\frac{2}{x^2+4x+4}\right]$

  ◦ $(2+x)\cdot P_2(x)$ is analytic at $x=-2$

  $\left((2+x)\cdot P_2(x)\right)\bigg|_{x=-2}=4$

  ◦ $(2+x)^2\cdot P_3(x)$ is analytic at $x=-2$

  $\left((2+x)^2\cdot P_3(x)\right)\bigg|_{x=-2}=2$

  ◦ $x=-2$is a regular singular point

  Check to see if $x_0=-2$ is a regular singular point

  $x_0=-2$

- Multiply by denominators

$(2+x)\, y''(x^2+4x+4)+(4x^2+16x+16)\, y'+(2x+4)\, y=0$

- Change variables using $x=u-2$ so that the regular singular point is at $u=0$

$u^3\left(\frac{d^2}{du^2}y(u)\right)+4u^2\left(\frac{d}{du}y(u)\right)+2uy(u)=0$

- Assume series solution for $y(u)$

$y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite DE with series expansions

  ◦ Convert $u\cdot y(u)$ to series expansion

$$u \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+1}$$

- Shift index using $k- >k - 1$

$$u \cdot y(u) = \sum_{k=1}^{\infty} a_{k-1} u^{k+r}$$

- Convert $u^2 \cdot \left(\frac{d}{du} y(u)\right)$ to series expansion

$$u^2 \cdot \left(\frac{d}{du} y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\, u^{k+r+1}$$

- Shift index using $k- >k - 1$

$$u^2 \cdot \left(\frac{d}{du} y(u)\right) = \sum_{k=1}^{\infty} a_{k-1} (k-1+r)\, u^{k+r}$$

- Convert $u^3 \cdot \left(\frac{d^2}{du^2} y(u)\right)$ to series expansion

$$u^3 \cdot \left(\frac{d^2}{du^2} y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\,(k-1+r)\, u^{k+r+1}$$

- Shift index using $k- >k - 1$

$$u^3 \cdot \left(\frac{d^2}{du^2} y(u)\right) = \sum_{k=1}^{\infty} a_{k-1} (k-1+r)\,(k-2+r)\, u^{k+r}$$

Rewrite DE with series expansions

$$\sum_{k=1}^{\infty} a_{k-1} (k+r+1)\,(k+r)\, u^{k+r} = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$r = 0$$

- Each term in the series must be 0, giving the recursion relation

$$a_{k-1}(k+1)\, k = 0$$

- Shift index using $k- >k + 1$

$$a_k (k+2)\,(k+1) = 0$$

- Recursion relation that defines series solution to ODE

$$a_k = 0$$

- Recursion relation for $r = 0$

$$a_k = 0$$

- Solution for $r = 0$

$$\left[y(u)=\sum_{k=0}^{\infty} a_k u^k, a_k=0\right]$$

- Revert the change of variables $u=2+x$

$$\left[y=\sum_{k=0}^{\infty} a_k (2+x)^k, a_k=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 31(e).
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact linear second order ode", "second_order_integrable_as_is", "second order series method. Ordinary point", "second_order_change_of_variable_on_y_method_1", "linear_second_order_ode_solved_by_an_integrating_factor", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{\left(3x^2+8x+4\right)y''+(16+12x)\,y'+6y=0}$$

With the expansion point for the power series method at $x=0$.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0)=y_0$ and $y'(x_0)=y'_0$. Using

Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0,y_0,y_0'} + \frac{x^3}{3!} f'|_{x_0,y_0,y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \left.\frac{d^n f}{dx^n}\right|_{x_0,y_0,y_0'}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (1019) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (1020) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{2(6y'x+8y'+3y)}{3x^2+8x+4}\\
F_1 &= \frac{dF_0}{dx}\\
&= \frac{\partial F_0}{\partial x}+\frac{\partial F_0}{\partial y}y'+\frac{\partial F_0}{\partial y'}F_0\\
&= \frac{(162x^2+432x+312)\,y'+(108x+144)\,y}{(3x^2+8x+4)^2}\\
F_2 &= \frac{dF_1}{dx}\\
&= \frac{\partial F_1}{\partial x}+\frac{\partial F_1}{\partial y}y'+\frac{\partial F_1}{\partial y'}F_1\\
&= \frac{(-2592x^3-10368x^2-14976x-7680)\,y'-1944\left(x^2+\frac{8}{3}x+\frac{52}{27}\right)y}{(3x^2+8x+4)^3}\\
F_3 &= \frac{dF_2}{dx}\\
&= \frac{\partial F_2}{\partial x}+\frac{\partial F_2}{\partial y}y'+\frac{\partial F_2}{\partial y'}F_2\\
&= \frac{(48600x^4+259200x^3+561600x^2+576000x+232320)\,y'+38880\left(\frac{4}{3}+x\right)\left(x^2+\frac{8}{3}x+\frac{20}{9}\right)y}{(3x^2+8x+4)^4}\\
F_4 &= \frac{dF_3}{dx}\\
&= \frac{\partial F_3}{\partial x}+\frac{\partial F_3}{\partial y}y'+\frac{\partial F_3}{\partial y'}F_3\\
&= \frac{-1049760\left(x^2+\frac{8}{3}x+\frac{52}{27}\right)\left(\frac{4}{3}+x\right)\left(x^2+\frac{8}{3}x+\frac{28}{9}\right)y'-874800\left(x^4+\frac{16}{3}x^3+\frac{104}{9}x^2+\frac{320}{27}x+\frac{1936}{405}\right)y}{(3x^2+8x+4)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=y(0)$ and $y'(0)=y'(0)$ gives

$$
\begin{aligned}
F_0 &= -\frac{3y(0)}{2}-4y'(0)\\
F_1 &= 9y(0)+\frac{39y'(0)}{2}\\
F_2 &= -\frac{117y(0)}{2}-120y'(0)\\
F_3 &= 450y(0)+\frac{1815y'(0)}{2}\\
F_4 &= -\frac{16335y(0)}{4}-8190y'(0)
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y = \left(1 - \frac{3}{4}x^2 + \frac{3}{2}x^3 - \frac{39}{16}x^4 + \frac{15}{4}x^5 - \frac{363}{64}x^6\right) y(0) + \left(x - 2x^2 + \frac{13}{4}x^3 - 5x^4 + \frac{121}{16}x^5 - \frac{91}{8}x^6\right) y'(0) + O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(3x^2 + 8x + 4) y'' + (16 + 12x) y' + 6y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(3x^2 + 8x + 4) \left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + (16 + 12x) \left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) + 6\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 3x^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} 8n\, x^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} 4n(n-1) a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 16 n a_n x^{n-1}\right) + \left(\sum_{n=1}^{\infty} 12 n a_n x^n\right) + \left(\sum_{n=0}^{\infty} 6 a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the

power and the corresponding index gives

$$\sum_{n=2}^{\infty} 8n\, x^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} 8(n+1)\, a_{n+1} n\, x^n$$

$$\sum_{n=2}^{\infty} 4n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} 4(n+2)\, a_{n+2}(n+1)\, x^n$$

$$\sum_{n=1}^{\infty} 16n a_n x^{n-1} = \sum_{n=0}^{\infty} 16(n+1)\, a_{n+1} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\begin{aligned}&\left(\sum_{n=2}^{\infty} 3x^n a_n n(n-1)\right) + \left(\sum_{n=1}^{\infty} 8(n+1)\, a_{n+1} n\, x^n\right) \\ &+ \left(\sum_{n=0}^{\infty} 4(n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=0}^{\infty} 16(n+1)\, a_{n+1} x^n\right) \\ &+ \left(\sum_{n=1}^{\infty} 12n a_n x^n\right) + \left(\sum_{n=0}^{\infty} 6a_n x^n\right) = 0\end{aligned} \tag{3}$$

$n = 0$ gives

$$8a_2 + 16a_1 + 6a_0 = 0$$

$$a_2 = -\frac{3a_0}{4} - 2a_1$$

$n = 1$ gives

$$48a_2 + 24a_3 + 18a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{3a_0}{2} + \frac{13a_1}{4}$$

For $2 \le n$, the recurrence equation is

$$3na_n(n-1) + 8(n+1)\, a_{n+1} n + 4(n+2)\, a_{n+2}(n+1) + 16(n+1)\, a_{n+1} + 12na_n + 6a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$
\begin{aligned}
a_{n+2} &= -\frac{3a_n}{4} - 2a_{n+1} \\
&= -\frac{3a_n}{4} - 2a_{n+1}
\end{aligned} \tag{5}
$$

For $n = 2$ the recurrence equation gives

$$36a_2 + 96a_3 + 48a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{39a_0}{16} - 5a_1$$

For $n = 3$ the recurrence equation gives

$$60a_3 + 160a_4 + 80a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{15a_0}{4} + \frac{121a_1}{16}$$

For $n = 4$ the recurrence equation gives

$$90a_4 + 240a_5 + 120a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{363a_0}{64} - \frac{91a_1}{8}$$

For $n = 5$ the recurrence equation gives

$$126a_5 + 336a_6 + 168a_7 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{273a_0}{32} + \frac{1093a_1}{64}$$

And so on. Therefore the solution is

$$
\begin{aligned}
y &= \sum_{n=0}^{\infty} a_n x^n \\
&= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots
\end{aligned}
$$

Substituting the values for a_n found above, the solution becomes

$$
\begin{aligned}
y = a_0 + a_1 x + \left(-\frac{3a_0}{4} - 2a_1\right) x^2 + \left(\frac{3a_0}{2} + \frac{13a_1}{4}\right) x^3 \\
+ \left(-\frac{39a_0}{16} - 5a_1\right) x^4 + \left(\frac{15a_0}{4} + \frac{121a_1}{16}\right) x^5 + \dots
\end{aligned}
$$

Collecting terms, the solution becomes

$$
y = \left(1 - \frac{3}{4}x^2 + \frac{3}{2}x^3 - \frac{39}{16}x^4 + \frac{15}{4}x^5\right) a_0 + \left(x - 2x^2 + \frac{13}{4}x^3 - 5x^4 + \frac{121}{16}x^5\right) a_1 + O(x^6) \tag{3}
$$

At $x = 0$ the solution above becomes

$$
y = \left(1 - \frac{3}{4}x^2 + \frac{3}{2}x^3 - \frac{39}{16}x^4 + \frac{15}{4}x^5\right) c_1 + \left(x - 2x^2 + \frac{13}{4}x^3 - 5x^4 + \frac{121}{16}x^5\right) c_2 + O(x^6)
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = \left(1 - \frac{3}{4}x^2 + \frac{3}{2}x^3 - \frac{39}{16}x^4 + \frac{15}{4}x^5 - \frac{363}{64}x^6\right) y(0) \\
+ \left(x - 2x^2 + \frac{13}{4}x^3 - 5x^4 + \frac{121}{16}x^5 - \frac{91}{8}x^6\right) y'(0) + O(x^6)
\end{aligned} \tag{1}
$$

$$
y = \left(1 - \frac{3}{4}x^2 + \frac{3}{2}x^3 - \frac{39}{16}x^4 + \frac{15}{4}x^5\right) c_1 + \left(x - 2x^2 + \frac{13}{4}x^3 - 5x^4 + \frac{121}{16}x^5\right) c_2 + O(x^6) \tag{2}
$$

Verification of solutions

$$y = \left(1-\frac{3}{4}x^{2}+\frac{3}{2}x^{3}-\frac{39}{16}x^{4}+\frac{15}{4}x^{5}-\frac{363}{64}x^{6}\right)y(0) + \left(x-2x^{2}+\frac{13}{4}x^{3}-5x^{4}+\frac{121}{16}x^{5}-\frac{91}{8}x^{6}\right)y'(0)+O\left(x^{6}\right)$$

Verified OK.

$$y = \left(1-\frac{3}{4}x^{2}+\frac{3}{2}x^{3}-\frac{39}{16}x^{4}+\frac{15}{4}x^{5}\right)c_{1}+\left(x-2x^{2}+\frac{13}{4}x^{3}-5x^{4}+\frac{121}{16}x^{5}\right)c_{2}+O\left(x^{6}\right)$$

Verified OK.

13.31.1 Maple step by step solution

Let's solve

$(3x^{2}+8x+4)\,y''+(16+12x)\,y'+6y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{6y}{3x^{2}+8x+4}-\frac{4(3x+4)y'}{3x^{2}+8x+4}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{4(3x+4)y'}{3x^{2}+8x+4}+\frac{6y}{3x^{2}+8x+4}=0$

□ Check to see if x_0 is a regular singular point

  ○ Define functions

    $\left[P_{2}(x)=\frac{4(3x+4)}{3x^{2}+8x+4}, P_{3}(x)=\frac{6}{3x^{2}+8x+4}\right]$

  ○ $(2+x)\cdot P_{2}(x)$ is analytic at $x=-2$

    $\left((2+x)\cdot P_{2}(x)\right)\Big|_{x=-2}=2$

  ○ $(2+x)^{2}\cdot P_{3}(x)$ is analytic at $x=-2$

    $\left((2+x)^{2}\cdot P_{3}(x)\right)\Big|_{x=-2}=0$

  ○ $x=-2$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-2$

- Multiply by denominators

  $\left(3x^2+8x+4\right)y''+\left(16+12x\right)y'+6y=0$

- Change variables using $x=u-2$ so that the regular singular point is at $u=0$

  $\left(3u^2-4u\right)\left(\frac{d^2}{du^2}y(u)\right)+\left(-8+12u\right)\left(\frac{d}{du}y(u)\right)+6y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..1$

    $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,u^{k+r-1+m}$

  - Shift index using $k->k+1-m$

    $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,u^{k+r}$

  - Convert $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m=1..2$

    $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,(k+r-1)\,u^{k+r-2+m}$

  - Shift index using $k->k+2-m$

    $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=-2+m}^{\infty}a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$

  Rewrite ODE with series expansions

  $-4a_0r(1+r)\,u^{-1+r}+\left(\sum_{k=0}^{\infty}\left(-4a_{k+1}(k+r+1)\,(k+r+2)+3a_k(k+r+2)\,(k+r+1)\right)u^{k+r}\right)$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-4r(1+r)=0$

- Values of r that satisfy the indicial equation

  $r\in\{-1,0\}$

- Each term in the series must be 0, giving the recursion relation

  $(k+r+2)\,(k+r+1)\,(-4a_{k+1}+3a_k)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+1}=\frac{3a_k}{4}$

- Recursion relation for $r = -1$

  $a_{k+1} = \frac{3a_k}{4}$
- Solution for $r = -1$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-1}, a_{k+1} = \frac{3a_k}{4}\right]$
- Revert the change of variables $u = 2 + x$

  $\left[y = \sum_{k=0}^{\infty} a_k (2+x)^{k-1}, a_{k+1} = \frac{3a_k}{4}\right]$
- Recursion relation for $r = 0$

  $a_{k+1} = \frac{3a_k}{4}$
- Solution for $r = 0$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k}, a_{k+1} = \frac{3a_k}{4}\right]$
- Revert the change of variables $u = 2 + x$

  $\left[y = \sum_{k=0}^{\infty} a_k (2+x)^{k}, a_{k+1} = \frac{3a_k}{4}\right]$
- Combine solutions and rename parameters

  $\left[y = \left(\sum_{k=0}^{\infty} a_k (2+x)^{k-1}\right) + \left(\sum_{k=0}^{\infty} b_k (2+x)^{k}\right), a_{1+k} = \frac{3a_k}{4}, b_{1+k} = \frac{3b_k}{4}\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 32.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' + 2y'x + (2x^2 + 3)\, y = 0}$$

With initial conditions

$$[y(0) = 1, y'(0) = -2]$$

With the expansion point for the power series method at $x = 0$.

13.32.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= 2x \\ q(x) &= 2x^2 + 3 \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + 2y'x + (2x^2 + 3)\, y = 0$$

The domain of $p(x) = 2x$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = 2x^2 + 3$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y_0'$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0, y_0, y_0'} + \frac{x^3}{3!} f'|_{x_0, y_0, y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \left. \frac{d^n f}{dx^n} \right|_{x_0, y_0, y_0'}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{1022}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{1023}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') && (4)\\
F_1 &= \frac{df}{dx} \\
&= \frac{dF_0}{dx} \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right) \\
&= \frac{d}{dx}(F_1) \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0 \\
&\vdots \\
F_n &= \frac{d}{dx}(F_{n-1}) \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -2x^2y - 2y'x - 3y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \\
&= 4yx^3 + 2y'x^2 + 2yx - 5y' \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y}y' + \frac{\partial F_1}{\partial y'}F_1 \\
&= 16y'x - 4\left(x^4 - 4x^2 - \frac{17}{4}\right) y \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y}y' + \frac{\partial F_2}{\partial y'}F_2 \\
&= \left(-4x^4 - 16x^2 + 33\right) y' + \left(-48x^3 - 16x\right) y \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y}y' + \frac{\partial F_3}{\partial y'}F_3 \\
&= \left(8x^5 - 32x^3 - 114x\right) y' + 8y\left(x^6 + \frac{11}{2}x^4 - \frac{81}{4}x^2 - \frac{115}{8}\right)
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 1$ and $y'(0) = -2$ gives

$$
\begin{aligned}
F_0 &= -3 \\
F_1 &= 10 \\
F_2 &= 17 \\
F_3 &= -66 \\
F_4 &= -115
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = 1 - 2x - \frac{3x^2}{2} + \frac{5x^3}{3} + \frac{17x^4}{24} - \frac{11x^5}{20} - \frac{23x^6}{144} + O\left(x^6\right)
$$

$$
y = 1 - 2x - \frac{3x^2}{2} + \frac{5x^3}{3} + \frac{17x^4}{24} - \frac{11x^5}{20} - \frac{23x^6}{144} + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = -2x^2 \left(\sum_{n=0}^{\infty} a_n x^n\right) - 2\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x - 3\left(\sum_{n=0}^{\infty} a_n x^n\right) \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 2n\, x^n a_n\right) + \left(\sum_{n=0}^{\infty} 2x^{n+2} a_n\right) + \left(\sum_{n=0}^{\infty} 3a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n$$
$$\sum_{n=0}^{\infty} 2x^{n+2} a_n = \sum_{n=2}^{\infty} 2a_{n-2} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n\right) + \left(\sum_{n=1}^{\infty} 2n\, x^n a_n\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2} x^n\right) + \left(\sum_{n=0}^{\infty} 3a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 3a_0 = 0$$

$$a_2 = -\frac{3a_0}{2}$$

$n = 1$ gives

$$6a_3 + 5a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{5a_1}{6}$$

For $2 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) + 2na_n + 2a_{n-2} + 3a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{2na_n + 3a_n + 2a_{n-2}}{(n+2)\,(n+1)} \\ &= -\frac{(2n+3)\, a_n}{(n+2)\,(n+1)} - \frac{2a_{n-2}}{(n+2)\,(n+1)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$12a_4 + 7a_2 + 2a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{17a_0}{24}$$

For $n = 3$ the recurrence equation gives

$$20a_5 + 9a_3 + 2a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{11a_1}{40}$$

For $n = 4$ the recurrence equation gives

$$30a_6 + 11a_4 + 2a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{23a_0}{144}$$

For $n = 5$ the recurrence equation gives

$$42a_7 + 13a_5 + 2a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{229a_1}{5040}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - \frac{3}{2}a_0 x^2 - \frac{5}{6}a_1 x^3 + \frac{17}{24}a_0 x^4 + \frac{11}{40}a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{3}{2}x^2 + \frac{17}{24}x^4\right) a_0 + \left(x - \frac{5}{6}x^3 + \frac{11}{40}x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{3}{2}x^2 + \frac{17}{24}x^4\right) c_1 + \left(x - \frac{5}{6}x^3 + \frac{11}{40}x^5\right) c_2 + O(x^6)$$

$$y = 1 - \frac{3x^2}{2} + \frac{17x^4}{24} - 2x + \frac{5x^3}{3} - \frac{11x^5}{20} + O(x^6)$$

Summary
The solution(s) found are the following

$$y = 1 - 2x - \frac{3x^2}{2} + \frac{5x^3}{3} + \frac{17x^4}{24} - \frac{11x^5}{20} - \frac{23x^6}{144} + O(x^6) \tag{1}$$

$$y = 1 - \frac{3x^2}{2} + \frac{17x^4}{24} - 2x + \frac{5x^3}{3} - \frac{11x^5}{20} + O(x^6) \tag{2}$$

Verification of solutions

$$y = 1 - 2x - \frac{3x^2}{2} + \frac{5x^3}{3} + \frac{17x^4}{24} - \frac{11x^5}{20} - \frac{23x^6}{144} + O(x^6)$$

Verified OK.

$$y = 1 - \frac{3x^2}{2} + \frac{17x^4}{24} - 2x + \frac{5x^3}{3} - \frac{11x^5}{20} + O(x^6)$$

Verified OK.

13.32.2 Maple step by step solution

Let's solve

$$\left[y'' = -2x^2y - 2y'x - 3y, y(0) = 1, y'\Big|_{\{x=0\}} = -2\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = (-2x^2 - 3)\,y - 2y'x$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + 2y'x + (2x^2 + 3)\,y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=\max(0,-m)}^{\infty} a_k x^{k+m}$$

- Shift index using $k- >k-m$

$$x^m \cdot y = \sum_{k=\max(0,-m)+m}^{\infty} a_{k-m} x^k$$

- Convert $x \cdot y'$ to series expansion

$$x \cdot y' = \sum_{k=0}^{\infty} a_k k \, x^k$$

- Convert y'' to series expansion

$$y'' = \sum_{k=2}^{\infty} a_k k(k-1) \, x^{k-2}$$

- Shift index using $k- >k+2$

$$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)(k+1) \, x^k$$

Rewrite ODE with series expansions

$$2a_2 + 3a_0 + (6a_3 + 5a_1) x + \left(\sum_{k=2}^{\infty} (a_{k+2}(k+2)(k+1) + a_k(2k+3) + 2a_{k-2}) \, x^k\right) = 0$$

- The coefficients of each power of x must be 0

$$[2a_2 + 3a_0 = 0, 6a_3 + 5a_1 = 0]$$

- Solve for the dependent coefficient(s)

$$\left\{a_2 = -\frac{3a_0}{2}, a_3 = -\frac{5a_1}{6}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$(k^2 + 3k + 2) a_{k+2} + 2a_k k + 3a_k + 2a_{k-2} = 0$$

- Shift index using $k- >k+2$

$$\left((k+2)^2 + 3k + 8\right) a_{k+4} + 2a_{k+2}(k+2) + 3a_{k+2} + 2a_k = 0$$

- Recursion relation that defines the series solution to the ODE

$$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+4} = -\frac{2ka_{k+2} + 2a_k + 7a_{k+2}}{k^2 + 7k + 12}, a_2 = -\frac{3a_0}{2}, a_3 = -\frac{5a_1}{6}\right]$$

ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' - 3y'x + (2x^2 + 5)\, y = 0}$$

With initial conditions

$$[y(0) = 1, y'(0) = -2]$$

With the expansion point for the power series method at $x = 0$.

13.33.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= -3x \\ q(x) &= 2x^2 + 5 \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' - 3y'x + (2x^2 + 5)\, y = 0$$

The domain of $p(x) = -3x$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = 2x^2 + 5$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' && (1025)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (1026)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)\\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f && (3)\\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \qquad (7)$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -2x^2y + 3y'x - 5y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \\
&= -6yx^3 + 7y'x^2 - 19yx - 2y' \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y}y' + \frac{\partial F_1}{\partial y'}F_1 \\
&= \left(15x^3 - 11x\right)y' + \left(-14x^4 - 49x^2 - 9\right)y \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y}y' + \frac{\partial F_2}{\partial y'}F_2 \\
&= \left(31x^4 - 37x^2 - 20\right)y' + \left(-30x^5 - 109x^3 - 43x\right)y \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y}y' + \frac{\partial F_3}{\partial y'}F_3 \\
&= \left(63x^5 - 96x^3 - 177x\right)y' + \left(-62x^6 - 231x^4 - 102x^2 + 57\right)y
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=1$ and $y'(0)=-2$ gives

$$
\begin{aligned}
F_0 &= -5 \\
F_1 &= 4 \\
F_2 &= -9 \\
F_3 &= 40 \\
F_4 &= 57
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = 1 - 2x - \frac{5x^2}{2} + \frac{2x^3}{3} - \frac{3x^4}{8} + \frac{x^5}{3} + \frac{19x^6}{240} + O\left(x^6\right)
$$

$$
y = 1 - 2x - \frac{5x^2}{2} + \frac{2x^3}{3} - \frac{3x^4}{8} + \frac{x^5}{3} + \frac{19x^6}{240} + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = -2x^2 \left(\sum_{n=0}^{\infty} a_n x^n\right) + 3\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x - 5\left(\sum_{n=0}^{\infty} a_n x^n\right) \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + \sum_{n=1}^{\infty} (-3n\, x^n a_n) + \left(\sum_{n=0}^{\infty} 2x^{n+2} a_n\right) + \left(\sum_{n=0}^{\infty} 5a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n$$
$$\sum_{n=0}^{\infty} 2x^{n+2} a_n = \sum_{n=2}^{\infty} 2a_{n-2} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n\right) + \sum_{n=1}^{\infty} (-3n\, x^n a_n) + \left(\sum_{n=2}^{\infty} 2a_{n-2} x^n\right) + \left(\sum_{n=0}^{\infty} 5a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 5a_0 = 0$$

$$a_2 = -\frac{5a_0}{2}$$

$n = 1$ gives

$$6a_3 + 2a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{a_1}{3}$$

For $2 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) - 3na_n + 2a_{n-2} + 5a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= \frac{3na_n - 5a_n - 2a_{n-2}}{(n+2)\,(n+1)} \\ &= \frac{(3n-5)\, a_n}{(n+2)\,(n+1)} - \frac{2a_{n-2}}{(n+2)\,(n+1)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$12a_4 - a_2 + 2a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{3a_0}{8}$$

For $n = 3$ the recurrence equation gives

$$20a_5 - 4a_3 + 2a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{a_1}{6}$$

For $n = 4$ the recurrence equation gives

$$30a_6 - 7a_4 + 2a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{19a_0}{240}$$

For $n = 5$ the recurrence equation gives

$$42a_7 - 10a_5 + 2a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{a_1}{42}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - \frac{5}{2} a_0 x^2 - \frac{1}{3} a_1 x^3 - \frac{3}{8} a_0 x^4 - \frac{1}{6} a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{5}{2}x^2 - \frac{3}{8}x^4\right) a_0 + \left(x - \frac{1}{3}x^3 - \frac{1}{6}x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{5}{2}x^2 - \frac{3}{8}x^4\right) c_1 + \left(x - \frac{1}{3}x^3 - \frac{1}{6}x^5\right) c_2 + O(x^6)$$

$$y = 1 - \frac{5x^2}{2} - \frac{3x^4}{8} - 2x + \frac{2x^3}{3} + \frac{x^5}{3} + O\left(x^6\right)$$

Summary

The solution(s) found are the following

$$y = 1 - 2x - \frac{5x^2}{2} + \frac{2x^3}{3} - \frac{3x^4}{8} + \frac{x^5}{3} + \frac{19x^6}{240} + O\left(x^6\right) \tag{1}$$

$$y = 1 - \frac{5x^2}{2} - \frac{3x^4}{8} - 2x + \frac{2x^3}{3} + \frac{x^5}{3} + O\left(x^6\right) \tag{2}$$

Verification of solutions

$$y = 1 - 2x - \frac{5x^2}{2} + \frac{2x^3}{3} - \frac{3x^4}{8} + \frac{x^5}{3} + \frac{19x^6}{240} + O\left(x^6\right)$$

Verified OK.

$$y = 1 - \frac{5x^2}{2} - \frac{3x^4}{8} - 2x + \frac{2x^3}{3} + \frac{x^5}{3} + O\left(x^6\right)$$

Verified OK.

13.33.2 Maple step by step solution

Let's solve

$$\left[y'' = -2x^2y + 3y'x - 5y, y(0) = 1, y'\Big|_{\{x=0\}} = -2\right]$$

- Highest derivative means the order of the ODE is 2

  y''
- Isolate 2nd derivative

  $y'' = (-2x^2 - 5)\, y + 3y'x$
- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - 3y'x + (2x^2 + 5)\, y = 0$
- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=\max(0,-m)}^{\infty} a_k x^{k+m}$$

- Shift index using $k- >k-m$

  $$x^m \cdot y = \sum_{k=\max(0,-m)+m}^{\infty} a_{k-m} x^k$$

- Convert $x \cdot y'$ to series expansion

  $$x \cdot y' = \sum_{k=0}^{\infty} a_k k\, x^k$$

- Convert y'' to series expansion

  $$y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$$

- Shift index using $k- >k+2$

  $$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$$

  Rewrite ODE with series expansions

  $$2a_2 + 5a_0 + (6a_3 + 2a_1)\, x + \left(\sum_{k=2}^{\infty} (a_{k+2}(k+2)\,(k+1) - a_k(3k-5) + 2a_{k-2})\, x^k\right) = 0$$

- The coefficients of each power of x must be 0

  $$[2a_2 + 5a_0 = 0, 6a_3 + 2a_1 = 0]$$

- Solve for the dependent coefficient(s)

  $$\left\{a_2 = -\frac{5a_0}{2}, a_3 = -\frac{a_1}{3}\right\}$$

- Each term in the series must be 0, giving the recursion relation

  $$(k^2 + 3k + 2)\, a_{k+2} - 3a_k k + 5a_k + 2a_{k-2} = 0$$

- Shift index using $k- >k+2$

  $$\left((k+2)^2 + 3k + 8\right) a_{k+4} - 3a_{k+2}(k+2) + 5a_{k+2} + 2a_k = 0$$

- Recursion relation that defines the series solution to the ODE

  $$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+4} = \frac{3k a_{k+2} - 2a_k + a_{k+2}}{k^2 + 7k + 12}, a_2 = -\frac{5a_0}{2}, a_3 = -\frac{a_1}{3}\right]$$

Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 34.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' + 5y'x - (-x^2 + 3)\, y = 0}$$

With initial conditions

$$[y(0) = 6, y'(0) = -2]$$

With the expansion point for the power series method at $x = 0$.

13.34.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= 5x \\ q(x) &= x^2 - 3 \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + 5y'x + (x^2 - 3)\, y = 0$$

The domain of $p(x) = 5x$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = x^2 - 3$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned} y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\ &= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\ &= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0} \end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{1028}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{1029}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -x^2y - 5y'x + 3y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \\
&= 5yx^3 + 24y'x^2 - 17yx - 2y' \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y}y' + \frac{\partial F_1}{\partial y'}F_1 \\
&= \left(-115x^3 + 41x\right)y' + \left(-24x^4 + 89x^2 - 23\right)y \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y}y' + \frac{\partial F_2}{\partial y'}F_2 \\
&= \left(551x^4 - 461x^2 + 18\right)y' + \left(115x^5 - 482x^3 + 301x\right)y \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y}y' + \frac{\partial F_3}{\partial y'}F_3 \\
&= \left(-2640x^5 + 4027x^3 - 711x\right)y' + \left(-551x^6 + 2689x^4 - 2847x^2 + 355\right)y
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=6$ and $y'(0)=-2$ gives

$$
\begin{aligned}
F_0 &= 18 \\
F_1 &= 4 \\
F_2 &= -138 \\
F_3 &= -36 \\
F_4 &= 2130
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = 9x^2 - 2x + 6 + \frac{2x^3}{3} - \frac{23x^4}{4} - \frac{3x^5}{10} + \frac{71x^6}{24} + O(x^6)
$$

$$
y = 9x^2 - 2x + 6 + \frac{2x^3}{3} - \frac{23x^4}{4} - \frac{3x^5}{10} + \frac{71x^6}{24} + O(x^6)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = -x^2\left(\sum_{n=0}^{\infty} a_n x^n\right) - 5\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x + 3\left(\sum_{n=0}^{\infty} a_n x^n\right) \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 5n\, x^n a_n\right) + \left(\sum_{n=0}^{\infty} x^{n+2} a_n\right) + \sum_{n=0}^{\infty} (-3 a_n x^n) = 0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n$$
$$\sum_{n=0}^{\infty} x^{n+2} a_n = \sum_{n=2}^{\infty} a_{n-2} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=1}^{\infty} 5n\, x^n a_n\right) + \left(\sum_{n=2}^{\infty} a_{n-2} x^n\right) + \sum_{n=0}^{\infty} (-3 a_n x^n) = 0 \quad (3)$$

$n = 0$ gives

$$2a_2 - 3a_0 = 0$$

$$a_2 = \frac{3a_0}{2}$$

$n = 1$ gives

$$6a_3 + 2a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{a_1}{3}$$

For $2 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) + 5na_n + a_{n-2} - 3a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{5na_n - 3a_n + a_{n-2}}{(n+2)\,(n+1)} \\ &= -\frac{(5n-3)\, a_n}{(n+2)\,(n+1)} - \frac{a_{n-2}}{(n+2)\,(n+1)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$12a_4 + 7a_2 + a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{23a_0}{24}$$

For $n = 3$ the recurrence equation gives

$$20a_5 + 12a_3 + a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{3a_1}{20}$$

For $n = 4$ the recurrence equation gives

$$30a_6 + 17a_4 + a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{71a_0}{144}$$

For $n = 5$ the recurrence equation gives

$$42a_7 + 22a_5 + a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{89a_1}{1260}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x + \frac{3}{2} a_0 x^2 - \frac{1}{3} a_1 x^3 - \frac{23}{24} a_0 x^4 + \frac{3}{20} a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 + \frac{3}{2}x^2 - \frac{23}{24}x^4\right) a_0 + \left(x - \frac{1}{3}x^3 + \frac{3}{20}x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 + \frac{3}{2}x^2 - \frac{23}{24}x^4\right) c_1 + \left(x - \frac{1}{3}x^3 + \frac{3}{20}x^5\right) c_2 + O(x^6)$$

$$y = 6 + 9x^2 - \frac{23x^4}{4} - 2x + \frac{2x^3}{3} - \frac{3x^5}{10} + O(x^6)$$

Summary
The solution(s) found are the following

$$y = 9x^2 - 2x + 6 + \frac{2x^3}{3} - \frac{23x^4}{4} - \frac{3x^5}{10} + \frac{71x^6}{24} + O(x^6) \tag{1}$$

$$y = 6 + 9x^2 - \frac{23x^4}{4} - 2x + \frac{2x^3}{3} - \frac{3x^5}{10} + O(x^6) \tag{2}$$

Verification of solutions

$$y = 9x^2 - 2x + 6 + \frac{2x^3}{3} - \frac{23x^4}{4} - \frac{3x^5}{10} + \frac{71x^6}{24} + O(x^6)$$

Verified OK.

$$y = 6 + 9x^2 - \frac{23x^4}{4} - 2x + \frac{2x^3}{3} - \frac{3x^5}{10} + O(x^6)$$

Verified OK.

13.34.2 Maple step by step solution

Let's solve

$\left[y'' = -x^2 y - 5y'x + 3y, y(0) = 6, y'\Big|_{\{x=0\}} = -2\right]$

$$x \cdot y' = \sum_{k=0}^{\infty} a_k k\, x^k$$

- Convert y'' to series expansion

$$y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$$

- Shift index using $k- >k + 2$

$$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$$

Rewrite ODE with series expansions

$$2a_2 - 3a_0 + (6a_3 + 2a_1)\, x + \left(\sum_{k=2}^{\infty} (a_{k+2}(k+2)\,(k+1) + a_k(5k-3) + a_{k-2})\, x^k\right) = 0$$

- The coefficients of each power of x must be 0

$$[2a_2 - 3a_0 = 0, 6a_3 + 2a_1 = 0]$$

- Solve for the dependent coefficient(s)

$$\left\{a_2 = \frac{3a_0}{2}, a_3 = -\frac{a_1}{3}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$(k^2 + 3k + 2)\, a_{k+2} + 5a_k k - 3a_k + a_{k-2} = 0$$

- Shift index using $k- >k + 2$

$$\left((k+2)^2 + 3k + 8\right) a_{k+4} + 5a_{k+2}(k+2) - 3a_{k+2} + a_k = 0$$

- Recursion relation that defines the series solution to the ODE

$$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+4} = -\frac{5k a_{k+2} + a_k + 7a_{k+2}}{k^2 + 7k + 12}, a_2 = \frac{3a_0}{2}, a_3 = -\frac{a_1}{3}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 35.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' - 2y'x - (3x^2 + 2)\, y = 0}$$

With initial conditions

$$[y(0) = 2, y'(0) = -5]$$

With the expansion point for the power series method at $x = 0$.

13.35.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= -2x \\ q(x) &= -3x^2 - 2 \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' - 2y'x + \left(-3x^2 - 2\right) y = 0$$

The domain of $p(x) = -2x$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = -3x^2 - 2$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' && (1031) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (1032) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \qquad (7)$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= 3x^2y + 2y'x + 2y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \\
&= 6yx^3 + 7y'x^2 + 10yx + 4y' \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y}y' + \frac{\partial F_1}{\partial y'}F_1 \\
&= \left(20x^3 + 32x\right) y' + y\left(21x^4 + 44x^2 + 18\right) \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y}y' + \frac{\partial F_2}{\partial y'}F_2 \\
&= \left(61x^4 + 168x^2 + 50\right) y' + 60\left(x^4 + \frac{11}{3}x^2 + \frac{38}{15}\right) xy \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y}y' + \frac{\partial F_3}{\partial y'}F_3 \\
&= \left(182x^5 + 800x^3 + 588x\right) y' + y\left(183x^6 + 926x^4 + 1146x^2 + 252\right)
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 2$ and $y'(0) = -5$ gives

$$
\begin{aligned}
F_0 &= 4 \\
F_1 &= -20 \\
F_2 &= 36 \\
F_3 &= -250 \\
F_4 &= 504
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = 2x^2 - 5x + 2 - \frac{10x^3}{3} + \frac{3x^4}{2} - \frac{25x^5}{12} + \frac{7x^6}{10} + O\left(x^6\right)
$$

$$
y = 2x^2 - 5x + 2 - \frac{10x^3}{3} + \frac{3x^4}{2} - \frac{25x^5}{12} + \frac{7x^6}{10} + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = 3x^2 \left(\sum_{n=0}^{\infty} a_n x^n\right) + 2\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x + 2\left(\sum_{n=0}^{\infty} a_n x^n\right) \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \sum_{n=1}^{\infty} (-2n\, x^n a_n) + \sum_{n=0}^{\infty} \left(-3x^{n+2} a_n\right) + \sum_{n=0}^{\infty} (-2a_n x^n) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n$$
$$\sum_{n=0}^{\infty} \left(-3x^{n+2} a_n\right) = \sum_{n=2}^{\infty} \left(-3a_{n-2} x^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \sum_{n=1}^{\infty} (-2n\, x^n a_n) + \sum_{n=2}^{\infty} \left(-3a_{n-2} x^n\right) + \sum_{n=0}^{\infty} (-2a_n x^n) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 - 2a_0 = 0$$

$$a_2 = a_0$$

$n = 1$ gives

$$6a_3 - 4a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{2a_1}{3}$$

For $2 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) - 2na_n - 3a_{n-2} - 2a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= \frac{2na_n + 2a_n + 3a_{n-2}}{(n+2)\,(n+1)} \\ &= \frac{(2n+2)\, a_n}{(n+2)\,(n+1)} + \frac{3a_{n-2}}{(n+2)\,(n+1)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$12a_4 - 6a_2 - 3a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{3a_0}{4}$$

For $n = 3$ the recurrence equation gives

$$20a_5 - 8a_3 - 3a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{5a_1}{12}$$

For $n = 4$ the recurrence equation gives

$$30a_6 - 10a_4 - 3a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{7a_0}{20}$$

For $n = 5$ the recurrence equation gives

$$42a_7 - 12a_5 - 3a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{a_1}{6}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x + a_0 x^2 + \frac{2}{3} a_1 x^3 + \frac{3}{4} a_0 x^4 + \frac{5}{12} a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 + x^2 + \frac{3}{4} x^4\right) a_0 + \left(x + \frac{2}{3} x^3 + \frac{5}{12} x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 + x^2 + \frac{3}{4} x^4\right) c_1 + \left(x + \frac{2}{3} x^3 + \frac{5}{12} x^5\right) c_2 + O(x^6)$$

$$y = 2 + 2x^2 + \frac{3x^4}{2} - 5x - \frac{10x^3}{3} - \frac{25x^5}{12} + O(x^6)$$

Summary

The solution(s) found are the following

$$y = 2x^2 - 5x + 2 - \frac{10x^3}{3} + \frac{3x^4}{2} - \frac{25x^5}{12} + \frac{7x^6}{10} + O(x^6) \tag{1}$$

$$y = 2 + 2x^2 + \frac{3x^4}{2} - 5x - \frac{10x^3}{3} - \frac{25x^5}{12} + O(x^6) \tag{2}$$

Verification of solutions

$$y = 2x^2 - 5x + 2 - \frac{10x^3}{3} + \frac{3x^4}{2} - \frac{25x^5}{12} + \frac{7x^6}{10} + O(x^6)$$

Verified OK.

$$y = 2 + 2x^2 + \frac{3x^4}{2} - 5x - \frac{10x^3}{3} - \frac{25x^5}{12} + O(x^6)$$

Verified OK.

13.35.2 Maple step by step solution

Let's solve

$$\left[y'' = 3x^2y + 2y'x + 2y, y(0) = 2, y'\Big|_{\{x=0\}} = -5\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = 2y'x + (3x^2 + 2)\,y$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - 2y'x + (-3x^2 - 2)\,y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

    $x^m \cdot y = \sum_{k=\max(0,-m)}^{\infty} a_k x^{k+m}$

  ◦ Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=\max(0,-m)+m}^{\infty} a_{k-m} x^k$$

- Convert $x \cdot y'$ to series expansion

$$x \cdot y' = \sum_{k=0}^{\infty} a_k k \, x^k$$

- Convert y'' to series expansion

$$y'' = \sum_{k=2}^{\infty} a_k k(k-1) \, x^{k-2}$$

- Shift index using $k- >k+2$

$$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)(k+1) \, x^k$$

Rewrite ODE with series expansions

$$2a_2 - 2a_0 + (6a_3 - 4a_1) x + \left(\sum_{k=2}^{\infty} (a_{k+2}(k+2)(k+1) - 2a_k(k+1) - 3a_{k-2}) \, x^k\right) = 0$$

- The coefficients of each power of x must be 0

$$[2a_2 - 2a_0 = 0, 6a_3 - 4a_1 = 0]$$

- Solve for the dependent coefficient(s)

$$\left\{a_2 = a_0, a_3 = \frac{2a_1}{3}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$(k^2 + 3k + 2) \, a_{k+2} - 2a_k k - 2a_k - 3a_{k-2} = 0$$

- Shift index using $k- >k+2$

$$\left((k+2)^2 + 3k + 8\right) a_{k+4} - 2a_{k+2}(k+2) - 2a_{k+2} - 3a_k = 0$$

- Recursion relation that defines the series solution to the ODE

$$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+4} = \frac{2k a_{k+2} + 3a_k + 6a_{k+2}}{k^2 + 7k + 12}, a_2 = a_0, a_3 = \frac{2a_1}{3}\right]$$

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' + 3y'x + \left(4x^2 + 2\right) y = 0}$$

With initial conditions

$$[y(0) = 3, y'(0) = 6]$$

With the expansion point for the power series method at $x = 0$.

13.36.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= 3x \\ q(x) &= 4x^2 + 2 \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + 3y'x + (4x^2 + 2) y = 0$$

The domain of $p(x) = 3x$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = 4x^2 + 2$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0) y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + xy'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\
&= y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' && (1034) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (1035) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -4x^2 y - 3y' x - 2y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= 5\left(x^2 - 1\right) y' + 2\left(6x^3 - x\right) y \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \left(-3x^3 + 23x\right) y' + \left(-20x^4 + 46x^2 + 8\right) y \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \left(-11x^4 - 32x^2 + 31\right) y' + 12x\left(x^4 - \frac{83}{6}x^2 + \frac{23}{6}\right) y \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \left(45x^5 - 114x^3 - 111x\right) y' + \left(44x^6 + 210x^4 - 558x^2 - 16\right) y
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 3$ and $y'(0) = 6$ gives

$$
\begin{aligned}
F_0 &= -6 \\
F_1 &= -30 \\
F_2 &= 24 \\
F_3 &= 186 \\
F_4 &= -48
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = x^4 - 5x^3 - 3x^2 + 6x + 3 + \frac{31x^5}{20} - \frac{x^6}{15} + O\left(x^6\right)
$$

$$
y = x^4 - 5x^3 - 3x^2 + 6x + 3 + \frac{31x^5}{20} - \frac{x^6}{15} + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$\begin{aligned} y' &= \sum_{n=1}^{\infty} n a_n x^{n-1} \\ y'' &= \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} \end{aligned}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = -4x^2 \left(\sum_{n=0}^{\infty} a_n x^n\right) - 3\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x - 2\left(\sum_{n=0}^{\infty} a_n x^n\right) \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 3n\, x^n a_n\right) + \left(\sum_{n=0}^{\infty} 4x^{n+2} a_n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\begin{aligned} \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} &= \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n \\ \sum_{n=0}^{\infty} 4x^{n+2} a_n &= \sum_{n=2}^{\infty} 4a_{n-2} x^n \end{aligned}$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=1}^{\infty} 3n\, x^n a_n\right) + \left(\sum_{n=2}^{\infty} 4a_{n-2} x^n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 2a_0 = 0$$

$$a_2 = -a_0$$

$n = 1$ gives

$$6a_3 + 5a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{5a_1}{6}$$

For $2 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) + 3na_n + 4a_{n-2} + 2a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{3na_n + 2a_n + 4a_{n-2}}{(n+2)\,(n+1)} \\ &= -\frac{(3n+2)\, a_n}{(n+2)\,(n+1)} - \frac{4a_{n-2}}{(n+2)\,(n+1)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$12a_4 + 8a_2 + 4a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{3}$$

For $n = 3$ the recurrence equation gives

$$20a_5 + 11a_3 + 4a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{31a_1}{120}$$

For $n = 4$ the recurrence equation gives

$$30a_6 + 14a_4 + 4a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{a_0}{45}$$

For $n = 5$ the recurrence equation gives

$$42a_7 + 17a_5 + 4a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{127a_1}{5040}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1x - a_0x^2 - \frac{5}{6}a_1x^3 + \frac{1}{3}a_0x^4 + \frac{31}{120}a_1x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - x^2 + \frac{1}{3}x^4\right) a_0 + \left(x - \frac{5}{6}x^3 + \frac{31}{120}x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - x^2 + \frac{1}{3}x^4\right) c_1 + \left(x - \frac{5}{6}x^3 + \frac{31}{120}x^5\right) c_2 + O(x^6)$$

$$y = x^4 - 3x^2 + 3 + 6x - 5x^3 + \frac{31x^5}{20} + O(x^6)$$

Summary

The solution(s) found are the following

$$y = x^4 - 5x^3 - 3x^2 + 6x + 3 + \frac{31x^5}{20} - \frac{x^6}{15} + O(x^6) \tag{1}$$

$$y = x^4 - 3x^2 + 3 + 6x - 5x^3 + \frac{31x^5}{20} + O(x^6) \tag{2}$$

Verification of solutions

$$y = x^4 - 5x^3 - 3x^2 + 6x + 3 + \frac{31x^5}{20} - \frac{x^6}{15} + O(x^6)$$

Verified OK.

$$y = x^4 - 3x^2 + 3 + 6x - 5x^3 + \frac{31x^5}{20} + O(x^6)$$

Verified OK.

13.36.2 Maple step by step solution

Let's solve

$\left[y'' = -4x^2y - 3y'x - 2y, y(0) = 3, y'\Big|_{\{x=0\}} = 6\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = (-4x^2 - 2)\, y - 3y'x$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + 3y'x + (4x^2 + 2)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

    $x^m \cdot y = \sum_{k=\max(0,-m)}^{\infty} a_k x^{k+m}$

  ◦ Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=\max(0,-m)+m}^{\infty} a_{k-m} x^k$$

- Convert $x \cdot y'$ to series expansion

  $$x \cdot y' = \sum_{k=0}^{\infty} a_k k\, x^k$$

- Convert y'' to series expansion

  $$y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$$

- Shift index using $k- >k+2$

  $$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$$

  Rewrite ODE with series expansions

  $$2a_2 + 2a_0 + (6a_3 + 5a_1)\, x + \left(\sum_{k=2}^{\infty} \left(a_{k+2}(k+2)\,(k+1) + a_k(3k+2) + 4a_{k-2}\right) x^k\right) = 0$$

- The coefficients of each power of x must be 0

  $$[2a_2 + 2a_0 = 0, 6a_3 + 5a_1 = 0]$$

- Solve for the dependent coefficient(s)

  $$\left\{a_2 = -a_0, a_3 = -\frac{5a_1}{6}\right\}$$

- Each term in the series must be 0, giving the recursion relation

  $$\left(k^2 + 3k + 2\right) a_{k+2} + 3a_k k + 2a_k + 4a_{k-2} = 0$$

- Shift index using $k- >k+2$

  $$\left((k+2)^2 + 3k + 8\right) a_{k+4} + 3a_{k+2}(k+2) + 2a_{k+2} + 4a_k = 0$$

- Recursion relation that defines the series solution to the ODE

  $$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+4} = -\frac{3k a_{k+2} + 4a_k + 8a_{k+2}}{k^2 + 7k + 12}, a_2 = -a_0, a_3 = -\frac{5a_1}{6}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 37.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2y'' + 5y'x + (2x^2 + 4)\, y = 0}$$

With initial conditions

$$[y(0) = 3, y'(0) = -2]$$

With the expansion point for the power series method at $x = 0$.

13.37.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= \frac{5x}{2} \\ q(x) &= x^2 + 2 \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{5y'x}{2} + \left(x^2 + 2\right) y = 0$$

The domain of $p(x) = \frac{5x}{2}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = x^2 + 2$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{1037}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{1038}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -x^2 y - \frac{5y' x}{2} - 2y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{3(7x^2-6)\, y'}{4} + \frac{(5x^3+6x)\, y}{2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(-85x^3+198x)\, y'}{8} + \frac{3(-7x^4+2x^2+16)\, y}{4} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(341x^4-1476x^2+588)\, y'}{16} + \frac{(85x^5-196x^3-372x)\, y}{8} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{21(-65x^5+444x^3-492x)\, y'}{32} + \frac{(-341x^6+1644x^4+1188x^2-1920)\, y}{16}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=3$ and $y'(0)=-2$ gives

$$
\begin{aligned}
F_0 &= -6 \\
F_1 &= 9 \\
F_2 &= 36 \\
F_3 &= -\frac{147}{2} \\
F_4 &= -360
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = -3x^2 - 2x + 3 + \frac{3x^3}{2} + \frac{3x^4}{2} - \frac{49x^5}{80} - \frac{x^6}{2} + O\left(x^6\right)
$$

$$y = -3x^2 - 2x + 3 + \frac{3x^3}{2} + \frac{3x^4}{2} - \frac{49x^5}{80} - \frac{x^6}{2} + O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = -x^2 \left(\sum_{n=0}^{\infty} a_n x^n\right) - \frac{5\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x}{2} - 2\left(\sum_{n=0}^{\infty} a_n x^n\right) \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} 2n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 5n\, x^n a_n\right) + \left(\sum_{n=0}^{\infty} 2x^{n+2} a_n\right) + \left(\sum_{n=0}^{\infty} 4 a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 2n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} 2(n+2)\, a_{n+2}(n+1)\, x^n$$

$$\sum_{n=0}^{\infty} 2x^{n+2} a_n = \sum_{n=2}^{\infty} 2a_{n-2} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} 2(n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=1}^{\infty} 5n\, x^n a_n\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2} x^n\right) + \left(\sum_{n=0}^{\infty} 4 a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$4a_2 + 4a_0 = 0$$

$$a_2 = -a_0$$

$n = 1$ gives

$$12a_3 + 9a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{3a_1}{4}$$

For $2 \leq n$, the recurrence equation is

$$2(n+2)\, a_{n+2}(n+1) + 5na_n + 2a_{n-2} + 4a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{5na_n + 4a_n + 2a_{n-2}}{2\,(n+2)\,(n+1)} \\ &= -\frac{(5n+4)\, a_n}{2\,(n+2)\,(n+1)} - \frac{a_{n-2}}{(n+2)\,(n+1)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$24a_4 + 14a_2 + 2a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{2}$$

For $n = 3$ the recurrence equation gives

$$40a_5 + 19a_3 + 2a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{49a_1}{160}$$

For $n = 4$ the recurrence equation gives

$$60a_6 + 24a_4 + 2a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{a_0}{6}$$

For $n = 5$ the recurrence equation gives

$$84a_7 + 29a_5 + 2a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{1181a_1}{13440}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1x - a_0x^2 - \frac{3}{4}a_1x^3 + \frac{1}{2}a_0x^4 + \frac{49}{160}a_1x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - x^2 + \frac{1}{2}x^4\right)a_0 + \left(x - \frac{3}{4}x^3 + \frac{49}{160}x^5\right)a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - x^2 + \frac{1}{2}x^4\right)c_1 + \left(x - \frac{3}{4}x^3 + \frac{49}{160}x^5\right)c_2 + O(x^6)$$

$$y = 3 - 3x^2 + \frac{3x^4}{2} - 2x + \frac{3x^3}{2} - \frac{49x^5}{80} + O(x^6)$$

Summary
The solution(s) found are the following

$$y = -3x^2 - 2x + 3 + \frac{3x^3}{2} + \frac{3x^4}{2} - \frac{49x^5}{80} - \frac{x^6}{2} + O(x^6) \tag{1}$$

$$y = 3 - 3x^2 + \frac{3x^4}{2} - 2x + \frac{3x^3}{2} - \frac{49x^5}{80} + O(x^6) \tag{2}$$

Verification of solutions

$$y = -3x^2 - 2x + 3 + \frac{3x^3}{2} + \frac{3x^4}{2} - \frac{49x^5}{80} - \frac{x^6}{2} + O(x^6)$$

Verified OK.

$$y = 3 - 3x^2 + \frac{3x^4}{2} - 2x + \frac{3x^3}{2} - \frac{49x^5}{80} + O(x^6)$$

Verified OK.

13.37.2 Maple step by step solution

Let's solve

$\left[y'' = -x^2 y - \frac{5y'x}{2} - 2y, y(0) = 3, y'\Big|_{\{x=0\}} = -2\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = (-x^2 - 2)\, y - \frac{5y'x}{2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{5y'x}{2} + (x^2 + 2)\, y = 0$

- Multiply by denominators

  $2y'' + 5y'x + (2x^2 + 4)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=\max(0,-m)}^{\infty} a_k x^{k+m}$$

- Shift index using $k- >k-m$

$$x^m \cdot y = \sum_{k=\max(0,-m)+m}^{\infty} a_{k-m} x^k$$

- Convert $x \cdot y'$ to series expansion

$$x \cdot y' = \sum_{k=0}^{\infty} a_k k\, x^k$$

- Convert y'' to series expansion

$$y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$$

- Shift index using $k- >k+2$

$$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$$

Rewrite ODE with series expansions

$$4a_2 + 4a_0 + (12a_3 + 9a_1)\, x + \left(\sum_{k=2}^{\infty} (2a_{k+2}(k+2)\,(k+1) + a_k(5k+4) + 2a_{k-2})\, x^k\right) = 0$$

- The coefficients of each power of x must be 0

$$[4a_2 + 4a_0 = 0, 12a_3 + 9a_1 = 0]$$

- Solve for the dependent coefficient(s)

$$\left\{a_2 = -a_0, a_3 = -\frac{3a_1}{4}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$(2k^2 + 6k + 4)\, a_{k+2} + 5a_k k + 4a_k + 2a_{k-2} = 0$$

- Shift index using $k- >k+2$

$$\left(2(k+2)^2 + 6k + 16\right) a_{k+4} + 5a_{k+2}(k+2) + 4a_{k+2} + 2a_k = 0$$

- Recursion relation that defines the series solution to the ODE

$$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+4} = -\frac{5k a_{k+2} + 2a_k + 14a_{k+2}}{2(k^2 + 7k + 12)}, a_2 = -a_0, a_3 = -\frac{3a_1}{4}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 38.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{3y'' + 2y'x + \left(-x^2 + 4\right) y = 0}$$

With initial conditions

$$[y(0) = -2, y'(0) = 3]$$

With the expansion point for the power series method at $x = 0$.

13.38.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= \frac{2x}{3} \\ q(x) &= -\frac{x^2}{3} + \frac{4}{3} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y''+\frac{2y'x}{3}+\left(-\frac{x^{2}}{3}+\frac{4}{3}\right)y = 0$$

The domain of $p(x)=\frac{2x}{3}$ is

$$\{-\infty <x<\infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x)=-\frac{x^{2}}{3}+\frac{4}{3}$ is

$$\{-\infty <x<\infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x-x_0)\,y'(x_0) + \frac{(x-x_0)^2}{2}y''(x_0) + \frac{(x-x_0)^3}{3!}y'''(x_0) + \cdots \\
&= y_0 + xy'_0 + \frac{x^2}{2}\,f|_{x_0,y_0,y'_0} + \frac{x^3}{3!}\,f'|_{x_0,y_0,y'_0} + \cdots \\
&= y_0 + xy'_0 + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}\,\frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{1040}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{1041}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') && (4) \\
F_1 &= \frac{df}{dx} \\
&= \frac{dF_0}{dx} \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (5) \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right) \\
&= \frac{d}{dx}(F_1) \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0 \\
&\vdots \\
F_n &= \frac{d}{dx}(F_{n-1}) \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} F_n|_{x_0, y_0, y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= \frac{x^2 y}{3} - \frac{2y' x}{3} - \frac{4y}{3} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= -\frac{2y x^3}{9} + \frac{7y' x^2}{9} + \frac{14yx}{9} - 2y' \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{20(-x^3 + 6x)\, y'}{27} + \frac{y(7x^4 - 64x^2 + 114)}{27} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(61x^4 - 612x^2 + 702)\, y'}{81} - \frac{20\left(x^4 - \frac{71}{5}x^2 + \frac{216}{5}\right) xy}{81} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{2(-91x^5 + 1404x^3 - 3834x)\, y'}{243} + \frac{y(61x^6 - 1156x^4 + 5706x^2 - 5400)}{243}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = -2$ and $y'(0) = 3$ gives

$$
\begin{aligned}
F_0 &= \frac{8}{3} \\
F_1 &= -6 \\
F_2 &= -\frac{76}{9} \\
F_3 &= 26 \\
F_4 &= \frac{400}{9}
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = 3x - 2 + \frac{4x^2}{3} - x^3 - \frac{19x^4}{54} + \frac{13x^5}{60} + \frac{5x^6}{81} + O\left(x^6\right)
$$

$$
y = 3x - 2 + \frac{4x^2}{3} - x^3 - \frac{19x^4}{54} + \frac{13x^5}{60} + \frac{5x^6}{81} + O(x^6)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$
y = \sum_{n=0}^{\infty} a_n x^n
$$

Then

$$
y' = \sum_{n=1}^{\infty} n a_n x^{n-1}
$$

$$
y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}
$$

Substituting the above back into the ode gives

$$
\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \frac{x^2 \left(\sum_{n=0}^{\infty} a_n x^n\right)}{3} - \frac{2\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x}{3} - \frac{4\left(\sum_{n=0}^{\infty} a_n x^n\right)}{3} \tag{1}
$$

Which simplifies to

$$
\left(\sum_{n=2}^{\infty} 3n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 2n\, x^n a_n\right) + \sum_{n=0}^{\infty} \left(-x^{n+2} a_n\right) + \left(\sum_{n=0}^{\infty} 4 a_n x^n\right) = 0 \tag{2}
$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$
\sum_{n=2}^{\infty} 3n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} 3(n+2)\, a_{n+2}(n+1)\, x^n
$$

$$
\sum_{n=0}^{\infty} \left(-x^{n+2} a_n\right) = \sum_{n=2}^{\infty} \left(-a_{n-2} x^n\right)
$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$
\left(\sum_{n=0}^{\infty} 3(n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=1}^{\infty} 2n\, x^n a_n\right) + \sum_{n=2}^{\infty} \left(-a_{n-2} x^n\right) + \left(\sum_{n=0}^{\infty} 4 a_n x^n\right) = 0 \tag{3}
$$

$n = 0$ gives

$$6a_2 + 4a_0 = 0$$

$$a_2 = -\frac{2a_0}{3}$$

$n = 1$ gives

$$18a_3 + 6a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{a_1}{3}$$

For $2 \leq n$, the recurrence equation is

$$3(n+2)\, a_{n+2}(n+1) + 2na_n - a_{n-2} + 4a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{2na_n + 4a_n - a_{n-2}}{3\,(n+2)\,(n+1)} \\ &= -\frac{(2n+4)\, a_n}{3\,(n+2)\,(n+1)} + \frac{a_{n-2}}{3\,(n+2)\,(n+1)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$36a_4 + 8a_2 - a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{19a_0}{108}$$

For $n = 3$ the recurrence equation gives

$$60a_5 + 10a_3 - a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{13a_1}{180}$$

For $n = 4$ the recurrence equation gives

$$90a_6 + 12a_4 - a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{5a_0}{162}$$

For $n = 5$ the recurrence equation gives

$$126a_7 + 14a_5 - a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{121a_1}{11340}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - \frac{2}{3} a_0 x^2 - \frac{1}{3} a_1 x^3 + \frac{19}{108} a_0 x^4 + \frac{13}{180} a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{2}{3}x^2 + \frac{19}{108}x^4\right) a_0 + \left(x - \frac{1}{3}x^3 + \frac{13}{180}x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{2}{3}x^2 + \frac{19}{108}x^4\right) c_1 + \left(x - \frac{1}{3}x^3 + \frac{13}{180}x^5\right) c_2 + O(x^6)$$

$$y = -2+\frac{4x^{2}}{3}-\frac{19x^{4}}{54}+3x-x^{3}+\frac{13x^{5}}{60}+O\left(x^{6}\right)$$

Summary

The solution(s) found are the following

$$y = 3x-2+\frac{4x^{2}}{3}-x^{3}-\frac{19x^{4}}{54}+\frac{13x^{5}}{60}+\frac{5x^{6}}{81}+O\left(x^{6}\right) \tag{1}$$

$$y = -2+\frac{4x^{2}}{3}-\frac{19x^{4}}{54}+3x-x^{3}+\frac{13x^{5}}{60}+O\left(x^{6}\right) \tag{2}$$

Verification of solutions

$$y = 3x-2+\frac{4x^{2}}{3}-x^{3}-\frac{19x^{4}}{54}+\frac{13x^{5}}{60}+\frac{5x^{6}}{81}+O\left(x^{6}\right)$$

Verified OK.

$$y = -2+\frac{4x^{2}}{3}-\frac{19x^{4}}{54}+3x-x^{3}+\frac{13x^{5}}{60}+O\left(x^{6}\right)$$

Verified OK.

13.38.2 Maple step by step solution

Let's solve

$\left[y'' = \frac{x^{2}y}{3}-\frac{2y'x}{3}-\frac{4y}{3}, y(0) = -2, y'\Big|_{\{x=0\}} = 3\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \left(\frac{x^{2}}{3}-\frac{4}{3}\right)y-\frac{2y'x}{3}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{2y'x}{3}+\left(-\frac{x^{2}}{3}+\frac{4}{3}\right)y = 0$

- Multiply by denominators

  $3y''+2y'x+\left(-x^{2}+4\right)y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_{k} x^{k}$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $$x^m \cdot y = \sum_{k=\max(0,-m)}^{\infty} a_k x^{k+m}$$

- Shift index using $k- >k - m$

  $$x^m \cdot y = \sum_{k=\max(0,-m)+m}^{\infty} a_{k-m} x^k$$

- Convert $x \cdot y'$ to series expansion

  $$x \cdot y' = \sum_{k=0}^{\infty} a_k k\, x^k$$

- Convert y'' to series expansion

  $$y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$$

- Shift index using $k- >k + 2$

  $$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$$

  Rewrite ODE with series expansions

  $$6a_2 + 4a_0 + (18a_3 + 6a_1)\, x + \left(\sum_{k=2}^{\infty} \left(3a_{k+2}(k+2)\,(k+1) + 2a_k(k+2) - a_{k-2}\right) x^k\right) = 0$$

- The coefficients of each power of x must be 0

  $$[6a_2 + 4a_0 = 0, 18a_3 + 6a_1 = 0]$$

- Solve for the dependent coefficient(s)

  $$\left\{a_2 = -\frac{2a_0}{3}, a_3 = -\frac{a_1}{3}\right\}$$

- Each term in the series must be 0, giving the recursion relation

  $$(3k^2 + 9k + 6)\, a_{k+2} + 2a_k k + 4a_k - a_{k-2} = 0$$

- Shift index using $k- >k + 2$

  $$\left(3(k+2)^2 + 9k + 24\right) a_{k+4} + 2a_{k+2}(k+2) + 4a_{k+2} - a_k = 0$$

- Recursion relation that defines the series solution to the ODE

  $$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+4} = -\frac{2ka_{k+2} - a_k + 8a_{k+2}}{3(k^2+7k+12)}, a_2 = -\frac{2a_0}{3}, a_3 = -\frac{a_1}{3}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 39 (a).
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second_order_change_of_variable_on_y_method_1", "linear_second_order_ode_solved_by_an_integrating_factor", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' + 4y'x + \left(4x^2 + 2\right) y = 0}$$

With initial conditions

$$[y(0) = 1, y'(0) = 0]$$

With the expansion point for the power series method at $x = 0$.

13.39.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= 4x \\ q(x) &= 4x^2 + 2 \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + 4y'x + \left(4x^2 + 2\right) y = 0$$

The domain of $p(x) = 4x$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = 4x^2 + 2$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{1043}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{1044}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n |_{x_0, y_0, y'_0} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -4x^2y - 4y'x - 2y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \\
&= 16yx^3 + 12y'x^2 - 6y' \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y}y' + \frac{\partial F_1}{\partial y'}F_1 \\
&= \left(-32x^3 + 48x\right)y' - 48\left(x^4 - x^2 - \frac{1}{4}\right)y \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y}y' + \frac{\partial F_2}{\partial y'}F_2 \\
&= 128yx^5 + 80y'x^4 - 320yx^3 - 240y'x^2 + 60y' \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y}y' + \frac{\partial F_3}{\partial y'}F_3 \\
&= \left(-192x^5 + 960x^3 - 720x\right)y' - 320\left(x^6 - \frac{9}{2}x^4 + \frac{9}{4}x^2 + \frac{3}{8}\right)y
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=1$ and $y'(0)=0$ gives

$$
\begin{aligned}
F_0 &= -2 \\
F_1 &= 0 \\
F_2 &= 12 \\
F_3 &= 0 \\
F_4 &= -120
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = 1 - x^2 + \frac{x^4}{2} - \frac{x^6}{6} + O(x^6)
$$

$$
y = 1 - x^2 + \frac{x^4}{2} - \frac{x^6}{6} + O(x^6)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = -4x^2 \left(\sum_{n=0}^{\infty} a_n x^n\right) - 4\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x - 2\left(\sum_{n=0}^{\infty} a_n x^n\right) \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 4n\, x^n a_n\right) + \left(\sum_{n=0}^{\infty} 4x^{n+2} a_n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n$$
$$\sum_{n=0}^{\infty} 4x^{n+2} a_n = \sum_{n=2}^{\infty} 4a_{n-2} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2) a_{n+2}(n+1) x^n\right) + \left(\sum_{n=1}^{\infty} 4n\, x^n a_n\right) + \left(\sum_{n=2}^{\infty} 4a_{n-2} x^n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 2a_0 = 0$$

$$a_2 = -a_0$$

$n = 1$ gives

$$6a_3 + 6a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -a_1$$

For $2 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) + 4na_n + 4a_{n-2} + 2a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{2(2na_n + a_n + 2a_{n-2})}{(n+2)\,(n+1)} \\ &= -\frac{2(2n+1)\, a_n}{(n+2)\,(n+1)} - \frac{4a_{n-2}}{(n+2)\,(n+1)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$12a_4 + 10a_2 + 4a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{2}$$

For $n = 3$ the recurrence equation gives

$$20a_5 + 14a_3 + 4a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_1}{2}$$

For $n = 4$ the recurrence equation gives

$$30a_6 + 18a_4 + 4a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{a_0}{6}$$

For $n = 5$ the recurrence equation gives

$$42a_7 + 22a_5 + 4a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{a_1}{6}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - a_0 x^2 - a_1 x^3 + \frac{1}{2} a_0 x^4 + \frac{1}{2} a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - x^2 + \frac{1}{2} x^4\right) a_0 + \left(x - x^3 + \frac{1}{2} x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - x^2 + \frac{1}{2} x^4\right) c_1 + \left(x - x^3 + \frac{1}{2} x^5\right) c_2 + O(x^6)$$

$$y = 1 - x^2 + \frac{x^4}{2} + O(x^6)$$

Summary

The solution(s) found are the following

$$y = 1 - x^2 + \frac{x^4}{2} - \frac{x^6}{6} + O(x^6) \tag{1}$$

$$y = 1 - x^2 + \frac{x^4}{2} + O(x^6) \tag{2}$$

Verification of solutions

$$y = 1 - x^2 + \frac{x^4}{2} - \frac{x^6}{6} + O(x^6)$$

Verified OK.

$$y = 1 - x^2 + \frac{x^4}{2} + O(x^6)$$

Verified OK.

13.39.2 Maple step by step solution

Let's solve

$$\left[y'' = -4x^2y - 4y'x - 2y, y(0) = 1, y'\Big|_{\{x=0\}} = 0\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = (-4x^2 - 2)\,y - 4y'x$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + 4y'x + (4x^2 + 2)\,y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

    $x^m \cdot y = \sum_{k=\max(0,-m)}^{\infty} a_k x^{k+m}$

  - Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=\max(0,-m)+m}^{\infty} a_{k-m} x^k$$

- Convert $x \cdot y'$ to series expansion

  $$x \cdot y' = \sum_{k=0}^{\infty} a_k k\, x^k$$

- Convert y'' to series expansion

  $$y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$$

- Shift index using $k- >k+2$

  $$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$$

  Rewrite ODE with series expansions

  $$2a_2 + 2a_0 + (6a_3 + 6a_1)\, x + \left(\sum_{k=2}^{\infty} (a_{k+2}(k+2)\,(k+1) + 2a_k(2k+1) + 4a_{k-2})\, x^k\right) = 0$$

- The coefficients of each power of x must be 0

  $$[2a_2 + 2a_0 = 0, 6a_3 + 6a_1 = 0]$$

- Solve for the dependent coefficient(s)

  $$\{a_2 = -a_0, a_3 = -a_1\}$$

- Each term in the series must be 0, giving the recursion relation

  $$(k^2 + 3k + 2)\, a_{k+2} + 4a_k k + 2a_k + 4a_{k-2} = 0$$

- Shift index using $k- >k+2$

  $$\left((k+2)^2 + 3k + 8\right) a_{k+4} + 4a_{k+2}(k+2) + 2a_{k+2} + 4a_k = 0$$

- Recursion relation that defines the series solution to the ODE

  $$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+4} = -\frac{2(2ka_{k+2} + 2a_k + 5a_{k+2})}{k^2 + 7k + 12}, a_2 = -a_0, a_3 = -a_1\right]$$

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second_order_change_of_variable_on_y_method_1", "linear_second_order_ode_solved_by_an_integrating_factor", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' + 4y'x + (4x^2 + 2)\, y = 0}$$

With initial conditions

$$[y(0) = 0, y'(0) = 1]$$

With the expansion point for the power series method at $x = 0$.

13.40.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$p(x) = 4x$$
$$q(x) = 4x^2 + 2$$
$$F = 0$$

Hence the ode is

$$y'' + 4y'x + (4x^2 + 2)\, y = 0$$

The domain of $p(x) = 4x$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = 4x^2 + 2$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \left. \frac{d^n f}{dx^n} \right|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{1046}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{1047}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y'_0} \qquad (7)
$$

To find $y(x)$ series solution around $x=0$. Hence

$$
\begin{aligned}
F_0 &= -4x^2y - 4y'x - 2y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0 \\
&= 16yx^3 + 12y'x^2 - 6y' \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y}y' + \frac{\partial F_1}{\partial y'}F_1 \\
&= \left(-32x^3 + 48x\right)y' - 48\left(x^4 - x^2 - \frac{1}{4}\right)y \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y}y' + \frac{\partial F_2}{\partial y'}F_2 \\
&= 128yx^5 + 80y'x^4 - 320yx^3 - 240y'x^2 + 60y' \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y}y' + \frac{\partial F_3}{\partial y'}F_3 \\
&= \left(-192x^5 + 960x^3 - 720x\right)y' - 320\left(x^6 - \frac{9}{2}x^4 + \frac{9}{4}x^2 + \frac{3}{8}\right)y
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x=0$ and $y(0)=0$ and $y'(0)=1$ gives

$$
\begin{aligned}
F_0 &= 0 \\
F_1 &= -6 \\
F_2 &= 0 \\
F_3 &= 60 \\
F_4 &= 0
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = x - x^3 + \frac{x^5}{2} + O\left(x^6\right)
$$

$$
y = x - x^3 + \frac{x^5}{2} + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = -4x^2 \left(\sum_{n=0}^{\infty} a_n x^n\right) - 4\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x - 2\left(\sum_{n=0}^{\infty} a_n x^n\right) \quad (1)$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} 4n\, x^n a_n\right) + \left(\sum_{n=0}^{\infty} 4x^{n+2} a_n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \quad (2)$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n$$
$$\sum_{n=0}^{\infty} 4x^{n+2} a_n = \sum_{n=2}^{\infty} 4a_{n-2} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(n+1)\, x^n\right) + \left(\sum_{n=1}^{\infty} 4n\, x^n a_n\right) + \left(\sum_{n=2}^{\infty} 4a_{n-2} x^n\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \quad (3)$$

$n = 0$ gives

$$2a_2 + 2a_0 = 0$$

$$a_2 = -a_0$$

$n = 1$ gives

$$6a_3 + 6a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -a_1$$

For $2 \leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(n+1) + 4na_n + 4a_{n-2} + 2a_n = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{2(2na_n + a_n + 2a_{n-2})}{(n+2)\,(n+1)} \\ &= -\frac{2(2n+1)\, a_n}{(n+2)\,(n+1)} - \frac{4a_{n-2}}{(n+2)\,(n+1)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$12a_4 + 10a_2 + 4a_0 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{2}$$

For $n = 3$ the recurrence equation gives

$$20a_5 + 14a_3 + 4a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_1}{2}$$

For $n = 4$ the recurrence equation gives

$$30a_6 + 18a_4 + 4a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{a_0}{6}$$

For $n = 5$ the recurrence equation gives

$$42a_7 + 22a_5 + 4a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{a_1}{6}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - a_0 x^2 - a_1 x^3 + \frac{1}{2} a_0 x^4 + \frac{1}{2} a_1 x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - x^2 + \frac{1}{2}x^4\right) a_0 + \left(x - x^3 + \frac{1}{2}x^5\right) a_1 + O\left(x^6\right) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - x^2 + \frac{1}{2}x^4\right) c_1 + \left(x - x^3 + \frac{1}{2}x^5\right) c_2 + O\left(x^6\right)$$

$$y = x - x^3 + \frac{x^5}{2} + O\left(x^6\right)$$

Summary
The solution(s) found are the following

$$y = x - x^3 + \frac{x^5}{2} + O(x^6) \tag{1}$$

$$y = x - x^3 + \frac{x^5}{2} + O(x^6) \tag{2}$$

Verification of solutions

$$y = x - x^3 + \frac{x^5}{2} + O(x^6)$$

Verified OK.

$$y = x - x^3 + \frac{x^5}{2} + O(x^6)$$

Verified OK.

13.40.2 Maple step by step solution

Let's solve

$\left[y'' = -4x^2y - 4y'x - 2y, y(0) = 0, y'\Big|_{\{x=0\}} = 1\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = (-4x^2 - 2)\, y - 4y'x$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + 4y'x + (4x^2 + 2)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite ODE with series expansions

- ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=\max(0,-m)}^{\infty} a_k x^{k+m}$

- ◦ Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=\max(0,-m)+m}^{\infty} a_{k-m} x^k$$

- Convert $x \cdot y'$ to series expansion

$$x \cdot y' = \sum_{k=0}^{\infty} a_k k\, x^k$$

- Convert y'' to series expansion

$$y'' = \sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$$

- Shift index using $k->k+2$

$$y'' = \sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$$

Rewrite ODE with series expansions

$$2a_2 + 2a_0 + (6a_3 + 6a_1)\, x + \left(\sum_{k=2}^{\infty} (a_{k+2}(k+2)\,(k+1) + 2a_k(2k+1) + 4a_{k-2})\, x^k\right) = 0$$

- The coefficients of each power of x must be 0

$$[2a_2 + 2a_0 = 0, 6a_3 + 6a_1 = 0]$$

- Solve for the dependent coefficient(s)

$$\{a_2 = -a_0, a_3 = -a_1\}$$

- Each term in the series must be 0, giving the recursion relation

$$(k^2 + 3k + 2)\, a_{k+2} + 4a_k k + 2a_k + 4a_{k-2} = 0$$

- Shift index using $k->k+2$

$$\left((k+2)^2 + 3k + 8\right) a_{k+4} + 4a_{k+2}(k+2) + 2a_{k+2} + 4a_k = 0$$

- Recursion relation that defines the series solution to the ODE

$$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+4} = -\frac{2(2k a_{k+2} + 2a_k + 5a_{k+2})}{k^2 + 7k + 12}, a_2 = -a_0, a_3 = -a_1\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 40.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(x+1)\,y''+y'x^2+(1+2x)\,y=0}$$

With initial conditions

$$[y(0)=-2, y'(0)=3]$$

With the expansion point for the power series method at $x=0$.

13.41.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=\frac{x^2}{x+1}\\ q(x)&=\frac{1+2x}{x+1}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' + \frac{x^2 y'}{x+1} + \frac{(1+2x)\,y}{x+1} = 0$$

The domain of $p(x) = \frac{x^2}{x+1}$ is

$$\{x < -1 \lor -1 < x\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{1+2x}{x+1}$ is

$$\{x < -1 \lor -1 < x\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\,y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{1049}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{1050}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y'_0} \qquad (7)$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{y'x^2 + 2yx + y}{x+1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{(x^4 - 3x^2 - 5x - 1)\, y' + y(2x^3 + x^2 - 1)}{(x+1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(-x^6 + 7x^4 + 12x^3 + 2x^2 - 2x - 4)\, y' - 2\left(x^5 + \frac{1}{2}x^4 - 4x^3 - \frac{19}{2}x^2 - \frac{9}{2}x - \frac{3}{2}\right) y}{(x+1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(x^8 - 12x^6 - 21x^5 + 12x^4 + 57x^3 + 66x^2 + 20x + 13)\, y' + 2\left(x^7 + \frac{1}{2}x^6 - 9x^5 - 21x^4 - 10x^3 + \frac{7}{2}x^2 + \right.}{(x+1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-x^{10} + 18x^8 + 32x^7 - 53x^6 - 210x^5 - 233x^4 - 42x^3 + 63x^2 + 106x - 28)\, y' - 2\left(x^9 + \frac{1}{2}x^8 - 15x^7 \right.}{(x+1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = -2$ and $y'(0) = 3$ gives

$$
\begin{aligned}
F_0 &= 2 \\
F_1 &= -1 \\
F_2 &= -18 \\
F_3 &= 31 \\
F_4 &= -86
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = x^2 + 3x - 2 - \frac{x^3}{6} - \frac{3x^4}{4} + \frac{31x^5}{120} - \frac{43x^6}{360} + O(x^6)
$$

$$
y = x^2 + 3x - 2 - \frac{x^3}{6} - \frac{3x^4}{4} + \frac{31x^5}{120} - \frac{43x^6}{360} + O(x^6)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$
(x+1)\, y'' + y' x^2 + (1+2x)\, y = 0
$$

Let the solution be represented as power series of the form

$$
y = \sum_{n=0}^{\infty} a_n x^n
$$

Then

$$
y' = \sum_{n=1}^{\infty} n a_n x^{n-1}
$$
$$
y'' = \sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}
$$

Substituting the above back into the ode gives

$$
(x+1)\left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x^2 + (1+2x)\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \quad (1)
$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} n\, x^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2}\right) \\
&+ \left(\sum_{n=1}^{\infty} n\, x^{1+n} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^n\right) + \left(\sum_{n=0}^{\infty} 2x^{1+n} a_n\right) = 0
\end{aligned} \quad (2)
$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$
\sum_{n=2}^{\infty} n\, x^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} (1+n)\, a_{1+n} n\, x^n
$$

$$
\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2} (1+n)\, x^n
$$

$$\sum_{n=1}^{\infty} n\, x^{1+n} a_{n} = \sum_{n=2}^{\infty} (n-1)\, a_{n-1} x^{n}$$

$$\sum_{n=0}^{\infty} 2 x^{1+n} a_{n} = \sum_{n=1}^{\infty} 2 a_{n-1} x^{n}$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=1}^{\infty} (1+n)\, a_{1+n} n\, x^{n}\right) + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2} (1+n)\, x^{n}\right) + \left(\sum_{n=2}^{\infty} (n-1)\, a_{n-1} x^{n}\right) + \left(\sum_{n=0}^{\infty} a_{n} x^{n}\right) + \left(\sum_{n=1}^{\infty} 2 a_{n-1} x^{n}\right) = 0 \tag{3}$$

$n = 0$ gives

$$2 a_{2} + a_{0} = 0$$

$$a_{2} = -\frac{a_{0}}{2}$$

$n = 1$ gives

$$2 a_{2} + 6 a_{3} + a_{1} + 2 a_{0} = 0$$

Which after substituting earlier equations, simplifies to

$$a_{3} = -\frac{a_{0}}{6} - \frac{a_{1}}{6}$$

For $2 \le n$, the recurrence equation is

$$(1+n)\, a_{1+n} n + (n+2)\, a_{n+2} (1+n) + (n-1)\, a_{n-1} + a_{n} + 2 a_{n-1} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{n^{2} a_{1+n} + n a_{1+n} + n a_{n-1} + a_{n} + a_{n-1}}{(n+2)\,(1+n)} \\ &= -\frac{a_{n}}{(n+2)\,(1+n)} - \frac{(n^{2}+n)\, a_{1+n}}{(n+2)\,(1+n)} - \frac{a_{n-1}}{n+2} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$6a_3 + 12a_4 + 3a_1 + a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{8} - \frac{a_1}{6}$$

For $n = 3$ the recurrence equation gives

$$12a_4 + 20a_5 + 4a_2 + a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_0}{30} + \frac{13a_1}{120}$$

For $n = 4$ the recurrence equation gives

$$20a_5 + 30a_6 + 5a_3 + a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{a_0}{720} - \frac{7a_1}{180}$$

For $n = 5$ the recurrence equation gives

$$30a_6 + 42a_7 + 6a_4 + a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{11a_0}{560} + \frac{247a_1}{5040}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - \frac{a_0 x^2}{2} + \left(-\frac{a_0}{6} - \frac{a_1}{6}\right) x^3 + \left(\frac{a_0}{8} - \frac{a_1}{6}\right) x^4 + \left(\frac{a_0}{30} + \frac{13 a_1}{120}\right) x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{1}{2}x^2 - \frac{1}{6}x^3 + \frac{1}{8}x^4 + \frac{1}{30}x^5\right) a_0 + \left(x - \frac{1}{6}x^3 - \frac{1}{6}x^4 + \frac{13}{120}x^5\right) a_1 + O(x^6) \quad (3)$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{1}{2}x^2 - \frac{1}{6}x^3 + \frac{1}{8}x^4 + \frac{1}{30}x^5\right) c_1 + \left(x - \frac{1}{6}x^3 - \frac{1}{6}x^4 + \frac{13}{120}x^5\right) c_2 + O(x^6)$$

$$y = -2 + x^2 - \frac{x^3}{6} - \frac{3x^4}{4} + \frac{31x^5}{120} + 3x + O(x^6)$$

Summary

The solution(s) found are the following

$$y = x^2 + 3x - 2 - \frac{x^3}{6} - \frac{3x^4}{4} + \frac{31x^5}{120} - \frac{43x^6}{360} + O(x^6) \quad (1)$$

$$y = -2 + x^2 - \frac{x^3}{6} - \frac{3x^4}{4} + \frac{31x^5}{120} + 3x + O(x^6) \quad (2)$$

Verification of solutions

$$y = x^2 + 3x - 2 - \frac{x^3}{6} - \frac{3x^4}{4} + \frac{31x^5}{120} - \frac{43x^6}{360} + O(x^6)$$

Verified OK.

$$y = -2 + x^2 - \frac{x^3}{6} - \frac{3x^4}{4} + \frac{31x^5}{120} + 3x + O(x^6)$$

Verified OK.

13.41.2 Maple step by step solution

Let's solve

$\left[(x+1)\,y''+y' x^2+(1+2x)\,y=0, y(0)=-2, y'\Big|_{\{x=0\}}=3\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{x^2 y'}{x+1}-\frac{(1+2x)y}{x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{x^2 y'}{x+1}+\frac{(1+2x)y}{x+1}=0$

☐ Check to see if $x_0=-1$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{x^2}{x+1}, P_3(x)=\frac{1+2x}{x+1}\right]$

  ◦ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

  $\left((x+1)\cdot P_2(x)\right)\Big|_{x=-1}=1$

  ◦ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

  $\left((x+1)^2\cdot P_3(x)\right)\Big|_{x=-1}=0$

  ◦ $x=-1$is a regular singular point

  Check to see if $x_0=-1$ is a regular singular point

  $x_0=-1$

- Multiply by denominators

  $(x+1)\,y''+y' x^2+(1+2x)\,y=0$

- Change variables using $x=u-1$ so that the regular singular point is at $u=0$

  $u\left(\frac{d^2}{du^2}y(u)\right)+\left(u^2-2u+1\right)\left(\frac{d}{du}y(u)\right)+(-1+2u)\,y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

$$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

- Shift index using $k- >k - m$

$$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

$$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

$$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

$$u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-1}$$

- Shift index using $k- >k + 1$

$$u \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\,(k+r)\, u^{k+r}$$

Rewrite ODE with series expansions

$$a_0 r^2 u^{-1+r} + \left(a_1(1+r)^2 - a_0(1+2r)\right) u^r + \left(\sum_{k=1}^{\infty} \left(a_{k+1}(k+1+r)^2 - a_k(2k+2r+1) + a_{k-1}(k -\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$r^2 = 0$$

- Values of r that satisfy the indicial equation

$$r = 0$$

- Each term must be 0

$$a_1(1+r)^2 - a_0(1+2r) = 0$$

- Each term in the series must be 0, giving the recursion relation

$$k^2 a_{k+1} + (-2a_k + a_{k-1} + 2a_{k+1})\, k - a_k + a_{k-1} + a_{k+1} = 0$$

- Shift index using $k- >k + 1$

$$(k+1)^2 a_{k+2} + (-2a_{k+1} + a_k + 2a_{k+2})\,(k+1) - a_{k+1} + a_k + a_{k+2} = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{a_k k - 2k a_{k+1} + 2a_k - 3a_{k+1}}{k^2 + 4k + 4}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{a_k k - 2k a_{k+1} + 2a_k - 3a_{k+1}}{k^2 + 4k + 4}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{a_k k - 2k a_{k+1} + 2a_k - 3a_{k+1}}{k^2 + 4k + 4}, a_1 - a_0 = 0\right]$$

- Revert the change of variables $u = x + 1$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^k, a_{k+2} = -\frac{a_k k - 2k a_{k+1} + 2a_k - 3a_{k+1}}{k^2 + 4k + 4}, a_1 - a_0 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 41.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' + (x^2 + 2x + 1)\, y' + 2y = 0}$$

With initial conditions

$$[y(0) = 2, y'(0) = 3]$$

With the expansion point for the power series method at $x = 0$.

13.42.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= (x+1)^2 \\ q(x) &= 2 \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + (x+1)^2 y' + 2y = 0$$

The domain of $p(x) = (x+1)^2$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = 2$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0) y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \left. \frac{d^n f}{dx^n} \right|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{1052}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{1053}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)\,!}F_n|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -y'x^2 - 2y'x - y' - 2y \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \left(x^4 + 4x^3 + 6x^2 + 2x - 3\right) y' + 2y(x+1)^2 \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \left(-x^6 - 6x^5 - 15x^4 - 14x^3 + 7x^2 + 20x + 7\right) y' - 2y\left(x^4 + 4x^3 + 6x^2 - 5\right) \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \left(x^8 + 8x^7 + 28x^6 + 44x^5 + 4x^4 - 88x^3 - 108x^2 - 20x + 23\right) y' + 2y\left(x^6 + 6x^5 + 15x^4 + 10x^3 - 19x^2
\\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \left(-x^{10} - 10x^9 - 45x^8 - 100x^7 - 62x^6 + 216x^5 + 530x^4 + 360x^3 - 177x^2 - 306x - 57\right) y' - 2y\left(x^8 +
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 2$ and $y'(0) = 3$ gives

$$
\begin{aligned}
F_0 &= -7 \\
F_1 &= -5 \\
F_2 &= 41 \\
F_3 &= 41 \\
F_4 &= -391
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = 3x + 2 - \frac{7x^2}{2} - \frac{5x^3}{6} + \frac{41x^4}{24} + \frac{41x^5}{120} - \frac{391x^6}{720} + O\left(x^6\right)
$$

$$
y = 3x + 2 - \frac{7x^2}{2} - \frac{5x^3}{6} + \frac{41x^4}{24} + \frac{41x^5}{120} - \frac{391x^6}{720} + O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = -\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x^2 - 2\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) x - \left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) - 2\left(\sum_{n=0}^{\infty} a_n x^n\right) \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + \left(\sum_{n=1}^{\infty} n\, x^{1+n} a_n\right) + \left(\sum_{n=1}^{\infty} 2n a_n x^n\right) + \left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right) + \left(\sum_{n=0}^{\infty} 2a_n x^n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2) a_{n+2}(1+n) x^n$$
$$\sum_{n=1}^{\infty} n\, x^{1+n} a_n = \sum_{n=2}^{\infty} (n-1) a_{n-1} x^n$$
$$\sum_{n=1}^{\infty} n a_n x^{n-1} = \sum_{n=0}^{\infty} (1+n) a_{1+n} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, x^{n}\right)+\left(\sum_{n=2}^{\infty} (n-1)\, a_{n-1} x^{n}\right) \\ +\left(\sum_{n=1}^{\infty} 2n a_{n} x^{n}\right)+\left(\sum_{n=0}^{\infty} (1+n)\, a_{1+n} x^{n}\right)+\left(\sum_{n=0}^{\infty} 2 a_{n} x^{n}\right)=0 \tag{3}$$

$n=0$ gives

$$2a_{2}+a_{1}+2a_{0}=0$$

$$a_{2}=-a_{0}-\frac{a_{1}}{2}$$

$n=1$ gives

$$6a_{3}+4a_{1}+2a_{2}=0$$

Which after substituting earlier equations, simplifies to

$$a_{3}=\frac{a_{0}}{3}-\frac{a_{1}}{2}$$

For $2\leq n$, the recurrence equation is

$$(n+2)\, a_{n+2}(1+n)+(n-1)\, a_{n-1}+2n a_{n}+(1+n)\, a_{1+n}+2a_{n}=0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2}&=-\frac{2n a_{n}+n a_{1+n}+n a_{n-1}+2a_{n}+a_{1+n}-a_{n-1}}{(n+2)\,(1+n)} \\ &=-\frac{(2n+2)\, a_{n}}{(n+2)\,(1+n)}-\frac{a_{1+n}}{n+2}-\frac{(n-1)\, a_{n-1}}{(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n=2$ the recurrence equation gives

$$12a_{4}+a_{1}+6a_{2}+3a_{3}=0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{7a_1}{24} + \frac{5a_0}{12}$$

For $n = 3$ the recurrence equation gives

$$20a_5 + 2a_2 + 8a_3 + 4a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{7a_0}{60} + \frac{23a_1}{120}$$

For $n = 4$ the recurrence equation gives

$$30a_6 + 3a_3 + 10a_4 + 5a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{11a_0}{72} - \frac{19a_1}{240}$$

For $n = 5$ the recurrence equation gives

$$42a_7 + 4a_4 + 12a_5 + 6a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{359a_1}{5040} + \frac{13a_0}{840}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x + \left(-a_0 - \frac{a_1}{2}\right) x^2 + \left(\frac{a_0}{3} - \frac{a_1}{2}\right) x^3 + \left(\frac{7a_1}{24} + \frac{5a_0}{12}\right) x^4 + \left(-\frac{7a_0}{60} + \frac{23a_1}{120}\right) x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - x^2 + \frac{1}{3}x^3 + \frac{5}{12}x^4 - \frac{7}{60}x^5\right) a_0 + \left(x - \frac{1}{2}x^2 - \frac{1}{2}x^3 + \frac{7}{24}x^4 + \frac{23}{120}x^5\right) a_1 + O(x^6) \tag{3}$$

At $x = 0$ the solution above becomes

$$y = \left(1 - x^2 + \frac{1}{3}x^3 + \frac{5}{12}x^4 - \frac{7}{60}x^5\right) c_1 + \left(x - \frac{1}{2}x^2 - \frac{1}{2}x^3 + \frac{7}{24}x^4 + \frac{23}{120}x^5\right) c_2 + O(x^6)$$

$$y = 2 - \frac{7x^2}{2} - \frac{5x^3}{6} + \frac{41x^4}{24} + \frac{41x^5}{120} + 3x + O(x^6)$$

Summary

The solution(s) found are the following

$$y = 3x + 2 - \frac{7x^2}{2} - \frac{5x^3}{6} + \frac{41x^4}{24} + \frac{41x^5}{120} - \frac{391x^6}{720} + O(x^6) \tag{1}$$

$$y = 2 - \frac{7x^2}{2} - \frac{5x^3}{6} + \frac{41x^4}{24} + \frac{41x^5}{120} + 3x + O(x^6) \tag{2}$$

Verification of solutions

$$y = 3x + 2 - \frac{7x^2}{2} - \frac{5x^3}{6} + \frac{41x^4}{24} + \frac{41x^5}{120} - \frac{391x^6}{720} + O(x^6)$$

Verified OK.

$$y = 2 - \frac{7x^2}{2} - \frac{5x^3}{6} + \frac{41x^4}{24} + \frac{41x^5}{120} + 3x + O(x^6)$$

Verified OK.

13.42.2 Maple step by step solution

Let's solve

$$\left[y'' = -y'x^2 - 2y'x - y' - 2y, y(0) = 2, y'\Big|_{\{x=0\}} = 3\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$$y''+(x^2+2x+1)\,y'+2y=0$$

- Assume series solution for y

$$y=\sum_{k=0}^{\infty} a_k x^k$$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y'$ to series expansion for $m=0..2$

$$x^m \cdot y'=\sum_{k=\max(0,1-m)}^{\infty} a_k k\, x^{k-1+m}$$

  - Shift index using $k->k+1-m$

$$x^m \cdot y'=\sum_{k=\max(0,1-m)+m-1}^{\infty} a_{k+1-m}(k+1-m)\, x^k$$

  - Convert y'' to series expansion

$$y''=\sum_{k=2}^{\infty} a_k k(k-1)\, x^{k-2}$$

  - Shift index using $k->k+2$

$$y''=\sum_{k=0}^{\infty} a_{k+2}(k+2)\,(k+1)\, x^k$$

Rewrite ODE with series expansions

$$2a_2+a_1+2a_0+\left(\sum_{k=1}^{\infty} \left(a_{k+2}(k+2)\,(k+1)+a_{k+1}(k+1)+2a_k(k+1)+a_{k-1}(k-1)\right) x^k\right)=0$$

- Each term must be 0

$$2a_2+a_1+2a_0=0$$

- Each term in the series must be 0, giving the recursion relation

$$k^2a_{k+2}+(2a_k+a_{k-1}+a_{k+1}+3a_{k+2})\,k+2a_k-a_{k-1}+a_{k+1}+2a_{k+2}=0$$

- Shift index using $k->k+1$

$$(k+1)^2\, a_{k+3}+(2a_{k+1}+a_k+a_{k+2}+3a_{k+3})\,(k+1)+2a_{k+1}-a_k+a_{k+2}+2a_{k+3}=0$$

- Recursion relation that defines the series solution to the ODE

$$\left[y=\sum_{k=0}^{\infty} a_k x^k, a_{k+3}=-\frac{a_k k+2a_{k+1}k+k a_{k+2}+4a_{k+1}+2a_{k+2}}{k^2+5k+6}, 2a_2+a_1+2a_0=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 42.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(x^2+1)\, y''+(x^2+2)\, y'+yx=0}$$

With initial conditions

$$[y(0)=-3, y'(0)=5]$$

With the expansion point for the power series method at $x=0$.

13.43.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=\frac{x^2+2}{x^2+1}\\ q(x)&=\frac{x}{x^2+1}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' + \frac{(x^2+2)\,y'}{x^2+1} + \frac{xy}{x^2+1} = 0$$

The domain of $p(x) = \frac{x^2+2}{x^2+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{x}{x^2+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\,y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{1055}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{1056}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') && (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f && (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 && (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \tag{7}
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{y' x^2 + yx + 2y'}{x^2 + 1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{(x^4 - x^3 + 4x^2 + x + 4)\, y' + y(x^3 + x^2 + 2x - 1)}{(x^2 + 1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(-x^6 + 2x^5 - 4x^4 - 18x^2 - 8x - 8)\, y' - y(x^5 + 6x^3 + 4x^2 - 2x - 2)}{(x^2 + 1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(x^8 - 3x^7 + 4x^6 - 9x^5 + 32x^4 + 60x^3 + 82x^2 + 30x + 10)\, y' + y(x^7 - x^6 + 4x^5 + 13x^4 + 34x^3 - 20x}{(x^2 + 1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-x^{10} + 4x^9 - 4x^8 + 20x^7 - 22x^6 - 108x^5 - 498x^4 - 492x^3 - 222x^2 + 12x + 12)\, y' - y(x^9 - 2x^8 +}{(x^2 + 1)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = -3$ and $y'(0) = 5$ gives

$$
\begin{aligned}
F_0 &= -10 \\
F_1 &= 23 \\
F_2 &= -46 \\
F_3 &= 44 \\
F_4 &= 96
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = -5x^2 + 5x - 3 + \frac{23x^3}{6} - \frac{23x^4}{12} + \frac{11x^5}{30} + \frac{2x^6}{15} + O(x^6)
$$

$$
y = -5x^2+5x-3+\frac{23x^3}{6}-\frac{23x^4}{12}+\frac{11x^5}{30}+\frac{2x^6}{15}+O\left(x^6\right)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$
\left(x^2+1\right)y''+\left(x^2+2\right)y'+yx = 0
$$

Let the solution be represented as power series of the form

$$
y = \sum_{n=0}^{\infty} a_n x^n
$$

Then

$$
\begin{aligned}
y' &= \sum_{n=1}^{\infty} n a_n x^{n-1} \\
y'' &= \sum_{n=2}^{\infty} n(n-1)\,a_n x^{n-2}
\end{aligned}
$$

Substituting the above back into the ode gives

$$
\left(x^2+1\right)\left(\sum_{n=2}^{\infty} n(n-1)\,a_n x^{n-2}\right)+\left(x^2+2\right)\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right)+\left(\sum_{n=0}^{\infty} a_n x^n\right)x = 0 \tag{1}
$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} x^n a_n n(n-1)\right)+\left(\sum_{n=2}^{\infty} n(n-1)\,a_n x^{n-2}\right) \\
&+\left(\sum_{n=1}^{\infty} n\,x^{1+n} a_n\right)+\left(\sum_{n=1}^{\infty} 2n a_n x^{n-1}\right)+\left(\sum_{n=0}^{\infty} x^{1+n} a_n\right) = 0
\end{aligned} \tag{2}
$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=2}^{\infty} n(n-1)\,a_n x^{n-2} &= \sum_{n=0}^{\infty} (n+2)\,a_{n+2}(1+n)\,x^n \\
\sum_{n=1}^{\infty} n\,x^{1+n} a_n &= \sum_{n=2}^{\infty} (n-1)\,a_{n-1} x^n
\end{aligned}
$$

$$\sum_{n=1}^{\infty} 2n a_n x^{n-1} = \sum_{n=0}^{\infty} 2(1+n) a_{1+n} x^n$$

$$\sum_{n=0}^{\infty} x^{1+n} a_n = \sum_{n=1}^{\infty} a_{n-1} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} x^n a_n n(n-1)\right) + \left(\sum_{n=0}^{\infty} (n+2) a_{n+2}(1+n) x^n\right) + \left(\sum_{n=2}^{\infty} (n-1) a_{n-1} x^n\right) + \left(\sum_{n=0}^{\infty} 2(1+n) a_{1+n} x^n\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$2a_2 + 2a_1 = 0$$

$$a_2 = -a_1$$

$n = 1$ gives

$$6a_3 + 4a_2 + a_0 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{a_0}{6} + \frac{2a_1}{3}$$

For $2 \leq n$, the recurrence equation is

$$n a_n(n-1) + (n+2) a_{n+2}(1+n) + (n-1) a_{n-1} + 2(1+n) a_{1+n} + a_{n-1} = 0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{n^2 a_n - n a_n + 2n a_{1+n} + n a_{n-1} + 2a_{1+n}}{(n+2)(1+n)} \\ &= -\frac{(n^2-n) a_n}{(n+2)(1+n)} - \frac{(2n+2) a_{1+n}}{(n+2)(1+n)} - \frac{n a_{n-1}}{(n+2)(1+n)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$2a_2 + 12a_4 + 2a_1 + 6a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{a_1}{3} + \frac{a_0}{12}$$

For $n = 3$ the recurrence equation gives

$$6a_3 + 20a_5 + 3a_2 + 8a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_0}{60} + \frac{a_1}{12}$$

For $n = 4$ the recurrence equation gives

$$12a_4 + 30a_6 + 4a_3 + 10a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{a_1}{60} - \frac{a_0}{60}$$

For $n = 5$ the recurrence equation gives

$$20a_5 + 42a_7 + 5a_4 + 12a_6 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{11a_0}{840} - \frac{a_1}{210}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - a_1 x^2 + \left(-\frac{a_0}{6} + \frac{2a_1}{3}\right) x^3 + \left(-\frac{a_1}{3} + \frac{a_0}{12}\right) x^4 + \left(\frac{a_0}{60} + \frac{a_1}{12}\right) x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{1}{6}x^3 + \frac{1}{12}x^4 + \frac{1}{60}x^5\right) a_0 + \left(x - x^2 + \frac{2}{3}x^3 - \frac{1}{3}x^4 + \frac{1}{12}x^5\right) a_1 + O(x^6) \quad (3)$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{1}{6}x^3 + \frac{1}{12}x^4 + \frac{1}{60}x^5\right) c_1 + \left(x - x^2 + \frac{2}{3}x^3 - \frac{1}{3}x^4 + \frac{1}{12}x^5\right) c_2 + O(x^6)$$

$$y = -3 + \frac{23x^3}{6} - \frac{23x^4}{12} + \frac{11x^5}{30} + 5x - 5x^2 + O(x^6)$$

Summary

The solution(s) found are the following

$$y = -5x^2 + 5x - 3 + \frac{23x^3}{6} - \frac{23x^4}{12} + \frac{11x^5}{30} + \frac{2x^6}{15} + O(x^6) \quad (1)$$

$$y = -3 + \frac{23x^3}{6} - \frac{23x^4}{12} + \frac{11x^5}{30} + 5x - 5x^2 + O(x^6) \quad (2)$$

Verification of solutions

$$y = -5x^2 + 5x - 3 + \frac{23x^3}{6} - \frac{23x^4}{12} + \frac{11x^5}{30} + \frac{2x^6}{15} + O(x^6)$$

Verified OK.

$$y = -3 + \frac{23x^3}{6} - \frac{23x^4}{12} + \frac{11x^5}{30} + 5x - 5x^2 + O(x^6)$$

Verified OK.

