Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, First-Order differential equations
Problem number: 1.1.1.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"quadrature"**

Maple gives the following as the ode type

`[_quadrature]`

$$\boxed{y' = f(x)}$$

1.1.1 Solving as quadrature ode

Integrating both sides gives

$$\begin{aligned} y &= \int f(x)\, \mathrm{d}x \\ &= \int f(x)\, dx + c_1 \end{aligned}$$

Summary
The solution(s) found are the following

$$y = \int f(x)\, dx + c_1 \tag{1}$$

Verification of solutions

$$y = \int f(x)\, dx + c_1$$

Verified OK.

1.1.2 Maple step by step solution

Let's solve

$y' = f(x)$

- Highest derivative means the order of the ODE is 1

  y'

- Integrate both sides with respect to x

  $\int y' dx = \int f(x) \, dx + c_1$

- Evaluate integral

  $y = \int f(x) \, dx + c_1$

- Solve for y

  $y = \int f(x) \, dx + c_1$

The type(s) of ODE detected by this program : **"quadrature"**

Maple gives the following as the ode type

`[_quadrature]`

$$\boxed{y' - f(y) = 0}$$

1.2.1 Solving as quadrature ode

Integrating both sides gives

$$\int \frac{1}{f(y)} dy = \int dx$$
$$\int^{y} \frac{1}{f(\_a)} d\_a = x + c_1$$

Summary
The solution(s) found are the following

$$\int^{y} \frac{1}{f(\_a)} d\_a = x + c_1 \tag{1}$$

Verification of solutions

$$\int^{y} \frac{1}{f(\_a)} d\_a = x + c_1$$

Verified OK.

1.2.2 Maple step by step solution

Let's solve

$y' - f(y) = 0$

- Highest derivative means the order of the ODE is 1

  y'

- Separate variables

  $\frac{y'}{f(y)} = 1$

- Integrate both sides with respect to x

  $\int \frac{y'}{f(y)} dx = \int 1 dx + c_1$

- Cannot compute integral

  $\int \frac{y'}{f(y)} dx = x + c_1$

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, First-Order differential equations
Problem number: 1.1.3.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"exact", "separable", "first_order_ode_lie_symmetry_lookup"**

Maple gives the following as the ode type

`[_separable]`

$$\boxed{y' - f(x)\, g(y) = 0}$$

1.3.1 Solving as separable ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= f(x)g(y) \\ &= f(x)\, g(y) \end{aligned}$$

Where $f(x) = f(x)$ and $g(y) = g(y)$. Integrating both sides gives

$$\frac{1}{g(y)}\, dy = f(x)\, dx$$

$$\int \frac{1}{g(y)}\, dy = \int f(x)\, dx$$

$$\int^{y} \frac{1}{g(\_a)} d\_a = \int f(x)\, dx + c_1$$

Which results in

$$\int^{y} \frac{1}{g(\_a)} d\_a = \int f(x)\, dx + c_1$$

The solution is

$$\int^{y} \frac{1}{g(\_a)} d\_a - \left(\int f(x)\, dx\right) - c_1 = 0$$

Summary

The solution(s) found are the following

$$\int^{y} \frac{1}{g(\_a)} d\_a - \left(\int f(x)\, dx\right) - c_1 = 0 \tag{1}$$

Verification of solutions

$$\int^{y} \frac{1}{g(\_a)} d\_a - \left(\int f(x)\, dx\right) - c_1 = 0$$

Verified OK.

1.3.2 Solving as first order ode lie symmetry lookup ode

Writing the ode as

$$y' = f(x)\, g(y)$$
$$y' = \omega(x, y)$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x + \omega(\eta_y - \xi_x) - \omega^2 \xi_y - \omega_x \xi - \omega_y \eta = 0 \tag{A}$$

The type of this ode is known. It is of type `separable`. Therefore we do not need to solve the PDE (A), and can just use the lookup table shown below to find ξ, η

Table 3: Lie symmetry infinitesimal lookup table for known first order ODE's

ODE class	Form	ξ	η
linear ode	$y' = f(x)y(x) + g(x)$	0	$e^{\int f dx}$
separable ode	$y' = f(x)\, g(y)$	$\frac{1}{f}$	0
quadrature ode	$y' = f(x)$	0	1
quadrature ode	$y' = g(y)$	1	0
homogeneous ODEs of Class A	$y' = f\left(\frac{y}{x}\right)$	x	y
homogeneous ODEs of Class C	$y' = (a + bx + cy)^{\frac{n}{m}}$	1	$-\frac{b}{c}$
homogeneous class D	$y' = \frac{y}{x} + g(x)\, F\left(\frac{y}{x}\right)$	x^2	xy
First order special form ID 1	$y' = g(x)\, e^{h(x)+by} + f(x)$	$\frac{e^{-\int bf(x)dx - h(x)}}{g(x)}$	$\frac{f(x)e^{-\int bf(x)dx - h(x)}}{g(x)}$
polynomial type ode	$y' = \frac{a_1x+b_1y+c_1}{a_2x+b_2y+c_2}$	$\frac{a_1b_2x - a_2b_1x - b_1c_2 + b_2c_1}{a_1b_2 - a_2b_1}$	$\frac{a_1b_2y - a_2b_1y - a_1c_2 - a_2c_1}{a_1b_2 - a_2b_1}$
Bernoulli ode	$y' = f(x)\, y + g(x)\, y^n$	0	$e^{-\int (n-1)f(x)dx} y^n$
Reduced Riccati	$y' = f_1(x)\, y + f_2(x)\, y^2$	0	$e^{-\int f_1 dx}$