Problem number: 43.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(x+1)\,y''+\left(2x^{2}-3x+1\right)y'-(x-4)\,y=0}$$

With initial conditions

$$[y(1)=-2, y'(1)=3]$$

With the expansion point for the power series method at $x=1$.

13.44.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=\frac{2x^{2}-3x+1}{x+1}\\ q(x)&=\frac{-x+4}{x+1}\\ F&=0\end{aligned}$$

Hence the ode is

$$y'' + \frac{(2x^2 - 3x + 1)\, y'}{x+1} + \frac{(-x+4)\, y}{x+1} = 0$$

The domain of $p(x) = \frac{2x^2-3x+1}{x+1}$ is

$$\{x < -1 \lor -1 < x\}$$

And the point $x_0 = 1$ is inside this domain. The domain of $q(x) = \frac{-x+4}{x+1}$ is

$$\{x < -1 \lor -1 < x\}$$

And the point $x_0 = 1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x - 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(\frac{d^2}{dt^2} y(t)\right) (2+t) + \left(2(t+1)^2 - 3t - 2\right) \left(\frac{d}{dt} y(t)\right) + (-t+3)\, y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = -2$$
$$y'(0) = 3$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (1058) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (1059) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y''\\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0, y_0, y_0'} \qquad (7)$$

To find $y(x)$ series solution around $x = 0$. Hence

$$F_0 = -\frac{2\left(\frac{d}{dt}y(t)\right)t^2 + t\left(\frac{d}{dt}y(t)\right) - y(t)\,t + 3y(t)}{2+t}$$

$$\begin{aligned}
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y(t)}F_0 \\
&= \frac{(4t^4 + 4t^3 - 9t - 8)\left(\frac{d}{dt}y(t)\right) - 2\left(t^3 - \frac{5}{2}t^2 - \frac{3}{2}t - \frac{5}{2}\right)y(t)}{(2+t)^2}
\end{aligned}$$

$$\begin{aligned}
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y(t)}F_1 \\
&= \frac{(-8t^6 - 12t^5 + 2t^4 + 55t^3 + 62t^2 + 28t + 8)\left(\frac{d}{dt}y(t)\right) + 4\left(t^5 - 2t^4 - \frac{7}{2}t^3 - \frac{21}{4}t^2 + 9t + 5\right)y(t)}{(2+t)^3}
\end{aligned}$$

$$\begin{aligned}
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y(t)}F_2 \\
&= \frac{(16t^8 + 32t^7 - 12t^6 - 232t^5 - 327t^4 - 151t^3 + 218t^2 + 276t + 72)\left(\frac{d}{dt}y(t)\right) - 8\left(t^7 - \frac{3}{2}t^6 - \frac{23}{4}t^5 - \frac{81}{8}t\right.}{(2+t)^4}
\end{aligned}$$

$$\begin{aligned}
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y(t)}F_3 \\
&= \frac{(-32t^{10} - 80t^9 + 48t^8 + 824t^7 + 1380t^6 + 426t^5 - 2610t^4 - 3790t^3 - 2436t^2 - 504t + 240)\left(\frac{d}{dt}y(t)\right)}{(2+t)^5}
\end{aligned}$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = -2$ and $y'(0) = 3$ gives

$$\begin{aligned}
F_0 &= 3 \\
F_1 &= -\frac{17}{2} \\
F_2 &= -2 \\
F_3 &= 15 \\
F_4 &= 62
\end{aligned}$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = -2 + 3t + \frac{3t^2}{2} - \frac{17t^3}{12} - \frac{t^4}{12} + \frac{t^5}{8} + \frac{31t^6}{360} + O(t^6)$$

$$y(t) = -2 + 3t + \frac{3t^2}{2} - \frac{17t^3}{12} - \frac{t^4}{12} + \frac{t^5}{8} + \frac{31t^6}{360} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(2+t) + (2t^2+t)\left(\frac{d}{dt}y(t)\right) + (-t+3)\,y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right)(2+t) + (2t^2+t)\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + (-t+3)\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} n\,t^{n-1}a_n(n-1)\right) + \left(\sum_{n=2}^{\infty} 2n(n-1)\,a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} 2n\,t^{1+n}a_n\right) + \left(\sum_{n=1}^{\infty} n a_n t^n\right) + \sum_{n=0}^{\infty}\left(-t^{1+n}a_n\right) + \left(\sum_{n=0}^{\infty} 3a_n t^n\right) = 0 \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=2}^{\infty} n\, t^{n-1} a_n (n-1) &= \sum_{n=1}^{\infty} (1+n)\, a_{1+n} n\, t^n \\
\sum_{n=2}^{\infty} 2n(n-1)\, a_n t^{n-2} &= \sum_{n=0}^{\infty} 2(n+2)\, a_{n+2} (1+n)\, t^n \\
\sum_{n=1}^{\infty} 2n\, t^{1+n} a_n &= \sum_{n=2}^{\infty} 2(n-1)\, a_{n-1} t^n \\
\sum_{n=0}^{\infty} \left(-t^{1+n} a_n\right) &= \sum_{n=1}^{\infty} \left(-a_{n-1} t^n\right)
\end{aligned}
$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$
\begin{aligned}
&\left(\sum_{n=1}^{\infty} (1+n)\, a_{1+n} n\, t^n\right) + \left(\sum_{n=0}^{\infty} 2(n+2)\, a_{n+2} (1+n)\, t^n\right) \\
&+ \left(\sum_{n=2}^{\infty} 2(n-1)\, a_{n-1} t^n\right) + \left(\sum_{n=1}^{\infty} n a_n t^n\right) + \sum_{n=1}^{\infty} \left(-a_{n-1} t^n\right) + \left(\sum_{n=0}^{\infty} 3 a_n t^n\right) = 0
\end{aligned} \tag{3}
$$

$n = 0$ gives

$$4a_2 + 3a_0 = 0$$

$$a_2 = -\frac{3a_0}{4}$$

$n = 1$ gives

$$2a_2 + 12a_3 + 4a_1 - a_0 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{5a_0}{24} - \frac{a_1}{3}$$

For $2 \leq n$, the recurrence equation is

$$(1+n) a_{1+n} n + 2(n+2) a_{n+2}(1+n) + 2(n-1) a_{n-1} + n a_n - a_{n-1} + 3a_n = 0 \quad (4)$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{n^2 a_{1+n} + n a_n + n a_{1+n} + 2n a_{n-1} + 3a_n - 3a_{n-1}}{2(n+2)(1+n)} \\ &= -\frac{(n+3) a_n}{2(n+2)(1+n)} - \frac{(n^2+n) a_{1+n}}{2(n+2)(1+n)} - \frac{(2n-3) a_{n-1}}{2(n+2)(1+n)} \end{aligned} \quad (5)$$

For $n = 2$ the recurrence equation gives

$$6a_3 + 24a_4 + a_1 + 5a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{5a_0}{48} + \frac{a_1}{24}$$

For $n = 3$ the recurrence equation gives

$$12a_4 + 40a_5 + 3a_2 + 6a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{a_0}{160} + \frac{3a_1}{80}$$

For $n = 4$ the recurrence equation gives

$$20a_5 + 60a_6 + 5a_3 + 7a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{79a_0}{2880} + \frac{a_1}{96}$$

For $n = 5$ the recurrence equation gives

$$30a_6 + 84a_7 + 7a_4 + 8a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{23a_0}{13440} - \frac{31a_1}{2880}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t - \frac{3a_0 t^2}{4} + \left(\frac{5a_0}{24} - \frac{a_1}{3}\right) t^3 + \left(\frac{5a_0}{48} + \frac{a_1}{24}\right) t^4 + \left(-\frac{a_0}{160} + \frac{3a_1}{80}\right) t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - \frac{3}{4}t^2 + \frac{5}{24}t^3 + \frac{5}{48}t^4 - \frac{1}{160}t^5\right) a_0 + \left(t - \frac{1}{3}t^3 + \frac{1}{24}t^4 + \frac{3}{80}t^5\right) a_1 + O(t^6) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - \frac{3}{4}t^2 + \frac{5}{24}t^3 + \frac{5}{48}t^4 - \frac{1}{160}t^5\right) c_1 + \left(t - \frac{1}{3}t^3 + \frac{1}{24}t^4 + \frac{3}{80}t^5\right) c_2 + O(t^6)$$

$$y(t) = -2 + \frac{3t^2}{2} - \frac{17t^3}{12} - \frac{t^4}{12} + \frac{t^5}{8} + 3t + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x-1$ results in

$$y = -5 + 3x + \frac{3(x-1)^2}{2} - \frac{17(x-1)^3}{12} - \frac{(x-1)^4}{12} + \frac{(x-1)^5}{8} + \frac{31(x-1)^6}{360} + O\left((x-1)^6\right)$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = -5 + 3x + \frac{3(x-1)^2}{2} - \frac{17(x-1)^3}{12} - \frac{(x-1)^4}{12} \\ + \frac{(x-1)^5}{8} + \frac{31(x-1)^6}{360} + O\left((x-1)^6\right) \end{aligned} \quad (1)$$

Verification of solutions

$$y = -5+3x+\frac{3(x-1)^2}{2}-\frac{17(x-1)^3}{12}-\frac{(x-1)^4}{12}+\frac{(x-1)^5}{8}+\frac{31(x-1)^6}{360}+O\left((x-1)^6\right)$$

Verified OK.

13.44.2 Maple step by step solution

Let's solve

$\left[(x+1)\,y''+(2x^2-3x+1)\,y'+(-x+4)\,y=0, y(1)=-2, y'\Big|_{\{x=1\}}=3\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{(x-4)y}{x+1}-\frac{(2x^2-3x+1)y'}{x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(2x^2-3x+1)y'}{x+1}-\frac{(x-4)y}{x+1}=0$

□ Check to see if $x_0=-1$ is a regular singular point

- ◦ Define functions

  $\left[P_2(x)=\frac{2x^2-3x+1}{x+1}, P_3(x)=-\frac{x-4}{x+1}\right]$

- ◦ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

  $\left((x+1)\cdot P_2(x)\right)\Big|_{x=-1}=6$

- ◦ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

  $\left((x+1)^2\cdot P_3(x)\right)\Big|_{x=-1}=0$

- ◦ $x=-1$is a regular singular point

  Check to see if $x_0=-1$ is a regular singular point

  $x_0=-1$

- Multiply by denominators

  $(x+1)\,y''+(2x^2-3x+1)\,y'+(-x+4)\,y=0$

- Change variables using $x=u-1$ so that the regular singular point is at $u=0$

$$u\left(\frac{d^2}{du^2}y(u)\right)+(2u^2-7u+6)\left(\frac{d}{du}y(u)\right)+(-u+5)\,y(u)=0$$

- Assume series solution for $y(u)$

$$y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$$

□ Rewrite ODE with series expansions

- ○ Convert $u^m\cdot y(u)$ to series expansion for $m=0..1$

$$u^m\cdot y(u)=\sum_{k=0}^{\infty}a_k u^{k+r+m}$$

- ○ Shift index using $k->k-m$

$$u^m\cdot y(u)=\sum_{k=m}^{\infty}a_{k-m}u^{k+r}$$

- ○ Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..2$

$$u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,u^{k+r-1+m}$$

- ○ Shift index using $k->k+1-m$

$$u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,u^{k+r}$$

- ○ Convert $u\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion

$$u\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,(k+r-1)\,u^{k+r-1}$$

- ○ Shift index using $k->k+1$

$$u\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=-1}^{\infty}a_{k+1}(k+1+r)\,(k+r)\,u^{k+r}$$

Rewrite ODE with series expansions

$$a_0r(5+r)\,u^{-1+r}+(a_1(1+r)\,(6+r)-a_0(-5+7r))\,u^r+\left(\sum_{k=1}^{\infty}(a_{k+1}(k+1+r)\,(k+6+r)-a_{k}\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$r(5+r)=0$$

- Values of r that satisfy the indicial equation

$$r\in\{-5,0\}$$

- Each term must be 0

$$a_1(1+r)\,(6+r)-a_0(-5+7r)=0$$

- Each term in the series must be 0, giving the recursion relation

  $a_{k+1}(k+1+r)(k+6+r)+(-7a_k+2a_{k-1})k+(-7a_k+2a_{k-1})r+5a_k-3a_{k-1}=0$

- Shift index using $k->k+1$

  $a_{k+2}(k+2+r)(k+7+r)+(-7a_{k+1}+2a_k)(k+1)+(-7a_{k+1}+2a_k)r+5a_{k+1}-3a_k=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{2a_k k-7ka_{k+1}+2a_k r-7ra_{k+1}-a_k-2a_{k+1}}{(k+2+r)(k+7+r)}$

- Recursion relation for $r=-5$

  $a_{k+2}=-\frac{2a_k k-7ka_{k+1}-11a_k+33a_{k+1}}{(k-3)(k+2)}$

- Series not valid for $r=-5$, division by 0 in the recursion relation at $k=3$

  $a_{k+2}=-\frac{2a_k k-7ka_{k+1}-11a_k+33a_{k+1}}{(k-3)(k+2)}$

- Recursion relation for $r=0$

  $a_{k+2}=-\frac{2a_k k-7ka_{k+1}-a_k-2a_{k+1}}{(k+2)(k+7)}$

- Solution for $r=0$

  $\left[y(u)=\sum_{k=0}^{\infty}a_k u^k, a_{k+2}=-\frac{2a_k k-7ka_{k+1}-a_k-2a_{k+1}}{(k+2)(k+7)}, 6a_1+5a_0=0\right]$

- Revert the change of variables $u=x+1$

  $\left[y=\sum_{k=0}^{\infty}a_k(x+1)^k, a_{k+2}=-\frac{2a_k k-7ka_{k+1}-a_k-2a_{k+1}}{(k+2)(k+7)}, 6a_1+5a_0=0\right]$

Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 44.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{y'' + (3x^2 + 12x + 13)\, y' + (2x + 5)\, y = 0}$$

With initial conditions

$$[y(-2) = 2, y'(-2) = -3]$$

With the expansion point for the power series method at $x = -2$.

13.45.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= 3x^2 + 12x + 13 \\ q(x) &= 2x + 5 \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + (3x^2 + 12x + 13)\, y' + (2x + 5)\, y = 0$$

The domain of $p(x) = 3x^2 + 12x + 13$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = -2$ is inside this domain. The domain of $q(x) = 2x + 5$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = -2$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = 2 + x$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\frac{d^2}{dt^2}y(t) + \left(3(t-2)^2 + 12t - 11\right)\left(\frac{d}{dt}y(t)\right) + (1 + 2t)\, y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$\begin{aligned} y(0) &= 2 \\ y'(0) &= -3 \end{aligned}$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (1061)\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (1062)\\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2)\\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3)\\
&\vdots
\end{aligned}$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -3\left(\frac{d}{dt}y(t)\right)t^2 - 2y(t)\,t - \frac{d}{dt}y(t) - y(t) \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y(t)}F_0 \\
&= \left(9t^4 + 6t^2 - 8t\right)\left(\frac{d}{dt}y(t)\right) + 6\left(t^3 + \frac{1}{2}t^2 + \frac{1}{3}t - \frac{1}{6}\right)y(t) \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y(t)}F_1 \\
&= \left(-27t^6 - 27t^4 + 66t^3 - 3t^2 + 22t - 9\right)\left(\frac{d}{dt}y(t)\right) - 18\left(t^5 + \frac{1}{2}t^4 + \frac{2}{3}t^3 - \frac{14}{9}t^2 - \frac{7}{9}t - \frac{1}{9}\right)y(t) \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y(t)}F_2 \\
&= \left(81t^8 + 108t^6 - 378t^5 + 27t^4 - 252t^3 + 256t^2 - 14t + 33\right)\left(\frac{d}{dt}y(t)\right) + 54\left(t^7 + \frac{1}{2}t^6 + t^5 - \frac{65}{18}t^4 - \frac{1}{9}\right. \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y(t)}F_3 \\
&= \left(-243t^{10} - 405t^8 + 1836t^7 - 162t^6 + 1836t^5 - 2880t^4 + 306t^3 - 1188t^2 + 578t - 24\right)\left(\frac{d}{dt}y(t)\right) - 1
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = 2$ and $y'(0) = -3$ gives

$$
\begin{aligned}
F_0 &= 1 \\
F_1 &= -2 \\
F_2 &= 31 \\
F_3 &= -53 \\
F_4 &= 110
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y(t) = 2 - 3t + \frac{t^2}{2} - \frac{t^3}{3} + \frac{31t^4}{24} - \frac{53t^5}{120} + \frac{11t^6}{72} + O\left(t^6\right)
$$

$$
y(t)=2-3t+\frac{t^{2}}{2}-\frac{t^{3}}{3}+\frac{31t^{4}}{24}-\frac{53t^{5}}{120}+\frac{11t^{6}}{72}+O(t^{6})
$$

Since the expansion point $t=0$ is an ordinary, we can also solve this using standard power series Let the solution be represented as power series of the form

$$
y(t)=\sum_{n=0}^{\infty} a_n t^n
$$

Then

$$
\begin{aligned}
\frac{d}{dt}y(t) &= \sum_{n=1}^{\infty} n a_n t^{n-1} \\
\frac{d^2}{dt^2}y(t) &= \sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}
\end{aligned}
$$

Substituting the above back into the ode gives

$$
\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} = -3\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) t^2 - 2\left(\sum_{n=0}^{\infty} a_n t^n\right) t - \left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) - \left(\sum_{n=0}^{\infty} a_n t^n\right) \tag{1}
$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} 3n\, t^{1+n} a_n\right) \\
&+ \left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + \left(\sum_{n=0}^{\infty} a_n t^n\right) + \left(\sum_{n=0}^{\infty} 2t^{1+n} a_n\right) = 0
\end{aligned} \tag{2}
$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} &= \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, t^n \\
\sum_{n=1}^{\infty} 3n\, t^{1+n} a_n &= \sum_{n=2}^{\infty} 3(n-1)\, a_{n-1} t^n \\
\sum_{n=1}^{\infty} n a_n t^{n-1} &= \sum_{n=0}^{\infty} (1+n)\, a_{1+n} t^n \\
\sum_{n=0}^{\infty} 2t^{1+n} a_n &= \sum_{n=1}^{\infty} 2a_{n-1} t^n
\end{aligned}
$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$
\left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, t^{n}\right) + \left(\sum_{n=2}^{\infty} 3(n-1)\, a_{n-1} t^{n}\right) + \left(\sum_{n=0}^{\infty} (1+n)\, a_{1+n} t^{n}\right) + \left(\sum_{n=0}^{\infty} a_{n} t^{n}\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1} t^{n}\right) = 0 \tag{3}
$$

$n = 0$ gives

$$
2a_2 + a_1 + a_0 = 0
$$

$$
a_2 = -\frac{a_0}{2} - \frac{a_1}{2}
$$

$n = 1$ gives

$$
6a_3 + 2a_2 + a_1 + 2a_0 = 0
$$

Which after substituting earlier equations, simplifies to

$$
a_3 = -\frac{a_0}{6}
$$

For $2 \leq n$, the recurrence equation is

$$
(n+2)\, a_{n+2}(1+n) + 3(n-1)\, a_{n-1} + (1+n)\, a_{1+n} + a_n + 2a_{n-1} = 0 \tag{4}
$$

Solving for a_{n+2}, gives

$$
\begin{aligned}
a_{n+2} &= -\frac{n a_{1+n} + 3n a_{n-1} + a_n + a_{1+n} - a_{n-1}}{(n+2)\,(1+n)} \\
&= -\frac{a_n}{(n+2)\,(1+n)} - \frac{a_{1+n}}{n+2} - \frac{(3n-1)\, a_{n-1}}{(n+2)\,(1+n)}
\end{aligned} \tag{5}
$$

For $n = 2$ the recurrence equation gives

$$
12a_4 + 5a_1 + 3a_3 + a_2 = 0
$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{3a_1}{8} + \frac{a_0}{12}$$

For $n = 3$ the recurrence equation gives

$$20a_5 + 8a_2 + 4a_4 + a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{23a_0}{120} + \frac{11a_1}{40}$$

For $n = 4$ the recurrence equation gives

$$30a_6 + 11a_3 + 5a_5 + a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{19a_0}{720} - \frac{a_1}{30}$$

For $n = 5$ the recurrence equation gives

$$42a_7 + 14a_4 + 6a_6 + a_5 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{69a_1}{560} - \frac{13a_0}{360}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + \left(-\frac{a_0}{2} - \frac{a_1}{2}\right) t^2 - \frac{a_0 t^3}{6} + \left(-\frac{3a_1}{8} + \frac{a_0}{12}\right) t^4 + \left(\frac{23a_0}{120} + \frac{11a_1}{40}\right) t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1-\frac{1}{2}t^2-\frac{1}{6}t^3+\frac{1}{12}t^4+\frac{23}{120}t^5\right)a_0+\left(t-\frac{1}{2}t^2-\frac{3}{8}t^4+\frac{11}{40}t^5\right)a_1+O(t^6) \quad (3)$$

At $t=0$ the solution above becomes

$$y(t) = \left(1-\frac{1}{2}t^2-\frac{1}{6}t^3+\frac{1}{12}t^4+\frac{23}{120}t^5\right)c_1+\left(t-\frac{1}{2}t^2-\frac{3}{8}t^4+\frac{11}{40}t^5\right)c_2+O(t^6)$$

$$y(t) = 2+\frac{t^2}{2}-\frac{t^3}{3}+\frac{31t^4}{24}-\frac{53t^5}{120}-3t+O(t^6)$$

Replacing t in the above with the original independent variable $x$using $t=2+x$ results in

$$y = -4-3x+\frac{(2+x)^2}{2}-\frac{(2+x)^3}{3}+\frac{31(2+x)^4}{24}-\frac{53(2+x)^5}{120}+\frac{11(2+x)^6}{72}+O\left((2+x)^6\right)$$

Summary

The solution(s) found are the following

$$y = -4-3x+\frac{(2+x)^2}{2}-\frac{(2+x)^3}{3}+\frac{31(2+x)^4}{24}-\frac{53(2+x)^5}{120}+\frac{11(2+x)^6}{72}+O\left((2+x)^6\right) \quad (1)$$

Verification of solutions

$$y = -4-3x+\frac{(2+x)^2}{2}-\frac{(2+x)^3}{3}+\frac{31(2+x)^4}{24}-\frac{53(2+x)^5}{120}+\frac{11(2+x)^6}{72}+O\left((2+x)^6\right)$$

Verified OK.

13.45.2 Maple step by step solution

Let's solve

$$\left[y''+(3x^2+12x+13)\,y'+(2x+5)\,y=0, y(-2)=2, y'\Big|_{\{x=-2\}}=-3\right]$$

- Highest derivative means the order of the ODE is 2

y''

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^k$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..1$

    $x^m \cdot y = \sum_{k=\max(0,-m)}^{\infty} a_k x^{k+m}$

  - Shift index using $k- >k - m$

    $x^m \cdot y = \sum_{k=\max(0,-m)+m}^{\infty} a_{k-m} x^k$

  - Convert $x^m \cdot y'$ to series expansion for $m = 0..2$

    $x^m \cdot y' = \sum_{k=\max(0,1-m)}^{\infty} a_k k\, x^{k-1+m}$

  - Shift index using $k- >k + 1 - m$

    $x^m \cdot y' = \sum_{k=\max(0,1-m)+m-1}^{\infty} a_{k+1-m}(k + 1 - m)\, x^k$

  - Convert y'' to series expansion

    $y'' = \sum_{k=2}^{\infty} a_k k(k - 1)\, x^{k-2}$

  - Shift index using $k- >k + 2$

    $y'' = \sum_{k=0}^{\infty} a_{k+2}(k + 2)\,(k + 1)\, x^k$

  Rewrite ODE with series expansions

  $2a_2 + 13a_1 + 5a_0 + \left(\sum_{k=1}^{\infty} (a_{k+2}(k + 2)\,(k + 1) + 13a_{k+1}(k + 1) + a_k(12k + 5) + a_{k-1}(3k - 1))\, x^k\right.$

- Each term must be 0

  $2a_2 + 13a_1 + 5a_0 = 0$

- Each term in the series must be 0, giving the recursion relation

  $k^2 a_{k+2} + (12a_k + 3a_{k-1} + 13a_{k+1} + 3a_{k+2})\, k + 5a_k - a_{k-1} + 13a_{k+1} + 2a_{k+2} = 0$

- Shift index using $k- >k + 1$

  $(k + 1)^2\, a_{k+3} + (12a_{k+1} + 3a_k + 13a_{k+2} + 3a_{k+3})\,(k + 1) + 5a_{k+1} - a_k + 13a_{k+2} + 2a_{k+3} = 0$

- Recursion relation that defines the series solution to the ODE

$$\left[y=\sum_{k=0}^{\infty} a_k x^k, a_{k+3}=-\frac{3a_k k+12a_{k+1}k+13ka_{k+2}+2a_k+17a_{k+1}+26a_{k+2}}{k^2+5k+6}, 2a_2+13a_1+5a_0=0\right]$$

ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(3x^2+2x+1)\,y''+(-x^2+2)\,y'+(x+1)\,y=0}$$

With initial conditions

$$[y(0)=1, y'(0)=-2]$$

With the expansion point for the power series method at $x=0$.

13.46.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned} p(x) &= \frac{-x^2+2}{3x^2+2x+1} \\ q(x) &= \frac{x+1}{3x^2+2x+1} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{(-x^2+2)\, y'}{3x^2+2x+1} + \frac{(x+1)\, y}{3x^2+2x+1} = 0$$

The domain of $p(x) = \frac{-x^2+2}{3x^2+2x+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{x+1}{3x^2+2x+1}$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{1064}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{1065}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= \frac{y'x^2 - yx - 2y' - y}{3x^2 + 2x + 1} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{(x^4 - 3x^3 - 7x^2 + 11x + 7)\, y' - y(x^3 - 2x^2 - 8x - 3)}{(3x^2 + 2x + 1)^2} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(x^6 - 6x^5 + 8x^4 + 84x^3 - 60x^2 - 128x - 28)\, y' - y(x^5 - 5x^4 + 4x^3 + 79x^2 + 66x + 11)}{(3x^2 + 2x + 1)^3} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(x^8 - 9x^7 + 43x^6 + 27x^5 - 1086x^4 + 96x^3 + 2140x^2 + 1064x + 85)\, y' - y(x^7 - 8x^6 + 36x^5 + 51x^4 -}{(3x^2 + 2x + 1)^4} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(x^{10} - 12x^9 + 98x^8 - 352x^7 - 1523x^6 + 16080x^5 + 8816x^4 - 37212x^3 - 32483x^2 - 5756x + 242)\, y'}{(3x^2 + 2x +}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 1$ and $y'(0) = -2$ gives

$$
\begin{aligned}
F_0 &= 3 \\
F_1 &= -11 \\
F_2 &= 45 \\
F_3 &= -142 \\
F_4 &= -333
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = 1 - 2x + \frac{3x^2}{2} - \frac{11x^3}{6} + \frac{15x^4}{8} - \frac{71x^5}{60} - \frac{37x^6}{80} + O(x^6)
$$

$$
y = 1-2x+\frac{3x^2}{2}-\frac{11x^3}{6}+\frac{15x^4}{8}-\frac{71x^5}{60}-\frac{37x^6}{80}+O(x^6)
$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$
(3x^2+2x+1)\,y''+(-x^2+2)\,y'+(x+1)\,y = 0
$$

Let the solution be represented as power series of the form

$$
y = \sum_{n=0}^{\infty} a_n x^n
$$

Then

$$
y' = \sum_{n=1}^{\infty} n a_n x^{n-1}
$$
$$
y'' = \sum_{n=2}^{\infty} n(n-1)\,a_n x^{n-2}
$$

Substituting the above back into the ode gives

$$
(3x^2+2x+1)\left(\sum_{n=2}^{\infty} n(n-1)\,a_n x^{n-2}\right)+(-x^2+2)\left(\sum_{n=1}^{\infty} n a_n x^{n-1}\right)+(x+1)\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}
$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} 3x^n a_n n(n-1)\right)+\left(\sum_{n=2}^{\infty} 2n\, x^{n-1} a_n(n-1)\right)+\left(\sum_{n=2}^{\infty} n(n-1)\,a_n x^{n-2}\right) \\
&+\sum_{n=1}^{\infty}\left(-n\, x^{1+n} a_n\right)+\left(\sum_{n=1}^{\infty} 2n a_n x^{n-1}\right)+\left(\sum_{n=0}^{\infty} x^{1+n} a_n\right)+\left(\sum_{n=0}^{\infty} a_n x^n\right) = 0
\end{aligned} \tag{2}
$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the

power and the corresponding index gives

$$\sum_{n=2}^{\infty} 2n\, x^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} 2(1+n)\, a_{1+n} n\, x^n$$

$$\sum_{n=2}^{\infty} n(n-1)\, a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, x^n$$

$$\sum_{n=1}^{\infty} \left(-n\, x^{1+n} a_n\right) = \sum_{n=2}^{\infty} \left(-(n-1)\, a_{n-1} x^n\right)$$

$$\sum_{n=1}^{\infty} 2n a_n x^{n-1} = \sum_{n=0}^{\infty} 2(1+n)\, a_{1+n} x^n$$

$$\sum_{n=0}^{\infty} x^{1+n} a_n = \sum_{n=1}^{\infty} a_{n-1} x^n$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\begin{gathered}\left(\sum_{n=2}^{\infty} 3x^n a_n n(n-1)\right) + \left(\sum_{n=1}^{\infty} 2(1+n)\, a_{1+n} n\, x^n\right) \\ + \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2}(1+n)\, x^n\right) + \sum_{n=2}^{\infty} \left(-(n-1)\, a_{n-1} x^n\right) \\ + \left(\sum_{n=0}^{\infty} 2(1+n)\, a_{1+n} x^n\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^n\right) + \left(\sum_{n=0}^{\infty} a_n x^n\right) = 0\end{gathered} \tag{3}$$

$n = 0$ gives

$$2a_2 + 2a_1 + a_0 = 0$$

$$a_2 = -\frac{a_0}{2} - a_1$$

$n = 1$ gives

$$8a_2 + 6a_3 + a_0 + a_1 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{a_0}{2} + \frac{7a_1}{6}$$

For $2 \leq n$, the recurrence equation is

$$\begin{aligned} 3na_n(n-1) + 2(1+n)\, a_{1+n}n + (n+2)\, a_{n+2}(1+n) \\ -(n-1)\, a_{n-1} + 2(1+n)\, a_{1+n} + a_{n-1} + a_n = 0 \end{aligned} \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{3n^2a_n + 2n^2a_{1+n} - 3na_n + 4na_{1+n} - na_{n-1} + a_n + 2a_{1+n} + 2a_{n-1}}{(n+2)\,(1+n)} \\ &= -\frac{(3n^2-3n+1)\, a_n}{(n+2)\,(1+n)} - \frac{(2n^2+4n+2)\, a_{1+n}}{(n+2)\,(1+n)} - \frac{(-n+2)\, a_{n-1}}{(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$7a_2 + 18a_3 + 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{11a_0}{24} - \frac{7a_1}{6}$$

For $n = 3$ the recurrence equation gives

$$19a_3 + 32a_4 + 20a_5 - a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{7a_0}{30} + \frac{17a_1}{24}$$

For $n = 4$ the recurrence equation gives

$$37a_4 + 50a_5 + 30a_6 - 2a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = \frac{151a_0}{720} + \frac{121a_1}{360}$$

For $n = 5$ the recurrence equation gives

$$61a_5 + 72a_6 + 42a_7 - 3a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{737a_0}{1008} - \frac{8509a_1}{5040}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3x^3 + a_2x^2 + a_1x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$\begin{aligned} y = a_0 + a_1x + \left(-\frac{a_0}{2} - a_1\right)x^2 + \left(\frac{a_0}{2} + \frac{7a_1}{6}\right)x^3 \\ + \left(-\frac{11a_0}{24} - \frac{7a_1}{6}\right)x^4 + \left(\frac{7a_0}{30} + \frac{17a_1}{24}\right)x^5 + \dots \end{aligned}$$

Collecting terms, the solution becomes

$$y = \left(1 - \frac{1}{2}x^2 + \frac{1}{2}x^3 - \frac{11}{24}x^4 + \frac{7}{30}x^5\right)a_0 + \left(x - x^2 + \frac{7}{6}x^3 - \frac{7}{6}x^4 + \frac{17}{24}x^5\right)a_1 + O(x^6) \quad (3)$$

At $x = 0$ the solution above becomes

$$y = \left(1 - \frac{1}{2}x^2 + \frac{1}{2}x^3 - \frac{11}{24}x^4 + \frac{7}{30}x^5\right)c_1 + \left(x - x^2 + \frac{7}{6}x^3 - \frac{7}{6}x^4 + \frac{17}{24}x^5\right)c_2 + O(x^6)$$

$$y = 1 + \frac{3x^2}{2} - \frac{11x^3}{6} + \frac{15x^4}{8} - \frac{71x^5}{60} - 2x + O(x^6)$$

Summary

The solution(s) found are the following

$$y = 1-2x+\frac{3x^{2}}{2}-\frac{11x^{3}}{6}+\frac{15x^{4}}{8}-\frac{71x^{5}}{60}-\frac{37x^{6}}{80}+O\left(x^{6}\right) \tag{1}$$

$$y = 1+\frac{3x^{2}}{2}-\frac{11x^{3}}{6}+\frac{15x^{4}}{8}-\frac{71x^{5}}{60}-2x+O\left(x^{6}\right) \tag{2}$$

Verification of solutions

$$y = 1-2x+\frac{3x^{2}}{2}-\frac{11x^{3}}{6}+\frac{15x^{4}}{8}-\frac{71x^{5}}{60}-\frac{37x^{6}}{80}+O\left(x^{6}\right)$$

Verified OK.

$$y = 1+\frac{3x^{2}}{2}-\frac{11x^{3}}{6}+\frac{15x^{4}}{8}-\frac{71x^{5}}{60}-2x+O\left(x^{6}\right)$$

Verified OK.

13.46.2 Maple step by step solution

Let's solve

$\left[\left(3x^{2}+2x+1\right)y''+\left(-x^{2}+2\right)y'+\left(x+1\right)y=0, y(0)=1, y'\Big|_{\{x=0\}}=-2\right]$

- Highest derivative means the order of the ODE is 2

  y''
- Isolate 2nd derivative

  $y''=\frac{(x^{2}-2)y'}{3x^{2}+2x+1}-\frac{(x+1)y}{3x^{2}+2x+1}$
- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{(x^{2}-2)y'}{3x^{2}+2x+1}+\frac{(x+1)y}{3x^{2}+2x+1}=0$

□ Check to see if x_0 is a regular singular point

- ◦ Define functions

  $\left[P_2(x)=-\frac{x^{2}-2}{3x^{2}+2x+1}, P_3(x)=\frac{x+1}{3x^{2}+2x+1}\right]$
- ◦ $\left(\frac{\mathrm{I}\sqrt{2}}{3}+x+\frac{1}{3}\right)\cdot P_2(x)$ is analytic at $x=-\frac{1}{3}-\frac{\mathrm{I}\sqrt{2}}{3}$

  $\left(\left(\frac{\mathrm{I}\sqrt{2}}{3}+x+\frac{1}{3}\right)\cdot P_2(x)\right)\Big|_{x=-\frac{1}{3}-\frac{\mathrm{I}\sqrt{2}}{3}}=0$

- $\left(\frac{I\sqrt{2}}{3}+x+\frac{1}{3}\right)^{2}\cdot P_{3}(x)$ is analytic at $x=-\frac{1}{3}-\frac{I\sqrt{2}}{3}$

  $\left(\left(\frac{I\sqrt{2}}{3}+x+\frac{1}{3}\right)^{2}\cdot P_{3}(x)\right)\Big|_{x=-\frac{1}{3}-\frac{I\sqrt{2}}{3}}=0$

- $x=-\frac{1}{3}-\frac{I\sqrt{2}}{3}$ is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-\frac{1}{3}-\frac{I\sqrt{2}}{3}$

- Multiply by denominators

  $(3x^2+2x+1)\,y''+(-x^2+2)\,y'+(x+1)\,y=0$

- Change variables using $x=u-\frac{1}{3}-\frac{I\sqrt{2}}{3}$ so that the regular singular point is at $u=0$

  $(3u^2-2\,\mathrm{I}u\sqrt{2})\left(\frac{d^2}{du^2}y(u)\right)+\left(-u^2+\frac{2u}{3}+\frac{2\,\mathrm{I}u\sqrt{2}}{3}+\frac{19}{9}-\frac{2\,\mathrm{I}\sqrt{2}}{9}\right)\left(\frac{d}{du}y(u)\right)+\left(u+\frac{2}{3}-\frac{I\sqrt{2}}{3}\right)y(u)=$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

- ☐ Rewrite ODE with series expansions

  - Convert $u^m\cdot y(u)$ to series expansion for $m=0..1$

    $u^m\cdot y(u)=\sum_{k=0}^{\infty}a_k u^{k+r+m}$

  - Shift index using $k->k-m$

    $u^m\cdot y(u)=\sum_{k=m}^{\infty}a_{k-m}u^{k+r}$

  - Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..2$

    $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,u^{k+r-1+m}$

  - Shift index using $k->k+1-m$

    $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,u^{k+r}$

  - Convert $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m=1..2$

    $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty}a_k(k+r)\,(k+r-1)\,u^{k+r-2+m}$

  - Shift index using $k->k+2-m$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\,u^{k+r}$$

Rewrite ODE with series expansions

$$-\frac{\mathrm{I}\sqrt{2}\left(19\,\mathrm{I}\sqrt{2}-32+36r\right)r a_0 u^{-1+r}}{18}+\left(-\frac{\mathrm{I}\sqrt{2}\left(19\,\mathrm{I}\sqrt{2}+4+36r\right)(1+r)a_1}{18}-\frac{\left(\mathrm{I}\sqrt{2}+4-9r\right)\left(\mathrm{I}\sqrt{2}-1+3r\right)a_0}{9}\right)u^r+\left(\sum_{k=1}^{\infty}\left(-\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-\frac{\mathrm{I}}{18}\sqrt{2}\left(19\,\mathrm{I}\sqrt{2}-32+36r\right)r=0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{0, \frac{8}{9}-\frac{19\,\mathrm{I}\sqrt{2}}{36}\right\}$$

- Each term must be 0

$$-\frac{\mathrm{I}\sqrt{2}\left(19\,\mathrm{I}\sqrt{2}+4+36r\right)(1+r)a_1}{18}-\frac{\left(\mathrm{I}\sqrt{2}+4-9r\right)\left(\mathrm{I}\sqrt{2}-1+3r\right)a_0}{9}=0$$

- Each term in the series must be 0, giving the recursion relation

$$\frac{2\,\mathrm{I}\left(-3\left(k+r+\frac{1}{9}\right)(k+1+r)a_{k+1}+\left(k+r-\frac{1}{2}\right)a_k\right)\sqrt{2}}{3}+\frac{19(k+1+r)a_{k+1}}{9}+\frac{\left(2+9k^2+(18r-7)k+9r^2-7r\right)a_k}{3}-a_{k-1}(k-2+r)$$

- Shift index using $k->k+1$

$$\frac{2\,\mathrm{I}\left(-3\left(k+\frac{10}{9}+r\right)(k+2+r)a_{k+2}+\left(k+\frac{1}{2}+r\right)a_{k+1}\right)\sqrt{2}}{3}+\frac{19(k+2+r)a_{k+2}}{9}+\frac{\left(2+9(k+1)^2+(18r-7)(k+1)+9r^2-7r\right)a_{k+1}}{3}-a_k(k$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=\frac{3\left(2\,\mathrm{I}\sqrt{2}\,a_{k+1}k+2\,\mathrm{I}\sqrt{2}\,a_{k+1}r+\mathrm{I}\sqrt{2}\,a_{k+1}+9k^2a_{k+1}+18kra_{k+1}+9r^2a_{k+1}-3ka_k+11ka_{k+1}-3ra_k+11ra_{k+1}+3a_k+4a_{k+1}\right)}{-38+56\,\mathrm{I}\sqrt{2}\,k+56\,\mathrm{I}\sqrt{2}\,r+40\,\mathrm{I}\sqrt{2}+18\,\mathrm{I}\sqrt{2}\,r^2+36\,\mathrm{I}\sqrt{2}\,kr+18\,\mathrm{I}\sqrt{2}\,k^2-19k-19r}$$

- Recursion relation for $r=0$

$$a_{k+2}=\frac{3\left(2\,\mathrm{I}\sqrt{2}\,a_{k+1}k+\mathrm{I}\sqrt{2}\,a_{k+1}+9k^2a_{k+1}-3ka_k+11ka_{k+1}+3a_k+4a_{k+1}\right)}{-38+56\,\mathrm{I}\sqrt{2}\,k+40\,\mathrm{I}\sqrt{2}+18\,\mathrm{I}\sqrt{2}\,k^2-19k}$$

- Solution for $r=0$

$$\left[y(u)=\sum_{k=0}^{\infty}a_k u^k, a_{k+2}=\frac{3\left(2\,\mathrm{I}\sqrt{2}\,a_{k+1}k+\mathrm{I}\sqrt{2}\,a_{k+1}+9k^2a_{k+1}-3ka_k+11ka_{k+1}+3a_k+4a_{k+1}\right)}{-38+56\,\mathrm{I}\sqrt{2}\,k+40\,\mathrm{I}\sqrt{2}+18\,\mathrm{I}\sqrt{2}\,k^2-19k}, -\frac{\mathrm{I}\sqrt{2}\left(19\,\mathrm{I}\sqrt{2}+4\right)a_1}{18}-\right.$$

- Revert the change of variables $u=\frac{\mathrm{I}\sqrt{2}}{3}+x+\frac{1}{3}$

$$\left[y=\sum_{k=0}^{\infty}a_k\left(\frac{\mathrm{I}\sqrt{2}}{3}+x+\frac{1}{3}\right)^k, a_{k+2}=\frac{3\left(2\,\mathrm{I}\sqrt{2}\,a_{k+1}k+\mathrm{I}\sqrt{2}\,a_{k+1}+9k^2a_{k+1}-3ka_k+11ka_{k+1}+3a_k+4a_{k+1}\right)}{-38+56\,\mathrm{I}\sqrt{2}\,k+40\,\mathrm{I}\sqrt{2}+18\,\mathrm{I}\sqrt{2}\,k^2-19k}, -\frac{\mathrm{I}\sqrt{2}\left(19\,\mathrm{I}\right.}{1}\right.$$

- Recursion relation for $r=\frac{8}{9}-\frac{19\,\mathrm{I}\sqrt{2}}{36}$

$$a_{k+2}=\frac{3\left(2\,\mathrm{I}\sqrt{2}\,a_{k+1}k+2\,\mathrm{I}\sqrt{2}\,a_{k+1}\left(\frac{8}{9}-\frac{19\,\mathrm{I}\sqrt{2}}{36}\right)+\mathrm{I}\sqrt{2}\,a_{k+1}+9k^2a_{k+1}+18k\left(\frac{8}{9}-\frac{19\,\mathrm{I}\sqrt{2}}{36}\right)a_{k+1}+9\left(\frac{8}{9}-\frac{19\,\mathrm{I}\sqrt{2}}{36}\right)^2a_{k+1}-3ka_k+11ka_k\right.}{-\frac{494}{9}+56\,\mathrm{I}\sqrt{2}\,k+56\,\mathrm{I}\sqrt{2}\left(\frac{8}{9}-\frac{19\,\mathrm{I}\sqrt{2}}{36}\right)+\frac{1801\,\mathrm{I}\sqrt{2}}{36}+18\,\mathrm{I}\sqrt{2}\left(\frac{8}{9}-\frac{19\,\mathrm{I}\sqrt{2}}{36}\right)^2+36\,\mathrm{I}\sqrt{2}\,k\left(\frac{8}{9}-\frac{1}{}\right.}$$

- Solution for $r = \frac{8}{9} - \frac{19 \mathrm{I}\sqrt{2}}{36}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+\frac{8}{9}-\frac{19 \mathrm{I}\sqrt{2}}{36}}, a_{k+2} = \frac{3\left(2 \mathrm{I}\sqrt{2}\, a_{k+1} k + 2 \mathrm{I}\sqrt{2}\, a_{k+1}\left(\frac{8}{9} - \frac{19 \mathrm{I}\sqrt{2}}{36}\right) + \mathrm{I}\sqrt{2}\, a_{k+1} + 9k^2 a_{k+1} + 18k\left(\frac{8}{9} - \frac{19 \mathrm{I}\sqrt{2}}{36}\right) a_{k+1}\right.}{-\frac{494}{9} + 56 \mathrm{I}\sqrt{2}\, k + 56 \mathrm{I}\sqrt{2}\left(\frac{8}{9} - \frac{19 \mathrm{I}\sqrt{2}}{36}\right) + \frac{1801 \mathrm{I}\sqrt{2}}{36} + 1}\right.$$

- Revert the change of variables $u = \frac{\mathrm{I}\sqrt{2}}{3} + x + \frac{1}{3}$

$$\left[y = \sum_{k=0}^{\infty} a_k \left(\frac{\mathrm{I}\sqrt{2}}{3} + x + \frac{1}{3}\right)^{k+\frac{8}{9}-\frac{19 \mathrm{I}\sqrt{2}}{36}}, a_{k+2} = \frac{3\left(2 \mathrm{I}\sqrt{2}\, a_{k+1} k + 2 \mathrm{I}\sqrt{2}\, a_{k+1}\left(\frac{8}{9} - \frac{19 \mathrm{I}\sqrt{2}}{36}\right) + \mathrm{I}\sqrt{2}\, a_{k+1} + 9k^2 a_{k+1} + 18k\left(\frac{8}{9}\right.\right.}{-\frac{494}{9} + 56 \mathrm{I}\sqrt{2}\, k + 56 \mathrm{I}\sqrt{2}\left(\frac{8}{9} - \frac{19 \mathrm{I}\sqrt{2}}{36}\right.}\right.$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k \left(\frac{\mathrm{I}\sqrt{2}}{3} + x + \frac{1}{3}\right)^{k}\right) + \left(\sum_{k=0}^{\infty} b_k \left(\frac{\mathrm{I}\sqrt{2}}{3} + x + \frac{1}{3}\right)^{k+\frac{8}{9}-\frac{19 \mathrm{I}\sqrt{2}}{36}}\right), a_{k+2} = \frac{3\left(2 \mathrm{I}\sqrt{2}\, a_{1+k} k + \mathrm{I}\sqrt{2}\, a_{1+k} +\right.}{-38 + 56 \mathrm{I}\sqrt{2}}\right.$$

Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 46.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(x^2+4x+3)\,y''-(-x^2+4x+5)\,y'-(2+x)\,y=0}$$

With initial conditions

$$[y(-2)=2, y'(-2)=-1]$$

With the expansion point for the power series method at $x=-2$.

13.47.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned}p(x)&=\frac{x^2-4x-5}{x^2+4x+3}\\ q(x)&=\frac{-x-2}{x^2+4x+3}\\ F&=0\end{aligned}$$

Hence the ode is

$$y''+\frac{(x^2-4x-5)\,y'}{x^2+4x+3}+\frac{(-x-2)\,y}{x^2+4x+3}=0$$

The domain of $p(x)=\frac{x^2-4x-5}{x^2+4x+3}$ is

$$\{-\infty\le x<-3,-3<x<-1,-1<x\le\infty\}$$

And the point $x_0=-2$ is inside this domain. The domain of $q(x)=\frac{-x-2}{x^2+4x+3}$ is

$$\{-\infty\le x<-3,-3<x<-1,-1<x\le\infty\}$$

And the point $x_0=-2$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x=0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t=2+x$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left((t-2)^2+4t-5\right)\left(\frac{d^2}{dt^2}y(t)\right)+\left((t-2)^2-4t+3\right)\left(\frac{d}{dt}y(t)\right)-y(t)\,t=0$$

With its expansion point and initial conditions now at $t=0$. With initial conditions now becoming

$$y(0)=2$$
$$y'(0)=-1$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y_0'$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y_0' + \frac{x^2}{2} f|_{x_0, y_0, y_0'} + \frac{x^3}{3!} f'|_{x_0, y_0, y_0'} + \cdots \\
&= y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y_0'}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (1067) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (1068) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty}\frac{x^{n+2}}{(n+2)!}F_n|_{x_0,y_0,y_0'} \tag{7}$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{\left(\frac{d}{dt}y(t)\right)t^2 - 8t\left(\frac{d}{dt}y(t)\right) - y(t)\,t + 7\frac{d}{dt}y(t)}{t^2 - 1} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0 \\
&= \frac{(t^4 - 15t^3 + 70t^2 - 97t + 41)\left(\frac{d}{dt}y(t)\right) - y(t)\,(t^3 - 7t^2 + 7t + 1)}{(t^2 - 1)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1 \\
&= \frac{(-t^6 + 22t^5 - 175t^4 + 612t^3 - 979t^2 + 710t - 189)\left(\frac{d}{dt}y(t)\right) + y(t)\,(t^5 - 14t^4 + 56t^3 - 73t^2 + 31t +}{(t^2 - 1)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2 \\
&= \frac{(t+1)\,(-1+t)\left((-1+t)\,(t^7 - 28t^6 + 294t^5 - 1461t^4 + 3634t^3 - 4601t^2 + 2815t - 606)\left(\frac{d}{dt}y(t)\right) -\right.}{(t^2 - 1)^5} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3 \\
&= -\frac{(t+1)\,(-1+t)\left((-1+t)\,(t^9 - 35t^8 + 476t^7 - 3260t^6 + 12243t^5 - 26241t^4 + 32822t^3 - 23242t^2 +\right.}{}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = 2$ and $y'(0) = -1$ gives

$$
\begin{aligned}
F_0 &= -7 \\
F_1 &= -43 \\
F_2 &= -203 \\
F_3 &= -668 \\
F_4 &= -960
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = -t + 2 - \frac{7t^2}{2} - \frac{43t^3}{6} - \frac{203t^4}{24} - \frac{167t^5}{30} - \frac{4t^6}{3} + O(t^6)$$

$$y(t) = -t + 2 - \frac{7t^2}{2} - \frac{43t^3}{6} - \frac{203t^4}{24} - \frac{167t^5}{30} - \frac{4t^6}{3} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(t^2 - 1) + (t^2 - 8t + 7)\left(\frac{d}{dt}y(t)\right) - y(t)\,t = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right)(t^2 - 1) + (t^2 - 8t + 7)\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) - \left(\sum_{n=0}^{\infty} a_n t^n\right) t = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}\left(\sum_{n=2}^{\infty} t^n a_n n(n-1)\right) + \sum_{n=2}^{\infty}\left(-n(n-1)\,a_n t^{n-2}\right) + \left(\sum_{n=1}^{\infty} n\,t^{1+n} a_n\right) \\ + \sum_{n=1}^{\infty}\left(-8n a_n t^n\right) + \left(\sum_{n=1}^{\infty} 7n a_n t^{n-1}\right) + \sum_{n=0}^{\infty}\left(-t^{1+n} a_n\right) = 0\end{aligned} \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} \left(-n(n-1)\, a_n t^{n-2}\right) = \sum_{n=0}^{\infty} \left(-(n+2)\, a_{n+2}(1+n)\, t^n\right)$$

$$\sum_{n=1}^{\infty} n\, t^{1+n} a_n = \sum_{n=2}^{\infty} (n-1)\, a_{n-1} t^n$$

$$\sum_{n=1}^{\infty} 7n a_n t^{n-1} = \sum_{n=0}^{\infty} 7(1+n)\, a_{1+n} t^n$$

$$\sum_{n=0}^{\infty} \left(-t^{1+n} a_n\right) = \sum_{n=1}^{\infty} \left(-a_{n-1} t^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} t^n a_n n(n-1)\right) + \sum_{n=0}^{\infty} \left(-(n+2)\, a_{n+2}(1+n)\, t^n\right) + \left(\sum_{n=2}^{\infty} (n-1)\, a_{n-1} t^n\right) + \sum_{n=1}^{\infty} \left(-8n a_n t^n\right) + \left(\sum_{n=0}^{\infty} 7(1+n)\, a_{1+n} t^n\right) + \sum_{n=1}^{\infty} \left(-a_{n-1} t^n\right) = 0 \tag{3}$$

$n = 0$ gives

$$-2a_2 + 7a_1 = 0$$

$$a_2 = \frac{7a_1}{2}$$

$n = 1$ gives

$$-6a_3 - 8a_1 + 14a_2 - a_0 = 0$$

Which after substituting earlier equations, simplifies to

$$a_3 = -\frac{a_0}{6} + \frac{41a_1}{6}$$

For $2 \leq n$, the recurrence equation is

$$n a_{n}(n-1)-(n+2) a_{n+2}(1+n)+(n-1) a_{n-1}-8 n a_{n}+7(1+n) a_{1+n}-a_{n-1}=0 \quad (4)$$

Solving for a_{n+2}, gives

$$
\begin{aligned}
a_{n+2} &= \frac{n^{2} a_{n}-9 n a_{n}+7 n a_{1+n}+n a_{n-1}+7 a_{1+n}-2 a_{n-1}}{(n+2)(1+n)} \\
&= \frac{(n^{2}-9 n) a_{n}}{(n+2)(1+n)}+\frac{(7 n+7) a_{1+n}}{(n+2)(1+n)}+\frac{(n-2) a_{n-1}}{(n+2)(1+n)}
\end{aligned} \quad (5)
$$

For $n = 2$ the recurrence equation gives

$$-14 a_{2}-12 a_{4}+21 a_{3}=0$$

Which after substituting the earlier terms found becomes

$$a_{4}=\frac{63 a_{1}}{8}-\frac{7 a_{0}}{24}$$

For $n = 3$ the recurrence equation gives

$$-18 a_{3}-20 a_{5}+a_{2}+28 a_{4}=0$$

Which after substituting the earlier terms found becomes

$$a_{5}=-\frac{31 a_{0}}{120}+\frac{101 a_{1}}{20}$$

For $n = 4$ the recurrence equation gives

$$-20 a_{4}-30 a_{6}+2 a_{3}+35 a_{5}=0$$

Which after substituting the earlier terms found becomes

$$a_{6}=\frac{79 a_{1}}{72}-\frac{17 a_{0}}{144}$$

For $n = 5$ the recurrence equation gives

$$-20 a_{5}-42 a_{7}+3 a_{4}+42 a_{6}=0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{a_0}{63} - \frac{751a_1}{1008}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + \frac{7a_1 t^2}{2} + \left(-\frac{a_0}{6} + \frac{41a_1}{6}\right) t^3 + \left(\frac{63a_1}{8} - \frac{7a_0}{24}\right) t^4 + \left(-\frac{31a_0}{120} + \frac{101a_1}{20}\right) t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - \frac{1}{6}t^3 - \frac{7}{24}t^4 - \frac{31}{120}t^5\right) a_0 + \left(t + \frac{7}{2}t^2 + \frac{41}{6}t^3 + \frac{63}{8}t^4 + \frac{101}{20}t^5\right) a_1 + O(t^6) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - \frac{1}{6}t^3 - \frac{7}{24}t^4 - \frac{31}{120}t^5\right) c_1 + \left(t + \frac{7}{2}t^2 + \frac{41}{6}t^3 + \frac{63}{8}t^4 + \frac{101}{20}t^5\right) c_2 + O(t^6)$$

$$y(t) = 2 - \frac{43t^3}{6} - \frac{203t^4}{24} - \frac{167t^5}{30} - t - \frac{7t^2}{2} + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = 2 + x$ results in

$$y = -x - \frac{7(2+x)^2}{2} - \frac{43(2+x)^3}{6} - \frac{203(2+x)^4}{24} - \frac{167(2+x)^5}{30} - \frac{4(2+x)^6}{3} + O\left((2+x)^6\right)$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = -x - \frac{7(2+x)^2}{2} - \frac{43(2+x)^3}{6} - \frac{203(2+x)^4}{24} \\ - \frac{167(2+x)^5}{30} - \frac{4(2+x)^6}{3} + O\left((2+x)^6\right) \end{aligned} \quad (1)$$

Verification of solutions

$$y = -x - \frac{7(2+x)^2}{2} - \frac{43(2+x)^3}{6} - \frac{203(2+x)^4}{24} - \frac{167(2+x)^5}{30} - \frac{4(2+x)^6}{3} + O\left((2+x)^6\right)$$

Verified OK.

13.47.2 Maple step by step solution

Let's solve

$$\left[(x^2+4x+3)\, y'' + (x^2-4x-5)\, y' + (-x-2)\, y = 0, y(-2) = 2, y'\Big|_{\{x=-2\}} = -1\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(2+x)y}{x^2+4x+3} - \frac{y'(x-5)}{x+3}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{y'(x-5)}{x+3} - \frac{(2+x)y}{x^2+4x+3} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x) = \frac{x-5}{x+3}, P_3(x) = -\frac{2+x}{x^2+4x+3}\right]$

  ◦ $(x+3)\cdot P_2(x)$ is analytic at $x=-3$

    $\left((x+3)\cdot P_2(x)\right)\Big|_{x=-3} = -8$

  ◦ $(x+3)^2\cdot P_3(x)$ is analytic at $x=-3$

    $\left((x+3)^2\cdot P_3(x)\right)\Big|_{x=-3} = 0$

  ◦ $x=-3$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = -3$

- Multiply by denominators

  $(x+3)\, y''(x^2+4x+3) + (x-5)\,(x^2+4x+3)\, y' - (2+x)\,(x+3)\, y = 0$

- Change variables using $x = u-3$ so that the regular singular point is at $u=0$

$$\left(u^3 - 2u^2\right)\left(\frac{d^2}{du^2}y(u)\right) + \left(u^3 - 10u^2 + 16u\right)\left(\frac{d}{du}y(u)\right) + \left(-u^2 + u\right)y(u) = 0$$

- Assume series solution for $y(u)$

$$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$$

☐ Rewrite ODE with series expansions

  - Convert $u^m \cdot y(u)$ to series expansion for $m = 1..2$

$$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

  - Shift index using $k- >k - m$

$$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 1..3$

$$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k + r)\, u^{k+r-1+m}$$

  - Shift index using $k- >k + 1 - m$

$$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k + 1 - m + r)\, u^{k+r}$$

  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 2..3$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k + r)\,(k + r - 1)\, u^{k+r-2+m}$$

  - Shift index using $k- >k + 2 - m$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k + 2 - m + r)\,(k + 1 - m + r)\, u^{k+r}$$

Rewrite ODE with series expansions

$$-2a_0 r(-9 + r)\, u^r + \left(-2a_1(1 + r)\,(-8 + r) + a_0\left(r^2 - 11r + 1\right)\right) u^{1+r} + \left(\sum_{k=2}^{\infty} \left(-2a_k(k + r)\,(k + r\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-2r(-9 + r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \{0, 9\}$$

- Each term must be 0

$$-2a_1(1 + r)\,(-8 + r) + a_0\left(r^2 - 11r + 1\right) = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = \frac{a_0(r^2-11r+1)}{2(r^2-7r-8)}$$

- Each term in the series must be 0, giving the recursion relation

$$(-2a_k + a_{k-1})\, k^2 + ((-4a_k + 2a_{k-1})\, r + 18a_k + a_{k-2} - 13a_{k-1})\, k + (-2a_k + a_{k-1})\, r^2 + (18a_k +$$

- Shift index using $k- >k+2$

$$(-2a_{k+2} + a_{k+1})\,(k+2)^2 + ((-4a_{k+2} + 2a_{k+1})\, r + 18a_{k+2} + a_k - 13a_{k+1})\,(k+2) + (-2a_{k+2} + a$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = \frac{k^2a_{k+1}+2kra_{k+1}+r^2a_{k+1}+ka_k-9ka_{k+1}+ra_k-9ra_{k+1}-a_k-9a_{k+1}}{2(k^2+2kr+r^2-5k-5r-14)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = \frac{k^2a_{k+1}+ka_k-9ka_{k+1}-a_k-9a_{k+1}}{2(k^2-5k-14)}$$

- Series not valid for $r = 0$, division by 0 in the recursion relation at $k = 7$

$$a_{k+2} = \frac{k^2a_{k+1}+ka_k-9ka_{k+1}-a_k-9a_{k+1}}{2(k^2-5k-14)}$$

- Recursion relation for $r = 9$

$$a_{k+2} = \frac{k^2a_{k+1}+ka_k+9ka_{k+1}+8a_k-9a_{k+1}}{2(k^2+13k+22)}$$

- Solution for $r = 9$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+9}, a_{k+2} = \frac{k^2a_{k+1}+ka_k+9ka_{k+1}+8a_k-9a_{k+1}}{2(k^2+13k+22)}, a_1 = -\frac{17a_0}{20}\right]$$

- Revert the change of variables $u = x + 3$

$$\left[y = \sum_{k=0}^{\infty} a_k(x+3)^{k+9}, a_{k+2} = \frac{k^2a_{k+1}+ka_k+9ka_{k+1}+8a_k-9a_{k+1}}{2(k^2+13k+22)}, a_1 = -\frac{17a_0}{20}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 47.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(x^2+2x+1)\, y''+(1-x)\, y=0}$$

With initial conditions

$$[y(0)=2, y'(0)=-1]$$

With the expansion point for the power series method at $x=0$.

13.48.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned} p(x) &= 0 \\ q(x) &= \frac{1-x}{(x+1)^2} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{(1-x)\,y}{(x+1)^2} = 0$$

The domain of $p(x) = 0$ is

$$\{-\infty < x < \infty\}$$

And the point $x_0 = 0$ is inside this domain. The domain of $q(x) = \frac{1-x}{(x+1)^2}$ is

$$\{x < -1 \lor -1 < x\}$$

And the point $x_0 = 0$ is also inside this domain. Hence solution exists and is unique.

Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\,y'(x_0) + \frac{(x - x_0)^2}{2} y''(x_0) + \frac{(x - x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0, y_0, y'_0} + \frac{x^3}{3!} f'|_{x_0, y_0, y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0, y_0, y'_0}
\end{aligned}$$

But

$$\frac{df}{dx} = \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} \tag{1}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y'' \tag{1070}$$

$$= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \tag{1071}$$

$$\frac{d^2 f}{dx^2} = \frac{d}{dx}\left(\frac{df}{dx}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right)y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right)f \tag{2}$$

$$\frac{d^3 f}{dx^3} = \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right)$$

$$= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right)y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right)f \tag{3}$$

$$\vdots$$

And so on. Hence if we name $F_0 = f(x, y, y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x, y, y') \qquad (4)\\
F_1 &= \frac{df}{dx} \\
&= \frac{dF_0}{dx} \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx} f\right) \\
&= \frac{d}{dx}(F_1) \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_1 + \left(\frac{\partial F_1}{\partial y}\right) y' + \left(\frac{\partial F_1}{\partial y'}\right) F_0 \\
&\vdots \\
F_n &= \frac{d}{dx}(F_{n-1}) \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) y'' \\
&= \frac{\partial}{\partial x} F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right) y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right) F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + x y_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n |_{x_0, y_0, y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= \frac{(x-1)\,y}{(x+1)^2} \\
F_1 &= \frac{dF_0}{dx} \\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y} y' + \frac{\partial F_0}{\partial y'} F_0 \\
&= \frac{y'x^2 - yx + 3y - y'}{(x+1)^3} \\
F_2 &= \frac{dF_1}{dx} \\
&= \frac{\partial F_1}{\partial x} + \frac{\partial F_1}{\partial y} y' + \frac{\partial F_1}{\partial y'} F_1 \\
&= \frac{(x-3)\left((-2x-2)\,y' + y(x+3)\right)}{(x+1)^4} \\
F_3 &= \frac{dF_2}{dx} \\
&= \frac{\partial F_2}{\partial x} + \frac{\partial F_2}{\partial y} y' + \frac{\partial F_2}{\partial y'} F_2 \\
&= \frac{(x^3 + 5x^2 - 25x - 29)\,y' - 4\left(x^2 - \frac{5}{2}x - \frac{15}{2}\right) y}{(x+1)^5} \\
F_4 &= \frac{dF_3}{dx} \\
&= \frac{\partial F_3}{\partial x} + \frac{\partial F_3}{\partial y} y' + \frac{\partial F_3}{\partial y'} F_3 \\
&= \frac{(-6x^3 - 6x^2 + 150x + 150)\,y' + y(x^3 + 15x^2 - 81x - 111)}{(x+1)^6}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $x = 0$ and $y(0) = 2$ and $y'(0) = -1$ gives

$$
\begin{aligned}
F_0 &= -2 \\
F_1 &= 7 \\
F_2 &= -24 \\
F_3 &= 89 \\
F_4 &= -372
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$
y = -x^2 - x + 2 + \frac{7x^3}{6} - x^4 + \frac{89x^5}{120} - \frac{31x^6}{60} + O\left(x^6\right)
$$

$$y = -x^2 - x + 2 + \frac{7x^3}{6} - x^4 + \frac{89x^5}{120} - \frac{31x^6}{60} + O(x^6)$$

Since the expansion point $x = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(x^2 + 2x + 1) y'' + (1 - x) y = 0$$

Let the solution be represented as power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^n$$

Then

$$y' = \sum_{n=1}^{\infty} n a_n x^{n-1}$$
$$y'' = \sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}$$

Substituting the above back into the ode gives

$$(x^2 + 2x + 1) \left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + (1 - x) \left(\sum_{n=0}^{\infty} a_n x^n\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=2}^{\infty} x^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} 2n\, x^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2}\right) + \left(\sum_{n=0}^{\infty} a_n x^n\right) + \sum_{n=0}^{\infty} \left(-x^{1+n} a_n\right) = 0 \tag{2}$$

The next step is to make all powers of x be n in each summation term. Going over each summation term above with power of x in it which is not already x^n and adjusting the power and the corresponding index gives

$$\sum_{n=2}^{\infty} 2n\, x^{n-1} a_n (n-1) = \sum_{n=1}^{\infty} 2(1+n) a_{1+n} n\, x^n$$

$$\sum_{n=2}^{\infty} n(n-1) a_n x^{n-2} = \sum_{n=0}^{\infty} (n+2) a_{n+2} (1+n) x^n$$

$$\sum_{n=0}^{\infty} \left(-x^{1+n} a_n\right) = \sum_{n=1}^{\infty} \left(-a_{n-1} x^n\right)$$

Substituting all the above in Eq (2) gives the following equation where now all powers of x are the same and equal to n.

$$\left(\sum_{n=2}^{\infty} x^{n} a_{n} n(n-1)\right)+\left(\sum_{n=1}^{\infty} 2(1+n) a_{1+n} n x^{n}\right)$$
$$+\left(\sum_{n=0}^{\infty}(n+2) a_{n+2}(1+n) x^{n}\right)+\left(\sum_{n=0}^{\infty} a_{n} x^{n}\right)+\sum_{n=1}^{\infty}\left(-a_{n-1} x^{n}\right)=0 \tag{3}$$

$n=0$ gives

$$2a_2+a_0=0$$

$$a_2=-\frac{a_0}{2}$$

$n=1$ gives

$$4a_2+6a_3+a_1-a_0=0$$

Which after substituting earlier equations, simplifies to

$$a_3=\frac{a_0}{2}-\frac{a_1}{6}$$

For $2 \leq n$, the recurrence equation is

$$n a_{n}(n-1)+2(1+n) a_{1+n} n+(n+2) a_{n+2}(1+n)+a_{n}-a_{n-1}=0 \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &=-\frac{n^{2} a_{n}+2 n^{2} a_{1+n}-n a_{n}+2 n a_{1+n}+a_{n}-a_{n-1}}{(n+2)(1+n)} \\ &=-\frac{\left(n^{2}-n+1\right) a_{n}}{(n+2)(1+n)}-\frac{\left(2 n^{2}+2 n\right) a_{1+n}}{(n+2)(1+n)}+\frac{a_{n-1}}{(n+2)(1+n)} \end{aligned} \tag{5}$$

For $n=2$ the recurrence equation gives

$$3a_2+12a_3+12a_4-a_1=0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{3a_0}{8} + \frac{a_1}{4}$$

For $n = 3$ the recurrence equation gives

$$7a_3 + 24a_4 + 20a_5 - a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = \frac{a_0}{4} - \frac{29a_1}{120}$$

For $n = 4$ the recurrence equation gives

$$13a_4 + 40a_5 + 30a_6 - a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{37a_0}{240} + \frac{5a_1}{24}$$

For $n = 5$ the recurrence equation gives

$$21a_5 + 60a_6 + 42a_7 - a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{29a_0}{336} - \frac{41a_1}{240}$$

And so on. Therefore the solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} a_n x^n \\ &= a_3 x^3 + a_2 x^2 + a_1 x + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y = a_0 + a_1 x - \frac{a_0 x^2}{2} + \left(\frac{a_0}{2} - \frac{a_1}{6}\right) x^3 + \left(-\frac{3a_0}{8} + \frac{a_1}{4}\right) x^4 + \left(\frac{a_0}{4} - \frac{29a_1}{120}\right) x^5 + \dots$$

Collecting terms, the solution becomes

$$y = \left(1-\frac{1}{2}x^2+\frac{1}{2}x^3-\frac{3}{8}x^4+\frac{1}{4}x^5\right)a_0+\left(x-\frac{1}{6}x^3+\frac{1}{4}x^4-\frac{29}{120}x^5\right)a_1+O\left(x^6\right) \tag{3}$$

At $x=0$ the solution above becomes

$$y = \left(1-\frac{1}{2}x^2+\frac{1}{2}x^3-\frac{3}{8}x^4+\frac{1}{4}x^5\right)c_1+\left(x-\frac{1}{6}x^3+\frac{1}{4}x^4-\frac{29}{120}x^5\right)c_2+O\left(x^6\right)$$

$$y = 2-x^2+\frac{7x^3}{6}-x^4+\frac{89x^5}{120}-x+O\left(x^6\right)$$

<u>Summary</u>
The solution(s) found are the following

$$y = -x^2-x+2+\frac{7x^3}{6}-x^4+\frac{89x^5}{120}-\frac{31x^6}{60}+O\left(x^6\right) \tag{1}$$
$$y = 2-x^2+\frac{7x^3}{6}-x^4+\frac{89x^5}{120}-x+O\left(x^6\right) \tag{2}$$

<u>Verification of solutions</u>

$$y = -x^2-x+2+\frac{7x^3}{6}-x^4+\frac{89x^5}{120}-\frac{31x^6}{60}+O\left(x^6\right)$$

Verified OK.

$$y = 2-x^2+\frac{7x^3}{6}-x^4+\frac{89x^5}{120}-x+O\left(x^6\right)$$

Verified OK.

13.48.2 Maple step by step solution

Let's solve

$$\left[\left(x^2+2x+1\right)y''+(1-x)\,y=0, y(0)=2, y'\Big|_{\{x=0\}}=-1\right]$$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

$y'' = \frac{(x-1)y}{x^2+2x+1}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{(x-1)y}{x^2+2x+1} = 0$

- ☐ Check to see if $x_0 = -1$ is a regular singular point
  - Define functions

    $\left[P_2(x) = 0, P_3(x) = -\frac{x-1}{x^2+2x+1}\right]$
  - $(x+1) \cdot P_2(x)$ is analytic at $x = -1$

    $\left((x+1) \cdot P_2(x)\right)\Big|_{x=-1} = 0$
  - $(x+1)^2 \cdot P_3(x)$ is analytic at $x = -1$

    $\left((x+1)^2 \cdot P_3(x)\right)\Big|_{x=-1} = 2$
  - $x = -1$is a regular singular point

  Check to see if $x_0 = -1$ is a regular singular point

  $x_0 = -1$

- Multiply by denominators

  $(x^2 + 2x + 1)\, y'' + (1 - x)\, y = 0$

- Change variables using $x = u - 1$ so that the regular singular point is at $u = 0$

  $u^2 \left(\frac{d^2}{du^2} y(u)\right) + (2 - u)\, y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

- ☐ Rewrite ODE with series expansions
  - Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

    $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$
  - Shift index using $k- > k - m$

    $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$
  - Convert $u^2 \cdot \left(\frac{d^2}{du^2} y(u)\right)$ to series expansion

$$u^2 \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)(k+r-1)\, u^{k+r}$$

Rewrite ODE with series expansions

$$a_0(r^2-r+2)\, u^r + \left(\sum_{k=1}^{\infty} \left(a_k(k^2+2kr+r^2-k-r+2) - a_{k-1}\right) u^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$r^2 - r + 2 = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-\frac{\mathrm{I}\sqrt{7}}{2} + \frac{1}{2}, \frac{\mathrm{I}\sqrt{7}}{2} + \frac{1}{2}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$(k^2 + (2r-1)\,k + r^2 - r + 2)\, a_k - a_{k-1} = 0$$

- Shift index using $k- >k+1$

$$\left((k+1)^2 + (2r-1)(k+1) + r^2 - r + 2\right) a_{k+1} - a_k = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = \frac{a_k}{k^2+2kr+r^2+k+r+2}$$

- Recursion relation for $r = -\frac{\mathrm{I}\sqrt{7}}{2} + \frac{1}{2}$

$$a_{k+1} = \frac{a_k}{k^2+2k\left(-\frac{\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}\right)+\left(-\frac{\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}\right)^2+k-\frac{\mathrm{I}\sqrt{7}}{2}+\frac{5}{2}}$$

- Solution for $r = -\frac{\mathrm{I}\sqrt{7}}{2} + \frac{1}{2}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}}, a_{k+1} = \frac{a_k}{k^2+2k\left(-\frac{\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}\right)+\left(-\frac{\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}\right)^2+k-\frac{\mathrm{I}\sqrt{7}}{2}+\frac{5}{2}}\right]$$

- Revert the change of variables $u = x+1$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^{k-\frac{\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}}, a_{k+1} = \frac{a_k}{k^2+2k\left(-\frac{\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}\right)+\left(-\frac{\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}\right)^2+k-\frac{\mathrm{I}\sqrt{7}}{2}+\frac{5}{2}}\right]$$

- Recursion relation for $r = \frac{\mathrm{I}\sqrt{7}}{2} + \frac{1}{2}$

$$a_{k+1} = \frac{a_k}{k^2+2k\left(\frac{\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}\right)+\left(\frac{\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}\right)^2+k+\frac{\mathrm{I}\sqrt{7}}{2}+\frac{5}{2}}$$

- Solution for $r = \frac{\mathrm{I}\sqrt{7}}{2} + \frac{1}{2}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+\frac{\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}}, a_{k+1} = \frac{a_k}{k^2+2k\left(\frac{\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}\right)+\left(\frac{\mathrm{I}\sqrt{7}}{2}+\frac{1}{2}\right)^2+k+\frac{\mathrm{I}\sqrt{7}}{2}+\frac{5}{2}}\right]$$

- Revert the change of variables $u = x+1$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^{k+\frac{I\sqrt{7}}{2}+\frac{1}{2}}, a_{k+1} = \frac{a_k}{k^2+2k\left(\frac{I\sqrt{7}}{2}+\frac{1}{2}\right)+\left(\frac{I\sqrt{7}}{2}+\frac{1}{2}\right)^2+k+\frac{I\sqrt{7}}{2}+\frac{5}{2}}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k (x+1)^{k-\frac{I\sqrt{7}}{2}+\frac{1}{2}}\right) + \left(\sum_{k=0}^{\infty} b_k (x+1)^{k+\frac{I\sqrt{7}}{2}+\frac{1}{2}}\right), a_{1+k} = \frac{a_k}{k^2+2k\left(-\frac{I\sqrt{7}}{2}+\frac{1}{2}\right)+\left(-\frac{I\sqrt{7}}{2}+\frac{1}{2}\right)^2+k-\frac{I\sqrt{}}{2}}\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.3 SERIES SOLUTIONS NEAR AN ORDINARY POINT II. Exercises 7.3. Page 338
Problem number: 48.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{\left(-2x^{2}+x\right) y''+\left(-x^{2}+3x+1\right) y'+\left(2+x\right) y=0}$$

With initial conditions

$$[y(1)=1, y'(1)=0]$$

With the expansion point for the power series method at $x=1$.

13.49.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y''+p(x)y'+q(x)y=F$$

Where here

$$\begin{aligned} p(x) &= \frac{-x^{2}+3x+1}{-2x^{2}+x} \\ q(x) &= \frac{2+x}{-2x^{2}+x} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y'' + \frac{(-x^2+3x+1)\, y'}{-2x^2+x} + \frac{(2+x)\, y}{-2x^2+x} = 0$$

The domain of $p(x) = \frac{-x^2+3x+1}{-2x^2+x}$ is

$$\left\{-\infty \le x < 0, 0 < x < \frac{1}{2}, \frac{1}{2} < x \le \infty\right\}$$

And the point $x_0 = 1$ is inside this domain. The domain of $q(x) = \frac{2+x}{-2x^2+x}$ is

$$\left\{-\infty \le x < 0, 0 < x < \frac{1}{2}, \frac{1}{2} < x \le \infty\right\}$$

And the point $x_0 = 1$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x = 0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t = x - 1$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(-2(t+1)^2 + t + 1\right)\left(\frac{d^2}{dt^2}y(t)\right) + \left(-(t+1)^2 + 3t + 4\right)\left(\frac{d}{dt}y(t)\right) + (t+3)\, y(t) = 0$$

With its expansion point and initial conditions now at $t = 0$. With initial conditions now becoming

$$y(0) = 1$$
$$y'(0) = 0$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y'' = f(x, y, y')$$

Assuming expansion is at $x_0 = 0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x, y, y')$ is analytic at x_0 which must be the case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + x y'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\
&= y_0 + x y'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (1073) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (1074) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}$$

Therefore (6) can be used from now on along with

$$y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)!} F_n|_{x_0,y_0,y_0'} \qquad (7)$$

To find $y(x)$ series solution around $x = 0$. Hence

$$F_0 = -\frac{\left(\frac{d}{dt}y(t)\right)t^2 - t\left(\frac{d}{dt}y(t)\right) - y(t)\,t - 3\frac{d}{dt}y(t) - 3y(t)}{2t^2 + 3t + 1}$$

$$\begin{aligned}
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\,(t)}F_0 \\
&= \frac{(t^4 - t^2 + 2t + 4)\left(\frac{d}{dt}y(t)\right) - y(t)\,(t^3 + 4t^2 + 6t - 1)}{(2t^2 + 3t + 1)^2}
\end{aligned}$$

$$\begin{aligned}
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\,(t)}F_1 \\
&= \frac{(-t^6 - t^5 - t^4 - 20t^3 - 37t^2 - 33t - 9)\left(\frac{d}{dt}y(t)\right) + y(t)\,t(t^4 + 5t^3 + 12t^2 + 32t + 12)}{(2t^2 + 3t + 1)^3}
\end{aligned}$$

$$\begin{aligned}
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\,(t)}F_2 \\
&= \frac{(t^8 + 2t^7 + 3t^6 + 48t^5 + 231t^4 + 360t^3 + 314t^2 + 136t + 21)\left(\frac{d}{dt}y(t)\right) - y(t)\,(t^7 + 6t^6 + 18t^5 + 75t^4 +}{(2t^2 + 3t + 1)^4}
\end{aligned}$$

$$\begin{aligned}
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\,(t)}F_3 \\
&= -\frac{2(t+1)\left((t^{10} + 3t^9 + 5t^8 + 80t^7 + 640t^6 + 2580t^5 + 4343t^4 + 4203t^3 + 2353t^2 + 664t + 68)\left(\frac{d}{dt}y(t\right.\right.}{(2t^2 + 3t}
\end{aligned}$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = 1$ and $y'(0) = 0$ gives

$$\begin{aligned}
F_0 &= 3 \\
F_1 &= 1 \\
F_2 &= 0 \\
F_3 &= -15 \\
F_4 &= 127
\end{aligned}$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = 1 + \frac{3t^2}{2} + \frac{t^3}{6} - \frac{t^5}{8} + \frac{127t^6}{720} + O(t^6)$$

$$y(t) = 1 + \frac{3t^2}{2} + \frac{t^3}{6} - \frac{t^5}{8} + \frac{127t^6}{720} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$(-2t^2 - 3t - 1)\left(\frac{d^2}{dt^2}y(t)\right) + (-t^2 + t + 3)\left(\frac{d}{dt}y(t)\right) + (t + 3)\,y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}$$

Substituting the above back into the ode gives

$$(-2t^2 - 3t - 1)\left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right) + (-t^2 + t + 3)\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + (t + 3)\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}
&\sum_{n=2}^{\infty}\left(-2t^n a_n n(n-1)\right) + \sum_{n=2}^{\infty}\left(-3n\,t^{n-1}a_n(n-1)\right) \\
&+ \sum_{n=2}^{\infty}\left(-n(n-1)\,a_n t^{n-2}\right) + \sum_{n=1}^{\infty}\left(-n\,t^{1+n}a_n\right) + \left(\sum_{n=1}^{\infty} n a_n t^n\right) \\
&+ \left(\sum_{n=1}^{\infty} 3n a_n t^{n-1}\right) + \left(\sum_{n=0}^{\infty} t^{1+n}a_n\right) + \left(\sum_{n=0}^{\infty} 3a_n t^n\right) = 0
\end{aligned} \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=2}^{\infty} \left(-3n\, t^{n-1} a_n (n-1)\right) &= \sum_{n=1}^{\infty} \left(-3(1+n)\, a_{1+n} n\, t^n\right) \\
\sum_{n=2}^{\infty} \left(-n(n-1)\, a_n t^{n-2}\right) &= \sum_{n=0}^{\infty} \left(-(n+2)\, a_{n+2}(1+n)\, t^n\right) \\
\sum_{n=1}^{\infty} \left(-n\, t^{1+n} a_n\right) &= \sum_{n=2}^{\infty} \left(-(n-1)\, a_{n-1} t^n\right) \\
\sum_{n=1}^{\infty} 3n a_n t^{n-1} &= \sum_{n=0}^{\infty} 3(1+n)\, a_{1+n} t^n \\
\sum_{n=0}^{\infty} t^{1+n} a_n &= \sum_{n=1}^{\infty} a_{n-1} t^n
\end{aligned}
$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$
\begin{aligned}
&\sum_{n=2}^{\infty} \left(-2t^n a_n n(n-1)\right) + \sum_{n=1}^{\infty} \left(-3(1+n)\, a_{1+n} n\, t^n\right) \\
&+ \sum_{n=0}^{\infty} \left(-(n+2)\, a_{n+2}(1+n)\, t^n\right) + \sum_{n=2}^{\infty} \left(-(n-1)\, a_{n-1} t^n\right) + \left(\sum_{n=1}^{\infty} n a_n t^n\right) \\
&+ \left(\sum_{n=0}^{\infty} 3(1+n)\, a_{1+n} t^n\right) + \left(\sum_{n=1}^{\infty} a_{n-1} t^n\right) + \left(\sum_{n=0}^{\infty} 3 a_n t^n\right) = 0
\end{aligned} \tag{3}
$$

$n = 0$ gives

$$
-2a_2 + 3a_1 + 3a_0 = 0
$$

$$
a_2 = \frac{3a_0}{2} + \frac{3a_1}{2}
$$

$n = 1$ gives

$$
-6a_3 + 4a_1 + a_0 = 0
$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{a_0}{6} + \frac{2a_1}{3}$$

For $2 \leq n$, the recurrence equation is

$$\begin{aligned} -2na_n(n-1) - 3(1+n)\, a_{1+n}n - (n+2)\, a_{n+2}(1+n) \\ - (n-1)\, a_{n-1} + na_n + 3(1+n)\, a_{1+n} + a_{n-1} + 3a_n = 0 \end{aligned} \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{2n^2a_n + 3n^2a_{1+n} - 3na_n + na_{n-1} - 3a_n - 3a_{1+n} - 2a_{n-1}}{(n+2)\,(1+n)} \\ &= -\frac{(2n^2-3n-3)\, a_n}{(n+2)\,(1+n)} - \frac{(3n^2-3)\, a_{1+n}}{(n+2)\,(1+n)} - \frac{(n-2)\, a_{n-1}}{(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$a_2 - 9a_3 - 12a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = -\frac{3a_1}{8}$$

For $n = 3$ the recurrence equation gives

$$-6a_3 - 24a_4 - 20a_5 - a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{a_0}{8} + \frac{7a_1}{40}$$

For $n = 4$ the recurrence equation gives

$$-17a_4 - 45a_5 - 30a_6 - 2a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{17a_1}{180} + \frac{127a_0}{720}$$

For $n = 5$ the recurrence equation gives

$$-32a_5 - 72a_6 - 42a_7 - 3a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = -\frac{29a_0}{140} + \frac{31a_1}{560}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3 t^3 + a_2 t^2 + a_1 t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + \left(\frac{3a_0}{2} + \frac{3a_1}{2}\right) t^2 + \left(\frac{a_0}{6} + \frac{2a_1}{3}\right) t^3 - \frac{3a_1 t^4}{8} + \left(-\frac{a_0}{8} + \frac{7a_1}{40}\right) t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 + \frac{3}{2}t^2 + \frac{1}{6}t^3 - \frac{1}{8}t^5\right) a_0 + \left(t + \frac{3}{2}t^2 + \frac{2}{3}t^3 - \frac{3}{8}t^4 + \frac{7}{40}t^5\right) a_1 + O(t^6) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 + \frac{3}{2}t^2 + \frac{1}{6}t^3 - \frac{1}{8}t^5\right) c_1 + \left(t + \frac{3}{2}t^2 + \frac{2}{3}t^3 - \frac{3}{8}t^4 + \frac{7}{40}t^5\right) c_2 + O(t^6)$$

$$y(t) = 1 + \frac{3t^2}{2} + \frac{t^3}{6} - \frac{t^5}{8} + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x-1$ results in

$$y = 1 + \frac{3(x-1)^2}{2} + \frac{(x-1)^3}{6} - \frac{(x-1)^5}{8} + \frac{127(x-1)^6}{720} + O\left((x-1)^6\right)$$

Summary

The solution(s) found are the following

$$y = 1 + \frac{3(x-1)^2}{2} + \frac{(x-1)^3}{6} - \frac{(x-1)^5}{8} + \frac{127(x-1)^6}{720} + O\left((x-1)^6\right) \tag{1}$$

Verification of solutions

$$y = 1 + \frac{3(x-1)^2}{2} + \frac{(x-1)^3}{6} - \frac{(x-1)^5}{8} + \frac{127(x-1)^6}{720} + O\left((x-1)^6\right)$$

Verified OK.

13.49.2 Maple step by step solution

Let's solve

$\left[(-2x^2+x)\, y'' + (-x^2+3x+1)\, y' + (2+x)\, y = 0, y(1) = 1, y'\Big|_{\{x=1\}} = 0\right]$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(2+x)y}{x(2x-1)} - \frac{(x^2-3x-1)y'}{x(2x-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x^2-3x-1)y'}{x(2x-1)} - \frac{(2+x)y}{x(2x-1)} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x) = \frac{x^2-3x-1}{x(2x-1)}, P_3(x) = -\frac{2+x}{x(2x-1)}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

    $(x \cdot P_2(x))\Big|_{x=0} = 1$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $(x^2 \cdot P_3(x))\Big|_{x=0} = 0$

  ◦ $x = 0$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = 0$

- Multiply by denominators

  $y''x(2x-1)+(x^2-3x-1)\,y'+(-x-2)\,y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m=0..1$

    $x^m \cdot y=\sum_{k=0}^{\infty} a_k x^{k+r+m}$

  - Shift index using $k->k-m$

    $x^m \cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  - Convert $x^m \cdot y'$ to series expansion for $m=0..2$

    $x^m \cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$

  - Shift index using $k->k+1-m$

    $x^m \cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$

  - Convert $x^m \cdot y''$ to series expansion for $m=1..2$

    $x^m \cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$

  - Shift index using $k->k+2-m$

    $x^m \cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$

  Rewrite ODE with series expansions

  $-a_0 r^2 x^{-1+r}+\left(-a_1(1+r)^2+a_0(2r^2-5r-2)\right)x^r+\left(\sum_{k=1}^{\infty}\left(-a_{k+1}(k+1+r)^2+a_k(2k^2+4kr+\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-r^2=0$

- Values of r that satisfy the indicial equation

  $r=0$

- Each term must be 0

  $-a_1(1+r)^2+a_0(2r^2-5r-2)=0$

- Each term in the series must be 0, giving the recursion relation

  $$(2a_k - a_{k+1})k^2 + (-5a_k + a_{k-1} - 2a_{k+1})k - 2a_k - 2a_{k-1} - a_{k+1} = 0$$

- Shift index using $k- > k+1$

  $$(2a_{k+1} - a_{k+2})(k+1)^2 + (-5a_{k+1} + a_k - 2a_{k+2})(k+1) - 2a_{k+1} - 2a_k - a_{k+2} = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2} = \frac{2k^2a_{k+1} + ka_k - ka_{k+1} - a_k - 5a_{k+1}}{k^2+4k+4}$$

- Recursion relation for $r = 0$

  $$a_{k+2} = \frac{2k^2a_{k+1} + ka_k - ka_{k+1} - a_k - 5a_{k+1}}{k^2+4k+4}$$

- Solution for $r = 0$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+2} = \frac{2k^2a_{k+1} + ka_k - ka_{k+1} - a_k - 5a_{k+1}}{k^2+4k+4}, -a_1 - 2a_0 = 0\right]$$

The type(s) of ODE detected by this program : **"second order series method. Ordinary point", "second order series method. Taylor series method"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{(2x^2 - 11x + 16)\, y'' + (x^2 - 6x + 10)\, y' - (2 - x)\, y = 0}$$

With initial conditions

$$[y(3) = 1, y'(3) = -2]$$

With the expansion point for the power series method at $x = 3$.

13.50.1 Existence and uniqueness analysis

This is a linear ODE. In canonical form it is written as

$$y'' + p(x)y' + q(x)y = F$$

Where here

$$\begin{aligned} p(x) &= \frac{x^2 - 6x + 10}{2x^2 - 11x + 16} \\ q(x) &= \frac{-2 + x}{2x^2 - 11x + 16} \\ F &= 0 \end{aligned}$$

Hence the ode is

$$y''+\frac{(x^2-6x+10)\,y'}{2x^2-11x+16}+\frac{(-2+x)\,y}{2x^2-11x+16}=0$$

The domain of $p(x)=\frac{x^2-6x+10}{2x^2-11x+16}$ is

$$\{-\infty<x<\infty\}$$

And the point $x_0=3$ is inside this domain. The domain of $q(x)=\frac{-2+x}{2x^2-11x+16}$ is

$$\{-\infty<x<\infty\}$$

And the point $x_0=3$ is also inside this domain. Hence solution exists and is unique.

The ode does not have its expansion point at $x=0$, therefore to simplify the computation of power series expansion, change of variable is made on the independent variable to shift the initial conditions and the expasion point back to zero. The new ode is then solved more easily since the expansion point is now at zero. The solution converted back to the original independent variable. Let

$$t=x-3$$

The ode is converted to be in terms of the new independent variable t. This results in

$$\left(2(t+3)^2-11t-17\right)\left(\frac{d^2}{dt^2}y(t)\right)+\left((t+3)^2-6t-8\right)\left(\frac{d}{dt}y(t)\right)+(t+1)\,y(t)=0$$

With its expansion point and initial conditions now at $t=0$. With initial conditions now becoming

$$y(0)=1$$
$$y'(0)=-2$$

The transformed ODE is now solved. Solving ode using Taylor series method. This gives review on how the Taylor series method works for solving second order ode.

Let

$$y''=f(x,y,y')$$

Assuming expansion is at $x_0=0$ (we can always shift the actual expansion point to 0 by change of variables) and assuming $f(x,y,y')$ is analytic at x_0 which must be the

case for an ordinary point. Let initial conditions be $y(x_0) = y_0$ and $y'(x_0) = y'_0$. Using Taylor series gives

$$
\begin{aligned}
y(x) &= y(x_0) + (x - x_0)\, y'(x_0) + \frac{(x-x_0)^2}{2} y''(x_0) + \frac{(x-x_0)^3}{3!} y'''(x_0) + \cdots \\
&= y_0 + xy'_0 + \frac{x^2}{2} f|_{x_0,y_0,y'_0} + \frac{x^3}{3!} f'|_{x_0,y_0,y'_0} + \cdots \\
&= y_0 + xy'_0 + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} \frac{d^n f}{dx^n}\bigg|_{x_0,y_0,y'_0}
\end{aligned}
$$

But

$$
\begin{aligned}
\frac{df}{dx} &= \frac{\partial f}{\partial x}\frac{dx}{dx} + \frac{\partial f}{\partial y}\frac{dy}{dx} + \frac{\partial f}{\partial y'}\frac{dy'}{dx} && (1) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' && (1076) \\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} f && (1077) \\
\frac{d^2 f}{dx^2} &= \frac{d}{dx}\left(\frac{df}{dx}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{df}{dx}\right) + \frac{\partial}{\partial y}\left(\frac{df}{dx}\right) y' + \frac{\partial}{\partial y'}\left(\frac{df}{dx}\right) f && (2) \\
\frac{d^3 f}{dx^3} &= \frac{d}{dx}\left(\frac{d^2 f}{dx^2}\right) \\
&= \frac{\partial}{\partial x}\left(\frac{d^2 f}{dx^2}\right) + \left(\frac{\partial}{\partial y}\frac{d^2 f}{dx^2}\right) y' + \frac{\partial}{\partial y'}\left(\frac{d^2 f}{dx^2}\right) f && (3) \\
&\ \vdots
\end{aligned}
$$

And so on. Hence if we name $F_0 = f(x,y,y')$ then the above can be written as

$$
\begin{aligned}
F_0 &= f(x,y,y') \qquad (4)\\
F_1 &= \frac{df}{dx}\\
&= \frac{dF_0}{dx}\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}y''\\
&= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y}y' + \frac{\partial f}{\partial y'}f \qquad (5)\\
&= \frac{\partial F_0}{\partial x} + \frac{\partial F_0}{\partial y}y' + \frac{\partial F_0}{\partial y'}F_0\\
F_2 &= \frac{d}{dx}\left(\frac{d}{dx}f\right)\\
&= \frac{d}{dx}(F_1)\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_1 + \left(\frac{\partial F_1}{\partial y}\right)y' + \left(\frac{\partial F_1}{\partial y'}\right)F_0\\
&\vdots\\
F_n &= \frac{d}{dx}(F_{n-1})\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)y''\\
&= \frac{\partial}{\partial x}F_{n-1} + \left(\frac{\partial F_{n-1}}{\partial y}\right)y' + \left(\frac{\partial F_{n-1}}{\partial y'}\right)F_0 \qquad (6)
\end{aligned}
$$

Therefore (6) can be used from now on along with

$$
y(x) = y_0 + xy_0' + \sum_{n=0}^{\infty} \frac{x^{n+2}}{(n+2)\,!} F_n|_{x_0,y_0,y_0'} \qquad (7)
$$

To find $y(x)$ series solution around $x = 0$. Hence

$$
\begin{aligned}
F_0 &= -\frac{\left(\frac{d}{dt}y(t)\right)t^2 + y(t)\,t + \frac{d}{dt}y(t) + y(t)}{2t^2 + t + 1} \\
F_1 &= \frac{dF_0}{dt} \\
&= \frac{\partial F_0}{\partial t} + \frac{\partial F_0}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_0}{\partial \frac{d}{dt}y\left(t\right)}F_0 \\
&= \frac{(t^4 - 2t^3 - 2t^2 + 1)\left(\frac{d}{dt}y(t)\right) + y(t)\,(t^3 + 3t^2 + 5t + 1)}{\left(2t^2 + t + 1\right)^2} \\
F_2 &= \frac{dF_1}{dt} \\
&= \frac{\partial F_1}{\partial t} + \frac{\partial F_1}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_1}{\partial \frac{d}{dt}y\left(t\right)}F_1 \\
&= \frac{(-t^6 + 4t^5 + 14t^4 + 26t^3 + 5t^2 - 6t - 2)\left(\frac{d}{dt}y(t)\right) - y(t)\,(t^5 + t^4 + 7t^3 + 25t^2 + 8t - 2)}{\left(2t^2 + t + 1\right)^3} \\
F_3 &= \frac{dF_2}{dt} \\
&= \frac{\partial F_2}{\partial t} + \frac{\partial F_2}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_2}{\partial \frac{d}{dt}y\left(t\right)}F_2 \\
&= \frac{(t^8 - 6t^7 - 27t^6 - 100t^5 - 199t^4 - 52t^3 + 101t^2 + 46t + 4)\left(\frac{d}{dt}y(t)\right) + y(t)\,(t^7 - t^6 - 16t^5 - 4t^4 + 16}{\left(2t^2 + t + 1\right)^4} \\
F_4 &= \frac{dF_3}{dt} \\
&= \frac{\partial F_3}{\partial t} + \frac{\partial F_3}{\partial y}\frac{d}{dt}y(t) + \frac{\partial F_3}{\partial \frac{d}{dt}y\left(t\right)}F_3 \\
&= \frac{(-t^{10} + 8t^9 + 41t^8 + 172t^7 + 705t^6 + 1792t^5 + 449t^4 - 1800t^3 - 1096t^2 - 108t + 14)\left(\frac{d}{dt}y(t)\right) - y(t}{\left(2t^2 + t + 1\right)^5}
\end{aligned}
$$

And so on. Evaluating all the above at initial conditions $t = 0$ and $y(0) = 1$ and $y'(0) = -2$ gives

$$
\begin{aligned}
F_0 &= 1 \\
F_1 &= -1 \\
F_2 &= 6 \\
F_3 &= -20 \\
F_4 &= -34
\end{aligned}
$$

Substituting all the above in (7) and simplifying gives the solution as

$$y(t) = 1 + \frac{t^2}{2} - 2t - \frac{t^3}{6} + \frac{t^4}{4} - \frac{t^5}{6} - \frac{17t^6}{360} + O(t^6)$$

$$y(t) = 1 + \frac{t^2}{2} - 2t - \frac{t^3}{6} + \frac{t^4}{4} - \frac{t^5}{6} - \frac{17t^6}{360} + O(t^6)$$

Since the expansion point $t = 0$ is an ordinary, we can also solve this using standard power series The ode is normalized to be

$$\left(\frac{d^2}{dt^2}y(t)\right)(2t^2 + t + 1) + (t^2 + 1)\left(\frac{d}{dt}y(t)\right) + (t + 1)\,y(t) = 0$$

Let the solution be represented as power series of the form

$$y(t) = \sum_{n=0}^{\infty} a_n t^n$$

Then

$$\frac{d}{dt}y(t) = \sum_{n=1}^{\infty} n a_n t^{n-1}$$
$$\frac{d^2}{dt^2}y(t) = \sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}$$

Substituting the above back into the ode gives

$$\left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right)(2t^2 + t + 1) + (t^2 + 1)\left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + (t + 1)\left(\sum_{n=0}^{\infty} a_n t^n\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right) + \left(\sum_{n=2}^{\infty} n\, t^{n-1} a_n (n-1)\right) + \left(\sum_{n=2}^{\infty} n(n-1)\,a_n t^{n-2}\right) \\ + \left(\sum_{n=1}^{\infty} n\, t^{1+n} a_n\right) + \left(\sum_{n=1}^{\infty} n a_n t^{n-1}\right) + \left(\sum_{n=0}^{\infty} t^{1+n} a_n\right) + \left(\sum_{n=0}^{\infty} a_n t^n\right) = 0\end{aligned} \tag{2}$$

The next step is to make all powers of t be n in each summation term. Going over each summation term above with power of t in it which is not already t^n and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=2}^{\infty} n\, t^{n-1} a_n (n-1) &= \sum_{n=1}^{\infty} (1+n)\, a_{1+n} n\, t^n \\
\sum_{n=2}^{\infty} n(n-1)\, a_n t^{n-2} &= \sum_{n=0}^{\infty} (n+2)\, a_{n+2} (1+n)\, t^n \\
\sum_{n=1}^{\infty} n\, t^{1+n} a_n &= \sum_{n=2}^{\infty} (n-1)\, a_{n-1} t^n \\
\sum_{n=1}^{\infty} n a_n t^{n-1} &= \sum_{n=0}^{\infty} (1+n)\, a_{1+n} t^n \\
\sum_{n=0}^{\infty} t^{1+n} a_n &= \sum_{n=1}^{\infty} a_{n-1} t^n
\end{aligned}
$$

Substituting all the above in Eq (2) gives the following equation where now all powers of t are the same and equal to n.

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} 2t^n a_n n(n-1)\right) + \left(\sum_{n=1}^{\infty} (1+n)\, a_{1+n} n\, t^n\right) \\
&+ \left(\sum_{n=0}^{\infty} (n+2)\, a_{n+2} (1+n)\, t^n\right) + \left(\sum_{n=2}^{\infty} (n-1)\, a_{n-1} t^n\right) \\
&+ \left(\sum_{n=0}^{\infty} (1+n)\, a_{1+n} t^n\right) + \left(\sum_{n=1}^{\infty} a_{n-1} t^n\right) + \left(\sum_{n=0}^{\infty} a_n t^n\right) = 0
\end{aligned} \tag{3}
$$

$n = 0$ gives

$$
2a_2 + a_1 + a_0 = 0
$$

$$
a_2 = -\frac{a_0}{2} - \frac{a_1}{2}
$$

$n = 1$ gives

$$
4a_2 + 6a_3 + a_0 + a_1 = 0
$$

Which after substituting earlier equations, simplifies to

$$a_3 = \frac{a_0}{6} + \frac{a_1}{6}$$

For $2 \leq n$, the recurrence equation is

$$\begin{aligned} &2na_n(n-1) + (1+n)\, a_{1+n} n + (n+2)\, a_{n+2}(1+n) \\ &+ (n-1)\, a_{n-1} + (1+n)\, a_{1+n} + a_{n-1} + a_n = 0 \end{aligned} \tag{4}$$

Solving for a_{n+2}, gives

$$\begin{aligned} a_{n+2} &= -\frac{2n^2 a_n + n^2 a_{1+n} - 2na_n + 2na_{1+n} + na_{n-1} + a_n + a_{1+n}}{(n+2)\,(1+n)} \\ &= -\frac{(2n^2 - 2n + 1)\, a_n}{(n+2)\,(1+n)} - \frac{(n^2 + 2n + 1)\, a_{1+n}}{(n+2)\,(1+n)} - \frac{na_{n-1}}{(n+2)\,(1+n)} \end{aligned} \tag{5}$$

For $n = 2$ the recurrence equation gives

$$5a_2 + 9a_3 + 12a_4 + 2a_1 = 0$$

Which after substituting the earlier terms found becomes

$$a_4 = \frac{a_0}{12} - \frac{a_1}{12}$$

For $n = 3$ the recurrence equation gives

$$13a_3 + 16a_4 + 20a_5 + 3a_2 = 0$$

Which after substituting the earlier terms found becomes

$$a_5 = -\frac{a_0}{10} + \frac{a_1}{30}$$

For $n = 4$ the recurrence equation gives

$$25a_4 + 25a_5 + 30a_6 + 4a_3 = 0$$

Which after substituting the earlier terms found becomes

$$a_6 = -\frac{a_0}{120} + \frac{7a_1}{360}$$

For $n = 5$ the recurrence equation gives

$$41a_5 + 36a_6 + 42a_7 + 5a_4 = 0$$

Which after substituting the earlier terms found becomes

$$a_7 = \frac{239a_0}{2520} - \frac{11a_1}{280}$$

And so on. Therefore the solution is

$$\begin{aligned} y(t) &= \sum_{n=0}^{\infty} a_n t^n \\ &= a_3t^3 + a_2t^2 + a_1t + a_0 + \dots \end{aligned}$$

Substituting the values for a_n found above, the solution becomes

$$y(t) = a_0 + a_1 t + \left(-\frac{a_0}{2} - \frac{a_1}{2}\right) t^2 + \left(\frac{a_0}{6} + \frac{a_1}{6}\right) t^3 + \left(\frac{a_0}{12} - \frac{a_1}{12}\right) t^4 + \left(-\frac{a_0}{10} + \frac{a_1}{30}\right) t^5 + \dots$$

Collecting terms, the solution becomes

$$y(t) = \left(1 - \frac{1}{2}t^2 + \frac{1}{6}t^3 + \frac{1}{12}t^4 - \frac{1}{10}t^5\right) a_0 + \left(t - \frac{1}{2}t^2 + \frac{1}{6}t^3 - \frac{1}{12}t^4 + \frac{1}{30}t^5\right) a_1 + O(t^6) \quad (3)$$

At $t = 0$ the solution above becomes

$$y(t) = \left(1 - \frac{1}{2}t^2 + \frac{1}{6}t^3 + \frac{1}{12}t^4 - \frac{1}{10}t^5\right) c_1 + \left(t - \frac{1}{2}t^2 + \frac{1}{6}t^3 - \frac{1}{12}t^4 + \frac{1}{30}t^5\right) c_2 + O(t^6)$$

$$y(t) = 1 + \frac{t^2}{2} - \frac{t^3}{6} + \frac{t^4}{4} - \frac{t^5}{6} - 2t + O(t^6)$$

Replacing t in the above with the original independent variable $x$susing $t = x - 3$ results in

$$y = 7 + \frac{(x-3)^2}{2} - 2x - \frac{(x-3)^3}{6} + \frac{(x-3)^4}{4} - \frac{(x-3)^5}{6} - \frac{17(x-3)^6}{360} + O\left((x-3)^6\right)$$

Summary

The solution(s) found are the following

$$y = 7+\frac{(x-3)^{2}}{2}-2x-\frac{(x-3)^{3}}{6}+\frac{(x-3)^{4}}{4}-\frac{(x-3)^{5}}{6}-\frac{17(x-3)^{6}}{360}+O\left((x-3)^{6}\right) \tag{1}$$

Verification of solutions

$$y = 7+\frac{(x-3)^{2}}{2}-2x-\frac{(x-3)^{3}}{6}+\frac{(x-3)^{4}}{4}-\frac{(x-3)^{5}}{6}-\frac{17(x-3)^{6}}{360}+O\left((x-3)^{6}\right)$$

Verified OK.

13.50.2 Maple step by step solution

Let's solve

$$\left[\left(2x^{2}-11x+16\right) y''+\left(x^{2}-6x+10\right) y'+\left(-2+x\right) y=0, y(3)=1, y'\Big|_{\{x=3\}}=-2\right]$$

- Highest derivative means the order of the ODE is 2

  y''
- Isolate 2nd derivative

  $y''=-\frac{(-2+x)y}{2x^{2}-11x+16}-\frac{(x^{2}-6x+10)y'}{2x^{2}-11x+16}$
- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(x^{2}-6x+10)y'}{2x^{2}-11x+16}+\frac{(-2+x)y}{2x^{2}-11x+16}=0$

☐ Check to see if x_0 is a regular singular point

- ◦ Define functions

  $\left[P_2(x)=\frac{x^{2}-6x+10}{2x^{2}-11x+16}, P_3(x)=\frac{-2+x}{2x^{2}-11x+16}\right]$
- ◦ $\left(\frac{I\sqrt{7}}{4}+x-\frac{11}{4}\right)\cdot P_2(x)$ is analytic at $x=-\frac{I\sqrt{7}}{4}+\frac{11}{4}$

  $\left(\left(\frac{I\sqrt{7}}{4}+x-\frac{11}{4}\right)\cdot P_2(x)\right)\Big|_{x=-\frac{I\sqrt{7}}{4}+\frac{11}{4}}=0$
- ◦ $\left(\frac{I\sqrt{7}}{4}+x-\frac{11}{4}\right)^{2}\cdot P_3(x)$ is analytic at $x=-\frac{I\sqrt{7}}{4}+\frac{11}{4}$

  $\left(\left(\frac{I\sqrt{7}}{4}+x-\frac{11}{4}\right)^{2}\cdot P_3(x)\right)\Big|_{x=-\frac{I\sqrt{7}}{4}+\frac{11}{4}}=0$
- ◦ $x=-\frac{I\sqrt{7}}{4}+\frac{11}{4}$ is a regular singular point

  Check to see if x_0 is a regular singular point

$x_0 = -\frac{I\sqrt{7}}{4} + \frac{11}{4}$

- Multiply by denominators

$(2x^2 - 11x + 16)\, y'' + (x^2 - 6x + 10)\, y' + (-2 + x)\, y = 0$

- Change variables using $x = u - \frac{I\sqrt{7}}{4} + \frac{11}{4}$ so that the regular singular point is at $u = 0$

$(2u^2 - Iu\sqrt{7})\left(\frac{d^2}{du^2}y(u)\right) + \left(u^2 - \frac{Iu\sqrt{7}}{2} - \frac{u}{2} + \frac{5}{8} + \frac{I\sqrt{7}}{8}\right)\left(\frac{d}{du}y(u)\right) + \left(\frac{3}{4} + u - \frac{I\sqrt{7}}{4}\right) y(u) = 0$

- Assume series solution for $y(u)$

$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

  - Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

    $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$

  - Shift index using $k- >k - m$

    $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\, u^{k+r-1+m}$

  - Shift index using $k- >k + 1 - m$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$

  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..2$

    $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, u^{k+r-2+m}$

  - Shift index using $k- >k + 2 - m$

    $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$

Rewrite ODE with series expansions

$-\frac{I\sqrt{7}\, r\left(5\, I\sqrt{7} - 63 + 56r\right) a_0 u^{-1+r}}{56} + \left(-\frac{I\sqrt{7}\,(1+r)\left(5\, I\sqrt{7} - 7 + 56r\right) a_1}{56} - \frac{\left(-3 + 2\, Ir\sqrt{7} + I\sqrt{7} - 8r^2 + 10r\right) a_0}{4}\right) u^r + \left(\sum_{k=1}^{\infty} \left(\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$-\frac{I}{56}\sqrt{7}\, r\left(5\, I\sqrt{7} - 63 + 56r\right) = 0$

- Values of r that satisfy the indicial equation

$r \in \left\{0, \frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}\right\}$

- Each term must be 0

$-\frac{\mathrm{I}\sqrt{7}\,(1+r)\left(5\,\mathrm{I}\sqrt{7}-7+56r\right)a_1}{56}-\frac{\left(-3+2\,\mathrm{I}r\sqrt{7}+\mathrm{I}\sqrt{7}-8r^2+10r\right)a_0}{4}=0$

- Each term in the series must be 0, giving the recursion relation

$\frac{\mathrm{I}(-2(k+r-\frac{1}{8})(k+r+1)a_{k+1}-(k+r+\frac{1}{2})a_k)\sqrt{7}}{2}+\frac{5(k+r+1)a_{k+1}}{8}+2\left(k+r-\frac{3}{4}\right)\left(k+r-\frac{1}{2}\right)a_k+a_{k-1}(k+r)=$

- Shift index using $k->k+1$

$\frac{\mathrm{I}(-2(k+\frac{7}{8}+r)(k+2+r)a_{k+2}-(k+\frac{3}{2}+r)a_{k+1})\sqrt{7}}{2}+\frac{5(k+2+r)a_{k+2}}{8}+2\left(k+\frac{1}{4}+r\right)\left(k+r+\frac{1}{2}\right)a_{k+1}+a_k(k+r$

- Recursion relation that defines series solution to ODE

$a_{k+2}=-\frac{2\left(2\,\mathrm{I}\sqrt{7}\,a_{k+1}k+2\,\mathrm{I}\sqrt{7}\,a_{k+1}r+3\,\mathrm{I}\sqrt{7}\,a_{k+1}-8k^2a_{k+1}-16kra_{k+1}-8r^2a_{k+1}-4ka_k-6ka_{k+1}-4ra_k-6ra_{k+1}-4a_k-a_{k+1}\right)}{-10+14\,\mathrm{I}\sqrt{7}+8\,\mathrm{I}\sqrt{7}\,k^2+16\,\mathrm{I}\sqrt{7}\,kr+23\,\mathrm{I}\sqrt{7}\,k+23\,\mathrm{I}\sqrt{7}\,r+8\,\mathrm{I}\sqrt{7}\,r^2-5k-5r}$

- Recursion relation for $r=0$

$a_{k+2}=-\frac{2\left(2\,\mathrm{I}\sqrt{7}\,a_{k+1}k+3\,\mathrm{I}\sqrt{7}\,a_{k+1}-8k^2a_{k+1}-4ka_k-6ka_{k+1}-4a_k-a_{k+1}\right)}{-10+14\,\mathrm{I}\sqrt{7}+8\,\mathrm{I}\sqrt{7}\,k^2+23\,\mathrm{I}\sqrt{7}\,k-5k}$

- Solution for $r=0$

$\left[y(u)=\sum_{k=0}^{\infty}a_ku^k, a_{k+2}=-\frac{2\left(2\,\mathrm{I}\sqrt{7}\,a_{k+1}k+3\,\mathrm{I}\sqrt{7}\,a_{k+1}-8k^2a_{k+1}-4ka_k-6ka_{k+1}-4a_k-a_{k+1}\right)}{-10+14\,\mathrm{I}\sqrt{7}+8\,\mathrm{I}\sqrt{7}\,k^2+23\,\mathrm{I}\sqrt{7}\,k-5k}, -\frac{\mathrm{I}\sqrt{7}\left(5\,\mathrm{I}\sqrt{7}-7\right)a_1}{56}-\right.$

- Revert the change of variables $u=\frac{\mathrm{I}\sqrt{7}}{4}+x-\frac{11}{4}$

$\left[y=\sum_{k=0}^{\infty}a_k\left(\frac{\mathrm{I}\sqrt{7}}{4}+x-\frac{11}{4}\right)^k, a_{k+2}=-\frac{2\left(2\,\mathrm{I}\sqrt{7}\,a_{k+1}k+3\,\mathrm{I}\sqrt{7}\,a_{k+1}-8k^2a_{k+1}-4ka_k-6ka_{k+1}-4a_k-a_{k+1}\right)}{-10+14\,\mathrm{I}\sqrt{7}+8\,\mathrm{I}\sqrt{7}\,k^2+23\,\mathrm{I}\sqrt{7}\,k-5k}, -\frac{\mathrm{I}\sqrt{7}\,(5}{}\right.$

- Recursion relation for $r=\frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}$

$a_{k+2}=-\frac{2\left(2\,\mathrm{I}\sqrt{7}\,a_{k+1}k+2\,\mathrm{I}\sqrt{7}\,a_{k+1}\left(\frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}\right)+3\,\mathrm{I}\sqrt{7}\,a_{k+1}-8k^2a_{k+1}-16k\left(\frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}\right)a_{k+1}-8\left(\frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}\right)^2a_{k+1}-4ka_k-6ka_k\right.}{-\frac{125}{8}+\frac{809\,\mathrm{I}\sqrt{7}}{56}+8\,\mathrm{I}\sqrt{7}\,k^2+16\,\mathrm{I}\sqrt{7}\,k\left(\frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}\right)+23\,\mathrm{I}\sqrt{7}\,k+23\,\mathrm{I}\sqrt{7}\left(\frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}\right)+8\,\mathrm{I}\sqrt{}}$

- Solution for $r=\frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}$

$\left[y(u)=\sum_{k=0}^{\infty}a_ku^{k+\frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}}, a_{k+2}=-\frac{2\left(2\,\mathrm{I}\sqrt{7}\,a_{k+1}k+2\,\mathrm{I}\sqrt{7}\,a_{k+1}\left(\frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}\right)+3\,\mathrm{I}\sqrt{7}\,a_{k+1}-8k^2a_{k+1}-16k\left(\frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}\right)a_{k+}\right.}{-\frac{125}{8}+\frac{809\,\mathrm{I}\sqrt{7}}{56}+8\,\mathrm{I}\sqrt{7}\,k^2+16\,\mathrm{I}\sqrt{7}\,k\left(\frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}\right)+}\right.$

- Revert the change of variables $u=\frac{\mathrm{I}\sqrt{7}}{4}+x-\frac{11}{4}$

$\left[y=\sum_{k=0}^{\infty}a_k\left(\frac{\mathrm{I}\sqrt{7}}{4}+x-\frac{11}{4}\right)^{k+\frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}}, a_{k+2}=-\frac{2\left(2\,\mathrm{I}\sqrt{7}\,a_{k+1}k+2\,\mathrm{I}\sqrt{7}\,a_{k+1}\left(\frac{9}{8}-\frac{5\,\mathrm{I}\sqrt{7}}{56}\right)+3\,\mathrm{I}\sqrt{7}\,a_{k+1}-8k^2a_{k+1}-16k\right.}{-\frac{125}{8}+\frac{809\,\mathrm{I}\sqrt{7}}{56}+8\,\mathrm{I}\sqrt{7}\,k^2+16\,\mathrm{I}\sqrt{}}\right.$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k \left(\frac{I\sqrt{7}}{4} + x - \frac{11}{4}\right)^k\right) + \left(\sum_{k=0}^{\infty} b_k \left(\frac{I\sqrt{7}}{4} + x - \frac{11}{4}\right)^{k+\frac{9}{8}-\frac{5I\sqrt{7}}{56}}\right), a_{k+2} = -\frac{2\left(2I\sqrt{7}\, a_{1+k}k + 3I\sqrt{7}\, a\right.}{-10+14}\right.$$

Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: Example 7.5.1 page 353.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2(x^2+x+1)\,y''+x(11x^2+11x+9)\,y'+(7x^2+10x+6)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(2x^4+2x^3+2x^2)\,y''+(11x^3+11x^2+9x)\,y'+(7x^2+10x+6)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{11x^2+11x+9}{2\,(x^2+x+1)\,x}$$
$$q(x)=\frac{7x^2+10x+6}{2x^2\,(x^2+x+1)}$$

Table 530: Table $p(x), q(x)$ singularites.

$p(x) = \frac{11x^2+11x+9}{2(x^2+x+1)x}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2} - \frac{i\sqrt{3}}{2}$	"regular"
$x = -\frac{1}{2} + \frac{i\sqrt{3}}{2}$	"regular"

$q(x) = \frac{7x^2+10x+6}{2x^2(x^2+x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2} - \frac{i\sqrt{3}}{2}$	"regular"
$x = -\frac{1}{2} + \frac{i\sqrt{3}}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{1}{2} - \frac{i\sqrt{3}}{2}, -\frac{1}{2} + \frac{i\sqrt{3}}{2}, \infty\right]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2\left(x^2+x+1\right)y'' + \left(11x^3+11x^2+9x\right)y' + \left(7x^2+10x+6\right)y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2\left(x^2+x+1\right)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(11x^3+11x^2+9x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(7x^2+10x+6\right)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)\,(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)\,(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)\,(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 11x^{n+r+2} a_n (n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 11x^{1+n+r} a_n (n+r)\right)+\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 7x^{n+r+2} a_n\right)+\left(\sum_{n=0}^{\infty} 10x^{1+n+r} a_n\right)+\left(\sum_{n=0}^{\infty} 6a_n x^{n+r}\right)=0
\end{aligned}
\tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)\,(n+r-1)=\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\,(n-3+r)\,x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)\,(n+r-1)=\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 11x^{n+r+2} a_n (n+r)=\sum_{n=2}^{\infty} 11a_{n-2}(n+r-2)\,x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 11x^{1+n+r} a_n (n+r)=\sum_{n=1}^{\infty} 11a_{n-1}(n+r-1)\,x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 7x^{n+r+2} a_n=\sum_{n=2}^{\infty} 7a_{n-2}x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 10x^{1+n+r} a_n=\sum_{n=1}^{\infty} 10a_{n-1}x^{n+r}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\,(n-3+r)\,x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r}a_n(n+r)\,(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 11a_{n-2}(n+r-2)\,x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 11a_{n-1}(n+r-1)\,x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r}a_n(n+r)\right) + \left(\sum_{n=2}^{\infty} 7a_{n-2}x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 10a_{n-1}x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 6a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$2x^{n+r}a_n(n+r)\,(n+r-1) + 9x^{n+r}a_n(n+r) + 6a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$2x^r a_0 r(-1+r) + 9x^r a_0 r + 6a_0 x^r = 0$$

Or

$$(2x^r r(-1+r) + 9x^r r + 6x^r)\,a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(2r^2+7r+6\right)x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$2r^2+7r+6 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -\frac{3}{2}$$
$$r_2 = -2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(2r^2+7r+6\right)x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{2}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-\frac{3}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-2}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = \frac{-r-2}{r+3}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &2a_{n-2}(n+r-2)(n-3+r)+2a_{n-1}(n+r-1)(n+r-2)+2a_n(n+r)(n+r-1) \\ &+11a_{n-2}(n+r-2)+11a_{n-1}(n+r-1)+9a_n(n+r)+7a_{n-2}+10a_{n-1}+6a_n=0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{na_{n-2}+na_{n-1}+ra_{n-2}+ra_{n-1}-a_{n-2}+a_{n-1}}{n+r+2} \tag{4}$$

Which for the root $r = -\frac{3}{2}$ becomes

$$a_n = \frac{(-2a_{n-2}-2a_{n-1})\,n+5a_{n-2}+a_{n-1}}{2n+1} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -\frac{3}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-2}{r+3}$	$-\frac{1}{3}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1}{4 + r}$$

Which for the root $r = -\frac{3}{2}$ becomes

$$a_2 = \frac{2}{5}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-2}{r+3}$	$-\frac{1}{3}$
a_2	$\frac{1}{4+r}$	$\frac{2}{5}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{r^2 + 3r + 1}{(r + 3)(5 + r)}$$

Which for the root $r = -\frac{3}{2}$ becomes

$$a_3 = -\frac{5}{21}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-2}{r+3}$	$-\frac{1}{3}$
a_2	$\frac{1}{4+r}$	$\frac{2}{5}$
a_3	$\frac{r^2+3r+1}{(r+3)(5+r)}$	$-\frac{5}{21}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{-r^3 - 8r^2 - 19r - 13}{(6 + r)(r + 3)(4 + r)}$$

Which for the root $r = -\frac{3}{2}$ becomes

$$a_4 = \frac{7}{135}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-2}{r+3}$	$-\frac{1}{3}$
a_2	$\frac{1}{4+r}$	$\frac{2}{5}$
a_3	$\frac{r^2+3r+1}{(r+3)(5+r)}$	$-\frac{5}{21}$
a_4	$\frac{-r^3-8r^2-19r-13}{(6+r)(r+3)(4+r)}$	$\frac{7}{135}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{2r^3 + 18r^2 + 52r + 49}{(r+3)(4+r)(5+r)(7+r)}$$

Which for the root $r = -\frac{3}{2}$ becomes

$$a_5 = \frac{76}{1155}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r-2}{r+3}$	$-\frac{1}{3}$
a_2	$\frac{1}{4+r}$	$\frac{2}{5}$
a_3	$\frac{r^2+3r+1}{(r+3)(5+r)}$	$-\frac{5}{21}$
a_4	$\frac{-r^3-8r^2-19r-13}{(6+r)(r+3)(4+r)}$	$\frac{7}{135}$
a_5	$\frac{2r^3+18r^2+52r+49}{(r+3)(4+r)(5+r)(7+r)}$	$\frac{76}{1155}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= \frac{1}{x^{\frac{3}{2}}}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\
&= \frac{1 - \frac{x}{3} + \frac{2x^2}{5} - \frac{5x^3}{21} + \frac{7x^4}{135} + \frac{76x^5}{1155} + O(x^6)}{x^{\frac{3}{2}}}
\end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = \frac{-r-2}{r+3}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &2b_{n-2}(n+r-2)(n-3+r)+2b_{n-1}(n+r-1)(n+r-2)+2b_n(n+r)(n+r-1) \\ &+11b_{n-2}(n+r-2)+11b_{n-1}(n+r-1)+9b_n(n+r)+7b_{n-2}+10b_{n-1}+6b_n=0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{nb_{n-2} + nb_{n-1} + rb_{n-2} + rb_{n-1} - b_{n-2} + b_{n-1}}{n+r+2} \tag{4}$$

Which for the root $r = -2$ becomes

$$b_n = \frac{(-b_{n-2} - b_{n-1})\, n + 3b_{n-2} + b_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -2$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r-2}{r+3}$	0

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{1}{4+r}$$

Which for the root $r = -2$ becomes

$$b_2 = \frac{1}{2}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r-2}{r+3}$	0
b_2	$\frac{1}{4+r}$	$\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{r^2 + 3r + 1}{(r+3)(5+r)}$$

Which for the root $r = -2$ becomes

$$b_3 = -\frac{1}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r-2}{r+3}$	0
b_2	$\frac{1}{4+r}$	$\frac{1}{2}$
b_3	$\frac{r^2+3r+1}{(r+3)(5+r)}$	$-\frac{1}{3}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{-r^3 - 8r^2 - 19r - 13}{(6+r)(r+3)(4+r)}$$

Which for the root $r = -2$ becomes

$$b_4 = \frac{1}{8}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r-2}{r+3}$	0
b_2	$\frac{1}{4+r}$	$\frac{1}{2}$
b_3	$\frac{r^2+3r+1}{(r+3)(5+r)}$	$-\frac{1}{3}$
b_4	$\frac{-r^3-8r^2-19r-13}{(6+r)(r+3)(4+r)}$	$\frac{1}{8}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{2r^3 + 18r^2 + 52r + 49}{(r+3)(4+r)(5+r)(7+r)}$$

Which for the root $r = -2$ becomes

$$b_5 = \frac{1}{30}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r-2}{r+3}$	0
b_2	$\frac{1}{4+r}$	$\frac{1}{2}$
b_3	$\frac{r^2+3r+1}{(r+3)(5+r)}$	$-\frac{1}{3}$
b_4	$\frac{-r^3-8r^2-19r-13}{(6+r)(r+3)(4+r)}$	$\frac{1}{8}$
b_5	$\frac{2r^3+18r^2+52r+49}{(r+3)(4+r)(5+r)(7+r)}$	$\frac{1}{30}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= \frac{1}{x^{\frac{3}{2}}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 + \frac{x^2}{2} - \frac{x^3}{3} + \frac{x^4}{8} + \frac{x^5}{30} + O(x^6)}{x^2} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= \frac{c_1\left(1 - \frac{x}{3} + \frac{2x^2}{5} - \frac{5x^3}{21} + \frac{7x^4}{135} + \frac{76x^5}{1155} + O(x^6)\right)}{x^{\frac{3}{2}}} + \frac{c_2\left(1 + \frac{x^2}{2} - \frac{x^3}{3} + \frac{x^4}{8} + \frac{x^5}{30} + O(x^6)\right)}{x^2} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= \frac{c_1\left(1 - \frac{x}{3} + \frac{2x^2}{5} - \frac{5x^3}{21} + \frac{7x^4}{135} + \frac{76x^5}{1155} + O(x^6)\right)}{x^{\frac{3}{2}}} + \frac{c_2\left(1 + \frac{x^2}{2} - \frac{x^3}{3} + \frac{x^4}{8} + \frac{x^5}{30} + O(x^6)\right)}{x^2} \end{aligned}$$

Summary
The solution(s) found are the following

$$
y = \frac{c_1 \left(1-\frac{x}{3}+\frac{2 x^2}{5}-\frac{5 x^3}{21}+\frac{7 x^4}{135}+\frac{76 x^5}{1155}+O\left(x^6\right)\right)}{x^{\frac{3}{2}}} + \frac{c_2 \left(1+\frac{x^2}{2}-\frac{x^3}{3}+\frac{x^4}{8}+\frac{x^5}{30}+O\left(x^6\right)\right)}{x^2} \tag{1}
$$

Verification of solutions

$$
y = \frac{c_1 \left(1-\frac{x}{3}+\frac{2 x^2}{5}-\frac{5 x^3}{21}+\frac{7 x^4}{135}+\frac{76 x^5}{1155}+O\left(x^6\right)\right)}{x^{\frac{3}{2}}} + \frac{c_2 \left(1+\frac{x^2}{2}-\frac{x^3}{3}+\frac{x^4}{8}+\frac{x^5}{30}+O\left(x^6\right)\right)}{x^2}
$$

Verified OK.

14.1.1 Maple step by step solution

Let's solve

$2x^2(x^2+x+1)\, y''+(11x^3+11x^2+9x)\, y'+(7x^2+10x+6)\, y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(7x^2+10x+6)y}{2x^2(x^2+x+1)}-\frac{(11x^2+11x+9)y'}{2x(x^2+x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(11x^2+11x+9)y'}{2x(x^2+x+1)}+\frac{(7x^2+10x+6)y}{2x^2(x^2+x+1)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{11x^2+11x+9}{2(x^2+x+1)x}, P_3(x)=\frac{7x^2+10x+6}{2x^2(x^2+x+1)}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $\left(x\cdot P_2(x)\right)\bigg|_{x=0}=\frac{9}{2}$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $\left(x^2\cdot P_3(x)\right)\bigg|_{x=0}=3$

  - $x=0$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0 = 0$

- Multiply by denominators

$2x^2(x^2+x+1)\,y''+x(11x^2+11x+9)\,y'+(7x^2+10x+6)\,y=0$

- Assume series solution for y

$y=\sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

  - Convert $x^m\cdot y$ to series expansion for $m=0..2$

  $x^m\cdot y=\sum_{k=0}^{\infty} a_k x^{k+r+m}$

  - Shift index using $k->k-m$

  $x^m\cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  - Convert $x^m\cdot y'$ to series expansion for $m=1..3$

  $x^m\cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$

  - Shift index using $k->k+1-m$

  $x^m\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$

  - Convert $x^m\cdot y''$ to series expansion for $m=2..4$

  $x^m\cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$

  - Shift index using $k->k+2-m$

  $x^m\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$

Rewrite ODE with series expansions

$a_0(2+r)\,(3+2r)\,x^r+\left(a_1(3+r)\,(5+2r)+a_0(5+2r)\,(2+r)\right)x^{1+r}+\left(\sum_{k=2}^{\infty}\left(a_k(k+r+2)\,(2k+\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$(2+r)\,(3+2r)=0$

- Values of r that satisfy the indicial equation

$r\in\left\{-2,-\frac{3}{2}\right\}$

- Each term must be 0

$$a_1(3+r)(5+2r)+a_0(5+2r)(2+r)=0$$

- Solve for the dependent coefficient(s)

$$a_1=-\frac{(2+r)a_0}{3+r}$$

- Each term in the series must be 0, giving the recursion relation

$$2\left(k+r+\frac{3}{2}\right)\left((a_k+a_{k-2}+a_{k-1})k+(a_k+a_{k-2}+a_{k-1})r+2a_k-a_{k-2}+a_{k-1}\right)=0$$

- Shift index using $k->k+2$

$$2\left(k+\frac{7}{2}+r\right)\left((a_{k+2}+a_k+a_{k+1})(k+2)+(a_{k+2}+a_k+a_{k+1})r+2a_{k+2}-a_k+a_{k+1}\right)=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{ka_k+ka_{k+1}+ra_k+ra_{k+1}+a_k+3a_{k+1}}{k+4+r}$$

- Recursion relation for $r=-2$

$$a_{k+2}=-\frac{ka_k+ka_{k+1}-a_k+a_{k+1}}{k+2}$$

- Solution for $r=-2$

$$\left[y=\sum_{k=0}^{\infty}a_kx^{k-2},a_{k+2}=-\frac{ka_k+ka_{k+1}-a_k+a_{k+1}}{k+2},a_1=0\right]$$

- Recursion relation for $r=-\frac{3}{2}$

$$a_{k+2}=-\frac{ka_k+ka_{k+1}-\frac{1}{2}a_k+\frac{3}{2}a_{k+1}}{k+\frac{5}{2}}$$

- Solution for $r=-\frac{3}{2}$

$$\left[y=\sum_{k=0}^{\infty}a_kx^{k-\frac{3}{2}},a_{k+2}=-\frac{ka_k+ka_{k+1}-\frac{1}{2}a_k+\frac{3}{2}a_{k+1}}{k+\frac{5}{2}},a_1=-\frac{a_0}{3}\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty}a_kx^{k-2}\right)+\left(\sum_{k=0}^{\infty}b_kx^{k-\frac{3}{2}}\right),a_{k+2}=-\frac{ka_k+ka_{1+k}-a_k+a_{1+k}}{k+2},a_1=0,b_{k+2}=-\frac{kb_k+kb_{1+k}-\frac{1}{2}b_k+}{k+\frac{5}{2}}\right.$$

ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x^2(x+3)\,y''+5x(x+1)\,y'-(-4x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^3+3x^2\right)y''+\left(5x^2+5x\right)y'+(4x-1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{5x+5}{x\,(x+3)}$$
$$q(x)=\frac{4x-1}{x^2\,(x+3)}$$

Table 532: Table $p(x), q(x)$ singularites.

$p(x) = \frac{5x+5}{x(x+3)}$	
singularity	type
$x = -3$	"regular"
$x = 0$	"regular"

$q(x) = \frac{4x-1}{x^2(x+3)}$	
singularity	type
$x = -3$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-3, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x+3)\,y'' + \left(5x^2+5x\right)y' + (4x-1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x+3)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + \left(5x^2+5x\right)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (4x-1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)(n+r-1)\right)\\
&+\left(\sum_{n=0}^{\infty} 5x^{1+n+r} a_n (n+r)\right)+\left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right)\\
&+\left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n\right)+\sum_{n=0}^{\infty}\left(-a_n x^{n+r}\right)=0
\end{aligned}
\tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1) &= \sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\\
\sum_{n=0}^{\infty} 5x^{1+n+r} a_n (n+r) &= \sum_{n=1}^{\infty} 5a_{n-1}(n+r-1)\, x^{n+r}\\
\sum_{n=0}^{\infty} 4x^{1+n+r} a_n &= \sum_{n=1}^{\infty} 4a_{n-1} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right)\\
&+\left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=1}^{\infty} 5a_{n-1}(n+r-1)\, x^{n+r}\right)\\
&+\left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right)+\left(\sum_{n=1}^{\infty} 4a_{n-1} x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-a_n x^{n+r}\right)=0
\end{aligned}
\tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
3x^{n+r} a_n (n+r)(n+r-1)+5x^{n+r} a_n (n+r)-a_n x^{n+r}=0
$$

When $n = 0$ the above becomes

$$3x^r a_0 r(-1+r) + 5x^r a_0 r - a_0 x^r = 0$$

Or

$$(3x^r r(-1+r) + 5x^r r - x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(3r^2 + 2r - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$3r^2 + 2r - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(3r^2 + 2r - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{4}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-1}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-1}(n+r-1)\,(n+r-2) + 3a_n(n+r)\,(n+r-1) \\ + 5a_{n-1}(n+r-1) + 5a_n(n+r) + 4a_{n-1} - a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(1+n+r)\,a_{n-1}}{3n+3r-1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = -\frac{(4+3n)\,a_{n-1}}{9n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-2-r}{2+3r}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_1 = -\frac{7}{9}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{2+3r}$	$-\frac{7}{9}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{r^2+5r+6}{9r^2+21r+10}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = \frac{35}{81}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{2+3r}$	$-\frac{7}{9}$
a_2	$\frac{r^2+5r+6}{9r^2+21r+10}$	$\frac{35}{81}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-r^3 - 9r^2 - 26r - 24}{27r^3 + 135r^2 + 198r + 80}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = -\frac{455}{2187}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{2+3r}$	$-\frac{7}{9}$
a_2	$\frac{r^2+5r+6}{9r^2+21r+10}$	$\frac{35}{81}$
a_3	$\frac{-r^3-9r^2-26r-24}{27r^3+135r^2+198r+80}$	$-\frac{455}{2187}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^4 + 14r^3 + 71r^2 + 154r + 120}{81r^4 + 702r^3 + 2079r^2 + 2418r + 880}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{1820}{19683}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{2+3r}$	$-\frac{7}{9}$
a_2	$\frac{r^2+5r+6}{9r^2+21r+10}$	$\frac{35}{81}$
a_3	$\frac{-r^3-9r^2-26r-24}{27r^3+135r^2+198r+80}$	$-\frac{455}{2187}$
a_4	$\frac{r^4+14r^3+71r^2+154r+120}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{1820}{19683}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-r^5 - 20r^4 - 155r^3 - 580r^2 - 1044r - 720}{243r^5 + 3240r^4 + 16065r^3 + 36360r^2 + 36492r + 12320}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_5 = -\frac{6916}{177147}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{2+3r}$	$-\frac{7}{9}$
a_2	$\frac{r^2+5r+6}{9r^2+21r+10}$	$\frac{35}{81}$
a_3	$\frac{-r^3-9r^2-26r-24}{27r^3+135r^2+198r+80}$	$-\frac{455}{2187}$
a_4	$\frac{r^4+14r^3+71r^2+154r+120}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{1820}{19683}$
a_5	$\frac{-r^5-20r^4-155r^3-580r^2-1044r-720}{243r^5+3240r^4+16065r^3+36360r^2+36492r+12320}$	$-\frac{6916}{177147}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(1 - \frac{7x}{9} + \frac{35x^2}{81} - \frac{455x^3}{2187} + \frac{1820x^4}{19683} - \frac{6916x^5}{177147} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &b_{n-1}(n+r-1)(n+r-2) + 3b_n(n+r)(n+r-1) \\ &+ 5b_{n-1}(n+r-1) + 5b_n(n+r) + 4b_{n-1} - b_n = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{(1+n+r)\,b_{n-1}}{3n+3r-1} \tag{4}$$

Which for the root $r = -1$ becomes

$$b_n = -\frac{n b_{n-1}}{3n-4} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{-2 - r}{2 + 3r}$$

Which for the root $r = -1$ becomes

$$b_1 = 1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2-r}{2+3r}$	1

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{r^2 + 5r + 6}{9r^2 + 21r + 10}$$

Which for the root $r = -1$ becomes

$$b_2 = -1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2-r}{2+3r}$	1
b_2	$\frac{r^2+5r+6}{9r^2+21r+10}$	-1

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{-r^3 - 9r^2 - 26r - 24}{27r^3 + 135r^2 + 198r + 80}$$

Which for the root $r = -1$ becomes

$$b_3 = \frac{3}{5}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2-r}{2+3r}$	1
b_2	$\frac{r^2+5r+6}{9r^2+21r+10}$	-1
b_3	$\frac{-r^3-9r^2-26r-24}{27r^3+135r^2+198r+80}$	$\frac{3}{5}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^4 + 14r^3 + 71r^2 + 154r + 120}{81r^4 + 702r^3 + 2079r^2 + 2418r + 880}$$

Which for the root $r = -1$ becomes

$$b_4 = -\frac{3}{10}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2-r}{2+3r}$	1
b_2	$\frac{r^2+5r+6}{9r^2+21r+10}$	-1
b_3	$\frac{-r^3-9r^2-26r-24}{27r^3+135r^2+198r+80}$	$\frac{3}{5}$
b_4	$\frac{r^4+14r^3+71r^2+154r+120}{81r^4+702r^3+2079r^2+2418r+880}$	$-\frac{3}{10}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{-r^5 - 20r^4 - 155r^3 - 580r^2 - 1044r - 720}{243r^5 + 3240r^4 + 16065r^3 + 36360r^2 + 36492r + 12320}$$

Which for the root $r = -1$ becomes

$$b_5 = \frac{3}{22}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2-r}{2+3r}$	1
b_2	$\frac{r^2+5r+6}{9r^2+21r+10}$	-1
b_3	$\frac{-r^3-9r^2-26r-24}{27r^3+135r^2+198r+80}$	$\frac{3}{5}$
b_4	$\frac{r^4+14r^3+71r^2+154r+120}{81r^4+702r^3+2079r^2+2418r+880}$	$-\frac{3}{10}$
b_5	$\frac{-r^5-20r^4-155r^3-580r^2-1044r-720}{243r^5+3240r^4+16065r^3+36360r^2+36492r+12320}$	$\frac{3}{22}$

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= x^{\frac{1}{3}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= \frac{1 + x - x^2 + \frac{3x^3}{5} - \frac{3x^4}{10} + \frac{3x^5}{22} + O(x^6)}{x}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{1}{3}}\left(1 - \frac{7x}{9} + \frac{35x^2}{81} - \frac{455x^3}{2187} + \frac{1820x^4}{19683} - \frac{6916x^5}{177147} + O(x^6)\right) \\
&+ \frac{c_2\left(1 + x - x^2 + \frac{3x^3}{5} - \frac{3x^4}{10} + \frac{3x^5}{22} + O(x^6)\right)}{x}
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{1}{3}}\left(1 - \frac{7x}{9} + \frac{35x^2}{81} - \frac{455x^3}{2187} + \frac{1820x^4}{19683} - \frac{6916x^5}{177147} + O(x^6)\right) \\
&+ \frac{c_2\left(1 + x - x^2 + \frac{3x^3}{5} - \frac{3x^4}{10} + \frac{3x^5}{22} + O(x^6)\right)}{x}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{3}} \left(1 - \frac{7x}{9} + \frac{35x^2}{81} - \frac{455x^3}{2187} + \frac{1820x^4}{19683} - \frac{6916x^5}{177147} + O(x^6)\right) + \frac{c_2 \left(1 + x - x^2 + \frac{3x^3}{5} - \frac{3x^4}{10} + \frac{3x^5}{22} + O(x^6)\right)}{x} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{3}} \left(1 - \frac{7x}{9} + \frac{35x^2}{81} - \frac{455x^3}{2187} + \frac{1820x^4}{19683} - \frac{6916x^5}{177147} + O(x^6)\right) + \frac{c_2 \left(1 + x - x^2 + \frac{3x^3}{5} - \frac{3x^4}{10} + \frac{3x^5}{22} + O(x^6)\right)}{x}$$

Verified OK.

14.2.1 Maple step by step solution

Let's solve

$x^2(x+3)\,y'' + (5x^2+5x)\,y' + (4x-1)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(4x-1)y}{x^2(x+3)} - \frac{5(x+1)y'}{x(x+3)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{5(x+1)y'}{x(x+3)} + \frac{(4x-1)y}{x^2(x+3)} = 0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{5(x+1)}{x(x+3)}, P_3(x) = \frac{4x-1}{x^2(x+3)}\right]$

  - $(x+3)\cdot P_2(x)$ is analytic at $x=-3$

    $\left((x+3)\cdot P_2(x)\right)\Big|_{x=-3} = \frac{10}{3}$

  - $(x+3)^2\cdot P_3(x)$ is analytic at $x=-3$

    $\left((x+3)^2\cdot P_3(x)\right)\Big|_{x=-3} = 0$

- $x=-3$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-3$

- Multiply by denominators

  $x^2(x+3)\,y''+5x(x+1)\,y'+(4x-1)\,y=0$

- Change variables using $x=u-3$ so that the regular singular point is at $u=0$

  $(u^3-6u^2+9u)\left(\frac{d^2}{du^2}y(u)\right)+(5u^2-25u+30)\left(\frac{d}{du}y(u)\right)+(4u-13)\,y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$

- ☐ Rewrite ODE with series expansions
  - Convert $u^m\cdot y(u)$ to series expansion for $m=0..1$

    $u^m\cdot y(u)=\sum_{k=0}^{\infty} a_k u^{k+r+m}$
  - Shift index using $k->k-m$

    $u^m\cdot y(u)=\sum_{k=m}^{\infty} a_{k-m} u^{k+r}$
  - Convert $u^m\cdot\left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..2$

    $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$
  - Shift index using $k->k+1-m$

    $u^m\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,u^{k+r}$
  - Convert $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m=1..3$

    $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,u^{k+r-2+m}$
  - Shift index using $k->k+2-m$

    $u^m\cdot\left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$

  Rewrite ODE with series expansions

  $3a_0r(7+3r)\,u^{-1+r}+(3a_1(1+r)\,(10+3r)-a_0(13+6r)\,(1+r))\,u^r+\left(\sum_{k=1}^{\infty}(3a_{k+1}(k+r+1)\,(3\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $3r(7+3r)=0$

- Values of r that satisfy the indicial equation

  $r \in \{0, -\frac{7}{3}\}$

- Each term must be 0

  $3a_1(1+r)(10+3r) - a_0(13+6r)(1+r) = 0$

- Each term in the series must be 0, giving the recursion relation

  $-6\left(\left(a_k - \frac{a_{k-1}}{6} - \frac{3a_{k+1}}{2}\right)k + \left(a_k - \frac{a_{k-1}}{6} - \frac{3a_{k+1}}{2}\right)r + \frac{13a_k}{6} - \frac{a_{k-1}}{6} - 5a_{k+1}\right)(k+r+1) = 0$

- Shift index using $k->k+1$

  $-6\left(\left(a_{k+1} - \frac{a_k}{6} - \frac{3a_{k+2}}{2}\right)(k+1) + \left(a_{k+1} - \frac{a_k}{6} - \frac{3a_{k+2}}{2}\right)r + \frac{13a_{k+1}}{6} - \frac{a_k}{6} - 5a_{k+2}\right)(k+r+2) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+2} = -\frac{ka_k - 6ka_{k+1} + ra_k - 6ra_{k+1} + 2a_k - 19a_{k+1}}{3(3k+13+3r)}$

- Recursion relation for $r=0$

  $a_{k+2} = -\frac{ka_k - 6ka_{k+1} + 2a_k - 19a_{k+1}}{3(3k+13)}$

- Solution for $r=0$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{ka_k - 6ka_{k+1} + 2a_k - 19a_{k+1}}{3(3k+13)}, 30a_1 - 13a_0 = 0\right]$

- Revert the change of variables $u = x+3$

  $\left[y = \sum_{k=0}^{\infty} a_k (x+3)^k, a_{k+2} = -\frac{ka_k - 6ka_{k+1} + 2a_k - 19a_{k+1}}{3(3k+13)}, 30a_1 - 13a_0 = 0\right]$

- Recursion relation for $r = -\frac{7}{3}$

  $a_{k+2} = -\frac{ka_k - 6ka_{k+1} - \frac{1}{3}a_k - 5a_{k+1}}{3(3k+6)}$

- Solution for $r = -\frac{7}{3}$

  $\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{7}{3}}, a_{k+2} = -\frac{ka_k - 6ka_{k+1} - \frac{1}{3}a_k - 5a_{k+1}}{3(3k+6)}, -12a_1 - \frac{4a_0}{3} = 0\right]$

- Revert the change of variables $u = x+3$

  $\left[y = \sum_{k=0}^{\infty} a_k (x+3)^{k-\frac{7}{3}}, a_{k+2} = -\frac{ka_k - 6ka_{k+1} - \frac{1}{3}a_k - 5a_{k+1}}{3(3k+6)}, -12a_1 - \frac{4a_0}{3} = 0\right]$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k (x+3)^k\right) + \left(\sum_{k=0}^{\infty} b_k (x+3)^{k-\frac{7}{3}}\right), a_{k+2} = -\frac{k a_k - 6k a_{1+k} + 2a_k - 19a_{1+k}}{3(3k+13)}, 30a_1 - 13a_0 = 0, b\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: Example 7.5.3 page 356.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(-x^2+2)\,y''-x(4x^2+3)\,y'+(2+2x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(-x^4+2x^2)\,y''+(-4x^3-3x)\,y'+(2+2x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned} p(x) &= \frac{4x^2+3}{x\,(x^2-2)} \\ q(x) &= -\frac{2(x+1)}{x^2\,(x^2-2)} \end{aligned}$$

Table 534: Table $p(x), q(x)$ singularites.

$p(x) = \frac{4x^2+3}{x(x^2-2)}$	
singularity	type
$x = 0$	"regular"
$x = \sqrt{2}$	"regular"
$x = -\sqrt{2}$	"regular"

$q(x) = -\frac{2(x+1)}{x^2(x^2-2)}$	
singularity	type
$x = 0$	"regular"
$x = \sqrt{2}$	"regular"
$x = -\sqrt{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \sqrt{2}, -\sqrt{2}, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-y''x^2(x^2-2) + (-4x^3-3x)\,y' + (2+2x)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) x^2(x^2-2) + (-4x^3-3x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (2+2x)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\sum_{n=0}^{\infty} \left(-x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) \\
&\quad + \sum_{n=0}^{\infty} \left(-4x^{n+r+2} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-3x^{n+r} a_n (n+r)\right) \\
&\quad + \left(\sum_{n=0}^{\infty} 2a_n x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} \left(-x^{n+r+2} a_n (n+r)(n+r-1)\right) &= \sum_{n=2}^{\infty} \left(-a_{n-2} (n+r-2)(n-3+r)\, x^{n+r}\right) \\
\sum_{n=0}^{\infty} \left(-4x^{n+r+2} a_n (n+r)\right) &= \sum_{n=2}^{\infty} \left(-4a_{n-2} (n+r-2)\, x^{n+r}\right) \\
\sum_{n=0}^{\infty} 2x^{1+n+r} a_n &= \sum_{n=1}^{\infty} 2a_{n-1} x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\sum_{n=2}^{\infty} \left(-a_{n-2} (n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) \\
&\quad + \sum_{n=2}^{\infty} \left(-4a_{n-2} (n+r-2)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-3x^{n+r} a_n (n+r)\right) \\
&\quad + \left(\sum_{n=0}^{\infty} 2a_n x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1} x^{n+r}\right) = 0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
2x^{n+r} a_n (n+r)(n+r-1) - 3x^{n+r} a_n (n+r) + 2a_n x^{n+r} = 0
$$

When $n = 0$ the above becomes

$$2x^r a_0 r(-1+r) - 3x^r a_0 r + 2a_0 x^r = 0$$

Or

$$(2x^r r(-1+r) - 3x^r r + 2x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(2r^2 - 5r + 2\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$2r^2 - 5r + 2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 2$$
$$r_2 = \frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(2r^2 - 5r + 2\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{3}{2}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+2}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{2}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -\frac{2}{2r^2 - r - 1}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} -a_{n-2}(n+r-2)\,(n-3+r)+2a_n(n+r)\,(n+r-1) \\ -4a_{n-2}(n+r-2)-3a_n(n+r)+2a_n+2a_{n-1}=0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{n^2 a_{n-2} + 2nra_{n-2} + r^2 a_{n-2} - na_{n-2} - ra_{n-2} - 2a_{n-2} - 2a_{n-1}}{2n^2 + 4nr + 2r^2 - 5n - 5r + 2} \tag{4}$$

Which for the root $r = 2$ becomes

$$a_n = \frac{n^2 a_{n-2} + 3na_{n-2} - 2a_{n-1}}{n\,(2n+3)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 2$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{2r^2-r-1}$	$-\frac{2}{5}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{2r^4 + 5r^3 - 4r^2 - 3r + 4}{4r^4 + 4r^3 - 5r^2 - 3r}$$

Which for the root $r = 2$ becomes

$$a_2 = \frac{27}{35}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{2r^2-r-1}$	$-\frac{2}{5}$
a_2	$\frac{2r^4+5r^3-4r^2-3r+4}{4r^4+4r^3-5r^2-3r}$	$\frac{27}{35}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-8r^3 - 28r^2 - 10r - 8}{(2r+5)\,r\,(4r^3 + 4r^2 - 5r - 3)}$$

Which for the root $r = 2$ becomes

$$a_3 = -\frac{34}{105}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{2r^2-r-1}$	$-\frac{2}{5}$
a_2	$\frac{2r^4+5r^3-4r^2-3r+4}{4r^4+4r^3-5r^2-3r}$	$\frac{27}{35}$
a_3	$\frac{-8r^3-28r^2-10r-8}{(2r+5)r(4r^3+4r^2-5r-3)}$	$-\frac{34}{105}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4r^7 + 48r^6 + 197r^5 + 293r^4 - 3r^3 - 233r^2 + 90r + 216}{(2r + 5) r (4r^3 + 4r^2 - 5r - 3) (2r^2 + 11r + 14)}$$

Which for the root $r = 2$ becomes

$$a_4 = \frac{584}{1155}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{2r^2-r-1}$	$-\frac{2}{5}$
a_2	$\frac{2r^4+5r^3-4r^2-3r+4}{4r^4+4r^3-5r^2-3r}$	$\frac{27}{35}$
a_3	$\frac{-8r^3-28r^2-10r-8}{(2r+5)r(4r^3+4r^2-5r-3)}$	$-\frac{34}{105}$
a_4	$\frac{4r^7+48r^6+197r^5+293r^4-3r^3-233r^2+90r+216}{(2r+5)r(4r^3+4r^2-5r-3)(2r^2+11r+14)}$	$\frac{584}{1155}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{6(4r^7 + 64r^6 + 403r^5 + 1276r^4 + 2134r^3 + 1837r^2 + 882r + 408)}{(2r + 5) r (4r^3 + 4r^2 - 5r - 3) (2r^2 + 11r + 14) (2r^2 + 15r + 27)}$$

Which for the root $r = 2$ becomes

$$a_5 = -\frac{768}{3575}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{2r^2-r-1}$	$-\frac{2}{5}$
a_2	$\frac{2r^4+5r^3-4r^2-3r+4}{4r^4+4r^3-5r^2-3r}$	$\frac{27}{35}$
a_3	$\frac{-8r^3-28r^2-10r-8}{(2r+5)r(4r^3+4r^2-5r-3)}$	$-\frac{34}{105}$
a_4	$\frac{4r^7+48r^6+197r^5+293r^4-3r^3-233r^2+90r+216}{(2r+5)r(4r^3+4r^2-5r-3)(2r^2+11r+14)}$	$\frac{584}{1155}$
a_5	$-\frac{6(4r^7+64r^6+403r^5+1276r^4+2134r^3+1837r^2+882r+408)}{(2r+5)r(4r^3+4r^2-5r-3)(2r^2+11r+14)(2r^2+15r+27)}$	$-\frac{768}{3575}$

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^2\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^2\left(1 - \frac{2x}{5} + \frac{27x^2}{35} - \frac{34x^3}{105} + \frac{584x^4}{1155} - \frac{768x^5}{3575} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
b_1 = -\frac{2}{2r^2 - r - 1}
$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&-b_{n-2}(n+r-2)\,(n-3+r) + 2b_n(n+r)\,(n+r-1) \\
&- 4b_{n-2}(n+r-2) - 3b_n(n+r) + 2b_n + 2b_{n-1} = 0
\end{aligned}
\tag{3}
$$

Solving for b_n from recursive equation (4) gives

$$
b_n = \frac{n^2 b_{n-2} + 2nrb_{n-2} + r^2 b_{n-2} - nb_{n-2} - rb_{n-2} - 2b_{n-2} - 2b_{n-1}}{2n^2 + 4nr + 2r^2 - 5n - 5r + 2}
\tag{4}
$$

Which for the root $r = \frac{1}{2}$ becomes

$$
b_n = \frac{4n^2 b_{n-2} - 9b_{n-2} - 8b_{n-1}}{8n^2 - 12n}
\tag{5}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{2r^2-r-1}$	2

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{2r^4 + 5r^3 - 4r^2 - 3r + 4}{4r^4 + 4r^3 - 5r^2 - 3r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_2 = -\frac{9}{8}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{2r^2-r-1}$	2
b_2	$\frac{2r^4+5r^3-4r^2-3r+4}{4r^4+4r^3-5r^2-3r}$	$-\frac{9}{8}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{-8r^3 - 28r^2 - 10r - 8}{(2r + 5)\, r\, (4r^3 + 4r^2 - 5r - 3)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_3 = \frac{7}{4}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{2r^2-r-1}$	2
b_2	$\frac{2r^4+5r^3-4r^2-3r+4}{4r^4+4r^3-5r^2-3r}$	$-\frac{9}{8}$
b_3	$\frac{-8r^3-28r^2-10r-8}{(2r+5)r(4r^3+4r^2-5r-3)}$	$\frac{7}{4}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{4r^7 + 48r^6 + 197r^5 + 293r^4 - 3r^3 - 233r^2 + 90r + 216}{(2r + 5)\, r\, (4r^3 + 4r^2 - 5r - 3)\, (2r^2 + 11r + 14)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_4 = -\frac{607}{640}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{2r^2-r-1}$	2
b_2	$\frac{2r^4+5r^3-4r^2-3r+4}{4r^4+4r^3-5r^2-3r}$	$-\frac{9}{8}$
b_3	$\frac{-8r^3-28r^2-10r-8}{(2r+5)r(4r^3+4r^2-5r-3)}$	$\frac{7}{4}$
b_4	$\frac{4r^7+48r^6+197r^5+293r^4-3r^3-233r^2+90r+216}{(2r+5)r(4r^3+4r^2-5r-3)(2r^2+11r+14)}$	$-\frac{607}{640}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{6(4r^7 + 64r^6 + 403r^5 + 1276r^4 + 2134r^3 + 1837r^2 + 882r + 408)}{(2r+5)\, r\,(4r^3 + 4r^2 - 5r - 3)\,(2r^2 + 11r + 14)\,(2r^2 + 15r + 27)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_5 = \frac{13347}{11200}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{2r^2-r-1}$	2
b_2	$\frac{2r^4+5r^3-4r^2-3r+4}{4r^4+4r^3-5r^2-3r}$	$-\frac{9}{8}$
b_3	$\frac{-8r^3-28r^2-10r-8}{(2r+5)r(4r^3+4r^2-5r-3)}$	$\frac{7}{4}$
b_4	$\frac{4r^7+48r^6+197r^5+293r^4-3r^3-233r^2+90r+216}{(2r+5)r(4r^3+4r^2-5r-3)(2r^2+11r+14)}$	$-\frac{607}{640}$
b_5	$-\frac{6(4r^7+64r^6+403r^5+1276r^4+2134r^3+1837r^2+882r+408)}{(2r+5)r(4r^3+4r^2-5r-3)(2r^2+11r+14)(2r^2+15r+27)}$	$\frac{13347}{11200}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^2\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \sqrt{x}\left(1 + 2x - \frac{9x^2}{8} + \frac{7x^3}{4} - \frac{607x^4}{640} + \frac{13347x^5}{11200} + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^2 \left(1 - \frac{2x}{5} + \frac{27x^2}{35} - \frac{34x^3}{105} + \frac{584x^4}{1155} - \frac{768x^5}{3575} + O(x^6)\right) \\
&\quad + c_2 \sqrt{x}\left(1 + 2x - \frac{9x^2}{8} + \frac{7x^3}{4} - \frac{607x^4}{640} + \frac{13347x^5}{11200} + O(x^6)\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x^2 \left(1 - \frac{2x}{5} + \frac{27x^2}{35} - \frac{34x^3}{105} + \frac{584x^4}{1155} - \frac{768x^5}{3575} + O(x^6)\right) \\
&\quad + c_2 \sqrt{x}\left(1 + 2x - \frac{9x^2}{8} + \frac{7x^3}{4} - \frac{607x^4}{640} + \frac{13347x^5}{11200} + O(x^6)\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y = c_1 x^2 &\left(1 - \frac{2x}{5} + \frac{27x^2}{35} - \frac{34x^3}{105} + \frac{584x^4}{1155} - \frac{768x^5}{3575} + O(x^6)\right) \\
&+ c_2 \sqrt{x}\left(1 + 2x - \frac{9x^2}{8} + \frac{7x^3}{4} - \frac{607x^4}{640} + \frac{13347x^5}{11200} + O(x^6)\right)
\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}
y = c_1 x^2 &\left(1 - \frac{2x}{5} + \frac{27x^2}{35} - \frac{34x^3}{105} + \frac{584x^4}{1155} - \frac{768x^5}{3575} + O(x^6)\right) \\
&+ c_2 \sqrt{x}\left(1 + 2x - \frac{9x^2}{8} + \frac{7x^3}{4} - \frac{607x^4}{640} + \frac{13347x^5}{11200} + O(x^6)\right)
\end{aligned}$$

Verified OK.

14.3.1 Maple step by step solution

Let's solve

$-y''x^2(x^2-2)+(-4x^3-3x)\,y'+(2+2x)\,y=0$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y''=\frac{2(x+1)y}{x^2(x^2-2)}-\frac{(4x^2+3)y'}{x(x^2-2)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''+\frac{(4x^2+3)y'}{x(x^2-2)}-\frac{2(x+1)y}{x^2(x^2-2)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

  $\left[P_2(x)=\frac{4x^2+3}{x(x^2-2)}, P_3(x)=-\frac{2(x+1)}{x^2(x^2-2)}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

  $\left.(x\cdot P_2(x))\right|_{x=0}=-\frac{3}{2}$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left.(x^2\cdot P_3(x))\right|_{x=0}=1$

  - $x=0$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0=0$

- Multiply by denominators

$y''x^2(x^2-2)+x(4x^2+3)\,y'+(-2x-2)\,y=0$

- Assume series solution for y

$y=\sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m\cdot y$ to series expansion for $m=0..1$

  $x^m\cdot y=\sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$
- Convert $x^{m}\cdot y'$ to series expansion for $m=1..3$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\, x^{k+r-1+m}$
- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$
- Convert $x^{m}\cdot y''$ to series expansion for $m=2..4$

  $x^{m}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r-2+m}$
- Shift index using $k->k+2-m$

  $x^{m}\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $-a_{0}(-1+2r)\,(-2+r)\, x^{r}+\left(-a_{1}(1+2r)\,(-1+r)-2a_{0}\right) x^{1+r}+\left(\sum_{k=2}^{\infty} \left(-a_{k}(2k+2r-1)\,(k+r\right.\right.$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $-(-1+2r)\,(-2+r)=0$
- Values of r that satisfy the indicial equation

  $r\in\left\{2, \frac{1}{2}\right\}$
- Each term must be 0

  $-a_{1}(1+2r)\,(-1+r)-2a_{0}=0$
- Solve for the dependent coefficient(s)

  $a_{1}=-\frac{2a_{0}}{2r^{2}-r-1}$
- Each term in the series must be 0, giving the recursion relation

  $a_{k-2}(k+r-2)\,(k+1+r)-2(k+r-2)\left(k+r-\frac{1}{2}\right) a_{k}-2a_{k-1}=0$
- Shift index using $k->k+2$

  $a_{k}(k+r)\,(k+r+3)-2(k+r)\left(k+\frac{3}{2}+r\right) a_{k+2}-2a_{k+1}=0$
- Recursion relation that defines series solution to ODE

$$a_{k+2} = \frac{k^2 a_k + 2kra_k + r^2 a_k + 3ka_k + 3ra_k - 2a_{k+1}}{(k+r)(2k+3+2r)}$$

- Recursion relation for $r = 2$

$$a_{k+2} = \frac{k^2 a_k + 7ka_k + 10a_k - 2a_{k+1}}{(k+2)(2k+7)}$$

- Solution for $r = 2$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+2}, a_{k+2} = \frac{k^2 a_k + 7ka_k + 10a_k - 2a_{k+1}}{(k+2)(2k+7)}, a_1 = -\frac{2a_0}{5}\right]$$

- Recursion relation for $r = \frac{1}{2}$

$$a_{k+2} = \frac{k^2 a_k + 4ka_k + \frac{7}{4}a_k - 2a_{k+1}}{(k+\frac{1}{2})(2k+4)}$$

- Solution for $r = \frac{1}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+2} = \frac{k^2 a_k + 4ka_k + \frac{7}{4}a_k - 2a_{k+1}}{(k+\frac{1}{2})(2k+4)}, a_1 = 2a_0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k+2}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{2}}\right), a_{k+2} = \frac{k^2 a_k + 7ka_k + 10a_k - 2a_{1+k}}{(k+2)(2k+7)}, a_1 = -\frac{2a_0}{5}, b_{k+2} = \frac{k^2 b_k + 4kb_k + \frac{7}{4}b}{(k+\frac{1}{2})(2k}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 1.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Complex roots"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2(x^2+x+1)\,y''+x(5x^2+3x+3)\,y'+y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(2x^4+2x^3+2x^2)\,y''+(5x^3+3x^2+3x)\,y'+y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{5x^2+3x+3}{2\,(x^2+x+1)\,x}\\ q(x)&=\frac{1}{2x^2\,(x^2+x+1)}\end{aligned}$$

Table 536: Table $p(x), q(x)$ singularites.

$p(x) = \frac{5x^2+3x+3}{2(x^2+x+1)x}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2} - \frac{i\sqrt{3}}{2}$	"regular"
$x = -\frac{1}{2} + \frac{i\sqrt{3}}{2}$	"regular"

$q(x) = \frac{1}{2x^2(x^2+x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{1}{2} - \frac{i\sqrt{3}}{2}$	"regular"
$x = -\frac{1}{2} + \frac{i\sqrt{3}}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{1}{2} - \frac{i\sqrt{3}}{2}, -\frac{1}{2} + \frac{i\sqrt{3}}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2\left(x^2 + x + 1\right) y'' + \left(5x^3 + 3x^2 + 3x\right) y' + y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)(n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2\left(x^2 + x + 1\right) \left(\sum_{n=0}^{\infty} (n + r)(n + r - 1) a_n x^{n+r-2}\right) + \left(5x^3 + 3x^2 + 3x\right) \left(\sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 5x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 5a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 3a_{n-1}(n+r-1)\, x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 5a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 3a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$2x^{n+r}a_n(n+r)(n+r-1) + 3x^{n+r}a_n(n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$2x^r a_0 r(-1+r) + 3x^r a_0 r + a_0 x^r = 0$$

Or

$$(2x^r r(-1+r) + 3x^r r + x^r) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(2r^2 + r + 1) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$2r^2 + r + 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{i\sqrt{7}}{4} - \frac{1}{4}$$
$$r_2 = -\frac{i\sqrt{7}}{4} - \frac{1}{4}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(2r^2 + r + 1) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since the roots are complex conjugates, then two linearly independent solutions can be constructed using

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{i\sqrt{7}}{4}-\frac{1}{4}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-\frac{i\sqrt{7}}{4}-\frac{1}{4}}$$

$y_1(x)$ is found first. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = \frac{-2r^2 - r}{2r^2 + 5r + 4}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &2a_{n-2}(n+r-2)(n-3+r) + 2a_{n-1}(n+r-1)(n+r-2) + 2a_n(n+r)(n+r-1) \\ &+ 5a_{n-2}(n+r-2) + 3a_{n-1}(n+r-1) + 3a_n(n+r) + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{2n^2 a_{n-2} + 2n^2 a_{n-1} + 4nr a_{n-2} + 4nr a_{n-1} + 2r^2 a_{n-2} + 2r^2 a_{n-1} - 5n a_{n-2} - 3n a_{n-1} - 5r a_{n-2} - 3r}{2n^2 + 4nr + 2r^2 + n + r + 1} \tag{4}$$

Which for the root $r = \frac{i\sqrt{7}}{4} - \frac{1}{4}$ becomes

$$a_n = \frac{i(2(-a_{n-2} - a_{n-1})\,n + 3a_{n-2} + 2a_{n-1})\sqrt{7} + 4(-a_{n-2} - a_{n-1})\,n^2 + 4(3a_{n-2} + 2a_{n-1})\,n - 5a_{n-2} - 2}{2n\left(i\sqrt{7} + 2n\right)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{i\sqrt{7}}{4} - \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r^2-r}{2r^2+5r+4}$	$\frac{1}{i\sqrt{7}+2}$

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{(2r+3)^2 r}{4r^4 + 28r^3 + 75r^2 + 91r + 44}$$

Which for the root $r = \frac{i\sqrt{7}}{4} - \frac{1}{4}$ becomes

$$a_2 = -\frac{5\left(i\sqrt{7} - 1\right)\left(i\sqrt{7} + \frac{9}{5}\right)}{16\left(i\sqrt{7} + 2\right)\left(i\sqrt{7} + 4\right)}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r^2-r}{2r^2+5r+4}$	$\frac{1}{i\sqrt{7}+2}$
a_2	$-\frac{(2r+3)^2 r}{4r^4+28r^3+75r^2+91r+44}$	$-\frac{5\left(i\sqrt{7}-1\right)\left(i\sqrt{7}+\frac{9}{5}\right)}{16\left(i\sqrt{7}+2\right)\left(i\sqrt{7}+4\right)}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{8r^6+76r^5+282r^4+505r^3+433r^2+145r}{8r^6+108r^5+602r^4+1773r^3+2921r^2+2574r+968}$$

Which for the root $r = \frac{i\sqrt{7}}{4} - \frac{1}{4}$ becomes

$$a_3 = \frac{49i\sqrt{7}+89}{432-444i\sqrt{7}}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r^2-r}{2r^2+5r+4}$	$\frac{1}{i\sqrt{7}+2}$
a_2	$-\frac{(2r+3)^2 r}{4r^4+28r^3+75r^2+91r+44}$	$-\frac{5\left(i\sqrt{7}-1\right)\left(i\sqrt{7}+\frac{9}{5}\right)}{16\left(i\sqrt{7}+2\right)\left(i\sqrt{7}+4\right)}$
a_3	$\frac{8r^6+76r^5+282r^4+505r^3+433r^2+145r}{8r^6+108r^5+602r^4+1773r^3+2921r^2+2574r+968}$	$\frac{49i\sqrt{7}+89}{432-444i\sqrt{7}}$

For $n = 4$, using the above recursive equation gives

$$a_4 = -\frac{(16r^7+240r^6+1480r^5+4800r^4+8645r^3+8269r^2+3466r+273)\,r}{(2r^2+17r+37)\,(8r^6+108r^5+602r^4+1773r^3+2921r^2+2574r+968)}$$

Which for the root $r = \frac{i\sqrt{7}}{4} - \frac{1}{4}$ becomes

$$a_4 = \frac{1553i+395\sqrt{7}}{26256i+12480\sqrt{7}}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r^2-r}{2r^2+5r+4}$	$\frac{1}{i\sqrt{7}+2}$
a_2	$-\frac{(2r+3)^2 r}{4r^4+28r^3+75r^2+91r+44}$	$-\frac{5\left(i\sqrt{7}-1\right)\left(i\sqrt{7}+\frac{9}{5}\right)}{16\left(i\sqrt{7}+2\right)\left(i\sqrt{7}+4\right)}$
a_3	$\frac{8r^6+76r^5+282r^4+505r^3+433r^2+145r}{8r^6+108r^5+602r^4+1773r^3+2921r^2+2574r+968}$	$\frac{49i\sqrt{7}+89}{432-444i\sqrt{7}}$
a_4	$-\frac{(16r^7+240r^6+1480r^5+4800r^4+8645r^3+8269r^2+3466r+273)r}{(2r^2+17r+37)(8r^6+108r^5+602r^4+1773r^3+2921r^2+2574r+968)}$	$\frac{1553i+395\sqrt{7}}{26256i+12480\sqrt{7}}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{64\left(r^7+18r^6+136r^5+559r^4+\frac{21571}{16}r^3+\frac{7619}{4}r^2+\frac{23343}{16}r+\frac{15003}{32}\right)\left(r+\frac{9}{2}\right)r}{(2r^2+17r+37)(8r^6+108r^5+602r^4+1773r^3+2921r^2+2574r+968)(2r^2+21r+56)}$$

Which for the root $r = \frac{i\sqrt{7}}{4} - \frac{1}{4}$ becomes

$$a_5 = \frac{42423i\sqrt{7}+45275}{492720i\sqrt{7}-1749600}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2r^2-r}{2r^2+5r+4}$	$\frac{1}{i\sqrt{7}+2}$
a_2	$-\frac{(2r+3)^2 r}{4r^4+28r^3+75r^2+91r+44}$	$-\frac{5\left(i\sqrt{7}-1\right)\left(i\sqrt{7}+\frac{9}{5}\right)}{16\left(i\sqrt{7}+2\right)\left(i\sqrt{7}+4\right)}$
a_3	$\frac{8r^6+76r^5+282r^4+505r^3+433r^2+145r}{8r^6+108r^5+602r^4+1773r^3+2921r^2+2574r+968}$	$\frac{49i\sqrt{7}+89}{432-444i\sqrt{7}}$
a_4	$-\frac{(16r^7+240r^6+1480r^5+4800r^4+8645r^3+8269r^2+3466r+273)r}{(2r^2+17r+37)(8r^6+108r^5+602r^4+1773r^3+2921r^2+2574r+968)}$	$\frac{1553i+395\sqrt{7}}{26256i+12480\sqrt{7}}$
a_5	$-\frac{64\left(r^7+18r^6+136r^5+559r^4+\frac{21571}{16}r^3+\frac{7619}{4}r^2+\frac{23343}{16}r+\frac{15003}{32}\right)\left(r+\frac{9}{2}\right)r}{(2r^2+17r+37)(8r^6+108r^5+602r^4+1773r^3+2921r^2+2574r+968)(2r^2+21r+56)}$	$\frac{42423i\sqrt{7}+45275}{492720i\sqrt{7}-1749600}$

Using the above table, then the solution $y_1(x)$ is

$$y_1(x) = x^{\frac{i\sqrt{7}}{4}-\frac{1}{4}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right)$$

$$= x^{\frac{i\sqrt{7}}{4}-\frac{1}{4}} \left(1+\frac{x}{i\sqrt{7}+2}-\frac{5\left(i\sqrt{7}-1\right)\left(i\sqrt{7}+\frac{9}{5}\right)x^{2}}{16\left(i\sqrt{7}+2\right)\left(i\sqrt{7}+4\right)}+\frac{\left(49i\sqrt{7}+89\right)x^{3}}{432-444i\sqrt{7}} + \frac{\left(1553i+395\sqrt{7}\right)x^{4}}{26256i+12480\sqrt{7}}+\frac{\left(42423i\sqrt{7}+45275\right)x^{5}}{492720i\sqrt{7}-1749600}+O\left(x^{6}\right)\right)$$

The second solution $y_2(x)$ is found by taking the complex conjugate of $y_1(x)$ which gives

$$y_2(x) = x^{-\frac{i\sqrt{7}}{4}-\frac{1}{4}} \left(1+\frac{x}{-i\sqrt{7}+2}-\frac{5\left(-i\sqrt{7}-1\right)\left(-i\sqrt{7}+\frac{9}{5}\right)x^{2}}{16\left(-i\sqrt{7}+2\right)\left(-i\sqrt{7}+4\right)}+\frac{\left(-49i\sqrt{7}+89\right)x^{3}}{432+444i\sqrt{7}} + \frac{\left(-1553i+395\sqrt{7}\right)x^{4}}{-26256i+12480\sqrt{7}}+\frac{\left(-42423i\sqrt{7}+45275\right)x^{5}}{-492720i\sqrt{7}-1749600}+O\left(x^{6}\right)\right)$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{i\sqrt{7}}{4}-\frac{1}{4}} \left(1+\frac{x}{i\sqrt{7}+2}-\frac{5\left(i\sqrt{7}-1\right)\left(i\sqrt{7}+\frac{9}{5}\right)x^{2}}{16\left(i\sqrt{7}+2\right)\left(i\sqrt{7}+4\right)}+\frac{\left(49i\sqrt{7}+89\right)x^{3}}{432-444i\sqrt{7}} + \frac{\left(1553i+395\sqrt{7}\right)x^{4}}{26256i+12480\sqrt{7}}+\frac{\left(42423i\sqrt{7}+45275\right)x^{5}}{492720i\sqrt{7}-1749600}+O\left(x^{6}\right)\right) \\ &+ c_2 x^{-\frac{i\sqrt{7}}{4}-\frac{1}{4}} \left(1+\frac{x}{-i\sqrt{7}+2}-\frac{5\left(-i\sqrt{7}-1\right)\left(-i\sqrt{7}+\frac{9}{5}\right)x^{2}}{16\left(-i\sqrt{7}+2\right)\left(-i\sqrt{7}+4\right)}+\frac{\left(-49i\sqrt{7}+89\right)x^{3}}{432+444i\sqrt{7}} + \frac{\left(-1553i+395\sqrt{7}\right)x^{4}}{-26256i+12480\sqrt{7}}+\frac{\left(-42423i\sqrt{7}+45275\right)x^{5}}{-492720i\sqrt{7}-1749600}+O\left(x^{6}\right)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{i\sqrt{7}}{4}-\frac{1}{4}} \left(1+\frac{x}{i\sqrt{7}+2}-\frac{5\left(i\sqrt{7}-1\right)\left(i\sqrt{7}+\frac{9}{5}\right)x^{2}}{16\left(i\sqrt{7}+2\right)\left(i\sqrt{7}+4\right)}+\frac{\left(49i\sqrt{7}+89\right)x^{3}}{432-444i\sqrt{7}} + \frac{\left(1553i+395\sqrt{7}\right)x^{4}}{26256i+12480\sqrt{7}}+\frac{\left(42423i\sqrt{7}+45275\right)x^{5}}{492720i\sqrt{7}-1749600}+O\left(x^{6}\right)\right) \\ &+ c_2 x^{-\frac{i\sqrt{7}}{4}-\frac{1}{4}} \left(1+\frac{x}{-i\sqrt{7}+2}-\frac{5\left(-i\sqrt{7}-1\right)\left(-i\sqrt{7}+\frac{9}{5}\right)x^{2}}{16\left(-i\sqrt{7}+2\right)\left(-i\sqrt{7}+4\right)}+\frac{\left(-49i\sqrt{7}+89\right)x^{3}}{432+444i\sqrt{7}} + \frac{\left(-1553i+395\sqrt{7}\right)x^{4}}{-26256i+12480\sqrt{7}}+\frac{\left(-42423i\sqrt{7}+45275\right)x^{5}}{-492720i\sqrt{7}-1749600}+O\left(x^{6}\right)\right) \end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1 x^{\frac{i\sqrt{7}}{4}-\frac{1}{4}} \left(1 + \frac{x}{i\sqrt{7}+2} - \frac{5\left(i\sqrt{7}-1\right)\left(i\sqrt{7}+\frac{9}{5}\right)x^2}{16\left(i\sqrt{7}+2\right)\left(i\sqrt{7}+4\right)} + \frac{\left(49i\sqrt{7}+89\right)x^3}{432-444i\sqrt{7}} + \frac{\left(1553i+395\sqrt{7}\right)x^4}{26256i+12480\sqrt{7}} + \frac{\left(42423i\sqrt{7}+45275\right)x^5}{492720i\sqrt{7}-1749600} + O\left(x^6\right)\right) + c_2 x^{-\frac{i\sqrt{7}}{4}-\frac{1}{4}} \left(1 + \frac{x}{-i\sqrt{7}+2} - \frac{5\left(-i\sqrt{7}-1\right)\left(-i\sqrt{7}+\frac{9}{5}\right)x^2}{16\left(-i\sqrt{7}+2\right)\left(-i\sqrt{7}+4\right)} + \frac{\left(-49i\sqrt{7}+89\right)x^3}{432+444i\sqrt{7}} + \frac{\left(-1553i+395\sqrt{7}\right)x^4}{-26256i+12480\sqrt{7}} + \frac{\left(-42423i\sqrt{7}+45275\right)x^5}{-492720i\sqrt{7}-1749600} + O\left(x^6\right)\right) \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{i\sqrt{7}}{4}-\frac{1}{4}} \left(1 + \frac{x}{i\sqrt{7}+2} - \frac{5\left(i\sqrt{7}-1\right)\left(i\sqrt{7}+\frac{9}{5}\right)x^2}{16\left(i\sqrt{7}+2\right)\left(i\sqrt{7}+4\right)} + \frac{\left(49i\sqrt{7}+89\right)x^3}{432-444i\sqrt{7}} + \frac{\left(1553i+395\sqrt{7}\right)x^4}{26256i+12480\sqrt{7}} + \frac{\left(42423i\sqrt{7}+45275\right)x^5}{492720i\sqrt{7}-1749600} + O\left(x^6\right)\right) + c_2 x^{-\frac{i\sqrt{7}}{4}-\frac{1}{4}} \left(1 + \frac{x}{-i\sqrt{7}+2} - \frac{5\left(-i\sqrt{7}-1\right)\left(-i\sqrt{7}+\frac{9}{5}\right)x^2}{16\left(-i\sqrt{7}+2\right)\left(-i\sqrt{7}+4\right)} + \frac{\left(-49i\sqrt{7}+89\right)x^3}{432+444i\sqrt{7}} + \frac{\left(-1553i+395\sqrt{7}\right)x^4}{-26256i+12480\sqrt{7}} + \frac{\left(-42423i\sqrt{7}+45275\right)x^5}{-492720i\sqrt{7}-1749600} + O\left(x^6\right)\right)$$

Verified OK.

14.4.1 Maple step by step solution

Let's solve

$2x^2(x^2+x+1)\,y'' + (5x^3+3x^2+3x)\,y' + y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{y}{2x^2(x^2+x+1)} - \frac{(5x^2+3x+3)y'}{2x(x^2+x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(5x^2+3x+3)y'}{2x(x^2+x+1)} + \frac{y}{2x^2(x^2+x+1)} = 0$

- ☐ Check to see if x_0 is a regular singular point
  - Define functions

    $\left[P_2(x) = \frac{5x^2+3x+3}{2(x^2+x+1)x}, P_3(x) = \frac{1}{2x^2(x^2+x+1)}\right]$
  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $\left(x \cdot P_2(x)\right)\Big|_{x=0} = \frac{3}{2}$
  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $\left(x^2 \cdot P_3(x)\right)\Big|_{x=0} = \frac{1}{2}$
  - $x = 0$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = 0$
- Multiply by denominators

  $2x^2(x^2+x+1)\, y'' + x(5x^2+3x+3)\, y' + y = 0$
- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$
- ☐ Rewrite ODE with series expansions
  - Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$
  - Shift index using $k- >k+1-m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$
  - Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

    $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$
  - Shift index using $k- >k+2-m$

    $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

    Rewrite ODE with series expansions

$$a_0(2r^2+r+1)\,x^r+\left(\left(2r^2+5r+4\right)a_1+a_0r(1+2r)\right)x^{1+r}+\left(\sum_{k=2}^{\infty}\left(a_k\left(2k^2+4kr+2r^2+k+r\right.\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$2r^2+r+1=0$$

- Values of r that satisfy the indicial equation

$$r\in\left\{-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4},\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right\}$$

- Each term must be 0

$$\left(2r^2+5r+4\right)a_1+a_0r(1+2r)=0$$

- Solve for the dependent coefficient(s)

$$a_1=-\frac{a_0r(1+2r)}{2r^2+5r+4}$$

- Each term in the series must be 0, giving the recursion relation

$$\left(2a_k+2a_{k-2}+2a_{k-1}\right)k^2+\left(\left(4a_k+4a_{k-2}+4a_{k-1}\right)r+a_k-5a_{k-2}-3a_{k-1}\right)k+\left(2a_k+2a_{k-2}+\right.$$

- Shift index using $k->k+2$

$$\left(2a_{k+2}+2a_k+2a_{k+1}\right)(k+2)^2+\left(\left(4a_{k+2}+4a_k+4a_{k+1}\right)r+a_{k+2}-5a_k-3a_{k+1}\right)(k+2)+\left(2a_k\right.$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{2k^2a_k+2k^2a_{k+1}+4kra_k+4kra_{k+1}+2r^2a_k+2r^2a_{k+1}+3ka_k+5ka_{k+1}+3ra_k+5ra_{k+1}+3a_{k+1}}{2k^2+4kr+2r^2+9k+9r+11}$$

- Recursion relation for $r=-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}$

$$a_{k+2}=-\frac{2k^2a_k+2k^2a_{k+1}+4k\left(-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)a_k+4k\left(-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)a_{k+1}+2\left(-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)^2a_k+2\left(-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)^2a_{k+1}+3ka_k+5ka_{k+1}+3\left(-\right.}{2k^2+4k\left(-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)+2\left(-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)^2+9k-\frac{9\,\mathrm{I}\sqrt{7}}{4}+\frac{35}{4}}$$

- Solution for $r=-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}$

$$\left[y=\sum_{k=0}^{\infty}a_kx^{k-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}},a_{k+2}=-\frac{2k^2a_k+2k^2a_{k+1}+4k\left(-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)a_k+4k\left(-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)a_{k+1}+2\left(-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)^2a_k+2\left(-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right.}{2k^2+4k\left(-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)+2\left(-\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)^2}\right.$$

- Recursion relation for $r=\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}$

$$a_{k+2}=-\frac{2k^2a_k+2k^2a_{k+1}+4k\left(\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)a_k+4k\left(\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)a_{k+1}+2\left(\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)^2a_k+2\left(\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)^2a_{k+1}+3ka_k+5ka_{k+1}+3\left(\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)}{2k^2+4k\left(\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)+2\left(\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)^2+9k+\frac{9\,\mathrm{I}\sqrt{7}}{4}+\frac{35}{4}}$$

- Solution for $r=\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}$

$$\left[y=\sum_{k=0}^{\infty}a_kx^{k+\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}},a_{k+2}=-\frac{2k^2a_k+2k^2a_{k+1}+4k\left(\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)a_k+4k\left(\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)a_{k+1}+2\left(\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)^2a_k+2\left(\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)^2a_{k+1}}{2k^2+4k\left(\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)+2\left(\frac{\mathrm{I}\sqrt{7}}{4}-\frac{1}{4}\right)^2+9k+}\right.$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-\frac{I\sqrt{7}}{4}-\frac{1}{4}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{I\sqrt{7}}{4}-\frac{1}{4}}\right), a_{k+2} = -\frac{2k^2 a_k + 2k^2 a_{1+k} + 4k\left(-\frac{I\sqrt{7}}{4}-\frac{1}{4}\right)a_k + 4k\left(-\frac{I\sqrt{7}}{4}-\frac{1}{4}\right)a_{1+}}{2}\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 2.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries], [_2nd_order, _linear, `
  _with_symmetry_[0,F(x)]`]]
```

$$\boxed{3x^2y'' + 2x(-2x^2 + x + 1)\, y' + (-8x^2 + 2x)\, y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$3x^2y'' + (-4x^3 + 2x^2 + 2x)\, y' + (-8x^2 + 2x)\, y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$\begin{aligned} p(x) &= -\frac{2(2x^2 - x - 1)}{3x} \\ q(x) &= -\frac{2(4x - 1)}{3x} \end{aligned}$$

Table 538: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{2(2x^2-x-1)}{3x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = -\frac{2(4x-1)}{3x}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$3x^2y'' + \left(-4x^3 + 2x^2 + 2x\right)y' + \left(-8x^2 + 2x\right)y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$3x^2\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(-4x^3+2x^2+2x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(-8x^2+2x\right)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}
&\left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-4x^{n+r+2} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)\right) \\
&+ \sum_{n=0}^{\infty} \left(-8x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n\right) = 0
\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\begin{aligned}
\sum_{n=0}^{\infty} \left(-4x^{n+r+2} a_n (n+r)\right) &= \sum_{n=2}^{\infty} \left(-4a_{n-2}(n+r-2)\, x^{n+r}\right) \\
\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r) &= \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\, x^{n+r} \\
\sum_{n=0}^{\infty} \left(-8x^{n+r+2} a_n\right) &= \sum_{n=2}^{\infty} \left(-8a_{n-2} x^{n+r}\right) \\
\sum_{n=0}^{\infty} 2x^{1+n+r} a_n &= \sum_{n=1}^{\infty} 2a_{n-1} x^{n+r}
\end{aligned}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\begin{aligned}
&\left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=2}^{\infty} \left(-4a_{n-2}(n+r-2)\, x^{n+r}\right) \\
&+ \left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)\right) \\
&+ \sum_{n=2}^{\infty} \left(-8a_{n-2} x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1} x^{n+r}\right) = 0
\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$3x^{n+r}a_n(n+r)(n+r-1) + 2x^{n+r}a_n(n+r) = 0$$

When $n = 0$ the above becomes

$$3x^r a_0 r(-1+r) + 2x^r a_0 r = 0$$

Or

$$(3x^r r(-1+r) + 2x^r r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$x^r r(-1+3r) = 0$$

Since the above is true for all x then the indicial equation becomes

$$3r^2 - r = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = 0$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^r r(-1+3r) = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^n$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -\frac{2}{3r+2}$$

For $2 \leq n$ the recursive equation is

$$3a_n(n+r)(n+r-1) - 4a_{n-2}(n+r-2) + 2a_{n-1}(n+r-1) + 2a_n(n+r) - 8a_{n-2} + 2a_{n-1} = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{4a_{n-2} - 2a_{n-1}}{3n - 1 + 3r} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = \frac{4a_{n-2} - 2a_{n-1}}{3n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{3r+2}$	$-\frac{2}{3}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{12 + 12r}{9r^2 + 21r + 10}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = \frac{8}{9}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{3r+2}$	$-\frac{2}{3}$
a_2	$\frac{12+12r}{9r^2+21r+10}$	$\frac{8}{9}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-64 - 48r}{27r^3 + 135r^2 + 198r + 80}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = -\frac{40}{81}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{3r+2}$	$-\frac{2}{3}$
a_2	$\frac{12+12r}{9r^2+21r+10}$	$\frac{8}{9}$
a_3	$\frac{-64-48r}{27r^3+135r^2+198r+80}$	$-\frac{40}{81}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{144r^2 + 624r + 512}{81r^4 + 702r^3 + 2079r^2 + 2418r + 880}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{92}{243}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{3r+2}$	$-\frac{2}{3}$
a_2	$\frac{12+12r}{9r^2+21r+10}$	$\frac{8}{9}$
a_3	$\frac{-64-48r}{27r^3+135r^2+198r+80}$	$-\frac{40}{81}$
a_4	$\frac{144r^2+624r+512}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{92}{243}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-864r^2 - 4128r - 3840}{243r^5 + 3240r^4 + 16065r^3 + 36360r^2 + 36492r + 12320}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_5 = -\frac{664}{3645}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{3r+2}$	$-\frac{2}{3}$
a_2	$\frac{12+12r}{9r^2+21r+10}$	$\frac{8}{9}$
a_3	$\frac{-64-48r}{27r^3+135r^2+198r+80}$	$-\frac{40}{81}$
a_4	$\frac{144r^2+624r+512}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{92}{243}$
a_5	$\frac{-864r^2-4128r-3840}{243r^5+3240r^4+16065r^3+36360r^2+36492r+12320}$	$-\frac{664}{3645}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}} \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}} \left(1 - \frac{2x}{3} + \frac{8x^2}{9} - \frac{40x^3}{81} + \frac{92x^4}{243} - \frac{664x^5}{3645} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = -\frac{2}{3r+2}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &3b_n(n+r)(n+r-1) - 4b_{n-2}(n+r-2) \\ &+ 2b_{n-1}(n+r-1) + 2b_n(n+r) - 8b_{n-2} + 2b_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = \frac{4b_{n-2} - 2b_{n-1}}{3n - 1 + 3r} \tag{4}$$

Which for the root $r = 0$ becomes

$$b_n = \frac{4b_{n-2} - 2b_{n-1}}{3n - 1} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = 0$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{3r+2}$	-1

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{12 + 12r}{9r^2 + 21r + 10}$$

Which for the root $r = 0$ becomes

$$b_2 = \frac{6}{5}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{3r+2}$	-1
b_2	$\frac{12+12r}{9r^2+21r+10}$	$\frac{6}{5}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{-64 - 48r}{27r^3 + 135r^2 + 198r + 80}$$

Which for the root $r = 0$ becomes

$$b_3 = -\frac{4}{5}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{3r+2}$	-1
b_2	$\frac{12+12r}{9r^2+21r+10}$	$\frac{6}{5}$
b_3	$\frac{-64-48r}{27r^3+135r^2+198r+80}$	$-\frac{4}{5}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{144r^2 + 624r + 512}{81r^4 + 702r^3 + 2079r^2 + 2418r + 880}$$

Which for the root $r = 0$ becomes

$$b_4 = \frac{32}{55}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{3r+2}$	-1
b_2	$\frac{12+12r}{9r^2+21r+10}$	$\frac{6}{5}$
b_3	$\frac{-64-48r}{27r^3+135r^2+198r+80}$	$-\frac{4}{5}$
b_4	$\frac{144r^2+624r+512}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{32}{55}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{-864r^2 - 4128r - 3840}{243r^5 + 3240r^4 + 16065r^3 + 36360r^2 + 36492r + 12320}$$

Which for the root $r = 0$ becomes

$$b_5 = -\frac{24}{77}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{3r+2}$	-1
b_2	$\frac{12+12r}{9r^2+21r+10}$	$\frac{6}{5}$
b_3	$\frac{-64-48r}{27r^3+135r^2+198r+80}$	$-\frac{4}{5}$
b_4	$\frac{144r^2+624r+512}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{32}{55}$
b_5	$\frac{-864r^2-4128r-3840}{243r^5+3240r^4+16065r^3+36360r^2+36492r+12320}$	$-\frac{24}{77}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\ &= 1 - x + \frac{6x^2}{5} - \frac{4x^3}{5} + \frac{32x^4}{55} - \frac{24x^5}{77} + O(x^6) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{1}{3}} \left(1 - \frac{2x}{3} + \frac{8x^2}{9} - \frac{40x^3}{81} + \frac{92x^4}{243} - \frac{664x^5}{3645} + O(x^6)\right) \\
&\quad + c_2 \left(1 - x + \frac{6x^2}{5} - \frac{4x^3}{5} + \frac{32x^4}{55} - \frac{24x^5}{77} + O(x^6)\right)
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{1}{3}} \left(1 - \frac{2x}{3} + \frac{8x^2}{9} - \frac{40x^3}{81} + \frac{92x^4}{243} - \frac{664x^5}{3645} + O(x^6)\right) \\
&\quad + c_2 \left(1 - x + \frac{6x^2}{5} - \frac{4x^3}{5} + \frac{32x^4}{55} - \frac{24x^5}{77} + O(x^6)\right)
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y = c_1 x^{\frac{1}{3}} &\left(1 - \frac{2x}{3} + \frac{8x^2}{9} - \frac{40x^3}{81} + \frac{92x^4}{243} - \frac{664x^5}{3645} + O(x^6)\right) \\
&+ c_2 \left(1 - x + \frac{6x^2}{5} - \frac{4x^3}{5} + \frac{32x^4}{55} - \frac{24x^5}{77} + O(x^6)\right)
\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}
y = c_1 x^{\frac{1}{3}} &\left(1 - \frac{2x}{3} + \frac{8x^2}{9} - \frac{40x^3}{81} + \frac{92x^4}{243} - \frac{664x^5}{3645} + O(x^6)\right) \\
&+ c_2 \left(1 - x + \frac{6x^2}{5} - \frac{4x^3}{5} + \frac{32x^4}{55} - \frac{24x^5}{77} + O(x^6)\right)
\end{aligned}$$

Verified OK.

14.5.1 Maple step by step solution

Let's solve

$3x^2y'' + (-4x^3 + 2x^2 + 2x)\, y' + (-8x^2 + 2x)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{2(4x-1)y}{3x} + \frac{2(2x^2-x-1)y'}{3x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{2(2x^2-x-1)y'}{3x} - \frac{2(4x-1)y}{3x} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  - Define functions

    $\left[P_2(x) = -\frac{2(2x^2-x-1)}{3x}, P_3(x) = -\frac{2(4x-1)}{3x}\right]$

  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $(x \cdot P_2(x))\bigg|_{x=0} = \frac{2}{3}$

  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $(x^2 \cdot P_3(x))\bigg|_{x=0} = 0$

  - $x = 0$is a regular singular point

    Check to see if $x_0 = 0$ is a regular singular point

    $x_0 = 0$

- Multiply by denominators

  $3y''x + (-4x^2 + 2x + 2)\, y' + (-8x + 2)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..1$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^m\cdot y=\sum_{k=m}^{\infty} a_{k-m}x^{k+r}$
- Convert $x^m\cdot y'$ to series expansion for $m=0..2$

  $x^m\cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$
- Shift index using $k->k+1-m$

  $x^m\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$
- Convert $x\cdot y''$ to series expansion

  $x\cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-1}$
- Shift index using $k->k+1$

  $x\cdot y''=\sum_{k=-1}^{\infty} a_{k+1}(k+1+r)\,(k+r)\,x^{k+r}$

  Rewrite ODE with series expansions

  $a_0r(-1+3r)\,x^{-1+r}+(a_1(1+r)\,(2+3r)+2a_0(1+r))\,x^r+\left(\sum_{k=1}^{\infty} (a_{k+1}(k+1+r)\,(3k+2+3r)\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $r(-1+3r)=0$
- Values of r that satisfy the indicial equation

  $r\in\left\{0,\frac{1}{3}\right\}$
- Each term must be 0

  $a_1(1+r)\,(2+3r)+2a_0(1+r)=0$
- Each term in the series must be 0, giving the recursion relation

  $(k+1+r)\,(3ka_{k+1}+3ra_{k+1}+2a_k-4a_{k-1}+2a_{k+1})=0$
- Shift index using $k->k+1$

  $(k+r+2)\,(3(k+1)\,a_{k+2}+3ra_{k+2}+2a_{k+1}-4a_k+2a_{k+2})=0$
- Recursion relation that defines series solution to ODE

  $a_{k+2}=\frac{2(-a_{k+1}+2a_k)}{3k+5+3r}$
- Recursion relation for $r=0$

  $a_{k+2}=\frac{2(-a_{k+1}+2a_k)}{3k+5}$

- Solution for $r = 0$

$$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+2} = \frac{2(-a_{k+1} + 2a_k)}{3k+5}, 2a_1 + 2a_0 = 0\right]$$

- Recursion relation for $r = \frac{1}{3}$

$$a_{k+2} = \frac{2(-a_{k+1} + 2a_k)}{3k+6}$$

- Solution for $r = \frac{1}{3}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+2} = \frac{2(-a_{k+1} + 2a_k)}{3k+6}, 4a_1 + \frac{8a_0}{3} = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^k\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{3}}\right), a_{k+2} = \frac{2(-a_{1+k} + 2a_k)}{3k+5}, 2a_1 + 2a_0 = 0, b_{k+2} = \frac{2(-b_{1+k} + 2b_k)}{3k+6}, 4b_1 +$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 3.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2\left(x^2+3x+3\right)y''+x\left(7x^2+8x+5\right)y'-\left(-9x^2-2x+1\right)y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^4+3x^3+3x^2\right)y''+\left(7x^3+8x^2+5x\right)y'+\left(9x^2+2x-1\right)y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{7x^2+8x+5}{x\left(x^2+3x+3\right)}$$
$$q(x)=\frac{9x^2+2x-1}{x^2\left(x^2+3x+3\right)}$$

Table 540: Table $p(x), q(x)$ singularites.

$p(x) = \frac{7x^2+8x+5}{x(x^2+3x+3)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{3}}{2} - \frac{3}{2}$	"regular"
$x = \frac{i\sqrt{3}}{2} - \frac{3}{2}$	"regular"

$q(x) = \frac{9x^2+2x-1}{x^2(x^2+3x+3)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{3}}{2} - \frac{3}{2}$	"regular"
$x = \frac{i\sqrt{3}}{2} - \frac{3}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{i\sqrt{3}}{2} - \frac{3}{2}, \frac{i\sqrt{3}}{2} - \frac{3}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2\left(x^2+3x+3\right)y'' + \left(7x^3+8x^2+5x\right)y' + \left(9x^2+2x-1\right)y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2\left(x^2+3x+3\right)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(7x^3+8x^2+5x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(9x^2+2x-1\right)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 3 x^{1+n+r} a_n (n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} 3 x^{n+r} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 7 x^{n+r+2} a_n (n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 8 x^{1+n+r} a_n (n+r)\right)+\left(\sum_{n=0}^{\infty} 5 x^{n+r} a_n (n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 9 x^{n+r+2} a_n\right)+\left(\sum_{n=0}^{\infty} 2 x^{1+n+r} a_n\right)+\sum_{n=0}^{\infty}\left(-a_n x^{n+r}\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)=\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 3 x^{1+n+r} a_n (n+r)(n+r-1)=\sum_{n=1}^{\infty} 3 a_{n-1}(n+r-1)(n+r-2) x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 7 x^{n+r+2} a_n (n+r)=\sum_{n=2}^{\infty} 7 a_{n-2}(n+r-2) x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 8 x^{1+n+r} a_n (n+r)=\sum_{n=1}^{\infty} 8 a_{n-1}(n+r-1) x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 9 x^{n+r+2} a_n=\sum_{n=2}^{\infty} 9 a_{n-2} x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 2 x^{1+n+r} a_n=\sum_{n=1}^{\infty} 2 a_{n-1} x^{n+r}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 3a_{n-1}(n+r-1)(n+r-2)x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r}a_n(n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 7a_{n-2}(n+r-2)x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 8a_{n-1}(n+r-1)x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r}a_n(n+r)\right) + \left(\sum_{n=2}^{\infty} 9a_{n-2}x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1}x^{n+r}\right) + \sum_{n=0}^{\infty}\left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$3x^{n+r}a_n(n+r)(n+r-1) + 5x^{n+r}a_n(n+r) - a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$3x^r a_0 r(-1+r) + 5x^r a_0 r - a_0 x^r = 0$$

Or

$$\left(3x^r r(-1+r) + 5x^r r - x^r\right)a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(3r^2 + 2r - 1\right)x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$3r^2 + 2r - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(3r^2 + 2r - 1\right)x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{4}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-1}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = \frac{-1-r}{r+2}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-2}(n+r-2)(n-3+r)+3a_{n-1}(n+r-1)(n+r-2)+3a_n(n+r)(n+r-1) \\ +7a_{n-2}(n+r-2)+8a_{n-1}(n+r-1)+5a_n(n+r)+9a_{n-2}+2a_{n-1}-a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{n^2 a_{n-2} + 3n^2 a_{n-1} + 2nra_{n-2} + 6nra_{n-1} + r^2 a_{n-2} + 3r^2 a_{n-1} + 2na_{n-2} - na_{n-1} + 2ra_{n-2} - ra_{n-1}}{3n^2 + 6nr + 3r^2 + 2n + 2r - 1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = \frac{(-9a_{n-2} - 27a_{n-1})n^2 + (-24a_{n-2} - 9a_{n-1})n - 16a_{n-2}}{27n^2 + 36n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{r+2}$	$-\frac{4}{7}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{2r^2 + 2r - 4}{3r^2 + 14r + 15}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = -\frac{7}{45}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{r+2}$	$-\frac{4}{7}$
a_2	$\frac{2r^2+2r-4}{3r^2+14r+15}$	$-\frac{7}{45}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-3r^4 - 2r^3 + 69r^2 + 192r + 144}{9r^4 + 93r^3 + 346r^2 + 552r + 320}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = \frac{970}{2457}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{r+2}$	$-\frac{4}{7}$
a_2	$\frac{2r^2+2r-4}{3r^2+14r+15}$	$-\frac{7}{45}$
a_3	$\frac{-3r^4-2r^3+69r^2+192r+144}{9r^4+93r^3+346r^2+552r+320}$	$\frac{970}{2457}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{3r^6 - 28r^5 - 606r^4 - 3196r^3 - 7445r^2 - 7976r - 3152}{(3r^2 + 26r + 55)(9r^3 + 57r^2 + 118r + 80)(r + 3)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = -\frac{5707}{22680}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{r+2}$	$-\frac{4}{7}$
a_2	$\frac{2r^2+2r-4}{3r^2+14r+15}$	$-\frac{7}{45}$
a_3	$\frac{-3r^4-2r^3+69r^2+192r+144}{9r^4+93r^3+346r^2+552r+320}$	$\frac{970}{2457}$
a_4	$\frac{3r^6-28r^5-606r^4-3196r^3-7445r^2-7976r-3152}{(3r^2+26r+55)(9r^3+57r^2+118r+80)(r+3)}$	$-\frac{5707}{22680}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{180r^6 + 3066r^5 + 20450r^4 + 66790r^3 + 107050r^2 + 68544r + 2720}{(3r^2 + 32r + 84)(r + 3)(9r^2 + 39r + 40)(3r + 11)(r + 4)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_5 = \frac{13568}{300105}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{r+2}$	$-\frac{4}{7}$
a_2	$\frac{2r^2+2r-4}{3r^2+14r+15}$	$-\frac{7}{45}$
a_3	$\frac{-3r^4-2r^3+69r^2+192r+144}{9r^4+93r^3+346r^2+552r+320}$	$\frac{970}{2457}$
a_4	$\frac{3r^6-28r^5-606r^4-3196r^3-7445r^2-7976r-3152}{(3r^2+26r+55)(9r^3+57r^2+118r+80)(r+3)}$	$-\frac{5707}{22680}$
a_5	$\frac{180r^6+3066r^5+20450r^4+66790r^3+107050r^2+68544r+2720}{(3r^2+32r+84)(r+3)(9r^2+39r+40)(3r+11)(r+4)}$	$\frac{13568}{300105}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(1 - \frac{4x}{7} - \frac{7x^2}{45} + \frac{970x^3}{2457} - \frac{5707x^4}{22680} + \frac{13568x^5}{300105} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = \frac{-1-r}{r+2}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned}b_{n-2}(n+r-2)\,(n-3+r)+3b_{n-1}(n+r-1)\,(n+r-2)+3b_n(n+r)\,(n+r-1)\\ + 7b_{n-2}(n+r-2) + 8b_{n-1}(n+r-1) + 5b_n(n+r) + 9b_{n-2} + 2b_{n-1} - b_n = 0\end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{n^2 b_{n-2} + 3n^2 b_{n-1} + 2nrb_{n-2} + 6nrb_{n-1} + r^2 b_{n-2} + 3r^2 b_{n-1} + 2nb_{n-2} - nb_{n-1} + 2rb_{n-2} - rb_{n-1} +}{3n^2 + 6nr + 3r^2 + 2n + 2r - 1} \tag{4}$$

Which for the root $r = -1$ becomes

$$b_n = \frac{(-b_{n-2} - 3b_{n-1})\,n^2 + 7nb_{n-1} - 4b_{n-1}}{3n^2 - 4n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{r+2}$	0

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{2r^2 + 2r - 4}{3r^2 + 14r + 15}$$

Which for the root $r = -1$ becomes

$$b_2 = -1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{r+2}$	0
b_2	$\frac{2r^2+2r-4}{3r^2+14r+15}$	-1

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{-3r^4 - 2r^3 + 69r^2 + 192r + 144}{9r^4 + 93r^3 + 346r^2 + 552r + 320}$$

Which for the root $r = -1$ becomes

$$b_3 = \frac{2}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{r+2}$	0
b_2	$\frac{2r^2+2r-4}{3r^2+14r+15}$	-1
b_3	$\frac{-3r^4-2r^3+69r^2+192r+144}{9r^4+93r^3+346r^2+552r+320}$	$\frac{2}{3}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{3r^6 - 28r^5 - 606r^4 - 3196r^3 - 7445r^2 - 7976r - 3152}{(3r^2 + 26r + 55)(9r^3 + 57r^2 + 118r + 80)(r + 3)}$$

Which for the root $r = -1$ becomes

$$b_4 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{r+2}$	0
b_2	$\frac{2r^2+2r-4}{3r^2+14r+15}$	-1
b_3	$\frac{-3r^4-2r^3+69r^2+192r+144}{9r^4+93r^3+346r^2+552r+320}$	$\frac{2}{3}$
b_4	$\frac{3r^6-28r^5-606r^4-3196r^3-7445r^2-7976r-3152}{(3r^2+26r+55)(9r^3+57r^2+118r+80)(r+3)}$	0

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{180r^6 + 3066r^5 + 20450r^4 + 66790r^3 + 107050r^2 + 68544r + 2720}{(3r^2 + 32r + 84)(r + 3)(9r^2 + 39r + 40)(3r + 11)(r + 4)}$$

Which for the root $r=-1$ becomes

$$b_5 = -\frac{10}{33}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{r+2}$	0
b_2	$\frac{2r^2+2r-4}{3r^2+14r+15}$	-1
b_3	$\frac{-3r^4-2r^3+69r^2+192r+144}{9r^4+93r^3+346r^2+552r+320}$	$\frac{2}{3}$
b_4	$\frac{3r^6-28r^5-606r^4-3196r^3-7445r^2-7976r-3152}{(3r^2+26r+55)(9r^3+57r^2+118r+80)(r+3)}$	0
b_5	$\frac{180r^6+3066r^5+20450r^4+66790r^3+107050r^2+68544r+2720}{(3r^2+32r+84)(r+3)(9r^2+39r+40)(3r+11)(r+4)}$	$-\frac{10}{33}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{1}{3}}\left(b_0+b_1x+b_2x^2+b_3x^3+b_4x^4+b_5x^5+b_6x^6\dots\right) \\ &= \frac{1-x^2+\frac{2x^3}{3}-\frac{10x^5}{33}+O(x^6)}{x} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1y_1(x)+c_2y_2(x) \\ &= c_1x^{\frac{1}{3}}\left(1-\frac{4x}{7}-\frac{7x^2}{45}+\frac{970x^3}{2457}-\frac{5707x^4}{22680}+\frac{13568x^5}{300105}+O(x^6)\right) \\ &+ \frac{c_2\left(1-x^2+\frac{2x^3}{3}-\frac{10x^5}{33}+O(x^6)\right)}{x} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1x^{\frac{1}{3}}\left(1-\frac{4x}{7}-\frac{7x^2}{45}+\frac{970x^3}{2457}-\frac{5707x^4}{22680}+\frac{13568x^5}{300105}+O(x^6)\right) \\ &+ \frac{c_2\left(1-x^2+\frac{2x^3}{3}-\frac{10x^5}{33}+O(x^6)\right)}{x} \end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1 x^{\frac{1}{3}} \left(1 - \frac{4x}{7} - \frac{7x^2}{45} + \frac{970x^3}{2457} - \frac{5707x^4}{22680} + \frac{13568x^5}{300105} + O(x^6)\right) + \frac{c_2 \left(1 - x^2 + \frac{2x^3}{3} - \frac{10x^5}{33} + O(x^6)\right)}{x} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{3}} \left(1 - \frac{4x}{7} - \frac{7x^2}{45} + \frac{970x^3}{2457} - \frac{5707x^4}{22680} + \frac{13568x^5}{300105} + O(x^6)\right) + \frac{c_2 \left(1 - x^2 + \frac{2x^3}{3} - \frac{10x^5}{33} + O(x^6)\right)}{x}$$

Verified OK.

14.6.1 Maple step by step solution

Let's solve

$x^2(x^2+3x+3)\,y'' + (7x^3+8x^2+5x)\,y' + (9x^2+2x-1)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(9x^2+2x-1)y}{x^2(x^2+3x+3)} - \frac{(7x^2+8x+5)y'}{x(x^2+3x+3)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(7x^2+8x+5)y'}{x(x^2+3x+3)} + \frac{(9x^2+2x-1)y}{x^2(x^2+3x+3)} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x) = \frac{7x^2+8x+5}{x(x^2+3x+3)}, P_3(x) = \frac{9x^2+2x-1}{x^2(x^2+3x+3)}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

    $\left.(x \cdot P_2(x))\right|_{x=0} = \frac{5}{3}$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

$$\left(x^2 \cdot P_3(x)\right)\Bigg|_{x=0} = -\frac{1}{3}$$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $$x^2(x^2+3x+3)\,y'' + x(7x^2+8x+5)\,y' + (9x^2+2x-1)\,y = 0$$

- Assume series solution for y

  $$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k - m$

  $$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

  $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

  $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(1+r)\,(-1+3r)\,x^r + \left(a_1(2+r)\,(2+3r) + a_0(1+r)\,(2+3r)\right)x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(k+r+1)\,(3k\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1+r)(-1+3r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-1, \frac{1}{3}\right\}$$

- Each term must be 0

$$a_1(2+r)(2+3r) + a_0(1+r)(2+3r) = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = -\frac{(1+r)a_0}{2+r}$$

- Each term in the series must be 0, giving the recursion relation

$$a_{k-2}(k+r+1)^2 + 3\left(k+r-\frac{1}{3}\right)(a_k(k+r+1) + a_{k-1}(k+r)) = 0$$

- Shift index using $k- >k+2$

$$a_k(k+r+3)^2 + 3\left(k+\frac{5}{3}+r\right)(a_{k+2}(k+r+3) + a_{k+1}(k+2+r)) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{k^2a_k+3k^2a_{k+1}+2kra_k+6kra_{k+1}+r^2a_k+3r^2a_{k+1}+6ka_k+11ka_{k+1}+6ra_k+11ra_{k+1}+9a_k+10a_{k+1}}{(3k+5+3r)(k+r+3)}$$

- Recursion relation for $r = -1$

$$a_{k+2} = -\frac{k^2a_k+3k^2a_{k+1}+4ka_k+5ka_{k+1}+4a_k+2a_{k+1}}{(3k+2)(k+2)}$$

- Solution for $r = -1$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+2} = -\frac{k^2a_k+3k^2a_{k+1}+4ka_k+5ka_{k+1}+4a_k+2a_{k+1}}{(3k+2)(k+2)}, a_1 = 0\right]$$

- Recursion relation for $r = \frac{1}{3}$

$$a_{k+2} = -\frac{k^2a_k+3k^2a_{k+1}+\frac{20}{3}ka_k+13ka_{k+1}+\frac{100}{9}a_k+14a_{k+1}}{(3k+6)\left(k+\frac{10}{3}\right)}$$

- Solution for $r = \frac{1}{3}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+2} = -\frac{k^2a_k+3k^2a_{k+1}+\frac{20}{3}ka_k+13ka_{k+1}+\frac{100}{9}a_k+14a_{k+1}}{(3k+6)\left(k+\frac{10}{3}\right)}, a_1 = -\frac{4a_0}{7}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-1}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{3}}\right), a_{k+2} = -\frac{k^2a_k+3k^2a_{1+k}+4ka_k+5ka_{1+k}+4a_k+2a_{1+k}}{(3k+2)(k+2)}, a_1 = 0, b_{k+2} =\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 4.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2y'' + x\left(4x^2+2x+7\right)y' - \left(-7x^2-4x+1\right)y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$4x^2y'' + \left(4x^3+2x^2+7x\right)y' + \left(7x^2+4x-1\right)y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{4x^2+2x+7}{4x}$$
$$q(x) = \frac{7x^2+4x-1}{4x^2}$$

Table 542: Table $p(x), q(x)$ singularites.

$p(x) = \frac{4x^2+2x+7}{4x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{7x^2+4x-1}{4x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$4x^2y'' + (4x^3 + 2x^2 + 7x)\, y' + (7x^2 + 4x - 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$4x^2 \left(\sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2} \right) + (4x^3 + 2x^2 + 7x) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1} \right) + (7x^2 + 4x - 1) \left(\sum_{n=0}^{\infty} a_n x^{n+r} \right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 7x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 7x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 7x^{n+r+2} a_n = \sum_{n=2}^{\infty} 7a_{n-2} x^{n+r}$$

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n = \sum_{n=1}^{\infty} 4a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 7x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 7a_{n-2} x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 4a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$4x^{n+r}a_n(n+r)(n+r-1) + 7x^{n+r}a_n(n+r) - a_nx^{n+r} = 0$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) + 7x^r a_0 r - a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) + 7x^r r - x^r) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 + 3r - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 + 3r - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{4}$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 + 3r - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{5}{4}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{4}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-1}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -\frac{2}{4r+3}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &4a_n(n+r)(n+r-1) + 4a_{n-2}(n+r-2) \\ &+ 2a_{n-1}(n+r-1) + 7a_n(n+r) + 7a_{n-2} + 4a_{n-1} - a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{4na_{n-2} + 2na_{n-1} + 4ra_{n-2} + 2ra_{n-1} - a_{n-2} + 2a_{n-1}}{4n^2 + 8nr + 4r^2 + 3n + 3r - 1} \tag{4}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_n = \frac{(-8a_{n-2} - 4a_{n-1})\, n - 5a_{n-1}}{8n^2 + 10n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{4r+3}$	$-\frac{1}{2}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-16r^2 - 36r - 9}{16r^3 + 88r^2 + 141r + 63}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_2 = -\frac{19}{104}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{4r+3}$	$-\frac{1}{2}$
a_2	$\frac{-16r^2-36r-9}{16r^3+88r^2+141r+63}$	$-\frac{19}{104}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{64r^3 + 440r^2 + 892r + 534}{64r^5 + 784r^4 + 3644r^3 + 7931r^2 + 7905r + 2772}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_3 = \frac{1571}{10608}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{4r+3}$	$-\frac{1}{2}$
a_2	$\frac{-16r^2-36r-9}{16r^3+88r^2+141r+63}$	$-\frac{19}{104}$
a_3	$\frac{64r^3+440r^2+892r+534}{64r^5+784r^4+3644r^3+7931r^2+7905r+2772}$	$\frac{1571}{10608}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{256r^5 + 3136r^4 + 13968r^3 + 26804r^2 + 19001r + 600}{256r^7 + 5376r^6 + 46816r^5 + 218064r^4 + 582505r^3 + 882588r^2 + 689895r + 207900}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_4 = \frac{3225}{198016}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{4r+3}$	$-\frac{1}{2}$
a_2	$\frac{-16r^2-36r-9}{16r^3+88r^2+141r+63}$	$-\frac{19}{104}$
a_3	$\frac{64r^3+440r^2+892r+534}{64r^5+784r^4+3644r^3+7931r^2+7905r+2772}$	$\frac{1571}{10608}$
a_4	$\frac{256r^5+3136r^4+13968r^3+26804r^2+19001r+600}{256r^7+5376r^6+46816r^5+218064r^4+582505r^3+882588r^2+689895r+207900}$	$\frac{3225}{198016}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-1536r^6 - 30208r^5 - 236640r^4 - 938240r^3 - 1962774r^2 - 2015622r - 768150}{(4r^2 + 43r + 114)\left(256r^7 + 5376r^6 + 46816r^5 + 218064r^4 + 582505r^3 + 882588r^2 + 689895r + 2079\right.}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_5 = -\frac{752183}{29702400}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{4r+3}$	$-\frac{1}{2}$
a_2	$\frac{-16r^2-36r-9}{16r^3+88r^2+141r+63}$	$-\frac{19}{104}$
a_3	$\frac{64r^3+440r^2+892r+534}{64r^5+784r^4+3644r^3+7931r^2+7905r+2772}$	$\frac{1571}{10608}$
a_4	$\frac{256r^5+3136r^4+13968r^3+26804r^2+19001r+600}{256r^7+5376r^6+46816r^5+218064r^4+582505r^3+882588r^2+689895r+207900}$	$\frac{3225}{198016}$
a_5	$\frac{-1536r^6-30208r^5-236640r^4-938240r^3-1962774r^2-2015622r-768150}{(4r^2+43r+114)(256r^7+5376r^6+46816r^5+218064r^4+582505r^3+882588r^2+689895r+207900)}$	$-\frac{752183}{29702400}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{4}}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= x^{\frac{1}{4}}\left(1 - \frac{x}{2} - \frac{19x^2}{104} + \frac{1571x^3}{10608} + \frac{3225x^4}{198016} - \frac{752183x^5}{29702400} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = -\frac{2}{4r+3}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &4b_n(n+r)(n+r-1) + 4b_{n-2}(n+r-2) \\ &+ 2b_{n-1}(n+r-1) + 7b_n(n+r) + 7b_{n-2} + 4b_{n-1} - b_n = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{4nb_{n-2} + 2nb_{n-1} + 4rb_{n-2} + 2rb_{n-1} - b_{n-2} + 2b_{n-1}}{4n^2 + 8nr + 4r^2 + 3n + 3r - 1} \tag{4}$$

Which for the root $r = -1$ becomes

$$b_n = \frac{(-4b_{n-2} - 2b_{n-1})\,n + 5b_{n-2}}{4n^2 - 5n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{4r+3}$	2

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{-16r^2 - 36r - 9}{16r^3 + 88r^2 + 141r + 63}$$

Which for the root $r = -1$ becomes

$$b_2 = -\frac{11}{6}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{4r+3}$	2
b_2	$\frac{-16r^2-36r-9}{16r^3+88r^2+141r+63}$	$-\frac{11}{6}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{64r^3 + 440r^2 + 892r + 534}{64r^5 + 784r^4 + 3644r^3 + 7931r^2 + 7905r + 2772}$$

Which for the root $r = -1$ becomes

$$b_3 = -\frac{1}{7}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{4r+3}$	2
b_2	$\frac{-16r^2-36r-9}{16r^3+88r^2+141r+63}$	$-\frac{11}{6}$
b_3	$\frac{64r^3+440r^2+892r+534}{64r^5+784r^4+3644r^3+7931r^2+7905r+2772}$	$-\frac{1}{7}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{256r^5 + 3136r^4 + 13968r^3 + 26804r^2 + 19001r + 600}{256r^7 + 5376r^6 + 46816r^5 + 218064r^4 + 582505r^3 + 882588r^2 + 689895r + 207900}$$

Which for the root $r = -1$ becomes

$$b_4 = \frac{895}{1848}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{4r+3}$	2
b_2	$\frac{-16r^2-36r-9}{16r^3+88r^2+141r+63}$	$-\frac{11}{6}$
b_3	$\frac{64r^3+440r^2+892r+534}{64r^5+784r^4+3644r^3+7931r^2+7905r+2772}$	$-\frac{1}{7}$
b_4	$\frac{256r^5+3136r^4+13968r^3+26804r^2+19001r+600}{256r^7+5376r^6+46816r^5+218064r^4+582505r^3+882588r^2+689895r+207900}$	$\frac{895}{1848}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{-1536r^6 - 30208r^5 - 236640r^4 - 938240r^3 - 1962774r^2 - 2015622r - 768150}{(4r^2 + 43r + 114)(256r^7 + 5376r^6 + 46816r^5 + 218064r^4 + 582505r^3 + 882588r^2 + 689895r + 2079}$$

Which for the root $r = -1$ becomes

$$b_5 = -\frac{499}{13860}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{4r+3}$	2
b_2	$\frac{-16r^2-36r-9}{16r^3+88r^2+141r+63}$	$-\frac{11}{6}$
b_3	$\frac{64r^3+440r^2+892r+534}{64r^5+784r^4+3644r^3+7931r^2+7905r+2772}$	$-\frac{1}{7}$
b_4	$\frac{256r^5+3136r^4+13968r^3+26804r^2+19001r+600}{256r^7+5376r^6+46816r^5+218064r^4+582505r^3+882588r^2+689895r+207900}$	$\frac{895}{1848}$
b_5	$\frac{-1536r^6-30208r^5-236640r^4-938240r^3-1962774r^2-2015622r-768150}{(4r^2+43r+114)(256r^7+5376r^6+46816r^5+218064r^4+582505r^3+882588r^2+689895r+207900)}$	$-\frac{499}{13860}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{1}{4}}\left(b_0+b_1x+b_2x^2+b_3x^3+b_4x^4+b_5x^5+b_6x^6\dots\right) \\ &= \frac{1+2x-\frac{11x^2}{6}-\frac{x^3}{7}+\frac{895x^4}{1848}-\frac{499x^5}{13860}+O(x^6)}{x} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1y_1(x)+c_2y_2(x) \\ &= c_1x^{\frac{1}{4}}\left(1-\frac{x}{2}-\frac{19x^2}{104}+\frac{1571x^3}{10608}+\frac{3225x^4}{198016}-\frac{752183x^5}{29702400}+O\left(x^6\right)\right) \\ &+ \frac{c_2\left(1+2x-\frac{11x^2}{6}-\frac{x^3}{7}+\frac{895x^4}{1848}-\frac{499x^5}{13860}+O(x^6)\right)}{x} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1x^{\frac{1}{4}}\left(1-\frac{x}{2}-\frac{19x^2}{104}+\frac{1571x^3}{10608}+\frac{3225x^4}{198016}-\frac{752183x^5}{29702400}+O\left(x^6\right)\right) \\ &+ \frac{c_2\left(1+2x-\frac{11x^2}{6}-\frac{x^3}{7}+\frac{895x^4}{1848}-\frac{499x^5}{13860}+O(x^6)\right)}{x} \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y &= c_1x^{\frac{1}{4}}\left(1-\frac{x}{2}-\frac{19x^2}{104}+\frac{1571x^3}{10608}+\frac{3225x^4}{198016}-\frac{752183x^5}{29702400}+O\left(x^6\right)\right) \\ &+ \frac{c_2\left(1+2x-\frac{11x^2}{6}-\frac{x^3}{7}+\frac{895x^4}{1848}-\frac{499x^5}{13860}+O(x^6)\right)}{x} \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y &= c_1x^{\frac{1}{4}}\left(1-\frac{x}{2}-\frac{19x^2}{104}+\frac{1571x^3}{10608}+\frac{3225x^4}{198016}-\frac{752183x^5}{29702400}+O\left(x^6\right)\right) \\ &+ \frac{c_2\left(1+2x-\frac{11x^2}{6}-\frac{x^3}{7}+\frac{895x^4}{1848}-\frac{499x^5}{13860}+O(x^6)\right)}{x} \end{aligned}$$

Verified OK.

14.7.1 Maple step by step solution

Let's solve

$4x^2y'' + (4x^3 + 2x^2 + 7x)\, y' + (7x^2 + 4x - 1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(7x^2+4x-1)y}{4x^2} - \frac{(4x^2+2x+7)y'}{4x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(4x^2+2x+7)y'}{4x} + \frac{(7x^2+4x-1)y}{4x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{4x^2+2x+7}{4x}, P_3(x) = \frac{7x^2+4x-1}{4x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\Big|_{x=0} = \frac{7}{4}$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\Big|_{x=0} = -\frac{1}{4}$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $4x^2y'' + x(4x^2 + 2x + 7)\, y' + (7x^2 + 4x - 1)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m}x^{k+r}$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..3$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^{2}\cdot y''$ to series expansion

  $x^{2}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}(1+r)\,(-1+4r)\, x^{r}+(a_{1}(2+r)\,(3+4r)+2a_{0}(2+r))\, x^{1+r}+\left(\sum_{k=2}^{\infty} (a_{k}(k+r+1)\,(4k+4r-\right.$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $(1+r)\,(-1+4r)=0$

- Values of r that satisfy the indicial equation

  $r\in\left\{-1,\frac{1}{4}\right\}$

- Each term must be 0

  $a_{1}(2+r)\,(3+4r)+2a_{0}(2+r)=0$

- Solve for the dependent coefficient(s)

  $a_{1}=-\frac{2a_{0}}{3+4r}$

- Each term in the series must be 0, giving the recursion relation

  $4\left(k+r-\frac{1}{4}\right)(k+r+1)\, a_{k}+(4a_{k-2}+2a_{k-1})\, k+(4a_{k-2}+2a_{k-1})\, r-a_{k-2}+2a_{k-1}=0$

- Shift index using $k->k+2$

  $4\left(k+\frac{7}{4}+r\right)(k+3+r)\, a_{k+2}+(4a_{k}+2a_{k+1})\,(k+2)+(4a_{k}+2a_{k+1})\, r-a_{k}+2a_{k+1}=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{4ka_{k}+2ka_{k+1}+4ra_{k}+2ra_{k+1}+7a_{k}+6a_{k+1}}{(4k+4r+7)(k+3+r)}$

- Recursion relation for $r=-1$

  $a_{k+2}=-\frac{4ka_{k}+2ka_{k+1}+3a_{k}+4a_{k+1}}{(4k+3)(k+2)}$

- Solution for $r = -1$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+2} = -\frac{4k a_k + 2k a_{k+1} + 3a_k + 4a_{k+1}}{(4k+3)(k+2)}, a_1 = 2a_0\right]$$

- Recursion relation for $r = \frac{1}{4}$

$$a_{k+2} = -\frac{4k a_k + 2k a_{k+1} + 8a_k + \frac{13}{2} a_{k+1}}{(4k+8)\left(k+\frac{13}{4}\right)}$$

- Solution for $r = \frac{1}{4}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{4}}, a_{k+2} = -\frac{4k a_k + 2k a_{k+1} + 8a_k + \frac{13}{2} a_{k+1}}{(4k+8)\left(k+\frac{13}{4}\right)}, a_1 = -\frac{a_0}{2}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-1}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{4}}\right), a_{k+2} = -\frac{4k a_k + 2k a_{1+k} + 3a_k + 4a_{1+k}}{(4k+3)(k+2)}, a_1 = 2a_0, b_{k+2} = -\frac{4k b_k + 2k b_{1}}{(4k+}\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 5.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{12x^2(x+1)\,y''+x\left(3x^2+35x+11\right)y'-\left(-5x^2-10x+1\right)y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(12x^3+12x^2\right)y''+\left(3x^3+35x^2+11x\right)y'+\left(5x^2+10x-1\right)y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{3x^2+35x+11}{12x\,(x+1)}$$
$$q(x)=\frac{5x^2+10x-1}{12x^2\,(x+1)}$$

Table 544: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3x^2+35x+11}{12x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = \frac{5x^2+10x-1}{12x^2(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$12x^2(x+1)\, y'' + \left(3x^3 + 35x^2 + 11x\right) y' + \left(5x^2 + 10x - 1\right) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\begin{aligned} &12x^2(x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) \\ &+ \left(3x^3 + 35x^2 + 11x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) \\ &+ \left(5x^2 + 10x - 1\right)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \end{aligned} \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 12x^{1+n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 12x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 35x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 11x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 5x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 10x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty} 12x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 12a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)\, x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 35x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 35a_{n-1}(n+r-1)\, x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 5x^{n+r+2} a_n = \sum_{n=2}^{\infty} 5a_{n-2} x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 10x^{1+n+r} a_n = \sum_{n=1}^{\infty} 10a_{n-1} x^{n+r}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 12a_{n-1}(n+r-1)(n+r-2)\,x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 12x^{n+r}a_n(n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)\,x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 35a_{n-1}(n+r-1)\,x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 11x^{n+r}a_n(n+r)\right) + \left(\sum_{n=2}^{\infty} 5a_{n-2}x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 10a_{n-1}x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$12x^{n+r}a_n(n+r)(n+r-1) + 11x^{n+r}a_n(n+r) - a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$12x^r a_0 r(-1+r) + 11x^r a_0 r - a_0 x^r = 0$$

Or

$$\left(12x^r r(-1+r) + 11x^r r - x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(12r^2 - r - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$12r^2 - r - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = -\frac{1}{4}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(12r^2 - r - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{7}{12}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{4}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -1$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &12a_{n-1}(n+r-1)(n+r-2) + 12a_n(n+r)(n+r-1) + 3a_{n-2}(n+r-2) \\ &+ 35a_{n-1}(n+r-1) + 11a_n(n+r) + 5a_{n-2} + 10a_{n-1} - a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{4na_{n-1} + 4ra_{n-1} + a_{n-2} + a_{n-1}}{4n + 4r + 1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = \frac{(-12n - 7)\, a_{n-1} - 3a_{n-2}}{12n + 7} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4r+8}{9+4r}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = \frac{28}{31}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	$\frac{4r+8}{9+4r}$	$\frac{28}{31}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-16r^2-80r-95}{16r^2+88r+117}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = -\frac{1111}{1333}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	$\frac{4r+8}{9+4r}$	$\frac{28}{31}$
a_3	$\frac{-16r^2-80r-95}{16r^2+88r+117}$	$-\frac{1111}{1333}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{64r^3+576r^2+1656r+1511}{64r^3+624r^2+1964r+1989}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{57493}{73315}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	$\frac{4r+8}{9+4r}$	$\frac{28}{31}$
a_3	$\frac{-16r^2-80r-95}{16r^2+88r+117}$	$-\frac{1111}{1333}$
a_4	$\frac{64r^3+576r^2+1656r+1511}{64r^3+624r^2+1964r+1989}$	$\frac{57493}{73315}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{4(64r^4 + 896r^3 + 4532r^2 + 9770r + 7529)}{(16r^2 + 88r + 117)(17 + 4r)(21 + 4r)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_5 = -\frac{3668716}{4912105}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	-1	-1
a_2	$\frac{4r+8}{9+4r}$	$\frac{28}{31}$
a_3	$\frac{-16r^2-80r-95}{16r^2+88r+117}$	$-\frac{1111}{1333}$
a_4	$\frac{64r^3+576r^2+1656r+1511}{64r^3+624r^2+1964r+1989}$	$\frac{57493}{73315}$
a_5	$-\frac{4(64r^4+896r^3+4532r^2+9770r+7529)}{(16r^2+88r+117)(17+4r)(21+4r)}$	$-\frac{3668716}{4912105}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\
&= x^{\frac{1}{3}}\left(1 - x + \frac{28x^2}{31} - \frac{1111x^3}{1333} + \frac{57493x^4}{73315} - \frac{3668716x^5}{4912105} + O(x^6)\right)
\end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = -1$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned}12b_{n-1}(n+r-1)(n+r-2) + 12b_n(n+r)(n+r-1) + 3b_{n-2}(n+r-2) \\ + 35b_{n-1}(n+r-1) + 11b_n(n+r) + 5b_{n-2} + 10b_{n-1} - b_n = 0\end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{4nb_{n-1} + 4rb_{n-1} + b_{n-2} + b_{n-1}}{4n + 4r + 1} \tag{4}$$

Which for the root $r = -\frac{1}{4}$ becomes

$$b_n = \frac{-4nb_{n-1} - b_{n-2}}{4n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-1	-1

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{4r + 8}{9 + 4r}$$

Which for the root $r = -\frac{1}{4}$ becomes

$$b_2 = \frac{7}{8}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-1	-1
b_2	$\frac{4r+8}{9+4r}$	$\frac{7}{8}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{-16r^2 - 80r - 95}{16r^2 + 88r + 117}$$

Which for the root $r = -\frac{1}{4}$ becomes

$$b_3 = -\frac{19}{24}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-1	-1
b_2	$\frac{4r+8}{9+4r}$	$\frac{7}{8}$
b_3	$\frac{-16r^2-80r-95}{16r^2+88r+117}$	$-\frac{19}{24}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{64r^3 + 576r^2 + 1656r + 1511}{64r^3 + 624r^2 + 1964r + 1989}$$

Which for the root $r = -\frac{1}{4}$ becomes

$$b_4 = \frac{283}{384}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-1	-1
b_2	$\frac{4r+8}{9+4r}$	$\frac{7}{8}$
b_3	$\frac{-16r^2-80r-95}{16r^2+88r+117}$	$-\frac{19}{24}$
b_4	$\frac{64r^3+576r^2+1656r+1511}{64r^3+624r^2+1964r+1989}$	$\frac{283}{384}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{4(64r^4 + 896r^3 + 4532r^2 + 9770r + 7529)}{(16r^2 + 88r + 117)(17 + 4r)(21 + 4r)}$$

Which for the root $r = -\frac{1}{4}$ becomes

$$b_5 = -\frac{1339}{1920}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	-1	-1
b_2	$\frac{4r+8}{9+4r}$	$\frac{7}{8}$
b_3	$\frac{-16r^2-80r-95}{16r^2+88r+117}$	$-\frac{19}{24}$
b_4	$\frac{64r^3+576r^2+1656r+1511}{64r^3+624r^2+1964r+1989}$	$\frac{283}{384}$
b_5	$-\frac{4(64r^4+896r^3+4532r^2+9770r+7529)}{(16r^2+88r+117)(17+4r)(21+4r)}$	$-\frac{1339}{1920}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{1}{3}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 - x + \frac{7x^2}{8} - \frac{19x^3}{24} + \frac{283x^4}{384} - \frac{1339x^5}{1920} + O(x^6)}{x^{\frac{1}{4}}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{1}{3}}\left(1 - x + \frac{28x^2}{31} - \frac{1111x^3}{1333} + \frac{57493x^4}{73315} - \frac{3668716x^5}{4912105} + O(x^6)\right) \\ &+ \frac{c_2\left(1 - x + \frac{7x^2}{8} - \frac{19x^3}{24} + \frac{283x^4}{384} - \frac{1339x^5}{1920} + O(x^6)\right)}{x^{\frac{1}{4}}} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{1}{3}}\left(1 - x + \frac{28x^2}{31} - \frac{1111x^3}{1333} + \frac{57493x^4}{73315} - \frac{3668716x^5}{4912105} + O(x^6)\right) \\ &+ \frac{c_2\left(1 - x + \frac{7x^2}{8} - \frac{19x^3}{24} + \frac{283x^4}{384} - \frac{1339x^5}{1920} + O(x^6)\right)}{x^{\frac{1}{4}}} \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{3}} \left(1 - x + \frac{28x^2}{31} - \frac{1111x^3}{1333} + \frac{57493x^4}{73315} - \frac{3668716x^5}{4912105} + O(x^6)\right) + \frac{c_2 \left(1 - x + \frac{7x^2}{8} - \frac{19x^3}{24} + \frac{283x^4}{384} - \frac{1339x^5}{1920} + O(x^6)\right)}{x^{\frac{1}{4}}} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{3}} \left(1 - x + \frac{28x^2}{31} - \frac{1111x^3}{1333} + \frac{57493x^4}{73315} - \frac{3668716x^5}{4912105} + O(x^6)\right) + \frac{c_2 \left(1 - x + \frac{7x^2}{8} - \frac{19x^3}{24} + \frac{283x^4}{384} - \frac{1339x^5}{1920} + O(x^6)\right)}{x^{\frac{1}{4}}}$$

Verified OK.

14.8.1 Maple step by step solution

Let's solve

$12x^2(x+1)\, y'' + (3x^3 + 35x^2 + 11x)\, y' + (5x^2 + 10x - 1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(5x^2+10x-1)y}{12x^2(x+1)} - \frac{(3x^2+35x+11)y'}{12x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(3x^2+35x+11)y'}{12x(x+1)} + \frac{(5x^2+10x-1)y}{12x^2(x+1)} = 0$

□ Check to see if x_0 is a regular singular point

- ◦ Define functions

  $\left[P_2(x) = \frac{3x^2+35x+11}{12x(x+1)}, P_3(x) = \frac{5x^2+10x-1}{12x^2(x+1)}\right]$

- ◦ $(x+1) \cdot P_2(x)$ is analytic at $x = -1$

  $\left((x+1) \cdot P_2(x)\right)\Big|_{x=-1} = \frac{7}{4}$

- ◦ $(x+1)^2 \cdot P_3(x)$ is analytic at $x = -1$

$$\left((x+1)^2 \cdot P_3(x)\right)\bigg|_{x=-1} = 0$$

- $x = -1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = -1$

- Multiply by denominators

  $12x^2(x+1)\,y'' + x(3x^2+35x+11)\,y' + (5x^2+10x-1)\,y = 0$

- Change variables using $x = u-1$ so that the regular singular point is at $u = 0$

  $(12u^3-24u^2+12u)\left(\frac{d^2}{du^2}y(u)\right) + (3u^3+26u^2-50u+21)\left(\frac{d}{du}y(u)\right) + (5u^2-6)\,y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..2$

  $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$

- Shift index using $k- >k-m$

  $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..3$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\, u^{k+r-1+m}$

- Shift index using $k- >k+1-m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)(k+r-1)\, u^{k+r-2+m}$

- Shift index using $k- >k+2-m$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, u^{k+r}$

  Rewrite ODE with series expansions

$3a_0r(3+4r)\,u^{-1+r}+\left(3a_1(1+r)\,(7+4r)-2a_0(3+4r)\,(1+3r)\right)u^r+\left(3a_2(2+r)\,(11+4r)-2\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $3r(3+4r)=0$

- Values of r that satisfy the indicial equation

  $r\in\left\{0,-\frac{3}{4}\right\}$

- The coefficients of each power of u must be 0

  $[3a_1(1+r)\,(7+4r)-2a_0(3+4r)\,(1+3r)=0,3a_2(2+r)\,(11+4r)-2a_1(7+4r)\,(4+3r)+2a$

- Solve for the dependent coefficient(s)

  $\left\{a_1=\frac{2a_0(12r^2+13r+3)}{3(4r^2+11r+7)},a_2=\frac{2a_0(54r^3+135r^2+101r+24)}{9(4r^3+23r^2+41r+22)}\right\}$

- Each term in the series must be 0, giving the recursion relation

  $12(-2a_k+a_{k-1}+a_{k+1})\,k^2+\left(24(-2a_k+a_{k-1}+a_{k+1})\,r-26a_k+3a_{k-2}-10a_{k-1}+33a_{k+1}\right)k+$

- Shift index using $k->k+2$

  $12(-2a_{k+2}+a_{k+1}+a_{k+3})\,(k+2)^2+\left(24(-2a_{k+2}+a_{k+1}+a_{k+3})\,r-26a_{k+2}+3a_k-10a_{k+1}+3\right.$

- Recursion relation that defines series solution to ODE

  $a_{k+3}=-\frac{12k^2a_{k+1}-24k^2a_{k+2}+24kra_{k+1}-48kra_{k+2}+12r^2a_{k+1}-24r^2a_{k+2}+3ka_k+38ka_{k+1}-122ka_{k+2}+3ra_k+38ra_{k+1}-122r}{3(4k^2+8kr+4r^2+27k+27r+45)}$

- Recursion relation for $r=0$

  $a_{k+3}=-\frac{12k^2a_{k+1}-24k^2a_{k+2}+3ka_k+38ka_{k+1}-122ka_{k+2}+5a_k+26a_{k+1}-154a_{k+2}}{3(4k^2+27k+45)}$

- Solution for $r=0$

  $\left[y(u)=\sum_{k=0}^{\infty}a_ku^k,a_{k+3}=-\frac{12k^2a_{k+1}-24k^2a_{k+2}+3ka_k+38ka_{k+1}-122ka_{k+2}+5a_k+26a_{k+1}-154a_{k+2}}{3(4k^2+27k+45)},a_1=\frac{2a_0}{7},a_2=\right.$

- Revert the change of variables $u=x+1$

  $\left[y=\sum_{k=0}^{\infty}a_k(x+1)^k,a_{k+3}=-\frac{12k^2a_{k+1}-24k^2a_{k+2}+3ka_k+38ka_{k+1}-122ka_{k+2}+5a_k+26a_{k+1}-154a_{k+2}}{3(4k^2+27k+45)},a_1=\frac{2a_0}{7},\right.$

- Recursion relation for $r=-\frac{3}{4}$

  $a_{k+3}=-\frac{12k^2a_{k+1}-24k^2a_{k+2}+3ka_k+20ka_{k+1}-86ka_{k+2}+\frac{11}{4}a_k+\frac{17}{4}a_{k+1}-76a_{k+2}}{3(4k^2+21k+27)}$

- Solution for $r=-\frac{3}{4}$

  $\left[y(u)=\sum_{k=0}^{\infty}a_ku^{k-\frac{3}{4}},a_{k+3}=-\frac{12k^2a_{k+1}-24k^2a_{k+2}+3ka_k+20ka_{k+1}-86ka_{k+2}+\frac{11}{4}a_k+\frac{17}{4}a_{k+1}-76a_{k+2}}{3(4k^2+21k+27)},a_1=0,a_2\right.$

- Revert the change of variables $u=x+1$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^{k-\frac{3}{4}}, a_{k+3} = -\frac{12k^2 a_{k+1} - 24k^2 a_{k+2} + 3k a_k + 20k a_{k+1} - 86k a_{k+2} + \frac{11}{4} a_k + \frac{17}{4} a_{k+1} - 76 a_{k+2}}{3(4k^2+21k+27)}, a_1 = 0,\right.$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k (x+1)^k\right) + \left(\sum_{k=0}^{\infty} b_k (x+1)^{k-\frac{3}{4}}\right), a_{k+3} = -\frac{12k^2 a_{1+k} - 24k^2 a_{k+2} + 3k a_k + 38k a_{1+k} - 122k a_{k+2} + 5a}{3(4k^2+27k+45)}\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 6.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries], [_2nd_order, _linear, `
   _with_symmetry_[0,F(x)]`]]
```

$$\boxed{x^2(10x^2+x+5)\,y''+x(48x^2+3x+4)\,y'+(36x^2+x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The ODE is

$$(10x^4+x^3+5x^2)\,y''+(48x^3+3x^2+4x)\,y'+(36x^2+x)\,y=0$$

Or

$$x(10y''x^3+48y'x^2+x^2y''+36yx+3y'x+5y''x+y+4y')=0$$

For $x\neq 0$ the above simplifies to

$$(10x^3+x^2+5x)\,y''+(48x^2+3x+4)\,y'+(36x+1)\,y=0$$

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(10x^4+x^3+5x^2)\,y''+(48x^3+3x^2+4x)\,y'+(36x^2+x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$\begin{aligned} p(x) &= \frac{48x^2 + 3x + 4}{x\,(10x^2 + x + 5)} \\ q(x) &= \frac{36x + 1}{x\,(10x^2 + x + 5)} \end{aligned}$$

Table 546: Table $p(x), q(x)$ singularites.

$p(x) = \frac{48x^2+3x+4}{x(10x^2+x+5)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{199}}{20} - \frac{1}{20}$	"regular"
$x = \frac{i\sqrt{199}}{20} - \frac{1}{20}$	"regular"

$q(x) = \frac{36x+1}{x(10x^2+x+5)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{199}}{20} - \frac{1}{20}$	"regular"
$x = \frac{i\sqrt{199}}{20} - \frac{1}{20}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{i\sqrt{199}}{20} - \frac{1}{20}, \frac{i\sqrt{199}}{20} - \frac{1}{20}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2\left(10x^2 + x + 5\right) y'' + \left(48x^3 + 3x^2 + 4x\right) y' + \left(36x^2 + x\right) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$\begin{aligned} y' &= \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1} \\ y'' &= \sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2} \end{aligned}$$

Substituting the above back into the ode gives

$$
\begin{aligned}
&x^{2} \left(10 x^{2}+x +5\right) \left(\sum_{n =0}^{\infty} \left(n +r \right) \left(n +r -1\right) a_{n} x^{n +r -2}\right)\\
&+\left(48 x^{3}+3 x^{2}+4 x \right) \left(\sum_{n =0}^{\infty} \left(n +r \right) a_{n} x^{n +r -1}\right)+\left(36 x^{2}+x \right) \left(\sum_{n =0}^{\infty} a_{n} x^{n +r}\right) = 0
\end{aligned} \tag{1}
$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n =0}^{\infty} 10 x^{n +r +2} a_{n} \left(n +r \right) \left(n +r -1\right)\right)+\left(\sum_{n =0}^{\infty} x^{1+n +r} a_{n} \left(n +r \right) \left(n +r -1\right)\right)\\
&+\left(\sum_{n =0}^{\infty} 5 x^{n +r} a_{n} \left(n +r \right) \left(n +r -1\right)\right)+\left(\sum_{n =0}^{\infty} 48 x^{n +r +2} a_{n} \left(n +r \right)\right)\\
&+\left(\sum_{n =0}^{\infty} 3 x^{1+n +r} a_{n} \left(n +r \right)\right)+\left(\sum_{n =0}^{\infty} 4 x^{n +r} a_{n} \left(n +r \right)\right)\\
&+\left(\sum_{n =0}^{\infty} 36 x^{n +r +2} a_{n}\right)+\left(\sum_{n =0}^{\infty} x^{1+n +r} a_{n}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n +r$ in each summation term. Going over each summation term above with power of x in it which is not already $x^{n +r}$ and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n =0}^{\infty} 10 x^{n +r +2} a_{n} \left(n +r \right) \left(n +r -1\right) &= \sum_{n =2}^{\infty} 10 a_{n -2} \left(n +r -2\right) \left(n -3+r \right) x^{n +r} \\
\sum_{n =0}^{\infty} x^{1+n +r} a_{n} \left(n +r \right) \left(n +r -1\right) &= \sum_{n =1}^{\infty} a_{n -1} \left(n +r -1\right) \left(n +r -2\right) x^{n +r} \\
\sum_{n =0}^{\infty} 48 x^{n +r +2} a_{n} \left(n +r \right) &= \sum_{n =2}^{\infty} 48 a_{n -2} \left(n +r -2\right) x^{n +r} \\
\sum_{n =0}^{\infty} 3 x^{1+n +r} a_{n} \left(n +r \right) &= \sum_{n =1}^{\infty} 3 a_{n -1} \left(n +r -1\right) x^{n +r} \\
\sum_{n =0}^{\infty} 36 x^{n +r +2} a_{n} &= \sum_{n =2}^{\infty} 36 a_{n -2} x^{n +r}
\end{aligned}
$$

$$
\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} 10 a_{n-2}(n+r-2)(n-3+r) x^{n+r}\right) \\
&+\left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2) x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 5 x^{n+r} a_n(n+r)(n+r-1)\right) \\
&+\left(\sum_{n=2}^{\infty} 48 a_{n-2}(n+r-2) x^{n+r}\right)+\left(\sum_{n=1}^{\infty} 3 a_{n-1}(n+r-1) x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 4 x^{n+r} a_n(n+r)\right)+\left(\sum_{n=2}^{\infty} 36 a_{n-2} x^{n+r}\right)+\left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right)=0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
5 x^{n+r} a_n(n+r)(n+r-1)+4 x^{n+r} a_n(n+r)=0
$$

When $n=0$ the above becomes

$$
5 x^r a_0 r(-1+r)+4 x^r a_0 r=0
$$

Or

$$
\left(5 x^r r(-1+r)+4 x^r r\right) a_0=0
$$

Since $a_0 \neq 0$ then the above simplifies to

$$
x^r r(-1+5 r)=0
$$

Since the above is true for all x then the indicial equation becomes

$$
5 r^2-r=0
$$

Solving for r gives the roots of the indicial equation as

$$
\begin{aligned}
r_1 &= \frac{1}{5} \\
r_2 &= 0
\end{aligned}
$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$x^r r(-1+5r) = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{5}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{5}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^n$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n=0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n=1$ in Eq. (2B) gives

$$a_1 = \frac{-1-r}{5r+4}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} 10a_{n-2}(n+r-2)(n-3+r)+a_{n-1}(n+r-1)(n+r-2)+5a_n(n+r)(n+r-1) \\ +48a_{n-2}(n+r-2)+3a_{n-1}(n+r-1)+4a_n(n+r)+36a_{n-2}+a_{n-1}=0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{10na_{n-2}+na_{n-1}+10ra_{n-2}+ra_{n-1}-2a_{n-2}}{5n-1+5r} \tag{4}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_n = \frac{(-50a_{n-2}-5a_{n-1})\,n-a_{n-1}}{25n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{5}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{5r+4}$	$-\frac{6}{25}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-49r^2 - 127r - 70}{25r^2 + 65r + 36}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_2 = -\frac{1217}{625}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{5r+4}$	$-\frac{6}{25}$
a_2	$\frac{-49r^2-127r-70}{25r^2+65r+36}$	$-\frac{1217}{625}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{99r^3 + 554r^2 + 933r + 462}{125r^3 + 675r^2 + 1090r + 504}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_3 = \frac{41972}{46875}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{5r+4}$	$-\frac{6}{25}$
a_2	$\frac{-49r^2-127r-70}{25r^2+65r+36}$	$-\frac{1217}{625}$
a_3	$\frac{99r^3+554r^2+933r+462}{125r^3+675r^2+1090r+504}$	$\frac{41972}{46875}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{2351r^4 + 21570r^3 + 68329r^2 + 86470r + 35392}{625r^4 + 5750r^3 + 18275r^2 + 23230r + 9576}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_4 = \frac{1447799}{390625}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{5r+4}$	$-\frac{6}{25}$
a_2	$\frac{-49r^2-127r-70}{25r^2+65r+36}$	$-\frac{1217}{625}$
a_3	$\frac{99r^3+554r^2+933r+462}{125r^3+675r^2+1090r+504}$	$\frac{41972}{46875}$
a_4	$\frac{2351r^4+21570r^3+68329r^2+86470r+35392}{625r^4+5750r^3+18275r^2+23230r+9576}$	$\frac{1447799}{390625}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-7301r^5 - 103595r^4 - 551337r^3 - 1357653r^2 - 1517298r - 598304}{3125r^5 + 43750r^4 + 229375r^3 + 554750r^2 + 605400r + 229824}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_5 = -\frac{375253322}{146484375}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{5r+4}$	$-\frac{6}{25}$
a_2	$\frac{-49r^2-127r-70}{25r^2+65r+36}$	$-\frac{1217}{625}$
a_3	$\frac{99r^3+554r^2+933r+462}{125r^3+675r^2+1090r+504}$	$\frac{41972}{46875}$
a_4	$\frac{2351r^4+21570r^3+68329r^2+86470r+35392}{625r^4+5750r^3+18275r^2+23230r+9576}$	$\frac{1447799}{390625}$
a_5	$\frac{-7301r^5-103595r^4-551337r^3-1357653r^2-1517298r-598304}{3125r^5+43750r^4+229375r^3+554750r^2+605400r+229824}$	$-\frac{375253322}{146484375}$

Using the above table, then the solution $y_1(x)$ is

$$y_1(x) = x^{\frac{1}{5}} \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots \right)$$
$$= x^{\frac{1}{5}} \left(1 - \frac{6x}{25} - \frac{1217x^2}{625} + \frac{41972x^3}{46875} + \frac{1447799x^4}{390625} - \frac{375253322x^5}{146484375} + O(x^6)\right)$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = \frac{-1 - r}{5r + 4}$$

For $2 \leq n$ the recursive equation is

$$10b_{n-2}(n+r-2)(n-3+r) + b_{n-1}(n+r-1)(n+r-2) + 5b_n(n+r)(n+r-1) + 48b_{n-2}(n+r-2) + 3b_{n-1}(n+r-1) + 4b_n(n+r) + 36b_{n-2} + b_{n-1} = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{10nb_{n-2} + nb_{n-1} + 10rb_{n-2} + rb_{n-1} - 2b_{n-2}}{5n - 1 + 5r} \tag{4}$$

Which for the root $r = 0$ becomes

$$b_n = \frac{(-10b_{n-2} - b_{n-1})\,n + 2b_{n-2}}{5n - 1} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = 0$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{5r+4}$	$-\frac{1}{4}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{-49r^2 - 127r - 70}{25r^2 + 65r + 36}$$

Which for the root $r = 0$ becomes

$$b_2 = -\frac{35}{18}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{5r+4}$	$-\frac{1}{4}$
b_2	$\frac{-49r^2-127r-70}{25r^2+65r+36}$	$-\frac{35}{18}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{99r^3 + 554r^2 + 933r + 462}{125r^3 + 675r^2 + 1090r + 504}$$

Which for the root $r = 0$ becomes

$$b_3 = \frac{11}{12}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{5r+4}$	$-\frac{1}{4}$
b_2	$\frac{-49r^2-127r-70}{25r^2+65r+36}$	$-\frac{35}{18}$
b_3	$\frac{99r^3+554r^2+933r+462}{125r^3+675r^2+1090r+504}$	$\frac{11}{12}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{2351r^4 + 21570r^3 + 68329r^2 + 86470r + 35392}{625r^4 + 5750r^3 + 18275r^2 + 23230r + 9576}$$

Which for the root $r = 0$ becomes

$$b_4 = \frac{632}{171}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{5r+4}$	$-\frac{1}{4}$
b_2	$\frac{-49r^2-127r-70}{25r^2+65r+36}$	$-\frac{35}{18}$
b_3	$\frac{99r^3+554r^2+933r+462}{125r^3+675r^2+1090r+504}$	$\frac{11}{12}$
b_4	$\frac{2351r^4+21570r^3+68329r^2+86470r+35392}{625r^4+5750r^3+18275r^2+23230r+9576}$	$\frac{632}{171}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{-7301r^5 - 103595r^4 - 551337r^3 - 1357653r^2 - 1517298r - 598304}{3125r^5 + 43750r^4 + 229375r^3 + 554750r^2 + 605400r + 229824}$$

Which for the root $r = 0$ becomes

$$b_5 = -\frac{2671}{1026}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{5r+4}$	$-\frac{1}{4}$
b_2	$\frac{-49r^2-127r-70}{25r^2+65r+36}$	$-\frac{35}{18}$
b_3	$\frac{99r^3+554r^2+933r+462}{125r^3+675r^2+1090r+504}$	$\frac{11}{12}$
b_4	$\frac{2351r^4+21570r^3+68329r^2+86470r+35392}{625r^4+5750r^3+18275r^2+23230r+9576}$	$\frac{632}{171}$
b_5	$\frac{-7301r^5-103595r^4-551337r^3-1357653r^2-1517298r-598304}{3125r^5+43750r^4+229375r^3+554750r^2+605400r+229824}$	$-\frac{2671}{1026}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\ &= 1 - \frac{x}{4} - \frac{35x^2}{18} + \frac{11x^3}{12} + \frac{632x^4}{171} - \frac{2671x^5}{1026} + O(x^6) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{1}{5}} \left(1 - \frac{6x}{25} - \frac{1217x^2}{625} + \frac{41972x^3}{46875} + \frac{1447799x^4}{390625} - \frac{375253322x^5}{146484375} + O(x^6)\right) \\ &\quad + c_2 \left(1 - \frac{x}{4} - \frac{35x^2}{18} + \frac{11x^3}{12} + \frac{632x^4}{171} - \frac{2671x^5}{1026} + O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{1}{5}} \left(1 - \frac{6x}{25} - \frac{1217x^2}{625} + \frac{41972x^3}{46875} + \frac{1447799x^4}{390625} - \frac{375253322x^5}{146484375} + O(x^6)\right) \\ &\quad + c_2 \left(1 - \frac{x}{4} - \frac{35x^2}{18} + \frac{11x^3}{12} + \frac{632x^4}{171} - \frac{2671x^5}{1026} + O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{5}} \left(1 - \frac{6x}{25} - \frac{1217x^2}{625} + \frac{41972x^3}{46875} + \frac{1447799x^4}{390625} - \frac{375253322x^5}{146484375} + O(x^6)\right) + c_2 \left(1 - \frac{x}{4} - \frac{35x^2}{18} + \frac{11x^3}{12} + \frac{632x^4}{171} - \frac{2671x^5}{1026} + O(x^6)\right) \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{5}} \left(1 - \frac{6x}{25} - \frac{1217x^2}{625} + \frac{41972x^3}{46875} + \frac{1447799x^4}{390625} - \frac{375253322x^5}{146484375} + O(x^6)\right) + c_2 \left(1 - \frac{x}{4} - \frac{35x^2}{18} + \frac{11x^3}{12} + \frac{632x^4}{171} - \frac{2671x^5}{1026} + O(x^6)\right)$$

Verified OK.

14.9.1 Maple step by step solution

Let's solve

$x^2(10x^2 + x + 5)\, y'' + (48x^3 + 3x^2 + 4x)\, y' + (36x^2 + x)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(36x+1)y}{x(10x^2+x+5)} - \frac{(48x^2+3x+4)y'}{x(10x^2+x+5)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(48x^2+3x+4)y'}{x(10x^2+x+5)} + \frac{(36x+1)y}{x(10x^2+x+5)} = 0$

□ Check to see if x_0 is a regular singular point

- ○ Define functions

  $\left[P_2(x) = \frac{48x^2+3x+4}{x(10x^2+x+5)}, P_3(x) = \frac{36x+1}{x(10x^2+x+5)}\right]$

- ○ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\Big|_{x=0} = \frac{4}{5}$

- ○ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\Big|_{x=0} = 0$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $(36x+1)\, y + (48x^2+3x+4)\, y' + x(10x^2+x+5)\, y'' = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k- > k-m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 0..2$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$

- Shift index using $k- > k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 1..3$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k- > k+2-m$

  $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m} (k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0 r(-1+5r)\, x^{-1+r} + \left(a_1(1+r)\,(4+5r) + a_0(1+r)^2\right) x^r + \left(\sum_{k=1}^{\infty} \left(a_{k+1}(k+r+1)\,(5k+4+5r\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $r(-1+5r) = 0$

- Values of r that satisfy the indicial equation

$r \in \left\{0, \frac{1}{5}\right\}$

- Each term must be 0

$$a_1(1+r)(4+5r)+a_0(1+r)^2=0$$

- Each term in the series must be 0, giving the recursion relation

$$\left(\left(a_k+10a_{k-1}+5a_{k+1}\right)k+\left(a_k+10a_{k-1}+5a_{k+1}\right)r+a_k+8a_{k-1}+4a_{k+1}\right)(k+r+1)=0$$

- Shift index using $k->k+1$

$$\left(\left(a_{k+1}+10a_k+5a_{k+2}\right)(k+1)+\left(a_{k+1}+10a_k+5a_{k+2}\right)r+a_{k+1}+8a_k+4a_{k+2}\right)(k+r+2)=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{10ka_k+ka_{k+1}+10ra_k+ra_{k+1}+18a_k+2a_{k+1}}{5k+5r+9}$$

- Recursion relation for $r=0$

$$a_{k+2}=-\frac{10ka_k+ka_{k+1}+18a_k+2a_{k+1}}{5k+9}$$

- Solution for $r=0$

$$\left[y=\sum_{k=0}^{\infty} a_k x^k, a_{k+2}=-\frac{10ka_k+ka_{k+1}+18a_k+2a_{k+1}}{5k+9}, 4a_1+a_0=0\right]$$

- Recursion relation for $r=\frac{1}{5}$

$$a_{k+2}=-\frac{10ka_k+ka_{k+1}+20a_k+\frac{11}{5}a_{k+1}}{5k+10}$$

- Solution for $r=\frac{1}{5}$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k+\frac{1}{5}}, a_{k+2}=-\frac{10ka_k+ka_{k+1}+20a_k+\frac{11}{5}a_{k+1}}{5k+10}, 6a_1+\frac{36a_0}{25}=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k x^k\right)+\left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{5}}\right), a_{k+2}=-\frac{10ka_k+ka_{1+k}+18a_k+2a_{1+k}}{5k+9}, 4a_1+a_0=0, b_{k+2}=-\frac{10kb_k+}{}\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 7.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{8x^2y'' - 2x\left(-x^2 - 4x + 3\right)y' + \left(x^2 + 6x + 3\right)y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$8x^2y'' + \left(2x^3 + 8x^2 - 6x\right)y' + \left(x^2 + 6x + 3\right)y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{x^2 + 4x - 3}{4x}$$
$$q(x) = \frac{x^2 + 6x + 3}{8x^2}$$

Table 548: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x^2+4x-3}{4x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{x^2+6x+3}{8x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$8x^2y'' + (2x^3 + 8x^2 - 6x)\, y' + (x^2 + 6x + 3)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$8x^2 \left(\sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2} \right) + (2x^3 + 8x^2 - 6x) \left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1} \right) + (x^2 + 6x + 3) \left(\sum_{n=0}^{\infty} a_n x^{n+r} \right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}
&\left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} 8x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-6x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 6x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} 3a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\begin{aligned}
\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r) &= \sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 8x^{1+n+r} a_n (n+r) &= \sum_{n=1}^{\infty} 8a_{n-1}(n+r-1)\, x^{n+r} \\
\sum_{n=0}^{\infty} x^{n+r+2} a_n &= \sum_{n=2}^{\infty} a_{n-2} x^{n+r} \\
\sum_{n=0}^{\infty} 6x^{1+n+r} a_n &= \sum_{n=1}^{\infty} 6a_{n-1} x^{n+r}
\end{aligned}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\begin{aligned}
&\left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r}\right) \\
&+ \left(\sum_{n=1}^{\infty} 8a_{n-1}(n+r-1)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-6x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=2}^{\infty} a_{n-2} x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 6a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3a_n x^{n+r}\right) = 0
\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$8x^{n+r}a_n(n+r)(n+r-1) - 6x^{n+r}a_n(n+r) + 3a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$8x^r a_0 r(-1+r) - 6x^r a_0 r + 3a_0 x^r = 0$$

Or

$$(8x^r r(-1+r) - 6x^r r + 3x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(8r^2 - 14r + 3\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$8r^2 - 14r + 3 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{3}{2}$$
$$r_2 = \frac{1}{4}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(8r^2 - 14r + 3\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{5}{4}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{3}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{4}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -\frac{2}{2r - 1}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &8a_n(n+r)(n+r-1) + 2a_{n-2}(n+r-2) \\ &+ 8a_{n-1}(n+r-1) - 6a_n(n+r) + a_{n-2} + 6a_{n-1} + 3a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{2na_{n-2} + 8na_{n-1} + 2ra_{n-2} + 8ra_{n-1} - 3a_{n-2} - 2a_{n-1}}{8n^2 + 16nr + 8r^2 - 14n - 14r + 3} \tag{4}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_n = \frac{(-a_{n-2} - 4a_{n-1})\, n - 5a_{n-1}}{4n^2 + 5n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{3}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{2r-1}$	-1

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-4r^2 + 16r + 29}{16r^3 + 28r^2 - 4r - 7}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_2 = \frac{11}{26}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{2r-1}$	-1
a_2	$\frac{-4r^2+16r+29}{16r^3+28r^2-4r-7}$	$\frac{11}{26}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{64r^3 + 80r^2 - 448r - 596}{128r^5 + 768r^4 + 1448r^3 + 732r^2 - 370r - 231}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_3 = -\frac{109}{1326}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{2r-1}$	-1
a_2	$\frac{-4r^2+16r+29}{16r^3+28r^2-4r-7}$	$\frac{11}{26}$
a_3	$\frac{64r^3+80r^2-448r-596}{128r^5+768r^4+1448r^3+732r^2-370r-231}$	$-\frac{109}{1326}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{64r^5 - 336r^4 - 3808r^3 - 5064r^2 + 8724r + 13095}{(128r^5 + 768r^4 + 1448r^3 + 732r^2 - 370r - 231)(8r^2 + 50r + 75)}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_4 = \frac{5}{12376}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{2r-1}$	-1
a_2	$\frac{-4r^2+16r+29}{16r^3+28r^2-4r-7}$	$\frac{11}{26}$
a_3	$\frac{64r^3+80r^2-448r-596}{128r^5+768r^4+1448r^3+732r^2-370r-231}$	$-\frac{109}{1326}$
a_4	$\frac{64r^5-336r^4-3808r^3-5064r^2+8724r+13095}{(128r^5+768r^4+1448r^3+732r^2-370r-231)(8r^2+50r+75)}$	$\frac{5}{12376}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-1536r^6 - 11008r^5 + 5920r^4 + 191040r^3 + 397616r^2 + 96928r - 184710}{(128r^5 + 768r^4 + 1448r^3 + 732r^2 - 370r - 231)(8r^2 + 50r + 75)(8r^2 + 66r + 133)}$$

Which for the root $r = \frac{3}{2}$ becomes

$$a_5 = \frac{229}{71400}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{2}{2r-1}$	-1
a_2	$\frac{-4r^2+16r+29}{16r^3+28r^2-4r-7}$	$\frac{11}{26}$
a_3	$\frac{64r^3+80r^2-448r-596}{128r^5+768r^4+1448r^3+732r^2-370r-231}$	$-\frac{109}{1326}$
a_4	$\frac{64r^5-336r^4-3808r^3-5064r^2+8724r+13095}{(128r^5+768r^4+1448r^3+732r^2-370r-231)(8r^2+50r+75)}$	$\frac{5}{12376}$
a_5	$\frac{-1536r^6-11008r^5+5920r^4+191040r^3+397616r^2+96928r-184710}{(128r^5+768r^4+1448r^3+732r^2-370r-231)(8r^2+50r+75)(8r^2+66r+133)}$	$\frac{229}{71400}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{3}{2}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{3}{2}}\left(1 - x + \frac{11x^2}{26} - \frac{109x^3}{1326} + \frac{5x^4}{12376} + \frac{229x^5}{71400} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = -\frac{2}{2r-1}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &8b_n(n+r)(n+r-1) + 2b_{n-2}(n+r-2) \\ &+ 8b_{n-1}(n+r-1) - 6b_n(n+r) + b_{n-2} + 6b_{n-1} + 3b_n = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{2nb_{n-2} + 8nb_{n-1} + 2rb_{n-2} + 8rb_{n-1} - 3b_{n-2} - 2b_{n-1}}{8n^2 + 16nr + 8r^2 - 14n - 14r + 3} \tag{4}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_n = \frac{(-4b_{n-2} - 16b_{n-1})\, n + 5b_{n-2}}{16n^2 - 20n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{2r-1}$	4

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{-4r^2 + 16r + 29}{16r^3 + 28r^2 - 4r - 7}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_2 = -\frac{131}{24}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{2r-1}$	4
b_2	$\frac{-4r^2+16r+29}{16r^3+28r^2-4r-7}$	$-\frac{131}{24}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{64r^3 + 80r^2 - 448r - 596}{128r^5 + 768r^4 + 1448r^3 + 732r^2 - 370r - 231}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_3 = \frac{39}{14}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{2r-1}$	4
b_2	$\frac{-4r^2+16r+29}{16r^3+28r^2-4r-7}$	$-\frac{131}{24}$
b_3	$\frac{64r^3+80r^2-448r-596}{128r^5+768r^4+1448r^3+732r^2-370r-231}$	$\frac{39}{14}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{64r^5 - 336r^4 - 3808r^3 - 5064r^2 + 8724r + 13095}{(128r^5 + 768r^4 + 1448r^3 + 732r^2 - 370r - 231)(8r^2 + 50r + 75)}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_4 = -\frac{19865}{29568}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{2r-1}$	4
b_2	$\frac{-4r^2+16r+29}{16r^3+28r^2-4r-7}$	$-\frac{131}{24}$
b_3	$\frac{64r^3+80r^2-448r-596}{128r^5+768r^4+1448r^3+732r^2-370r-231}$	$\frac{39}{14}$
b_4	$\frac{64r^5-336r^4-3808r^3-5064r^2+8724r+13095}{(128r^5+768r^4+1448r^3+732r^2-370r-231)(8r^2+50r+75)}$	$-\frac{19865}{29568}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{-1536r^6 - 11008r^5 + 5920r^4 + 191040r^3 + 397616r^2 + 96928r - 184710}{(128r^5 + 768r^4 + 1448r^3 + 732r^2 - 370r - 231)(8r^2 + 50r + 75)(8r^2 + 66r + 133)}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_5 = \frac{4421}{110880}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{2}{2r-1}$	4
b_2	$\frac{-4r^2+16r+29}{16r^3+28r^2-4r-7}$	$-\frac{131}{24}$
b_3	$\frac{64r^3+80r^2-448r-596}{128r^5+768r^4+1448r^3+732r^2-370r-231}$	$\frac{39}{14}$
b_4	$\frac{64r^5-336r^4-3808r^3-5064r^2+8724r+13095}{(128r^5+768r^4+1448r^3+732r^2-370r-231)(8r^2+50r+75)}$	$-\frac{19865}{29568}$
b_5	$\frac{-1536r^6-11008r^5+5920r^4+191040r^3+397616r^2+96928r-184710}{(128r^5+768r^4+1448r^3+732r^2-370r-231)(8r^2+50r+75)(8r^2+66r+133)}$	$\frac{4421}{110880}$

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= x^{\frac{3}{2}}\left(b_0+b_1x+b_2x^2+b_3x^3+b_4x^4+b_5x^5+b_6x^6\dots\right) \\
&= x^{\frac{1}{4}}\left(1+4x-\frac{131x^2}{24}+\frac{39x^3}{14}-\frac{19865x^4}{29568}+\frac{4421x^5}{110880}+O(x^6)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1y_1(x)+c_2y_2(x) \\
&= c_1x^{\frac{3}{2}}\left(1-x+\frac{11x^2}{26}-\frac{109x^3}{1326}+\frac{5x^4}{12376}+\frac{229x^5}{71400}+O(x^6)\right) \\
&\quad + c_2x^{\frac{1}{4}}\left(1+4x-\frac{131x^2}{24}+\frac{39x^3}{14}-\frac{19865x^4}{29568}+\frac{4421x^5}{110880}+O(x^6)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1x^{\frac{3}{2}}\left(1-x+\frac{11x^2}{26}-\frac{109x^3}{1326}+\frac{5x^4}{12376}+\frac{229x^5}{71400}+O(x^6)\right) \\
&\quad + c_2x^{\frac{1}{4}}\left(1+4x-\frac{131x^2}{24}+\frac{39x^3}{14}-\frac{19865x^4}{29568}+\frac{4421x^5}{110880}+O(x^6)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1x^{\frac{3}{2}}\left(1-x+\frac{11x^2}{26}-\frac{109x^3}{1326}+\frac{5x^4}{12376}+\frac{229x^5}{71400}+O(x^6)\right) \\
&\quad + c_2x^{\frac{1}{4}}\left(1+4x-\frac{131x^2}{24}+\frac{39x^3}{14}-\frac{19865x^4}{29568}+\frac{4421x^5}{110880}+O(x^6)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1x^{\frac{3}{2}}\left(1-x+\frac{11x^2}{26}-\frac{109x^3}{1326}+\frac{5x^4}{12376}+\frac{229x^5}{71400}+O(x^6)\right) \\
&\quad + c_2x^{\frac{1}{4}}\left(1+4x-\frac{131x^2}{24}+\frac{39x^3}{14}-\frac{19865x^4}{29568}+\frac{4421x^5}{110880}+O(x^6)\right)
\end{aligned}
$$

Verified OK.

14.10.1 Maple step by step solution

Let's solve

$8x^2y'' + (2x^3 + 8x^2 - 6x)\, y' + (x^2 + 6x + 3)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(x^2+6x+3)y}{8x^2} - \frac{(x^2+4x-3)y'}{4x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x^2+4x-3)y'}{4x} + \frac{(x^2+6x+3)y}{8x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{x^2+4x-3}{4x}, P_3(x) = \frac{x^2+6x+3}{8x^2}\right]$

  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $(x \cdot P_2(x))\Big|_{x=0} = -\frac{3}{4}$

  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $(x^2 \cdot P_3(x))\Big|_{x=0} = \frac{3}{8}$

  - $x = 0$is a regular singular point

    Check to see if $x_0 = 0$ is a regular singular point

    $x_0 = 0$

- Multiply by denominators

  $8x^2y'' + 2x(x^2 + 4x - 3)\, y' + (x^2 + 6x + 3)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m}x^{k+r}$
- Convert $x^{m}\cdot y'$ to series expansion for $m=1..3$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\, x^{k+r-1+m}$
- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$
- Convert $x^{2}\cdot y''$ to series expansion

  $x^{2}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}(-1+4r)\,(-3+2r)\, x^{r}+\left(a_{1}(3+4r)\,(-1+2r)+2a_{0}(3+4r)\right) x^{1+r}+\left(\sum_{k=2}^{\infty} \left(a_{k}(4k+4r-1)\,(\right.\right.$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $(-1+4r)\,(-3+2r)=0$
- Values of r that satisfy the indicial equation

  $r\in\left\{\frac{1}{4}, \frac{3}{2}\right\}$
- Each term must be 0

  $a_{1}(3+4r)\,(-1+2r)+2a_{0}(3+4r)=0$
- Solve for the dependent coefficient(s)

  $a_{1}=-\frac{2a_{0}}{-1+2r}$
- Each term in the series must be 0, giving the recursion relation

  $8\left(k+r-\frac{1}{4}\right)\left(k+r-\frac{3}{2}\right) a_{k}+\left(2a_{k-2}+8a_{k-1}\right) k+\left(2a_{k-2}+8a_{k-1}\right) r-3a_{k-2}-2a_{k-1}=0$
- Shift index using $k->k+2$

  $8\left(k+\frac{7}{4}+r\right)\left(k+\frac{1}{2}+r\right) a_{k+2}+\left(2a_{k}+8a_{k+1}\right)(k+2)+\left(2a_{k}+8a_{k+1}\right) r-3a_{k}-2a_{k+1}=0$
- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{2ka_{k}+8ka_{k+1}+2ra_{k}+8ra_{k+1}+a_{k}+14a_{k+1}}{(4k+7+4r)(2k+2r+1)}$
- Recursion relation for $r=\frac{1}{4}$

  $a_{k+2}=-\frac{2ka_{k}+8ka_{k+1}+\frac{3}{2}a_{k}+16a_{k+1}}{(4k+8)\left(2k+\frac{3}{2}\right)}$

- Solution for $r = \frac{1}{4}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{4}}, a_{k+2} = -\frac{2k a_k + 8k a_{k+1} + \frac{3}{2} a_k + 16 a_{k+1}}{(4k+8)\left(2k+\frac{3}{2}\right)}, a_1 = 4a_0\right]$$

- Recursion relation for $r = \frac{3}{2}$

$$a_{k+2} = -\frac{2k a_k + 8k a_{k+1} + 4a_k + 26 a_{k+1}}{(4k+13)(2k+4)}$$

- Solution for $r = \frac{3}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{3}{2}}, a_{k+2} = -\frac{2k a_k + 8k a_{k+1} + 4a_k + 26 a_{k+1}}{(4k+13)(2k+4)}, a_1 = -a_0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k+\frac{1}{4}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{3}{2}}\right), a_{k+2} = -\frac{2k a_k + 8k a_{1+k} + \frac{3}{2} a_k + 16 a_{1+k}}{(4k+8)\left(2k+\frac{3}{2}\right)}, a_1 = 4a_0, b_{k+2} = -\frac{2k b_k + 8k \cdots}{(4k \cdots}$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 8.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{18x^2(x+1)\,y''+3x\left(x^2+11x+5\right)y'-\left(-5x^2-2x+1\right)y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(18x^3+18x^2\right)y''+\left(3x^3+33x^2+15x\right)y'+\left(5x^2+2x-1\right)y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{x^2+11x+5}{6x\,(x+1)}$$
$$q(x)=\frac{5x^2+2x-1}{18x^2\,(x+1)}$$

Table 550: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x^2+11x+5}{6x(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

$q(x) = \frac{5x^2+2x-1}{18x^2(x+1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$18x^2(x+1)\,y'' + \left(3x^3 + 33x^2 + 15x\right) y' + \left(5x^2 + 2x - 1\right) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$18x^2(x+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(3x^3+33x^2+15x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(5x^2+2x-1\right)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 18x^{1+n+r} a_n (n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} 18x^{n+r} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 33x^{1+n+r} a_n (n+r)\right)+\left(\sum_{n=0}^{\infty} 15x^{n+r} a_n (n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 5x^{n+r+2} a_n\right)+\left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n\right)+\sum_{n=0}^{\infty}\left(-a_n x^{n+r}\right)=0
\end{aligned}
\tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty} 18x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 18a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)\, x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 33x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 33a_{n-1}(n+r-1)\, x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 5x^{n+r+2} a_n = \sum_{n=2}^{\infty} 5a_{n-2} x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 2x^{1+n+r} a_n = \sum_{n=1}^{\infty} 2a_{n-1} x^{n+r}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 18 a_{n-1} (n+r-1) (n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 18 x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=2}^{\infty} 3 a_{n-2} (n+r-2) x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 33 a_{n-1} (n+r-1) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 15 x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 5 a_{n-2} x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 2 a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$18 x^{n+r} a_n (n+r) (n+r-1) + 15 x^{n+r} a_n (n+r) - a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$18 x^r a_0 r(-1+r) + 15 x^r a_0 r - a_0 x^r = 0$$

Or

$$\left(18 x^r r(-1+r) + 15 x^r r - x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(18 r^2 - 3r - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$18 r^2 - 3r - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = -\frac{1}{6}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(18 r^2 - 3r - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{2}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{6}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = \frac{-1-6r}{6r+7}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} 18a_{n-1}(n+r-1)(n+r-2) + 18a_n(n+r)(n+r-1) + 3a_{n-2}(n+r-2) \\ + 33a_{n-1}(n+r-1) + 15a_n(n+r) + 5a_{n-2} + 2a_{n-1} - a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{6na_{n-1} + 6ra_{n-1} + a_{n-2} - 5a_{n-1}}{6n + 6r + 1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = \frac{(-6n+3)\,a_{n-1} - a_{n-2}}{6n+3} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-6r}{6r+7}$	$-\frac{1}{3}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{6r}{13 + 6r}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = \frac{2}{15}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-6r}{6r+7}$	$-\frac{1}{3}$
a_2	$\frac{6r}{13+6r}$	$\frac{2}{15}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-36r^2 - 36r + 1}{(19 + 6r)(6r + 7)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = -\frac{5}{63}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-6r}{6r+7}$	$-\frac{1}{3}$
a_2	$\frac{6r}{13+6r}$	$\frac{2}{15}$
a_3	$\frac{-36r^2-36r+1}{(19+6r)(6r+7)}$	$-\frac{5}{63}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{216r^3 + 648r^2 + 420r - 13}{(6r + 7)(13 + 6r)(25 + 6r)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{23}{405}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-6r}{6r+7}$	$-\frac{1}{3}$
a_2	$\frac{6r}{13+6r}$	$\frac{2}{15}$
a_3	$\frac{-36r^2-36r+1}{(19+6r)(6r+7)}$	$-\frac{5}{63}$
a_4	$\frac{216r^3+648r^2+420r-13}{(6r+7)(13+6r)(25+6r)}$	$\frac{23}{405}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-1296r^4 - 7776r^3 - 14148r^2 - 7440r + 234}{(6r + 7)(13 + 6r)(19 + 6r)(31 + 6r)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_5 = -\frac{458}{10395}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-6r}{6r+7}$	$-\frac{1}{3}$
a_2	$\frac{6r}{13+6r}$	$\frac{2}{15}$
a_3	$\frac{-36r^2-36r+1}{(19+6r)(6r+7)}$	$-\frac{5}{63}$
a_4	$\frac{216r^3+648r^2+420r-13}{(6r+7)(13+6r)(25+6r)}$	$\frac{23}{405}$
a_5	$\frac{-1296r^4-7776r^3-14148r^2-7440r+234}{(6r+7)(13+6r)(19+6r)(31+6r)}$	$-\frac{458}{10395}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(1 - \frac{x}{3} + \frac{2x^2}{15} - \frac{5x^3}{63} + \frac{23x^4}{405} - \frac{458x^5}{10395} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = \frac{-1 - 6r}{6r + 7}$$

For $2 \leq n$ the recursive equation is

$$18b_{n-1}(n + r - 1)(n + r - 2) + 18b_n(n + r)(n + r - 1) + 3b_{n-2}(n + r - 2) + 33b_{n-1}(n + r - 1) + 15b_n(n + r) + 5b_{n-2} + 2b_{n-1} - b_n = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{6nb_{n-1} + 6rb_{n-1} + b_{n-2} - 5b_{n-1}}{6n + 6r + 1} \tag{4}$$

Which for the root $r = -\frac{1}{6}$ becomes

$$b_n = \frac{(-6n + 6)\, b_{n-1} - b_{n-2}}{6n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{6}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-6r}{6r+7}$	0

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{6r}{13 + 6r}$$

Which for the root $r = -\frac{1}{6}$ becomes

$$b_2 = -\frac{1}{12}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-6r}{6r+7}$	0
b_2	$\frac{6r}{13+6r}$	$-\frac{1}{12}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{-36r^2 - 36r + 1}{(19 + 6r)(6r + 7)}$$

Which for the root $r = -\frac{1}{6}$ becomes

$$b_3 = \frac{1}{18}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-6r}{6r+7}$	0
b_2	$\frac{6r}{13+6r}$	$-\frac{1}{12}$
b_3	$\frac{-36r^2-36r+1}{(19+6r)(6r+7)}$	$\frac{1}{18}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{216r^3 + 648r^2 + 420r - 13}{(6r + 7)(13 + 6r)(25 + 6r)}$$

Which for the root $r = -\frac{1}{6}$ becomes

$$b_4 = -\frac{11}{288}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-6r}{6r+7}$	0
b_2	$\frac{6r}{13+6r}$	$-\frac{1}{12}$
b_3	$\frac{-36r^2-36r+1}{(19+6r)(6r+7)}$	$\frac{1}{18}$
b_4	$\frac{216r^3+648r^2+420r-13}{(6r+7)(13+6r)(25+6r)}$	$-\frac{11}{288}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{-1296r^4 - 7776r^3 - 14148r^2 - 7440r + 234}{(6r + 7)(13 + 6r)(19 + 6r)(31 + 6r)}$$

Which for the root $r = -\frac{1}{6}$ becomes

$$b_5 = \frac{31}{1080}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-6r}{6r+7}$	0
b_2	$\frac{6r}{13+6r}$	$-\frac{1}{12}$
b_3	$\frac{-36r^2-36r+1}{(19+6r)(6r+7)}$	$\frac{1}{18}$
b_4	$\frac{216r^3+648r^2+420r-13}{(6r+7)(13+6r)(25+6r)}$	$-\frac{11}{288}$
b_5	$\frac{-1296r^4-7776r^3-14148r^2-7440r+234}{(6r+7)(13+6r)(19+6r)(31+6r)}$	$\frac{31}{1080}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{1}{3}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 - \frac{x^2}{12} + \frac{x^3}{18} - \frac{11x^4}{288} + \frac{31x^5}{1080} + O(x^6)}{x^{\frac{1}{6}}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{1}{3}}\left(1 - \frac{x}{3} + \frac{2x^2}{15} - \frac{5x^3}{63} + \frac{23x^4}{405} - \frac{458x^5}{10395} + O(x^6)\right) \\ &+ \frac{c_2\left(1 - \frac{x^2}{12} + \frac{x^3}{18} - \frac{11x^4}{288} + \frac{31x^5}{1080} + O(x^6)\right)}{x^{\frac{1}{6}}} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{1}{3}}\left(1 - \frac{x}{3} + \frac{2x^2}{15} - \frac{5x^3}{63} + \frac{23x^4}{405} - \frac{458x^5}{10395} + O(x^6)\right) \\ &+ \frac{c_2\left(1 - \frac{x^2}{12} + \frac{x^3}{18} - \frac{11x^4}{288} + \frac{31x^5}{1080} + O(x^6)\right)}{x^{\frac{1}{6}}} \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{3}} \left(1 - \frac{x}{3} + \frac{2x^2}{15} - \frac{5x^3}{63} + \frac{23x^4}{405} - \frac{458x^5}{10395} + O(x^6)\right) + \frac{c_2 \left(1 - \frac{x^2}{12} + \frac{x^3}{18} - \frac{11x^4}{288} + \frac{31x^5}{1080} + O(x^6)\right)}{x^{\frac{1}{6}}} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{3}} \left(1 - \frac{x}{3} + \frac{2x^2}{15} - \frac{5x^3}{63} + \frac{23x^4}{405} - \frac{458x^5}{10395} + O(x^6)\right) + \frac{c_2 \left(1 - \frac{x^2}{12} + \frac{x^3}{18} - \frac{11x^4}{288} + \frac{31x^5}{1080} + O(x^6)\right)}{x^{\frac{1}{6}}}$$

Verified OK.

14.11.1 Maple step by step solution

Let's solve

$18x^2(x+1)\, y'' + (3x^3 + 33x^2 + 15x)\, y' + (5x^2 + 2x - 1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(5x^2+2x-1)y}{18x^2(x+1)} - \frac{(x^2+11x+5)y'}{6x(x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x^2+11x+5)y'}{6x(x+1)} + \frac{(5x^2+2x-1)y}{18x^2(x+1)} = 0$

□ Check to see if x_0 is a regular singular point

- ○ Define functions

  $\left[P_2(x) = \frac{x^2+11x+5}{6x(x+1)}, P_3(x) = \frac{5x^2+2x-1}{18x^2(x+1)}\right]$

- ○ $(x+1) \cdot P_2(x)$ is analytic at $x = -1$

  $\left((x+1) \cdot P_2(x)\right)\Big|_{x=-1} = \frac{5}{6}$

- ○ $(x+1)^2 \cdot P_3(x)$ is analytic at $x = -1$

$$\left((x+1)^2 \cdot P_3(x)\right)\bigg|_{x=-1} = 0$$

- $x = -1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = -1$

- Multiply by denominators

  $18x^2(x+1)\, y'' + 3x(x^2+11x+5)\, y' + (5x^2+2x-1)\, y = 0$

- Change variables using $x = u-1$ so that the regular singular point is at $u = 0$

  $(18u^3-36u^2+18u)\left(\frac{d^2}{du^2}y(u)\right) + (3u^3+24u^2-42u+15)\left(\frac{d}{du}y(u)\right) + (5u^2-8u+2)\, y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..2$

  $u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$

- Shift index using $k- >k-m$

  $u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..3$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$

- Shift index using $k- >k+1-m$

  $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$

- Shift index using $k- >k+2-m$

  $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$

  Rewrite ODE with series expansions

$$3a_0r(-1+6r)\,u^{-1+r}+(3a_1(1+r)\,(5+6r)-2a_0(1+3r)\,(-1+6r))\,u^r+(3a_2(2+r)\,(11+6r)$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$3r(-1+6r)=0$$

- Values of r that satisfy the indicial equation

  $$r\in\left\{0,\frac{1}{6}\right\}$$

- The coefficients of each power of u must be 0

  $$[3a_1(1+r)\,(5+6r)-2a_0(1+3r)\,(-1+6r)=0,3a_2(2+r)\,(11+6r)-2a_1(4+3r)\,(5+6r)+$$

- Solve for the dependent coefficient(s)

  $$\left\{a_1=\frac{2a_0(18r^2+3r-1)}{3(6r^2+11r+5)},a_2=\frac{2a_0(81r^3+126r^2+21r+4)}{9(6r^3+29r^2+45r+22)}\right\}$$

- Each term in the series must be 0, giving the recursion relation

  $$18(-2a_k+a_{k-1}+a_{k+1})\,k^2+3(12(-2a_k+a_{k-1}+a_{k+1})\,r-2a_k+a_{k-2}-10a_{k-1}+11a_{k+1})\,k+$$

- Shift index using $k->k+2$

  $$18(-2a_{k+2}+a_{k+1}+a_{k+3})\,(k+2)^2+3(12(-2a_{k+2}+a_{k+1}+a_{k+3})\,r-2a_{k+2}+a_k-10a_{k+1}+11$$

- Recursion relation that defines series solution to ODE

  $$a_{k+3}=-\frac{18k^2a_{k+1}-36k^2a_{k+2}+36kra_{k+1}-72kra_{k+2}+18r^2a_{k+1}-36r^2a_{k+2}+3ka_k+42ka_{k+1}-150ka_{k+2}+3ra_k+42ra_{k+1}-150}{3(6k^2+12kr+6r^2+35k+35r+51)}$$

- Recursion relation for $r=0$

  $$a_{k+3}=-\frac{18k^2a_{k+1}-36k^2a_{k+2}+3ka_k+42ka_{k+1}-150ka_{k+2}+5a_k+16a_{k+1}-154a_{k+2}}{3(6k^2+35k+51)}$$

- Solution for $r=0$

  $$\left[y(u)=\sum_{k=0}^{\infty}a_ku^k,a_{k+3}=-\frac{18k^2a_{k+1}-36k^2a_{k+2}+3ka_k+42ka_{k+1}-150ka_{k+2}+5a_k+16a_{k+1}-154a_{k+2}}{3(6k^2+35k+51)},a_1=-\frac{2a_0}{15},a\right.$$

- Revert the change of variables $u=x+1$

  $$\left[y=\sum_{k=0}^{\infty}a_k(x+1)^k,a_{k+3}=-\frac{18k^2a_{k+1}-36k^2a_{k+2}+3ka_k+42ka_{k+1}-150ka_{k+2}+5a_k+16a_{k+1}-154a_{k+2}}{3(6k^2+35k+51)},a_1=-\frac{2a_0}{15}\right.$$

- Recursion relation for $r=\frac{1}{6}$

  $$a_{k+3}=-\frac{18k^2a_{k+1}-36k^2a_{k+2}+3ka_k+48ka_{k+1}-162ka_{k+2}+\frac{11}{2}a_k+\frac{47}{2}a_{k+1}-180a_{k+2}}{3(6k^2+37k+57)}$$

- Solution for $r=\frac{1}{6}$

  $$\left[y(u)=\sum_{k=0}^{\infty}a_ku^{k+\frac{1}{6}},a_{k+3}=-\frac{18k^2a_{k+1}-36k^2a_{k+2}+3ka_k+48ka_{k+1}-162ka_{k+2}+\frac{11}{2}a_k+\frac{47}{2}a_{k+1}-180a_{k+2}}{3(6k^2+37k+57)},a_1=0,a\right.$$

- Revert the change of variables $u=x+1$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+1)^{k+\frac{1}{6}}, a_{k+3} = -\frac{18k^2 a_{k+1} - 36k^2 a_{k+2} + 3k a_k + 48k a_{k+1} - 162k a_{k+2} + \frac{11}{2} a_k + \frac{47}{2} a_{k+1} - 180 a_{k+2}}{3(6k^2+37k+57)}, a_1 = \right.$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k (x+1)^k\right) + \left(\sum_{k=0}^{\infty} b_k (x+1)^{k+\frac{1}{6}}\right), a_{k+3} = -\frac{18k^2 a_{1+k} - 36k^2 a_{k+2} + 3k a_k + 42k a_{1+k} - 150k a_{k+2} + 5a}{3(6k^2+35k+51)}\right.$$

Problem number: 9.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x\left(x^2+x+3\right) y''+\left(-x^2+x+4\right) y'+yx=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^3+x^2+3x\right) y''+\left(-x^2+x+4\right) y'+yx=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{x^2-x-4}{x\left(x^2+x+3\right)}$$
$$q(x)=\frac{1}{x^2+x+3}$$

Table 552: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{x^2-x-4}{x(x^2+x+3)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{11}}{2} - \frac{1}{2}$	"regular"
$x = \frac{i\sqrt{11}}{2} - \frac{1}{2}$	"regular"

$q(x) = \frac{1}{x^2+x+3}$	
singularity	type
$x = -\frac{i\sqrt{11}}{2} - \frac{1}{2}$	"regular"
$x = \frac{i\sqrt{11}}{2} - \frac{1}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{i\sqrt{11}}{2} - \frac{1}{2}, \frac{i\sqrt{11}}{2} - \frac{1}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x\left(x^2 + x + 3\right) y'' + \left(-x^2 + x + 4\right) y' + yx = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x\left(x^2 + x + 3\right) \left(\sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}\right) + \left(-x^2 + x + 4\right) \left(\sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) x = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r-1} a_n (n+r)(n+r-1)\right)+\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n (n+r)\right)+\left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4(n+r) a_n x^{n+r-1}\right)+\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r-1} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r-1}$$

$$\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2) x^{n+r-1}$$

$$\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n (n+r)\right) = \sum_{n=2}^{\infty} \left(-a_{n-2}(n+r-2) x^{n+r-1}\right)$$

$$\sum_{n=0}^{\infty} x^{n+r} a_n (n+r) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1) x^{n+r-1}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=2}^{\infty} a_{n-2} x^{n+r-1}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r-1$.

$$\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)\,(n-3+r)\,x^{n+r-1}\right) + \left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\,(n+r-2)\,x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r-1}a_n(n+r)\,(n+r-1)\right) + \sum_{n=2}^{\infty}\left(-a_{n-2}(n+r-2)\,x^{n+r-1}\right) + \left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\,x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} 4(n+r)\,a_n x^{n+r-1}\right) + \left(\sum_{n=2}^{\infty} a_{n-2}x^{n+r-1}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$3x^{n+r-1}a_n(n+r)\,(n+r-1) + 4(n+r)\,a_n x^{n+r-1} = 0$$

When $n=0$ the above becomes

$$3x^{-1+r}a_0 r(-1+r) + 4ra_0x^{-1+r} = 0$$

Or

$$\left(3x^{-1+r}r(-1+r) + 4r\,x^{-1+r}\right)a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(3r^2+r\right)x^{-1+r} = 0$$

Since the above is true for all x then the indicial equation becomes

$$3r^2+r = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 0$$
$$r_2 = -\frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(3r^2+r\right)x^{-1+r} = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^n$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{3}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = -\frac{r^2}{3r^2 + 7r + 4}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-2}(n+r-2)(n-3+r) + a_{n-1}(n+r-1)(n+r-2) + 3a_n(n+r)(n+r-1) \\ - a_{n-2}(n+r-2) + a_{n-1}(n+r-1) + 4a_n(n+r) + a_{n-2} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{n^2 a_{n-2} + n^2 a_{n-1} + 2nr a_{n-2} + 2nr a_{n-1} + r^2 a_{n-2} + r^2 a_{n-1} - 6n a_{n-2} - 2n a_{n-1} - 6r a_{n-2} - 2r a_{n-1}}{3n^2 + 6nr + 3r^2 + n + r} \tag{4}$$

Which for the root $r = 0$ becomes

$$a_n = \frac{(-a_{n-2} - a_{n-1})\, n^2 + (6a_{n-2} + 2a_{n-1})\, n - 9a_{n-2} - a_{n-1}}{3n^2 + n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 0$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{r^2}{3r^2+7r+4}$	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-2r^3 + 3r^2 + 5r - 4}{9r^3 + 51r^2 + 94r + 56}$$

Which for the root $r = 0$ becomes

$$a_2 = -\frac{1}{14}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{r^2}{3r^2+7r+4}$	0
a_2	$\frac{-2r^3+3r^2+5r-4}{9r^3+51r^2+94r+56}$	$-\frac{1}{14}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{5r^5 + 10r^4 - 10r^3 - 17r^2 + 2r + 8}{(3r^2 + 19r + 30)(9r^2 + 33r + 28)(1 + r)}$$

Which for the root $r = 0$ becomes

$$a_3 = \frac{1}{105}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{r^2}{3r^2+7r+4}$	0
a_2	$\frac{-2r^3+3r^2+5r-4}{9r^3+51r^2+94r+56}$	$-\frac{1}{14}$
a_3	$\frac{5r^5+10r^4-10r^3-17r^2+2r+8}{(3r^2+19r+30)(9r^2+33r+28)(1+r)}$	$\frac{1}{105}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^7 - 6r^6 - 64r^5 - 127r^4 - 55r^3 + 45r^2 + 30r - 8}{(3r^2 + 25r + 52)(1 + r)(9r^2 + 33r + 28)(3r + 10)(r + 2)}$$

Which for the root $r = 0$ becomes

$$a_4 = -\frac{1}{3640}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{r^2}{3r^2+7r+4}$	0
a_2	$\frac{-2r^3+3r^2+5r-4}{9r^3+51r^2+94r+56}$	$-\frac{1}{14}$
a_3	$\frac{5r^5+10r^4-10r^3-17r^2+2r+8}{(3r^2+19r+30)(9r^2+33r+28)(1+r)}$	$\frac{1}{105}$
a_4	$\frac{r^7-6r^6-64r^5-127r^4-55r^3+45r^2+30r-8}{(3r^2+25r+52)(1+r)(9r^2+33r+28)(3r+10)(r+2)}$	$-\frac{1}{3640}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-16r^9 - 186r^8 - 756r^7 - 1032r^6 + 1053r^5 + 4476r^4 + 3939r^3 - 246r^2 - 1952r - 736}{(3r^2 + 31r + 80)(r + 2)(3r + 10)(3r + 13)(1 + r)(9r^2 + 33r + 28)(r + 3)}$$

Which for the root $r = 0$ becomes

$$a_5 = -\frac{23}{54600}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{r^2}{3r^2+7r+4}$	0
a_2	$\frac{-2r^3+3r^2+5r-4}{9r^3+51r^2+94r+56}$	$-\frac{1}{14}$
a_3	$\frac{5r^5+10r^4-10r^3-17r^2+2r+8}{(3r^2+19r+30)(9r^2+33r+28)(1+r)}$	$\frac{1}{105}$
a_4	$\frac{r^7-6r^6-64r^5-127r^4-55r^3+45r^2+30r-8}{(3r^2+25r+52)(1+r)(9r^2+33r+28)(3r+10)(r+2)}$	$-\frac{1}{3640}$
a_5	$\frac{-16r^9-186r^8-756r^7-1032r^6+1053r^5+4476r^4+3939r^3-246r^2-1952r-736}{(3r^2+31r+80)(r+2)(3r+10)(3r+13)(1+r)(9r^2+33r+28)(r+3)}$	$-\frac{23}{54600}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots \\ &= 1 - \frac{x^2}{14} + \frac{x^3}{105} - \frac{x^4}{3640} - \frac{23x^5}{54600} + O(x^6) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = -\frac{r^2}{3r^2 + 7r + 4}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} b_{n-2}(n+r-2)(n-3+r) + b_{n-1}(n+r-1)(n+r-2) + 3b_n(n+r)(n+r-1) \\ - b_{n-2}(n+r-2) + b_{n-1}(n+r-1) + 4(n+r) b_n + b_{n-2} = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{n^2 b_{n-2} + n^2 b_{n-1} + 2nr b_{n-2} + 2nr b_{n-1} + r^2 b_{n-2} + r^2 b_{n-1} - 6n b_{n-2} - 2n b_{n-1} - 6r b_{n-2} - 2r b_{n-1} +}{3n^2 + 6nr + 3r^2 + n + r} \tag{4}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_n = \frac{(-9b_{n-2} - 9b_{n-1}) n^2 + (60b_{n-2} + 24b_{n-1}) n - 100b_{n-2} - 16b_{n-1}}{27n^2 - 9n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{r^2}{3r^2+7r+4}$	$-\frac{1}{18}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{-2r^3 + 3r^2 + 5r - 4}{9r^3 + 51r^2 + 94r + 56}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_2 = -\frac{71}{405}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{r^2}{3r^2+7r+4}$	$-\frac{1}{18}$
b_2	$\frac{-2r^3+3r^2+5r-4}{9r^3+51r^2+94r+56}$	$-\frac{71}{405}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{5r^5 + 10r^4 - 10r^3 - 17r^2 + 2r + 8}{(3r^2 + 19r + 30)(9r^2 + 33r + 28)(1 + r)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_3 = \frac{719}{34992}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{r^2}{3r^2+7r+4}$	$-\frac{1}{18}$
b_2	$\frac{-2r^3+3r^2+5r-4}{9r^3+51r^2+94r+56}$	$-\frac{71}{405}$
b_3	$\frac{5r^5+10r^4-10r^3-17r^2+2r+8}{(3r^2+19r+30)(9r^2+33r+28)(1+r)}$	$\frac{719}{34992}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^7 - 6r^6 - 64r^5 - 127r^4 - 55r^3 + 45r^2 + 30r - 8}{(3r^2 + 25r + 52)(1 + r)(9r^2 + 33r + 28)(3r + 10)(r + 2)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_4 = -\frac{1678}{1082565}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{r^2}{3r^2+7r+4}$	$-\frac{1}{18}$
b_2	$\frac{-2r^3+3r^2+5r-4}{9r^3+51r^2+94r+56}$	$-\frac{71}{405}$
b_3	$\frac{5r^5+10r^4-10r^3-17r^2+2r+8}{(3r^2+19r+30)(9r^2+33r+28)(1+r)}$	$\frac{719}{34992}$
b_4	$\frac{r^7-6r^6-64r^5-127r^4-55r^3+45r^2+30r-8}{(3r^2+25r+52)(1+r)(9r^2+33r+28)(3r+10)(r+2)}$	$-\frac{1678}{1082565}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{-16r^9 - 186r^8 - 756r^7 - 1032r^6 + 1053r^5 + 4476r^4 + 3939r^3 - 246r^2 - 1952r - 736}{(3r^2 + 31r + 80)(r + 2)(3r + 10)(3r + 13)(1 + r)(9r^2 + 33r + 28)(r + 3)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_5 = -\frac{513547}{992023200}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{r^2}{3r^2+7r+4}$	$-\frac{1}{18}$
b_2	$\frac{-2r^3+3r^2+5r-4}{9r^3+51r^2+94r+56}$	$-\frac{71}{405}$
b_3	$\frac{5r^5+10r^4-10r^3-17r^2+2r+8}{(3r^2+19r+30)(9r^2+33r+28)(1+r)}$	$\frac{719}{34992}$
b_4	$\frac{r^7-6r^6-64r^5-127r^4-55r^3+45r^2+30r-8}{(3r^2+25r+52)(1+r)(9r^2+33r+28)(3r+10)(r+2)}$	$-\frac{1678}{1082565}$
b_5	$\frac{-16r^9-186r^8-756r^7-1032r^6+1053r^5+4476r^4+3939r^3-246r^2-1952r-736}{(3r^2+31r+80)(r+2)(3r+10)(3r+13)(1+r)(9r^2+33r+28)(r+3)}$	$-\frac{513547}{992023200}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= 1\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 - \frac{x}{18} - \frac{71x^2}{405} + \frac{719x^3}{34992} - \frac{1678x^4}{1082565} - \frac{513547x^5}{992023200} + O(x^6)}{x^{\frac{1}{3}}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 \left(1 - \frac{x^2}{14} + \frac{x^3}{105} - \frac{x^4}{3640} - \frac{23x^5}{54600} + O(x^6)\right) \\ &+ \frac{c_2 \left(1 - \frac{x}{18} - \frac{71x^2}{405} + \frac{719x^3}{34992} - \frac{1678x^4}{1082565} - \frac{513547x^5}{992023200} + O(x^6)\right)}{x^{\frac{1}{3}}} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 \left(1 - \frac{x^2}{14} + \frac{x^3}{105} - \frac{x^4}{3640} - \frac{23x^5}{54600} + O(x^6)\right) \\ &+ \frac{c_2 \left(1 - \frac{x}{18} - \frac{71x^2}{405} + \frac{719x^3}{34992} - \frac{1678x^4}{1082565} - \frac{513547x^5}{992023200} + O(x^6)\right)}{x^{\frac{1}{3}}} \end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1\left(1-\frac{x^2}{14}+\frac{x^3}{105}-\frac{x^4}{3640}-\frac{23x^5}{54600}+O(x^6)\right) + \frac{c_2\left(1-\frac{x}{18}-\frac{71x^2}{405}+\frac{719x^3}{34992}-\frac{1678x^4}{1082565}-\frac{513547x^5}{992023200}+O(x^6)\right)}{x^{\frac{1}{3}}} \tag{1}$$

Verification of solutions

$$y = c_1\left(1-\frac{x^2}{14}+\frac{x^3}{105}-\frac{x^4}{3640}-\frac{23x^5}{54600}+O(x^6)\right) + \frac{c_2\left(1-\frac{x}{18}-\frac{71x^2}{405}+\frac{719x^3}{34992}-\frac{1678x^4}{1082565}-\frac{513547x^5}{992023200}+O(x^6)\right)}{x^{\frac{1}{3}}}$$

Verified OK.

14.12.1 Maple step by step solution

Let's solve

$x(x^2+x+3)\,y''+(-x^2+x+4)\,y'+yx=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{y}{x^2+x+3}+\frac{(x^2-x-4)y'}{x(x^2+x+3)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{(x^2-x-4)y'}{x(x^2+x+3)}+\frac{y}{x^2+x+3}=0$

□ Check to see if x_0 is a regular singular point

- ◦ Define functions

  $\left[P_2(x)=-\frac{x^2-x-4}{x(x^2+x+3)},P_3(x)=\frac{1}{x^2+x+3}\right]$

- ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left(x\cdot P_2(x)\right)\bigg|_{x=0}=\frac{4}{3}$

- ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

$$\left(x^2 \cdot P_3(x)\right)\Big|_{x=0} = 0$$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x(x^2+x+3)\,y'' + (-x^2+x+4)\,y' + yx = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

- Convert $x \cdot y$ to series expansion

  $x \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+1}$

- Shift index using $k->k-1$

  $x \cdot y = \sum_{k=1}^{\infty} a_{k-1} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 0..2$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 1..3$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$

  Rewrite ODE with series expansions

  $a_0 r(1+3r)\,x^{-1+r} + \left(a_1(1+r)\,(4+3r) + a_0 r^2\right) x^r + \left(\sum_{k=1}^{\infty} \left(a_{k+1}(k+r+1)\,(3k+4+3r) + a_k(k\right.\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$r(1+3r)=0$

- Values of r that satisfy the indicial equation

$r \in \{0, -\frac{1}{3}\}$

- Each term must be 0

$a_1(1+r)(4+3r)+a_0 r^2=0$

- Each term in the series must be 0, giving the recursion relation

$a_{k+1}(k+r+1)(3k+4+3r)+a_k(k+r)^2+a_{k-1}(k-2+r)^2=0$

- Shift index using $k->k+1$

$a_{k+2}(k+2+r)(3k+7+3r)+a_{k+1}(k+r+1)^2+a_k(k+r-1)^2=0$

- Recursion relation that defines series solution to ODE

$a_{k+2}=-\frac{k^2a_k+k^2a_{k+1}+2kra_k+2kra_{k+1}+r^2a_k+r^2a_{k+1}-2ka_k+2ka_{k+1}-2ra_k+2ra_{k+1}+a_k+a_{k+1}}{(k+2+r)(3k+7+3r)}$

- Recursion relation for $r=0$

$a_{k+2}=-\frac{k^2a_k+k^2a_{k+1}-2ka_k+2ka_{k+1}+a_k+a_{k+1}}{(k+2)(3k+7)}$

- Solution for $r=0$

$\left[y=\sum_{k=0}^{\infty} a_k x^k, a_{k+2}=-\frac{k^2a_k+k^2a_{k+1}-2ka_k+2ka_{k+1}+a_k+a_{k+1}}{(k+2)(3k+7)}, 4a_1=0\right]$

- Recursion relation for $r=-\frac{1}{3}$

$a_{k+2}=-\frac{k^2a_k+k^2a_{k+1}-\frac{8}{3}ka_k+\frac{4}{3}ka_{k+1}+\frac{16}{9}a_k+\frac{4}{9}a_{k+1}}{(k+\frac{5}{3})(3k+6)}$

- Solution for $r=-\frac{1}{3}$

$\left[y=\sum_{k=0}^{\infty} a_k x^{k-\frac{1}{3}}, a_{k+2}=-\frac{k^2a_k+k^2a_{k+1}-\frac{8}{3}ka_k+\frac{4}{3}ka_{k+1}+\frac{16}{9}a_k+\frac{4}{9}a_{k+1}}{(k+\frac{5}{3})(3k+6)}, 2a_1+\frac{a_0}{9}=0\right]$

- Combine solutions and rename parameters

$\left[y=\left(\sum_{k=0}^{\infty} a_k x^k\right)+\left(\sum_{k=0}^{\infty} b_k x^{k-\frac{1}{3}}\right), a_{k+2}=-\frac{k^2a_k+k^2a_{1+k}-2ka_k+2ka_{1+k}+a_k+a_{1+k}}{(k+2)(3k+7)}, 4a_1=0, b_{k+2}=-\frac{k^2}{}\right.$

[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{10x^2\left(2x^2+x+1\right)y''+x\left(66x^2+13x+13\right)y'-\left(10x^2+4x+1\right)y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(20x^4+10x^3+10x^2\right)y''+\left(66x^3+13x^2+13x\right)y'+\left(-10x^2-4x-1\right)y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{66x^2+13x+13}{10x\left(2x^2+x+1\right)}$$
$$q(x)=-\frac{10x^2+4x+1}{10x^2\left(2x^2+x+1\right)}$$

Table 554: Table $p(x), q(x)$ singularites.

$p(x) = \frac{66x^2+13x+13}{10x(2x^2+x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{7}}{4} - \frac{1}{4}$	"regular"
$x = \frac{i\sqrt{7}}{4} - \frac{1}{4}$	"regular"

$q(x) = -\frac{10x^2+4x+1}{10x^2(2x^2+x+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{7}}{4} - \frac{1}{4}$	"regular"
$x = \frac{i\sqrt{7}}{4} - \frac{1}{4}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{i\sqrt{7}}{4} - \frac{1}{4}, \frac{i\sqrt{7}}{4} - \frac{1}{4}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$10x^2(2x^2 + x + 1)\, y'' + (66x^3 + 13x^2 + 13x)\, y' + (-10x^2 - 4x - 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\begin{aligned} &10x^2(2x^2 + x + 1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) \\ &+ (66x^3 + 13x^2 + 13x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) \\ &+ (-10x^2 - 4x - 1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \end{aligned} \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 20x^{n+r+2} a_n(n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} 10x^{1+n+r} a_n(n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} 10x^{n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 66x^{n+r+2} a_n(n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 13x^{1+n+r} a_n(n+r)\right)+\left(\sum_{n=0}^{\infty} 13x^{n+r} a_n(n+r)\right) \\
&+\sum_{n=0}^{\infty}\left(-10x^{n+r+2} a_n\right)+\sum_{n=0}^{\infty}\left(-4x^{1+n+r} a_n\right)+\sum_{n=0}^{\infty}\left(-a_n x^{n+r}\right)=0
\end{aligned}
\tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty} 20x^{n+r+2} a_n(n+r)(n+r-1)=\sum_{n=2}^{\infty} 20a_{n-2}(n+r-2)(n-3+r)\,x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 10x^{1+n+r} a_n(n+r)(n+r-1)=\sum_{n=1}^{\infty} 10a_{n-1}(n+r-1)(n+r-2)\,x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 66x^{n+r+2} a_n(n+r)=\sum_{n=2}^{\infty} 66a_{n-2}(n+r-2)\,x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 13x^{1+n+r} a_n(n+r)=\sum_{n=1}^{\infty} 13a_{n-1}(n+r-1)\,x^{n+r}
$$

$$
\sum_{n=0}^{\infty}\left(-10x^{n+r+2} a_n\right)=\sum_{n=2}^{\infty}\left(-10a_{n-2}x^{n+r}\right)
$$

$$
\sum_{n=0}^{\infty}\left(-4x^{1+n+r} a_n\right)=\sum_{n=1}^{\infty}\left(-4a_{n-1}x^{n+r}\right)
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers

of x are the same and equal to $n+r$.

$$\begin{aligned}
&\left(\sum_{n=2}^{\infty} 20a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) \\
&+\left(\sum_{n=1}^{\infty} 10a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 10x^{n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=2}^{\infty} 66a_{n-2}(n+r-2)\, x^{n+r}\right) \\
&+\left(\sum_{n=1}^{\infty} 13a_{n-1}(n+r-1)\, x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 13x^{n+r} a_n(n+r)\right) \\
&+\sum_{n=2}^{\infty}\left(-10a_{n-2}x^{n+r}\right)+\sum_{n=1}^{\infty}\left(-4a_{n-1}x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-a_n x^{n+r}\right)=0
\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$10x^{n+r}a_n(n+r)(n+r-1)+13x^{n+r}a_n(n+r)-a_nx^{n+r}=0$$

When $n=0$ the above becomes

$$10x^r a_0 r(-1+r)+13x^r a_0 r-a_0x^r=0$$

Or

$$\left(10x^r r(-1+r)+13x^r r-x^r\right) a_0=0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(10r^2+3r-1\right) x^r=0$$

Since the above is true for all x then the indicial equation becomes

$$10r^2+3r-1=0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned}
r_1 &= \frac{1}{5} \\
r_2 &= -\frac{1}{2}
\end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(10r^2+3r-1\right) x^r=0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{7}{10}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{5}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = \frac{1 - 2r}{2r + 3}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &20a_{n-2}(n+r-2)(n-3+r) + 10a_{n-1}(n+r-1)(n+r-2) \\ &+ 10a_n(n+r)(n+r-1) + 66a_{n-2}(n+r-2) \\ &+ 13a_{n-1}(n+r-1) + 13a_n(n+r) - 10a_{n-2} - 4a_{n-1} - a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{20n^2a_{n-2} + 10n^2a_{n-1} + 40nra_{n-2} + 20nra_{n-1} + 20r^2a_{n-2} + 10r^2a_{n-1} - 34na_{n-2} - 17na_{n-1} - 34r}{10n^2 + 20nr + 10r^2 + 3n + 3r - 1} \tag{4}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_n = \frac{(-20a_{n-2} - 10a_{n-1})n^2 + (26a_{n-2} + 13a_{n-1})n + 28a_{n-2}}{10n^2 + 7n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{5}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1-2r}{2r+3}$	$\frac{3}{17}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-20r^3 - 116r^2 - 123r + 21}{20r^3 + 116r^2 + 219r + 135}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_2 = -\frac{7}{153}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1-2r}{2r+3}$	$\frac{3}{17}$
a_2	$\frac{-20r^3-116r^2-123r+21}{20r^3+116r^2+219r+135}$	$-\frac{7}{153}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{600r^5 + 5260r^4 + 15654r^3 + 17349r^2 + 3025r - 3402}{200r^5 + 2420r^4 + 11458r^3 + 26515r^2 + 29967r + 13230}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_3 = -\frac{547}{5661}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1-2r}{2r+3}$	$\frac{3}{17}$
a_2	$\frac{-20r^3-116r^2-123r+21}{20r^3+116r^2+219r+135}$	$-\frac{7}{153}$
a_3	$\frac{600r^5+5260r^4+15654r^3+17349r^2+3025r-3402}{200r^5+2420r^4+11458r^3+26515r^2+29967r+13230}$	$-\frac{547}{5661}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{-2000r^7 - 16800r^6 + 2360r^5 + 433536r^4 + 1687211r^3 + 2569170r^2 + 1406065r - 10206}{2000r^7 + 40800r^6 + 349640r^5 + 1629984r^4 + 4459733r^3 + 7153626r^2 + 6222447r + 2262330}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_4 = \frac{26942}{266067}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1-2r}{2r+3}$	$\frac{3}{17}$
a_2	$\frac{-20r^3-116r^2-123r+21}{20r^3+116r^2+219r+135}$	$-\frac{7}{153}$
a_3	$\frac{600r^5+5260r^4+15654r^3+17349r^2+3025r-3402}{200r^5+2420r^4+11458r^3+26515r^2+29967r+13230}$	$-\frac{547}{5661}$
a_4	$\frac{-2000r^7-16800r^6+2360r^5+433536r^4+1687211r^3+2569170r^2+1406065r-10206}{2000r^7+40800r^6+349640r^5+1629984r^4+4459733r^3+7153626r^2+6222447r+2262330}$	$\frac{26942}{266067}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-100000r^9 - 2710000r^8 - 31054000r^7 - 196182200r^6 - 744265370r^5 - 1721296863r^4 - 232124294}{(10r^2 + 103r + 264)(2000r^7 + 40800r^6 + 349640r^5 + 1629984r^4 + 4459733r^3 + 715}$$

Which for the root $r = \frac{1}{5}$ becomes

$$a_5 = \frac{200432}{3991005}$$

And the table now becomes

n	$a_{n,r}$
a_0	1
a_1	$\frac{1-2r}{2r+3}$
a_2	$\frac{-20r^3-116r^2-123r+21}{20r^3+116r^2+219r+135}$
a_3	$\frac{600r^5+5260r^4+15654r^3+17349r^2+3025r-3402}{200r^5+2420r^4+11458r^3+26515r^2+29967r+13230}$
a_4	$\frac{-2000r^7-16800r^6+2360r^5+433536r^4+1687211r^3+2569170r^2+1406065r-10206}{2000r^7+40800r^6+349640r^5+1629984r^4+4459733r^3+7153626r^2+6222447r+2262330}$
a_5	$\frac{-100000r^9-2710000r^8-31054000r^7-196182200r^6-744265370r^5-1721296863r^4-2321242940r^3-1556172021r^2-211154622r+1808911}{(10r^2+103r+264)(2000r^7+40800r^6+349640r^5+1629984r^4+4459733r^3+7153626r^2+6222447r+2262330)}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{5}}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6\dots\right) \\ &= x^{\frac{1}{5}}\left(1 + \frac{3x}{17} - \frac{7x^2}{153} - \frac{547x^3}{5661} + \frac{26942x^4}{266067} + \frac{200432x^5}{3991005} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = \frac{1-2r}{2r+3}$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &20b_{n-2}(n+r-2)(n-3+r) + 10b_{n-1}(n+r-1)(n+r-2) \\ &+ 10b_n(n+r)(n+r-1) + 66b_{n-2}(n+r-2) \\ &+ 13b_{n-1}(n+r-1) + 13b_n(n+r) - 10b_{n-2} - 4b_{n-1} - b_n = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{20n^2b_{n-2} + 10n^2b_{n-1} + 40nrb_{n-2} + 20nrb_{n-1} + 20r^2b_{n-2} + 10r^2b_{n-1} - 34nb_{n-2} - 17nb_{n-1} - 34rb_{n}}{10n^2 + 20nr + 10r^2 + 3n + 3r - 1} \tag{4}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_n = \frac{(-20b_{n-2} - 10b_{n-1})\, n^2 + (54b_{n-2} + 27b_{n-1})\, n - 14b_{n-1}}{10n^2 - 7n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{1-2r}{2r+3}$	1

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{-20r^3 - 116r^2 - 123r + 21}{20r^3 + 116r^2 + 219r + 135}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_2 = \frac{14}{13}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{1-2r}{2r+3}$	1
b_2	$\frac{-20r^3-116r^2-123r+21}{20r^3+116r^2+219r+135}$	$\frac{14}{13}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{600r^5 + 5260r^4 + 15654r^3 + 17349r^2 + 3025r - 3402}{200r^5 + 2420r^4 + 11458r^3 + 26515r^2 + 29967r + 13230}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_3 = -\frac{556}{897}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{1-2r}{2r+3}$	1
b_2	$\frac{-20r^3-116r^2-123r+21}{20r^3+116r^2+219r+135}$	$\frac{14}{13}$
b_3	$\frac{600r^5+5260r^4+15654r^3+17349r^2+3025r-3402}{200r^5+2420r^4+11458r^3+26515r^2+29967r+13230}$	$-\frac{556}{897}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{-2000r^7 - 16800r^6 + 2360r^5 + 433536r^4 + 1687211r^3 + 2569170r^2 + 1406065r - 10206}{2000r^7 + 40800r^6 + 349640r^5 + 1629984r^4 + 4459733r^3 + 7153626r^2 + 6222447r + 2262330}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_4 = -\frac{5314}{9867}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{1-2r}{2r+3}$	1
b_2	$\frac{-20r^3-116r^2-123r+21}{20r^3+116r^2+219r+135}$	$\frac{14}{13}$
b_3	$\frac{600r^5+5260r^4+15654r^3+17349r^2+3025r-3402}{200r^5+2420r^4+11458r^3+26515r^2+29967r+13230}$	$-\frac{556}{897}$
b_4	$\frac{-2000r^7-16800r^6+2360r^5+433536r^4+1687211r^3+2569170r^2+1406065r-10206}{2000r^7+40800r^6+349640r^5+1629984r^4+4459733r^3+7153626r^2+6222447r+2262330}$	$-\frac{5314}{9867}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{-100000r^9 - 2710000r^8 - 31054000r^7 - 196182200r^6 - 744265370r^5 - 1721296863r^4 - 232124294}{(10r^2 + 103r + 264)(2000r^7 + 40800r^6 + 349640r^5 + 1629984r^4 + 4459733r^3 + 715}$$

Which for the root $r=-\frac{1}{2}$ becomes

$$b_5=\frac{2092186}{2121405}$$

And the table now becomes

n	$b_{n,r}$
b_0	1
b_1	$\frac{1-2r}{2r+3}$
b_2	$\frac{-20r^3-116r^2-123r+21}{20r^3+116r^2+219r+135}$
b_3	$\frac{600r^5+5260r^4+15654r^3+17349r^2+3025r-3402}{200r^5+2420r^4+11458r^3+26515r^2+29967r+13230}$
b_4	$\frac{-2000r^7-16800r^6+2360r^5+433536r^4+1687211r^3+2569170r^2+1406065r-10206}{2000r^7+40800r^6+349640r^5+1629984r^4+4459733r^3+7153626r^2+6222447r+2262330}$
b_5	$\frac{-100000r^9-2710000r^8-31054000r^7-196182200r^6-744265370r^5-1721296863r^4-2321242940r^3-1556172021r^2-211154622r+1808911}{(10r^2+103r+264)(2000r^7+40800r^6+349640r^5+1629984r^4+4459733r^3+7153626r^2+6222447r+2262330)}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned}y_2(x)&=x^{\frac{1}{5}}\left(b_0+b_1x+b_2x^2+b_3x^3+b_4x^4+b_5x^5+b_6x^6\dots\right)\\&=\frac{1+x+\frac{14x^2}{13}-\frac{556x^3}{897}-\frac{5314x^4}{9867}+\frac{2092186x^5}{2121405}+O(x^6)}{\sqrt{x}}\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x)&=c_1y_1(x)+c_2y_2(x)\\&=c_1x^{\frac{1}{5}}\left(1+\frac{3x}{17}-\frac{7x^2}{153}-\frac{547x^3}{5661}+\frac{26942x^4}{266067}+\frac{200432x^5}{3991005}+O(x^6)\right)\\&\quad+\frac{c_2\left(1+x+\frac{14x^2}{13}-\frac{556x^3}{897}-\frac{5314x^4}{9867}+\frac{2092186x^5}{2121405}+O(x^6)\right)}{\sqrt{x}}\end{aligned}$$

Hence the final solution is

$$\begin{aligned}y&=y_h\\&=c_1x^{\frac{1}{5}}\left(1+\frac{3x}{17}-\frac{7x^2}{153}-\frac{547x^3}{5661}+\frac{26942x^4}{266067}+\frac{200432x^5}{3991005}+O(x^6)\right)\\&\quad+\frac{c_2\left(1+x+\frac{14x^2}{13}-\frac{556x^3}{897}-\frac{5314x^4}{9867}+\frac{2092186x^5}{2121405}+O(x^6)\right)}{\sqrt{x}}\end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{5}} \left(1+\frac{3x}{17}-\frac{7x^2}{153}-\frac{547x^3}{5661}+\frac{26942x^4}{266067}+\frac{200432x^5}{3991005}+O(x^6)\right) + \frac{c_2\left(1+x+\frac{14x^2}{13}-\frac{556x^3}{897}-\frac{5314x^4}{9867}+\frac{2092186x^5}{2121405}+O(x^6)\right)}{\sqrt{x}} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{5}} \left(1+\frac{3x}{17}-\frac{7x^2}{153}-\frac{547x^3}{5661}+\frac{26942x^4}{266067}+\frac{200432x^5}{3991005}+O(x^6)\right) + \frac{c_2\left(1+x+\frac{14x^2}{13}-\frac{556x^3}{897}-\frac{5314x^4}{9867}+\frac{2092186x^5}{2121405}+O(x^6)\right)}{\sqrt{x}}$$

Verified OK.

14.13.1 Maple step by step solution

Let's solve

$10x^2(2x^2+x+1)\,y''+(66x^3+13x^2+13x)\,y'+(-10x^2-4x-1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{(10x^2+4x+1)y}{10x^2(2x^2+x+1)}-\frac{(66x^2+13x+13)y'}{10x(2x^2+x+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(66x^2+13x+13)y'}{10x(2x^2+x+1)}-\frac{(10x^2+4x+1)y}{10x^2(2x^2+x+1)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x)=\frac{66x^2+13x+13}{10x(2x^2+x+1)}, P_3(x)=-\frac{10x^2+4x+1}{10x^2(2x^2+x+1)}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

    $\left.(x\cdot P_2(x))\right|_{x=0}=\frac{13}{10}$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

$(x^2 \cdot P_3(x)) \bigg|_{x=0} = -\frac{1}{10}$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $10x^2(2x^2+x+1)\,y'' + x(66x^2+13x+13)\,y' + (-10x^2-4x-1)\,y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

- □ Rewrite ODE with series expansions
  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  - Shift index using $k- > k-m$

    $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  - Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$

  - Shift index using $k- > k+1-m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$

  - Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

    $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$

  - Shift index using $k- > k+2-m$

    $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(1+2r)\,(-1+5r)\,x^r + (a_1(3+2r)\,(4+5r) + a_0(4+5r)\,(-1+2r))\,x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(2k+2r\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$(1+2r)(-1+5r)=0$

- Values of r that satisfy the indicial equation

  $r \in \left\{-\frac{1}{2}, \frac{1}{5}\right\}$

- Each term must be 0

  $a_1(3+2r)(4+5r)+a_0(4+5r)(-1+2r)=0$

- Solve for the dependent coefficient(s)

  $a_1=-\frac{(-1+2r)a_0}{3+2r}$

- Each term in the series must be 0, giving the recursion relation

  $a_k(2k+2r+1)(5k+5r-1)+a_{k-1}(5k+5r-1)(2k-3+2r)+2a_{k-2}(2k+2r+1)(5k-11$

- Shift index using $k->k+2$

  $a_{k+2}(2k+2r+5)(5k+9+5r)+a_{k+1}(5k+9+5r)(2k+2r+1)+2a_k(2k+2r+5)(5k+5r$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{20k^2a_k+10k^2a_{k+1}+40kra_k+20kra_{k+1}+20r^2a_k+10r^2a_{k+1}+46ka_k+23ka_{k+1}+46ra_k+23ra_{k+1}-10a_k+9a_{k+1}}{(2k+2r+5)(5k+9+5r)}$

- Recursion relation for $r=-\frac{1}{2}$

  $a_{k+2}=-\frac{20k^2a_k+10k^2a_{k+1}+26ka_k+13ka_{k+1}-28a_k}{(2k+4)\left(5k+\frac{13}{2}\right)}$

- Solution for $r=-\frac{1}{2}$

  $\left[y=\sum_{k=0}^{\infty} a_k x^{k-\frac{1}{2}}, a_{k+2}=-\frac{20k^2a_k+10k^2a_{k+1}+26ka_k+13ka_{k+1}-28a_k}{(2k+4)\left(5k+\frac{13}{2}\right)}, a_1=a_0\right]$

- Recursion relation for $r=\frac{1}{5}$

  $a_{k+2}=-\frac{20k^2a_k+10k^2a_{k+1}+54ka_k+27ka_{k+1}+14a_{k+1}}{\left(2k+\frac{27}{5}\right)(5k+10)}$

- Solution for $r=\frac{1}{5}$

  $\left[y=\sum_{k=0}^{\infty} a_k x^{k+\frac{1}{5}}, a_{k+2}=-\frac{20k^2a_k+10k^2a_{k+1}+54ka_k+27ka_{k+1}+14a_{k+1}}{\left(2k+\frac{27}{5}\right)(5k+10)}, a_1=\frac{3a_0}{17}\right]$

- Combine solutions and rename parameters

  $\left[y=\left(\sum_{k=0}^{\infty} a_k x^{k-\frac{1}{2}}\right)+\left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{5}}\right), a_{k+2}=-\frac{20k^2a_k+10k^2a_{1+k}+26ka_k+13ka_{1+k}-28a_k}{(2k+4)\left(5k+\frac{13}{2}\right)}, a_1=a_0, b_{k+2}=\right.$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 14.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2y'' + x(2x+3)\,y' - (1-x)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$2x^2y'' + \left(2x^2+3x\right)y' + y(x-1) = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$\begin{aligned} p(x) &= \frac{2x+3}{2x} \\ q(x) &= \frac{x-1}{2x^2} \end{aligned}$$

Table 556: Table $p(x), q(x)$ singularites.

$p(x) = \frac{2x+3}{2x}$	
singularity	type
$x = 0$	"regular"

$q(x) = \frac{x-1}{2x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2y'' + (2x^2 + 3x)\, y' + y(x - 1) = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2 \left(\sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}\right) + (2x^2 + 3x) \left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) (x - 1) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{1+n+r} a_n(n+r) = \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n(n+r)\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$2x^{n+r} a_n(n+r)(n+r-1) + 3x^{n+r} a_n(n+r) - a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$2x^r a_0 r(-1+r) + 3x^r a_0 r - a_0 x^r = 0$$

Or

$$\left(2x^r r(-1+r) + 3x^r r - x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(2r^2 + r - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$2r^2 + r - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(2r^2 + r - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{3}{2}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-1}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$2a_n(n+r)(n+r-1) + 2a_{n-1}(n+r-1) + 3a_n(n+r) + a_{n-1} - a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}}{1+n+r} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{2a_{n-1}}{3+2n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{1}{2+r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = -\frac{2}{5}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{2+r}$	$-\frac{2}{5}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1}{(2+r)(3+r)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = \frac{4}{35}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{2+r}$	$-\frac{2}{5}$
a_2	$\frac{1}{(2+r)(3+r)}$	$\frac{4}{35}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{1}{(2+r)(3+r)(4+r)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = -\frac{8}{315}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{2+r}$	$-\frac{2}{5}$
a_2	$\frac{1}{(2+r)(3+r)}$	$\frac{4}{35}$
a_3	$-\frac{1}{(2+r)(3+r)(4+r)}$	$-\frac{8}{315}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{(2+r)(3+r)(4+r)(5+r)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{16}{3465}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{2+r}$	$-\frac{2}{5}$
a_2	$\frac{1}{(2+r)(3+r)}$	$\frac{4}{35}$
a_3	$-\frac{1}{(2+r)(3+r)(4+r)}$	$-\frac{8}{315}$
a_4	$\frac{1}{(2+r)(3+r)(4+r)(5+r)}$	$\frac{16}{3465}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{1}{(2+r)(3+r)(4+r)(5+r)(6+r)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = -\frac{32}{45045}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{2+r}$	$-\frac{2}{5}$
a_2	$\frac{1}{(2+r)(3+r)}$	$\frac{4}{35}$
a_3	$-\frac{1}{(2+r)(3+r)(4+r)}$	$-\frac{8}{315}$
a_4	$\frac{1}{(2+r)(3+r)(4+r)(5+r)}$	$\frac{16}{3465}$
a_5	$-\frac{1}{(2+r)(3+r)(4+r)(5+r)(6+r)}$	$-\frac{32}{45045}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}\,(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots) \\ &= \sqrt{x}\left(1 - \frac{2x}{5} + \frac{4x^2}{35} - \frac{8x^3}{315} + \frac{16x^4}{3465} - \frac{32x^5}{45045} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$2b_n(n+r)(n+r-1) + 2b_{n-1}(n+r-1) + 3b_n(n+r) + b_{n-1} - b_n = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{b_{n-1}}{1+n+r} \tag{4}$$

Which for the root $r = -1$ becomes

$$b_n = -\frac{b_{n-1}}{n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{1}{2+r}$$

Which for the root $r = -1$ becomes

$$b_1 = -1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{2+r}$	-1

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{1}{(2+r)(3+r)}$$

Which for the root $r = -1$ becomes

$$b_2 = \frac{1}{2}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{2+r}$	-1
b_2	$\frac{1}{(2+r)(3+r)}$	$\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{1}{(2+r)(3+r)(4+r)}$$

Which for the root $r = -1$ becomes

$$b_3 = -\frac{1}{6}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{2+r}$	-1
b_2	$\frac{1}{(2+r)(3+r)}$	$\frac{1}{2}$
b_3	$-\frac{1}{(2+r)(3+r)(4+r)}$	$-\frac{1}{6}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{1}{(2+r)(3+r)(4+r)(5+r)}$$

Which for the root $r = -1$ becomes

$$b_4 = \frac{1}{24}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{2+r}$	-1
b_2	$\frac{1}{(2+r)(3+r)}$	$\frac{1}{2}$
b_3	$-\frac{1}{(2+r)(3+r)(4+r)}$	$-\frac{1}{6}$
b_4	$\frac{1}{(2+r)(3+r)(4+r)(5+r)}$	$\frac{1}{24}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{1}{(2+r)(3+r)(4+r)(5+r)(6+r)}$$

Which for the root $r = -1$ becomes

$$b_5 = -\frac{1}{120}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{2+r}$	-1
b_2	$\frac{1}{(2+r)(3+r)}$	$\frac{1}{2}$
b_3	$-\frac{1}{(2+r)(3+r)(4+r)}$	$-\frac{1}{6}$
b_4	$\frac{1}{(2+r)(3+r)(4+r)(5+r)}$	$\frac{1}{24}$
b_5	$-\frac{1}{(2+r)(3+r)(4+r)(5+r)(6+r)}$	$-\frac{1}{120}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= \sqrt{x}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} - \frac{x^5}{120} + O(x^6)}{x} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 \sqrt{x}\left(1 - \frac{2x}{5} + \frac{4x^2}{35} - \frac{8x^3}{315} + \frac{16x^4}{3465} - \frac{32x^5}{45045} + O(x^6)\right) \\ &+ \frac{c_2\left(1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} - \frac{x^5}{120} + O(x^6)\right)}{x} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 \sqrt{x}\left(1 - \frac{2x}{5} + \frac{4x^2}{35} - \frac{8x^3}{315} + \frac{16x^4}{3465} - \frac{32x^5}{45045} + O(x^6)\right) \\ &+ \frac{c_2\left(1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} - \frac{x^5}{120} + O(x^6)\right)}{x} \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = c_1 \sqrt{x}\left(1 - \frac{2x}{5} + \frac{4x^2}{35} - \frac{8x^3}{315} + \frac{16x^4}{3465} - \frac{32x^5}{45045} + O(x^6)\right) \\ + \frac{c_2\left(1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} - \frac{x^5}{120} + O(x^6)\right)}{x} \end{aligned} \tag{1}$$

Verification of solutions

$$y = c_1\sqrt{x}\left(1-\frac{2x}{5}+\frac{4x^2}{35}-\frac{8x^3}{315}+\frac{16x^4}{3465}-\frac{32x^5}{45045}+O(x^6)\right) + \frac{c_2\left(1-x+\frac{x^2}{2}-\frac{x^3}{6}+\frac{x^4}{24}-\frac{x^5}{120}+O(x^6)\right)}{x}$$

Verified OK.

14.14.1 Maple step by step solution

Let's solve

$2x^2y''+(2x^2+3x)\,y'+y(x-1)=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(x-1)y}{2x^2}-\frac{(2x+3)y'}{2x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(2x+3)y'}{2x}+\frac{(x-1)y}{2x^2}=0$

□ Check to see if $x_0=0$ is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{2x+3}{2x}, P_3(x)=\frac{x-1}{2x^2}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $(x\cdot P_2(x))\Big|_{x=0}=\frac{3}{2}$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $(x^2\cdot P_3(x))\Big|_{x=0}=-\frac{1}{2}$

  - $x=0$is a regular singular point

    Check to see if $x_0=0$ is a regular singular point

    $x_0=0$

- Multiply by denominators

  $2x^2y''+x(2x+3)\,y'+y(x-1)=0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

$$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(1+r)\,(-1+2r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(k+r+1)\,(2k+2r-1) + a_{k-1}(2k+2r-1)\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1+r)\,(-1+2r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-1, \frac{1}{2}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$2\left(k+r-\frac{1}{2}\right)\left(a_k(k+r+1) + a_{k-1}\right) = 0$$

- Shift index using $k- >k + 1$

$$2\left(k+\frac{1}{2}+r\right)\left(a_{k+1}(k+2+r) + a_k\right) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = -\frac{a_k}{k+2+r}$$

- Recursion relation for $r = -1$

$a_{k+1} = -\frac{a_k}{k+1}$

- Solution for $r = -1$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+1} = -\frac{a_k}{k+1}\right]$$

- Recursion relation for $r = \frac{1}{2}$

$a_{k+1} = -\frac{a_k}{k+\frac{5}{2}}$

- Solution for $r = \frac{1}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+1} = -\frac{a_k}{k+\frac{5}{2}}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-1}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{2}}\right), a_{1+k} = -\frac{a_k}{1+k}, b_{1+k} = -\frac{b_k}{k+\frac{5}{2}}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 15.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x^2(x+3)\,y''+x(4x+5)\,y'-(1-2x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^3+3x^2\right)y''+\left(4x^2+5x\right)y'+y(2x-1)=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{4x+5}{x\,(x+3)}$$
$$q(x)=\frac{2x-1}{x^2\,(x+3)}$$

Table 558: Table $p(x), q(x)$ singularites.

$p(x) = \frac{4x+5}{x(x+3)}$	
singularity	type
$x = -3$	"regular"
$x = 0$	"regular"

$q(x) = \frac{2x-1}{x^2(x+3)}$	
singularity	type
$x = -3$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-3, 0, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x+3)\, y'' + \left(4x^2 + 5x\right) y' + y(2x-1) = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\begin{aligned} x^2(x+3) & \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) \\ & + \left(4x^2 + 5x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) (2x-1) = 0 \end{aligned} \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r) (n+r-1) = \sum_{n=1}^{\infty} a_{n-1} (n+r-1) (n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 4a_{n-1} (n+r-1) x^{n+r}$$

$$\sum_{n=0}^{\infty} 2x^{1+n+r} a_n = \sum_{n=1}^{\infty} 2a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} a_{n-1} (n+r-1) (n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=1}^{\infty} 4a_{n-1} (n+r-1) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$3x^{n+r} a_n (n+r) (n+r-1) + 5x^{n+r} a_n (n+r) - a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$3x^r a_0 r(-1+r) + 5x^r a_0 r - a_0 x^r = 0$$

Or

$$(3x^r r(-1+r) + 5x^r r - x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(3r^2 + 2r - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$3r^2 + 2r - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(3r^2 + 2r - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{4}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-1}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-1}(n+r-1)(n+r-2) + 3a_n(n+r)(n+r-1) \\ + 4a_{n-1}(n+r-1) + 5a_n(n+r) + 2a_{n-1} - a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r)\, a_{n-1}}{3n+3r-1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = -\frac{(3n+1)\, a_{n-1}}{9n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-1-r}{2+3r}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_1 = -\frac{4}{9}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{2+3r}$	$-\frac{4}{9}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{r^2+3r+2}{9r^2+21r+10}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = \frac{14}{81}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{2+3r}$	$-\frac{4}{9}$
a_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	$\frac{14}{81}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-r^3 - 6r^2 - 11r - 6}{27r^3 + 135r^2 + 198r + 80}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = -\frac{140}{2187}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{2+3r}$	$-\frac{4}{9}$
a_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	$\frac{14}{81}$
a_3	$\frac{-r^3-6r^2-11r-6}{27r^3+135r^2+198r+80}$	$-\frac{140}{2187}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^4 + 10r^3 + 35r^2 + 50r + 24}{81r^4 + 702r^3 + 2079r^2 + 2418r + 880}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{455}{19683}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{2+3r}$	$-\frac{4}{9}$
a_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	$\frac{14}{81}$
a_3	$\frac{-r^3-6r^2-11r-6}{27r^3+135r^2+198r+80}$	$-\frac{140}{2187}$
a_4	$\frac{r^4+10r^3+35r^2+50r+24}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{455}{19683}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-r^5 - 15r^4 - 85r^3 - 225r^2 - 274r - 120}{243r^5 + 3240r^4 + 16065r^3 + 36360r^2 + 36492r + 12320}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_5 = -\frac{1456}{177147}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{2+3r}$	$-\frac{4}{9}$
a_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	$\frac{14}{81}$
a_3	$\frac{-r^3-6r^2-11r-6}{27r^3+135r^2+198r+80}$	$-\frac{140}{2187}$
a_4	$\frac{r^4+10r^3+35r^2+50r+24}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{455}{19683}$
a_5	$\frac{-r^5-15r^4-85r^3-225r^2-274r-120}{243r^5+3240r^4+16065r^3+36360r^2+36492r+12320}$	$-\frac{1456}{177147}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(1 - \frac{4x}{9} + \frac{14x^2}{81} - \frac{140x^3}{2187} + \frac{455x^4}{19683} - \frac{1456x^5}{177147} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} b_{n-1}(n+r-1)(n+r-2) + 3b_n(n+r)(n+r-1) \\ + 4b_{n-1}(n+r-1) + 5b_n(n+r) + 2b_{n-1} - b_n = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{(n+r)\, b_{n-1}}{3n + 3r - 1} \tag{4}$$

Which for the root $r = -1$ becomes

$$b_n = -\frac{(n-1)\, b_{n-1}}{3n - 4} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{-1 - r}{2 + 3r}$$

Which for the root $r = -1$ becomes

$$b_1 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{2+3r}$	0

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{r^2 + 3r + 2}{9r^2 + 21r + 10}$$

Which for the root $r = -1$ becomes

$$b_2 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{2+3r}$	0
b_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	0

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{-r^3 - 6r^2 - 11r - 6}{27r^3 + 135r^2 + 198r + 80}$$

Which for the root $r = -1$ becomes

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{2+3r}$	0
b_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	0
b_3	$\frac{-r^3-6r^2-11r-6}{27r^3+135r^2+198r+80}$	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^4 + 10r^3 + 35r^2 + 50r + 24}{81r^4 + 702r^3 + 2079r^2 + 2418r + 880}$$

Which for the root $r = -1$ becomes

$$b_4 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{2+3r}$	0
b_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	0
b_3	$\frac{-r^3-6r^2-11r-6}{27r^3+135r^2+198r+80}$	0
b_4	$\frac{r^4+10r^3+35r^2+50r+24}{81r^4+702r^3+2079r^2+2418r+880}$	0

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{-r^5 - 15r^4 - 85r^3 - 225r^2 - 274r - 120}{243r^5 + 3240r^4 + 16065r^3 + 36360r^2 + 36492r + 12320}$$

Which for the root $r = -1$ becomes

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{2+3r}$	0
b_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	0
b_3	$\frac{-r^3-6r^2-11r-6}{27r^3+135r^2+198r+80}$	0
b_4	$\frac{r^4+10r^3+35r^2+50r+24}{81r^4+702r^3+2079r^2+2418r+880}$	0
b_5	$\frac{-r^5-15r^4-85r^3-225r^2-274r-120}{243r^5+3240r^4+16065r^3+36360r^2+36492r+12320}$	0

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= x^{\frac{1}{3}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= \frac{1 + O(x^6)}{x}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{1}{3}}\left(1 - \frac{4x}{9} + \frac{14x^2}{81} - \frac{140x^3}{2187} + \frac{455x^4}{19683} - \frac{1456x^5}{177147} + O(x^6)\right) + \frac{c_2(1 + O(x^6))}{x}
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{1}{3}}\left(1 - \frac{4x}{9} + \frac{14x^2}{81} - \frac{140x^3}{2187} + \frac{455x^4}{19683} - \frac{1456x^5}{177147} + O(x^6)\right) + \frac{c_2(1 + O(x^6))}{x}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
y = c_1 x^{\frac{1}{3}}\left(1 - \frac{4x}{9} + \frac{14x^2}{81} - \frac{140x^3}{2187} + \frac{455x^4}{19683} - \frac{1456x^5}{177147} + O(x^6)\right) + \frac{c_2(1 + O(x^6))}{x} \tag{1}
$$

Verification of solutions

$$
y = c_1 x^{\frac{1}{3}}\left(1 - \frac{4x}{9} + \frac{14x^2}{81} - \frac{140x^3}{2187} + \frac{455x^4}{19683} - \frac{1456x^5}{177147} + O(x^6)\right) + \frac{c_2(1 + O(x^6))}{x}
$$

Verified OK.

14.15.1 Maple step by step solution

Let's solve

$x^2(x+3)\,y''+(4x^2+5x)\,y'+y(2x-1)=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(2x-1)y}{x^2(x+3)}-\frac{(4x+5)y'}{x(x+3)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(4x+5)y'}{x(x+3)}+\frac{(2x-1)y}{x^2(x+3)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x)=\frac{4x+5}{x(x+3)},P_3(x)=\frac{2x-1}{x^2(x+3)}\right]$

  ◦ $(x+3)\cdot P_2(x)$ is analytic at $x=-3$

    $\left((x+3)\cdot P_2(x)\right)\bigg|_{x=-3}=\frac{7}{3}$

  ◦ $(x+3)^2\cdot P_3(x)$ is analytic at $x=-3$

    $\left((x+3)^2\cdot P_3(x)\right)\bigg|_{x=-3}=0$

  ◦ $x=-3$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-3$

- Multiply by denominators

  $x^2(x+3)\,y''+x(4x+5)\,y'+y(2x-1)=0$

- Change variables using $x=u-3$ so that the regular singular point is at $u=0$

  $(u^3-6u^2+9u)\left(\frac{d^2}{du^2}y(u)\right)+(4u^2-19u+21)\left(\frac{d}{du}y(u)\right)+(2u-7)\,y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

  $$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

- Shift index using $k- >k - m$

  $$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d}{du} y(u)\right)$ to series expansion for $m = 0..2$

  $$u^m \cdot \left(\frac{d}{du} y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\, u^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

  $$u^m \cdot \left(\frac{d}{du} y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m} (k+1-m+r)\, u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d^2}{du^2} y(u)\right)$ to series expansion for $m = 1..3$

  $$u^m \cdot \left(\frac{d^2}{du^2} y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

  $$u^m \cdot \left(\frac{d^2}{du^2} y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m} (k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$3a_0 r(4+3r)\, u^{-1+r} + (3a_1(1+r)\,(7+3r) - a_0(7+6r)\,(1+r))\, u^r + \left(\sum_{k=1}^{\infty} (3a_{k+1}(k+r+1)\,(3k\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$3r(4+3r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{0, -\frac{4}{3}\right\}$$

- Each term must be 0

  $$3a_1(1+r)\,(7+3r) - a_0(7+6r)\,(1+r) = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$-6\left(\left(a_k - \frac{a_{k-1}}{6} - \frac{3a_{k+1}}{2}\right) k + \left(a_k - \frac{a_{k-1}}{6} - \frac{3a_{k+1}}{2}\right) r + \frac{7a_k}{6} - \frac{7a_{k+1}}{2}\right) (k+r+1) = 0$$

- Shift index using $k- >k + 1$

  $$-6\left(\left(a_{k+1} - \frac{a_k}{6} - \frac{3a_{k+2}}{2}\right) (k+1) + \left(a_{k+1} - \frac{a_k}{6} - \frac{3a_{k+2}}{2}\right) r + \frac{7a_{k+1}}{6} - \frac{7a_{k+2}}{2}\right) (k+r+2) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{k a_k - 6k a_{k+1} + r a_k - 6r a_{k+1} + a_k - 13a_{k+1}}{3(3k+10+3r)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{k a_k - 6k a_{k+1} + a_k - 13a_{k+1}}{3(3k+10)}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{k a_k - 6k a_{k+1} + a_k - 13a_{k+1}}{3(3k+10)}, 21a_1 - 7a_0 = 0\right]$$

- Revert the change of variables $u = x + 3$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+3)^k, a_{k+2} = -\frac{k a_k - 6k a_{k+1} + a_k - 13a_{k+1}}{3(3k+10)}, 21a_1 - 7a_0 = 0\right]$$

- Recursion relation for $r = -\frac{4}{3}$

$$a_{k+2} = -\frac{k a_k - 6k a_{k+1} - \frac{1}{3}a_k - 5a_{k+1}}{3(3k+6)}$$

- Solution for $r = -\frac{4}{3}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{4}{3}}, a_{k+2} = -\frac{k a_k - 6k a_{k+1} - \frac{1}{3}a_k - 5a_{k+1}}{3(3k+6)}, -3a_1 - \frac{a_0}{3} = 0\right]$$

- Revert the change of variables $u = x + 3$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+3)^{k-\frac{4}{3}}, a_{k+2} = -\frac{k a_k - 6k a_{k+1} - \frac{1}{3}a_k - 5a_{k+1}}{3(3k+6)}, -3a_1 - \frac{a_0}{3} = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k (x+3)^k\right) + \left(\sum_{k=0}^{\infty} b_k (x+3)^{k-\frac{4}{3}}\right), a_{k+2} = -\frac{k a_k - 6k a_{1+k} + a_k - 13a_{1+k}}{3(3k+10)}, 21a_1 - 7a_0 = 0, b_{k-}\right.$$

Problem number: 16.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2y'' + x(x+5)\,y' - (-3x+2)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$2x^2y'' + \left(x^2+5x\right)y' + (3x-2)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{x+5}{2x}$$
$$q(x) = \frac{3x-2}{2x^2}$$

Table 560: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x+5}{2x}$	
singularity	type
$x = 0$	"regular"

$q(x) = \frac{3x-2}{2x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : [∞]

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2y'' + (x^2 + 5x)\, y' + (3x - 2)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2 \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (x^2 + 5x) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (3x - 2) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-2a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{1+n+r} a_n = \sum_{n=1}^{\infty} 3a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} 3a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-2a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$2x^{n+r} a_n (n+r)(n+r-1) + 5x^{n+r} a_n (n+r) - 2a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$2x^r a_0 r(-1+r) + 5x^r a_0 r - 2a_0 x^r = 0$$

Or

$$\left(2x^r r(-1+r) + 5x^r r - 2x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(2r^2 + 3r - 2\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$2r^2 + 3r - 2 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= \frac{1}{2} \\ r_2 &= -2 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(2r^2 + 3r - 2\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{5}{2}$ is not an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}} \\ y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n-2} \end{aligned}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$2a_n(n+r)(n+r-1) + a_{n-1}(n+r-1) + 5a_n(n+r) + 3a_{n-1} - 2a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}}{2n + 2r - 1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{a_{n-1}}{2n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{1}{1+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = -\frac{1}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{1+2r}$	$-\frac{1}{2}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1}{4r^2 + 8r + 3}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = \frac{1}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{1+2r}$	$-\frac{1}{2}$
a_2	$\frac{1}{4r^2+8r+3}$	$\frac{1}{8}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{1}{8r^3 + 36r^2 + 46r + 15}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = -\frac{1}{48}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{1+2r}$	$-\frac{1}{2}$
a_2	$\frac{1}{4r^2+8r+3}$	$\frac{1}{8}$
a_3	$-\frac{1}{8r^3+36r^2+46r+15}$	$-\frac{1}{48}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{16r^4 + 128r^3 + 344r^2 + 352r + 105}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{1}{384}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{1+2r}$	$-\frac{1}{2}$
a_2	$\frac{1}{4r^2+8r+3}$	$\frac{1}{8}$
a_3	$-\frac{1}{8r^3+36r^2+46r+15}$	$-\frac{1}{48}$
a_4	$\frac{1}{16r^4+128r^3+344r^2+352r+105}$	$\frac{1}{384}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{1}{32r^5 + 400r^4 + 1840r^3 + 3800r^2 + 3378r + 945}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = -\frac{1}{3840}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{1+2r}$	$-\frac{1}{2}$
a_2	$\frac{1}{4r^2+8r+3}$	$\frac{1}{8}$
a_3	$-\frac{1}{8r^3+36r^2+46r+15}$	$-\frac{1}{48}$
a_4	$\frac{1}{16r^4+128r^3+344r^2+352r+105}$	$\frac{1}{384}$
a_5	$-\frac{1}{32r^5+400r^4+1840r^3+3800r^2+3378r+945}$	$-\frac{1}{3840}$

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= \sqrt{x}\left(1 - \frac{x}{2} + \frac{x^2}{8} - \frac{x^3}{48} + \frac{x^4}{384} - \frac{x^5}{3840} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$
2b_n(n+r)(n+r-1) + b_{n-1}(n+r-1) + 5b_n(n+r) + 3b_{n-1} - 2b_n = 0 \tag{3}
$$

Solving for b_n from recursive equation (4) gives

$$
b_n = -\frac{b_{n-1}}{2n+2r-1} \tag{4}
$$

Which for the root $r = -2$ becomes

$$
b_n = -\frac{b_{n-1}}{2n-5} \tag{5}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -2$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{1}{1 + 2r}$$

Which for the root $r = -2$ becomes

$$b_1 = \frac{1}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{1+2r}$	$\frac{1}{3}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{1}{4r^2 + 8r + 3}$$

Which for the root $r = -2$ becomes

$$b_2 = \frac{1}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{1+2r}$	$\frac{1}{3}$
b_2	$\frac{1}{4r^2+8r+3}$	$\frac{1}{3}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{1}{8r^3 + 36r^2 + 46r + 15}$$

Which for the root $r = -2$ becomes

$$b_3 = -\frac{1}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{1+2r}$	$\frac{1}{3}$
b_2	$\frac{1}{4r^2+8r+3}$	$\frac{1}{3}$
b_3	$-\frac{1}{8r^3+36r^2+46r+15}$	$-\frac{1}{3}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{1}{16r^4 + 128r^3 + 344r^2 + 352r + 105}$$

Which for the root $r = -2$ becomes

$$b_4 = \frac{1}{9}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{1+2r}$	$\frac{1}{3}$
b_2	$\frac{1}{4r^2+8r+3}$	$\frac{1}{3}$
b_3	$-\frac{1}{8r^3+36r^2+46r+15}$	$-\frac{1}{3}$
b_4	$\frac{1}{16r^4+128r^3+344r^2+352r+105}$	$\frac{1}{9}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{1}{32r^5 + 400r^4 + 1840r^3 + 3800r^2 + 3378r + 945}$$

Which for the root $r = -2$ becomes

$$b_5 = -\frac{1}{45}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{1+2r}$	$\frac{1}{3}$
b_2	$\frac{1}{4r^2+8r+3}$	$\frac{1}{3}$
b_3	$-\frac{1}{8r^3+36r^2+46r+15}$	$-\frac{1}{3}$
b_4	$\frac{1}{16r^4+128r^3+344r^2+352r+105}$	$\frac{1}{9}$
b_5	$-\frac{1}{32r^5+400r^4+1840r^3+3800r^2+3378r+945}$	$-\frac{1}{45}$

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= \sqrt{x}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= \frac{1 + \frac{x}{3} + \frac{x^2}{3} - \frac{x^3}{3} + \frac{x^4}{9} - \frac{x^5}{45} + O(x^6)}{x^2}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 \sqrt{x}\left(1 - \frac{x}{2} + \frac{x^2}{8} - \frac{x^3}{48} + \frac{x^4}{384} - \frac{x^5}{3840} + O(x^6)\right) \\
&\quad + \frac{c_2\left(1 + \frac{x}{3} + \frac{x^2}{3} - \frac{x^3}{3} + \frac{x^4}{9} - \frac{x^5}{45} + O(x^6)\right)}{x^2}
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 \sqrt{x}\left(1 - \frac{x}{2} + \frac{x^2}{8} - \frac{x^3}{48} + \frac{x^4}{384} - \frac{x^5}{3840} + O(x^6)\right) \\
&\quad + \frac{c_2\left(1 + \frac{x}{3} + \frac{x^2}{3} - \frac{x^3}{3} + \frac{x^4}{9} - \frac{x^5}{45} + O(x^6)\right)}{x^2}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 \sqrt{x}\left(1 - \frac{x}{2} + \frac{x^2}{8} - \frac{x^3}{48} + \frac{x^4}{384} - \frac{x^5}{3840} + O(x^6)\right) \\
&\quad + \frac{c_2\left(1 + \frac{x}{3} + \frac{x^2}{3} - \frac{x^3}{3} + \frac{x^4}{9} - \frac{x^5}{45} + O(x^6)\right)}{x^2}
\end{aligned} \tag{1}
$$

Verification of solutions

$$y = c_1\sqrt{x}\left(1-\frac{x}{2}+\frac{x^2}{8}-\frac{x^3}{48}+\frac{x^4}{384}-\frac{x^5}{3840}+O(x^6)\right) + \frac{c_2\left(1+\frac{x}{3}+\frac{x^2}{3}-\frac{x^3}{3}+\frac{x^4}{9}-\frac{x^5}{45}+O(x^6)\right)}{x^2}$$

Verified OK.

14.16.1 Maple step by step solution

Let's solve

$2x^2y''+(x^2+5x)\,y'+(3x-2)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(3x-2)y}{2x^2}-\frac{(x+5)y'}{2x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(x+5)y'}{2x}+\frac{(3x-2)y}{2x^2}=0$

□ Check to see if $x_0=0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{x+5}{2x}, P_3(x)=\frac{3x-2}{2x^2}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left.(x\cdot P_2(x))\right|_{x=0}=\frac{5}{2}$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left.(x^2\cdot P_3(x))\right|_{x=0}=-1$

  ◦ $x=0$is a regular singular point

  Check to see if $x_0=0$ is a regular singular point

  $x_0=0$

- Multiply by denominators

  $2x^2y''+x(x+5)\,y'+(3x-2)\,y=0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k->k-m$

  $$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

  $$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$$

- Shift index using $k->k+1-m$

  $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

  $$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(2+r)\,(-1+2r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(k+r+2)\,(2k+2r-1) + a_{k-1}(k+r+2)\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(2+r)\,(-1+2r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{-2, \frac{1}{2}\right\}$$

- Each term in the series must be 0, giving the recursion relation

  $$2(k+r+2)\left(\left(k+r-\frac{1}{2}\right) a_k + \frac{a_{k-1}}{2}\right) = 0$$

- Shift index using $k->k+1$

  $$2(k+r+3)\left(\left(k+\frac{1}{2}+r\right) a_{k+1} + \frac{a_k}{2}\right) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+1} = -\frac{a_k}{2k+1+2r}$$

- Recursion relation for $r = -2$

$a_{k+1} = -\frac{a_k}{2k-3}$

- Solution for $r = -2$

$\left[y = \sum_{k=0}^{\infty} a_k x^{k-2}, a_{k+1} = -\frac{a_k}{2k-3}\right]$

- Recursion relation for $r = \frac{1}{2}$

$a_{k+1} = -\frac{a_k}{2k+2}$

- Solution for $r = \frac{1}{2}$

$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+1} = -\frac{a_k}{2k+2}\right]$

- Combine solutions and rename parameters

$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-2}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{2}}\right), a_{1+k} = -\frac{a_k}{2k-3}, b_{1+k} = -\frac{b_k}{2k+2}\right]$

Problem number: 17.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{3x^2y'' + x(x+1)\,y' - y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$3x^2y'' + \left(x^2 + x\right)y' - y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{x+1}{3x}$$
$$q(x) = -\frac{1}{3x^2}$$

Table 562: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x+1}{3x}$	
singularity	type
$x = 0$	"regular"

$q(x) = -\frac{1}{3x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$3x^2 y'' + (x^2 + x) y' - y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$3x^2 \left(\sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}\right) + (x^2 + x) \left(\sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}\right) - \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right)+\sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right)=0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)=\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right)+\sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right)=0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$3x^{n+r} a_n (n+r)(n+r-1)+x^{n+r} a_n (n+r)-a_n x^{n+r}=0$$

When $n=0$ the above becomes

$$3x^r a_0 r(-1+r)+x^r a_0 r-a_0 x^r=0$$

Or

$$\left(3x^r r(-1+r)+x^r r-x^r\right) a_0=0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(3r^2-2r-1\right) x^r=0$$

Since the above is true for all x then the indicial equation becomes

$$3r^2-2r-1=0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = -\frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(3r^2 - 2r - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{4}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{1+n}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{3}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$3a_n(n+r)(n+r-1) + a_{n-1}(n+r-1) + a_n(n+r) - a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}}{3n+3r+1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{a_{n-1}}{3n+4} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{1}{4 + 3r}$$

Which for the root $r = 1$ becomes

$$a_1 = -\frac{1}{7}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4+3r}$	$-\frac{1}{7}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1}{9r^2 + 33r + 28}$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{1}{70}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4+3r}$	$-\frac{1}{7}$
a_2	$\frac{1}{9r^2+33r+28}$	$\frac{1}{70}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{1}{27r^3 + 189r^2 + 414r + 280}$$

Which for the root $r = 1$ becomes

$$a_3 = -\frac{1}{910}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4+3r}$	$-\frac{1}{7}$
a_2	$\frac{1}{9r^2+33r+28}$	$\frac{1}{70}$
a_3	$-\frac{1}{27r^3+189r^2+414r+280}$	$-\frac{1}{910}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{81r^4 + 918r^3 + 3699r^2 + 6222r + 3640}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{1}{14560}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4+3r}$	$-\frac{1}{7}$
a_2	$\frac{1}{9r^2+33r+28}$	$\frac{1}{70}$
a_3	$-\frac{1}{27r^3+189r^2+414r+280}$	$-\frac{1}{910}$
a_4	$\frac{1}{81r^4+918r^3+3699r^2+6222r+3640}$	$\frac{1}{14560}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{1}{243r^5 + 4050r^4 + 25785r^3 + 77850r^2 + 110472r + 58240}$$

Which for the root $r = 1$ becomes

$$a_5 = -\frac{1}{276640}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{4+3r}$	$-\frac{1}{7}$
a_2	$\frac{1}{9r^2+33r+28}$	$\frac{1}{70}$
a_3	$-\frac{1}{27r^3+189r^2+414r+280}$	$-\frac{1}{910}$
a_4	$\frac{1}{81r^4+918r^3+3699r^2+6222r+3640}$	$\frac{1}{14560}$
a_5	$-\frac{1}{243r^5+4050r^4+25785r^3+77850r^2+110472r+58240}$	$-\frac{1}{276640}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x\left(1 - \frac{x}{7} + \frac{x^2}{70} - \frac{x^3}{910} + \frac{x^4}{14560} - \frac{x^5}{276640} + O\left(x^6\right)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$3b_n(n+r)(n+r-1) + b_{n-1}(n+r-1) + b_n(n+r) - b_n = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{b_{n-1}}{3n+3r+1} \tag{4}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_n = -\frac{b_{n-1}}{3n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{1}{4+3r}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_1 = -\frac{1}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{4+3r}$	$-\frac{1}{3}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{1}{9r^2 + 33r + 28}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_2 = \frac{1}{18}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{4+3r}$	$-\frac{1}{3}$
b_2	$\frac{1}{9r^2+33r+28}$	$\frac{1}{18}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{1}{27r^3 + 189r^2 + 414r + 280}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_3 = -\frac{1}{162}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{4+3r}$	$-\frac{1}{3}$
b_2	$\frac{1}{9r^2+33r+28}$	$\frac{1}{18}$
b_3	$-\frac{1}{27r^3+189r^2+414r+280}$	$-\frac{1}{162}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{1}{81r^4 + 918r^3 + 3699r^2 + 6222r + 3640}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_4 = \frac{1}{1944}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{4+3r}$	$-\frac{1}{3}$
b_2	$\frac{1}{9r^2+33r+28}$	$\frac{1}{18}$
b_3	$-\frac{1}{27r^3+189r^2+414r+280}$	$-\frac{1}{162}$
b_4	$\frac{1}{81r^4+918r^3+3699r^2+6222r+3640}$	$\frac{1}{1944}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{1}{243r^5 + 4050r^4 + 25785r^3 + 77850r^2 + 110472r + 58240}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_5 = -\frac{1}{29160}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{4+3r}$	$-\frac{1}{3}$
b_2	$\frac{1}{9r^2+33r+28}$	$\frac{1}{18}$
b_3	$-\frac{1}{27r^3+189r^2+414r+280}$	$-\frac{1}{162}$
b_4	$\frac{1}{81r^4+918r^3+3699r^2+6222r+3640}$	$\frac{1}{1944}$
b_5	$-\frac{1}{243r^5+4050r^4+25785r^3+77850r^2+110472r+58240}$	$-\frac{1}{29160}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned}
y_2(x) &= x\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= \frac{1 - \frac{x}{3} + \frac{x^2}{18} - \frac{x^3}{162} + \frac{x^4}{1944} - \frac{x^5}{29160} + O(x^6)}{x^{\frac{1}{3}}}
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x \left(1 - \frac{x}{7} + \frac{x^2}{70} - \frac{x^3}{910} + \frac{x^4}{14560} - \frac{x^5}{276640} + O(x^6)\right) \\
&+ \frac{c_2 \left(1 - \frac{x}{3} + \frac{x^2}{18} - \frac{x^3}{162} + \frac{x^4}{1944} - \frac{x^5}{29160} + O(x^6)\right)}{x^{\frac{1}{3}}}
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 x \left(1 - \frac{x}{7} + \frac{x^2}{70} - \frac{x^3}{910} + \frac{x^4}{14560} - \frac{x^5}{276640} + O(x^6)\right) \\
&+ \frac{c_2 \left(1 - \frac{x}{3} + \frac{x^2}{18} - \frac{x^3}{162} + \frac{x^4}{1944} - \frac{x^5}{29160} + O(x^6)\right)}{x^{\frac{1}{3}}}
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y = c_1 x \left(1 - \frac{x}{7} + \frac{x^2}{70} - \frac{x^3}{910} + \frac{x^4}{14560} - \frac{x^5}{276640} + O(x^6)\right) \\
+ \frac{c_2 \left(1 - \frac{x}{3} + \frac{x^2}{18} - \frac{x^3}{162} + \frac{x^4}{1944} - \frac{x^5}{29160} + O(x^6)\right)}{x^{\frac{1}{3}}}
\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}
y = c_1 x \left(1 - \frac{x}{7} + \frac{x^2}{70} - \frac{x^3}{910} + \frac{x^4}{14560} - \frac{x^5}{276640} + O(x^6)\right) \\
+ \frac{c_2 \left(1 - \frac{x}{3} + \frac{x^2}{18} - \frac{x^3}{162} + \frac{x^4}{1944} - \frac{x^5}{29160} + O(x^6)\right)}{x^{\frac{1}{3}}}
\end{aligned}$$

Verified OK.

14.17.1 Maple step by step solution

Let's solve

$3x^2y'' + (x^2 + x)\,y' - y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{y}{3x^2} - \frac{(x+1)y'}{3x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x+1)y'}{3x} - \frac{y}{3x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

    $\left[P_2(x) = \frac{x+1}{3x}, P_3(x) = -\frac{1}{3x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

    $\left(x \cdot P_2(x)\right)\bigg|_{x=0} = \frac{1}{3}$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = -\frac{1}{3}$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $3x^2y'' + x(x+1)\,y' - y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$

  ◦ Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

  $$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(1+3r)\,(-1+r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(3k+3r+1)\,(k+r-1) + a_{k-1}(k+r-1)\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(1+3r)\,(-1+r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \left\{1, -\frac{1}{3}\right\}$

- Each term in the series must be 0, giving the recursion relation

  $3\left(\left(k+r+\frac{1}{3}\right) a_k + \frac{a_{k-1}}{3}\right)(k+r-1) = 0$

- Shift index using $k->k+1$

  $3\left(\left(k+\frac{4}{3}+r\right) a_{k+1} + \frac{a_k}{3}\right)(k+r) = 0$

- Recursion relation that defines series solution to ODE

  $a_{k+1} = -\frac{a_k}{3k+4+3r}$

- Recursion relation for $r = 1$

  $a_{k+1} = -\frac{a_k}{3k+7}$

- Solution for $r = 1$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+1} = -\frac{a_k}{3k+7}\right]$

- Recursion relation for $r = -\frac{1}{3}$

  $a_{k+1} = -\frac{a_k}{3k+3}$

- Solution for $r = -\frac{1}{3}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{1}{3}}, a_{k+1} = -\frac{a_k}{3k+3}\right]$

- Combine solutions and rename parameters

  $\left[y = \left(\sum_{k=0}^{\infty} a_k x^{1+k}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k-\frac{1}{3}}\right), a_{1+k} = -\frac{a_k}{3k+7}, b_{1+k} = -\frac{b_k}{3k+3}\right]$

Problem number: 18.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2y'' - y'x + (1 - 2x)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$2x^2y'' - y'x + (1 - 2x)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = -\frac{1}{2x}$$
$$q(x) = -\frac{2x - 1}{2x^2}$$

Table 564: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{1}{2x}$	
singularity	type
$x = 0$	"regular"

$q(x) = -\frac{2x-1}{2x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : [∞]

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2y'' - y'x + (1 - 2x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2 \left(\sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}\right) - \left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) x + (1 - 2x) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-2x^{1+n+r} a_n\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-2x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-2a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) + \sum_{n=1}^{\infty} \left(-2a_{n-1} x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$2x^{n+r} a_n (n+r)(n+r-1) - x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$2x^r a_0 r(-1+r) - x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(2x^r r(-1+r) - x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(2r^2 - 3r + 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$2r^2 - 3r + 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$
\begin{aligned}
r_1 &= 1 \\
r_2 &= \frac{1}{2}
\end{aligned}
$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$
\left(2r^2 - 3r + 1\right) x^r = 0
$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{2}$ is not an integer, then we can construct two linearly independent solutions

$$
\begin{aligned}
y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right) \\
y_2(x) &= x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)
\end{aligned}
$$

Or

$$
\begin{aligned}
y_1(x) &= \sum_{n=0}^{\infty} a_n x^{1+n} \\
y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{2}}
\end{aligned}
$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$
2a_n(n+r)(n+r-1) - a_n(n+r) + a_n - 2a_{n-1} = 0 \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = \frac{2a_{n-1}}{2n^2 + 4nr + 2r^2 - 3n - 3r + 1} \tag{4}
$$

Which for the root $r = 1$ becomes

$$
a_n = \frac{2a_{n-1}}{2n^2 + n} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{2}{2r^2 + r}$$

Which for the root $r = 1$ becomes

$$a_1 = \frac{2}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2}{2r^2+r}$	$\frac{2}{3}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4}{4r^4 + 12r^3 + 11r^2 + 3r}$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{2}{15}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2}{2r^2+r}$	$\frac{2}{3}$
a_2	$\frac{4}{4r^4+12r^3+11r^2+3r}$	$\frac{2}{15}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{8}{r\,(4r^3 + 12r^2 + 11r + 3)\,(2r^2 + 9r + 10)}$$

Which for the root $r = 1$ becomes

$$a_3 = \frac{4}{315}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2}{2r^2+r}$	$\frac{2}{3}$
a_2	$\frac{4}{4r^4+12r^3+11r^2+3r}$	$\frac{2}{15}$
a_3	$\frac{8}{r(4r^3+12r^2+11r+3)(2r^2+9r+10)}$	$\frac{4}{315}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16}{r\left(4r^3+12r^2+11r+3\right)\left(2r^2+9r+10\right)\left(2r^2+13r+21\right)}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{2}{2835}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2}{2r^2+r}$	$\frac{2}{3}$
a_2	$\frac{4}{4r^4+12r^3+11r^2+3r}$	$\frac{2}{15}$
a_3	$\frac{8}{r(4r^3+12r^2+11r+3)(2r^2+9r+10)}$	$\frac{4}{315}$
a_4	$\frac{16}{r(4r^3+12r^2+11r+3)(2r^2+9r+10)(2r^2+13r+21)}$	$\frac{2}{2835}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{32}{r\left(4r^3+12r^2+11r+3\right)\left(2r^2+9r+10\right)\left(2r^2+13r+21\right)\left(2r^2+17r+36\right)}$$

Which for the root $r = 1$ becomes

$$a_5 = \frac{4}{155925}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{2}{2r^2+r}$	$\frac{2}{3}$
a_2	$\frac{4}{4r^4+12r^3+11r^2+3r}$	$\frac{2}{15}$
a_3	$\frac{8}{r(4r^3+12r^2+11r+3)(2r^2+9r+10)}$	$\frac{4}{315}$
a_4	$\frac{16}{r(4r^3+12r^2+11r+3)(2r^2+9r+10)(2r^2+13r+21)}$	$\frac{2}{2835}$
a_5	$\frac{32}{r(4r^3+12r^2+11r+3)(2r^2+9r+10)(2r^2+13r+21)(2r^2+17r+36)}$	$\frac{4}{155925}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x\left(1 + \frac{2x}{3} + \frac{2x^2}{15} + \frac{4x^3}{315} + \frac{2x^4}{2835} + \frac{4x^5}{155925} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$2b_n(n+r)(n+r-1) - b_n(n+r) + b_n - 2b_{n-1} = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = \frac{2b_{n-1}}{2n^2 + 4nr + 2r^2 - 3n - 3r + 1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_n = \frac{2b_{n-1}}{n(2n-1)} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{2}{2r^2 + r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_1 = 2$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2}{2r^2+r}$	2

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{4}{4r^4 + 12r^3 + 11r^2 + 3r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_2 = \frac{2}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2}{2r^2+r}$	2
b_2	$\frac{4}{4r^4+12r^3+11r^2+3r}$	$\frac{2}{3}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{8}{r\left(4r^3 + 12r^2 + 11r + 3\right)\left(2r^2 + 9r + 10\right)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_3 = \frac{4}{45}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2}{2r^2+r}$	2
b_2	$\frac{4}{4r^4+12r^3+11r^2+3r}$	$\frac{2}{3}$
b_3	$\frac{8}{r(4r^3+12r^2+11r+3)(2r^2+9r+10)}$	$\frac{4}{45}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{16}{r\left(4r^3+12r^2+11r+3\right)\left(2r^2+9r+10\right)\left(2r^2+13r+21\right)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_4 = \frac{2}{315}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2}{2r^2+r}$	2
b_2	$\frac{4}{4r^4+12r^3+11r^2+3r}$	$\frac{2}{3}$
b_3	$\frac{8}{r(4r^3+12r^2+11r+3)(2r^2+9r+10)}$	$\frac{4}{45}$
b_4	$\frac{16}{r(4r^3+12r^2+11r+3)(2r^2+9r+10)(2r^2+13r+21)}$	$\frac{2}{315}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{32}{r\left(4r^3+12r^2+11r+3\right)\left(2r^2+9r+10\right)\left(2r^2+13r+21\right)\left(2r^2+17r+36\right)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_5 = \frac{4}{14175}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{2}{2r^2+r}$	2
b_2	$\frac{4}{4r^4+12r^3+11r^2+3r}$	$\frac{2}{3}$
b_3	$\frac{8}{r(4r^3+12r^2+11r+3)(2r^2+9r+10)}$	$\frac{4}{45}$
b_4	$\frac{16}{r(4r^3+12r^2+11r+3)(2r^2+9r+10)(2r^2+13r+21)}$	$\frac{2}{315}$
b_5	$\frac{32}{r(4r^3+12r^2+11r+3)(2r^2+9r+10)(2r^2+13r+21)(2r^2+17r+36)}$	$\frac{4}{14175}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \sqrt{x}\left(1 + 2x + \frac{2x^2}{3} + \frac{4x^3}{45} + \frac{2x^4}{315} + \frac{4x^5}{14175} + O\left(x^6\right)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x\left(1 + \frac{2x}{3} + \frac{2x^2}{15} + \frac{4x^3}{315} + \frac{2x^4}{2835} + \frac{4x^5}{155925} + O\left(x^6\right)\right) \\ &\quad + c_2\sqrt{x}\left(1 + 2x + \frac{2x^2}{3} + \frac{4x^3}{45} + \frac{2x^4}{315} + \frac{4x^5}{14175} + O\left(x^6\right)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x\left(1 + \frac{2x}{3} + \frac{2x^2}{15} + \frac{4x^3}{315} + \frac{2x^4}{2835} + \frac{4x^5}{155925} + O\left(x^6\right)\right) \\ &\quad + c_2\sqrt{x}\left(1 + 2x + \frac{2x^2}{3} + \frac{4x^3}{45} + \frac{2x^4}{315} + \frac{4x^5}{14175} + O\left(x^6\right)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned} y = c_1 x&\left(1 + \frac{2x}{3} + \frac{2x^2}{15} + \frac{4x^3}{315} + \frac{2x^4}{2835} + \frac{4x^5}{155925} + O\left(x^6\right)\right) \\ &+ c_2\sqrt{x}\left(1 + 2x + \frac{2x^2}{3} + \frac{4x^3}{45} + \frac{2x^4}{315} + \frac{4x^5}{14175} + O\left(x^6\right)\right) \end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned} y = c_1 x&\left(1 + \frac{2x}{3} + \frac{2x^2}{15} + \frac{4x^3}{315} + \frac{2x^4}{2835} + \frac{4x^5}{155925} + O\left(x^6\right)\right) \\ &+ c_2\sqrt{x}\left(1 + 2x + \frac{2x^2}{3} + \frac{4x^3}{45} + \frac{2x^4}{315} + \frac{4x^5}{14175} + O\left(x^6\right)\right) \end{aligned}$$

Verified OK.

14.18.1 Maple step by step solution

Let's solve

$2x^2y'' - y'x + (1-2x)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(2x-1)y}{2x^2} + \frac{y'}{2x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{y'}{2x} - \frac{(2x-1)y}{2x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = -\frac{1}{2x}, P_3(x) = -\frac{2x-1}{2x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\Big|_{x=0} = -\frac{1}{2}$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\Big|_{x=0} = \frac{1}{2}$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $2x^2y'' - y'x + (1-2x)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  ◦ Shift index using $k- > k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x \cdot y'$ to series expansion

$$x \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

$$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(-1+2r)\,(-1+r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(2k+2r-1)\,(k+r-1) - 2a_{k-1}\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(-1+2r)\,(-1+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{1, \frac{1}{2}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$2\left(k+r-\frac{1}{2}\right)(k+r-1)\, a_k - 2a_{k-1} = 0$$

- Shift index using $k- >k+1$

$$2\left(k+\frac{1}{2}+r\right)(k+r)\, a_{k+1} - 2a_k = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = \frac{2a_k}{(2k+1+2r)(k+r)}$$

- Recursion relation for $r = 1$

$$a_{k+1} = \frac{2a_k}{(2k+3)(k+1)}$$

- Solution for $r = 1$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+1} = \frac{2a_k}{(2k+3)(k+1)}\right]$$

- Recursion relation for $r = \frac{1}{2}$

$$a_{k+1} = \frac{2a_k}{(2k+2)\left(k+\frac{1}{2}\right)}$$

- Solution for $r = \frac{1}{2}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+1} = \frac{2a_k}{(2k+2)\left(k+\frac{1}{2}\right)}\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k x^{1+k}\right)+\left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{2}}\right), a_{1+k}=\frac{2a_k}{(2k+3)(1+k)}, b_{1+k}=\frac{2b_k}{(2k+2)\left(k+\frac{1}{2}\right)}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 19.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{9x^2y'' + 9y'x - (3x+1)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$9x^2y'' + 9y'x + (-3x-1)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{1}{x}$$
$$q(x) = -\frac{3x+1}{9x^2}$$

Table 566: Table $p(x), q(x)$ singularites.

$p(x) = \frac{1}{x}$	
singularity	type
$x = 0$	"regular"

$q(x) = -\frac{3x+1}{9x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$9x^2y'' + 9y'x + (-3x - 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$9x^2 \left(\sum_{n=0}^{\infty} (n + r)\,(n + r - 1)\, a_n x^{n+r-2}\right) + 9\left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) x + (-3x - 1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)\right) \\
&+ \sum_{n=0}^{\infty} \left(-3x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty} \left(-3x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-3a_{n-1} x^{n+r}\right)
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)\right) \\
&+ \sum_{n=1}^{\infty} \left(-3a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
9x^{n+r} a_n (n+r)(n+r-1) + 9x^{n+r} a_n (n+r) - a_n x^{n+r} = 0
$$

When $n=0$ the above becomes

$$
9x^r a_0 r(-1+r) + 9x^r a_0 r - a_0 x^r = 0
$$

Or

$$
\left(9x^r r(-1+r) + 9x^r r - x^r\right) a_0 = 0
$$

Since $a_0 \neq 0$ then the above simplifies to

$$
\left(9r^2 - 1\right) x^r = 0
$$

Since the above is true for all x then the indicial equation becomes

$$
9r^2 - 1 = 0
$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = -\frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(9r^2 - 1) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{2}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{3}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$9a_n(n + r)(n + r - 1) + 9a_n(n + r) - 3a_{n-1} - a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{3a_{n-1}}{9n^2 + 18nr + 9r^2 - 1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = \frac{a_{n-1}}{n(3n + 2)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{3}{9r^2 + 18r + 8}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_1 = \frac{1}{5}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3}{9r^2+18r+8}$	$\frac{1}{5}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{9}{(9r^2 + 18r + 8)(9r^2 + 36r + 35)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = \frac{1}{80}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3}{9r^2+18r+8}$	$\frac{1}{5}$
a_2	$\frac{9}{(9r^2+18r+8)(9r^2+36r+35)}$	$\frac{1}{80}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{27}{(9r^2 + 18r + 8)(9r^2 + 36r + 35)(9r^2 + 54r + 80)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = \frac{1}{2640}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3}{9r^2+18r+8}$	$\frac{1}{5}$
a_2	$\frac{9}{(9r^2+18r+8)(9r^2+36r+35)}$	$\frac{1}{80}$
a_3	$\frac{27}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)}$	$\frac{1}{2640}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{81}{(9r^2 + 18r + 8)(9r^2 + 36r + 35)(9r^2 + 54r + 80)(9r^2 + 72r + 143)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{1}{147840}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3}{9r^2+18r+8}$	$\frac{1}{5}$
a_2	$\frac{9}{(9r^2+18r+8)(9r^2+36r+35)}$	$\frac{1}{80}$
a_3	$\frac{27}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)}$	$\frac{1}{2640}$
a_4	$\frac{81}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)}$	$\frac{1}{147840}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{243}{(9r^2 + 18r + 8)(9r^2 + 36r + 35)(9r^2 + 54r + 80)(9r^2 + 72r + 143)(9r^2 + 90r + 224)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_5 = \frac{1}{12566400}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3}{9r^2+18r+8}$	$\frac{1}{5}$
a_2	$\frac{9}{(9r^2+18r+8)(9r^2+36r+35)}$	$\frac{1}{80}$
a_3	$\frac{27}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)}$	$\frac{1}{2640}$
a_4	$\frac{81}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)}$	$\frac{1}{147840}$
a_5	$\frac{243}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)(9r^2+90r+224)}$	$\frac{1}{12566400}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^{\frac{1}{3}}\left(1 + \frac{x}{5} + \frac{x^2}{80} + \frac{x^3}{2640} + \frac{x^4}{147840} + \frac{x^5}{12566400} + O(x^6)\right)
\end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$9b_n(n+r)(n+r-1) + 9b_n(n+r) - 3b_{n-1} - b_n = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = \frac{3b_{n-1}}{9n^2 + 18nr + 9r^2 - 1} \tag{4}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_n = \frac{b_{n-1}}{n(3n-2)} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{3}{9r^2 + 18r + 8}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_1 = 1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3}{9r^2+18r+8}$	1

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{9}{(9r^2 + 18r + 8)(9r^2 + 36r + 35)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_2 = \frac{1}{8}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3}{9r^2+18r+8}$	1
b_2	$\frac{9}{(9r^2+18r+8)(9r^2+36r+35)}$	$\frac{1}{8}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{27}{(9r^2 + 18r + 8)(9r^2 + 36r + 35)(9r^2 + 54r + 80)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_3 = \frac{1}{168}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3}{9r^2+18r+8}$	1
b_2	$\frac{9}{(9r^2+18r+8)(9r^2+36r+35)}$	$\frac{1}{8}$
b_3	$\frac{27}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)}$	$\frac{1}{168}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{81}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_4 = \frac{1}{6720}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3}{9r^2+18r+8}$	1
b_2	$\frac{9}{(9r^2+18r+8)(9r^2+36r+35)}$	$\frac{1}{8}$
b_3	$\frac{27}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)}$	$\frac{1}{168}$
b_4	$\frac{81}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)}$	$\frac{1}{6720}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{243}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)(9r^2+90r+224)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_5 = \frac{1}{436800}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3}{9r^2+18r+8}$	1
b_2	$\frac{9}{(9r^2+18r+8)(9r^2+36r+35)}$	$\frac{1}{8}$
b_3	$\frac{27}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)}$	$\frac{1}{168}$
b_4	$\frac{81}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)}$	$\frac{1}{6720}$
b_5	$\frac{243}{(9r^2+18r+8)(9r^2+36r+35)(9r^2+54r+80)(9r^2+72r+143)(9r^2+90r+224)}$	$\frac{1}{436800}$

Using the above table, then the solution $y_2(x)$ is

$$y_2(x) = x^{\frac{1}{3}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right)$$
$$= \frac{1 + x + \frac{x^2}{8} + \frac{x^3}{168} + \frac{x^4}{6720} + \frac{x^5}{436800} + O(x^6)}{x^{\frac{1}{3}}}$$

Therefore the homogeneous solution is

$$y_h(x) = c_1 y_1(x) + c_2 y_2(x)$$
$$= c_1 x^{\frac{1}{3}}\left(1 + \frac{x}{5} + \frac{x^2}{80} + \frac{x^3}{2640} + \frac{x^4}{147840} + \frac{x^5}{12566400} + O(x^6)\right)$$
$$+ \frac{c_2\left(1 + x + \frac{x^2}{8} + \frac{x^3}{168} + \frac{x^4}{6720} + \frac{x^5}{436800} + O(x^6)\right)}{x^{\frac{1}{3}}}$$

Hence the final solution is

$$y = y_h$$
$$= c_1 x^{\frac{1}{3}}\left(1 + \frac{x}{5} + \frac{x^2}{80} + \frac{x^3}{2640} + \frac{x^4}{147840} + \frac{x^5}{12566400} + O(x^6)\right)$$
$$+ \frac{c_2\left(1 + x + \frac{x^2}{8} + \frac{x^3}{168} + \frac{x^4}{6720} + \frac{x^5}{436800} + O(x^6)\right)}{x^{\frac{1}{3}}}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{3}}\left(1 + \frac{x}{5} + \frac{x^2}{80} + \frac{x^3}{2640} + \frac{x^4}{147840} + \frac{x^5}{12566400} + O(x^6)\right) + \frac{c_2\left(1 + x + \frac{x^2}{8} + \frac{x^3}{168} + \frac{x^4}{6720} + \frac{x^5}{436800} + O(x^6)\right)}{x^{\frac{1}{3}}} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{3}}\left(1 + \frac{x}{5} + \frac{x^2}{80} + \frac{x^3}{2640} + \frac{x^4}{147840} + \frac{x^5}{12566400} + O(x^6)\right) + \frac{c_2\left(1 + x + \frac{x^2}{8} + \frac{x^3}{168} + \frac{x^4}{6720} + \frac{x^5}{436800} + O(x^6)\right)}{x^{\frac{1}{3}}}$$

Verified OK.

14.19.1 Maple step by step solution

Let's solve

$9x^2y'' + 9y'x + (-3x - 1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(3x+1)y}{9x^2} - \frac{y'}{x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{y'}{x} - \frac{(3x+1)y}{9x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{1}{x}, P_3(x) = -\frac{3x+1}{9x^2}\right]$

  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $(x \cdot P_2(x))\Big|_{x=0} = 1$

  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $(x^2 \cdot P_3(x))\Big|_{x=0} = -\frac{1}{9}$

  - $x = 0$is a regular singular point

    Check to see if $x_0 = 0$ is a regular singular point

    $x_0 = 0$

- Multiply by denominators

  $9x^2y'' + 9y'x + (-3x - 1)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..1$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  - Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x \cdot y'$ to series expansion

$$x \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

$$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(1+3r)\,(-1+3r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(3k+3r+1)\,(3k+3r-1) - 3a_{k-1}\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1+3r)\,(-1+3r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-\frac{1}{3}, \frac{1}{3}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$a_k(3k+3r+1)\,(3k+3r-1) - 3a_{k-1} = 0$$

- Shift index using $k->k+1$

$$a_{k+1}(3k+4+3r)\,(3k+2+3r) - 3a_k = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = \frac{3a_k}{(3k+4+3r)(3k+2+3r)}$$

- Recursion relation for $r = -\frac{1}{3}$

$$a_{k+1} = \frac{3a_k}{(3k+3)(3k+1)}$$

- Solution for $r = -\frac{1}{3}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{1}{3}}, a_{k+1} = \frac{3a_k}{(3k+3)(3k+1)}\right]$$

- Recursion relation for $r = \frac{1}{3}$

$$a_{k+1} = \frac{3a_k}{(3k+5)(3k+3)}$$

- Solution for $r = \frac{1}{3}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+1} = \frac{3a_k}{(3k+5)(3k+3)}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-\frac{1}{3}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{3}}\right), a_{1+k} = \frac{3a_k}{(3k+3)(3k+1)}, b_{1+k} = \frac{3b_k}{(3k+5)(3k+3)}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 20.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{3x^2y'' + x(x+1)\,y' - (3x+1)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$3x^2y'' + \left(x^2 + x\right)y' + (-3x - 1)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{x+1}{3x}$$
$$q(x) = -\frac{3x+1}{3x^2}$$

Table 568: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x+1}{3x}$	
singularity	type
$x = 0$	"regular"

$q(x) = -\frac{3x+1}{3x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : [∞]

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$3x^2y'' + (x^2 + x) y' + (-3x - 1) y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$3x^2 \left(\sum_{n=0}^{\infty} (n + r) (n + r - 1) a_n x^{n+r-2}\right) + (x^2 + x) \left(\sum_{n=0}^{\infty} (n + r) a_n x^{n+r-1}\right) + (-3x - 1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 3x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)\right) + \sum_{n=0}^{\infty} \left(-3x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-3x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-3a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 3x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)\right) + \sum_{n=1}^{\infty} \left(-3a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$3x^{n+r} a_n(n+r)(n+r-1) + x^{n+r} a_n(n+r) - a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$3x^r a_0 r(-1+r) + x^r a_0 r - a_0 x^r = 0$$

Or

$$\left(3x^r r(-1+r) + x^r r - x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(3r^2 - 2r - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$3r^2 - 2r - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 1 \\ r_2 &= -\frac{1}{3} \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(3r^2 - 2r - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{4}{3}$ is not an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{1+n} \\ y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{3}} \end{aligned}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$3a_n(n+r)(n+r-1) + a_{n-1}(n+r-1) + a_n(n+r) - 3a_{n-1} - a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n+r-4)}{3n^2 + 6nr + 3r^2 - 2n - 2r - 1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{a_{n-1}(n-3)}{n(3n+4)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{3 - r}{r (3r + 4)}$$

Which for the root $r = 1$ becomes

$$a_1 = \frac{2}{7}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-r}{r(3r+4)}$	$\frac{2}{7}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(-3 + r) (-2 + r)}{9r^4 + 42r^3 + 61r^2 + 28r}$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{1}{70}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-r}{r(3r+4)}$	$\frac{2}{7}$
a_2	$\frac{(-3+r)(-2+r)}{9r^4+42r^3+61r^2+28r}$	$\frac{1}{70}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{(-3 + r) (-2 + r) (-1 + r)}{r (9r^3 + 42r^2 + 61r + 28) (3r^2 + 16r + 20)}$$

Which for the root $r = 1$ becomes

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-r}{r(3r+4)}$	$\frac{2}{7}$
a_2	$\frac{(-3+r)(-2+r)}{9r^4+42r^3+61r^2+28r}$	$\frac{1}{70}$
a_3	$-\frac{(-3+r)(-2+r)(-1+r)}{r(9r^3+42r^2+61r+28)(3r^2+16r+20)}$	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(-3+r)(-2+r)(-1+r)}{(9r^3+42r^2+61r+28)(3r^2+16r+20)(3r^2+22r+39)}$$

Which for the root $r = 1$ becomes

$$a_4 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-r}{r(3r+4)}$	$\frac{2}{7}$
a_2	$\frac{(-3+r)(-2+r)}{9r^4+42r^3+61r^2+28r}$	$\frac{1}{70}$
a_3	$-\frac{(-3+r)(-2+r)(-1+r)}{r(9r^3+42r^2+61r+28)(3r^2+16r+20)}$	0
a_4	$\frac{(-3+r)(-2+r)(-1+r)}{(9r^3+42r^2+61r+28)(3r^2+16r+20)(3r^2+22r+39)}$	0

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(-3+r)(-2+r)(-1+r)}{(3r^2+28r+64)(3r^2+22r+39)(3r^2+16r+20)(9r^2+33r+28)}$$

Which for the root $r = 1$ becomes

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{3-r}{r(3r+4)}$	$\frac{2}{7}$
a_2	$\frac{(-3+r)(-2+r)}{9r^4+42r^3+61r^2+28r}$	$\frac{1}{70}$
a_3	$-\frac{(-3+r)(-2+r)(-1+r)}{r(9r^3+42r^2+61r+28)(3r^2+16r+20)}$	0
a_4	$\frac{(-3+r)(-2+r)(-1+r)}{(9r^3+42r^2+61r+28)(3r^2+16r+20)(3r^2+22r+39)}$	0
a_5	$-\frac{(-3+r)(-2+r)(-1+r)}{(3r^2+28r+64)(3r^2+22r+39)(3r^2+16r+20)(9r^2+33r+28)}$	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= x\left(1 + \frac{2x}{7} + \frac{x^2}{70} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$3b_n(n+r)(n+r-1) + b_{n-1}(n+r-1) + b_n(n+r) - 3b_{n-1} - b_n = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{b_{n-1}(n+r-4)}{3n^2 + 6nr + 3r^2 - 2n - 2r - 1} \tag{4}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_n = \frac{-3nb_{n-1} + 13b_{n-1}}{9n^2 - 12n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{3-r}{r(3r+4)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_1 = -\frac{10}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3-r}{r(3r+4)}$	$-\frac{10}{3}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{(-3+r)(-2+r)}{9r^4 + 42r^3 + 61r^2 + 28r}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_2 = -\frac{35}{18}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3-r}{r(3r+4)}$	$-\frac{10}{3}$
b_2	$\frac{(-3+r)(-2+r)}{9r^4+42r^3+61r^2+28r}$	$-\frac{35}{18}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{(-3+r)(-2+r)(-1+r)}{r(9r^3 + 42r^2 + 61r + 28)(3r^2 + 16r + 20)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_3 = -\frac{14}{81}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3-r}{r(3r+4)}$	$-\frac{10}{3}$
b_2	$\frac{(-3+r)(-2+r)}{9r^4+42r^3+61r^2+28r}$	$-\frac{35}{18}$
b_3	$-\frac{(-3+r)(-2+r)(-1+r)}{r(9r^3+42r^2+61r+28)(3r^2+16r+20)}$	$-\frac{14}{81}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{(-3+r)(-2+r)(-1+r)}{(9r^3+42r^2+61r+28)(3r^2+16r+20)(3r^2+22r+39)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_4 = -\frac{7}{3888}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3-r}{r(3r+4)}$	$-\frac{10}{3}$
b_2	$\frac{(-3+r)(-2+r)}{9r^4+42r^3+61r^2+28r}$	$-\frac{35}{18}$
b_3	$-\frac{(-3+r)(-2+r)(-1+r)}{r(9r^3+42r^2+61r+28)(3r^2+16r+20)}$	$-\frac{14}{81}$
b_4	$\frac{(-3+r)(-2+r)(-1+r)}{(9r^3+42r^2+61r+28)(3r^2+16r+20)(3r^2+22r+39)}$	$-\frac{7}{3888}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{(-3+r)(-2+r)(-1+r)}{(3r^2+28r+64)(3r^2+22r+39)(3r^2+16r+20)(9r^2+33r+28)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_5 = \frac{7}{320760}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{3-r}{r(3r+4)}$	$-\frac{10}{3}$
b_2	$\frac{(-3+r)(-2+r)}{9r^4+42r^3+61r^2+28r}$	$-\frac{35}{18}$
b_3	$-\frac{(-3+r)(-2+r)(-1+r)}{r(9r^3+42r^2+61r+28)(3r^2+16r+20)}$	$-\frac{14}{81}$
b_4	$\frac{(-3+r)(-2+r)(-1+r)}{(9r^3+42r^2+61r+28)(3r^2+16r+20)(3r^2+22r+39)}$	$-\frac{7}{3888}$
b_5	$-\frac{(-3+r)(-2+r)(-1+r)}{(3r^2+28r+64)(3r^2+22r+39)(3r^2+16r+20)(9r^2+33r+28)}$	$\frac{7}{320760}$

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= x\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= \frac{1 - \frac{10x}{3} - \frac{35x^2}{18} - \frac{14x^3}{81} - \frac{7x^4}{3888} + \frac{7x^5}{320760} + O(x^6)}{x^{\frac{1}{3}}}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x\left(1 + \frac{2x}{7} + \frac{x^2}{70} + O(x^6)\right) + \frac{c_2\left(1 - \frac{10x}{3} - \frac{35x^2}{18} - \frac{14x^3}{81} - \frac{7x^4}{3888} + \frac{7x^5}{320760} + O(x^6)\right)}{x^{\frac{1}{3}}}
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x\left(1 + \frac{2x}{7} + \frac{x^2}{70} + O(x^6)\right) + \frac{c_2\left(1 - \frac{10x}{3} - \frac{35x^2}{18} - \frac{14x^3}{81} - \frac{7x^4}{3888} + \frac{7x^5}{320760} + O(x^6)\right)}{x^{\frac{1}{3}}}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
y = c_1 x\left(1 + \frac{2x}{7} + \frac{x^2}{70} + O(x^6)\right) + \frac{c_2\left(1 - \frac{10x}{3} - \frac{35x^2}{18} - \frac{14x^3}{81} - \frac{7x^4}{3888} + \frac{7x^5}{320760} + O(x^6)\right)}{x^{\frac{1}{3}}} \tag{1}
$$

Verification of solutions

$$y = c_1 x \left(1 + \frac{2x}{7} + \frac{x^2}{70} + O(x^6)\right) + \frac{c_2 \left(1 - \frac{10x}{3} - \frac{35x^2}{18} - \frac{14x^3}{81} - \frac{7x^4}{3888} + \frac{7x^5}{320760} + O(x^6)\right)}{x^{\frac{1}{3}}}$$

Verified OK.

14.20.1 Maple step by step solution

Let's solve

$3x^2y'' + (x^2 + x)\, y' + (-3x - 1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(3x+1)y}{3x^2} - \frac{(x+1)y'}{3x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x+1)y'}{3x} - \frac{(3x+1)y}{3x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{x+1}{3x}, P_3(x) = -\frac{3x+1}{3x^2}\right]$

  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $\left(x \cdot P_2(x)\right)\Big|_{x=0} = \frac{1}{3}$

  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $\left(x^2 \cdot P_3(x)\right)\Big|_{x=0} = -\frac{1}{3}$

  - $x = 0$is a regular singular point

    Check to see if $x_0 = 0$ is a regular singular point

    $x_0 = 0$

- Multiply by denominators

  $3x^2y'' + x(x + 1)\, y' + (-3x - 1)\, y = 0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k - m$

  $$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

  $$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

  $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

  $$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(1+3r)\,(-1+r)\, x^r + \left(\sum_{k=1}^{\infty} \left(a_k(3k+3r+1)\,(k+r-1) + a_{k-1}(k-4+r)\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(1+3r)\,(-1+r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{1, -\frac{1}{3}\right\}$$

- Each term in the series must be 0, giving the recursion relation

  $$3\left(k+r+\frac{1}{3}\right)(k+r-1)\, a_k + a_{k-1}(k-4+r) = 0$$

- Shift index using $k- >k + 1$

  $$3\left(k+\frac{4}{3}+r\right)(k+r)\, a_{k+1} + a_k(k+r-3) = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+1} = -\frac{a_k(k+r-3)}{(3k+4+3r)(k+r)}$$

- Recursion relation for $r = 1$; series terminates at $k = 2$

$a_{k+1} = -\frac{a_k(k-2)}{(3k+7)(k+1)}$

- Apply recursion relation for $k = 0$

  $a_1 = \frac{2a_0}{7}$

- Apply recursion relation for $k = 1$

  $a_2 = \frac{a_1}{20}$

- Express in terms of a_0

  $a_2 = \frac{a_0}{70}$

- Terminating series solution of the ODE for $r = 1$. Use reduction of order to find the second li

  $y = a_0 \cdot \left(1 + \frac{2}{7}x + \frac{1}{70}x^2\right)$

- Recursion relation for $r = -\frac{1}{3}$

  $a_{k+1} = -\frac{a_k\left(k-\frac{10}{3}\right)}{(3k+3)\left(k-\frac{1}{3}\right)}$

- Solution for $r = -\frac{1}{3}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{1}{3}}, a_{k+1} = -\frac{a_k\left(k-\frac{10}{3}\right)}{(3k+3)\left(k-\frac{1}{3}\right)}\right]$

- Combine solutions and rename parameters

  $\left[y = a_0 \cdot \left(1 + \frac{2}{7}x + \frac{1}{70}x^2\right) + \left(\sum_{k=0}^{\infty} b_k x^{k-\frac{1}{3}}\right), b_{1+k} = -\frac{b_k\left(k-\frac{10}{3}\right)}{(3k+3)\left(k-\frac{1}{3}\right)}\right]$

Problem number: 21.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2(x+3)\,y''+x(1+5x)\,y'+(x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(2x^3+6x^2\right)y''+\left(5x^2+x\right)y'+(x+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{1+5x}{2x\,(x+3)}\\q(x)&=\frac{x+1}{2x^2\,(x+3)}\end{aligned}$$

Table 570: Table $p(x), q(x)$ singularites.

$p(x) = \frac{1+5x}{2x(x+3)}$	
singularity	type
$x = -3$	"regular"
$x = 0$	"regular"

$q(x) = \frac{x+1}{2x^2(x+3)}$	
singularity	type
$x = -3$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-3, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2(x+3)\, y'' + \left(5x^2 + x\right) y' + (x+1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2(x+3) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(5x^2 + x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (x+1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 6x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 5x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 5x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 5a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 2a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 6x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 5a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$6x^{n+r} a_n (n+r)(n+r-1) + x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$6x^r a_0 r(-1+r) + x^r a_0 r + a_0 x^r = 0$$

Or

$$(6x^r r(-1+r) + x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(6r^2 - 5r + 1)\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$6r^2 - 5r + 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = \frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(6r^2 - 5r + 1)\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{6}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{3}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &2a_{n-1}(n+r-1)(n+r-2) + 6a_n(n+r)(n+r-1) \\ &+ 5a_{n-1}(n+r-1) + a_n(n+r) + a_{n-1} + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r)\, a_{n-1}}{3n+3r-1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = \frac{a_{n-1}(-1-2n)}{6n+1} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-1-r}{2+3r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = -\frac{3}{7}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{2+3r}$	$-\frac{3}{7}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{r^2+3r+2}{9r^2+21r+10}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = \frac{15}{91}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{2+3r}$	$-\frac{3}{7}$
a_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	$\frac{15}{91}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-r^3 - 6r^2 - 11r - 6}{27r^3 + 135r^2 + 198r + 80}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = -\frac{15}{247}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{2+3r}$	$-\frac{3}{7}$
a_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	$\frac{15}{91}$
a_3	$\frac{-r^3-6r^2-11r-6}{27r^3+135r^2+198r+80}$	$-\frac{15}{247}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^4 + 10r^3 + 35r^2 + 50r + 24}{81r^4 + 702r^3 + 2079r^2 + 2418r + 880}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{27}{1235}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{2+3r}$	$-\frac{3}{7}$
a_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	$\frac{15}{91}$
a_3	$\frac{-r^3-6r^2-11r-6}{27r^3+135r^2+198r+80}$	$-\frac{15}{247}$
a_4	$\frac{r^4+10r^3+35r^2+50r+24}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{27}{1235}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-r^5 - 15r^4 - 85r^3 - 225r^2 - 274r - 120}{243r^5 + 3240r^4 + 16065r^3 + 36360r^2 + 36492r + 12320}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = -\frac{297}{38285}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-r}{2+3r}$	$-\frac{3}{7}$
a_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	$\frac{15}{91}$
a_3	$\frac{-r^3-6r^2-11r-6}{27r^3+135r^2+198r+80}$	$-\frac{15}{247}$
a_4	$\frac{r^4+10r^3+35r^2+50r+24}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{27}{1235}$
a_5	$\frac{-r^5-15r^4-85r^3-225r^2-274r-120}{243r^5+3240r^4+16065r^3+36360r^2+36492r+12320}$	$-\frac{297}{38285}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6\dots\right) \\ &= \sqrt{x}\left(1 - \frac{3x}{7} + \frac{15x^2}{91} - \frac{15x^3}{247} + \frac{27x^4}{1235} - \frac{297x^5}{38285} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &2b_{n-1}(n+r-1)(n+r-2) + 6b_n(n+r)(n+r-1) \\ &+ 5b_{n-1}(n+r-1) + b_n(n+r) + b_{n-1} + b_n = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{(n+r)\,b_{n-1}}{3n+3r-1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_n = -\frac{(3n+1)\,b_{n-1}}{9n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{-1 - r}{2 + 3r}$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_1 = -\frac{4}{9}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{2+3r}$	$-\frac{4}{9}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{r^2 + 3r + 2}{9r^2 + 21r + 10}$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_2 = \frac{14}{81}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{2+3r}$	$-\frac{4}{9}$
b_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	$\frac{14}{81}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{-r^3 - 6r^2 - 11r - 6}{27r^3 + 135r^2 + 198r + 80}$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_3 = -\frac{140}{2187}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{2+3r}$	$-\frac{4}{9}$
b_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	$\frac{14}{81}$
b_3	$\frac{-r^3-6r^2-11r-6}{27r^3+135r^2+198r+80}$	$-\frac{140}{2187}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^4 + 10r^3 + 35r^2 + 50r + 24}{81r^4 + 702r^3 + 2079r^2 + 2418r + 880}$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_4 = \frac{455}{19683}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{2+3r}$	$-\frac{4}{9}$
b_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	$\frac{14}{81}$
b_3	$\frac{-r^3-6r^2-11r-6}{27r^3+135r^2+198r+80}$	$-\frac{140}{2187}$
b_4	$\frac{r^4+10r^3+35r^2+50r+24}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{455}{19683}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{-r^5 - 15r^4 - 85r^3 - 225r^2 - 274r - 120}{243r^5 + 3240r^4 + 16065r^3 + 36360r^2 + 36492r + 12320}$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_5 = -\frac{1456}{177147}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-r}{2+3r}$	$-\frac{4}{9}$
b_2	$\frac{r^2+3r+2}{9r^2+21r+10}$	$\frac{14}{81}$
b_3	$\frac{-r^3-6r^2-11r-6}{27r^3+135r^2+198r+80}$	$-\frac{140}{2187}$
b_4	$\frac{r^4+10r^3+35r^2+50r+24}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{455}{19683}$
b_5	$\frac{-r^5-15r^4-85r^3-225r^2-274r-120}{243r^5+3240r^4+16065r^3+36360r^2+36492r+12320}$	$-\frac{1456}{177147}$

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= \sqrt{x}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= x^{\frac{1}{3}}\left(1 - \frac{4x}{9} + \frac{14x^2}{81} - \frac{140x^3}{2187} + \frac{455x^4}{19683} - \frac{1456x^5}{177147} + O(x^6)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1\sqrt{x}\left(1 - \frac{3x}{7} + \frac{15x^2}{91} - \frac{15x^3}{247} + \frac{27x^4}{1235} - \frac{297x^5}{38285} + O(x^6)\right) \\
&\quad + c_2 x^{\frac{1}{3}}\left(1 - \frac{4x}{9} + \frac{14x^2}{81} - \frac{140x^3}{2187} + \frac{455x^4}{19683} - \frac{1456x^5}{177147} + O(x^6)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1\sqrt{x}\left(1 - \frac{3x}{7} + \frac{15x^2}{91} - \frac{15x^3}{247} + \frac{27x^4}{1235} - \frac{297x^5}{38285} + O(x^6)\right) \\
&\quad + c_2 x^{\frac{1}{3}}\left(1 - \frac{4x}{9} + \frac{14x^2}{81} - \frac{140x^3}{2187} + \frac{455x^4}{19683} - \frac{1456x^5}{177147} + O(x^6)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1\sqrt{x}\left(1 - \frac{3x}{7} + \frac{15x^2}{91} - \frac{15x^3}{247} + \frac{27x^4}{1235} - \frac{297x^5}{38285} + O(x^6)\right) \\
&\quad + c_2 x^{\frac{1}{3}}\left(1 - \frac{4x}{9} + \frac{14x^2}{81} - \frac{140x^3}{2187} + \frac{455x^4}{19683} - \frac{1456x^5}{177147} + O(x^6)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$y = c_1\sqrt{x}\left(1-\frac{3x}{7}+\frac{15x^2}{91}-\frac{15x^3}{247}+\frac{27x^4}{1235}-\frac{297x^5}{38285}+O(x^6)\right) + c_2x^{\frac{1}{3}}\left(1-\frac{4x}{9}+\frac{14x^2}{81}-\frac{140x^3}{2187}+\frac{455x^4}{19683}-\frac{1456x^5}{177147}+O(x^6)\right)$$

Verified OK.

14.21.1 Maple step by step solution

Let's solve

$2x^2(x+3)\,y''+(5x^2+x)\,y'+(x+1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(x+1)y}{2x^2(x+3)}-\frac{(1+5x)y'}{2x(x+3)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(1+5x)y'}{2x(x+3)}+\frac{(x+1)y}{2x^2(x+3)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{1+5x}{2x(x+3)}, P_3(x)=\frac{x+1}{2x^2(x+3)}\right]$

  - $(x+3)\cdot P_2(x)$ is analytic at $x=-3$

    $\left((x+3)\cdot P_2(x)\right)\Big|_{x=-3}=\frac{7}{3}$

  - $(x+3)^2\cdot P_3(x)$ is analytic at $x=-3$

    $\left((x+3)^2\cdot P_3(x)\right)\Big|_{x=-3}=0$

  - $x=-3$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-3$

- Multiply by denominators

  $2x^2(x+3)\,y''+x(1+5x)\,y'+(x+1)\,y=0$

- Change variables using $x = u - 3$ so that the regular singular point is at $u = 0$

$$\left(2u^3 - 12u^2 + 18u\right)\left(\frac{d^2}{du^2}y(u)\right) + \left(5u^2 - 29u + 42\right)\left(\frac{d}{du}y(u)\right) + (u - 2)\,y(u) = 0$$

- Assume series solution for $y(u)$

$$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$$

□ Rewrite ODE with series expansions

  - Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

$$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

  - Shift index using $k- >k - m$

$$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

$$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k + r)\,u^{k+r-1+m}$$

  - Shift index using $k- >k + 1 - m$

$$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k + 1 - m + r)\,u^{k+r}$$

  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k + r)(k + r - 1)\,u^{k+r-2+m}$$

  - Shift index using $k- >k + 2 - m$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k + 2 - m + r)(k + 1 - m + r)\,u^{k+r}$$

Rewrite ODE with series expansions

$$6a_0r(4 + 3r)\,u^{-1+r} + \left(6a_1(1 + r)(7 + 3r) - a_0\left(12r^2 + 17r + 2\right)\right)u^r + \left(\sum_{k=1}^{\infty}\left(6a_{k+1}(k + r + 1)(3k\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$6r(4 + 3r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{0, -\frac{4}{3}\right\}$$

- Each term must be 0

$$6a_1(1+r)(7+3r) - a_0(12r^2+17r+2) = 0$$

- Each term in the series must be 0, giving the recursion relation

$$2(-6a_k + a_{k-1} + 9a_{k+1})k^2 + (4(-6a_k + a_{k-1} + 9a_{k+1})r - 17a_k - a_{k-1} + 60a_{k+1})k + 2(-6a_k +$$

- Shift index using $k->k+1$

$$2(-6a_{k+1} + a_k + 9a_{k+2})(k+1)^2 + (4(-6a_{k+1} + a_k + 9a_{k+2})r - 17a_{k+1} - a_k + 60a_{k+2})(k+1)$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{2k^2a_k - 12k^2a_{k+1} + 4kra_k - 24kra_{k+1} + 2r^2a_k - 12r^2a_{k+1} + 3ka_k - 41ka_{k+1} + 3ra_k - 41ra_{k+1} + a_k - 31a_{k+1}}{6(3k^2+6kr+3r^2+16k+16r+20)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{2k^2a_k - 12k^2a_{k+1} + 3ka_k - 41ka_{k+1} + a_k - 31a_{k+1}}{6(3k^2+16k+20)}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{2k^2a_k - 12k^2a_{k+1} + 3ka_k - 41ka_{k+1} + a_k - 31a_{k+1}}{6(3k^2+16k+20)}, 42a_1 - 2a_0 = 0\right]$$

- Revert the change of variables $u = x+3$

$$\left[y = \sum_{k=0}^{\infty} a_k(x+3)^k, a_{k+2} = -\frac{2k^2a_k - 12k^2a_{k+1} + 3ka_k - 41ka_{k+1} + a_k - 31a_{k+1}}{6(3k^2+16k+20)}, 42a_1 - 2a_0 = 0\right]$$

- Recursion relation for $r = -\frac{4}{3}$

$$a_{k+2} = -\frac{2k^2a_k - 12k^2a_{k+1} - \frac{7}{3}ka_k - 9ka_{k+1} + \frac{5}{9}a_k + \frac{7}{3}a_{k+1}}{6(3k^2+8k+4)}$$

- Solution for $r = -\frac{4}{3}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{4}{3}}, a_{k+2} = -\frac{2k^2a_k - 12k^2a_{k+1} - \frac{7}{3}ka_k - 9ka_{k+1} + \frac{5}{9}a_k + \frac{7}{3}a_{k+1}}{6(3k^2+8k+4)}, -6a_1 - \frac{2a_0}{3} = 0\right]$$

- Revert the change of variables $u = x+3$

$$\left[y = \sum_{k=0}^{\infty} a_k(x+3)^{k-\frac{4}{3}}, a_{k+2} = -\frac{2k^2a_k - 12k^2a_{k+1} - \frac{7}{3}ka_k - 9ka_{k+1} + \frac{5}{9}a_k + \frac{7}{3}a_{k+1}}{6(3k^2+8k+4)}, -6a_1 - \frac{2a_0}{3} = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k(x+3)^k\right) + \left(\sum_{k=0}^{\infty} b_k(x+3)^{k-\frac{4}{3}}\right), a_{k+2} = -\frac{2k^2a_k - 12k^2a_{1+k} + 3ka_k - 41ka_{1+k} + a_k - 31a_{1+k}}{6(3k^2+16k+20)}, 42a\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 22.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x+4)\,y''-x(-3x+1)\,y'+y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^3+4x^2\right)y''+\left(3x^2-x\right)y'+y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{3x-1}{x\,(x+4)}$$
$$q(x)=\frac{1}{x^2\,(x+4)}$$

Table 572: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3x-1}{x(x+4)}$	
singularity	type
$x = -4$	"regular"
$x = 0$	"regular"

$q(x) = \frac{1}{x^2(x+4)}$	
singularity	type
$x = -4$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-4, 0, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x+4)\, y'' + \left(3x^2 - x\right) y' + y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x+4) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(3x^2 - x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) \\ + \left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} a_{n-1} (n+r-1)(n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 3a_{n-1} (n+r-1) x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} a_{n-1} (n+r-1)(n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) \\ + \left(\sum_{n=1}^{\infty} 3a_{n-1} (n+r-1) x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r)(n+r-1) - x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$4x^r a_0 r(-1+r) - x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(4x^r r(-1+r) - x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 - 5r + 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 - 5r + 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = \frac{1}{4}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 - 5r + 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{3}{4}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{1+n}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{4}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$a_{n-1}(n + r - 1)(n + r - 2) + 4a_n(n + r)(n + r - 1) + 3a_{n-1}(n + r - 1) - a_n(n + r) + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(1 + n + r) a_{n-1}}{4n + 4r - 1} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{(2 + n) a_{n-1}}{4n + 3} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-2 - r}{3 + 4r}$$

Which for the root $r = 1$ becomes

$$a_1 = -\frac{3}{7}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{3+4r}$	$-\frac{3}{7}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{r^2 + 5r + 6}{16r^2 + 40r + 21}$$

Which for the root $r = 1$ becomes

$$a_2 = \frac{12}{77}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{3+4r}$	$-\frac{3}{7}$
a_2	$\frac{r^2+5r+6}{16r^2+40r+21}$	$\frac{12}{77}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-r^3 - 9r^2 - 26r - 24}{64r^3 + 336r^2 + 524r + 231}$$

Which for the root $r = 1$ becomes

$$a_3 = -\frac{4}{77}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{3+4r}$	$-\frac{3}{7}$
a_2	$\frac{r^2+5r+6}{16r^2+40r+21}$	$\frac{12}{77}$
a_3	$\frac{-r^3-9r^2-26r-24}{64r^3+336r^2+524r+231}$	$-\frac{4}{77}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^4 + 14r^3 + 71r^2 + 154r + 120}{256r^4 + 2304r^3 + 7136r^2 + 8784r + 3465}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{24}{1463}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{3+4r}$	$-\frac{3}{7}$
a_2	$\frac{r^2+5r+6}{16r^2+40r+21}$	$\frac{12}{77}$
a_3	$\frac{-r^3-9r^2-26r-24}{64r^3+336r^2+524r+231}$	$-\frac{4}{77}$
a_4	$\frac{r^4+14r^3+71r^2+154r+120}{256r^4+2304r^3+7136r^2+8784r+3465}$	$\frac{24}{1463}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-r^5 - 20r^4 - 155r^3 - 580r^2 - 1044r - 720}{1024r^5 + 14080r^4 + 72320r^3 + 170720r^2 + 180756r + 65835}$$

Which for the root $r = 1$ becomes

$$a_5 = -\frac{24}{4807}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-2-r}{3+4r}$	$-\frac{3}{7}$
a_2	$\frac{r^2+5r+6}{16r^2+40r+21}$	$\frac{12}{77}$
a_3	$\frac{-r^3-9r^2-26r-24}{64r^3+336r^2+524r+231}$	$-\frac{4}{77}$
a_4	$\frac{r^4+14r^3+71r^2+154r+120}{256r^4+2304r^3+7136r^2+8784r+3465}$	$\frac{24}{1463}$
a_5	$\frac{-r^5-20r^4-155r^3-580r^2-1044r-720}{1024r^5+14080r^4+72320r^3+170720r^2+180756r+65835}$	$-\frac{24}{4807}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x\big(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\big) \\ &= x\left(1 - \frac{3x}{7} + \frac{12x^2}{77} - \frac{4x^3}{77} + \frac{24x^4}{1463} - \frac{24x^5}{4807} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \le n$ the recursive equation is

$$\begin{aligned} &b_{n-1}(n+r-1)(n+r-2) + 4b_n(n+r)(n+r-1) \\ &+ 3b_{n-1}(n+r-1) - b_n(n+r) + b_n = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{(1+n+r)\, b_{n-1}}{4n+4r-1} \tag{4}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_n = -\frac{(5+4n)\, b_{n-1}}{16n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{-2 - r}{3 + 4r}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_1 = -\frac{9}{16}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2-r}{3+4r}$	$-\frac{9}{16}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{r^2 + 5r + 6}{16r^2 + 40r + 21}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_2 = \frac{117}{512}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2-r}{3+4r}$	$-\frac{9}{16}$
b_2	$\frac{r^2+5r+6}{16r^2+40r+21}$	$\frac{117}{512}$

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{-r^3 - 9r^2 - 26r - 24}{64r^3 + 336r^2 + 524r + 231}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_3 = -\frac{663}{8192}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2-r}{3+4r}$	$-\frac{9}{16}$
b_2	$\frac{r^2+5r+6}{16r^2+40r+21}$	$\frac{117}{512}$
b_3	$\frac{-r^3-9r^2-26r-24}{64r^3+336r^2+524r+231}$	$-\frac{663}{8192}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^4 + 14r^3 + 71r^2 + 154r + 120}{256r^4 + 2304r^3 + 7136r^2 + 8784r + 3465}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_4 = \frac{13923}{524288}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2-r}{3+4r}$	$-\frac{9}{16}$
b_2	$\frac{r^2+5r+6}{16r^2+40r+21}$	$\frac{117}{512}$
b_3	$\frac{-r^3-9r^2-26r-24}{64r^3+336r^2+524r+231}$	$-\frac{663}{8192}$
b_4	$\frac{r^4+14r^3+71r^2+154r+120}{256r^4+2304r^3+7136r^2+8784r+3465}$	$\frac{13923}{524288}$

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{-r^5 - 20r^4 - 155r^3 - 580r^2 - 1044r - 720}{1024r^5 + 14080r^4 + 72320r^3 + 170720r^2 + 180756r + 65835}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_5 = -\frac{69615}{8388608}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-2-r}{3+4r}$	$-\frac{9}{16}$
b_2	$\frac{r^2+5r+6}{16r^2+40r+21}$	$\frac{117}{512}$
b_3	$\frac{-r^3-9r^2-26r-24}{64r^3+336r^2+524r+231}$	$-\frac{663}{8192}$
b_4	$\frac{r^4+14r^3+71r^2+154r+120}{256r^4+2304r^3+7136r^2+8784r+3465}$	$\frac{13923}{524288}$
b_5	$\frac{-r^5-20r^4-155r^3-580r^2-1044r-720}{1024r^5+14080r^4+72320r^3+170720r^2+180756r+65835}$	$-\frac{69615}{8388608}$

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= x\left(b_0+b_1x+b_2x^2+b_3x^3+b_4x^4+b_5x^5+b_6x^6\dots\right) \\
&= x^{\frac{1}{4}}\left(1-\frac{9x}{16}+\frac{117x^2}{512}-\frac{663x^3}{8192}+\frac{13923x^4}{524288}-\frac{69615x^5}{8388608}+O\left(x^6\right)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1y_1(x)+c_2y_2(x) \\
&= c_1x\left(1-\frac{3x}{7}+\frac{12x^2}{77}-\frac{4x^3}{77}+\frac{24x^4}{1463}-\frac{24x^5}{4807}+O\left(x^6\right)\right) \\
&\quad + c_2x^{\frac{1}{4}}\left(1-\frac{9x}{16}+\frac{117x^2}{512}-\frac{663x^3}{8192}+\frac{13923x^4}{524288}-\frac{69615x^5}{8388608}+O\left(x^6\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1x\left(1-\frac{3x}{7}+\frac{12x^2}{77}-\frac{4x^3}{77}+\frac{24x^4}{1463}-\frac{24x^5}{4807}+O\left(x^6\right)\right) \\
&\quad + c_2x^{\frac{1}{4}}\left(1-\frac{9x}{16}+\frac{117x^2}{512}-\frac{663x^3}{8192}+\frac{13923x^4}{524288}-\frac{69615x^5}{8388608}+O\left(x^6\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1x\left(1-\frac{3x}{7}+\frac{12x^2}{77}-\frac{4x^3}{77}+\frac{24x^4}{1463}-\frac{24x^5}{4807}+O\left(x^6\right)\right) \\
&\quad + c_2x^{\frac{1}{4}}\left(1-\frac{9x}{16}+\frac{117x^2}{512}-\frac{663x^3}{8192}+\frac{13923x^4}{524288}-\frac{69615x^5}{8388608}+O\left(x^6\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$y = c_1 x \left(1 - \frac{3x}{7} + \frac{12x^2}{77} - \frac{4x^3}{77} + \frac{24x^4}{1463} - \frac{24x^5}{4807} + O(x^6)\right) + c_2 x^{\frac{1}{4}} \left(1 - \frac{9x}{16} + \frac{117x^2}{512} - \frac{663x^3}{8192} + \frac{13923x^4}{524288} - \frac{69615x^5}{8388608} + O(x^6)\right)$$

Verified OK.

14.22.1 Maple step by step solution

Let's solve

$x^2(x+4)\, y'' + (3x^2 - x)\, y' + y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{y}{x^2(x+4)} - \frac{(3x-1)y'}{x(x+4)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(3x-1)y'}{x(x+4)} + \frac{y}{x^2(x+4)} = 0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{3x-1}{x(x+4)}, P_3(x) = \frac{1}{x^2(x+4)}\right]$

  - $(x+4) \cdot P_2(x)$ is analytic at $x = -4$

    $\left((x+4) \cdot P_2(x)\right)\bigg|_{x=-4} = \frac{13}{4}$

  - $(x+4)^2 \cdot P_3(x)$ is analytic at $x = -4$

    $\left((x+4)^2 \cdot P_3(x)\right)\bigg|_{x=-4} = 0$

  - $x = -4$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = -4$

- Multiply by denominators

  $x^2(x+4)\, y'' + x(3x-1)\, y' + y = 0$

- Change variables using $x = u - 4$ so that the regular singular point is at $u = 0$

  $(u^3 - 8u^2 + 16u)\left(\frac{d^2}{du^2}y(u)\right) + (3u^2 - 25u + 52)\left(\frac{d}{du}y(u)\right) + y(u) = 0$

- Assume series solution for $y(u)$

  $y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$

  - Shift index using $k- >k+1-m$

    $u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$

  - Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

    $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)(k+r-1)\, u^{k+r-2+m}$

  - Shift index using $k- >k+2-m$

    $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r)\, u^{k+r}$

  Rewrite ODE with series expansions

  $4a_0r(9+4r)\, u^{-1+r} + (4a_1(1+r)(13+4r) - a_0(8r^2+17r-1))\, u^r + \left(\sum_{k=1}^{\infty} (4a_{k+1}(k+1+r)(4k\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $4r(9+4r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \left\{0, -\frac{9}{4}\right\}$

- Each term must be 0

  $4a_1(1+r)(13+4r) - a_0(8r^2+17r-1) = 0$

- Each term in the series must be 0, giving the recursion relation

  $(-8a_k + a_{k-1} + 16a_{k+1})\, k^2 + (2(-8a_k + a_{k-1} + 16a_{k+1})\, r - 17a_k + 68a_{k+1})\, k + (-8a_k + a_{k-1} +$

- Shift index using $k- >k+1$

  $(-8a_{k+1} + a_k + 16a_{k+2})(k+1)^2 + (2(-8a_{k+1} + a_k + 16a_{k+2})\, r - 17a_{k+1} + 68a_{k+2})(k+1) + (-$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{k^2 a_k - 8k^2 a_{k+1} + 2kra_k - 16kra_{k+1} + r^2 a_k - 8r^2 a_{k+1} + 2ka_k - 33ka_{k+1} + 2ra_k - 33ra_{k+1} - 24a_{k+1}}{4(4k^2 + 8kr + 4r^2 + 25k + 25r + 34)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{k^2 a_k - 8k^2 a_{k+1} + 2ka_k - 33ka_{k+1} - 24a_{k+1}}{4(4k^2 + 25k + 34)}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{k^2 a_k - 8k^2 a_{k+1} + 2ka_k - 33ka_{k+1} - 24a_{k+1}}{4(4k^2 + 25k + 34)}, 52a_1 + a_0 = 0\right]$$

- Revert the change of variables $u = x + 4$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+4)^k, a_{k+2} = -\frac{k^2 a_k - 8k^2 a_{k+1} + 2ka_k - 33ka_{k+1} - 24a_{k+1}}{4(4k^2 + 25k + 34)}, 52a_1 + a_0 = 0\right]$$

- Recursion relation for $r = -\frac{9}{4}$

$$a_{k+2} = -\frac{k^2 a_k - 8k^2 a_{k+1} - \frac{5}{2}ka_k + 3ka_{k+1} + \frac{9}{16}a_k + \frac{39}{4}a_{k+1}}{4(4k^2 + 7k - 2)}$$

- Solution for $r = -\frac{9}{4}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{9}{4}}, a_{k+2} = -\frac{k^2 a_k - 8k^2 a_{k+1} - \frac{5}{2}ka_k + 3ka_{k+1} + \frac{9}{16}a_k + \frac{39}{4}a_{k+1}}{4(4k^2 + 7k - 2)}, -20a_1 - \frac{5a_0}{4} = 0\right]$$

- Revert the change of variables $u = x + 4$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+4)^{k-\frac{9}{4}}, a_{k+2} = -\frac{k^2 a_k - 8k^2 a_{k+1} - \frac{5}{2}ka_k + 3ka_{k+1} + \frac{9}{16}a_k + \frac{39}{4}a_{k+1}}{4(4k^2 + 7k - 2)}, -20a_1 - \frac{5a_0}{4} = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k (x+4)^k\right) + \left(\sum_{k=0}^{\infty} b_k (x+4)^{k-\frac{9}{4}}\right), a_{k+2} = -\frac{k^2 a_k - 8k^2 a_{1+k} + 2ka_k - 33ka_{1+k} - 24a_{1+k}}{4(4k^2 + 25k + 34)}, 52a_1 +$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 23.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2y'' + 5y'x + (x + 1)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$2x^2y'' + 5y'x + (x + 1)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$\begin{aligned} p(x) &= \frac{5}{2x} \\ q(x) &= \frac{x + 1}{2x^2} \end{aligned}$$

Table 574: Table $p(x), q(x)$ singularites.

$p(x) = \frac{5}{2x}$	
singularity	type
$x = 0$	"regular"

$q(x) = \frac{x+1}{2x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2y'' + 5y'x + (x+1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + 5\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) x + (x+1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$2x^{n+r} a_n (n+r)(n+r-1) + 5x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$2x^r a_0 r(-1+r) + 5x^r a_0 r + a_0 x^r = 0$$

Or

$$(2x^r r(-1+r) + 5x^r r + x^r) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(2r^2 + 3r + 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$2r^2 + 3r + 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = -\frac{1}{2}$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(2r^2 + 3r + 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{2}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n-\frac{1}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-1}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$2a_n(n + r)(n + r - 1) + 5a_n(n + r) + a_{n-1} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}}{2n^2 + 4nr + 2r^2 + 3n + 3r + 1} \tag{4}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_n = -\frac{a_{n-1}}{2n^2 + n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -\frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{1}{2r^2 + 7r + 6}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_1 = -\frac{1}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{2r^2+7r+6}$	$-\frac{1}{3}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1}{4r^4 + 36r^3 + 119r^2 + 171r + 90}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_2 = \frac{1}{30}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{2r^2+7r+6}$	$-\frac{1}{3}$
a_2	$\frac{1}{4r^4+36r^3+119r^2+171r+90}$	$\frac{1}{30}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{1}{8r^6 + 132r^5 + 890r^4 + 3135r^3 + 6077r^2 + 6138r + 2520}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_3 = -\frac{1}{630}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{2r^2+7r+6}$	$-\frac{1}{3}$
a_2	$\frac{1}{4r^4+36r^3+119r^2+171r+90}$	$\frac{1}{30}$
a_3	$-\frac{1}{8r^6+132r^5+890r^4+3135r^3+6077r^2+6138r+2520}$	$-\frac{1}{630}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{16r^8 + 416r^7 + 4648r^6 + 29120r^5 + 111769r^4 + 268814r^3 + 395127r^2 + 324090r + 113400}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_4 = \frac{1}{22680}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{2r^2+7r+6}$	$-\frac{1}{3}$
a_2	$\frac{1}{4r^4+36r^3+119r^2+171r+90}$	$\frac{1}{30}$
a_3	$-\frac{1}{8r^6+132r^5+890r^4+3135r^3+6077r^2+6138r+2520}$	$-\frac{1}{630}$
a_4	$\frac{1}{16r^8+416r^7+4648r^6+29120r^5+111769r^4+268814r^3+395127r^2+324090r+113400}$	$\frac{1}{22680}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{1}{(16r^8 + 416r^7 + 4648r^6 + 29120r^5 + 111769r^4 + 268814r^3 + 395127r^2 + 324090r + 113400)(2r^2 -}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$a_5 = -\frac{1}{1247400}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{1}{2r^2+7r+6}$	$-\frac{1}{3}$
a_2	$\frac{1}{4r^4+36r^3+119r^2+171r+90}$	$\frac{1}{30}$
a_3	$-\frac{1}{8r^6+132r^5+890r^4+3135r^3+6077r^2+6138r+2520}$	$-\frac{1}{630}$
a_4	$\frac{1}{16r^8+416r^7+4648r^6+29120r^5+111769r^4+268814r^3+395127r^2+324090r+113400}$	$\frac{1}{22680}$
a_5	$-\frac{1}{(16r^8+416r^7+4648r^6+29120r^5+111769r^4+268814r^3+395127r^2+324090r+113400)(2r^2+23r+66)}$	$-\frac{1}{1247400}$

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \frac{1}{\sqrt{x}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= \frac{1 - \frac{x}{3} + \frac{x^2}{30} - \frac{x^3}{630} + \frac{x^4}{22680} - \frac{x^5}{1247400} + O(x^6)}{\sqrt{x}}
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$
2b_n(n+r)(n+r-1) + 5b_n(n+r) + b_{n-1} + b_n = 0 \tag{3}
$$

Solving for b_n from recursive equation (4) gives

$$
b_n = -\frac{b_{n-1}}{2n^2 + 4nr + 2r^2 + 3n + 3r + 1} \tag{4}
$$

Which for the root $r = -1$ becomes

$$
b_n = -\frac{b_{n-1}}{n(2n-1)} \tag{5}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{1}{2r^2 + 7r + 6}$$

Which for the root $r = -1$ becomes

$$b_1 = -1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{2r^2+7r+6}$	-1

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{1}{4r^4 + 36r^3 + 119r^2 + 171r + 90}$$

Which for the root $r = -1$ becomes

$$b_2 = \frac{1}{6}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{2r^2+7r+6}$	-1
b_2	$\frac{1}{4r^4+36r^3+119r^2+171r+90}$	$\frac{1}{6}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{1}{8r^6 + 132r^5 + 890r^4 + 3135r^3 + 6077r^2 + 6138r + 2520}$$

Which for the root $r = -1$ becomes

$$b_3 = -\frac{1}{90}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{2r^2+7r+6}$	-1
b_2	$\frac{1}{4r^4+36r^3+119r^2+171r+90}$	$\frac{1}{6}$
b_3	$-\frac{1}{8r^6+132r^5+890r^4+3135r^3+6077r^2+6138r+2520}$	$-\frac{1}{90}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{1}{16r^8 + 416r^7 + 4648r^6 + 29120r^5 + 111769r^4 + 268814r^3 + 395127r^2 + 324090r + 113400}$$

Which for the root $r = -1$ becomes

$$b_4 = \frac{1}{2520}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{2r^2+7r+6}$	-1
b_2	$\frac{1}{4r^4+36r^3+119r^2+171r+90}$	$\frac{1}{6}$
b_3	$-\frac{1}{8r^6+132r^5+890r^4+3135r^3+6077r^2+6138r+2520}$	$-\frac{1}{90}$
b_4	$\frac{1}{16r^8+416r^7+4648r^6+29120r^5+111769r^4+268814r^3+395127r^2+324090r+113400}$	$\frac{1}{2520}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{1}{(16r^8 + 416r^7 + 4648r^6 + 29120r^5 + 111769r^4 + 268814r^3 + 395127r^2 + 324090r + 113400)\,(2r^2 +$$

Which for the root $r = -1$ becomes

$$b_5 = -\frac{1}{113400}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{1}{2r^2+7r+6}$	-1
b_2	$\frac{1}{4r^4+36r^3+119r^2+171r+90}$	$\frac{1}{6}$
b_3	$-\frac{1}{8r^6+132r^5+890r^4+3135r^3+6077r^2+6138r+2520}$	$-\frac{1}{90}$
b_4	$\frac{1}{16r^8+416r^7+4648r^6+29120r^5+111769r^4+268814r^3+395127r^2+324090r+113400}$	$\frac{1}{2520}$
b_5	$-\frac{1}{(16r^8+416r^7+4648r^6+29120r^5+111769r^4+268814r^3+395127r^2+324090r+113400)(2r^2+23r+66)}$	$-\frac{1}{113400}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned}
y_2(x) &= \frac{1}{\sqrt{x}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= \frac{1 - x + \frac{x^2}{6} - \frac{x^3}{90} + \frac{x^4}{2520} - \frac{x^5}{113400} + O(x^6)}{x}
\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= \frac{c_1\left(1 - \frac{x}{3} + \frac{x^2}{30} - \frac{x^3}{630} + \frac{x^4}{22680} - \frac{x^5}{1247400} + O(x^6)\right)}{\sqrt{x}} \\
&\quad + \frac{c_2\left(1 - x + \frac{x^2}{6} - \frac{x^3}{90} + \frac{x^4}{2520} - \frac{x^5}{113400} + O(x^6)\right)}{x}
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(1 - \frac{x}{3} + \frac{x^2}{30} - \frac{x^3}{630} + \frac{x^4}{22680} - \frac{x^5}{1247400} + O(x^6)\right)}{\sqrt{x}} \\
&\quad + \frac{c_2\left(1 - x + \frac{x^2}{6} - \frac{x^3}{90} + \frac{x^4}{2520} - \frac{x^5}{113400} + O(x^6)\right)}{x}
\end{aligned}$$

Summary

The solution(s) found are the following

$$y = \frac{c_1 \left(1-\frac{x}{3}+\frac{x^2}{30}-\frac{x^3}{630}+\frac{x^4}{22680}-\frac{x^5}{1247400}+O(x^6)\right)}{\sqrt{x}} + \frac{c_2 \left(1-x+\frac{x^2}{6}-\frac{x^3}{90}+\frac{x^4}{2520}-\frac{x^5}{113400}+O(x^6)\right)}{x} \tag{1}$$

Verification of solutions

$$y = \frac{c_1 \left(1-\frac{x}{3}+\frac{x^2}{30}-\frac{x^3}{630}+\frac{x^4}{22680}-\frac{x^5}{1247400}+O(x^6)\right)}{\sqrt{x}} + \frac{c_2 \left(1-x+\frac{x^2}{6}-\frac{x^3}{90}+\frac{x^4}{2520}-\frac{x^5}{113400}+O(x^6)\right)}{x}$$

Verified OK.

Let's solve

$2x^2y''+5y'x+(x+1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{5y'}{2x}-\frac{(x+1)y}{2x^2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{5y'}{2x}+\frac{(x+1)y}{2x^2}=0$

□ Check to see if $x_0=0$ is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{5}{2x}, P_3(x)=\frac{x+1}{2x^2}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $\left.(x\cdot P_2(x))\right|_{x=0}=\frac{5}{2}$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

$\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = \frac{1}{2}$

- $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $2x^2y'' + 5y'x + (x+1)\,y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

- ☐ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..1$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  - Shift index using $k- >k - m$

    $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

  - Convert $x \cdot y'$ to series expansion

    $x \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r}$

  - Convert $x^2 \cdot y''$ to series expansion

    $x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(1+r)\,(1+2r)\,x^r + \left(\sum_{k=1}^{\infty} \left(a_k(k+r+1)\,(2k+2r+1) + a_{k-1}\right) x^{k+r}\right) = 0$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(1+r)\,(1+2r) = 0$

- Values of r that satisfy the indicial equation

  $r \in \left\{-1, -\frac{1}{2}\right\}$

- Each term in the series must be 0, giving the recursion relation

  $2\left(k+r+\frac{1}{2}\right)(k+r+1)\,a_k + a_{k-1} = 0$

- Shift index using $k->k+1$

  $2\left(k+\frac{3}{2}+r\right)\left(k+2+r\right)a_{k+1}+a_{k}=0$
- Recursion relation that defines series solution to ODE

  $a_{k+1}=-\frac{a_{k}}{\left(2k+3+2r\right)\left(k+2+r\right)}$
- Recursion relation for $r=-1$

  $a_{k+1}=-\frac{a_{k}}{\left(2k+1\right)\left(k+1\right)}$
- Solution for $r=-1$

  $\left[y=\sum_{k=0}^{\infty}a_{k}x^{k-1}, a_{k+1}=-\frac{a_{k}}{\left(2k+1\right)\left(k+1\right)}\right]$
- Recursion relation for $r=-\frac{1}{2}$

  $a_{k+1}=-\frac{a_{k}}{\left(2k+2\right)\left(k+\frac{3}{2}\right)}$
- Solution for $r=-\frac{1}{2}$

  $\left[y=\sum_{k=0}^{\infty}a_{k}x^{k-\frac{1}{2}}, a_{k+1}=-\frac{a_{k}}{\left(2k+2\right)\left(k+\frac{3}{2}\right)}\right]$
- Combine solutions and rename parameters

  $\left[y=\left(\sum_{k=0}^{\infty}a_{k}x^{k-1}\right)+\left(\sum_{k=0}^{\infty}b_{k}x^{k-\frac{1}{2}}\right), a_{1+k}=-\frac{a_{k}}{\left(2k+1\right)\left(1+k\right)}, b_{1+k}=-\frac{b_{k}}{\left(2k+2\right)\left(k+\frac{3}{2}\right)}\right]$

Problem number: 24.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x^2(4x+3)\,y''+x(5+18x)\,y'-(1-12x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(4x^3+3x^2\right)y''+\left(18x^2+5x\right)y'+(12x-1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{5+18x}{x\,(4x+3)}\\ q(x)&=\frac{12x-1}{x^2\,(4x+3)}\end{aligned}$$

Table 576: Table $p(x), q(x)$ singularites.

$p(x) = \frac{5+18x}{x(4x+3)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{3}{4}$	"regular"

$q(x) = \frac{12x-1}{x^2(4x+3)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{3}{4}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{3}{4}, \infty\right]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(4x+3)\, y'' + \left(18x^2 + 5x\right) y' + (12x - 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(4x+3) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(18x^2 + 5x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (12x - 1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 18x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 12x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 18x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 18a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 12x^{1+n+r} a_n = \sum_{n=1}^{\infty} 12a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 18a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} 12a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$3x^{n+r} a_n (n+r)(n+r-1) + 5x^{n+r} a_n (n+r) - a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$3x^r a_0 r(-1+r) + 5x^r a_0 r - a_0 x^r = 0$$

Or

$$(3x^r r(-1+r) + 5x^r r - x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(3r^2 + 2r - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$3r^2 + 2r - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(3r^2 + 2r - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{4}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-1}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &4a_{n-1}(n+r-1)(n+r-2) + 3a_n(n+r)(n+r-1) \\ &+ 18a_{n-1}(n+r-1) + 5a_n(n+r) + 12a_{n-1} - a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{2(2n+2r+1)\,a_{n-1}}{3n+3r-1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = -\frac{2(6n+5)\,a_{n-1}}{9n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-4r-6}{2+3r}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_1 = -\frac{22}{9}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r-6}{2+3r}$	$-\frac{22}{9}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{16r^2+64r+60}{9r^2+21r+10}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = \frac{374}{81}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r-6}{2+3r}$	$-\frac{22}{9}$
a_2	$\frac{16r^2+64r+60}{9r^2+21r+10}$	$\frac{374}{81}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-64r^3 - 480r^2 - 1136r - 840}{27r^3 + 135r^2 + 198r + 80}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = -\frac{17204}{2187}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r-6}{2+3r}$	$-\frac{22}{9}$
a_2	$\frac{16r^2+64r+60}{9r^2+21r+10}$	$\frac{374}{81}$
a_3	$\frac{-64r^3-480r^2-1136r-840}{27r^3+135r^2+198r+80}$	$-\frac{17204}{2187}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{256r^4 + 3072r^3 + 13184r^2 + 23808r + 15120}{81r^4 + 702r^3 + 2079r^2 + 2418r + 880}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{249458}{19683}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r-6}{2+3r}$	$-\frac{22}{9}$
a_2	$\frac{16r^2+64r+60}{9r^2+21r+10}$	$\frac{374}{81}$
a_3	$\frac{-64r^3-480r^2-1136r-840}{27r^3+135r^2+198r+80}$	$-\frac{17204}{2187}$
a_4	$\frac{256r^4+3072r^3+13184r^2+23808r+15120}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{249458}{19683}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-1024r^5 - 17920r^4 - 120320r^3 - 385280r^2 - 584256r - 332640}{243r^5 + 3240r^4 + 16065r^3 + 36360r^2 + 36492r + 12320}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_5 = -\frac{3492412}{177147}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r-6}{2+3r}$	$-\frac{22}{9}$
a_2	$\frac{16r^2+64r+60}{9r^2+21r+10}$	$\frac{374}{81}$
a_3	$\frac{-64r^3-480r^2-1136r-840}{27r^3+135r^2+198r+80}$	$-\frac{17204}{2187}$
a_4	$\frac{256r^4+3072r^3+13184r^2+23808r+15120}{81r^4+702r^3+2079r^2+2418r+880}$	$\frac{249458}{19683}$
a_5	$\frac{-1024r^5-17920r^4-120320r^3-385280r^2-584256r-332640}{243r^5+3240r^4+16065r^3+36360r^2+36492r+12320}$	$-\frac{3492412}{177147}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(1 - \frac{22x}{9} + \frac{374x^2}{81} - \frac{17204x^3}{2187} + \frac{249458x^4}{19683} - \frac{3492412x^5}{177147} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &4b_{n-1}(n+r-1)(n+r-2) + 3b_n(n+r)(n+r-1) \\ &+ 18b_{n-1}(n+r-1) + 5b_n(n+r) + 12b_{n-1} - b_n = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{2(2n+2r+1)\, b_{n-1}}{3n+3r-1} \tag{4}$$

Which for the root $r = -1$ becomes

$$b_n = \frac{(-4n+2)\, b_{n-1}}{3n-4} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{-4r - 6}{2 + 3r}$$

Which for the root $r = -1$ becomes

$$b_1 = 2$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-4r-6}{2+3r}$	2

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{16r^2 + 64r + 60}{9r^2 + 21r + 10}$$

Which for the root $r = -1$ becomes

$$b_2 = -6$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-4r-6}{2+3r}$	2
b_2	$\frac{16r^2+64r+60}{9r^2+21r+10}$	-6

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{-64r^3 - 480r^2 - 1136r - 840}{27r^3 + 135r^2 + 198r + 80}$$

Which for the root $r = -1$ becomes

$$b_3 = 12$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-4r-6}{2+3r}$	2
b_2	$\frac{16r^2+64r+60}{9r^2+21r+10}$	-6
b_3	$\frac{-64r^3-480r^2-1136r-840}{27r^3+135r^2+198r+80}$	12

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{256r^4 + 3072r^3 + 13184r^2 + 23808r + 15120}{81r^4 + 702r^3 + 2079r^2 + 2418r + 880}$$

Which for the root $r = -1$ becomes

$$b_4 = -21$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-4r-6}{2+3r}$	2
b_2	$\frac{16r^2+64r+60}{9r^2+21r+10}$	-6
b_3	$\frac{-64r^3-480r^2-1136r-840}{27r^3+135r^2+198r+80}$	12
b_4	$\frac{256r^4+3072r^3+13184r^2+23808r+15120}{81r^4+702r^3+2079r^2+2418r+880}$	-21

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{-1024r^5 - 17920r^4 - 120320r^3 - 385280r^2 - 584256r - 332640}{243r^5 + 3240r^4 + 16065r^3 + 36360r^2 + 36492r + 12320}$$

Which for the root $r = -1$ becomes

$$b_5 = \frac{378}{11}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-4r-6}{2+3r}$	2
b_2	$\frac{16r^2+64r+60}{9r^2+21r+10}$	-6
b_3	$\frac{-64r^3-480r^2-1136r-840}{27r^3+135r^2+198r+80}$	12
b_4	$\frac{256r^4+3072r^3+13184r^2+23808r+15120}{81r^4+702r^3+2079r^2+2418r+880}$	-21
b_5	$\frac{-1024r^5-17920r^4-120320r^3-385280r^2-584256r-332640}{243r^5+3240r^4+16065r^3+36360r^2+36492r+12320}$	$\frac{378}{11}$

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= x^{\frac{1}{3}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= \frac{1 + 2x - 6x^2 + 12x^3 - 21x^4 + \frac{378x^5}{11} + O(x^6)}{x}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{1}{3}}\left(1 - \frac{22x}{9} + \frac{374x^2}{81} - \frac{17204x^3}{2187} + \frac{249458x^4}{19683} - \frac{3492412x^5}{177147} + O(x^6)\right) \\
&\quad + \frac{c_2\left(1 + 2x - 6x^2 + 12x^3 - 21x^4 + \frac{378x^5}{11} + O(x^6)\right)}{x}
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{1}{3}}\left(1 - \frac{22x}{9} + \frac{374x^2}{81} - \frac{17204x^3}{2187} + \frac{249458x^4}{19683} - \frac{3492412x^5}{177147} + O(x^6)\right) \\
&\quad + \frac{c_2\left(1 + 2x - 6x^2 + 12x^3 - 21x^4 + \frac{378x^5}{11} + O(x^6)\right)}{x}
\end{aligned}
$$

Summary
The solution(s) found are the following

$$y = c_1 x^{\frac{1}{3}} \left(1-\frac{22x}{9}+\frac{374x^2}{81}-\frac{17204x^3}{2187}+\frac{249458x^4}{19683}-\frac{3492412x^5}{177147}+O\left(x^6\right)\right) + \frac{c_2 \left(1+2x-6x^2+12x^3-21x^4+\frac{378x^5}{11}+O\left(x^6\right)\right)}{x} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{3}} \left(1-\frac{22x}{9}+\frac{374x^2}{81}-\frac{17204x^3}{2187}+\frac{249458x^4}{19683}-\frac{3492412x^5}{177147}+O\left(x^6\right)\right) + \frac{c_2 \left(1+2x-6x^2+12x^3-21x^4+\frac{378x^5}{11}+O\left(x^6\right)\right)}{x}$$

Verified OK.

14.24.1 Maple step by step solution

Let's solve

$x^2(4x+3)\, y''+(18x^2+5x)\, y'+(12x-1)\, y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(12x-1)y}{x^2(4x+3)}-\frac{(5+18x)y'}{x(4x+3)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(5+18x)y'}{x(4x+3)}+\frac{(12x-1)y}{x^2(4x+3)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x)=\frac{5+18x}{x(4x+3)}, P_3(x)=\frac{12x-1}{x^2(4x+3)}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x=0$

    $\left(x \cdot P_2(x)\right)\bigg|_{x=0}=\frac{5}{3}$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x=0$

    $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0}=-\frac{1}{3}$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2(4x+3)\, y'' + x(5+18x)\, y' + (12x-1)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k- >k-m$

  $x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

- Shift index using $k- >k+1-m$

  $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

  $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k- >k+2-m$

  $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(1+r)\,(-1+3r)\, x^r + \left(\sum_{k=1}^{\infty} (a_k(k+r+1)\,(3k+3r-1) + 2a_{k-1}(k+r+1)\,(2k+1+2r))\, x^{k+\cdots}\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(1+r)\,(-1+3r) = 0$

- Values of r that satisfy the indicial equation

$r \in \left\{-1, \frac{1}{3}\right\}$

- Each term in the series must be 0, giving the recursion relation

$$3\left(\frac{2a_{k-1}(2k+1+2r)}{3} + a_k\left(k+r-\frac{1}{3}\right)\right)(k+r+1) = 0$$

- Shift index using $k- > k+1$

$$3\left(\frac{2a_k(2k+2r+3)}{3} + a_{k+1}\left(k+\frac{2}{3}+r\right)\right)(k+r+2) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = -\frac{2a_k(2k+2r+3)}{3k+2+3r}$$

- Recursion relation for $r = -1$

$$a_{k+1} = -\frac{2a_k(2k+1)}{3k-1}$$

- Solution for $r = -1$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+1} = -\frac{2a_k(2k+1)}{3k-1}\right]$$

- Recursion relation for $r = \frac{1}{3}$

$$a_{k+1} = -\frac{2a_k\left(2k+\frac{11}{3}\right)}{3k+3}$$

- Solution for $r = \frac{1}{3}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+1} = -\frac{2a_k\left(2k+\frac{11}{3}\right)}{3k+3}\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-1}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{3}}\right), a_{1+k} = -\frac{2a_k(2k+1)}{3k-1}, b_{1+k} = -\frac{2b_k\left(2k+\frac{11}{3}\right)}{3k+3}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 25.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{6x^2y'' + x(10 - x)\,y' - (2 + x)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$6x^2y'' + \left(-x^2 + 10x\right)y' + (-x - 2)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = -\frac{x - 10}{6x}$$
$$q(x) = -\frac{2 + x}{6x^2}$$

Table 578: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{x-10}{6x}$	
singularity	type
$x = 0$	"regular"

$q(x) = -\frac{2+x}{6x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : [0]

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$6x^2y'' + (-x^2 + 10x)\, y' + (-x - 2)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$6x^2 \left(\sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2} \right) + (-x^2 + 10x) \left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1} \right) + (-x - 2) \left(\sum_{n=0}^{\infty} a_n x^{n+r} \right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 6x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 10x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-2a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n (n+r)\right) = \sum_{n=1}^{\infty} \left(-a_{n-1}(n+r-1)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n\right) = \sum_{n=1}^{\infty} \left(-a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 6x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=1}^{\infty} \left(-a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 10x^{n+r} a_n (n+r)\right) + \sum_{n=1}^{\infty} \left(-a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-2a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n = 0$. From Eq (2B) this gives

$$6x^{n+r} a_n (n+r)(n+r-1) + 10x^{n+r} a_n (n+r) - 2a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$6x^r a_0 r(-1+r) + 10x^r a_0 r - 2a_0 x^r = 0$$

Or

$$\left(6x^r r(-1+r) + 10x^r r - 2x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(6r^2 + 4r - 2\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$6r^2 + 4r - 2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(6r^2 + 4r - 2\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{4}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-1}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$6a_n(n+r)(n+r-1) - a_{n-1}(n+r-1) + 10a_n(n+r) - a_{n-1} - 2a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = \frac{a_{n-1}(n+r)}{6n^2 + 12nr + 6r^2 + 4n + 4r - 2} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = \frac{a_{n-1}(3n+1)}{6n\,(3n+4)} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{1+r}{6r^2 + 16r + 8}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_1 = \frac{2}{21}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1+r}{6r^2+16r+8}$	$\frac{2}{21}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{1+r}{36r^3 + 192r^2 + 292r + 120}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = \frac{1}{180}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1+r}{6r^2+16r+8}$	$\frac{2}{21}$
a_2	$\frac{1+r}{36r^3+192r^2+292r+120}$	$\frac{1}{180}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{1+r}{216r^4 + 1944r^3 + 5904r^2 + 6976r + 2560}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = \frac{1}{4212}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1+r}{6r^2+16r+8}$	$\frac{2}{21}$
a_2	$\frac{1+r}{36r^3+192r^2+292r+120}$	$\frac{1}{180}$
a_3	$\frac{1+r}{216r^4+1944r^3+5904r^2+6976r+2560}$	$\frac{1}{4212}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1+r}{1296r^5 + 17712r^4 + 89424r^3 + 205008r^2 + 207520r + 70400}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{1}{124416}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1+r}{6r^2+16r+8}$	$\frac{2}{21}$
a_2	$\frac{1+r}{36r^3+192r^2+292r+120}$	$\frac{1}{180}$
a_3	$\frac{1+r}{216r^4+1944r^3+5904r^2+6976r+2560}$	$\frac{1}{4212}$
a_4	$\frac{1+r}{1296r^5+17712r^4+89424r^3+205008r^2+207520r+70400}$	$\frac{1}{124416}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{1+r}{32\left(3r^2 + 32r + 84\right)\left(81r^4 + 702r^3 + 2079r^2 + 2418r + 880\right)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_5 = \frac{1}{4432320}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{1+r}{6r^2+16r+8}$	$\frac{2}{21}$
a_2	$\frac{1+r}{36r^3+192r^2+292r+120}$	$\frac{1}{180}$
a_3	$\frac{1+r}{216r^4+1944r^3+5904r^2+6976r+2560}$	$\frac{1}{4212}$
a_4	$\frac{1+r}{1296r^5+17712r^4+89424r^3+205008r^2+207520r+70400}$	$\frac{1}{124416}$
a_5	$\frac{1+r}{32(3r^2+32r+84)(81r^4+702r^3+2079r^2+2418r+880)}$	$\frac{1}{4432320}$

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^{\frac{1}{3}}\left(1 + \frac{2x}{21} + \frac{x^2}{180} + \frac{x^3}{4212} + \frac{x^4}{124416} + \frac{x^5}{4432320} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$
6b_n(n+r)(n+r-1) - b_{n-1}(n+r-1) + 10b_n(n+r) - b_{n-1} - 2b_n = 0 \tag{3}
$$

Solving for b_n from recursive equation (4) gives

$$
b_n = \frac{b_{n-1}(n+r)}{6n^2 + 12nr + 6r^2 + 4n + 4r - 2} \tag{4}
$$

Which for the root $r = -1$ becomes

$$
b_n = \frac{b_{n-1}(n-1)}{6n^2 - 8n} \tag{5}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{1+r}{6r^2+16r+8}$$

Which for the root $r = -1$ becomes

$$b_1 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{1+r}{6r^2+16r+8}$	0

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{1+r}{36r^3+192r^2+292r+120}$$

Which for the root $r = -1$ becomes

$$b_2 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{1+r}{6r^2+16r+8}$	0
b_2	$\frac{1+r}{36r^3+192r^2+292r+120}$	0

For $n = 3$, using the above recursive equation gives

$$b_3 = \frac{1+r}{216r^4+1944r^3+5904r^2+6976r+2560}$$

Which for the root $r = -1$ becomes

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{1+r}{6r^2+16r+8}$	0
b_2	$\frac{1+r}{36r^3+192r^2+292r+120}$	0
b_3	$\frac{1+r}{216r^4+1944r^3+5904r^2+6976r+2560}$	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{1+r}{1296r^5 + 17712r^4 + 89424r^3 + 205008r^2 + 207520r + 70400}$$

Which for the root $r = -1$ becomes

$$b_4 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{1+r}{6r^2+16r+8}$	0
b_2	$\frac{1+r}{36r^3+192r^2+292r+120}$	0
b_3	$\frac{1+r}{216r^4+1944r^3+5904r^2+6976r+2560}$	0
b_4	$\frac{1+r}{1296r^5+17712r^4+89424r^3+205008r^2+207520r+70400}$	0

For $n = 5$, using the above recursive equation gives

$$b_5 = \frac{1+r}{32\,(3r^2 + 32r + 84)\,(81r^4 + 702r^3 + 2079r^2 + 2418r + 880)}$$

Which for the root $r = -1$ becomes

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{1+r}{6r^2+16r+8}$	0
b_2	$\frac{1+r}{36r^3+192r^2+292r+120}$	0
b_3	$\frac{1+r}{216r^4+1944r^3+5904r^2+6976r+2560}$	0
b_4	$\frac{1+r}{1296r^5+17712r^4+89424r^3+205008r^2+207520r+70400}$	0
b_5	$\frac{1+r}{32(3r^2+32r+84)(81r^4+702r^3+2079r^2+2418r+880)}$	0

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= x^{\frac{1}{3}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= \frac{1 + O(x^6)}{x}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{1}{3}}\left(1 + \frac{2x}{21} + \frac{x^2}{180} + \frac{x^3}{4212} + \frac{x^4}{124416} + \frac{x^5}{4432320} + O(x^6)\right) + \frac{c_2(1 + O(x^6))}{x}
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{1}{3}}\left(1 + \frac{2x}{21} + \frac{x^2}{180} + \frac{x^3}{4212} + \frac{x^4}{124416} + \frac{x^5}{4432320} + O(x^6)\right) + \frac{c_2(1 + O(x^6))}{x}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
y = c_1 x^{\frac{1}{3}}\left(1 + \frac{2x}{21} + \frac{x^2}{180} + \frac{x^3}{4212} + \frac{x^4}{124416} + \frac{x^5}{4432320} + O(x^6)\right) + \frac{c_2(1 + O(x^6))}{x} \tag{1}
$$

Verification of solutions

$$
y = c_1 x^{\frac{1}{3}}\left(1 + \frac{2x}{21} + \frac{x^2}{180} + \frac{x^3}{4212} + \frac{x^4}{124416} + \frac{x^5}{4432320} + O(x^6)\right) + \frac{c_2(1 + O(x^6))}{x}
$$

Verified OK.

14.25.1 Maple step by step solution

Let's solve

$6x^2y'' + (-x^2 + 10x)\, y' + (-x - 2)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = \frac{(2+x)y}{6x^2} + \frac{(x-10)y'}{6x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' - \frac{(x-10)y'}{6x} - \frac{(2+x)y}{6x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = -\frac{x-10}{6x}, P_3(x) = -\frac{2+x}{6x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\bigg|_{x=0} = \frac{5}{3}$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\bigg|_{x=0} = -\frac{1}{3}$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $6x^2y'' - x(x - 10)\, y' + (-x - 2)\, y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

  ◦ Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- Shift index using $k- > k+1-m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^2 \cdot y''$ to series expansion

$$x^2 \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r}$$

Rewrite ODE with series expansions

$$2a_0(1+r)\,(-1+3r)\, x^r + \left(\sum_{k=1}^{\infty} \left(2a_k(k+r+1)\,(3k+3r-1) - a_{k-1}(k+r)\right) x^{k+r}\right) = 0$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$2(1+r)\,(-1+3r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-1, \frac{1}{3}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$6\left(k+r-\frac{1}{3}\right)(k+r+1)\, a_k - a_{k-1}(k+r) = 0$$

- Shift index using $k- > k+1$

$$6\left(k+\frac{2}{3}+r\right)(k+2+r)\, a_{k+1} - a_k(k+r+1) = 0$$

- Recursion relation that defines series solution to ODE

$$a_{k+1} = \frac{a_k(k+r+1)}{2(3k+2+3r)(k+2+r)}$$

- Recursion relation for $r = -1$

$$a_{k+1} = \frac{a_k k}{2(3k-1)(k+1)}$$

- Solution for $r = -1$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+1} = \frac{a_k k}{2(3k-1)(k+1)}\right]$$

- Recursion relation for $r = \frac{1}{3}$

$$a_{k+1} = \frac{a_k\left(k+\frac{4}{3}\right)}{2(3k+3)\left(k+\frac{7}{3}\right)}$$

- Solution for $r = \frac{1}{3}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+1} = \frac{a_k \left(k+\frac{4}{3}\right)}{2(3k+3)\left(k+\frac{7}{3}\right)}\right]$$

- Combine solutions and rename parameters

  $$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-1}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{3}}\right), a_{1+k} = \frac{a_k k}{2(3k-1)(1+k)}, b_{1+k} = \frac{b_k \left(k+\frac{4}{3}\right)}{2(3k+3)\left(k+\frac{7}{3}\right)}\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 28.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x+8)\,y''+x(3x+2)\,y'+(x+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^3+8x^2\right)y''+\left(3x^2+2x\right)y'+(x+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{3x+2}{x\,(x+8)}$$
$$q(x)=\frac{x+1}{x^2\,(x+8)}$$

Table 580: Table $p(x), q(x)$ singularites.

$p(x) = \frac{3x+2}{x(x+8)}$	
singularity	type
$x = -8$	"regular"
$x = 0$	"regular"

$q(x) = \frac{x+1}{x^2(x+8)}$	
singularity	type
$x = -8$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-8, 0, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x+8)\, y'' + \left(3x^2+2x\right) y' + (x+1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x+8) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(3x^2+2x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (x+1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 3a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 3a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$8x^{n+r} a_n (n+r)(n+r-1) + 2x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$8x^r a_0 r(-1+r) + 2x^r a_0 r + a_0 x^r = 0$$

Or

$$(8x^r r(-1+r) + 2x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(8r^2 - 6r + 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$8r^2 - 6r + 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = \frac{1}{4}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(8r^2 - 6r + 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{4}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{4}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-1}(n+r-1)(n+r-2) + 8a_n(n+r)(n+r-1) \\ + 3a_{n-1}(n+r-1) + 2a_n(n+r) + a_{n-1} + a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n^2 + 2nr + r^2)}{8n^2 + 16nr + 8r^2 - 6n - 6r + 1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{a_{n-1}(2n + 1)^2}{32n^2 + 8n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = -\frac{(r + 1)^2}{8r^2 + 10r + 3}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = -\frac{9}{40}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(r+1)^2}{8r^2+10r+3}$	$-\frac{9}{40}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(r + 1)^2 (r + 2)^2}{64r^4 + 288r^3 + 452r^2 + 288r + 63}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = \frac{5}{128}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(r+1)^2}{8r^2+10r+3}$	$-\frac{9}{40}$
a_2	$\frac{(r+1)^2(r+2)^2}{64r^4+288r^3+452r^2+288r+63}$	$\frac{5}{128}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{(r+1)^2 (r+2)^2 (r+3)^2}{512r^6 + 4992r^5 + 19232r^4 + 37128r^3 + 37460r^2 + 18486r + 3465}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = -\frac{245}{39936}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(r+1)^2}{8r^2+10r+3}$	$-\frac{9}{40}$
a_2	$\frac{(r+1)^2(r+2)^2}{64r^4+288r^3+452r^2+288r+63}$	$\frac{5}{128}$
a_3	$-\frac{(r+1)^2(r+2)^2(r+3)^2}{512r^6+4992r^5+19232r^4+37128r^3+37460r^2+18486r+3465}$	$-\frac{245}{39936}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(r+1)^2 (r+2)^2 (r+3)^2 (r+4)^2}{(512r^6 + 4992r^5 + 19232r^4 + 37128r^3 + 37460r^2 + 18486r + 3465)(8r^2 + 58r + 105)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{6615}{7241728}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(r+1)^2}{8r^2+10r+3}$	$-\frac{9}{40}$
a_2	$\frac{(r+1)^2(r+2)^2}{64r^4+288r^3+452r^2+288r+63}$	$\frac{5}{128}$
a_3	$-\frac{(r+1)^2(r+2)^2(r+3)^2}{512r^6+4992r^5+19232r^4+37128r^3+37460r^2+18486r+3465}$	$-\frac{245}{39936}$
a_4	$\frac{(r+1)^2(r+2)^2(r+3)^2(r+4)^2}{(512r^6+4992r^5+19232r^4+37128r^3+37460r^2+18486r+3465)(8r^2+58r+105)}$	$\frac{6615}{7241728}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(r+1)^2 (r+2)^2 (r+3)^2 (r+4)^2 (r+5)^2}{(512r^6 + 4992r^5 + 19232r^4 + 37128r^3 + 37460r^2 + 18486r + 3465) (8r^2 + 58r + 105) (8r^2 + 74r +$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = -\frac{7623}{57933824}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$-\frac{(r+1)^2}{8r^2+10r+3}$	$-\frac{9}{40}$
a_2	$\frac{(r+1)^2(r+2)^2}{64r^4+288r^3+452r^2+288r+63}$	$\frac{5}{128}$
a_3	$-\frac{(r+1)^2(r+2)^2(r+3)^2}{512r^6+4992r^5+19232r^4+37128r^3+37460r^2+18486r+3465}$	$-\frac{245}{39936}$
a_4	$\frac{(r+1)^2(r+2)^2(r+3)^2(r+4)^2}{(512r^6+4992r^5+19232r^4+37128r^3+37460r^2+18486r+3465)(8r^2+58r+105)}$	$\frac{6615}{7241728}$
a_5	$-\frac{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}{(512r^6+4992r^5+19232r^4+37128r^3+37460r^2+18486r+3465)(8r^2+58r+105)(8r^2+74r+171)}$	$-\frac{7623}{57933824}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \sqrt{x}\left(1 - \frac{9x}{40} + \frac{5x^2}{128} - \frac{245x^3}{39936} + \frac{6615x^4}{7241728} - \frac{7623x^5}{57933824} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$b_{n-1}(n+r-1)(n+r-2) + 8b_n(n+r)(n+r-1) + 3b_{n-1}(n+r-1) + 2b_n(n+r) + b_{n-1} + b_n = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{b_{n-1}(n^2 + 2nr + r^2)}{8n^2 + 16nr + 8r^2 - 6n - 6r + 1} \tag{4}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_n = -\frac{b_{n-1}(4n+1)^2}{128n^2 - 32n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{(r+1)^2}{8r^2 + 10r + 3}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_1 = -\frac{25}{96}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{(r+1)^2}{8r^2+10r+3}$	$-\frac{25}{96}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{(r+1)^2 (r+2)^2}{64r^4 + 288r^3 + 452r^2 + 288r + 63}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_2 = \frac{675}{14336}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{(r+1)^2}{8r^2+10r+3}$	$-\frac{25}{96}$
b_2	$\frac{(r+1)^2(r+2)^2}{64r^4+288r^3+452r^2+288r+63}$	$\frac{675}{14336}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{(r+1)^2 (r+2)^2 (r+3)^2}{512r^6 + 4992r^5 + 19232r^4 + 37128r^3 + 37460r^2 + 18486r + 3465}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_3 = -\frac{38025}{5046272}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{(r+1)^2}{8r^2+10r+3}$	$-\frac{25}{96}$
b_2	$\frac{(r+1)^2(r+2)^2}{64r^4+288r^3+452r^2+288r+63}$	$\frac{675}{14336}$
b_3	$-\frac{(r+1)^2(r+2)^2(r+3)^2}{512r^6+4992r^5+19232r^4+37128r^3+37460r^2+18486r+3465}$	$-\frac{38025}{5046272}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{(r+1)^2 (r+2)^2 (r+3)^2 (r+4)^2}{(512r^6 + 4992r^5 + 19232r^4 + 37128r^3 + 37460r^2 + 18486r + 3465)(8r^2 + 58r + 105)}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_4 = \frac{732615}{645922816}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{(r+1)^2}{8r^2+10r+3}$	$-\frac{25}{96}$
b_2	$\frac{(r+1)^2(r+2)^2}{64r^4+288r^3+452r^2+288r+63}$	$\frac{675}{14336}$
b_3	$-\frac{(r+1)^2(r+2)^2(r+3)^2}{512r^6+4992r^5+19232r^4+37128r^3+37460r^2+18486r+3465}$	$-\frac{38025}{5046272}$
b_4	$\frac{(r+1)^2(r+2)^2(r+3)^2(r+4)^2}{(512r^6+4992r^5+19232r^4+37128r^3+37460r^2+18486r+3465)(8r^2+58r+105)}$	$\frac{732615}{645922816}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{(r+1)^2 (r+2)^2 (r+3)^2 (r+4)^2 (r+5)^2}{(512r^6 + 4992r^5 + 19232r^4 + 37128r^3 + 37460r^2 + 18486r + 3465) (8r^2 + 58r + 105) (8r^2 + 74r +}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_5 = -\frac{9230949}{56103010304}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$-\frac{(r+1)^2}{8r^2+10r+3}$	$-\frac{25}{96}$
b_2	$\frac{(r+1)^2(r+2)^2}{64r^4+288r^3+452r^2+288r+63}$	$\frac{675}{14336}$
b_3	$-\frac{(r+1)^2(r+2)^2(r+3)^2}{512r^6+4992r^5+19232r^4+37128r^3+37460r^2+18486r+3465}$	$-\frac{38025}{5046272}$
b_4	$\frac{(r+1)^2(r+2)^2(r+3)^2(r+4)^2}{(512r^6+4992r^5+19232r^4+37128r^3+37460r^2+18486r+3465)(8r^2+58r+105)}$	$\frac{732615}{645922816}$
b_5	$-\frac{(r+1)^2(r+2)^2(r+3)^2(r+4)^2(r+5)^2}{(512r^6+4992r^5+19232r^4+37128r^3+37460r^2+18486r+3465)(8r^2+58r+105)(8r^2+74r+171)}$	$-\frac{9230949}{56103010304}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= \sqrt{x}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= x^{\frac{1}{4}}\left(1 - \frac{25x}{96} + \frac{675x^2}{14336} - \frac{38025x^3}{5046272} + \frac{732615x^4}{645922816} - \frac{9230949x^5}{56103010304} + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 \sqrt{x}\left(1-\frac{9x}{40}+\frac{5x^2}{128}-\frac{245x^3}{39936}+\frac{6615x^4}{7241728}-\frac{7623x^5}{57933824}+O\left(x^6\right)\right) \\
&\quad + c_2 x^{\frac{1}{4}}\left(1-\frac{25x}{96}+\frac{675x^2}{14336}-\frac{38025x^3}{5046272}+\frac{732615x^4}{645922816}-\frac{9230949x^5}{56103010304}+O\left(x^6\right)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 \sqrt{x}\left(1-\frac{9x}{40}+\frac{5x^2}{128}-\frac{245x^3}{39936}+\frac{6615x^4}{7241728}-\frac{7623x^5}{57933824}+O\left(x^6\right)\right) \\
&\quad + c_2 x^{\frac{1}{4}}\left(1-\frac{25x}{96}+\frac{675x^2}{14336}-\frac{38025x^3}{5046272}+\frac{732615x^4}{645922816}-\frac{9230949x^5}{56103010304}+O\left(x^6\right)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y &= c_1 \sqrt{x}\left(1-\frac{9x}{40}+\frac{5x^2}{128}-\frac{245x^3}{39936}+\frac{6615x^4}{7241728}-\frac{7623x^5}{57933824}+O\left(x^6\right)\right) \\
&\quad + c_2 x^{\frac{1}{4}}\left(1-\frac{25x}{96}+\frac{675x^2}{14336}-\frac{38025x^3}{5046272}+\frac{732615x^4}{645922816}-\frac{9230949x^5}{56103010304}+O\left(x^6\right)\right)
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y &= c_1 \sqrt{x}\left(1-\frac{9x}{40}+\frac{5x^2}{128}-\frac{245x^3}{39936}+\frac{6615x^4}{7241728}-\frac{7623x^5}{57933824}+O\left(x^6\right)\right) \\
&\quad + c_2 x^{\frac{1}{4}}\left(1-\frac{25x}{96}+\frac{675x^2}{14336}-\frac{38025x^3}{5046272}+\frac{732615x^4}{645922816}-\frac{9230949x^5}{56103010304}+O\left(x^6\right)\right)
\end{aligned}
$$

Verified OK.

14.26.1 Maple step by step solution

Let's solve

$x^2(x+8)\,y''+(3x^2+2x)\,y'+(x+1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(x+1)y}{x^2(x+8)}-\frac{(3x+2)y'}{x(x+8)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(3x+2)y'}{x(x+8)}+\frac{(x+1)y}{x^2(x+8)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{3x+2}{x(x+8)},P_3(x)=\frac{x+1}{x^2(x+8)}\right]$

  - $(x+8)\cdot P_2(x)$ is analytic at $x=-8$

    $\left((x+8)\cdot P_2(x)\right)\Big|_{x=-8}=\frac{11}{4}$

  - $(x+8)^2\cdot P_3(x)$ is analytic at $x=-8$

    $\left((x+8)^2\cdot P_3(x)\right)\Big|_{x=-8}=0$

  - $x=-8$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-8$

- Multiply by denominators

  $x^2(x+8)\,y''+x(3x+2)\,y'+(x+1)\,y=0$

- Change variables using $x=u-8$ so that the regular singular point is at $u=0$

  $(u^3-16u^2+64u)\left(\frac{d^2}{du^2}y(u)\right)+(3u^2-46u+176)\left(\frac{d}{du}y(u)\right)+(u-7)\,y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

  $$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

- Shift index using $k- >k - m$

  $$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$16a_0r(7+4r)\, u^{-1+r} + (16a_1(1+r)\,(11+4r) - a_0(16r^2+30r+7))\, u^r + \left(\sum_{k=1}^{\infty} (16a_{k+1}(k+r+1$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$16r(7+4r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{0, -\frac{7}{4}\right\}$$

- Each term must be 0

  $$16a_1(1+r)\,(11+4r) - a_0(16r^2+30r+7) = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$64\left(k+\frac{11}{4}+r\right)(k+r+1)\, a_{k+1} - a_k(16k^2+32kr+16r^2+30k+30r+7) + a_{k-1}(k+r)^2 = 0$$

- Shift index using $k- >k + 1$

  $$64\left(k+\frac{15}{4}+r\right)(k+2+r)\, a_{k+2} - a_{k+1}\left(16(k+1)^2+32(k+1)\, r+16r^2+30k+37+30r\right) + a_k($$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{k^2 a_k -16 k^2 a_{k+1}+2 k r a_k -32 k r a_{k+1}+r^2 a_k -16 r^2 a_{k+1}+2 k a_k -62 k a_{k+1}+2 r a_k -62 r a_{k+1}+a_k -53 a_{k+1}}{16 (4 k +15+4 r) (k +2+r)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{k^2 a_k -16 k^2 a_{k+1}+2 k a_k -62 k a_{k+1}+a_k -53 a_{k+1}}{16 (4 k +15) (k +2)}$$

- Solution for $r = 0$

$$\left[y \left(u \right) = \sum_{k =0}^{\infty} a_k u^{k}, a_{k+2} = -\frac{k^2 a_k -16 k^2 a_{k+1}+2 k a_k -62 k a_{k+1}+a_k -53 a_{k+1}}{16 (4 k +15) (k +2)}, 176 a_1 -7 a_0 = 0\right]$$

- Revert the change of variables $u = x +8$

$$\left[y = \sum_{k =0}^{\infty} a_k \left(x +8\right)^{k}, a_{k+2} = -\frac{k^2 a_k -16 k^2 a_{k+1}+2 k a_k -62 k a_{k+1}+a_k -53 a_{k+1}}{16 (4 k +15) (k +2)}, 176 a_1 -7 a_0 = 0\right]$$

- Recursion relation for $r = -\frac{7}{4}$

$$a_{k+2} = -\frac{k^2 a_k -16 k^2 a_{k+1}-\frac{3}{2} k a_k -6 k a_{k+1}+\frac{9}{16} a_k +\frac{13}{2} a_{k+1}}{16 (4 k +8) \left(k +\frac{1}{4}\right)}$$

- Solution for $r = -\frac{7}{4}$

$$\left[y \left(u \right) = \sum_{k =0}^{\infty} a_k u^{k -\frac{7}{4}}, a_{k+2} = -\frac{k^2 a_k -16 k^2 a_{k+1}-\frac{3}{2} k a_k -6 k a_{k+1}+\frac{9}{16} a_k +\frac{13}{2} a_{k+1}}{16 (4 k +8) \left(k +\frac{1}{4}\right)}, -48 a_1 -\frac{7 a_0}{2} = 0\right]$$

- Revert the change of variables $u = x +8$

$$\left[y = \sum_{k =0}^{\infty} a_k \left(x +8\right)^{k -\frac{7}{4}}, a_{k+2} = -\frac{k^2 a_k -16 k^2 a_{k+1}-\frac{3}{2} k a_k -6 k a_{k+1}+\frac{9}{16} a_k +\frac{13}{2} a_{k+1}}{16 (4 k +8) \left(k +\frac{1}{4}\right)}, -48 a_1 -\frac{7 a_0}{2} = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k =0}^{\infty} a_k \left(x +8\right)^{k}\right)+\left(\sum_{k =0}^{\infty} b_k \left(x +8\right)^{k -\frac{7}{4}}\right), a_{k+2} = -\frac{k^2 a_k -16 k^2 a_{1+k}+2 k a_k -62 k a_{1+k}+a_k -53 a_{1+k}}{16 (4 k +15) (k +2)}, 176\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 29.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(4x+3)\, y''+x(11+4x)\, y'-(4x+3)\, y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(4x^3+3x^2\right) y''+\left(4x^2+11x\right) y'+(-4x-3)\, y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}
p(x) &= \frac{11+4x}{x\,(4x+3)}\\
q(x) &= -\frac{1}{x^2}
\end{aligned}$$

Table 582: Table $p(x), q(x)$ singularites.

$p(x) = \frac{11+4x}{x(4x+3)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{3}{4}$	"regular"

$q(x) = -\frac{1}{x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{3}{4}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(4x+3)\, y'' + \left(4x^2 + 11x\right) y' + (-4x-3)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(4x+3) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(4x^2+11x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (-4x-3) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\begin{aligned}&\left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 3x^{n+r} a_n(n+r)(n+r-1)\right)\\&+\left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n(n+r)\right)+\left(\sum_{n=0}^{\infty} 11x^{n+r} a_n(n+r)\right)\\&+\sum_{n=0}^{\infty}\left(-4x^{1+n+r} a_n\right)+\sum_{n=0}^{\infty}\left(-3a_n x^{n+r}\right)=0\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n(n+r)(n+r-1)=\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 4x^{1+n+r} a_n(n+r)=\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty}\left(-4x^{1+n+r} a_n\right)=\sum_{n=1}^{\infty}\left(-4a_{n-1} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\begin{aligned}&\left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right)\\&+\left(\sum_{n=0}^{\infty} 3x^{n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)\, x^{n+r}\right)\\&+\left(\sum_{n=0}^{\infty} 11x^{n+r} a_n(n+r)\right)+\sum_{n=1}^{\infty}\left(-4a_{n-1} x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-3a_n x^{n+r}\right)=0\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$3x^{n+r} a_n(n+r)(n+r-1)+11x^{n+r} a_n(n+r)-3a_n x^{n+r}=0$$

When $n = 0$ the above becomes

$$3x^r a_0 r(-1+r) + 11x^r a_0 r - 3a_0 x^r = 0$$

Or

$$(3x^r r(-1+r) + 11x^r r - 3x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(3r^2 + 8r - 3\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$3r^2 + 8r - 3 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = -3$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(3r^2 + 8r - 3\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{10}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-3}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &4a_{n-1}(n+r-1)(n+r-2) + 3a_n(n+r)(n+r-1) \\ &+ 4a_{n-1}(n+r-1) + 11a_n(n+r) - 4a_{n-1} - 3a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{4a_{n-1}(n^2 + 2nr + r^2 - 2n - 2r)}{3n^2 + 6nr + 3r^2 + 8n + 8r - 3} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = -\frac{4a_{n-1}(9n^2 - 12n - 5)}{27n^2 + 90n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-4r^2 + 4}{3r^2 + 14r + 8}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_1 = \frac{32}{117}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2+4}{3r^2+14r+8}$	$\frac{32}{117}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{16(r^2 - 1) r(r + 2)}{(3r^2 + 14r + 8)(3r^2 + 20r + 25)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = -\frac{28}{1053}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2+4}{3r^2+14r+8}$	$\frac{32}{117}$
a_2	$\frac{16(r^2-1)r(r+2)}{(3r^2+14r+8)(3r^2+20r+25)}$	$-\frac{28}{1053}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{64(r^2-1)\,r(r+2)\,(r^2+4r+3)}{(3r^2+14r+8)\,(3r^2+20r+25)\,(3r^2+26r+48)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_3 = \frac{4480}{540189}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2+4}{3r^2+14r+8}$	$\frac{32}{117}$
a_2	$\frac{16(r^2-1)r(r+2)}{(3r^2+14r+8)(3r^2+20r+25)}$	$-\frac{28}{1053}$
a_3	$-\frac{64(r^2-1)r(r+2)(r^2+4r+3)}{(3r^2+14r+8)(3r^2+20r+25)(3r^2+26r+48)}$	$\frac{4480}{540189}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{256(r+2)^2\,(-1+r)\,(r+1)^2\,r(r+3)}{(3r^2+32r+77)\,(3r^2+26r+48)\,(3r^2+20r+25)\,(3r+2)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = -\frac{15680}{4113747}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2+4}{3r^2+14r+8}$	$\frac{32}{117}$
a_2	$\frac{16(r^2-1)r(r+2)}{(3r^2+14r+8)(3r^2+20r+25)}$	$-\frac{28}{1053}$
a_3	$-\frac{64(r^2-1)r(r+2)(r^2+4r+3)}{(3r^2+14r+8)(3r^2+20r+25)(3r^2+26r+48)}$	$\frac{4480}{540189}$
a_4	$\frac{256(r+2)^2(-1+r)(r+1)^2r(r+3)}{(3r^2+32r+77)(3r^2+26r+48)(3r^2+20r+25)(3r+2)}$	$-\frac{15680}{4113747}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{1024(r+3)^2 (r+2)^2 (-1+r) (r+1)^2 r}{(3r^2+38r+112)(3r+2)(3r+5)(3r^2+26r+48)(3r^2+32r+77)}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_5 = \frac{401408}{185118615}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-4r^2+4}{3r^2+14r+8}$	$\frac{32}{117}$
a_2	$\frac{16(r^2-1)r(r+2)}{(3r^2+14r+8)(3r^2+20r+25)}$	$-\frac{28}{1053}$
a_3	$-\frac{64(r^2-1)r(r+2)(r^2+4r+3)}{(3r^2+14r+8)(3r^2+20r+25)(3r^2+26r+48)}$	$\frac{4480}{540189}$
a_4	$\frac{256(r+2)^2(-1+r)(r+1)^2r(r+3)}{(3r^2+32r+77)(3r^2+26r+48)(3r^2+20r+25)(3r+2)}$	$-\frac{15680}{4113747}$
a_5	$-\frac{1024(r+3)^2(r+2)^2(-1+r)(r+1)^2r}{(3r^2+38r+112)(3r+2)(3r+5)(3r^2+26r+48)(3r^2+32r+77)}$	$\frac{401408}{185118615}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(1 + \frac{32x}{117} - \frac{28x^2}{1053} + \frac{4480x^3}{540189} - \frac{15680x^4}{4113747} + \frac{401408x^5}{185118615} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$4b_{n-1}(n+r-1)(n+r-2) + 3b_n(n+r)(n+r-1) + 4b_{n-1}(n+r-1) + 11b_n(n+r) - 4b_{n-1} - 3b_n = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{4b_{n-1}(n^2+2nr+r^2-2n-2r)}{3n^2+6nr+3r^2+8n+8r-3} \tag{4}$$

Which for the root $r = -3$ becomes

$$b_n = -\frac{4b_{n-1}(n^2-8n+15)}{n(3n-10)} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -3$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{-4r^2+4}{3r^2+14r+8}$$

Which for the root $r = -3$ becomes

$$b_1 = \frac{32}{7}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-4r^2+4}{3r^2+14r+8}$	$\frac{32}{7}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{16(r^2-1)\,r(r+2)}{(3r^2+14r+8)(3r^2+20r+25)}$$

Which for the root $r = -3$ becomes

$$b_2 = \frac{48}{7}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-4r^2+4}{3r^2+14r+8}$	$\frac{32}{7}$
b_2	$\frac{16(r^2-1)r(r+2)}{(3r^2+14r+8)(3r^2+20r+25)}$	$\frac{48}{7}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{64(r^2-1)\,r(r+2)\,(r^2+4r+3)}{(3r^2+14r+8)\,(3r^2+20r+25)\,(3r^2+26r+48)}$$

Which for the root $r = -3$ becomes

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-4r^2+4}{3r^2+14r+8}$	$\frac{32}{7}$
b_2	$\frac{16(r^2-1)r(r+2)}{(3r^2+14r+8)(3r^2+20r+25)}$	$\frac{48}{7}$
b_3	$-\frac{64(r^2-1)r(r+2)(r^2+4r+3)}{(3r^2+14r+8)(3r^2+20r+25)(3r^2+26r+48)}$	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{256(r+2)^2\,(-1+r)\,(r+1)^2\,r(r+3)}{(3r^2+32r+77)\,(3r^2+26r+48)\,(3r^2+20r+25)\,(3r+2)}$$

Which for the root $r = -3$ becomes

$$b_4 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-4r^2+4}{3r^2+14r+8}$	$\frac{32}{7}$
b_2	$\frac{16(r^2-1)r(r+2)}{(3r^2+14r+8)(3r^2+20r+25)}$	$\frac{48}{7}$
b_3	$-\frac{64(r^2-1)r(r+2)(r^2+4r+3)}{(3r^2+14r+8)(3r^2+20r+25)(3r^2+26r+48)}$	0
b_4	$\frac{256(r+2)^2(-1+r)(r+1)^2r(r+3)}{(3r^2+32r+77)(3r^2+26r+48)(3r^2+20r+25)(3r+2)}$	0

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{1024(r+3)^2(r+2)^2(-1+r)(r+1)^2 r}{(3r^2+38r+112)(3r+2)(3r+5)(3r^2+26r+48)(3r^2+32r+77)}$$

Which for the root $r = -3$ becomes

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-4r^2+4}{3r^2+14r+8}$	$\frac{32}{7}$
b_2	$\frac{16(r^2-1)r(r+2)}{(3r^2+14r+8)(3r^2+20r+25)}$	$\frac{48}{7}$
b_3	$-\frac{64(r^2-1)r(r+2)(r^2+4r+3)}{(3r^2+14r+8)(3r^2+20r+25)(3r^2+26r+48)}$	0
b_4	$\frac{256(r+2)^2(-1+r)(r+1)^2r(r+3)}{(3r^2+32r+77)(3r^2+26r+48)(3r^2+20r+25)(3r+2)}$	0
b_5	$-\frac{1024(r+3)^2(r+2)^2(-1+r)(r+1)^2r}{(3r^2+38r+112)(3r+2)(3r+5)(3r^2+26r+48)(3r^2+32r+77)}$	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{1}{3}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 + \frac{32x}{7} + \frac{48x^2}{7} + O(x^6)}{x^3} \end{aligned}$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{1}{3}} \left(1 + \frac{32x}{117} - \frac{28x^2}{1053} + \frac{4480x^3}{540189} - \frac{15680x^4}{4113747} + \frac{401408x^5}{185118615} + O(x^6)\right) \\
&\quad + \frac{c_2 \left(1 + \frac{32x}{7} + \frac{48x^2}{7} + O(x^6)\right)}{x^3}
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{1}{3}} \left(1 + \frac{32x}{117} - \frac{28x^2}{1053} + \frac{4480x^3}{540189} - \frac{15680x^4}{4113747} + \frac{401408x^5}{185118615} + O(x^6)\right) \\
&\quad + \frac{c_2 \left(1 + \frac{32x}{7} + \frac{48x^2}{7} + O(x^6)\right)}{x^3}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
y = c_1 x^{\frac{1}{3}} &\left(1 + \frac{32x}{117} - \frac{28x^2}{1053} + \frac{4480x^3}{540189} - \frac{15680x^4}{4113747} + \frac{401408x^5}{185118615} + O(x^6)\right) \\
&+ \frac{c_2 \left(1 + \frac{32x}{7} + \frac{48x^2}{7} + O(x^6)\right)}{x^3}
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
y = c_1 x^{\frac{1}{3}} &\left(1 + \frac{32x}{117} - \frac{28x^2}{1053} + \frac{4480x^3}{540189} - \frac{15680x^4}{4113747} + \frac{401408x^5}{185118615} + O(x^6)\right) \\
&+ \frac{c_2 \left(1 + \frac{32x}{7} + \frac{48x^2}{7} + O(x^6)\right)}{x^3}
\end{aligned}
$$

Verified OK.

14.27.1 Maple step by step solution

Let's solve

$x^2(4x+3)\,y''+(4x^2+11x)\,y'+(-4x-3)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{y}{x^2}-\frac{(11+4x)y'}{x(4x+3)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(11+4x)y'}{x(4x+3)}-\frac{y}{x^2}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{11+4x}{x(4x+3)},P_3(x)=-\frac{1}{x^2}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left.(x\cdot P_2(x))\right|_{x=0}=\frac{11}{3}$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left.(x^2\cdot P_3(x))\right|_{x=0}=-1$

  ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $x^2(4x+3)\,y''+x(11+4x)\,y'+(-4x-3)\,y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_kx^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m\cdot y$ to series expansion for $m=0..1$

  $x^m\cdot y=\sum_{k=0}^{\infty}a_kx^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m}x^{k+r}$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..2$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^{m}\cdot y''$ to series expansion for $m=2..3$

  $x^{m}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m}\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}(3+r)\,(-1+3r)\, x^{r}+\left(\sum_{k=1}^{\infty} \left(a_{k}(k+r+3)\,(3k+3r-1)+4a_{k-1}(k+r)\,(k-2+r)\right) x^{k+r}\right)=$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $(3+r)\,(-1+3r)=0$

- Values of r that satisfy the indicial equation

  $r\in\left\{-3, \frac{1}{3}\right\}$

- Each term in the series must be 0, giving the recursion relation

  $3(k+r+3)\left(k+r-\frac{1}{3}\right) a_{k}+4a_{k-1}(k+r)\,(k-2+r)=0$

- Shift index using $k->k+1$

  $3(k+4+r)\left(k+\frac{2}{3}+r\right) a_{k+1}+4a_{k}(k+r+1)\,(k+r-1)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+1}=-\frac{4a_{k}(k+r+1)(k+r-1)}{(k+4+r)(3k+2+3r)}$

- Recursion relation for $r=-3$; series terminates at $k=2$

  $a_{k+1}=-\frac{4a_{k}(k-2)(k-4)}{(k+1)(3k-7)}$

- Apply recursion relation for $k=0$

$a_1 = \frac{32a_0}{7}$

- Apply recursion relation for $k = 1$

  $a_2 = \frac{3a_1}{2}$

- Express in terms of a_0

  $a_2 = \frac{48a_0}{7}$

- Terminating series solution of the ODE for $r = -3$. Use reduction of order to find the second

  $y = a_0 \cdot \left(1 + \frac{32}{7}x + \frac{48}{7}x^2\right)$

- Recursion relation for $r = \frac{1}{3}$

  $a_{k+1} = -\frac{4a_k\left(k+\frac{4}{3}\right)\left(k-\frac{2}{3}\right)}{\left(k+\frac{13}{3}\right)(3k+3)}$

- Solution for $r = \frac{1}{3}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+1} = -\frac{4a_k\left(k+\frac{4}{3}\right)\left(k-\frac{2}{3}\right)}{\left(k+\frac{13}{3}\right)(3k+3)}\right]$

- Combine solutions and rename parameters

  $\left[y = a_0 \cdot \left(1 + \frac{32}{7}x + \frac{48}{7}x^2\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{3}}\right), b_{1+k} = -\frac{4b_k\left(k+\frac{4}{3}\right)\left(k-\frac{2}{3}\right)}{\left(k+\frac{13}{3}\right)(3k+3)}\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 30.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2(3x+2)\,y''+x(4+11x)\,y'-(1-x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(6x^3+4x^2\right)y''+\left(11x^2+4x\right)y'+y(x-1)=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{4+11x}{2x\,(3x+2)}\\ q(x)&=\frac{x-1}{2x^2\,(3x+2)}\end{aligned}$$

Table 584: Table $p(x), q(x)$ singularites.

$p(x) = \frac{4+11x}{2x(3x+2)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{2}{3}$	"regular"

$q(x) = \frac{x-1}{2x^2(3x+2)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{2}{3}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{2}{3}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2(3x+2)\, y'' + \left(11x^2+4x\right) y' + y(x-1) = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2(3x+2) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(11x^2+4x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right)(x-1) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 6x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 11x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 6x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} 6a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 11x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 11a_{n-1}(n+r-1)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n = \sum_{n=1}^{\infty} a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} 6a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 11a_{n-1}(n+r-1)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r)(n+r-1) + 4x^{n+r} a_n (n+r) - a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) + 4x^r a_0 r - a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) + 4x^r r - x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = -\frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 1$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sqrt{x} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{\sqrt{x}}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$6a_{n-1}(n+r-1)(n+r-2) + 4a_n(n+r)(n+r-1) + 11a_{n-1}(n+r-1) + 4a_n(n+r) + a_{n-1} - a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(3n+3r-2)\,a_{n-1}}{2n+2r+1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = \frac{-6na_{n-1} + a_{n-1}}{4+4n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-1-3r}{3+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = -\frac{5}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-3r}{3+2r}$	$-\frac{5}{8}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{9r^2+15r+4}{4r^2+16r+15}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = \frac{55}{96}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-3r}{3+2r}$	$-\frac{5}{8}$
a_2	$\frac{9r^2+15r+4}{4r^2+16r+15}$	$\frac{55}{96}$

For $n = 3$, using the above recursive equation gives

$$a_3 = \frac{-27r^3 - 108r^2 - 117r - 28}{8r^3 + 60r^2 + 142r + 105}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = -\frac{935}{1536}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-3r}{3+2r}$	$-\frac{5}{8}$
a_2	$\frac{9r^2+15r+4}{4r^2+16r+15}$	$\frac{55}{96}$
a_3	$\frac{-27r^3-108r^2-117r-28}{8r^3+60r^2+142r+105}$	$-\frac{935}{1536}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{81r^4 + 594r^3 + 1431r^2 + 1254r + 280}{(4r^2 + 16r + 15)(7 + 2r)(9 + 2r)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{4301}{6144}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-3r}{3+2r}$	$-\frac{5}{8}$
a_2	$\frac{9r^2+15r+4}{4r^2+16r+15}$	$\frac{55}{96}$
a_3	$\frac{-27r^3-108r^2-117r-28}{8r^3+60r^2+142r+105}$	$-\frac{935}{1536}$
a_4	$\frac{81r^4+594r^3+1431r^2+1254r+280}{(4r^2+16r+15)(7+2r)(9+2r)}$	$\frac{4301}{6144}$

For $n = 5$, using the above recursive equation gives

$$a_5 = \frac{-243r^5 - 2835r^4 - 12015r^3 - 22365r^2 - 17142r - 3640}{(4r^2 + 16r + 15)(7 + 2r)(11 + 2r)(9 + 2r)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = -\frac{124729}{147456}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-1-3r}{3+2r}$	$-\frac{5}{8}$
a_2	$\frac{9r^2+15r+4}{4r^2+16r+15}$	$\frac{55}{96}$
a_3	$\frac{-27r^3-108r^2-117r-28}{8r^3+60r^2+142r+105}$	$-\frac{935}{1536}$
a_4	$\frac{81r^4+594r^3+1431r^2+1254r+280}{(4r^2+16r+15)(7+2r)(9+2r)}$	$\frac{4301}{6144}$
a_5	$\frac{-243r^5-2835r^4-12015r^3-22365r^2-17142r-3640}{(4r^2+16r+15)(7+2r)(11+2r)(9+2r)}$	$-\frac{124729}{147456}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots) \\ &= \sqrt{x}\left(1 - \frac{5x}{8} + \frac{55x^2}{96} - \frac{935x^3}{1536} + \frac{4301x^4}{6144} - \frac{124729x^5}{147456} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 1$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r \to r_2} a_1(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned} a_N &= a_1 \\ &= \frac{-1 - 3r}{3 + 2r} \end{aligned}$$

Therefore

$$\begin{aligned} \lim_{r \to r_2} \frac{-1 - 3r}{3 + 2r} &= \lim_{r \to -\frac{1}{2}} \frac{-1 - 3r}{3 + 2r} \\ &= \frac{1}{4} \end{aligned}$$

The limit is $\frac{1}{4}$. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned} y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\ &= \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}} \end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &6b_{n-1}(n + r - 1)(n + r - 2) + 4b_n(n + r)(n + r - 1) \\ &+ 11b_{n-1}(n + r - 1) + 4b_n(n + r) + b_{n-1} - b_n = 0 \end{aligned} \tag{4}$$

Which for for the root $r = -\frac{1}{2}$ becomes

$$\begin{aligned} &6b_{n-1}\left(n - \frac{3}{2}\right)\left(n - \frac{5}{2}\right) + 4b_n\left(n - \frac{1}{2}\right)\left(n - \frac{3}{2}\right) \\ &+ 11b_{n-1}\left(n - \frac{3}{2}\right) + 4b_n\left(n - \frac{1}{2}\right) + b_{n-1} - b_n = 0 \end{aligned} \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{(3n + 3r - 2)\, b_{n-1}}{2n + 2r + 1} \tag{5}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_n = -\frac{\left(3n - \frac{7}{2}\right) b_{n-1}}{2n} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = -\frac{1 + 3r}{3 + 2r}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_1 = \frac{1}{4}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-3r}{3+2r}$	$\frac{1}{4}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{9r^2 + 15r + 4}{(3 + 2r)(5 + 2r)}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_2 = -\frac{5}{32}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-3r}{3+2r}$	$\frac{1}{4}$
b_2	$\frac{9r^2+15r+4}{4r^2+16r+15}$	$-\frac{5}{32}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{27r^3 + 108r^2 + 117r + 28}{(3 + 2r)(7 + 2r)(5 + 2r)}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_3 = \frac{55}{384}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-3r}{3+2r}$	$\frac{1}{4}$
b_2	$\frac{9r^2+15r+4}{4r^2+16r+15}$	$-\frac{5}{32}$
b_3	$\frac{-27r^3-108r^2-117r-28}{8r^3+60r^2+142r+105}$	$\frac{55}{384}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{81r^4 + 594r^3 + 1431r^2 + 1254r + 280}{(3 + 2r)(5 + 2r)(7 + 2r)(9 + 2r)}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_4 = -\frac{935}{6144}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-3r}{3+2r}$	$\frac{1}{4}$
b_2	$\frac{9r^2+15r+4}{4r^2+16r+15}$	$-\frac{5}{32}$
b_3	$\frac{-27r^3-108r^2-117r-28}{8r^3+60r^2+142r+105}$	$\frac{55}{384}$
b_4	$\frac{81r^4+594r^3+1431r^2+1254r+280}{16r^4+192r^3+824r^2+1488r+945}$	$-\frac{935}{6144}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{243r^5 + 2835r^4 + 12015r^3 + 22365r^2 + 17142r + 3640}{(3 + 2r)(7 + 2r)(5 + 2r)(11 + 2r)(9 + 2r)}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_5 = \frac{4301}{24576}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-1-3r}{3+2r}$	$\frac{1}{4}$
b_2	$\frac{9r^2+15r+4}{4r^2+16r+15}$	$-\frac{5}{32}$
b_3	$\frac{-27r^3-108r^2-117r-28}{8r^3+60r^2+142r+105}$	$\frac{55}{384}$
b_4	$\frac{81r^4+594r^3+1431r^2+1254r+280}{16r^4+192r^3+824r^2+1488r+945}$	$-\frac{935}{6144}$
b_5	$\frac{-243r^5-2835r^4-12015r^3-22365r^2-17142r-3640}{(3+2r)(7+2r)(5+2r)(11+2r)(9+2r)}$	$\frac{4301}{24576}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= \sqrt{x}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 + \frac{x}{4} - \frac{5x^2}{32} + \frac{55x^3}{384} - \frac{935x^4}{6144} + \frac{4301x^5}{24576} + O(x^6)}{\sqrt{x}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1\sqrt{x}\left(1 - \frac{5x}{8} + \frac{55x^2}{96} - \frac{935x^3}{1536} + \frac{4301x^4}{6144} - \frac{124729x^5}{147456} + O(x^6)\right) \\ &\quad + \frac{c_2\left(1 + \frac{x}{4} - \frac{5x^2}{32} + \frac{55x^3}{384} - \frac{935x^4}{6144} + \frac{4301x^5}{24576} + O(x^6)\right)}{\sqrt{x}} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1\sqrt{x}\left(1 - \frac{5x}{8} + \frac{55x^2}{96} - \frac{935x^3}{1536} + \frac{4301x^4}{6144} - \frac{124729x^5}{147456} + O(x^6)\right) \\ &\quad + \frac{c_2\left(1 + \frac{x}{4} - \frac{5x^2}{32} + \frac{55x^3}{384} - \frac{935x^4}{6144} + \frac{4301x^5}{24576} + O(x^6)\right)}{\sqrt{x}} \end{aligned}$$

Summary

The solution(s) found are the following

$$
y = c_1\sqrt{x}\left(1-\frac{5x}{8}+\frac{55x^2}{96}-\frac{935x^3}{1536}+\frac{4301x^4}{6144}-\frac{124729x^5}{147456}+O(x^6)\right) + \frac{c_2\left(1+\frac{x}{4}-\frac{5x^2}{32}+\frac{55x^3}{384}-\frac{935x^4}{6144}+\frac{4301x^5}{24576}+O(x^6)\right)}{\sqrt{x}} \tag{1}
$$

Verification of solutions

$$
y = c_1\sqrt{x}\left(1-\frac{5x}{8}+\frac{55x^2}{96}-\frac{935x^3}{1536}+\frac{4301x^4}{6144}-\frac{124729x^5}{147456}+O(x^6)\right) + \frac{c_2\left(1+\frac{x}{4}-\frac{5x^2}{32}+\frac{55x^3}{384}-\frac{935x^4}{6144}+\frac{4301x^5}{24576}+O(x^6)\right)}{\sqrt{x}}
$$

Verified OK.

14.28.1 Maple step by step solution

Let's solve

$2x^2(3x+2)\,y''+(11x^2+4x)\,y'+y(x-1)=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{y(x-1)}{2x^2(3x+2)}-\frac{(4+11x)y'}{2x(3x+2)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(4+11x)y'}{2x(3x+2)}+\frac{y(x-1)}{2x^2(3x+2)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{4+11x}{2x(3x+2)}, P_3(x)=\frac{x-1}{2x^2(3x+2)}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $\left.(x\cdot P_2(x))\right|_{x=0}=1$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

$$\left(x^2 \cdot P_3(x)\right)\Big|_{x=0} = -\frac{1}{4}$$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $$2x^2(3x+2)\,y'' + x(4+11x)\,y' + y(x-1) = 0$$

- Assume series solution for y

  $$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..1$

  $$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k->k-m$

  $$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..2$

  $$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$$

- Shift index using $k->k+1-m$

  $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..3$

  $$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$$

- Shift index using $k->k+2-m$

  $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(1+2r)\,(-1+2r)\,x^r + \left(\sum_{k=1}^{\infty} \left(a_k(2k+2r+1)\,(2k+2r-1) + a_{k-1}(2k+2r-1)\,(3k-2+3r\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$(1+2r)(-1+2r)=0$

- Values of r that satisfy the indicial equation

  $r \in \left\{-\frac{1}{2}, \frac{1}{2}\right\}$
- Each term in the series must be 0, giving the recursion relation

  $4\left(k+r-\frac{1}{2}\right)\left(\left(\frac{3k}{2}+\frac{3r}{2}-1\right)a_{k-1}+a_k\left(k+r+\frac{1}{2}\right)\right)=0$
- Shift index using $k->k+1$

  $4\left(k+r+\frac{1}{2}\right)\left(\left(\frac{3k}{2}+\frac{1}{2}+\frac{3r}{2}\right)a_k+a_{k+1}\left(k+\frac{3}{2}+r\right)\right)=0$
- Recursion relation that defines series solution to ODE

  $a_{k+1}=-\frac{(3k+3r+1)a_k}{2k+3+2r}$
- Recursion relation for $r=-\frac{1}{2}$

  $a_{k+1}=-\frac{\left(3k-\frac{1}{2}\right)a_k}{2k+2}$
- Solution for $r=-\frac{1}{2}$

  $\left[y=\sum_{k=0}^{\infty} a_k x^{k-\frac{1}{2}}, a_{k+1}=-\frac{\left(3k-\frac{1}{2}\right)a_k}{2k+2}\right]$
- Recursion relation for $r=\frac{1}{2}$

  $a_{k+1}=-\frac{\left(3k+\frac{5}{2}\right)a_k}{2k+4}$
- Solution for $r=\frac{1}{2}$

  $\left[y=\sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+1}=-\frac{\left(3k+\frac{5}{2}\right)a_k}{2k+4}\right]$
- Combine solutions and rename parameters

  $\left[y=\left(\sum_{k=0}^{\infty} a_k x^{k-\frac{1}{2}}\right)+\left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{2}}\right), a_{1+k}=-\frac{\left(3k-\frac{1}{2}\right)a_k}{2k+2}, b_{1+k}=-\frac{\left(3k+\frac{5}{2}\right)b_k}{2k+4}\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 31.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(2+x)\,y'' + 5x(1-x)\,y' - (-8x+2)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^3 + 2x^2\right) y'' + \left(-5x^2 + 5x\right) y' + (8x - 2)\, y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = -\frac{5(x-1)}{x\,(2+x)}$$
$$q(x) = \frac{8x-2}{x^2\,(2+x)}$$

Table 586: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{5(x-1)}{x(2+x)}$	
singularity	type
$x = -2$	"regular"
$x = 0$	"regular"

$q(x) = \frac{8x-2}{x^2(2+x)}$	
singularity	type
$x = -2$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-2, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(2+x)\,y'' + \left(-5x^2+5x\right)y' + (8x-2)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(2+x)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + \left(-5x^2+5x\right)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (8x-2)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-5x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 8x^{1+n+r} a_n\right) + \sum_{n=0}^{\infty} \left(-2a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} a_{n-1} (n+r-1)(n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} \left(-5x^{1+n+r} a_n (n+r)\right) = \sum_{n=1}^{\infty} \left(-5a_{n-1} (n+r-1) x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} 8x^{1+n+r} a_n = \sum_{n=1}^{\infty} 8a_{n-1} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=1}^{\infty} a_{n-1} (n+r-1)(n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=1}^{\infty} \left(-5a_{n-1} (n+r-1) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=1}^{\infty} 8a_{n-1} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-2a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$2x^{n+r} a_n (n+r)(n+r-1) + 5x^{n+r} a_n (n+r) - 2a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$2x^r a_0 r(-1+r) + 5x^r a_0 r - 2a_0 x^r = 0$$

Or

$$(2x^r r(-1+r) + 5x^r r - 2x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(2r^2 + 3r - 2)\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$2r^2 + 3r - 2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = -2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(2r^2 + 3r - 2)\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{5}{2}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-2}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-1}(n+r-1)(n+r-2) + 2a_n(n+r)(n+r-1) \\ -5a_{n-1}(n+r-1) + 5a_n(n+r) + 8a_{n-1} - 2a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n^2 + 2nr + r^2 - 8n - 8r + 15)}{2n^2 + 4nr + 2r^2 + 3n + 3r - 2} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{a_{n-1}(4n^2 - 28n + 45)}{8n^2 + 20n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-r^2 + 6r - 8}{2r^2 + 7r + 3}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_1 = -\frac{3}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+6r-8}{2r^2+7r+3}$	$-\frac{3}{4}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{r^4 - 10r^3 + 35r^2 - 50r + 24}{(2r^2 + 7r + 3)(2r^2 + 11r + 12)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = \frac{5}{96}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+6r-8}{2r^2+7r+3}$	$-\frac{3}{4}$
a_2	$\frac{r^4-10r^3+35r^2-50r+24}{(2r^2+7r+3)(2r^2+11r+12)}$	$\frac{5}{96}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{(-1+r)(r-2)^2(r-3)(r-4)r}{8r^6+132r^5+854r^4+2739r^3+4502r^2+3465r+900}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_3 = \frac{5}{4224}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+6r-8}{2r^2+7r+3}$	$-\frac{3}{4}$
a_2	$\frac{r^4-10r^3+35r^2-50r+24}{(2r^2+7r+3)(2r^2+11r+12)}$	$\frac{5}{96}$
a_3	$-\frac{(-1+r)(r-2)^2(r-3)(r-4)r}{8r^6+132r^5+854r^4+2739r^3+4502r^2+3465r+900}$	$\frac{5}{4224}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(-1+r)^2(r-2)^2(r-3)(r-4)r(r+1)}{16r^8+416r^7+4552r^6+27248r^5+96913r^4+207506r^3+256719r^2+162630r+37800}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{5}{292864}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+6r-8}{2r^2+7r+3}$	$-\frac{3}{4}$
a_2	$\frac{r^4-10r^3+35r^2-50r+24}{(2r^2+7r+3)(2r^2+11r+12)}$	$\frac{5}{96}$
a_3	$-\frac{(-1+r)(r-2)^2(r-3)(r-4)r}{8r^6+132r^5+854r^4+2739r^3+4502r^2+3465r+900}$	$\frac{5}{4224}$
a_4	$\frac{(-1+r)^2(r-2)^2(r-3)(r-4)r(r+1)}{16r^8+416r^7+4552r^6+27248r^5+96913r^4+207506r^3+256719r^2+162630r+37800}$	$\frac{5}{292864}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(-1+r)^2 (r-2)^2 (r-3)(r-4) r^2 (r+1)(r+2)}{(16r^8 + 416r^7 + 4552r^6 + 27248r^5 + 96913r^4 + 207506r^3 + 256719r^2 + 162630r + 37800)(2r^2 + 2}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_5 = -\frac{1}{3514368}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2+6r-8}{2r^2+7r+3}$	$-\frac{3}{4}$
a_2	$\frac{r^4-10r^3+35r^2-50r+24}{(2r^2+7r+3)(2r^2+11r+12)}$	$\frac{5}{96}$
a_3	$-\frac{(-1+r)(r-2)^2(r-3)(r-4)r}{8r^6+132r^5+854r^4+2739r^3+4502r^2+3465r+900}$	$\frac{5}{4224}$
a_4	$\frac{(-1+r)^2(r-2)^2(r-3)(r-4)r(r+1)}{16r^8+416r^7+4552r^6+27248r^5+96913r^4+207506r^3+256719r^2+162630r+37800}$	$\frac{5}{292864}$
a_5	$-\frac{(-1+r)^2(r-2)^2(r-3)(r-4)r^2(r+1)(r+2)}{(16r^8+416r^7+4552r^6+27248r^5+96913r^4+207506r^3+256719r^2+162630r+37800)(2r^2+23r+63)}$	$-\frac{1}{3514368}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \sqrt{x}\left(1 - \frac{3x}{4} + \frac{5x^2}{96} + \frac{5x^3}{4224} + \frac{5x^4}{292864} - \frac{x^5}{3514368} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} b_{n-1}(n+r-1)\,(n+r-2) + 2b_n(n+r)\,(n+r-1) \\ -5b_{n-1}(n+r-1) + 5b_n(n+r) + 8b_{n-1} - 2b_n = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{b_{n-1}(n^2 + 2nr + r^2 - 8n - 8r + 15)}{2n^2 + 4nr + 2r^2 + 3n + 3r - 2} \tag{4}$$

Which for the root $r = -2$ becomes

$$b_n = -\frac{b_{n-1}(n^2 - 12n + 35)}{n\,(2n - 5)} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -2$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{-r^2 + 6r - 8}{2r^2 + 7r + 3}$$

Which for the root $r = -2$ becomes

$$b_1 = 8$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+6r-8}{2r^2+7r+3}$	8

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{r^4 - 10r^3 + 35r^2 - 50r + 24}{(2r^2 + 7r + 3)\,(2r^2 + 11r + 12)}$$

Which for the root $r = -2$ becomes

$$b_2 = 60$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+6r-8}{2r^2+7r+3}$	8
b_2	$\frac{r^4-10r^3+35r^2-50r+24}{(2r^2+7r+3)(2r^2+11r+12)}$	60

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{(-1+r)(r-2)^2 (r-3)(r-4)r}{8r^6+132r^5+854r^4+2739r^3+4502r^2+3465r+900}$$

Which for the root $r = -2$ becomes

$$b_3 = -160$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+6r-8}{2r^2+7r+3}$	8
b_2	$\frac{r^4-10r^3+35r^2-50r+24}{(2r^2+7r+3)(2r^2+11r+12)}$	60
b_3	$-\frac{(-1+r)(r-2)^2(r-3)(r-4)r}{8r^6+132r^5+854r^4+2739r^3+4502r^2+3465r+900}$	-160

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{(-1+r)^2 (r-2)^2 (r-3)(r-4)r(r+1)}{16r^8+416r^7+4552r^6+27248r^5+96913r^4+207506r^3+256719r^2+162630r+37800}$$

Which for the root $r = -2$ becomes

$$b_4 = 40$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+6r-8}{2r^2+7r+3}$	8
b_2	$\frac{r^4-10r^3+35r^2-50r+24}{(2r^2+7r+3)(2r^2+11r+12)}$	60
b_3	$-\frac{(-1+r)(r-2)^2(r-3)(r-4)r}{8r^6+132r^5+854r^4+2739r^3+4502r^2+3465r+900}$	-160
b_4	$\frac{(-1+r)^2(r-2)^2(r-3)(r-4)r(r+1)}{16r^8+416r^7+4552r^6+27248r^5+96913r^4+207506r^3+256719r^2+162630r+37800}$	40

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{(-1+r)^2 (r-2)^2 (r-3) (r-4) r^2(r+1) (r+2)}{(16r^8 + 416r^7 + 4552r^6 + 27248r^5 + 96913r^4 + 207506r^3 + 256719r^2 + 162630r + 37800) (2r^2 + 2}$$

Which for the root $r = -2$ becomes

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2+6r-8}{2r^2+7r+3}$	8
b_2	$\frac{r^4-10r^3+35r^2-50r+24}{(2r^2+7r+3)(2r^2+11r+12)}$	60
b_3	$-\frac{(-1+r)(r-2)^2(r-3)(r-4)r}{8r^6+132r^5+854r^4+2739r^3+4502r^2+3465r+900}$	-160
b_4	$\frac{(-1+r)^2(r-2)^2(r-3)(r-4)r(r+1)}{16r^8+416r^7+4552r^6+27248r^5+96913r^4+207506r^3+256719r^2+162630r+37800}$	40
b_5	$-\frac{(-1+r)^2(r-2)^2(r-3)(r-4)r^2(r+1)(r+2)}{(16r^8+416r^7+4552r^6+27248r^5+96913r^4+207506r^3+256719r^2+162630r+37800)(2r^2+23r+63)}$	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= \sqrt{x}\big(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\big) \\ &= \frac{1 + 8x + 60x^2 - 160x^3 + 40x^4 + O(x^6)}{x^2} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 \sqrt{x} \left(1-\frac{3x}{4}+\frac{5x^2}{96}+\frac{5x^3}{4224}+\frac{5x^4}{292864}-\frac{x^5}{3514368}+O\left(x^6\right)\right) \\
&\quad + \frac{c_2 (1+8x+60x^2-160x^3+40x^4+O(x^6))}{x^2}
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= c_1 \sqrt{x} \left(1-\frac{3x}{4}+\frac{5x^2}{96}+\frac{5x^3}{4224}+\frac{5x^4}{292864}-\frac{x^5}{3514368}+O\left(x^6\right)\right) \\
&\quad + \frac{c_2 (1+8x+60x^2-160x^3+40x^4+O(x^6))}{x^2}
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y &= c_1 \sqrt{x} \left(1-\frac{3x}{4}+\frac{5x^2}{96}+\frac{5x^3}{4224}+\frac{5x^4}{292864}-\frac{x^5}{3514368}+O\left(x^6\right)\right) \\
&\quad + \frac{c_2 (1+8x+60x^2-160x^3+40x^4+O(x^6))}{x^2}
\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}
y &= c_1 \sqrt{x} \left(1-\frac{3x}{4}+\frac{5x^2}{96}+\frac{5x^3}{4224}+\frac{5x^4}{292864}-\frac{x^5}{3514368}+O\left(x^6\right)\right) \\
&\quad + \frac{c_2 (1+8x+60x^2-160x^3+40x^4+O(x^6))}{x^2}
\end{aligned}$$

Verified OK.

14.29.1 Maple step by step solution

Let's solve

$x^2 (2+x) y'' + (-5x^2+5x) y' + (8x-2) y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

$y'' = -\frac{2(4x-1)y}{x^2(2+x)} + \frac{5(x-1)y'}{x(2+x)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y'' - \frac{5(x-1)y'}{x(2+x)} + \frac{2(4x-1)y}{x^2(2+x)} = 0$

☐ Check to see if x_0 is a regular singular point

- ○ Define functions

$\left[P_2(x) = -\frac{5(x-1)}{x(2+x)}, P_3(x) = \frac{2(4x-1)}{x^2(2+x)}\right]$

- ○ $(2+x) \cdot P_2(x)$ is analytic at $x = -2$

$\left((2+x) \cdot P_2(x)\right)\Big|_{x=-2} = -\frac{15}{2}$

- ○ $(2+x)^2 \cdot P_3(x)$ is analytic at $x = -2$

$\left((2+x)^2 \cdot P_3(x)\right)\Big|_{x=-2} = 0$

- ○ $x = -2$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0 = -2$

- Multiply by denominators

$x^2(2+x)\, y'' - 5x(x-1)\, y' + (8x-2)\, y = 0$

- Change variables using $x = u - 2$ so that the regular singular point is at $u = 0$

$(u^3 - 4u^2 + 4u)\left(\frac{d^2}{du^2}y(u)\right) + (-5u^2 + 25u - 30)\left(\frac{d}{du}y(u)\right) + (8u - 18)\, y(u) = 0$

- Assume series solution for $y(u)$

$y(u) = \sum_{k=0}^{\infty} a_k u^{k+r}$

☐ Rewrite ODE with series expansions

- ○ Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$

- ○ Shift index using $k- > k - m$

$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$

- ○ Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

$$u^{m}\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty} a_{k}(k+r)\, u^{k+r-1+m}$$

- Shift index using $k->k+1-m$

$$u^{m}\cdot\left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u^{m}\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)$ to series expansion for $m=1..3$

$$u^{m}\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

$$u^{m}\cdot\left(\frac{d^{2}}{du^{2}}y(u)\right)=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

Rewrite ODE with series expansions

$$2a_{0}r(-17+2r)\, u^{-1+r}+\left(2a_{1}(1+r)\,(-15+2r)-a_{0}(4r^{2}-29r+18)\right)u^{r}+\left(\sum_{k=1}^{\infty}(2a_{k+1}(k+1+$$

- a_{0}cannot be 0 by assumption, giving the indicial equation

$$2r(-17+2r)=0$$

- Values of r that satisfy the indicial equation

$$r\in\left\{0,\frac{17}{2}\right\}$$

- Each term must be 0

$$2a_{1}(1+r)\,(-15+2r)-a_{0}(4r^{2}-29r+18)=0$$

- Each term in the series must be 0, giving the recursion relation

$$(-4a_{k}+a_{k-1}+4a_{k+1})\, k^{2}+\left((-8a_{k}+2a_{k-1}+8a_{k+1})\, r+29a_{k}-8a_{k-1}-26a_{k+1}\right)k+(-4a_{k}+a$$

- Shift index using $k->k+1$

$$(-4a_{k+1}+a_{k}+4a_{k+2})\,(k+1)^{2}+\left((-8a_{k+1}+2a_{k}+8a_{k+2})\, r+29a_{k+1}-8a_{k}-26a_{k+2}\right)(k+1)\,-$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{k^{2}a_{k}-4k^{2}a_{k+1}+2kra_{k}-8kra_{k+1}+r^{2}a_{k}-4r^{2}a_{k+1}-6ka_{k}+21ka_{k+1}-6ra_{k}+21ra_{k+1}+8a_{k}+7a_{k+1}}{2(2k^{2}+4kr+2r^{2}-9k-9r-26)}$$

- Recursion relation for $r=0$

$$a_{k+2}=-\frac{k^{2}a_{k}-4k^{2}a_{k+1}-6ka_{k}+21ka_{k+1}+8a_{k}+7a_{k+1}}{2(2k^{2}-9k-26)}$$

- Solution for $r=0$

$$\left[y(u)=\sum_{k=0}^{\infty} a_{k}u^{k}, a_{k+2}=-\frac{k^{2}a_{k}-4k^{2}a_{k+1}-6ka_{k}+21ka_{k+1}+8a_{k}+7a_{k+1}}{2(2k^{2}-9k-26)}, -30a_{1}-18a_{0}=0\right]$$

- Revert the change of variables $u = 2 + x$

$$\left[y = \sum_{k=0}^{\infty} a_k (2+x)^k , a_{k+2} = -\frac{k^2 a_k - 4k^2 a_{k+1} - 6k a_k + 21k a_{k+1} + 8a_k + 7a_{k+1}}{2(2k^2 - 9k - 26)}, -30a_1 - 18a_0 = 0\right]$$

- Recursion relation for $r = \frac{17}{2}$

$$a_{k+2} = -\frac{k^2 a_k - 4k^2 a_{k+1} + 11k a_k - 47k a_{k+1} + \frac{117}{4} a_k - \frac{207}{2} a_{k+1}}{2(2k^2 + 25k + 42)}$$

- Solution for $r = \frac{17}{2}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k+\frac{17}{2}}, a_{k+2} = -\frac{k^2 a_k - 4k^2 a_{k+1} + 11k a_k - 47k a_{k+1} + \frac{117}{4} a_k - \frac{207}{2} a_{k+1}}{2(2k^2 + 25k + 42)}, 38a_1 - \frac{121a_0}{2} = 0\right]$$

- Revert the change of variables $u = 2 + x$

$$\left[y = \sum_{k=0}^{\infty} a_k (2+x)^{k+\frac{17}{2}} , a_{k+2} = -\frac{k^2 a_k - 4k^2 a_{k+1} + 11k a_k - 47k a_{k+1} + \frac{117}{4} a_k - \frac{207}{2} a_{k+1}}{2(2k^2 + 25k + 42)}, 38a_1 - \frac{121a_0}{2} = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k (2+x)^k\right) + \left(\sum_{k=0}^{\infty} b_k (2+x)^{k+\frac{17}{2}}\right), a_{k+2} = -\frac{k^2 a_k - 4k^2 a_{1+k} - 6k a_k + 21k a_{1+k} + 8a_k + 7a_{1+k}}{2(2k^2 - 9k - 26)}, -30\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 32.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x+6)\,y''+x(11+4x)\,y'+(1+2x)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(x^3+6x^2\right)y''+\left(4x^2+11x\right)y'+(1+2x)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{11+4x}{x\,(x+6)}$$
$$q(x)=\frac{1+2x}{x^2\,(x+6)}$$

Table 588: Table $p(x), q(x)$ singularites.

$p(x) = \frac{11+4x}{x(x+6)}$	
singularity	type
$x = -6$	"regular"
$x = 0$	"regular"

$q(x) = \frac{1+2x}{x^2(x+6)}$	
singularity	type
$x = -6$	"regular"
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-6, 0, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x+6)\, y'' + \left(4x^2 + 11x\right) y' + (1+2x)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x+6) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + \left(4x^2 + 11x\right) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (1+2x) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 6x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 11x^{n+r} a_n (n+r)\right) \\
&+ \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 2x^{1+n+r} a_n\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\sum_{n=0}^{\infty} x^{1+n+r} a_n (n+r)(n+r-1) = \sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 4x^{1+n+r} a_n (n+r) = \sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)\, x^{n+r}
$$

$$
\sum_{n=0}^{\infty} 2x^{1+n+r} a_n = \sum_{n=1}^{\infty} 2a_{n-1} x^{n+r}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=1}^{\infty} a_{n-1}(n+r-1)(n+r-2)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} 6x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=1}^{\infty} 4a_{n-1}(n+r-1)\, x^{n+r}\right) \\
&+ \left(\sum_{n=0}^{\infty} 11x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) + \left(\sum_{n=1}^{\infty} 2a_{n-1} x^{n+r}\right) = 0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
6x^{n+r} a_n (n+r)(n+r-1) + 11x^{n+r} a_n (n+r) + a_n x^{n+r} = 0
$$

When $n=0$ the above becomes

$$6x^r a_0 r(-1+r) + 11x^r a_0 r + a_0 x^r = 0$$

Or

$$(6x^r r(-1+r) + 11x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(6r^2 + 5r + 1)\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$6r^2 + 5r + 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= -\frac{1}{3} \\ r_2 &= -\frac{1}{2} \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(6r^2 + 5r + 1)\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{6}$ is not an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n-\frac{1}{3}} \\ y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}} \end{aligned}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n=0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} &a_{n-1}(n+r-1)\,(n+r-2) + 6a_n(n+r)\,(n+r-1) \\ &+ 4a_{n-1}(n+r-1) + 11a_n(n+r) + a_n + 2a_{n-1} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-1}(n^2 + 2nr + r^2 + n + r)}{6n^2 + 12nr + 6r^2 + 5n + 5r + 1} \tag{4}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_n = -\frac{a_{n-1}(9n^2 + 3n - 2)}{54n^2 + 9n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = -\frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1

For $n = 1$, using the above recursive equation gives

$$a_1 = \frac{-r^2 - 3r - 2}{6r^2 + 17r + 12}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_1 = -\frac{10}{63}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-3r-2}{6r^2+17r+12}$	$-\frac{10}{63}$

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{(r+3)(r+1)(r+2)^2}{36r^4 + 276r^3 + 775r^2 + 943r + 420}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_2 = \frac{200}{7371}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-3r-2}{6r^2+17r+12}$	$-\frac{10}{63}$
a_2	$\frac{(r+3)(r+1)(r+2)^2}{36r^4+276r^3+775r^2+943r+420}$	$\frac{200}{7371}$

For $n = 3$, using the above recursive equation gives

$$a_3 = -\frac{(r+3)^2 (r+1) (r+2)^2 (r+4)}{216r^6 + 3132r^5 + 18486r^4 + 56753r^3 + 95433r^2 + 83230r + 29400}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_3 = -\frac{17600}{3781323}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-3r-2}{6r^2+17r+12}$	$-\frac{10}{63}$
a_2	$\frac{(r+3)(r+1)(r+2)^2}{36r^4+276r^3+775r^2+943r+420}$	$\frac{200}{7371}$
a_3	$-\frac{(r+3)^2(r+1)(r+2)^2(r+4)}{216r^6+3132r^5+18486r^4+56753r^3+95433r^2+83230r+29400}$	$-\frac{17600}{3781323}$

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{(r+3)^2 (r+1) (r+2)^2 (r+4)^2 (r+5)}{(216r^6 + 3132r^5 + 18486r^4 + 56753r^3 + 95433r^2 + 83230r + 29400) (6r^2 + 53r + 117)}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_4 = \frac{3872}{4861701}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-3r-2}{6r^2+17r+12}$	$-\frac{10}{63}$
a_2	$\frac{(r+3)(r+1)(r+2)^2}{36r^4+276r^3+775r^2+943r+420}$	$\frac{200}{7371}$
a_3	$-\frac{(r+3)^2(r+1)(r+2)^2(r+4)}{216r^6+3132r^5+18486r^4+56753r^3+95433r^2+83230r+29400}$	$-\frac{17600}{3781323}$
a_4	$\frac{(r+3)^2(r+1)(r+2)^2(r+4)^2(r+5)}{(216r^6+3132r^5+18486r^4+56753r^3+95433r^2+83230r+29400)(6r^2+53r+117)}$	$\frac{3872}{4861701}$

For $n = 5$, using the above recursive equation gives

$$a_5 = -\frac{(r+3)^2(r+1)(r+2)^2(r+4)^2(r+5)^2(6+r)}{(216r^6+3132r^5+18486r^4+56753r^3+95433r^2+83230r+29400)(6r^2+53r+117)(6r^2+65r}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$a_5 = -\frac{921536}{6782072895}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	$\frac{-r^2-3r-2}{6r^2+17r+12}$	$-\frac{10}{63}$
a_2	$\frac{(r+3)(r+1)(r+2)^2}{36r^4+276r^3+775r^2+943r+420}$	$\frac{200}{7371}$
a_3	$-\frac{(r+3)^2(r+1)(r+2)^2(r+4)}{216r^6+3132r^5+18486r^4+56753r^3+95433r^2+83230r+29400}$	$-\frac{17600}{3781323}$
a_4	$\frac{(r+3)^2(r+1)(r+2)^2(r+4)^2(r+5)}{(216r^6+3132r^5+18486r^4+56753r^3+95433r^2+83230r+29400)(6r^2+53r+117)}$	$\frac{3872}{4861701}$
a_5	$-\frac{(r+3)^2(r+1)(r+2)^2(r+4)^2(r+5)^2(6+r)}{(216r^6+3132r^5+18486r^4+56753r^3+95433r^2+83230r+29400)(6r^2+53r+117)(6r^2+65r+176)}$	$-\frac{921536}{6782072895}$

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \frac{1}{x^{\frac{1}{3}}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \frac{1 - \frac{10x}{63} + \frac{200x^2}{7371} - \frac{17600x^3}{3781323} + \frac{3872x^4}{4861701} - \frac{921536x^5}{6782072895} + O(x^6)}{x^{\frac{1}{3}}} \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. For $1 \leq n$ the recursive equation is

$$\begin{aligned} b_{n-1}(n+r-1)(n+r-2)+6b_n(n+r)(n+r-1) \\ +4b_{n-1}(n+r-1)+11b_n(n+r)+b_n+2b_{n-1}=0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{b_{n-1}(n^2+2nr+r^2+n+r)}{6n^2+12nr+6r^2+5n+5r+1} \tag{4}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_n = \frac{-4n^2b_{n-1}+b_{n-1}}{24n^2-4n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1

For $n = 1$, using the above recursive equation gives

$$b_1 = \frac{-r^2-3r-2}{6r^2+17r+12}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_1 = -\frac{3}{20}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2-3r-2}{6r^2+17r+12}$	$-\frac{3}{20}$

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{(r+3)(r+1)(r+2)^2}{36r^4+276r^3+775r^2+943r+420}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_2 = \frac{9}{352}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2-3r-2}{6r^2+17r+12}$	$-\frac{3}{20}$
b_2	$\frac{(r+3)(r+1)(r+2)^2}{36r^4+276r^3+775r^2+943r+420}$	$\frac{9}{352}$

For $n = 3$, using the above recursive equation gives

$$b_3 = -\frac{(r+3)^2 (r+1) (r+2)^2 (r+4)}{216r^6 + 3132r^5 + 18486r^4 + 56753r^3 + 95433r^2 + 83230r + 29400}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_3 = -\frac{105}{23936}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2-3r-2}{6r^2+17r+12}$	$-\frac{3}{20}$
b_2	$\frac{(r+3)(r+1)(r+2)^2}{36r^4+276r^3+775r^2+943r+420}$	$\frac{9}{352}$
b_3	$-\frac{(r+3)^2(r+1)(r+2)^2(r+4)}{216r^6+3132r^5+18486r^4+56753r^3+95433r^2+83230r+29400}$	$-\frac{105}{23936}$

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{(r+3)^2 (r+1) (r+2)^2 (r+4)^2 (r+5)}{(216r^6 + 3132r^5 + 18486r^4 + 56753r^3 + 95433r^2 + 83230r + 29400) (6r^2 + 53r + 117)}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_4 = \frac{6615}{8808448}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2-3r-2}{6r^2+17r+12}$	$-\frac{3}{20}$
b_2	$\frac{(r+3)(r+1)(r+2)^2}{36r^4+276r^3+775r^2+943r+420}$	$\frac{9}{352}$
b_3	$-\frac{(r+3)^2(r+1)(r+2)^2(r+4)}{216r^6+3132r^5+18486r^4+56753r^3+95433r^2+83230r+29400}$	$-\frac{105}{23936}$
b_4	$\frac{(r+3)^2(r+1)(r+2)^2(r+4)^2(r+5)}{(216r^6+3132r^5+18486r^4+56753r^3+95433r^2+83230r+29400)(6r^2+53r+117)}$	$\frac{6615}{8808448}$

For $n = 5$, using the above recursive equation gives

$$b_5 = -\frac{(r+3)^2 (r+1) (r+2)^2 (r+4)^2 (r+5)^2 (6+r)}{(216r^6 + 3132r^5 + 18486r^4 + 56753r^3 + 95433r^2 + 83230r + 29400) (6r^2 + 53r + 117) (6r^2 + 65r +}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_5 = -\frac{11907}{92889088}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	$\frac{-r^2-3r-2}{6r^2+17r+12}$	$-\frac{3}{20}$
b_2	$\frac{(r+3)(r+1)(r+2)^2}{36r^4+276r^3+775r^2+943r+420}$	$\frac{9}{352}$
b_3	$-\frac{(r+3)^2(r+1)(r+2)^2(r+4)}{216r^6+3132r^5+18486r^4+56753r^3+95433r^2+83230r+29400}$	$-\frac{105}{23936}$
b_4	$\frac{(r+3)^2(r+1)(r+2)^2(r+4)^2(r+5)}{(216r^6+3132r^5+18486r^4+56753r^3+95433r^2+83230r+29400)(6r^2+53r+117)}$	$\frac{6615}{8808448}$
b_5	$-\frac{(r+3)^2(r+1)(r+2)^2(r+4)^2(r+5)^2(6+r)}{(216r^6+3132r^5+18486r^4+56753r^3+95433r^2+83230r+29400)(6r^2+53r+117)(6r^2+65r+176)}$	$-\frac{11907}{92889088}$

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= \frac{1}{x^{\frac{1}{3}}} \left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \ldots\right) \\ &= \frac{1 - \frac{3x}{20} + \frac{9x^2}{352} - \frac{105x^3}{23936} + \frac{6615x^4}{8808448} - \frac{11907x^5}{92889088} + O(x^6)}{\sqrt{x}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= \frac{c_1\left(1-\frac{10x}{63}+\frac{200x^2}{7371}-\frac{17600x^3}{3781323}+\frac{3872x^4}{4861701}-\frac{921536x^5}{6782072895}+O(x^6)\right)}{x^{\frac{1}{3}}} \\
&\quad + \frac{c_2\left(1-\frac{3x}{20}+\frac{9x^2}{352}-\frac{105x^3}{23936}+\frac{6615x^4}{8808448}-\frac{11907x^5}{92889088}+O(x^6)\right)}{\sqrt{x}}
\end{aligned}$$

Hence the final solution is

$$\begin{aligned}
y &= y_h \\
&= \frac{c_1\left(1-\frac{10x}{63}+\frac{200x^2}{7371}-\frac{17600x^3}{3781323}+\frac{3872x^4}{4861701}-\frac{921536x^5}{6782072895}+O(x^6)\right)}{x^{\frac{1}{3}}} \\
&\quad + \frac{c_2\left(1-\frac{3x}{20}+\frac{9x^2}{352}-\frac{105x^3}{23936}+\frac{6615x^4}{8808448}-\frac{11907x^5}{92889088}+O(x^6)\right)}{\sqrt{x}}
\end{aligned}$$

Summary

The solution(s) found are the following

$$\begin{aligned}
y &= \frac{c_1\left(1-\frac{10x}{63}+\frac{200x^2}{7371}-\frac{17600x^3}{3781323}+\frac{3872x^4}{4861701}-\frac{921536x^5}{6782072895}+O(x^6)\right)}{x^{\frac{1}{3}}} \\
&\quad + \frac{c_2\left(1-\frac{3x}{20}+\frac{9x^2}{352}-\frac{105x^3}{23936}+\frac{6615x^4}{8808448}-\frac{11907x^5}{92889088}+O(x^6)\right)}{\sqrt{x}}
\end{aligned} \tag{1}$$

Verification of solutions

$$\begin{aligned}
y &= \frac{c_1\left(1-\frac{10x}{63}+\frac{200x^2}{7371}-\frac{17600x^3}{3781323}+\frac{3872x^4}{4861701}-\frac{921536x^5}{6782072895}+O(x^6)\right)}{x^{\frac{1}{3}}} \\
&\quad + \frac{c_2\left(1-\frac{3x}{20}+\frac{9x^2}{352}-\frac{105x^3}{23936}+\frac{6615x^4}{8808448}-\frac{11907x^5}{92889088}+O(x^6)\right)}{\sqrt{x}}
\end{aligned}$$

Verified OK.

14.30.1 Maple step by step solution

Let's solve

$x^2(x+6)\,y''+(4x^2+11x)\,y'+(1+2x)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(1+2x)y}{x^2(x+6)}-\frac{(11+4x)y'}{x(x+6)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(11+4x)y'}{x(x+6)}+\frac{(1+2x)y}{x^2(x+6)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{11+4x}{x(x+6)}, P_3(x)=\frac{1+2x}{x^2(x+6)}\right]$

  - $(x+6)\cdot P_2(x)$ is analytic at $x=-6$

    $\left((x+6)\cdot P_2(x)\right)\Big|_{x=-6}=\frac{13}{6}$

  - $(x+6)^2\cdot P_3(x)$ is analytic at $x=-6$

    $\left((x+6)^2\cdot P_3(x)\right)\Big|_{x=-6}=0$

  - $x=-6$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=-6$

- Multiply by denominators

  $x^2(x+6)\,y''+x(11+4x)\,y'+(1+2x)\,y=0$

- Change variables using $x=u-6$ so that the regular singular point is at $u=0$

  $(u^3-12u^2+36u)\left(\frac{d^2}{du^2}y(u)\right)+(4u^2-37u+78)\left(\frac{d}{du}y(u)\right)+(-11+2u)\,y(u)=0$

- Assume series solution for $y(u)$

  $y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..1$

  $$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

- Shift index using $k- >k - m$

  $$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..2$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\, u^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..3$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$6a_0 r(7+6r)\, u^{-1+r} + \left(6a_1(1+r)\,(13+6r) - a_0(12r^2+25r+11)\right) u^r + \left(\sum_{k=1}^{\infty} (6a_{k+1}(k+r+1)\,(\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$6r(7+6r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{0, -\frac{7}{6}\right\}$$

- Each term must be 0

  $$6a_1(1+r)\,(13+6r) - a_0(12r^2+25r+11) = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$(-12a_k + a_{k-1} + 36a_{k+1})\, k^2 + ((-24a_k + 2a_{k-1} + 72a_{k+1})\, r - 25a_k + a_{k-1} + 114a_{k+1})\, k + (-12$$

- Shift index using $k- >k + 1$

  $$(-12a_{k+1} + a_k + 36a_{k+2})\,(k+1)^2 + ((-24a_{k+1} + 2a_k + 72a_{k+2})\, r - 25a_{k+1} + a_k + 114a_{k+2})\,(k +$$

- Recursion relation that defines series solution to ODE

$$a_{k+2} = -\frac{k^2 a_k - 12k^2 a_{k+1} + 2kra_k - 24kra_{k+1} + r^2 a_k - 12r^2 a_{k+1} + 3ka_k - 49ka_{k+1} + 3ra_k - 49ra_{k+1} + 2a_k - 48a_{k+1}}{6(6k^2 + 12kr + 6r^2 + 31k + 31r + 38)}$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{k^2 a_k - 12k^2 a_{k+1} + 3ka_k - 49ka_{k+1} + 2a_k - 48a_{k+1}}{6(6k^2 + 31k + 38)}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+2} = -\frac{k^2 a_k - 12k^2 a_{k+1} + 3ka_k - 49ka_{k+1} + 2a_k - 48a_{k+1}}{6(6k^2 + 31k + 38)}, 78a_1 - 11a_0 = 0\right]$$

- Revert the change of variables $u = x + 6$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+6)^k, a_{k+2} = -\frac{k^2 a_k - 12k^2 a_{k+1} + 3ka_k - 49ka_{k+1} + 2a_k - 48a_{k+1}}{6(6k^2 + 31k + 38)}, 78a_1 - 11a_0 = 0\right]$$

- Recursion relation for $r = -\frac{7}{6}$

$$a_{k+2} = -\frac{k^2 a_k - 12k^2 a_{k+1} + \frac{2}{3}ka_k - 21ka_{k+1} - \frac{5}{36}a_k - \frac{43}{6}a_{k+1}}{6(6k^2 + 17k + 10)}$$

- Solution for $r = -\frac{7}{6}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{7}{6}}, a_{k+2} = -\frac{k^2 a_k - 12k^2 a_{k+1} + \frac{2}{3}ka_k - 21ka_{k+1} - \frac{5}{36}a_k - \frac{43}{6}a_{k+1}}{6(6k^2 + 17k + 10)}, -6a_1 + \frac{11a_0}{6} = 0\right]$$

- Revert the change of variables $u = x + 6$

$$\left[y = \sum_{k=0}^{\infty} a_k (x+6)^{k-\frac{7}{6}}, a_{k+2} = -\frac{k^2 a_k - 12k^2 a_{k+1} + \frac{2}{3}ka_k - 21ka_{k+1} - \frac{5}{36}a_k - \frac{43}{6}a_{k+1}}{6(6k^2 + 17k + 10)}, -6a_1 + \frac{11a_0}{6} = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k (x+6)^k\right) + \left(\sum_{k=0}^{\infty} b_k (x+6)^{k-\frac{7}{6}}\right), a_{k+2} = -\frac{k^2 a_k - 12k^2 a_{1+k} + 3ka_k - 49ka_{1+k} + 2a_k - 48a_{1+k}}{6(6k^2 + 31k + 38)}, 78a\right.$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 33.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{8x^2y'' + x(x^2+2)\,y' + y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$8x^2y'' + (x^3+2x)\,y' + y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{x^2+2}{8x}$$
$$q(x) = \frac{1}{8x^2}$$

Table 590: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x^2+2}{8x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{1}{8x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$8x^2y'' + (x^3 + 2x)\, y' + y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$8x^2 \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (x^3 + 2x) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 8x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r+2} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n(n+r) = \sum_{n=2}^{\infty} a_{n-2}(n+r-2)\, x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 8x^{n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$8x^{n+r} a_n(n+r)(n+r-1) + 2x^{n+r} a_n(n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$8x^r a_0 r(-1+r) + 2x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(8x^r r(-1+r) + 2x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(8r^2 - 6r + 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$8r^2 - 6r + 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = \frac{1}{4}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(8r^2 - 6r + 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{4}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{4}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$8a_n(n+r)(n+r-1) + a_{n-2}(n+r-2) + 2a_n(n+r) + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}(n+r-2)}{8n^2 + 16nr + 8r^2 - 6n - 6r + 1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = \frac{-2na_{n-2} + 3a_{n-2}}{16n^2 + 4n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{r}{8r^2 + 26r + 21}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = -\frac{1}{72}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r}{8r^2+26r+21}$	$-\frac{1}{72}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r}{8r^2+26r+21}$	$-\frac{1}{72}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r(2 + r)}{(8r^2 + 26r + 21)(8r^2 + 58r + 105)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{5}{19584}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r}{8r^2+26r+21}$	$-\frac{1}{72}$
a_3	0	0
a_4	$\frac{r(2+r)}{(8r^2+26r+21)(8r^2+58r+105)}$	$\frac{5}{19584}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r}{8r^2+26r+21}$	$-\frac{1}{72}$
a_3	0	0
a_4	$\frac{r(2+r)}{(8r^2+26r+21)(8r^2+58r+105)}$	$\frac{5}{19584}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \sqrt{x}\left(1 - \frac{x^2}{72} + \frac{5x^4}{19584} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the

indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$8b_n(n+r)(n+r-1) + b_{n-2}(n+r-2) + 2b_n(n+r) + b_n = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{b_{n-2}(n+r-2)}{8n^2 + 16nr + 8r^2 - 6n - 6r + 1} \tag{4}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_n = \frac{-4nb_{n-2} + 7b_{n-2}}{32n^2 - 8n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -\frac{r}{8r^2 + 26r + 21}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_2 = -\frac{1}{112}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r}{8r^2+26r+21}$	$-\frac{1}{112}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r}{8r^2+26r+21}$	$-\frac{1}{112}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r(2+r)}{(8r^2+26r+21)(8r^2+58r+105)}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_4 = \frac{3}{17920}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r}{8r^2+26r+21}$	$-\frac{1}{112}$
b_3	0	0
b_4	$\frac{r(2+r)}{(8r^2+26r+21)(8r^2+58r+105)}$	$\frac{3}{17920}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r}{8r^2+26r+21}$	$-\frac{1}{112}$
b_3	0	0
b_4	$\frac{r(2+r)}{(8r^2+26r+21)(8r^2+58r+105)}$	$\frac{3}{17920}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= \sqrt{x}(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots) \\
&= x^{\frac{1}{4}}\left(1 - \frac{x^2}{112} + \frac{3x^4}{17920} + O(x^6)\right)
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1\sqrt{x}\left(1 - \frac{x^2}{72} + \frac{5x^4}{19584} + O(x^6)\right) + c_2 x^{\frac{1}{4}}\left(1 - \frac{x^2}{112} + \frac{3x^4}{17920} + O(x^6)\right)
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1\sqrt{x}\left(1 - \frac{x^2}{72} + \frac{5x^4}{19584} + O(x^6)\right) + c_2 x^{\frac{1}{4}}\left(1 - \frac{x^2}{112} + \frac{3x^4}{17920} + O(x^6)\right)
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
y = c_1\sqrt{x}\left(1 - \frac{x^2}{72} + \frac{5x^4}{19584} + O(x^6)\right) + c_2 x^{\frac{1}{4}}\left(1 - \frac{x^2}{112} + \frac{3x^4}{17920} + O(x^6)\right) \tag{1}
$$

Verification of solutions

$$
y = c_1\sqrt{x}\left(1 - \frac{x^2}{72} + \frac{5x^4}{19584} + O(x^6)\right) + c_2 x^{\frac{1}{4}}\left(1 - \frac{x^2}{112} + \frac{3x^4}{17920} + O(x^6)\right)
$$

Verified OK.

14.31.1 Maple step by step solution

Let's solve

$8x^2y'' + (x^3+2x)\,y' + y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{y}{8x^2} - \frac{(x^2+2)y'}{8x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x^2+2)y'}{8x} + \frac{y}{8x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{x^2+2}{8x}, P_3(x) = \frac{1}{8x^2}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $(x \cdot P_2(x))\Big|_{x=0} = \frac{1}{4}$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $(x^2 \cdot P_3(x))\Big|_{x=0} = \frac{1}{8}$

  ◦ $x = 0$is a regular singular point

  Check to see if $x_0 = 0$ is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $8x^2y'' + x(x^2+2)\,y' + y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

  $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $$x^{m}\cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^2\cdot y''$ to series expansion

  $$x^{2}\cdot y'' = \sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_{0}(-1+4r)\,(-1+2r)\,x^{r}+a_{1}(3+4r)\,(1+2r)\,x^{1+r}+\left(\sum_{k=2}^{\infty}\left(a_{k}(4k+4r-1)\,(2k+2r-1)+a_{k-}\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(-1+4r)\,(-1+2r)=0$$

- Values of r that satisfy the indicial equation

  $$r\in\left\{\frac{1}{2},\frac{1}{4}\right\}$$

- Each term must be 0

  $$a_{1}(3+4r)\,(1+2r)=0$$

- Solve for the dependent coefficient(s)

  $$a_{1}=0$$

- Each term in the series must be 0, giving the recursion relation

  $$8\left(k+r-\frac{1}{2}\right)\left(k+r-\frac{1}{4}\right)a_{k}+a_{k-2}(k-2+r)=0$$

- Shift index using $k->k+2$

  $$8\left(k+\frac{3}{2}+r\right)\left(k+\frac{7}{4}+r\right)a_{k+2}+a_{k}(k+r)=0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2}=-\frac{a_{k}(k+r)}{(2k+3+2r)(4k+7+4r)}$$

- Recursion relation for $r=\frac{1}{2}$

  $$a_{k+2}=-\frac{a_{k}\left(k+\frac{1}{2}\right)}{(2k+4)(4k+9)}$$

- Solution for $r=\frac{1}{2}$

  $$\left[y=\sum_{k=0}^{\infty} a_{k}x^{k+\frac{1}{2}}, a_{k+2}=-\frac{a_{k}\left(k+\frac{1}{2}\right)}{(2k+4)(4k+9)}, a_{1}=0\right]$$

- Recursion relation for $r=\frac{1}{4}$

  $$a_{k+2}=-\frac{a_{k}\left(k+\frac{1}{4}\right)}{\left(2k+\frac{7}{2}\right)(4k+8)}$$

- Solution for $r = \frac{1}{4}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{4}}, a_{k+2} = -\frac{a_k \left(k+\frac{1}{4}\right)}{\left(2k+\frac{7}{2}\right)\left(4k+8\right)}, a_1 = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{4}}\right), a_{k+2} = -\frac{a_k \left(k+\frac{1}{2}\right)}{\left(2k+4\right)\left(4k+9\right)}, a_1 = 0, b_{k+2} = -\frac{b_k \left(k+\frac{1}{4}\right)}{\left(2k+\frac{7}{2}\right)\left(4k+8\right)}, b_1 = 0\right]$$

Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 34.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{8x^2(-x^2+1)\,y''+2x(-13x^2+1)\,y'+(-9x^2+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(-8x^4+8x^2)\,y''+(-26x^3+2x)\,y'+(-9x^2+1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{13x^2-1}{4x\,(x^2-1)}$$
$$q(x)=\frac{9x^2-1}{8x^2\,(x^2-1)}$$

Table 592: Table $p(x), q(x)$ singularites.

$p(x) = \frac{13x^2-1}{4x(x^2-1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"
$x = 1$	"regular"

$q(x) = \frac{9x^2-1}{8x^2(x^2-1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"
$x = 1$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, 1, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-8y''x^2\left(x^2-1\right) + \left(-26x^3+2x\right)y' + \left(-9x^2+1\right)y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-8\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) x^2\left(x^2-1\right) + \left(-26x^3+2x\right)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + \left(-9x^2+1\right)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=0}^{\infty} \left(-8x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-26x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-9x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} \left(-8x^{n+r+2} a_n (n+r)(n+r-1)\right) = \sum_{n=2}^{\infty} \left(-8a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} \left(-26x^{n+r+2} a_n (n+r)\right) = \sum_{n=2}^{\infty} \left(-26a_{n-2}(n+r-2)\, x^{n+r}\right)$$

$$\sum_{n=0}^{\infty} \left(-9x^{n+r+2} a_n\right) = \sum_{n=2}^{\infty} \left(-9a_{n-2} x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\sum_{n=2}^{\infty} \left(-8a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 8x^{n+r} a_n (n+r)(n+r-1)\right) + \sum_{n=2}^{\infty} \left(-26a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)\right) + \sum_{n=2}^{\infty} \left(-9a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$8x^{n+r} a_n (n+r)(n+r-1) + 2x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$8x^r a_0 r(-1+r) + 2x^r a_0 r + a_0 x^r = 0$$

Or

$$(8x^r r(-1+r) + 2x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(8r^2 - 6r + 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$8r^2 - 6r + 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = \frac{1}{4}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(8r^2 - 6r + 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{4}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{4}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
-8a_{n-2}(n+r-2)(n-3+r) + 8a_n(n+r)(n+r-1) \\
-26a_{n-2}(n+r-2) + 2a_n(n+r) - 9a_{n-2} + a_n = 0
\end{aligned}
\tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = \frac{(4n+4r-5)\, a_{n-2}}{4n+4r-1} \tag{4}
$$

Which for the root $r = \frac{1}{2}$ becomes

$$
a_n = \frac{(4n-3)\, a_{n-2}}{4n+1} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$
a_2 = \frac{3+4r}{7+4r}
$$

Which for the root $r = \frac{1}{2}$ becomes

$$
a_2 = \frac{5}{9}
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{3+4r}{7+4r}$	$\frac{5}{9}$

For $n = 3$, using the above recursive equation gives

$$
a_3 = 0
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{3+4r}{7+4r}$	$\frac{5}{9}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16r^2 + 56r + 33}{16r^2 + 88r + 105}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{65}{153}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{3+4r}{7+4r}$	$\frac{5}{9}$
a_3	0	0
a_4	$\frac{16r^2+56r+33}{16r^2+88r+105}$	$\frac{65}{153}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{3+4r}{7+4r}$	$\frac{5}{9}$
a_3	0	0
a_4	$\frac{16r^2+56r+33}{16r^2+88r+105}$	$\frac{65}{153}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}y_1(x) &= \sqrt{x}\,(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots) \\ &= \sqrt{x}\left(1 + \frac{5x^2}{9} + \frac{65x^4}{153} + O(x^6)\right)\end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned}&-8b_{n-2}(n+r-2)(n-3+r) + 8b_n(n+r)(n+r-1) \\ &- 26b_{n-2}(n+r-2) + 2b_n(n+r) - 9b_{n-2} + b_n = 0\end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = \frac{(4n+4r-5)\, b_{n-2}}{4n+4r-1} \tag{4}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_n = \frac{(n-1)\, b_{n-2}}{n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{3+4r}{7+4r}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_2 = \frac{1}{2}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{3+4r}{7+4r}$	$\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{3+4r}{7+4r}$	$\frac{1}{2}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{16r^2 + 56r + 33}{16r^2 + 88r + 105}$$

Which for the root $r = \frac{1}{4}$ becomes

$$b_4 = \frac{3}{8}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{3+4r}{7+4r}$	$\frac{1}{2}$
b_3	0	0
b_4	$\frac{16r^2+56r+33}{16r^2+88r+105}$	$\frac{3}{8}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{3+4r}{7+4r}$	$\frac{1}{2}$
b_3	0	0
b_4	$\frac{16r^2+56r+33}{16r^2+88r+105}$	$\frac{3}{8}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= \sqrt{x}\,(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \ldots) \\ &= x^{\frac{1}{4}} \left(1 + \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 \sqrt{x} \left(1 + \frac{5x^2}{9} + \frac{65x^4}{153} + O(x^6)\right) + c_2 x^{\frac{1}{4}} \left(1 + \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 \sqrt{x} \left(1 + \frac{5x^2}{9} + \frac{65x^4}{153} + O(x^6)\right) + c_2 x^{\frac{1}{4}} \left(1 + \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 \sqrt{x} \left(1 + \frac{5x^2}{9} + \frac{65x^4}{153} + O(x^6)\right) + c_2 x^{\frac{1}{4}} \left(1 + \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right) \tag{1}$$

Verification of solutions

$$y = c_1 \sqrt{x} \left(1 + \frac{5x^2}{9} + \frac{65x^4}{153} + O(x^6)\right) + c_2 x^{\frac{1}{4}} \left(1 + \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)$$

Verified OK.

14.32.1 Maple step by step solution

Let's solve

$-8y''x^2(x^2-1)+(-26x^3+2x)\,y'+(-9x^2+1)\,y=0$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y''=-\frac{(9x^2-1)y}{8x^2(x^2-1)}-\frac{(13x^2-1)y'}{4x(x^2-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''+\frac{(13x^2-1)y'}{4x(x^2-1)}+\frac{(9x^2-1)y}{8x^2(x^2-1)}=0$

□ Check to see if x_0 is a regular singular point

- ◦ Define functions

$\left[P_2(x)=\frac{13x^2-1}{4x(x^2-1)},P_3(x)=\frac{9x^2-1}{8x^2(x^2-1)}\right]$

- ◦ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

$\left((x+1)\cdot P_2(x)\right)\bigg|_{x=-1}=\frac{3}{2}$

- ◦ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

$\left((x+1)^2\cdot P_3(x)\right)\bigg|_{x=-1}=0$

- ◦ $x=-1$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0=-1$

- Multiply by denominators

$8y''x^2(x^2-1)+2x(13x^2-1)\,y'+y(9x^2-1)=0$

- Change variables using $x=u-1$ so that the regular singular point is at $u=0$

$(8u^4-32u^3+40u^2-16u)\left(\frac{d^2}{du^2}y(u)\right)+(26u^3-78u^2+76u-24)\left(\frac{d}{du}y(u)\right)+(9u^2-18u+8)\,y$

- Assume series solution for $y(u)$

$y(u)=\sum_{k=0}^{\infty}a_k u^{k+r}$

□ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m = 0..2$

  $$u^m \cdot y(u) = \sum_{k=0}^{\infty} a_k u^{k+r+m}$$

- Shift index using $k- > k - m$

  $$u^m \cdot y(u) = \sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m = 0..3$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\, u^{k+r-1+m}$$

- Shift index using $k- > k + 1 - m$

  $$u^m \cdot \left(\frac{d}{du}y(u)\right) = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m = 1..4$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, u^{k+r-2+m}$$

- Shift index using $k- > k + 2 - m$

  $$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right) = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, u^{k+r}$$

  Rewrite ODE with series expansions

  $$-8a_0 r(1+2r)\, u^{-1+r} + \left(-8a_1(1+r)\,(3+2r) + 4a_0(1+2r)\,(2+5r)\right) u^r + \left(-8a_2(2+r)\,(5+2r)\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$-8r(1+2r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{0, -\frac{1}{2}\right\}$$

- The coefficients of each power of u must be 0

  $$[-8a_1(1+r)\,(3+2r) + 4a_0(1+2r)\,(2+5r) = 0, -8a_2(2+r)\,(5+2r) + 4a_1(3+2r)\,(7+5r) -$$

- Solve for the dependent coefficient(s)

  $$\left\{a_1 = \frac{a_0\left(10r^2+9r+2\right)}{2(2r^2+5r+3)}, a_2 = \frac{a_0\left(34r^3+76r^2+41r+5\right)}{4(2r^3+11r^2+19r+10)}\right\}$$

- Each term in the series must be 0, giving the recursion relation

  $$8(5a_k + a_{k-2} - 4a_{k-1} - 2a_{k+1})\, k^2 + 2(8(5a_k + a_{k-2} - 4a_{k-1} - 2a_{k+1})\, r + 18a_k - 7a_{k-2} + 9a_{k-1}$$

- Shift index using $k->k+2$

  $8(5a_{k+2}+a_k-4a_{k+1}-2a_{k+3})(k+2)^2+2(8(5a_{k+2}+a_k-4a_{k+1}-2a_{k+3})r+18a_{k+2}-7a_k+9$

- Recursion relation that defines series solution to ODE

  $a_{k+3}=\frac{8k^2a_k-32k^2a_{k+1}+40k^2a_{k+2}+16kra_k-64kra_{k+1}+80kra_{k+2}+8r^2a_k-32r^2a_{k+1}+40r^2a_{k+2}+18ka_k-110ka_{k+1}+196ka_{k+}}{8(2k^2+4kr+2r^2+13k+13r+21)}$

- Recursion relation for $r=0$

  $a_{k+3}=\frac{8k^2a_k-32k^2a_{k+1}+40k^2a_{k+2}+18ka_k-110ka_{k+1}+196ka_{k+2}+9a_k-96a_{k+1}+240a_{k+2}}{8(2k^2+13k+21)}$

- Solution for $r=0$

  $\left[y(u)=\sum_{k=0}^{\infty}a_ku^k, a_{k+3}=\frac{8k^2a_k-32k^2a_{k+1}+40k^2a_{k+2}+18ka_k-110ka_{k+1}+196ka_{k+2}+9a_k-96a_{k+1}+240a_{k+2}}{8(2k^2+13k+21)}, a_1=\frac{a_0}{3}\right.$

- Revert the change of variables $u=x+1$

  $\left[y=\sum_{k=0}^{\infty}a_k(x+1)^k, a_{k+3}=\frac{8k^2a_k-32k^2a_{k+1}+40k^2a_{k+2}+18ka_k-110ka_{k+1}+196ka_{k+2}+9a_k-96a_{k+1}+240a_{k+2}}{8(2k^2+13k+21)}, a_1=\right.$

- Recursion relation for $r=-\frac{1}{2}$

  $a_{k+3}=\frac{8k^2a_k-32k^2a_{k+1}+40k^2a_{k+2}+10ka_k-78ka_{k+1}+156ka_{k+2}+2a_k-49a_{k+1}+152a_{k+2}}{8(2k^2+11k+15)}$

- Solution for $r=-\frac{1}{2}$

  $\left[y(u)=\sum_{k=0}^{\infty}a_ku^{k-\frac{1}{2}}, a_{k+3}=\frac{8k^2a_k-32k^2a_{k+1}+40k^2a_{k+2}+10ka_k-78ka_{k+1}+156ka_{k+2}+2a_k-49a_{k+1}+152a_{k+2}}{8(2k^2+11k+15)}, a_1=\right.$

- Revert the change of variables $u=x+1$

  $\left[y=\sum_{k=0}^{\infty}a_k(x+1)^{k-\frac{1}{2}}, a_{k+3}=\frac{8k^2a_k-32k^2a_{k+1}+40k^2a_{k+2}+10ka_k-78ka_{k+1}+156ka_{k+2}+2a_k-49a_{k+1}+152a_{k+2}}{8(2k^2+11k+15)}, a_1\right.$

- Combine solutions and rename parameters

  $\left[y=\left(\sum_{k=0}^{\infty}a_k(x+1)^k\right)+\left(\sum_{k=0}^{\infty}b_k(x+1)^{k-\frac{1}{2}}\right), a_{k+3}=\frac{8k^2a_k-32k^2a_{1+k}+40k^2a_{k+2}+18ka_k-110ka_{1+k}+196ka}{8(2k^2+13k+21)}\right.$

Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 35.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2+1)\,y''-2x(-x^2+2)\,y'+4y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+x^2)\,y''+(2x^3-4x)\,y'+4y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned} p(x) &= \frac{2x^2-4}{x\,(x^2+1)} \\ q(x) &= \frac{4}{x^2\,(x^2+1)} \end{aligned}$$

Table 594: Table $p(x), q(x)$ singularites.

$p(x) = \frac{2x^2-4}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{4}{x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+1)\,y'' + (2x^3-4x)\,y' + 4y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (2x^3-4x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + 4\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right) \tag{2A}$$
$$+ \left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n(n+r)\right) + \sum_{n=0}^{\infty} \left(-4x^{n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n(n+r)(n+r-1) = \sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n(n+r) = \sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n(n+r)(n+r-1)\right) \tag{2B}$$
$$+ \left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-4x^{n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} 4a_n x^{n+r}\right) = 0$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$x^{n+r} a_n(n+r)(n+r-1) - 4x^{n+r} a_n(n+r) + 4a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$x^r a_0 r(-1+r) - 4x^r a_0 r + 4a_0 x^r = 0$$

Or

$$\left(x^r r(-1+r) - 4x^r r + 4x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(r^2 - 5r + 4\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$r^2 - 5r + 4 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= 4 \\ r_2 &= 1 \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(r^2 - 5r + 4\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 3$ is an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right) \\ y_2(x) &= C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= x^4 \left(\sum_{n=0}^{\infty} a_n x^n\right) \\ y_2(x) &= C y_1(x) \ln(x) + x \left(\sum_{n=0}^{\infty} b_n x^n\right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+4} \\ y_2(x) &= C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+1}\right) \end{aligned}$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$a_{n-2}(n+r-2)(n-3+r)+a_n(n+r)(n+r-1) \\ +2a_{n-2}(n+r-2)-4a_n(n+r)+4a_n=0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}(n+r-2)}{n+r-4} \tag{4}$$

Which for the root $r=4$ becomes

$$a_n = -\frac{a_{n-2}(n+2)}{n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r=4$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n=2$, using the above recursive equation gives

$$a_2 = -\frac{r}{r-2}$$

Which for the root $r=4$ becomes

$$a_2 = -2$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r}{r-2}$	-2

For $n=3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r}{r-2}$	-2
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{2+r}{r-2}$$

Which for the root $r = 4$ becomes

$$a_4 = 3$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r}{r-2}$	-2
a_3	0	0
a_4	$\frac{2+r}{r-2}$	3

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r}{r-2}$	-2
a_3	0	0
a_4	$\frac{2+r}{r-2}$	3
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^4 (a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots) \\
&= x^4 (1 - 2x^2 + 3x^4 + O(x^6))
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Let

$$
r_1 - r_2 = N
$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 3$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_3(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$
\begin{aligned}
a_N &= a_3 \\
&= 0
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\lim_{r\to r_2} 0 &= \lim_{r\to 1} 0 \\
&= 0
\end{aligned}
$$

The limit is 0. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$
\begin{aligned}
y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\
&= \sum_{n=0}^{\infty} b_n x^{n+1}
\end{aligned}
$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq(3) gives

$$
b_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&b_{n-2}(n + r - 2)(n - 3 + r) + b_n(n + r)(n + r - 1) \\
&+ 2b_{n-2}(n + r - 2) - 4b_n(n + r) + 4b_n = 0
\end{aligned} \tag{4}
$$

Which for for the root $r = 1$ becomes

$$
b_{n-2}(n - 1)(n - 2) + b_n(n + 1) n + 2b_{n-2}(n - 1) - 4b_n(n + 1) + 4b_n = 0 \tag{4A}
$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{b_{n-2}(n+r-2)}{n+r-4} \tag{5}$$

Which for the root $r = 1$ becomes

$$b_n = -\frac{b_{n-2}(n-1)}{n-3} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -\frac{r}{r-2}$$

Which for the root $r = 1$ becomes

$$b_2 = 1$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r}{r-2}$	1

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r}{r-2}$	1
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{2+r}{r-2}$$

Which for the root $r = 1$ becomes

$$b_4 = -3$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r}{r-2}$	1
b_3	0	0
b_4	$\frac{2+r}{r-2}$	-3

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r}{r-2}$	1
b_3	0	0
b_4	$\frac{2+r}{r-2}$	-3
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^4\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= x\left(1 + x^2 - 3x^4 + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^4\left(1 - 2x^2 + 3x^4 + O(x^6)\right) + c_2 x\left(1 + x^2 - 3x^4 + O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^4 \left(1 - 2x^2 + 3x^4 + O(x^6)\right) + c_2 x \left(1 + x^2 - 3x^4 + O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^4 \left(1 - 2x^2 + 3x^4 + O(x^6)\right) + c_2 x \left(1 + x^2 - 3x^4 + O(x^6)\right) \tag{1}$$

Verification of solutions

$$y = c_1 x^4 \left(1 - 2x^2 + 3x^4 + O(x^6)\right) + c_2 x \left(1 + x^2 - 3x^4 + O(x^6)\right)$$

Verified OK.

14.33.1 Maple step by step solution

Let's solve

$x^2(x^2+1)\, y'' + (2x^3 - 4x)\, y' + 4y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{4y}{x^2(x^2+1)} - \frac{2(x^2-2)y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{2(x^2-2)y'}{x(x^2+1)} + \frac{4y}{x^2(x^2+1)} = 0$

□ Check to see if x_0 is a regular singular point

- ◦ Define functions

  $\left[P_2(x) = \frac{2(x^2-2)}{x(x^2+1)}, P_3(x) = \frac{4}{x^2(x^2+1)}\right]$

- ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left(x \cdot P_2(x)\right)\bigg|_{x=0} = -4$

- ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left(x^2 \cdot P_3(x)\right)\bigg|_{x=0} = 4$

- $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $x^2(x^2+1)\,y''+2x(x^2-2)\,y'+4y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

- □ Rewrite ODE with series expansions

  - Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

    $x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$

  - Shift index using $k->k+1-m$

    $x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,x^{k+r}$

  - Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

    $x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,x^{k+r-2+m}$

  - Shift index using $k->k+2-m$

    $x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(-1+r)\,(-4+r)\,x^r+a_1r(-3+r)\,x^{1+r}+\left(\sum_{k=2}^{\infty}(a_k(k+r-1)\,(k+r-4)+a_{k-2}(k-2+r)\,(\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(-1+r)\,(-4+r)=0$

- Values of r that satisfy the indicial equation

  $r \in \{1,4\}$

- Each term must be 0

  $a_1r(-3+r)=0$

- Solve for the dependent coefficient(s)

  $a_1=0$

- Each term in the series must be 0, giving the recursion relation

  $(k+r-1)\left(a_k(k+r-4)+a_{k-2}(k-2+r)\right)=0$
- Shift index using $k->k+2$

  $(k+r+1)\left(a_{k+2}(k-2+r)+a_k(k+r)\right)=0$
- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{a_k(k+r)}{k-2+r}$
- Recursion relation for $r=1$

  $a_{k+2}=-\frac{a_k(k+1)}{k-1}$
- Solution for $r=1$

  $\left[y=\sum_{k=0}^{\infty} a_k x^{k+1}, a_{k+2}=-\frac{a_k(k+1)}{k-1}, a_1=0\right]$
- Recursion relation for $r=4$

  $a_{k+2}=-\frac{a_k(k+4)}{k+2}$
- Solution for $r=4$

  $\left[y=\sum_{k=0}^{\infty} a_k x^{k+4}, a_{k+2}=-\frac{a_k(k+4)}{k+2}, a_1=0\right]$
- Combine solutions and rename parameters

  $\left[y=\left(\sum_{k=0}^{\infty} a_k x^{1+k}\right)+\left(\sum_{k=0}^{\infty} b_k x^{4+k}\right), a_{k+2}=-\frac{a_k(1+k)}{k-1}, a_1=0, b_{k+2}=-\frac{b_k(4+k)}{k+2}, b_1=0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 36.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x(x^2+3)\,y''+(-x^2+2)\,y'-8yx=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^3+3x)\,y''+(-x^2+2)\,y'-8yx=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=-\frac{x^2-2}{x\,(x^2+3)}$$
$$q(x)=-\frac{8}{x^2+3}$$

Table 596: Table $p(x), q(x)$ singularites.

$p(x) = -\frac{x^2-2}{x(x^2+3)}$	
singularity	type
$x = 0$	"regular"
$x = -i\sqrt{3}$	"regular"
$x = i\sqrt{3}$	"regular"

$q(x) = -\frac{8}{x^2+3}$	
singularity	type
$x = -i\sqrt{3}$	"regular"
$x = i\sqrt{3}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -i\sqrt{3}, i\sqrt{3}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x(x^2+3)\, y'' + (-x^2+2)\, y' - 8yx = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x(x^2+3) \left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (-x^2+2) \left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) - 8\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) x = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r-1} a_n(n+r)(n+r-1)\right) + \sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n(n+r)\right) + \left(\sum_{n=0}^{\infty} 2(n+r) a_n x^{n+r-1}\right) + \sum_{n=0}^{\infty} \left(-8x^{1+n+r} a_n\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r-1} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r)(n+r-1) = \sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r-1}$$

$$\sum_{n=0}^{\infty} \left(-x^{1+n+r} a_n(n+r)\right) = \sum_{n=2}^{\infty} \left(-a_{n-2}(n+r-2) x^{n+r-1}\right)$$

$$\sum_{n=0}^{\infty} \left(-8x^{1+n+r} a_n\right) = \sum_{n=2}^{\infty} \left(-8a_{n-2} x^{n+r-1}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r-1$.

$$\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r-1} a_n(n+r)(n+r-1)\right) + \sum_{n=2}^{\infty} \left(-a_{n-2}(n+r-2) x^{n+r-1}\right) + \left(\sum_{n=0}^{\infty} 2(n+r) a_n x^{n+r-1}\right) + \sum_{n=2}^{\infty} \left(-8a_{n-2} x^{n+r-1}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$3x^{n+r-1} a_n(n+r)(n+r-1) + 2(n+r) a_n x^{n+r-1} = 0$$

When $n=0$ the above becomes

$$3x^{-1+r} a_0 r(-1+r) + 2r a_0 x^{-1+r} = 0$$

Or

$$\left(3x^{-1+r}r(-1+r)+2r\,x^{-1+r}\right)a_0=0$$

Since $a_0\neq 0$ then the above simplifies to

$$r\,x^{-1+r}(-1+3r)=0$$

Since the above is true for all x then the indicial equation becomes

$$3r^2-r=0$$

Solving for r gives the roots of the indicial equation as

$$r_1=\frac{1}{3}$$
$$r_2=0$$

Since $a_0\neq 0$ then the indicial equation becomes

$$r\,x^{-1+r}(-1+3r)=0$$

Solving for r gives the roots of the indicial equation as Since $r_1-r_2=\frac{1}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x)=x^{r_1}\left(\sum_{n=0}^{\infty}a_n x^n\right)$$
$$y_2(x)=x^{r_2}\left(\sum_{n=0}^{\infty}b_n x^n\right)$$

Or

$$y_1(x)=\sum_{n=0}^{\infty}a_n x^{n+\frac{1}{3}}$$
$$y_2(x)=\sum_{n=0}^{\infty}b_n x^n$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n=0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0=1$. Substituting $n=1$ in Eq. (2B) gives

$$a_1=0$$

For $2\leq n$ the recursive equation is

$$a_{n-2}(n+r-2)(n-3+r)+3a_n(n+r)(n+r-1)-a_{n-2}(n+r-2)+2a_n(n+r)-8a_{n-2}=0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r-6)\, a_{n-2}}{3n-1+3r} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = -\frac{(3n-17)\, a_{n-2}}{9n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{4-r}{5+3r}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = \frac{11}{18}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{4-r}{5+3r}$	$\frac{11}{18}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{4-r}{5+3r}$	$\frac{11}{18}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 - 6r + 8}{9r^2 + 48r + 55}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{55}{648}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{4-r}{5+3r}$	$\frac{11}{18}$
a_3	0	0
a_4	$\frac{r^2-6r+8}{9r^2+48r+55}$	$\frac{55}{648}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{4-r}{5+3r}$	$\frac{11}{18}$
a_3	0	0
a_4	$\frac{r^2-6r+8}{9r^2+48r+55}$	$\frac{55}{648}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}} \left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}} \left(1 + \frac{11x^2}{18} + \frac{55x^4}{648} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} b_{n-2}(n+r-2)(n-3+r) + 3b_n(n+r)(n+r-1) \\ - b_{n-2}(n+r-2) + 2(n+r)b_n - 8b_{n-2} = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{(n+r-6)\,b_{n-2}}{3n-1+3r} \tag{4}$$

Which for the root $r = 0$ becomes

$$b_n = -\frac{(n-6)\,b_{n-2}}{3n-1} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = 0$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{4-r}{5+3r}$$

Which for the root $r = 0$ becomes

$$b_2 = \frac{4}{5}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{4-r}{5+3r}$	$\frac{4}{5}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{4-r}{5+3r}$	$\frac{4}{5}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^2 - 6r + 8}{9r^2 + 48r + 55}$$

Which for the root $r = 0$ becomes

$$b_4 = \frac{8}{55}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{4-r}{5+3r}$	$\frac{4}{5}$
b_3	0	0
b_4	$\frac{r^2-6r+8}{9r^2+48r+55}$	$\frac{8}{55}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{4-r}{5+3r}$	$\frac{4}{5}$
b_3	0	0
b_4	$\frac{r^2-6r+8}{9r^2+48r+55}$	$\frac{8}{55}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots \\ &= 1 + \frac{4x^2}{5} + \frac{8x^4}{55} + O(x^6) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{1}{3}} \left(1 + \frac{11x^2}{18} + \frac{55x^4}{648} + O(x^6)\right) + c_2 \left(1 + \frac{4x^2}{5} + \frac{8x^4}{55} + O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{1}{3}} \left(1 + \frac{11x^2}{18} + \frac{55x^4}{648} + O(x^6)\right) + c_2 \left(1 + \frac{4x^2}{5} + \frac{8x^4}{55} + O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{3}} \left(1 + \frac{11x^2}{18} + \frac{55x^4}{648} + O(x^6)\right) + c_2 \left(1 + \frac{4x^2}{5} + \frac{8x^4}{55} + O(x^6)\right) \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{3}} \left(1 + \frac{11x^2}{18} + \frac{55x^4}{648} + O(x^6)\right) + c_2 \left(1 + \frac{4x^2}{5} + \frac{8x^4}{55} + O(x^6)\right)$$

Verified OK.

14.34.1 Maple step by step solution

Let's solve

$x(x^2+3)\,y''+(-x^2+2)\,y'-8yx=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=\frac{(x^2-2)y'}{x(x^2+3)}+\frac{8y}{x^2+3}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''-\frac{(x^2-2)y'}{x(x^2+3)}-\frac{8y}{x^2+3}=0$

☐ Check to see if x_0 is a regular singular point

- ○ Define functions

  $\left[P_2(x)=-\frac{x^2-2}{x(x^2+3)}, P_3(x)=-\frac{8}{x^2+3}\right]$

- ○ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left.(x\cdot P_2(x))\right|_{x=0}=\frac{2}{3}$

- ○ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left.(x^2\cdot P_3(x))\right|_{x=0}=0$

- ○ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $x(x^2+3)\,y''+(-x^2+2)\,y'-8yx=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty} a_k x^{k+r}$

☐ Rewrite ODE with series expansions

- ○ Convert $x\cdot y$ to series expansion

  $x\cdot y=\sum_{k=0}^{\infty} a_k x^{k+r+1}$

- Shift index using $k->k-1$

  $x\cdot y=\sum_{k=1}^{\infty} a_{k-1} x^{k+r}$

- Convert $x^{m}\cdot y'$ to series expansion for $m=0..2$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^{m}\cdot y''$ to series expansion for $m=1..3$

  $x^{m}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m}\cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}r(-1+3r)\, x^{-1+r}+a_{1}(1+r)\,(2+3r)\, x^{r}+\left(\sum_{k=1}^{\infty} (a_{k+1}(k+r+1)\,(3k+2+3r)+a_{k-1}(k+r-$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $r(-1+3r)=0$

- Values of r that satisfy the indicial equation

  $r\in\left\{0, \frac{1}{3}\right\}$

- Each term must be 0

  $a_{1}(1+r)\,(2+3r)=0$

- Each term in the series must be 0, giving the recursion relation

  $\left(a_{k-1}(k-5+r)+3\left(k+\frac{2}{3}+r\right) a_{k+1}\right)(k+r+1)=0$

- Shift index using $k->k+1$

  $\left(a_{k}(k+r-4)+3\left(k+\frac{5}{3}+r\right) a_{k+2}\right)(k+r+2)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{a_{k}(k+r-4)}{3k+5+3r}$

- Recursion relation for $r=0$; series terminates at $k=4$

  $a_{k+2}=-\frac{a_{k}(k-4)}{3k+5}$

- Solution for $r = 0$

$$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+2} = -\frac{a_k(k-4)}{3k+5}, 2a_1 = 0\right]$$

- Recursion relation for $r = \frac{1}{3}$

$$a_{k+2} = -\frac{a_k\left(k-\frac{11}{3}\right)}{3k+6}$$

- Solution for $r = \frac{1}{3}$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+2} = -\frac{a_k\left(k-\frac{11}{3}\right)}{3k+6}, 4a_1 = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^k\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{3}}\right), a_{k+2} = -\frac{a_k(-4+k)}{3k+5}, 2a_1 = 0, b_{k+2} = -\frac{b_k\left(k-\frac{11}{3}\right)}{3k+6}, 4b_1 = 0\right]$$

Problem number: 37.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{4x^2(-x^2+1)\,y''+x(-19x^2+7)\,y'-(14x^2+1)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(-4x^4+4x^2)\,y''+(-19x^3+7x)\,y'+(-14x^2-1)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{19x^2-7}{4x\,(x^2-1)}\\ q(x)&=\frac{14x^2+1}{4x^2\,(x^2-1)}\end{aligned}$$

Table 598: Table $p(x), q(x)$ singularites.

$p(x) = \frac{19x^2-7}{4x(x^2-1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"
$x = 1$	"regular"

$q(x) = \frac{14x^2+1}{4x^2(x^2-1)}$	
singularity	type
$x = -1$	"regular"
$x = 0$	"regular"
$x = 1$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[-1, 0, 1, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-4y''x^2(x^2-1) + (-19x^3+7x)y' + (-14x^2-1)y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-4\left(\sum_{n=0}^{\infty} (n+r)(n+r-1) a_n x^{n+r-2}\right) x^2(x^2-1) + (-19x^3+7x)\left(\sum_{n=0}^{\infty} (n+r) a_n x^{n+r-1}\right) + (-14x^2-1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=0}^{\infty}\left(-4x^{n+r+2}a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty}4x^{n+r}a_n(n+r)(n+r-1)\right)$$
$$+\sum_{n=0}^{\infty}\left(-19x^{n+r+2}a_n(n+r)\right)+\left(\sum_{n=0}^{\infty}7x^{n+r}a_n(n+r)\right) \tag{2A}$$
$$+\sum_{n=0}^{\infty}\left(-14x^{n+r+2}a_n\right)+\sum_{n=0}^{\infty}\left(-a_n x^{n+r}\right)=0$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty}\left(-4x^{n+r+2}a_n(n+r)(n+r-1)\right)=\sum_{n=2}^{\infty}\left(-4a_{n-2}(n+r-2)(n-3+r)\,x^{n+r}\right)$$

$$\sum_{n=0}^{\infty}\left(-19x^{n+r+2}a_n(n+r)\right)=\sum_{n=2}^{\infty}\left(-19a_{n-2}(n+r-2)\,x^{n+r}\right)$$

$$\sum_{n=0}^{\infty}\left(-14x^{n+r+2}a_n\right)=\sum_{n=2}^{\infty}\left(-14a_{n-2}x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\sum_{n=2}^{\infty}\left(-4a_{n-2}(n+r-2)(n-3+r)\,x^{n+r}\right)+\left(\sum_{n=0}^{\infty}4x^{n+r}a_n(n+r)(n+r-1)\right)$$
$$+\sum_{n=2}^{\infty}\left(-19a_{n-2}(n+r-2)\,x^{n+r}\right)+\left(\sum_{n=0}^{\infty}7x^{n+r}a_n(n+r)\right) \tag{2B}$$
$$+\sum_{n=2}^{\infty}\left(-14a_{n-2}x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-a_n x^{n+r}\right)=0$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r}a_n(n+r)(n+r-1)+7x^{n+r}a_n(n+r)-a_n x^{n+r}=0$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) + 7x^r a_0 r - a_0 x^r = 0$$

Or

$$\left(4x^r r(-1+r) + 7x^r r - x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 + 3r - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 + 3r - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{4}$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 + 3r - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{5}{4}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{4}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-1}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
-4a_{n-2}(n+r-2)(n-3+r)+4a_n(n+r)(n+r-1) \\
-19a_{n-2}(n+r-2)+7a_n(n+r)-14a_{n-2}-a_n=0
\end{aligned} \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = \frac{(n+r)\, a_{n-2}}{n+1+r} \tag{4}
$$

Which for the root $r = \frac{1}{4}$ becomes

$$
a_n = \frac{(4n+1)\, a_{n-2}}{4n+5} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$
a_2 = \frac{2+r}{3+r}
$$

Which for the root $r = \frac{1}{4}$ becomes

$$
a_2 = \frac{9}{13}
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2+r}{3+r}$	$\frac{9}{13}$

For $n = 3$, using the above recursive equation gives

$$
a_3 = 0
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2+r}{3+r}$	$\frac{9}{13}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 + 6r + 8}{(3+r)(5+r)}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_4 = \frac{51}{91}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2+r}{3+r}$	$\frac{9}{13}$
a_3	0	0
a_4	$\frac{r^2+6r+8}{(3+r)(5+r)}$	$\frac{51}{91}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{2+r}{3+r}$	$\frac{9}{13}$
a_3	0	0
a_4	$\frac{r^2+6r+8}{(3+r)(5+r)}$	$\frac{51}{91}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^{\frac{1}{4}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^{\frac{1}{4}}\left(1 + \frac{9x^2}{13} + \frac{51x^4}{91} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
b_1 = 0
$$

For $2 \le n$ the recursive equation is

$$
\begin{aligned}
&-4b_{n-2}(n+r-2)(n-3+r) + 4b_n(n+r)(n+r-1) \\
&- 19b_{n-2}(n+r-2) + 7b_n(n+r) - 14b_{n-2} - b_n = 0
\end{aligned} \tag{3}
$$

Solving for b_n from recursive equation (4) gives

$$
b_n = \frac{(n+r)\, b_{n-2}}{n+1+r} \tag{4}
$$

Which for the root $r = -1$ becomes

$$
b_n = \frac{(n-1)\, b_{n-2}}{n} \tag{5}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$
b_2 = \frac{2+r}{3+r}
$$

Which for the root $r = -1$ becomes

$$
b_2 = \frac{1}{2}
$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{2+r}{3+r}$	$\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{2+r}{3+r}$	$\frac{1}{2}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^2 + 6r + 8}{(3 + r)(5 + r)}$$

Which for the root $r = -1$ becomes

$$b_4 = \frac{3}{8}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{2+r}{3+r}$	$\frac{1}{2}$
b_3	0	0
b_4	$\frac{r^2+6r+8}{(3+r)(5+r)}$	$\frac{3}{8}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{2+r}{3+r}$	$\frac{1}{2}$
b_3	0	0
b_4	$\frac{r^2+6r+8}{(3+r)(5+r)}$	$\frac{3}{8}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{1}{4}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 + \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)}{x} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{1}{4}}\left(1 + \frac{9x^2}{13} + \frac{51x^4}{91} + O(x^6)\right) + \frac{c_2\left(1 + \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)}{x} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{1}{4}}\left(1 + \frac{9x^2}{13} + \frac{51x^4}{91} + O(x^6)\right) + \frac{c_2\left(1 + \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)}{x} \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{4}}\left(1 + \frac{9x^2}{13} + \frac{51x^4}{91} + O(x^6)\right) + \frac{c_2\left(1 + \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)}{x} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{4}} \left(1 + \frac{9x^2}{13} + \frac{51x^4}{91} + O(x^6)\right) + \frac{c_2 \left(1 + \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)}{x}$$

Verified OK.

14.35.1 Maple step by step solution

Let's solve

$-4y''x^2(x^2-1) + (-19x^3+7x)\,y' + (-14x^2-1)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(14x^2+1)y}{4x^2(x^2-1)} - \frac{(19x^2-7)y'}{4x(x^2-1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(19x^2-7)y'}{4x(x^2-1)} + \frac{(14x^2+1)y}{4x^2(x^2-1)} = 0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{19x^2-7}{4x(x^2-1)}, P_3(x) = \frac{14x^2+1}{4x^2(x^2-1)}\right]$

  ◦ $(x+1)\cdot P_2(x)$ is analytic at $x=-1$

  $\left((x+1)\cdot P_2(x)\right)\Big|_{x=-1} = \frac{3}{2}$

  ◦ $(x+1)^2\cdot P_3(x)$ is analytic at $x=-1$

  $\left((x+1)^2\cdot P_3(x)\right)\Big|_{x=-1} = 0$

  ◦ $x=-1$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = -1$

- Multiply by denominators

  $4y''x^2(x^2-1) + x(19x^2-7)\,y' + (14x^2+1)\,y = 0$

- Change variables using $x = u-1$ so that the regular singular point is at $u=0$

$$\left(4u^4-16u^3+20u^2-8u\right)\left(\frac{d^2}{du^2}y(u)\right)+\left(19u^3-57u^2+50u-12\right)\left(\frac{d}{du}y(u)\right)+\left(14u^2-28u+15\right)$$

- Assume series solution for $y(u)$

$$y(u)=\sum_{k=0}^{\infty} a_k u^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $u^m \cdot y(u)$ to series expansion for $m=0..2$

$$u^m \cdot y(u)=\sum_{k=0}^{\infty} a_k u^{k+r+m}$$

- Shift index using $k->k-m$

$$u^m \cdot y(u)=\sum_{k=m}^{\infty} a_{k-m} u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d}{du}y(u)\right)$ to series expansion for $m=0..3$

$$u^m \cdot \left(\frac{d}{du}y(u)\right)=\sum_{k=0}^{\infty} a_k(k+r)\,u^{k+r-1+m}$$

- Shift index using $k->k+1-m$

$$u^m \cdot \left(\frac{d}{du}y(u)\right)=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\,u^{k+r}$$

- Convert $u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)$ to series expansion for $m=1..4$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\,u^{k+r-2+m}$$

- Shift index using $k->k+2-m$

$$u^m \cdot \left(\frac{d^2}{du^2}y(u)\right)=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,u^{k+r}$$

Rewrite ODE with series expansions

$$-4a_0r(1+2r)\,u^{-1+r}+\left(-4a_1(1+r)\,(3+2r)+5a_0(4r^2+6r+3)\right)u^r+\left(-4a_2(2+r)\,(5+2r)+\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$-4r(1+2r)=0$$

- Values of r that satisfy the indicial equation

$$r\in\left\{0,-\frac{1}{2}\right\}$$

- The coefficients of each power of u must be 0

$$\left[-4a_1(1+r)\,(3+2r)+5a_0(4r^2+6r+3)=0,-4a_2(2+r)\,(5+2r)+5a_1(4r^2+14r+13)-a_0\right.$$

- Solve for the dependent coefficient(s)

$$\left\{a_1 = \frac{5a_0(4r^2+6r+3)}{4(2r^2+5r+3)}, a_2 = \frac{a_0(272r^4+1352r^3+2464r^2+1948r+639)}{16(4r^4+28r^3+71r^2+77r+30)}\right\}$$

- Each term in the series must be 0, giving the recursion relation

$$4(5a_k + a_{k-2} - 4a_{k-1} - 2a_{k+1})k^2 + (8(5a_k + a_{k-2} - 4a_{k-1} - 2a_{k+1})r + 30a_k - a_{k-2} - 9a_{k-1} - 2$$

- Shift index using $k- >k+2$

$$4(5a_{k+2} + a_k - 4a_{k+1} - 2a_{k+3})(k+2)^2 + (8(5a_{k+2} + a_k - 4a_{k+1} - 2a_{k+3})r + 30a_{k+2} - a_k - 9a_k$$

- Recursion relation that defines series solution to ODE

$$a_{k+3} = \frac{4k^2a_k - 16k^2a_{k+1} + 20k^2a_{k+2} + 8kra_k - 32kra_{k+1} + 40kra_{k+2} + 4r^2a_k - 16r^2a_{k+1} + 20r^2a_{k+2} + 15ka_k - 73ka_{k+1} + 110ka_{k+2}}{4(2k^2+4kr+2r^2+13k+13r+21)}$$

- Recursion relation for $r = 0$

$$a_{k+3} = \frac{4k^2a_k - 16k^2a_{k+1} + 20k^2a_{k+2} + 15ka_k - 73ka_{k+1} + 110ka_{k+2} + 14a_k - 85a_{k+1} + 155a_{k+2}}{4(2k^2+13k+21)}$$

- Solution for $r = 0$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^k, a_{k+3} = \frac{4k^2a_k - 16k^2a_{k+1} + 20k^2a_{k+2} + 15ka_k - 73ka_{k+1} + 110ka_{k+2} + 14a_k - 85a_{k+1} + 155a_{k+2}}{4(2k^2+13k+21)}, a_1 = \frac{5a}{4}\right.$$

- Revert the change of variables $u = x + 1$

$$\left[y = \sum_{k=0}^{\infty} a_k(x+1)^k, a_{k+3} = \frac{4k^2a_k - 16k^2a_{k+1} + 20k^2a_{k+2} + 15ka_k - 73ka_{k+1} + 110ka_{k+2} + 14a_k - 85a_{k+1} + 155a_{k+2}}{4(2k^2+13k+21)}, a_1 =\right.$$

- Recursion relation for $r = -\frac{1}{2}$

$$a_{k+3} = \frac{4k^2a_k - 16k^2a_{k+1} + 20k^2a_{k+2} + 11ka_k - 57ka_{k+1} + 90ka_{k+2} + \frac{15}{2}a_k - \frac{105}{2}a_{k+1} + 105a_{k+2}}{4(2k^2+11k+15)}$$

- Solution for $r = -\frac{1}{2}$

$$\left[y(u) = \sum_{k=0}^{\infty} a_k u^{k-\frac{1}{2}}, a_{k+3} = \frac{4k^2a_k - 16k^2a_{k+1} + 20k^2a_{k+2} + 11ka_k - 57ka_{k+1} + 90ka_{k+2} + \frac{15}{2}a_k - \frac{105}{2}a_{k+1} + 105a_{k+2}}{4(2k^2+11k+15)}, a_1 =\right.$$

- Revert the change of variables $u = x + 1$

$$\left[y = \sum_{k=0}^{\infty} a_k(x+1)^{k-\frac{1}{2}}, a_{k+3} = \frac{4k^2a_k - 16k^2a_{k+1} + 20k^2a_{k+2} + 11ka_k - 57ka_{k+1} + 90ka_{k+2} + \frac{15}{2}a_k - \frac{105}{2}a_{k+1} + 105a_{k+2}}{4(2k^2+11k+15)}, a\right.$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k(x+1)^k\right) + \left(\sum_{k=0}^{\infty} b_k(x+1)^{k-\frac{1}{2}}\right), a_{k+3} = \frac{4k^2a_k - 16k^2a_{1+k} + 20k^2a_{k+2} + 15ka_k - 73ka_{1+k} + 110ka_k}{4(2k^2+13k+21)}\right.$$

Problem number: 38.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{3x^{2}\left(-x^{2}+2\right) y''+x\left(-11x^{2}+1\right) y'+\left(-5x^{2}+1\right) y=0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(-3x^{4}+6x^{2}\right) y''+\left(-11x^{3}+x\right) y'+\left(-5x^{2}+1\right) y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{11x^{2}-1}{3x\left(x^{2}-2\right)}$$
$$q(x)=\frac{5x^{2}-1}{3x^{2}\left(x^{2}-2\right)}$$

Table 600: Table $p(x), q(x)$ singularites.

$p(x) = \frac{11x^2-1}{3x(x^2-2)}$	
singularity	type
$x = 0$	"regular"
$x = \sqrt{2}$	"regular"
$x = -\sqrt{2}$	"regular"

$q(x) = \frac{5x^2-1}{3x^2(x^2-2)}$	
singularity	type
$x = 0$	"regular"
$x = \sqrt{2}$	"regular"
$x = -\sqrt{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, \sqrt{2}, -\sqrt{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$-3y''x^2(x^2-2) + (-11x^3 + x)\, y' + (-5x^2 + 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$-3\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) x^2(x^2-2) + (-11x^3 + x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (-5x^2 + 1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\sum_{n=0}^{\infty}\left(-3x^{n+r+2}a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty}6x^{n+r}a_n(n+r)(n+r-1)\right)$$
$$+\sum_{n=0}^{\infty}\left(-11x^{n+r+2}a_n(n+r)\right)+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)\right) \tag{2A}$$
$$+\sum_{n=0}^{\infty}\left(-5x^{n+r+2}a_n\right)+\left(\sum_{n=0}^{\infty}a_n x^{n+r}\right)=0$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty}\left(-3x^{n+r+2}a_n(n+r)(n+r-1)\right)=\sum_{n=2}^{\infty}\left(-3a_{n-2}(n+r-2)(n-3+r)x^{n+r}\right)$$
$$\sum_{n=0}^{\infty}\left(-11x^{n+r+2}a_n(n+r)\right)=\sum_{n=2}^{\infty}\left(-11a_{n-2}(n+r-2)x^{n+r}\right)$$
$$\sum_{n=0}^{\infty}\left(-5x^{n+r+2}a_n\right)=\sum_{n=2}^{\infty}\left(-5a_{n-2}x^{n+r}\right)$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\sum_{n=2}^{\infty}\left(-3a_{n-2}(n+r-2)(n-3+r)x^{n+r}\right)$$
$$+\left(\sum_{n=0}^{\infty}6x^{n+r}a_n(n+r)(n+r-1)\right)+\sum_{n=2}^{\infty}\left(-11a_{n-2}(n+r-2)x^{n+r}\right) \tag{2B}$$
$$+\left(\sum_{n=0}^{\infty}x^{n+r}a_n(n+r)\right)+\sum_{n=2}^{\infty}\left(-5a_{n-2}x^{n+r}\right)+\left(\sum_{n=0}^{\infty}a_n x^{n+r}\right)=0$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$6x^{n+r}a_n(n+r)(n+r-1)+x^{n+r}a_n(n+r)+a_n x^{n+r}=0$$

When $n = 0$ the above becomes

$$6x^r a_0 r(-1+r) + x^r a_0 r + a_0 x^r = 0$$

Or

$$\left(6x^r r(-1+r) + x^r r + x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(6r^2 - 5r + 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$6r^2 - 5r + 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = \frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(6r^2 - 5r + 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{6}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{3}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&-3a_{n-2}(n+r-2)(n-3+r)+6a_n(n+r)(n+r-1) \\
&-11a_{n-2}(n+r-2)+a_n(n+r)-5a_{n-2}+a_n=0
\end{aligned}
\tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = \frac{(n+r-1)\,a_{n-2}}{2n+2r-1} \tag{4}
$$

Which for the root $r=\frac{1}{2}$ becomes

$$
a_n = \frac{(2n-1)\,a_{n-2}}{4n} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r=\frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n=2$, using the above recursive equation gives

$$
a_2 = \frac{1+r}{3+2r}
$$

Which for the root $r=\frac{1}{2}$ becomes

$$
a_2 = \frac{3}{8}
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1+r}{3+2r}$	$\frac{3}{8}$

For $n=3$, using the above recursive equation gives

$$
a_3 = 0
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1+r}{3+2r}$	$\frac{3}{8}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 + 4r + 3}{4r^2 + 20r + 21}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{21}{128}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1+r}{3+2r}$	$\frac{3}{8}$
a_3	0	0
a_4	$\frac{r^2+4r+3}{4r^2+20r+21}$	$\frac{21}{128}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{1+r}{3+2r}$	$\frac{3}{8}$
a_3	0	0
a_4	$\frac{r^2+4r+3}{4r^2+20r+21}$	$\frac{21}{128}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \sqrt{x}\,(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots) \\
&= \sqrt{x}\left(1 + \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
b_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&-3b_{n-2}(n+r-2)\,(n-3+r) + 6b_n(n+r)\,(n+r-1) \\
&- 11b_{n-2}(n+r-2) + b_n(n+r) - 5b_{n-2} + b_n = 0
\end{aligned} \tag{3}
$$

Solving for b_n from recursive equation (4) gives

$$
b_n = \frac{(n+r-1)\,b_{n-2}}{2n+2r-1} \tag{4}
$$

Which for the root $r = \frac{1}{3}$ becomes

$$
b_n = \frac{(3n-2)\,b_{n-2}}{6n-1} \tag{5}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$
b_2 = \frac{1+r}{3+2r}
$$

Which for the root $r = \frac{1}{3}$ becomes

$$
b_2 = \frac{4}{11}
$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1+r}{3+2r}$	$\frac{4}{11}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1+r}{3+2r}$	$\frac{4}{11}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^2 + 4r + 3}{4r^2 + 20r + 21}$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_4 = \frac{40}{253}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1+r}{3+2r}$	$\frac{4}{11}$
b_3	0	0
b_4	$\frac{r^2+4r+3}{4r^2+20r+21}$	$\frac{40}{253}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{1+r}{3+2r}$	$\frac{4}{11}$
b_3	0	0
b_4	$\frac{r^2+4r+3}{4r^2+20r+21}$	$\frac{40}{253}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= \sqrt{x}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \ldots\right) \\ &= x^{\frac{1}{3}}\left(1 + \frac{4x^2}{11} + \frac{40x^4}{253} + O(x^6)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1\sqrt{x}\left(1 + \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right) + c_2 x^{\frac{1}{3}}\left(1 + \frac{4x^2}{11} + \frac{40x^4}{253} + O(x^6)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1\sqrt{x}\left(1 + \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right) + c_2 x^{\frac{1}{3}}\left(1 + \frac{4x^2}{11} + \frac{40x^4}{253} + O(x^6)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1\sqrt{x}\left(1 + \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right) + c_2 x^{\frac{1}{3}}\left(1 + \frac{4x^2}{11} + \frac{40x^4}{253} + O(x^6)\right) \tag{1}$$

Verification of solutions

$$y = c_1\sqrt{x}\left(1 + \frac{3x^2}{8} + \frac{21x^4}{128} + O(x^6)\right) + c_2 x^{\frac{1}{3}}\left(1 + \frac{4x^2}{11} + \frac{40x^4}{253} + O(x^6)\right)$$

Verified OK.

14.36.1 Maple step by step solution

Let's solve

$-3y''x^2(x^2-2)+(-11x^3+x)\,y'+(-5x^2+1)\,y=0$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y''=-\frac{(5x^2-1)y}{3x^2(x^2-2)}-\frac{(11x^2-1)y'}{3x(x^2-2)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''+\frac{(11x^2-1)y'}{3x(x^2-2)}+\frac{(5x^2-1)y}{3x^2(x^2-2)}=0$

□ Check to see if x_0 is a regular singular point

- ◦ Define functions

$\left[P_2(x)=\frac{11x^2-1}{3x(x^2-2)},P_3(x)=\frac{5x^2-1}{3x^2(x^2-2)}\right]$

- ◦ $x\cdot P_2(x)$ is analytic at $x=0$

$\left(x\cdot P_2(x)\right)\bigg|_{x=0}=\frac{1}{6}$

- ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

$\left(x^2\cdot P_3(x)\right)\bigg|_{x=0}=\frac{1}{6}$

- ◦ $x=0$is a regular singular point

Check to see if x_0 is a regular singular point

$x_0=0$

- Multiply by denominators

$3y''x^2(x^2-2)+x(11x^2-1)\,y'+(5x^2-1)\,y=0$

- Assume series solution for y

$y=\sum_{k=0}^{\infty}a_kx^{k+r}$

□ Rewrite ODE with series expansions

- ◦ Convert $x^m\cdot y$ to series expansion for $m=0..2$

$x^m\cdot y=\sum_{k=0}^{\infty}a_kx^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty}a_{k-m}x^{k+r}$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..3$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty}a_{k}(k+r)\,x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty}a_{k+1-m}(k+1-m+r)\,x^{k+r}$

- Convert $x^{m}\cdot y''$ to series expansion for $m=2..4$

  $x^{m}\cdot y''=\sum_{k=0}^{\infty}a_{k}(k+r)\,(k+r-1)\,x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m}\cdot y''=\sum_{k=-2+m}^{\infty}a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\,x^{k+r}$

  Rewrite ODE with series expansions

  $-a_{0}(-1+3r)\,(-1+2r)\,x^{r}-a_{1}(2+3r)\,(1+2r)\,x^{1+r}+\left(\sum_{k=2}^{\infty}(-a_{k}(3k+3r-1)\,(2k+2r-1)+$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $-(-1+3r)\,(-1+2r)=0$

- Values of r that satisfy the indicial equation

  $r\in\left\{\frac{1}{2},\frac{1}{3}\right\}$

- Each term must be 0

  $-a_{1}(2+3r)\,(1+2r)=0$

- Solve for the dependent coefficient(s)

  $a_{1}=0$

- Each term in the series must be 0, giving the recursion relation

  $-6\left(k+r-\frac{1}{3}\right)\left(\frac{(-k-r+1)a_{k-2}}{2}+a_{k}\left(k+r-\frac{1}{2}\right)\right)=0$

- Shift index using $k->k+2$

  $-6\left(k+\frac{5}{3}+r\right)\left(\frac{(-k-1-r)a_{k}}{2}+a_{k+2}\left(k+\frac{3}{2}+r\right)\right)=0$

- Recursion relation that defines series solution to ODE

$a_{k+2} = \frac{(k+r+1)a_k}{2k+3+2r}$

- Recursion relation for $r = \frac{1}{2}$

$a_{k+2} = \frac{\left(k+\frac{3}{2}\right)a_k}{2k+4}$

- Solution for $r = \frac{1}{2}$

$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+2} = \frac{\left(k+\frac{3}{2}\right)a_k}{2k+4}, a_1 = 0\right]$

- Recursion relation for $r = \frac{1}{3}$

$a_{k+2} = \frac{\left(k+\frac{4}{3}\right)a_k}{2k+\frac{11}{3}}$

- Solution for $r = \frac{1}{3}$

$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+2} = \frac{\left(k+\frac{4}{3}\right)a_k}{2k+\frac{11}{3}}, a_1 = 0\right]$

- Combine solutions and rename parameters

$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{3}}\right), a_{k+2} = \frac{\left(k+\frac{3}{2}\right)a_k}{2k+4}, a_1 = 0, b_{k+2} = \frac{\left(k+\frac{4}{3}\right)b_k}{2k+\frac{11}{3}}, b_1 = 0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 39.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2(x^2+2)\,y''-x(-7x^2+12)\,y'+(3x^2+7)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(2x^4+4x^2)\,y''+(7x^3-12x)\,y'+(3x^2+7)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{7x^2-12}{2\,(x^2+2)\,x}$$
$$q(x)=\frac{3x^2+7}{2x^2\,(x^2+2)}$$

Table 602: Table $p(x), q(x)$ singularites.

$p(x) = \frac{7x^2-12}{2(x^2+2)x}$	
singularity	type
$x = 0$	"regular"
$x = -i\sqrt{2}$	"regular"
$x = i\sqrt{2}$	"regular"

$q(x) = \frac{3x^2+7}{2x^2(x^2+2)}$	
singularity	type
$x = 0$	"regular"
$x = -i\sqrt{2}$	"regular"
$x = i\sqrt{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i\sqrt{2}, i\sqrt{2}, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2(x^2+2)\,y'' + (7x^3-12x)\,y' + (3x^2+7)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2(x^2+2)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (7x^3-12x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (3x^2+7)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 7x^{n+r+2} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-12x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} 7a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 7x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 7a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{n+r+2} a_n = \sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 7a_{n-2}(n+r-2)\, x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-12x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 7a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r)(n+r-1) - 12x^{n+r} a_n (n+r) + 7a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) - 12x^r a_0 r + 7a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) - 12x^r r + 7x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 - 16r + 7\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 - 16r + 7 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{7}{2}$$
$$r_2 = \frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 - 16r + 7\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 3$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = x^{\frac{7}{2}} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \sqrt{x} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{7}{2}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n+\frac{1}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &2a_{n-2}(n+r-2)(n-3+r) + 4a_n(n+r)(n+r-1) \\ &+ 7a_{n-2}(n+r-2) - 12a_n(n+r) + 3a_{n-2} + 7a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r-1)\,a_{n-2}}{2n+2r-7} \tag{4}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_n = -\frac{(2n+5)\,a_{n-2}}{4n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{7}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-1-r}{-3+2r}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_2 = -\frac{9}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{-3+2r}$	$-\frac{9}{8}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{-3+2r}$	$-\frac{9}{8}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 + 4r + 3}{4r^2 - 4r - 3}$$

Which for the root $r = \frac{7}{2}$ becomes

$$a_4 = \frac{117}{128}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{-3+2r}$	$-\frac{9}{8}$
a_3	0	0
a_4	$\frac{r^2+4r+3}{4r^2-4r-3}$	$\frac{117}{128}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{-3+2r}$	$-\frac{9}{8}$
a_3	0	0
a_4	$\frac{r^2+4r+3}{4r^2-4r-3}$	$\frac{117}{128}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^{\frac{7}{2}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^{\frac{7}{2}}\left(1 - \frac{9x^2}{8} + \frac{117x^4}{128} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Let

$$
r_1 - r_2 = N
$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 3$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\to r_2} a_3(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$
\begin{aligned}
a_N &= a_3 \\
&= 0
\end{aligned}
$$

Therefore

$$
\begin{aligned}
\lim_{r\to r_2} 0 &= \lim_{r\to \frac{1}{2}} 0 \\
&= 0
\end{aligned}
$$

The limit is 0. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$
\begin{aligned}
y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\
&= \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{2}}
\end{aligned}
$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq(3) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &2b_{n-2}(n+r-2)(n-3+r)+4b_n(n+r)(n+r-1) \\ &+7b_{n-2}(n+r-2)-12b_n(n+r)+3b_{n-2}+7b_n=0 \end{aligned} \tag{4}$$

Which for for the root $r = \frac{1}{2}$ becomes

$$\begin{aligned} &2b_{n-2}\left(n-\frac{3}{2}\right)\left(n-\frac{5}{2}\right)+4b_n\left(n+\frac{1}{2}\right)\left(n-\frac{1}{2}\right) \\ &+7b_{n-2}\left(n-\frac{3}{2}\right)-12b_n\left(n+\frac{1}{2}\right)+3b_{n-2}+7b_n=0 \end{aligned} \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{(n+r-1)\, b_{n-2}}{2n+2r-7} \tag{5}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_n = -\frac{\left(n-\frac{1}{2}\right) b_{n-2}}{2n-6} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -\frac{1+r}{-3+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_2 = \frac{3}{4}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-1-r}{-3+2r}$	$\frac{3}{4}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-1-r}{-3+2r}$	$\frac{3}{4}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^2 + 4r + 3}{(-3 + 2r)(1 + 2r)}$$

Which for the root $r = \frac{1}{2}$ becomes

$$b_4 = -\frac{21}{16}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-1-r}{-3+2r}$	$\frac{3}{4}$
b_3	0	0
b_4	$\frac{r^2+4r+3}{4r^2-4r-3}$	$-\frac{21}{16}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-1-r}{-3+2r}$	$\frac{3}{4}$
b_3	0	0
b_4	$\frac{r^2+4r+3}{4r^2-4r-3}$	$-\frac{21}{16}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{7}{2}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \sqrt{x}\left(1 + \frac{3x^2}{4} - \frac{21x^4}{16} + O\left(x^6\right)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{7}{2}}\left(1 - \frac{9x^2}{8} + \frac{117x^4}{128} + O\left(x^6\right)\right) + c_2\sqrt{x}\left(1 + \frac{3x^2}{4} - \frac{21x^4}{16} + O\left(x^6\right)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{7}{2}}\left(1 - \frac{9x^2}{8} + \frac{117x^4}{128} + O\left(x^6\right)\right) + c_2\sqrt{x}\left(1 + \frac{3x^2}{4} - \frac{21x^4}{16} + O\left(x^6\right)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{7}{2}}\left(1 - \frac{9x^2}{8} + \frac{117x^4}{128} + O\left(x^6\right)\right) + c_2\sqrt{x}\left(1 + \frac{3x^2}{4} - \frac{21x^4}{16} + O\left(x^6\right)\right) \quad (1)$$

Verification of solutions

$$y = c_1 x^{\frac{7}{2}}\left(1 - \frac{9x^2}{8} + \frac{117x^4}{128} + O\left(x^6\right)\right) + c_2\sqrt{x}\left(1 + \frac{3x^2}{4} - \frac{21x^4}{16} + O\left(x^6\right)\right)$$

Verified OK.

14.37.1 Maple step by step solution

Let's solve

$2x^2(x^2+2)\,y''+(7x^3-12x)\,y'+(3x^2+7)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(3x^2+7)y}{2x^2(x^2+2)}-\frac{(7x^2-12)y'}{2x(x^2+2)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(7x^2-12)y'}{2x(x^2+2)}+\frac{(3x^2+7)y}{2x^2(x^2+2)}=0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x)=\frac{7x^2-12}{2(x^2+2)x}, P_3(x)=\frac{3x^2+7}{2x^2(x^2+2)}\right]$

  - $x\cdot P_2(x)$ is analytic at $x=0$

    $(x\cdot P_2(x))\Big|_{x=0}=-3$

  - $x^2\cdot P_3(x)$ is analytic at $x=0$

    $(x^2\cdot P_3(x))\Big|_{x=0}=\frac{7}{4}$

  - $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $2x^2(x^2+2)\,y''+x(7x^2-12)\,y'+(3x^2+7)\,y=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_kx^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m\cdot y$ to series expansion for $m=0..2$

    $x^m\cdot y=\sum_{k=0}^{\infty}a_kx^{k+r+m}$

- Shift index using $k->k-m$

  $x^m \cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^m \cdot y'$ to series expansion for $m=1..3$

  $x^m \cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^m \cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^m \cdot y''$ to series expansion for $m=2..4$

  $x^m \cdot y''=\sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^m \cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_0(-1+2r)\,(-7+2r)\, x^r+a_1(1+2r)\,(-5+2r)\, x^{1+r}+\left(\sum_{k=2}^{\infty} (a_k(2k+2r-1)\,(2k+2r-7)+a\right.$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $(-1+2r)\,(-7+2r)=0$

- Values of r that satisfy the indicial equation

  $r \in \left\{\frac{1}{2}, \frac{7}{2}\right\}$

- Each term must be 0

  $a_1(1+2r)\,(-5+2r)=0$

- Solve for the dependent coefficient(s)

  $a_1=0$

- Each term in the series must be 0, giving the recursion relation

  $4\left(\frac{a_{k-2}(k+r-1)}{2}+a_k\left(k+r-\frac{7}{2}\right)\right)\left(k+r-\frac{1}{2}\right)=0$

- Shift index using $k->k+2$

  $4\left(\frac{a_k(k+r+1)}{2}+a_{k+2}\left(k-\frac{3}{2}+r\right)\right)\left(k+\frac{3}{2}+r\right)=0$

- Recursion relation that defines series solution to ODE

$a_{k+2} = -\frac{a_k(k+r+1)}{2k-3+2r}$

- Recursion relation for $r = \frac{1}{2}$

$a_{k+2} = -\frac{a_k(k+\frac{3}{2})}{2k-2}$

- Solution for $r = \frac{1}{2}$

$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+2} = -\frac{a_k(k+\frac{3}{2})}{2k-2}, a_1 = 0\right]$

- Recursion relation for $r = \frac{7}{2}$

$a_{k+2} = -\frac{a_k(k+\frac{9}{2})}{2k+4}$

- Solution for $r = \frac{7}{2}$

$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{7}{2}}, a_{k+2} = -\frac{a_k(k+\frac{9}{2})}{2k+4}, a_1 = 0\right]$

- Combine solutions and rename parameters

$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{7}{2}}\right), a_{k+2} = -\frac{a_k(k+\frac{3}{2})}{2k-2}, a_1 = 0, b_{k+2} = -\frac{b_k(k+\frac{9}{2})}{2k+4}, b_1 = 0\right]$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 40.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^{2}\left(x^{2}+2\right)y''+x\left(7x^{2}+4\right)y'-\left(-3x^{2}+1\right)y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(2x^{4}+4x^{2}\right)y''+\left(7x^{3}+4x\right)y'+\left(3x^{2}-1\right)y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{7x^{2}+4}{2\left(x^{2}+2\right)x}$$
$$q(x)=\frac{3x^{2}-1}{2x^{2}\left(x^{2}+2\right)}$$

Table 604: Table $p(x), q(x)$ singularites.

$p(x) = \frac{7x^2+4}{2(x^2+2)x}$	
singularity	type
$x = 0$	"regular"
$x = -i\sqrt{2}$	"regular"
$x = i\sqrt{2}$	"regular"

$q(x) = \frac{3x^2-1}{2x^2(x^2+2)}$	
singularity	type
$x = 0$	"regular"
$x = -i\sqrt{2}$	"regular"
$x = i\sqrt{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i\sqrt{2}, i\sqrt{2}, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2(x^2+2)\, y'' + (7x^3+4x)\, y' + (3x^2-1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2(x^2+2)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\, a_n x^{n+r-2}\right) + (7x^3+4x)\left(\sum_{n=0}^{\infty} (n+r)\, a_n x^{n+r-1}\right) + (3x^2-1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=0}^{\infty} 7x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r) (n+r-1) = \sum_{n=2}^{\infty} 2a_{n-2} (n+r-2) (n-3+r) x^{n+r}$$

$$\sum_{n=0}^{\infty} 7x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 7a_{n-2} (n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} 3x^{n+r+2} a_n = \sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 2a_{n-2} (n+r-2) (n-3+r) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r) (n+r-1)\right) + \left(\sum_{n=2}^{\infty} 7a_{n-2} (n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 4x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 3a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$4x^{n+r} a_n (n+r) (n+r-1) + 4x^{n+r} a_n (n+r) - a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$4x^r a_0 r(-1+r) + 4x^r a_0 r - a_0 x^r = 0$$

Or

$$(4x^r r(-1+r) + 4x^r r - x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(4r^2 - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$4r^2 - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = -\frac{1}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(4r^2 - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 1$ is an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sqrt{x} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = C y_1(x) \ln(x) + \frac{\sum_{n=0}^{\infty} b_n x^n}{\sqrt{x}}$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = C y_1(x) \ln(x) + \left(\sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$2a_{n-2}(n+r-2)(n-3+r) + 4a_n(n+r)(n+r-1) + 7a_{n-2}(n+r-2) + 4a_n(n+r) + 3a_{n-2} - a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(n+r-1)\, a_{n-2}}{2n+2r+1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = \frac{-2na_{n-2} + a_{n-2}}{4n+4} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-1-r}{5+2r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = -\frac{1}{4}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{5+2r}$	$-\frac{1}{4}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{5+2r}$	$-\frac{1}{4}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 + 4r + 3}{4r^2 + 28r + 45}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{7}{80}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{5+2r}$	$-\frac{1}{4}$
a_3	0	0
a_4	$\frac{r^2+4r+3}{4r^2+28r+45}$	$\frac{7}{80}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-1-r}{5+2r}$	$-\frac{1}{4}$
a_3	0	0
a_4	$\frac{r^2+4r+3}{4r^2+28r+45}$	$\frac{7}{80}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}y_1(x) &= \sqrt{x}\left(a_0 + a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6\dots\right)\\ &= \sqrt{x}\left(1 - \frac{x^2}{4} + \frac{7x^4}{80} + O(x^6)\right)\end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 1$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r\rightarrow r_2} a_1(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned}a_N &= a_1\\ &= 0\end{aligned}$$

Therefore

$$\begin{aligned}\lim_{r\rightarrow r_2} 0 &= \lim_{r\rightarrow -\frac{1}{2}} 0\\ &= 0\end{aligned}$$

The limit is 0. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned}y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r}\\ &= \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{2}}\end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq(3) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &2b_{n-2}(n+r-2)(n-3+r)+4b_n(n+r)(n+r-1) \\ &+7b_{n-2}(n+r-2)+4b_n(n+r)+3b_{n-2}-b_n=0 \end{aligned} \tag{4}$$

Which for for the root $r = -\frac{1}{2}$ becomes

$$\begin{aligned} &2b_{n-2}\left(n-\frac{5}{2}\right)\left(n-\frac{7}{2}\right)+4b_n\left(n-\frac{1}{2}\right)\left(n-\frac{3}{2}\right) \\ &+7b_{n-2}\left(n-\frac{5}{2}\right)+4b_n\left(n-\frac{1}{2}\right)+3b_{n-2}-b_n=0 \end{aligned} \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{(n+r-1)\, b_{n-2}}{2n+2r+1} \tag{5}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_n = -\frac{\left(n-\frac{3}{2}\right) b_{n-2}}{2n} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -\frac{1+r}{5+2r}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_2 = -\frac{1}{8}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-1-r}{5+2r}$	$-\frac{1}{8}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-1-r}{5+2r}$	$-\frac{1}{8}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^2 + 4r + 3}{(5 + 2r)(9 + 2r)}$$

Which for the root $r = -\frac{1}{2}$ becomes

$$b_4 = \frac{5}{128}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-1-r}{5+2r}$	$-\frac{1}{8}$
b_3	0	0
b_4	$\frac{r^2+4r+3}{4r^2+28r+45}$	$\frac{5}{128}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-1-r}{5+2r}$	$-\frac{1}{8}$
b_3	0	0
b_4	$\frac{r^2+4r+3}{4r^2+28r+45}$	$\frac{5}{128}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned}y_2(x) &= \sqrt{x}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 - \frac{x^2}{8} + \frac{5x^4}{128} + O(x^6)}{\sqrt{x}}\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1\sqrt{x}\left(1 - \frac{x^2}{4} + \frac{7x^4}{80} + O\left(x^6\right)\right) + \frac{c_2\left(1 - \frac{x^2}{8} + \frac{5x^4}{128} + O(x^6)\right)}{\sqrt{x}}\end{aligned}$$

Hence the final solution is

$$\begin{aligned}y &= y_h \\ &= c_1\sqrt{x}\left(1 - \frac{x^2}{4} + \frac{7x^4}{80} + O\left(x^6\right)\right) + \frac{c_2\left(1 - \frac{x^2}{8} + \frac{5x^4}{128} + O(x^6)\right)}{\sqrt{x}}\end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1\sqrt{x}\left(1 - \frac{x^2}{4} + \frac{7x^4}{80} + O\left(x^6\right)\right) + \frac{c_2\left(1 - \frac{x^2}{8} + \frac{5x^4}{128} + O(x^6)\right)}{\sqrt{x}} \tag{1}$$

Verification of solutions

$$y = c_1\sqrt{x}\left(1-\frac{x^2}{4}+\frac{7x^4}{80}+O(x^6)\right)+\frac{c_2\left(1-\frac{x^2}{8}+\frac{5x^4}{128}+O(x^6)\right)}{\sqrt{x}}$$

Verified OK.

14.38.1 Maple step by step solution

Let's solve

$2x^2(x^2+2)\,y''+(7x^3+4x)\,y'+(3x^2-1)\,y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(3x^2-1)y}{2x^2(x^2+2)}-\frac{(7x^2+4)y'}{2x(x^2+2)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(7x^2+4)y'}{2x(x^2+2)}+\frac{(3x^2-1)y}{2x^2(x^2+2)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{7x^2+4}{2(x^2+2)x}, P_3(x)=\frac{3x^2-1}{2x^2(x^2+2)}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $\left.(x\cdot P_2(x))\right|_{x=0}=1$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $\left.(x^2\cdot P_3(x))\right|_{x=0}=-\frac{1}{4}$

  ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $2x^2(x^2+2)\,y''+x(7x^2+4)\,y'+(3x^2-1)\,y=0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

□ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(1+2r)\,(-1+2r)\, x^r + a_1(3+2r)\,(1+2r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(2k+2r+1)\,(2k+2r-1) + a_{k-2}\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1+2r)\,(-1+2r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-\frac{1}{2}, \frac{1}{2}\right\}$$

- Each term must be 0

$$a_1(3+2r)\,(1+2r) = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

$$4\left(k+r-\frac{1}{2}\right)\left(\frac{a_{k-2}(k+r-1)}{2}+a_k\left(k+r+\frac{1}{2}\right)\right)=0$$

- Shift index using $k->k+2$

$$4\left(k+\frac{3}{2}+r\right)\left(\frac{a_k(k+r+1)}{2}+a_{k+2}\left(k+\frac{5}{2}+r\right)\right)=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{a_k(k+r+1)}{2k+5+2r}$$

- Recursion relation for $r=-\frac{1}{2}$

$$a_{k+2}=-\frac{a_k\left(k+\frac{1}{2}\right)}{2k+4}$$

- Solution for $r=-\frac{1}{2}$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k-\frac{1}{2}}, a_{k+2}=-\frac{a_k\left(k+\frac{1}{2}\right)}{2k+4}, a_1=0\right]$$

- Recursion relation for $r=\frac{1}{2}$

$$a_{k+2}=-\frac{a_k\left(k+\frac{3}{2}\right)}{2k+6}$$

- Solution for $r=\frac{1}{2}$

$$\left[y=\sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+2}=-\frac{a_k\left(k+\frac{3}{2}\right)}{2k+6}, a_1=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_k x^{k-\frac{1}{2}}\right)+\left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{2}}\right), a_{k+2}=-\frac{a_k\left(k+\frac{1}{2}\right)}{2k+4}, a_1=0, b_{k+2}=-\frac{b_k\left(k+\frac{3}{2}\right)}{2k+6}, b_1=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 41.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2(2x^2+1)\,y''+5x(6x^2+1)\,y'-(-40x^2+2)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(4x^4+2x^2)\,y''+(30x^3+5x)\,y'+(40x^2-2)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{15x^2+\frac{5}{2}}{x\,(2x^2+1)}$$
$$q(x)=\frac{20x^2-1}{x^2\,(2x^2+1)}$$

Table 606: Table $p(x), q(x)$ singularites.

$p(x) = \frac{15x^2+\frac{5}{2}}{x(2x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{2}}{2}$	"regular"
$x = \frac{i\sqrt{2}}{2}$	"regular"

$q(x) = \frac{20x^2-1}{x^2(2x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -\frac{i\sqrt{2}}{2}$	"regular"
$x = \frac{i\sqrt{2}}{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -\frac{i\sqrt{2}}{2}, \frac{i\sqrt{2}}{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2(2x^2+1)\,y'' + (30x^3+5x)\,y' + (40x^2-2)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$2x^2(2x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (30x^3+5x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (40x^2-2)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n(n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} 30x^{n+r+2} a_n(n+r)\right)+\left(\sum_{n=0}^{\infty} 5x^{n+r} a_n(n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 40x^{n+r+2} a_n\right)+\sum_{n=0}^{\infty}\left(-2a_n x^{n+r}\right)=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} 4x^{n+r+2} a_n(n+r)(n+r-1) &= \sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)(n-3+r)\,x^{n+r} \\
\sum_{n=0}^{\infty} 30x^{n+r+2} a_n(n+r) &= \sum_{n=2}^{\infty} 30a_{n-2}(n+r-2)\,x^{n+r} \\
\sum_{n=0}^{\infty} 40x^{n+r+2} a_n &= \sum_{n=2}^{\infty} 40a_{n-2}x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} 4a_{n-2}(n+r-2)(n-3+r)\,x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=2}^{\infty} 30a_{n-2}(n+r-2)\,x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 5x^{n+r} a_n(n+r)\right)+\left(\sum_{n=2}^{\infty} 40a_{n-2}x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-2a_n x^{n+r}\right)=0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
2x^{n+r} a_n(n+r)(n+r-1)+5x^{n+r} a_n(n+r)-2a_n x^{n+r}=0
$$

When $n = 0$ the above becomes

$$2x^r a_0 r(-1 + r) + 5x^r a_0 r - 2a_0 x^r = 0$$

Or

$$(2x^r r(-1 + r) + 5x^r r - 2x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(2r^2 + 3r - 2\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$2r^2 + 3r - 2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = -2$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(2r^2 + 3r - 2\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{5}{2}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-2}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&4a_{n-2}(n+r-2)(n-3+r)+2a_n(n+r)(n+r-1) \\
&+30a_{n-2}(n+r-2)+5a_n(n+r)+40a_{n-2}-2a_n=0
\end{aligned} \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = -\frac{2(2n+2r+1)\, a_{n-2}}{2n+2r-1} \tag{4}
$$

Which for the root $r = \frac{1}{2}$ becomes

$$
a_n = -\frac{2(n+1)\, a_{n-2}}{n} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$
a_2 = \frac{-4r-10}{3+2r}
$$

Which for the root $r = \frac{1}{2}$ becomes

$$
a_2 = -3
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4r-10}{3+2r}$	-3

For $n = 3$, using the above recursive equation gives

$$
a_3 = 0
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4r-10}{3+2r}$	-3
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{16r^2 + 112r + 180}{4r^2 + 20r + 21}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{15}{2}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4r-10}{3+2r}$	-3
a_3	0	0
a_4	$\frac{16r^2+112r+180}{4r^2+20r+21}$	$\frac{15}{2}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4r-10}{3+2r}$	-3
a_3	0	0
a_4	$\frac{16r^2+112r+180}{4r^2+20r+21}$	$\frac{15}{2}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= \sqrt{x}\,(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots) \\
&= \sqrt{x}\left(1 - 3x^2 + \frac{15x^4}{2} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
b_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&4b_{n-2}(n + r - 2)\,(n - 3 + r) + 2b_n(n + r)\,(n + r - 1) \\
&\quad + 30b_{n-2}(n + r - 2) + 5b_n(n + r) + 40b_{n-2} - 2b_n = 0
\end{aligned} \tag{3}
$$

Solving for b_n from recursive equation (4) gives

$$
b_n = -\frac{2(2n + 2r + 1)\, b_{n-2}}{2n + 2r - 1} \tag{4}
$$

Which for the root $r = -2$ becomes

$$
b_n = \frac{(6 - 4n)\, b_{n-2}}{2n - 5} \tag{5}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -2$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$
b_2 = \frac{-4r - 10}{3 + 2r}
$$

Which for the root $r = -2$ becomes

$$
b_2 = 2
$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4r-10}{3+2r}$	2

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4r-10}{3+2r}$	2
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{16r^2 + 112r + 180}{4r^2 + 20r + 21}$$

Which for the root $r = -2$ becomes

$$b_4 = -\frac{20}{3}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4r-10}{3+2r}$	2
b_3	0	0
b_4	$\frac{16r^2+112r+180}{4r^2+20r+21}$	$-\frac{20}{3}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4r-10}{3+2r}$	2
b_3	0	0
b_4	$\frac{16r^2+112r+180}{4r^2+20r+21}$	$-\frac{20}{3}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= \sqrt{x}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 + 2x^2 - \frac{20x^4}{3} + O(x^6)}{x^2} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1\sqrt{x}\left(1 - 3x^2 + \frac{15x^4}{2} + O(x^6)\right) + \frac{c_2\left(1 + 2x^2 - \frac{20x^4}{3} + O(x^6)\right)}{x^2} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1\sqrt{x}\left(1 - 3x^2 + \frac{15x^4}{2} + O(x^6)\right) + \frac{c_2\left(1 + 2x^2 - \frac{20x^4}{3} + O(x^6)\right)}{x^2} \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1\sqrt{x}\left(1 - 3x^2 + \frac{15x^4}{2} + O(x^6)\right) + \frac{c_2\left(1 + 2x^2 - \frac{20x^4}{3} + O(x^6)\right)}{x^2} \tag{1}$$

Verification of solutions

$$y = c_1\sqrt{x}\left(1-3x^2+\frac{15x^4}{2}+O\left(x^6\right)\right)+\frac{c_2\left(1+2x^2-\frac{20x^4}{3}+O(x^6)\right)}{x^2}$$

Verified OK.

14.39.1 Maple step by step solution

Let's solve

$2x^2(2x^2+1)\, y''+(30x^3+5x)\, y'+(40x^2-2)\, y=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{(20x^2-1)y}{x^2(2x^2+1)}-\frac{5(6x^2+1)y'}{2x(2x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{5(6x^2+1)y'}{2x(2x^2+1)}+\frac{(20x^2-1)y}{x^2(2x^2+1)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

    $\left[P_2(x)=\frac{5(6x^2+1)}{2x(2x^2+1)}, P_3(x)=\frac{20x^2-1}{x^2(2x^2+1)}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

    $\left.(x\cdot P_2(x))\right|_{x=0}=\frac{5}{2}$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

    $\left.(x^2\cdot P_3(x))\right|_{x=0}=-1$

  ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $2x^2(2x^2+1)\, y''+5x(6x^2+1)\, y'+(40x^2-2)\, y=0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

- ☐ Rewrite ODE with series expansions
  - ◦ Convert $x^m \cdot y$ to series expansion for $m = 0..2$

    $$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

  - ◦ Shift index using $k->k-m$

    $$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

  - ◦ Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

    $$x^m \cdot y' = \sum_{k=0}^{\infty} a_k(k+r)\, x^{k+r-1+m}$$

  - ◦ Shift index using $k->k+1-m$

    $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

  - ◦ Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

    $$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$$

  - ◦ Shift index using $k->k+2-m$

    $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(2+r)\,(-1+2r)\, x^r + a_1(3+r)\,(1+2r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(k+r+2)\,(2k+2r-1) + 2a_{k-2}(k -$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(2+r)\,(-1+2r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{-2, \frac{1}{2}\right\}$$

- Each term must be 0

  $$a_1(3+r)\,(1+2r) = 0$$

- Solve for the dependent coefficient(s)

  $$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

$$2(k+r+2)\left(a_{k-2}(2k+1+2r)+a_k\left(k+r-\frac{1}{2}\right)\right)=0$$

- Shift index using $k->k+2$

$$2(k+r+4)\left(a_k(2k+2r+5)+a_{k+2}\left(k+\frac{3}{2}+r\right)\right)=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{2a_k(2k+2r+5)}{2k+3+2r}$$

- Recursion relation for $r=-2$

$$a_{k+2}=-\frac{2a_k(2k+1)}{2k-1}$$

- Solution for $r=-2$

$$\left[y=\sum_{k=0}^{\infty}a_k x^{k-2}, a_{k+2}=-\frac{2a_k(2k+1)}{2k-1}, a_1=0\right]$$

- Recursion relation for $r=\frac{1}{2}$

$$a_{k+2}=-\frac{2a_k(2k+6)}{2k+4}$$

- Solution for $r=\frac{1}{2}$

$$\left[y=\sum_{k=0}^{\infty}a_k x^{k+\frac{1}{2}}, a_{k+2}=-\frac{2a_k(2k+6)}{2k+4}, a_1=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty}a_k x^{k-2}\right)+\left(\sum_{k=0}^{\infty}b_k x^{k+\frac{1}{2}}\right), a_{k+2}=-\frac{2a_k(2k+1)}{2k-1}, a_1=0, b_{k+2}=-\frac{2b_k(2k+6)}{2k+4}, b_1=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 42.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{3x^{2}\left(x^{2}+1\right) y''+5x\left(x^{2}+1\right) y'-\left(-5x^{2}+1\right) y=0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$\left(3x^{4}+3x^{2}\right) y''+\left(5x^{3}+5x\right) y'+\left(5x^{2}-1\right) y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}
p(x) &= \frac{5}{3x}\\
q(x) &= \frac{5x^{2}-1}{3x^{2}\left(x^{2}+1\right)}
\end{aligned}$$

Table 608: Table $p(x), q(x)$ singularites.

$p(x) = \frac{5}{3x}$	
singularity	type
$x = 0$	"regular"

$q(x) = \frac{5x^2-1}{3x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$3x^2(x^2+1)\,y'' + (5x^3+5x)\,y' + (5x^2-1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\begin{aligned}
&3x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)(n+r-1)\,a_n x^{n+r-2}\right) \\
&+ (5x^3+5x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (5x^2-1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0
\end{aligned} \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r)(n+r-1) = \sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 5x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 5a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 5x^{n+r+2} a_n = \sum_{n=2}^{\infty} 5a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 5a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 5a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$3x^{n+r} a_n (n+r)(n+r-1) + 5x^{n+r} a_n (n+r) - a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$3x^r a_0 r(-1+r) + 5x^r a_0 r - a_0 x^r = 0$$

Or

$$\left(3x^r r(-1+r) + 5x^r r - x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(3r^2 + 2r - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$3r^2 + 2r - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{3}$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(3r^2 + 2r - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{4}{3}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-1}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&3a_{n-2}(n+r-2)\,(n-3+r)+3a_n(n+r)\,(n+r-1) \\
&+5a_{n-2}(n+r-2)+5a_n(n+r)+5a_{n-2}-a_n=0
\end{aligned} \tag{3}
$$

Solving for a_n from recursive equation (4) gives

$$
a_n = -\frac{a_{n-2}(3n^2+6nr+3r^2-10n-10r+13)}{3n^2+6nr+3r^2+2n+2r-1} \tag{4}
$$

Which for the root $r = \frac{1}{3}$ becomes

$$
a_n = -\frac{a_{n-2}(3n^2-8n+10)}{3n^2+4n} \tag{5}
$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$
a_2 = \frac{-3r^2-2r-5}{3r^2+14r+15}
$$

Which for the root $r = \frac{1}{3}$ becomes

$$
a_2 = -\frac{3}{10}
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-3r^2-2r-5}{3r^2+14r+15}$	$-\frac{3}{10}$

For $n = 3$, using the above recursive equation gives

$$
a_3 = 0
$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-3r^2-2r-5}{3r^2+14r+15}$	$-\frac{3}{10}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{9r^4 + 48r^3 + 106r^2 + 112r + 105}{9r^4 + 120r^3 + 574r^2 + 1160r + 825}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{39}{320}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-3r^2-2r-5}{3r^2+14r+15}$	$-\frac{3}{10}$
a_3	0	0
a_4	$\frac{9r^4+48r^3+106r^2+112r+105}{9r^4+120r^3+574r^2+1160r+825}$	$\frac{39}{320}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-3r^2-2r-5}{3r^2+14r+15}$	$-\frac{3}{10}$
a_3	0	0
a_4	$\frac{9r^4+48r^3+106r^2+112r+105}{9r^4+120r^3+574r^2+1160r+825}$	$\frac{39}{320}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$
\begin{aligned}
y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\
&= x^{\frac{1}{3}}\left(1 - \frac{3x^2}{10} + \frac{39x^4}{320} + O(x^6)\right)
\end{aligned}
$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$
b_1 = 0
$$

For $2 \leq n$ the recursive equation is

$$
\begin{aligned}
&3b_{n-2}(n + r - 2)(n - 3 + r) + 3b_n(n + r)(n + r - 1) \\
&+ 5b_{n-2}(n + r - 2) + 5b_n(n + r) + 5b_{n-2} - b_n = 0
\end{aligned} \tag{3}
$$

Solving for b_n from recursive equation (4) gives

$$
b_n = -\frac{b_{n-2}(3n^2 + 6nr + 3r^2 - 10n - 10r + 13)}{3n^2 + 6nr + 3r^2 + 2n + 2r - 1} \tag{4}
$$

Which for the root $r = -1$ becomes

$$
b_n = -\frac{b_{n-2}(3n^2 - 16n + 26)}{3n^2 - 4n} \tag{5}
$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$
b_2 = \frac{-3r^2 - 2r - 5}{3r^2 + 14r + 15}
$$

Which for the root $r = -1$ becomes

$$
b_2 = -\frac{3}{2}
$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-3r^2-2r-5}{3r^2+14r+15}$	$-\frac{3}{2}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-3r^2-2r-5}{3r^2+14r+15}$	$-\frac{3}{2}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{9r^4 + 48r^3 + 106r^2 + 112r + 105}{9r^4 + 120r^3 + 574r^2 + 1160r + 825}$$

Which for the root $r = -1$ becomes

$$b_4 = \frac{15}{32}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-3r^2-2r-5}{3r^2+14r+15}$	$-\frac{3}{2}$
b_3	0	0
b_4	$\frac{9r^4+48r^3+106r^2+112r+105}{9r^4+120r^3+574r^2+1160r+825}$	$\frac{15}{32}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-3r^2-2r-5}{3r^2+14r+15}$	$-\frac{3}{2}$
b_3	0	0
b_4	$\frac{9r^4+48r^3+106r^2+112r+105}{9r^4+120r^3+574r^2+1160r+825}$	$\frac{15}{32}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x^{\frac{1}{3}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 - \frac{3x^2}{2} + \frac{15x^4}{32} + O(x^6)}{x} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x^{\frac{1}{3}}\left(1 - \frac{3x^2}{10} + \frac{39x^4}{320} + O(x^6)\right) + \frac{c_2\left(1 - \frac{3x^2}{2} + \frac{15x^4}{32} + O(x^6)\right)}{x} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x^{\frac{1}{3}}\left(1 - \frac{3x^2}{10} + \frac{39x^4}{320} + O(x^6)\right) + \frac{c_2\left(1 - \frac{3x^2}{2} + \frac{15x^4}{32} + O(x^6)\right)}{x} \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x^{\frac{1}{3}}\left(1 - \frac{3x^2}{10} + \frac{39x^4}{320} + O(x^6)\right) + \frac{c_2\left(1 - \frac{3x^2}{2} + \frac{15x^4}{32} + O(x^6)\right)}{x} \tag{1}$$

Verification of solutions

$$y = c_1 x^{\frac{1}{3}} \left(1 - \frac{3x^2}{10} + \frac{39x^4}{320} + O(x^6)\right) + \frac{c_2 \left(1 - \frac{3x^2}{2} + \frac{15x^4}{32} + O(x^6)\right)}{x}$$

Verified OK.

14.40.1 Maple step by step solution

Let's solve

$3x^2(x^2+1)\, y'' + (5x^3+5x)\, y' + (5x^2-1)\, y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(5x^2-1)y}{3x^2(x^2+1)} - \frac{5y'}{3x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{5y'}{3x} + \frac{(5x^2-1)y}{3x^2(x^2+1)} = 0$

□ Check to see if x_0 is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{5}{3x}, P_3(x) = \frac{5x^2-1}{3x^2(x^2+1)}\right]$

  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $(x \cdot P_2(x))\bigg|_{x=0} = \frac{5}{3}$

  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $(x^2 \cdot P_3(x))\bigg|_{x=0} = -\frac{1}{3}$

  - $x = 0$is a regular singular point

    Check to see if x_0 is a regular singular point

    $x_0 = 0$

- Multiply by denominators

  $3x^2(x^2+1)\, y'' + 5x(x^2+1)\, y' + (5x^2-1)\, y = 0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k-m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k+1-m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k- >k+2-m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(1+r)\,(-1+3r)\, x^r + a_1(2+r)\,(2+3r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(k+r+1)\,(3k+3r-1) + a_{k-2}(3(k\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(1+r)\,(-1+3r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{-1, \frac{1}{3}\right\}$$

- Each term must be 0

$$a_1(2+r)\,(2+3r) = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

$$\left(3k^2+\left(6r-10\right)k+3r^2-10r+13\right)a_{k-2}+3(k+r+1)\left(k+r-\frac{1}{3}\right)a_k=0$$

- Shift index using $k->k+2$

$$\left(3(k+2)^2+\left(6r-10\right)\left(k+2\right)+3r^2-10r+13\right)a_k+3(k+3+r)\left(k+\frac{5}{3}+r\right)a_{k+2}=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{\left(3k^2+6kr+3r^2+2k+2r+5\right)a_k}{\left(k+3+r\right)\left(3k+5+3r\right)}$$

- Recursion relation for $r=-1$

$$a_{k+2}=-\frac{\left(3k^2-4k+6\right)a_k}{\left(k+2\right)\left(3k+2\right)}$$

- Solution for $r=-1$

$$\left[y=\sum_{k=0}^{\infty}a_k x^{k-1},a_{k+2}=-\frac{\left(3k^2-4k+6\right)a_k}{\left(k+2\right)\left(3k+2\right)},a_1=0\right]$$

- Recursion relation for $r=\frac{1}{3}$

$$a_{k+2}=-\frac{\left(3k^2+4k+6\right)a_k}{\left(k+\frac{10}{3}\right)\left(3k+6\right)}$$

- Solution for $r=\frac{1}{3}$

$$\left[y=\sum_{k=0}^{\infty}a_k x^{k+\frac{1}{3}},a_{k+2}=-\frac{\left(3k^2+4k+6\right)a_k}{\left(k+\frac{10}{3}\right)\left(3k+6\right)},a_1=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty}a_k x^{k-1}\right)+\left(\sum_{k=0}^{\infty}b_k x^{k+\frac{1}{3}}\right),a_{k+2}=-\frac{\left(3k^2-4k+6\right)a_k}{\left(k+2\right)\left(3k+2\right)},a_1=0,b_{k+2}=-\frac{\left(3k^2+4k+6\right)b_k}{\left(k+\frac{10}{3}\right)\left(3k+6\right)},b_1=0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 43.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference is integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x(x^2+1)\,y''+(7x^2+4)\,y'+8yx=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^3+x)\,y''+(7x^2+4)\,y'+8yx=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$\begin{aligned}p(x)&=\frac{7x^2+4}{x\,(x^2+1)}\\q(x)&=\frac{8}{x^2+1}\end{aligned}$$

Table 610: Table $p(x), q(x)$ singularites.

$p(x) = \frac{7x^2+4}{x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{8}{x^2+1}$	
singularity	type
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x(x^2+1)\,y'' + (7x^2+4)\,y' + 8yx = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\begin{aligned} &x(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) \\ &+ (7x^2+4)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + 8\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) x = 0 \end{aligned} \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} x^{n+r-1} a_n(n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} 7 x^{1+n+r} a_n(n+r)\right)+\left(\sum_{n=0}^{\infty} 4(n+r) a_n x^{n+r-1}\right)+\left(\sum_{n=0}^{\infty} 8 x^{1+n+r} a_n\right) \\
&=0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r-1$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r-1} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} x^{1+n+r} a_n(n+r)(n+r-1) &= \sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r-1} \\
\sum_{n=0}^{\infty} 7 x^{1+n+r} a_n(n+r) &= \sum_{n=2}^{\infty} 7 a_{n-2}(n+r-2) x^{n+r-1} \\
\sum_{n=0}^{\infty} 8 x^{1+n+r} a_n &= \sum_{n=2}^{\infty} 8 a_{n-2} x^{n+r-1}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r-1$.

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r-1}\right) \\
&+\left(\sum_{n=0}^{\infty} x^{n+r-1} a_n(n+r)(n+r-1)\right)+\left(\sum_{n=2}^{\infty} 7 a_{n-2}(n+r-2) x^{n+r-1}\right) \\
&+\left(\sum_{n=0}^{\infty} 4(n+r) a_n x^{n+r-1}\right)+\left(\sum_{n=2}^{\infty} 8 a_{n-2} x^{n+r-1}\right)=0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
x^{n+r-1} a_n(n+r)(n+r-1)+4(n+r) a_n x^{n+r-1}=0
$$

When $n=0$ the above becomes

$$
x^{-1+r} a_0 r(-1+r)+4 r a_0 x^{-1+r}=0
$$

Or

$$\left(x^{-1+r} r(-1+r)+4 r\, x^{-1+r}\right) a_{0}=0$$

Since $a_0 \neq 0$ then the above simplifies to

$$r\, x^{-1+r}(3+r)=0$$

Since the above is true for all x then the indicial equation becomes

$$r(3+r)=0$$

Solving for r gives the roots of the indicial equation as

$$r_{1}=0$$
$$r_{2}=-3$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$r\, x^{-1+r}(3+r)=0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = 3$ is an integer, then we can construct two linearly independent solutions

$$y_{1}(x)=x^{r_{1}}\left(\sum_{n=0}^{\infty} a_{n} x^{n}\right)$$
$$y_{2}(x)=C y_{1}(x) \ln (x)+x^{r_{2}}\left(\sum_{n=0}^{\infty} b_{n} x^{n}\right)$$

Or

$$y_{1}(x)=\sum_{n=0}^{\infty} a_{n} x^{n}$$
$$y_{2}(x)=C y_{1}(x) \ln (x)+\frac{\sum_{n=0}^{\infty} b_{n} x^{n}}{x^{3}}$$

Or

$$y_{1}(x)=\sum_{n=0}^{\infty} a_{n} x^{n}$$
$$y_{2}(x)=C y_{1}(x) \ln (x)+\left(\sum_{n=0}^{\infty} b_{n} x^{n-3}\right)$$

Where C above can be zero. We start by finding y_1. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} a_{n-2}(n+r-2)(n-3+r) + a_n(n+r)(n+r-1) \\ + 7a_{n-2}(n+r-2) + 4a_n(n+r) + 8a_{n-2} = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(2+n+r)\,a_{n-2}}{n+3+r} \tag{4}$$

Which for the root $r = 0$ becomes

$$a_n = -\frac{(2+n)\,a_{n-2}}{n+3} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 0$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-4-r}{5+r}$$

Which for the root $r = 0$ becomes

$$a_2 = -\frac{4}{5}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-r}{5+r}$	$-\frac{4}{5}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-r}{5+r}$	$-\frac{4}{5}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 + 10r + 24}{(5 + r)(7 + r)}$$

Which for the root $r = 0$ becomes

$$a_4 = \frac{24}{35}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-r}{5+r}$	$-\frac{4}{5}$
a_3	0	0
a_4	$\frac{r^2+10r+24}{(5+r)(7+r)}$	$\frac{24}{35}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-r}{5+r}$	$-\frac{4}{5}$
a_3	0	0
a_4	$\frac{r^2+10r+24}{(5+r)(7+r)}$	$\frac{24}{35}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned}
y_1(x) &= a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots \\
&= 1 - \frac{4x^2}{5} + \frac{24x^4}{35} + O(x^6)
\end{aligned}$$

Now the second solution $y_2(x)$ is found. Let

$$r_1 - r_2 = N$$

Where N is positive integer which is the difference between the two roots. r_1 is taken as the larger root. Hence for this problem we have $N = 3$. Now we need to determine if C is zero or not. This is done by finding $\lim_{r \to r_2} a_3(r)$. If this limit exists, then $C = 0$, else we need to keep the log term and $C \neq 0$. The above table shows that

$$\begin{aligned}
a_N &= a_3 \\
&= 0
\end{aligned}$$

Therefore

$$\begin{aligned}
\lim_{r \to r_2} 0 &= \lim_{r \to -3} 0 \\
&= 0
\end{aligned}$$

The limit is 0. Since the limit exists then the log term is not needed and we can set $C = 0$. Therefore the second solution has the form

$$\begin{aligned}
y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n+r} \\
&= \sum_{n=0}^{\infty} b_n x^{n-3}
\end{aligned}$$

Eq (3) derived above is used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq(3) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} b_{n-2}(n+r-2)\,(n-3+r) + b_n(n+r)\,(n+r-1) \\ + 7b_{n-2}(n+r-2) + 4(n+r)\,b_n + 8b_{n-2} = 0 \end{aligned} \tag{4}$$

Which for for the root $r = -3$ becomes

$$b_{n-2}(n-5)\,(n-6) + b_n(n-3)\,(n-4) + 7b_{n-2}(n-5) + 4(n-3)\,b_n + 8b_{n-2} = 0 \tag{4A}$$

Solving for b_n from the recursive equation (4) gives

$$b_n = -\frac{(2+n+r)\,b_{n-2}}{n+3+r} \tag{5}$$

Which for the root $r = -3$ becomes

$$b_n = -\frac{(-1+n)\,b_{n-2}}{n} \tag{6}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -3$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -\frac{4+r}{5+r}$$

Which for the root $r = -3$ becomes

$$b_2 = -\frac{1}{2}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4-r}{5+r}$	$-\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4-r}{5+r}$	$-\frac{1}{2}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^2 + 10r + 24}{(5 + r)(7 + r)}$$

Which for the root $r = -3$ becomes

$$b_4 = \frac{3}{8}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4-r}{5+r}$	$-\frac{1}{2}$
b_3	0	0
b_4	$\frac{r^2+10r+24}{(5+r)(7+r)}$	$\frac{3}{8}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4-r}{5+r}$	$-\frac{1}{2}$
b_3	0	0
b_4	$\frac{r^2+10r+24}{(5+r)(7+r)}$	$\frac{3}{8}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= 1\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \ldots\right) \\ &= \frac{1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)}{x^3} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1\left(1 - \frac{4x^2}{5} + \frac{24x^4}{35} + O(x^6)\right) + \frac{c_2\left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)}{x^3} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1\left(1 - \frac{4x^2}{5} + \frac{24x^4}{35} + O(x^6)\right) + \frac{c_2\left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)}{x^3} \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1\left(1 - \frac{4x^2}{5} + \frac{24x^4}{35} + O(x^6)\right) + \frac{c_2\left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)}{x^3} \tag{1}$$

Verification of solutions

$$y = c_1\left(1 - \frac{4x^2}{5} + \frac{24x^4}{35} + O(x^6)\right) + \frac{c_2\left(1 - \frac{x^2}{2} + \frac{3x^4}{8} + O(x^6)\right)}{x^3}$$

Verified OK.

14.41.1 Maple step by step solution

Let's solve

$x(x^2+1)\,y''+(7x^2+4)\,y'+8yx=0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y''=-\frac{8y}{x^2+1}-\frac{(7x^2+4)y'}{x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y''+\frac{(7x^2+4)y'}{x(x^2+1)}+\frac{8y}{x^2+1}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{7x^2+4}{x(x^2+1)}, P_3(x)=\frac{8}{x^2+1}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $(x\cdot P_2(x))\Big|_{x=0}=4$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $(x^2\cdot P_3(x))\Big|_{x=0}=0$

  ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

  $x(x^2+1)\,y''+(7x^2+4)\,y'+8yx=0$

- Assume series solution for y

  $y=\sum_{k=0}^{\infty}a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x\cdot y$ to series expansion

  $x\cdot y=\sum_{k=0}^{\infty}a_k x^{k+r+1}$

- Shift index using $k->k-1$

  $x \cdot y=\sum_{k=1}^{\infty} a_{k-1} x^{k+r}$

- Convert $x^{m} \cdot y'$ to series expansion for $m=0..2$

  $x^{m} \cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r) x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m} \cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r) x^{k+r}$

- Convert $x^{m} \cdot y''$ to series expansion for $m=1..3$

  $x^{m} \cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)(k+r-1) x^{k+r-2+m}$

- Shift index using $k->k+2-m$

  $x^{m} \cdot y''=\sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)(k+1-m+r) x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0} r(3+r) x^{-1+r}+a_{1}(1+r)(4+r) x^{r}+\left(\sum_{k=1}^{\infty}\left(a_{k+1}(k+r+1)(k+r+4)+a_{k-1}(k+r+3)(k\right.\right.$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $r(3+r)=0$

- Values of r that satisfy the indicial equation

  $r \in\{-3,0\}$

- Each term must be 0

  $a_{1}(1+r)(4+r)=0$

- Each term in the series must be 0, giving the recursion relation

  $(k+r+1)\left(a_{k+1}(k+r+4)+a_{k-1}(k+r+3)\right)=0$

- Shift index using $k->k+1$

  $(k+r+2)\left(a_{k+2}(k+5+r)+a_{k}(k+r+4)\right)=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{a_{k}(k+r+4)}{k+5+r}$

- Recursion relation for $r=-3$

  $a_{k+2}=-\frac{a_{k}(k+1)}{k+2}$

- Solution for $r = -3$

$$\left[y = \sum_{k=0}^{\infty} a_k x^{k-3}, a_{k+2} = -\frac{a_k(k+1)}{k+2}, -2a_1 = 0\right]$$

- Recursion relation for $r = 0$

$$a_{k+2} = -\frac{a_k(k+4)}{k+5}$$

- Solution for $r = 0$

$$\left[y = \sum_{k=0}^{\infty} a_k x^k, a_{k+2} = -\frac{a_k(k+4)}{k+5}, 4a_1 = 0\right]$$

- Combine solutions and rename parameters

$$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-3}\right) + \left(\sum_{k=0}^{\infty} b_k x^k\right), a_{k+2} = -\frac{a_k(1+k)}{k+2}, -2a_1 = 0, b_{k+2} = -\frac{b_k(4+k)}{5+k}, 4b_1 = 0\right]$$

Problem number: 44.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{x^2(x^2+2)\,y''+x(x^2+3)\,y'-y=0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+2x^2)\,y''+(x^3+3x)\,y'-y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{x^2+3}{(x^2+2)\,x}$$
$$q(x)=-\frac{1}{x^2\,(x^2+2)}$$

Table 612: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x^2+3}{(x^2+2)x}$	
singularity	type
$x = 0$	"regular"
$x = -i\sqrt{2}$	"regular"
$x = i\sqrt{2}$	"regular"

$q(x) = -\frac{1}{x^2(x^2+2)}$	
singularity	type
$x = 0$	"regular"
$x = -i\sqrt{2}$	"regular"
$x = i\sqrt{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $\left[0, -i\sqrt{2}, i\sqrt{2}, \infty\right]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+2)\,y'' + (x^3+3x)\,y' - y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\begin{aligned} x^2(x^2+2)\left(\sum_{n=0}^{\infty} (n+r)(n+r-1)\,a_n x^{n+r-2}\right) \\ + (x^3+3x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) - \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \end{aligned} \tag{1}$$

Which simplifies to

$$
\begin{aligned}
&\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0
\end{aligned} \tag{2A}
$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$
\begin{aligned}
\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1) &= \sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r) x^{n+r} \\
\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r) &= \sum_{n=2}^{\infty} a_{n-2} (n+r-2) x^{n+r}
\end{aligned}
$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$
\begin{aligned}
&\left(\sum_{n=2}^{\infty} a_{n-2} (n+r-2)(n-3+r) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+ \left(\sum_{n=2}^{\infty} a_{n-2} (n+r-2) x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0
\end{aligned} \tag{2B}
$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$
2x^{n+r} a_n (n+r)(n+r-1) + 3x^{n+r} a_n (n+r) - a_n x^{n+r} = 0
$$

When $n=0$ the above becomes

$$
2x^r a_0 r(-1+r) + 3x^r a_0 r - a_0 x^r = 0
$$

Or

$$
\left(2x^r r(-1+r) + 3x^r r - x^r\right) a_0 = 0
$$

Since $a_0 \neq 0$ then the above simplifies to

$$
\left(2r^2 + r - 1\right) x^r = 0
$$

Since the above is true for all x then the indicial equation becomes

$$2r^2 + r - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(2r^2 + r - 1\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{3}{2}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-1}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} & a_{n-2}(n + r - 2)\,(n - 3 + r) + 2a_n(n + r)\,(n + r - 1) \\ & + a_{n-2}(n + r - 2) + 3a_n(n + r) - a_n = 0 \end{aligned} \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}(n^2 + 2nr + r^2 - 4n - 4r + 4)}{2n^2 + 4nr + 2r^2 + n + r - 1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{a_{n-2}(-3+2n)^2}{8n^2+12n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{r^2}{2r^2+9r+9}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = -\frac{1}{56}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r^2}{2r^2+9r+9}$	$-\frac{1}{56}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r^2}{2r^2+9r+9}$	$-\frac{1}{56}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 (r+2)^2}{4r^4 + 52r^3 + 241r^2 + 468r + 315}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{25}{9856}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r^2}{2r^2+9r+9}$	$-\frac{1}{56}$
a_3	0	0
a_4	$\frac{r^2(r+2)^2}{4r^4+52r^3+241r^2+468r+315}$	$\frac{25}{9856}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{r^2}{2r^2+9r+9}$	$-\frac{1}{56}$
a_3	0	0
a_4	$\frac{r^2(r+2)^2}{4r^4+52r^3+241r^2+468r+315}$	$\frac{25}{9856}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \sqrt{x}\left(1 - \frac{x^2}{56} + \frac{25x^4}{9856} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} & b_{n-2}(n+r-2)(n-3+r) + 2b_n(n+r)(n+r-1) \\ & + b_{n-2}(n+r-2) + 3b_n(n+r) - b_n = 0 \end{aligned} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{b_{n-2}(n^2 + 2nr + r^2 - 4n - 4r + 4)}{2n^2 + 4nr + 2r^2 + n + r - 1} \tag{4}$$

Which for the root $r = -1$ becomes

$$b_n = -\frac{b_{n-2}(n-3)^2}{2n^2 - 3n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -1$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -\frac{r^2}{2r^2 + 9r + 9}$$

Which for the root $r = -1$ becomes

$$b_2 = -\frac{1}{2}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r^2}{2r^2+9r+9}$	$-\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r^2}{2r^2+9r+9}$	$-\frac{1}{2}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{r^2(r+2)^2}{4r^4 + 52r^3 + 241r^2 + 468r + 315}$$

Which for the root $r = -1$ becomes

$$b_4 = \frac{1}{40}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r^2}{2r^2+9r+9}$	$-\frac{1}{2}$
b_3	0	0
b_4	$\frac{r^2(r+2)^2}{4r^4+52r^3+241r^2+468r+315}$	$\frac{1}{40}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{r^2}{2r^2+9r+9}$	$-\frac{1}{2}$
b_3	0	0
b_4	$\frac{r^2(r+2)^2}{4r^4+52r^3+241r^2+468r+315}$	$\frac{1}{40}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned}y_2(x) &= \sqrt{x}\left(b_0+b_1x+b_2x^2+b_3x^3+b_4x^4+b_5x^5+b_6x^6\dots\right)\\ &= \frac{1-\frac{x^2}{2}+\frac{x^4}{40}+O(x^6)}{x}\end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned}y_h(x) &= c_1y_1(x)+c_2y_2(x)\\ &= c_1\sqrt{x}\left(1-\frac{x^2}{56}+\frac{25x^4}{9856}+O(x^6)\right)+\frac{c_2\left(1-\frac{x^2}{2}+\frac{x^4}{40}+O(x^6)\right)}{x}\end{aligned}$$

Hence the final solution is

$$\begin{aligned}y &= y_h\\ &= c_1\sqrt{x}\left(1-\frac{x^2}{56}+\frac{25x^4}{9856}+O(x^6)\right)+\frac{c_2\left(1-\frac{x^2}{2}+\frac{x^4}{40}+O(x^6)\right)}{x}\end{aligned}$$

Summary
The solution(s) found are the following

$$y = c_1\sqrt{x}\left(1-\frac{x^2}{56}+\frac{25x^4}{9856}+O(x^6)\right)+\frac{c_2\left(1-\frac{x^2}{2}+\frac{x^4}{40}+O(x^6)\right)}{x} \tag{1}$$

Verification of solutions

$$y = c_1\sqrt{x}\left(1-\frac{x^2}{56}+\frac{25x^4}{9856}+O(x^6)\right)+\frac{c_2\left(1-\frac{x^2}{2}+\frac{x^4}{40}+O(x^6)\right)}{x}$$

Verified OK.

14.42.1 Maple step by step solution

Let's solve

$x^2(x^2+2)\,y''+(x^3+3x)\,y'-y=0$

- Highest derivative means the order of the ODE is 2

y''

- Isolate 2nd derivative

$y''=\frac{y}{x^2(x^2+2)}-\frac{(x^2+3)y'}{x(x^2+2)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

$y''+\frac{(x^2+3)y'}{x(x^2+2)}-\frac{y}{x^2(x^2+2)}=0$

□ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x)=\frac{x^2+3}{(x^2+2)x}, P_3(x)=-\frac{1}{x^2(x^2+2)}\right]$

  ◦ $x\cdot P_2(x)$ is analytic at $x=0$

  $(x\cdot P_2(x))\Big|_{x=0}=\frac{3}{2}$

  ◦ $x^2\cdot P_3(x)$ is analytic at $x=0$

  $(x^2\cdot P_3(x))\Big|_{x=0}=-\frac{1}{2}$

  ◦ $x=0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0=0$

- Multiply by denominators

$x^2(x^2+2)\,y''+x(x^2+3)\,y'-y=0$

- Assume series solution for y

$y=\sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  ◦ Convert $x^m\cdot y'$ to series expansion for $m=1..3$

  $x^m\cdot y'=\sum_{k=0}^{\infty} a_k(k+r)\,x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

  $$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k(k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k->k+2-m$

  $$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_0(1+r)\,(-1+2r)\, x^r + a_1(2+r)\,(1+2r)\, x^{1+r} + \left(\sum_{k=2}^{\infty} \left(a_k(k+r+1)\,(2k+2r-1) + a_{k-2}(k-\right.\right.$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

  $$(1+r)\,(-1+2r) = 0$$

- Values of r that satisfy the indicial equation

  $$r \in \left\{-1, \frac{1}{2}\right\}$$

- Each term must be 0

  $$a_1(2+r)\,(1+2r) = 0$$

- Solve for the dependent coefficient(s)

  $$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

  $$a_k(k+r+1)\,(2k+2r-1) + a_{k-2}(k-2+r)^2 = 0$$

- Shift index using $k->k+2$

  $$a_{k+2}(k+3+r)\,(2k+3+2r) + a_k(k+r)^2 = 0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2} = -\frac{a_k(k+r)^2}{(k+3+r)(2k+3+2r)}$$

- Recursion relation for $r = -1$

  $$a_{k+2} = -\frac{a_k(k-1)^2}{(k+2)(2k+1)}$$

- Solution for $r = -1$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k-1}, a_{k+2} = -\frac{a_k(k-1)^2}{(k+2)(2k+1)}, a_1 = 0\right]$$

- Recursion relation for $r = \frac{1}{2}$

  $$a_{k+2} = -\frac{a_k \left(k+\frac{1}{2}\right)^2}{\left(k+\frac{7}{2}\right)(2k+4)}$$

- Solution for $r = \frac{1}{2}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+2} = -\frac{a_k \left(k+\frac{1}{2}\right)^2}{\left(k+\frac{7}{2}\right)(2k+4)}, a_1 = 0\right]$$

- Combine solutions and rename parameters

  $$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-1}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{2}}\right), a_{k+2} = -\frac{a_k (k-1)^2}{(k+2)(2k+1)}, a_1 = 0, b_{k+2} = -\frac{b_k \left(k+\frac{1}{2}\right)^2}{\left(k+\frac{7}{2}\right)(2k+4)}, b_1 = 0\right]$$

Book: Elementary differential equations with boundary value problems. William F. Trench. Brooks/Cole 2001
Section: Chapter 7 Series Solutions of Linear Second Equations. 7.5 THE METHOD OF FROBENIUS I. Exercises 7.5. Page 358
Problem number: 45.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{2x^2(x^2+1)\,y''+x(8x^2+3)\,y'-(-4x^2+3)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(2x^4+2x^2)\,y''+(8x^3+3x)\,y'+(4x^2-3)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{8x^2+3}{2x\,(x^2+1)}$$
$$q(x)=\frac{4x^2-3}{2x^2\,(x^2+1)}$$

Table 614: Table $p(x), q(x)$ singularites.

$p(x) = \frac{8x^2+3}{2x(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

$q(x) = \frac{4x^2-3}{2x^2(x^2+1)}$	
singularity	type
$x = 0$	"regular"
$x = -i$	"regular"
$x = i$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -i, i, \infty]$

Irregular singular points : []

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$2x^2(x^2+1)\,y'' + (8x^3+3x)\,y' + (4x^2-3)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$\begin{aligned} &2x^2(x^2+1)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) \\ &+ (8x^3+3x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (4x^2-3)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \end{aligned} \tag{1}$$

Which simplifies to

$$\begin{aligned}
&\left(\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right) \\
&+\left(\sum_{n=0}^{\infty} 8x^{n+r+2} a_n (n+r)\right)+\left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right) \\
&+\left(\sum_{n=0}^{\infty} 4x^{n+r+2} a_n\right)+\sum_{n=0}^{\infty}\left(-3a_n x^{n+r}\right)=0
\end{aligned} \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\begin{aligned}
\sum_{n=0}^{\infty} 2x^{n+r+2} a_n (n+r)(n+r-1) &= \sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)(n-3+r)\, x^{n+r} \\
\sum_{n=0}^{\infty} 8x^{n+r+2} a_n (n+r) &= \sum_{n=2}^{\infty} 8a_{n-2}(n+r-2)\, x^{n+r} \\
\sum_{n=0}^{\infty} 4x^{n+r+2} a_n &= \sum_{n=2}^{\infty} 4a_{n-2} x^{n+r}
\end{aligned}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\begin{aligned}
&\left(\sum_{n=2}^{\infty} 2a_{n-2}(n+r-2)(n-3+r)\, x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 2x^{n+r} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=2}^{\infty} 8a_{n-2}(n+r-2)\, x^{n+r}\right) \\
&+\left(\sum_{n=0}^{\infty} 3x^{n+r} a_n (n+r)\right)+\left(\sum_{n=2}^{\infty} 4a_{n-2} x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-3a_n x^{n+r}\right)=0
\end{aligned} \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$2x^{n+r} a_n (n+r)(n+r-1) + 3x^{n+r} a_n (n+r) - 3a_n x^{n+r} = 0$$

When $n = 0$ the above becomes

$$2x^r a_0 r(-1 + r) + 3x^r a_0 r - 3a_0 x^r = 0$$

Or

$$\left(2x^r r(-1 + r) + 3x^r r - 3x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(2r^2 + r - 3\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$2r^2 + r - 3 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = 1$$
$$r_2 = -\frac{3}{2}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(2r^2 + r - 3\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{5}{2}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+1}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-\frac{3}{2}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$2a_{n-2}(n+r-2)(n-3+r)+2a_n(n+r)(n+r-1) \\ +8a_{n-2}(n+r-2)+3a_n(n+r)+4a_{n-2}-3a_n=0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{2(n+r)\,a_{n-2}}{2n+2r+3} \tag{4}$$

Which for the root $r = 1$ becomes

$$a_n = -\frac{2(n+1)\,a_{n-2}}{2n+5} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = 1$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-4-2r}{7+2r}$$

Which for the root $r = 1$ becomes

$$a_2 = -\frac{2}{3}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-2r}{7+2r}$	$-\frac{2}{3}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-2r}{7+2r}$	$-\frac{2}{3}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{4r^2 + 24r + 32}{4r^2 + 36r + 77}$$

Which for the root $r = 1$ becomes

$$a_4 = \frac{20}{39}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-2r}{7+2r}$	$-\frac{2}{3}$
a_3	0	0
a_4	$\frac{4r^2+24r+32}{4r^2+36r+77}$	$\frac{20}{39}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-4-2r}{7+2r}$	$-\frac{2}{3}$
a_3	0	0
a_4	$\frac{4r^2+24r+32}{4r^2+36r+77}$	$\frac{20}{39}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x\left(1 - \frac{2x^2}{3} + \frac{20x^4}{39} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{gathered} 2b_{n-2}(n+r-2)(n-3+r) + 2b_n(n+r)(n+r-1) \\ + 8b_{n-2}(n+r-2) + 3b_n(n+r) + 4b_{n-2} - 3b_n = 0 \end{gathered} \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{2(n+r)\, b_{n-2}}{2n+2r+3} \tag{4}$$

Which for the root $r = -\frac{3}{2}$ becomes

$$b_n = -\frac{(2n-3)\, b_{n-2}}{2n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{3}{2}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = \frac{-4-2r}{7+2r}$$

Which for the root $r = -\frac{3}{2}$ becomes

$$b_2 = -\frac{1}{4}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4-2r}{7+2r}$	$-\frac{1}{4}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4-2r}{7+2r}$	$-\frac{1}{4}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{4r^2 + 24r + 32}{4r^2 + 36r + 77}$$

Which for the root $r = -\frac{3}{2}$ becomes

$$b_4 = \frac{5}{32}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4-2r}{7+2r}$	$-\frac{1}{4}$
b_3	0	0
b_4	$\frac{4r^2+24r+32}{4r^2+36r+77}$	$\frac{5}{32}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$\frac{-4-2r}{7+2r}$	$-\frac{1}{4}$
b_3	0	0
b_4	$\frac{4r^2+24r+32}{4r^2+36r+77}$	$\frac{5}{32}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= x\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= \frac{1 - \frac{x^2}{4} + \frac{5x^4}{32} + O(x^6)}{x^{\frac{3}{2}}} \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1 x \left(1 - \frac{2x^2}{3} + \frac{20x^4}{39} + O(x^6)\right) + \frac{c_2 \left(1 - \frac{x^2}{4} + \frac{5x^4}{32} + O(x^6)\right)}{x^{\frac{3}{2}}} \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1 x \left(1 - \frac{2x^2}{3} + \frac{20x^4}{39} + O(x^6)\right) + \frac{c_2 \left(1 - \frac{x^2}{4} + \frac{5x^4}{32} + O(x^6)\right)}{x^{\frac{3}{2}}} \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1 x \left(1 - \frac{2x^2}{3} + \frac{20x^4}{39} + O(x^6)\right) + \frac{c_2 \left(1 - \frac{x^2}{4} + \frac{5x^4}{32} + O(x^6)\right)}{x^{\frac{3}{2}}} \quad (1)$$

Verification of solutions

$$y = c_1 x\left(1 - \frac{2x^2}{3} + \frac{20x^4}{39} + O(x^6)\right) + \frac{c_2\left(1 - \frac{x^2}{4} + \frac{5x^4}{32} + O(x^6)\right)}{x^{\frac{3}{2}}}$$

Verified OK.

14.43.1 Maple step by step solution

Let's solve

$2x^2(x^2+1)\,y'' + (8x^3+3x)\,y' + (4x^2-3)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(4x^2-3)y}{2x^2(x^2+1)} - \frac{(8x^2+3)y'}{2x(x^2+1)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(8x^2+3)y'}{2x(x^2+1)} + \frac{(4x^2-3)y}{2x^2(x^2+1)} = 0$

☐ Check to see if x_0 is a regular singular point

  ◦ Define functions

  $\left[P_2(x) = \frac{8x^2+3}{2x(x^2+1)}, P_3(x) = \frac{4x^2-3}{2x^2(x^2+1)}\right]$

  ◦ $x \cdot P_2(x)$ is analytic at $x = 0$

  $\left.(x \cdot P_2(x))\right|_{x=0} = \frac{3}{2}$

  ◦ $x^2 \cdot P_3(x)$ is analytic at $x = 0$

  $\left.(x^2 \cdot P_3(x))\right|_{x=0} = -\frac{3}{2}$

  ◦ $x = 0$is a regular singular point

  Check to see if x_0 is a regular singular point

  $x_0 = 0$

- Multiply by denominators

  $2x^2(x^2+1)\,y'' + x(8x^2+3)\,y' + (4x^2-3)\,y = 0$

- Assume series solution for y

$$y = \sum_{k=0}^{\infty} a_k x^{k+r}$$

☐ Rewrite ODE with series expansions

- Convert $x^m \cdot y$ to series expansion for $m = 0..2$

$$x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$$

- Shift index using $k- >k - m$

$$x^m \cdot y = \sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^m \cdot y'$ to series expansion for $m = 1..3$

$$x^m \cdot y' = \sum_{k=0}^{\infty} a_k (k+r)\, x^{k+r-1+m}$$

- Shift index using $k- >k + 1 - m$

$$x^m \cdot y' = \sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^m \cdot y''$ to series expansion for $m = 2..4$

$$x^m \cdot y'' = \sum_{k=0}^{\infty} a_k (k+r)\,(k+r-1)\, x^{k+r-2+m}$$

- Shift index using $k- >k + 2 - m$

$$x^m \cdot y'' = \sum_{k=-2+m}^{\infty} a_{k+2-m}(k+2-m+r)\,(k+1-m+r)\, x^{k+r}$$

Rewrite ODE with series expansions

$$a_0(2r+3)\,(-1+r)\, x^r + a_1(5+2r)\, r\, x^{1+r} + \left(\sum_{k=2}^{\infty} (a_k(2k+2r+3)\,(k+r-1) + 2a_{k-2}(k+r)\,(k$$

- $a_0$cannot be 0 by assumption, giving the indicial equation

$$(2r+3)\,(-1+r) = 0$$

- Values of r that satisfy the indicial equation

$$r \in \left\{1, -\frac{3}{2}\right\}$$

- Each term must be 0

$$a_1(5+2r)\, r = 0$$

- Solve for the dependent coefficient(s)

$$a_1 = 0$$

- Each term in the series must be 0, giving the recursion relation

$$2\left(\left(k+r+\frac{3}{2}\right) a_{k}+a_{k-2}(k+r)\right) (k+r-1)=0$$

- Shift index using $k->k+2$

$$2\left(\left(k+\frac{7}{2}+r\right) a_{k+2}+a_{k}(k+r+2)\right) (k+r+1)=0$$

- Recursion relation that defines series solution to ODE

$$a_{k+2}=-\frac{2a_{k}(k+r+2)}{2k+7+2r}$$

- Recursion relation for $r=1$

$$a_{k+2}=-\frac{2a_{k}(k+3)}{2k+9}$$

- Solution for $r=1$

$$\left[y=\sum_{k=0}^{\infty} a_{k} x^{k+1}, a_{k+2}=-\frac{2a_{k}(k+3)}{2k+9}, a_{1}=0\right]$$

- Recursion relation for $r=-\frac{3}{2}$

$$a_{k+2}=-\frac{2a_{k}\left(k+\frac{1}{2}\right)}{2k+4}$$

- Solution for $r=-\frac{3}{2}$

$$\left[y=\sum_{k=0}^{\infty} a_{k} x^{k-\frac{3}{2}}, a_{k+2}=-\frac{2a_{k}\left(k+\frac{1}{2}\right)}{2k+4}, a_{1}=0\right]$$

- Combine solutions and rename parameters

$$\left[y=\left(\sum_{k=0}^{\infty} a_{k} x^{1+k}\right)+\left(\sum_{k=0}^{\infty} b_{k} x^{k-\frac{3}{2}}\right), a_{k+2}=-\frac{2a_{k}(k+3)}{2k+9}, a_{1}=0, b_{k+2}=-\frac{2b_{k}\left(k+\frac{1}{2}\right)}{2k+4}, b_{1}=0\right]$$

Problem number: 46.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{9x^2y'' + 3x(x^2+3)\,y' - (-5x^2+1)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$9x^2y'' + (3x^3+9x)\,y' + (5x^2-1)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{x^2+3}{3x}$$
$$q(x) = \frac{5x^2-1}{9x^2}$$

Table 616: Table $p(x), q(x)$ singularites.

$p(x) = \frac{x^2+3}{3x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{5x^2-1}{9x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$9x^2y'' + (3x^3 + 9x)\, y' + (5x^2 - 1)\, y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$9x^2 \left(\sum_{n=0}^{\infty} (n + r)\, (n + r - 1)\, a_n x^{n+r-2}\right) + (3x^3 + 9x) \left(\sum_{n=0}^{\infty} (n + r)\, a_n x^{n+r-1}\right) + (5x^2 - 1) \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 5x^{n+r+2} a_n\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 3x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 5x^{n+r+2} a_n = \sum_{n=2}^{\infty} 5a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 3a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 5a_{n-2} x^{n+r}\right) + \sum_{n=0}^{\infty} \left(-a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$9x^{n+r} a_n (n+r)(n+r-1) + 9x^{n+r} a_n (n+r) - a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$9x^r a_0 r(-1+r) + 9x^r a_0 r - a_0 x^r = 0$$

Or

$$\left(9x^r r(-1+r) + 9x^r r - x^r\right) a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(9r^2 - 1\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$9r^2 - 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$\begin{aligned} r_1 &= \frac{1}{3} \\ r_2 &= -\frac{1}{3} \end{aligned}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(9r^2 - 1)\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{2}{3}$ is not an integer, then we can construct two linearly independent solutions

$$\begin{aligned} y_1(x) &= x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n \right) \\ y_2(x) &= x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n \right) \end{aligned}$$

Or

$$\begin{aligned} y_1(x) &= \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{3}} \\ y_2(x) &= \sum_{n=0}^{\infty} b_n x^{n-\frac{1}{3}} \end{aligned}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$9a_n(n + r)(n + r - 1) + 3a_{n-2}(n + r - 2) + 9a_n(n + r) + 5a_{n-2} - a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{a_{n-2}}{3n + 3r + 1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_n = -\frac{a_{n-2}}{3n+2} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{1}{7+3r}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_2 = -\frac{1}{8}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{7+3r}$	$-\frac{1}{8}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{7+3r}$	$-\frac{1}{8}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{1}{9r^2 + 60r + 91}$$

Which for the root $r = \frac{1}{3}$ becomes

$$a_4 = \frac{1}{112}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{7+3r}$	$-\frac{1}{8}$
a_3	0	0
a_4	$\frac{1}{9r^2+60r+91}$	$\frac{1}{112}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{1}{7+3r}$	$-\frac{1}{8}$
a_3	0	0
a_4	$\frac{1}{9r^2+60r+91}$	$\frac{1}{112}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{3}}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(1 - \frac{x^2}{8} + \frac{x^4}{112} + O\left(x^6\right)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$9b_n(n+r)(n+r-1) + 3b_{n-2}(n+r-2) + 9b_n(n+r) + 5b_{n-2} - b_n = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{b_{n-2}}{3n+3r+1} \tag{4}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_n = -\frac{b_{n-2}}{3n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = -\frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -\frac{1}{7+3r}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_2 = -\frac{1}{6}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{1}{7+3r}$	$-\frac{1}{6}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{1}{7+3r}$	$-\frac{1}{6}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{1}{9r^2 + 60r + 91}$$

Which for the root $r = -\frac{1}{3}$ becomes

$$b_4 = \frac{1}{72}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{1}{7+3r}$	$-\frac{1}{6}$
b_3	0	0
b_4	$\frac{1}{9r^2+60r+91}$	$\frac{1}{72}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{1}{7+3r}$	$-\frac{1}{6}$
b_3	0	0
b_4	$\frac{1}{9r^2+60r+91}$	$\frac{1}{72}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$
\begin{aligned}
y_2(x) &= x^{\frac{1}{3}}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\
&= \frac{1 - \frac{x^2}{6} + \frac{x^4}{72} + O(x^6)}{x^{\frac{1}{3}}}
\end{aligned}
$$

Therefore the homogeneous solution is

$$
\begin{aligned}
y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\
&= c_1 x^{\frac{1}{3}}\left(1 - \frac{x^2}{8} + \frac{x^4}{112} + O(x^6)\right) + \frac{c_2\left(1 - \frac{x^2}{6} + \frac{x^4}{72} + O(x^6)\right)}{x^{\frac{1}{3}}}
\end{aligned}
$$

Hence the final solution is

$$
\begin{aligned}
y &= y_h \\
&= c_1 x^{\frac{1}{3}}\left(1 - \frac{x^2}{8} + \frac{x^4}{112} + O(x^6)\right) + \frac{c_2\left(1 - \frac{x^2}{6} + \frac{x^4}{72} + O(x^6)\right)}{x^{\frac{1}{3}}}
\end{aligned}
$$

Summary

The solution(s) found are the following

$$
y = c_1 x^{\frac{1}{3}}\left(1 - \frac{x^2}{8} + \frac{x^4}{112} + O(x^6)\right) + \frac{c_2\left(1 - \frac{x^2}{6} + \frac{x^4}{72} + O(x^6)\right)}{x^{\frac{1}{3}}} \tag{1}
$$

Verification of solutions

$$
y = c_1 x^{\frac{1}{3}}\left(1 - \frac{x^2}{8} + \frac{x^4}{112} + O(x^6)\right) + \frac{c_2\left(1 - \frac{x^2}{6} + \frac{x^4}{72} + O(x^6)\right)}{x^{\frac{1}{3}}}
$$

Verified OK.

14.44.1 Maple step by step solution

Let's solve

$9x^2y'' + (3x^3 + 9x)\,y' + (5x^2 - 1)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(x^2+3)y'}{3x} - \frac{(5x^2-1)y}{9x^2}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(x^2+3)y'}{3x} + \frac{(5x^2-1)y}{9x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{x^2+3}{3x}, P_3(x) = \frac{5x^2-1}{9x^2}\right]$

  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $(x \cdot P_2(x))\bigg|_{x=0} = 1$

  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $(x^2 \cdot P_3(x))\bigg|_{x=0} = -\frac{1}{9}$

  - $x = 0$is a regular singular point

    Check to see if $x_0 = 0$ is a regular singular point

    $x_0 = 0$

- Multiply by denominators

  $9x^2y'' + 3x(x^2 + 3)\,y' + (5x^2 - 1)\,y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..3$

  $x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\, x^{k+r-1+m}$

- Shift index using $k->k+1-m$

  $x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$

- Convert $x^{2}\cdot y''$ to series expansion

  $x^{2}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r}$

  Rewrite ODE with series expansions

  $a_{0}(1+3r)\,(-1+3r)\, x^{r}+a_{1}(4+3r)\,(2+3r)\, x^{1+r}+\left(\sum_{k=2}^{\infty} (a_{k}(3k+3r+1)\,(3k+3r-1)+a_{k-2}\right.$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $(1+3r)\,(-1+3r)=0$

- Values of r that satisfy the indicial equation

  $r\in\left\{-\frac{1}{3}, \frac{1}{3}\right\}$

- Each term must be 0

  $a_{1}(4+3r)\,(2+3r)=0$

- Solve for the dependent coefficient(s)

  $a_{1}=0$

- Each term in the series must be 0, giving the recursion relation

  $(3k+3r-1)\,(3a_{k}k+3a_{k}r+a_{k}+a_{k-2})=0$

- Shift index using $k->k+2$

  $(3k+3r+5)\,(3a_{k+2}(k+2)+3a_{k+2}r+a_{k+2}+a_{k})=0$

- Recursion relation that defines series solution to ODE

  $a_{k+2}=-\frac{a_{k}}{3k+7+3r}$

- Recursion relation for $r=-\frac{1}{3}$

  $a_{k+2}=-\frac{a_{k}}{3k+6}$

- Solution for $r = -\frac{1}{3}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k-\frac{1}{3}}, a_{k+2} = -\frac{a_k}{3k+6}, a_1 = 0\right]$

- Recursion relation for $r = \frac{1}{3}$

  $a_{k+2} = -\frac{a_k}{3k+8}$

- Solution for $r = \frac{1}{3}$

  $\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+2} = -\frac{a_k}{3k+8}, a_1 = 0\right]$

- Combine solutions and rename parameters

  $\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k-\frac{1}{3}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{3}}\right), a_{k+2} = -\frac{a_k}{3k+6}, a_1 = 0, b_{k+2} = -\frac{b_k}{3k+8}, b_1 = 0\right]$

Problem number: 47.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _with_linear_symmetries]]
```

$$\boxed{6x^2y'' + x(6x^2+1)\,y' + (9x^2+1)\,y = 0}$$

With the expansion point for the power series method at $x = 0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$6x^2y'' + (6x^3+x)\,y' + (9x^2+1)\,y = 0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y'' + p(x)y' + q(x)y = 0$$

Where

$$p(x) = \frac{6x^2+1}{6x}$$
$$q(x) = \frac{9x^2+1}{6x^2}$$

Table 618: Table $p(x), q(x)$ singularites.

$p(x) = \frac{6x^2+1}{6x}$	
singularity	type
$x = 0$	"regular"
$x = \infty$	"regular"
$x = -\infty$	"regular"

$q(x) = \frac{9x^2+1}{6x^2}$	
singularity	type
$x = 0$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, \infty, -\infty]$

Irregular singular points : $[\infty]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$6x^2y'' + (6x^3 + x)\,y' + (9x^2 + 1)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$

$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$6x^2\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (6x^3 + x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (9x^2 + 1)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} 6x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 6x^{n+r+2} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 9x^{n+r+2} a_n\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} 6x^{n+r+2} a_n (n+r) = \sum_{n=2}^{\infty} 6a_{n-2}(n+r-2)\, x^{n+r}$$

$$\sum_{n=0}^{\infty} 9x^{n+r+2} a_n = \sum_{n=2}^{\infty} 9a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=0}^{\infty} 6x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 6a_{n-2}(n+r-2)\, x^{n+r}\right) + \left(\sum_{n=0}^{\infty} x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 9a_{n-2} x^{n+r}\right) + \left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$6x^{n+r} a_n (n+r)(n+r-1) + x^{n+r} a_n (n+r) + a_n x^{n+r} = 0$$

When $n=0$ the above becomes

$$6x^r a_0 r(-1+r) + x^r a_0 r + a_0 x^r = 0$$

Or

$$(6x^r r(-1+r) + x^r r + x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$(6r^2 - 5r + 1)\, x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$6r^2 - 5r + 1 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{2}$$
$$r_2 = \frac{1}{3}$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$(6r^2 - 5r + 1)\, x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{1}{6}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1}\left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2}\left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{2}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n+\frac{1}{3}}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$6a_n(n+r)(n+r-1) + 6a_{n-2}(n+r-2) + a_n(n+r) + 9a_{n-2} + a_n = 0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{3a_{n-2}}{3n+3r-1} \tag{4}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_n = -\frac{6a_{n-2}}{6n+1} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{2}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = -\frac{3}{5+3r}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_2 = -\frac{6}{13}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{3}{5+3r}$	$-\frac{6}{13}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{3}{5+3r}$	$-\frac{6}{13}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{9}{9r^2 + 48r + 55}$$

Which for the root $r = \frac{1}{2}$ becomes

$$a_4 = \frac{36}{325}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{3}{5+3r}$	$-\frac{6}{13}$
a_3	0	0
a_4	$\frac{9}{9r^2+48r+55}$	$\frac{36}{325}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$-\frac{3}{5+3r}$	$-\frac{6}{13}$
a_3	0	0
a_4	$\frac{9}{9r^2+48r+55}$	$\frac{36}{325}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= \sqrt{x}\left(a_0 + a_1 x + a_2 x^2 + a_3 x^3 + a_4 x^4 + a_5 x^5 + a_6 x^6 \dots\right) \\ &= \sqrt{x}\left(1 - \frac{6x^2}{13} + \frac{36x^4}{325} + O(x^6)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$6b_n(n+r)(n+r-1) + 6b_{n-2}(n+r-2) + b_n(n+r) + 9b_{n-2} + b_n = 0 \tag{3}$$

Solving for b_n from recursive equation (4) gives

$$b_n = -\frac{3b_{n-2}}{3n+3r-1} \tag{4}$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_n = -\frac{b_{n-2}}{n} \tag{5}$$

At this point, it is a good idea to keep track of b_n in a table both before substituting $r = \frac{1}{3}$ and after as more terms are found using the above recursive equation.

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0

For $n = 2$, using the above recursive equation gives

$$b_2 = -\frac{3}{5+3r}$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_2 = -\frac{1}{2}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{3}{5+3r}$	$-\frac{1}{2}$

For $n = 3$, using the above recursive equation gives

$$b_3 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{3}{5+3r}$	$-\frac{1}{2}$
b_3	0	0

For $n = 4$, using the above recursive equation gives

$$b_4 = \frac{9}{9r^2 + 48r + 55}$$

Which for the root $r = \frac{1}{3}$ becomes

$$b_4 = \frac{1}{8}$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{3}{5+3r}$	$-\frac{1}{2}$
b_3	0	0
b_4	$\frac{9}{9r^2+48r+55}$	$\frac{1}{8}$

For $n = 5$, using the above recursive equation gives

$$b_5 = 0$$

And the table now becomes

n	$b_{n,r}$	b_n
b_0	1	1
b_1	0	0
b_2	$-\frac{3}{5+3r}$	$-\frac{1}{2}$
b_3	0	0
b_4	$\frac{9}{9r^2+48r+55}$	$\frac{1}{8}$
b_5	0	0

Using the above table, then the solution $y_2(x)$ is

$$\begin{aligned} y_2(x) &= \sqrt{x}\left(b_0 + b_1 x + b_2 x^2 + b_3 x^3 + b_4 x^4 + b_5 x^5 + b_6 x^6 \dots\right) \\ &= x^{\frac{1}{3}}\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O\left(x^6\right)\right) \end{aligned}$$

Therefore the homogeneous solution is

$$\begin{aligned} y_h(x) &= c_1 y_1(x) + c_2 y_2(x) \\ &= c_1\sqrt{x}\left(1 - \frac{6x^2}{13} + \frac{36x^4}{325} + O\left(x^6\right)\right) + c_2 x^{\frac{1}{3}}\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O\left(x^6\right)\right) \end{aligned}$$

Hence the final solution is

$$\begin{aligned} y &= y_h \\ &= c_1\sqrt{x}\left(1 - \frac{6x^2}{13} + \frac{36x^4}{325} + O\left(x^6\right)\right) + c_2 x^{\frac{1}{3}}\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O\left(x^6\right)\right) \end{aligned}$$

Summary

The solution(s) found are the following

$$y = c_1\sqrt{x}\left(1 - \frac{6x^2}{13} + \frac{36x^4}{325} + O\left(x^6\right)\right) + c_2 x^{\frac{1}{3}}\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O\left(x^6\right)\right) \tag{1}$$

Verification of solutions

$$y = c_1\sqrt{x}\left(1 - \frac{6x^2}{13} + \frac{36x^4}{325} + O\left(x^6\right)\right) + c_2 x^{\frac{1}{3}}\left(1 - \frac{x^2}{2} + \frac{x^4}{8} + O\left(x^6\right)\right)$$

Verified OK.

14.45.1 Maple step by step solution

Let's solve

$6x^2y'' + (6x^3 + x)\,y' + (9x^2 + 1)\,y = 0$

- Highest derivative means the order of the ODE is 2

  y''

- Isolate 2nd derivative

  $y'' = -\frac{(9x^2+1)y}{6x^2} - \frac{(6x^2+1)y'}{6x}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE; ODE is linear

  $y'' + \frac{(6x^2+1)y'}{6x} + \frac{(9x^2+1)y}{6x^2} = 0$

□ Check to see if $x_0 = 0$ is a regular singular point

  - Define functions

    $\left[P_2(x) = \frac{6x^2+1}{6x}, P_3(x) = \frac{9x^2+1}{6x^2}\right]$

  - $x \cdot P_2(x)$ is analytic at $x = 0$

    $\left.(x \cdot P_2(x))\right|_{x=0} = \frac{1}{6}$

  - $x^2 \cdot P_3(x)$ is analytic at $x = 0$

    $\left.(x^2 \cdot P_3(x))\right|_{x=0} = \frac{1}{6}$

  - $x = 0$is a regular singular point

    Check to see if $x_0 = 0$ is a regular singular point

    $x_0 = 0$

- Multiply by denominators

  $6x^2y'' + x(6x^2 + 1)\,y' + (9x^2 + 1)\,y = 0$

- Assume series solution for y

  $y = \sum_{k=0}^{\infty} a_k x^{k+r}$

□ Rewrite ODE with series expansions

  - Convert $x^m \cdot y$ to series expansion for $m = 0..2$

    $x^m \cdot y = \sum_{k=0}^{\infty} a_k x^{k+r+m}$

- Shift index using $k->k-m$

  $$x^{m}\cdot y=\sum_{k=m}^{\infty} a_{k-m} x^{k+r}$$

- Convert $x^{m}\cdot y'$ to series expansion for $m=1..3$

  $$x^{m}\cdot y'=\sum_{k=0}^{\infty} a_{k}(k+r)\, x^{k+r-1+m}$$

- Shift index using $k->k+1-m$

  $$x^{m}\cdot y'=\sum_{k=-1+m}^{\infty} a_{k+1-m}(k+1-m+r)\, x^{k+r}$$

- Convert $x^{2}\cdot y''$ to series expansion

  $$x^{2}\cdot y''=\sum_{k=0}^{\infty} a_{k}(k+r)\,(k+r-1)\, x^{k+r}$$

  Rewrite ODE with series expansions

  $$a_{0}(-1+3r)\,(-1+2r)\, x^{r}+a_{1}(2+3r)\,(1+2r)\, x^{1+r}+\left(\sum_{k=2}^{\infty} \left(a_{k}(3k+3r-1)\,(2k+2r-1)+3a$$

- a_{0}cannot be 0 by assumption, giving the indicial equation

  $$(-1+3r)\,(-1+2r)=0$$

- Values of r that satisfy the indicial equation

  $$r\in\left\{\frac{1}{2}, \frac{1}{3}\right\}$$

- Each term must be 0

  $$a_{1}(2+3r)\,(1+2r)=0$$

- Solve for the dependent coefficient(s)

  $$a_{1}=0$$

- Each term in the series must be 0, giving the recursion relation

  $$6\left(k+r-\frac{1}{2}\right)\left(\left(k+r-\frac{1}{3}\right) a_{k}+a_{k-2}\right)=0$$

- Shift index using $k->k+2$

  $$6\left(k+\frac{3}{2}+r\right)\left(\left(k+\frac{5}{3}+r\right) a_{k+2}+a_{k}\right)=0$$

- Recursion relation that defines series solution to ODE

  $$a_{k+2}=-\frac{3a_{k}}{3k+5+3r}$$

- Recursion relation for $r=\frac{1}{2}$

  $$a_{k+2}=-\frac{3a_{k}}{3k+\frac{13}{2}}$$

- Solution for $r = \frac{1}{2}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}, a_{k+2} = -\frac{3a_k}{3k+\frac{13}{2}}, a_1 = 0\right]$$

- Recursion relation for $r = \frac{1}{3}$

  $$a_{k+2} = -\frac{3a_k}{3k+6}$$

- Solution for $r = \frac{1}{3}$

  $$\left[y = \sum_{k=0}^{\infty} a_k x^{k+\frac{1}{3}}, a_{k+2} = -\frac{3a_k}{3k+6}, a_1 = 0\right]$$

- Combine solutions and rename parameters

  $$\left[y = \left(\sum_{k=0}^{\infty} a_k x^{k+\frac{1}{2}}\right) + \left(\sum_{k=0}^{\infty} b_k x^{k+\frac{1}{3}}\right), a_{k+2} = -\frac{3a_k}{3k+\frac{13}{2}}, a_1 = 0, b_{k+2} = -\frac{3b_k}{3k+6}, b_1 = 0\right]$$

Problem number: 48.
ODE order: 2.
ODE degree: 1.

The type(s) of ODE detected by this program : **"second order series method. Regular singular point. Difference not integer"**

Maple gives the following as the ode type

```
[[_2nd_order, _exact, _linear, _homogeneous]]
```

$$\boxed{x^2(x^2+8)\,y''+7x(x^2+2)\,y'-(-9x^2+2)\,y=0}$$

With the expansion point for the power series method at $x=0$.

The type of the expansion point is first determined. This is done on the homogeneous part of the ODE.

$$(x^4+8x^2)\,y''+(7x^3+14x)\,y'+(9x^2-2)\,y=0$$

The following is summary of singularities for the above ode. Writing the ode as

$$y''+p(x)y'+q(x)y=0$$

Where

$$p(x)=\frac{7x^2+14}{x\,(x^2+8)}$$
$$q(x)=\frac{9x^2-2}{x^2\,(x^2+8)}$$

Table 620: Table $p(x), q(x)$ singularites.

$p(x) = \frac{7x^2+14}{x(x^2+8)}$	
singularity	type
$x = 0$	"regular"
$x = -2i\sqrt{2}$	"regular"
$x = 2i\sqrt{2}$	"regular"

$q(x) = \frac{9x^2-2}{x^2(x^2+8)}$	
singularity	type
$x = 0$	"regular"
$x = -2i\sqrt{2}$	"regular"
$x = 2i\sqrt{2}$	"regular"

Combining everything together gives the following summary of singularities for the ode as

Regular singular points : $[0, -2i\sqrt{2}, 2i\sqrt{2}, \infty]$

Irregular singular points : $[]$

Since $x = 0$ is regular singular point, then Frobenius power series is used. The ode is normalized to be

$$x^2(x^2+8)\,y'' + (7x^3+14x)\,y' + (9x^2-2)\,y = 0$$

Let the solution be represented as Frobenius power series of the form

$$y = \sum_{n=0}^{\infty} a_n x^{n+r}$$

Then

$$y' = \sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}$$
$$y'' = \sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}$$

Substituting the above back into the ode gives

$$x^2(x^2+8)\left(\sum_{n=0}^{\infty} (n+r)\,(n+r-1)\,a_n x^{n+r-2}\right) + (7x^3+14x)\left(\sum_{n=0}^{\infty} (n+r)\,a_n x^{n+r-1}\right) + (9x^2-2)\left(\sum_{n=0}^{\infty} a_n x^{n+r}\right) = 0 \tag{1}$$

Which simplifies to

$$\left(\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)\right)+\left(\sum_{n=0}^{\infty} 8 x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=0}^{\infty} 7 x^{n+r+2} a_n (n+r)\right)+\left(\sum_{n=0}^{\infty} 14 x^{n+r} a_n (n+r)\right) + \left(\sum_{n=0}^{\infty} 9 x^{n+r+2} a_n\right)+\sum_{n=0}^{\infty}\left(-2 a_n x^{n+r}\right)=0 \tag{2A}$$

The next step is to make all powers of x be $n+r$ in each summation term. Going over each summation term above with power of x in it which is not already x^{n+r} and adjusting the power and the corresponding index gives

$$\sum_{n=0}^{\infty} x^{n+r+2} a_n (n+r)(n+r-1)=\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r}$$

$$\sum_{n=0}^{\infty} 7 x^{n+r+2} a_n (n+r)=\sum_{n=2}^{\infty} 7 a_{n-2}(n+r-2) x^{n+r}$$

$$\sum_{n=0}^{\infty} 9 x^{n+r+2} a_n=\sum_{n=2}^{\infty} 9 a_{n-2} x^{n+r}$$

Substituting all the above in Eq (2A) gives the following equation where now all powers of x are the same and equal to $n+r$.

$$\left(\sum_{n=2}^{\infty} a_{n-2}(n+r-2)(n-3+r) x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 8 x^{n+r} a_n (n+r)(n+r-1)\right) + \left(\sum_{n=2}^{\infty} 7 a_{n-2}(n+r-2) x^{n+r}\right)+\left(\sum_{n=0}^{\infty} 14 x^{n+r} a_n (n+r)\right) + \left(\sum_{n=2}^{\infty} 9 a_{n-2} x^{n+r}\right)+\sum_{n=0}^{\infty}\left(-2 a_n x^{n+r}\right)=0 \tag{2B}$$

The indicial equation is obtained from $n=0$. From Eq (2B) this gives

$$8 x^{n+r} a_n (n+r)(n+r-1)+14 x^{n+r} a_n (n+r)-2 a_n x^{n+r}=0$$

When $n = 0$ the above becomes

$$8x^r a_0 r(-1+r) + 14x^r a_0 r - 2a_0 x^r = 0$$

Or

$$(8x^r r(-1+r) + 14x^r r - 2x^r)\, a_0 = 0$$

Since $a_0 \neq 0$ then the above simplifies to

$$\left(8r^2 + 6r - 2\right) x^r = 0$$

Since the above is true for all x then the indicial equation becomes

$$8r^2 + 6r - 2 = 0$$

Solving for r gives the roots of the indicial equation as

$$r_1 = \frac{1}{4}$$
$$r_2 = -1$$

Since $a_0 \neq 0$ then the indicial equation becomes

$$\left(8r^2 + 6r - 2\right) x^r = 0$$

Solving for r gives the roots of the indicial equation as Since $r_1 - r_2 = \frac{5}{4}$ is not an integer, then we can construct two linearly independent solutions

$$y_1(x) = x^{r_1} \left(\sum_{n=0}^{\infty} a_n x^n\right)$$
$$y_2(x) = x^{r_2} \left(\sum_{n=0}^{\infty} b_n x^n\right)$$

Or

$$y_1(x) = \sum_{n=0}^{\infty} a_n x^{n+\frac{1}{4}}$$
$$y_2(x) = \sum_{n=0}^{\infty} b_n x^{n-1}$$

We start by finding $y_1(x)$. Eq (2B) derived above is now used to find all a_n coefficients. The case $n = 0$ is skipped since it was used to find the roots of the indicial equation. a_0 is arbitrary and taken as $a_0 = 1$. Substituting $n = 1$ in Eq. (2B) gives

$$a_1 = 0$$

For $2 \leq n$ the recursive equation is

$$a_{n-2}(n+r-2)(n-3+r)+8a_n(n+r)(n+r-1) \\ +7a_{n-2}(n+r-2)+14a_n(n+r)+9a_{n-2}-2a_n=0 \tag{3}$$

Solving for a_n from recursive equation (4) gives

$$a_n = -\frac{(1+n+r)\,a_{n-2}}{2\,(4n+4r-1)} \tag{4}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_n = -\frac{(5+4n)\,a_{n-2}}{32n} \tag{5}$$

At this point, it is a good idea to keep track of a_n in a table both before substituting $r = \frac{1}{4}$ and after as more terms are found using the above recursive equation.

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0

For $n = 2$, using the above recursive equation gives

$$a_2 = \frac{-3-r}{14+8r}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_2 = -\frac{13}{64}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-3-r}{14+8r}$	$-\frac{13}{64}$

For $n = 3$, using the above recursive equation gives

$$a_3 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-3-r}{14+8r}$	$-\frac{13}{64}$
a_3	0	0

For $n = 4$, using the above recursive equation gives

$$a_4 = \frac{r^2 + 8r + 15}{64r^2 + 352r + 420}$$

Which for the root $r = \frac{1}{4}$ becomes

$$a_4 = \frac{273}{8192}$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-3-r}{14+8r}$	$-\frac{13}{64}$
a_3	0	0
a_4	$\frac{r^2+8r+15}{64r^2+352r+420}$	$\frac{273}{8192}$

For $n = 5$, using the above recursive equation gives

$$a_5 = 0$$

And the table now becomes

n	$a_{n,r}$	a_n
a_0	1	1
a_1	0	0
a_2	$\frac{-3-r}{14+8r}$	$-\frac{13}{64}$
a_3	0	0
a_4	$\frac{r^2+8r+15}{64r^2+352r+420}$	$\frac{273}{8192}$
a_5	0	0

Using the above table, then the solution $y_1(x)$ is

$$\begin{aligned} y_1(x) &= x^{\frac{1}{4}}\left(a_0+a_1x+a_2x^2+a_3x^3+a_4x^4+a_5x^5+a_6x^6\ldots\right) \\ &= x^{\frac{1}{4}}\left(1-\frac{13x^2}{64}+\frac{273x^4}{8192}+O\left(x^6\right)\right) \end{aligned}$$

Now the second solution $y_2(x)$ is found. Eq (2B) derived above is now used to find all b_n coefficients. The case $n=0$ is skipped since it was used to find the roots of the indicial equation. b_0 is arbitrary and taken as $b_0=1$. Substituting $n=1$ in Eq. (2B) gives

$$b_1 = 0$$

For $2 \leq n$ the recursive equation is

$$\begin{aligned} &b_{n-2}(n+r-2)\,(n-3+r)+8b_n(n+r)\,(n+r-1) \\ &+7b_{n-2}(n+r-2)+14b_n(n+r)+9b_{n-2}-2b_n=0 \end{aligned} \tag{3}$$