The above table shows that

$$
\begin{aligned}
\xi(x, y) &= \frac{1}{f(x)} \\
\eta(x, y) &= 0
\end{aligned} \tag{A1}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x, y) \to (R, S)$ where (R, S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$
\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}
$$

The above comes from the requirements that $\left(\xi \frac{\partial}{\partial x} + \eta \frac{\partial}{\partial y}\right) S(x, y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\eta = 0$ then in this special case

$$R = y$$

S is found from

$$\begin{aligned} S &= \int \frac{1}{\xi} dx \\ &= \int \frac{1}{\frac{1}{f(x)}} dx \end{aligned}$$

Which results in

$$S = \int f(x)\, dx$$

1.3.3 Solving as exact ode

Entering Exact first order ODE solver. (Form one type)

To solve an ode of the form

$$M(x,y) + N(x,y)\frac{dy}{dx} = 0 \tag{A}$$

We assume there exists a function $\phi(x,y) = c$ where c is constant, that satisfies the ode. Taking derivative of ϕ w.r.t. x gives

$$\frac{d}{dx}\phi(x,y) = 0$$

Hence

$$\frac{\partial \phi}{\partial x} + \frac{\partial \phi}{\partial y}\frac{dy}{dx} = 0 \tag{B}$$

Comparing (A,B) shows that

$$\begin{aligned} \frac{\partial \phi}{\partial x} &= M \\ \frac{\partial \phi}{\partial y} &= N \end{aligned}$$

But since $\frac{\partial^2 \phi}{\partial x \partial y} = \frac{\partial^2 \phi}{\partial y \partial x}$ then for the above to be valid, we require that

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$$

If the above condition is satisfied, then the original ode is called exact. We still need to determine $\phi(x,y)$ but at least we know now that we can do that since the condition

$\frac{\partial^2\phi}{\partial x \partial y} = \frac{\partial^2\phi}{\partial y \partial x}$ is satisfied. If this condition is not satisfied then this method will not work and we have to now look for an integrating factor to force this condition, which might or might not exist. The first step is to write the ODE in standard form to check for exactness, which is

$$M(x,y)\,\mathrm{d}x + N(x,y)\,\mathrm{d}y = 0 \tag{1A}$$

Therefore

$$\begin{aligned}
\left(\frac{1}{g(y)}\right)\mathrm{d}y &= (f(x))\,\mathrm{d}x \\
(-f(x))\,\mathrm{d}x + \left(\frac{1}{g(y)}\right)\mathrm{d}y &= 0 \qquad \text{(2A)}
\end{aligned}$$

Comparing (1A) and (2A) shows that

$$\begin{aligned}
M(x,y) &= -f(x) \\
N(x,y) &= \frac{1}{g(y)}
\end{aligned}$$

The next step is to determine if the ODE is is exact or not. The ODE is exact when the following condition is satisfied

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$$

Using result found above gives

$$\begin{aligned}
\frac{\partial M}{\partial y} &= \frac{\partial}{\partial y}(-f(x)) \\
&= 0
\end{aligned}$$

And

$$\begin{aligned}
\frac{\partial N}{\partial x} &= \frac{\partial}{\partial x}\left(\frac{1}{g(y)}\right) \\
&= 0
\end{aligned}$$

Since $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$, then the ODE is <u>exact</u> The following equations are now set up to solve for the function $\phi(x,y)$

$$\frac{\partial \phi}{\partial x} = M \tag{1}$$

$$\frac{\partial \phi}{\partial y} = N \tag{2}$$

Integrating (1) w.r.t. x gives

$$\int \frac{\partial \phi}{\partial x} \, \mathrm{d}x = \int M \, \mathrm{d}x$$

$$\int \frac{\partial \phi}{\partial x} \, \mathrm{d}x = \int -f(x) \, \mathrm{d}x$$

$$\phi = \int^{x} -f(\_a) \, d\_a + f(y) \tag{3}$$

Where $f(y)$ is used for the constant of integration since ϕ is a function of both x and y. Taking derivative of equation (3) w.r.t y gives

$$\frac{\partial \phi}{\partial y} = 0 + f'(y) \tag{4}$$

But equation (2) says that $\frac{\partial \phi}{\partial y} = \frac{1}{g(y)}$. Therefore equation (4) becomes

$$\frac{1}{g(y)} = 0 + f'(y) \tag{5}$$

Solving equation (5) for $f'(y)$ gives

$$f'(y) = \frac{1}{g(y)}$$

Integrating the above w.r.t y gives

$$\int f'(y) \, \mathrm{d}y = \int \left(\frac{1}{g(y)} \right) \mathrm{d}y$$

$$f(y) = \int_{0}^{y} \frac{1}{g(\_a)} d\_a + c_1$$

Where c_1 is constant of integration. Substituting result found above for $f(y)$ into equation (3) gives ϕ

$$\phi = \int^{x} -f(\_a) \, d\_a + \int_{0}^{y} \frac{1}{g(\_a)} d\_a + c_1$$

But since ϕ itself is a constant function, then let $\phi = c_2$ where c_2 is new constant and combining c_1 and c_2 constants into new constant c_1 gives the solution as

$$c_1 = \int^x -f(\_a)\, d\_a + \int_0^y \frac{1}{g(\_a)} d\_a$$

Summary

The solution(s) found are the following

$$\int^x -f(\_a)\, d\_a + \int_0^y \frac{1}{g(\_a)} d\_a = c_1 \tag{1}$$

Verification of solutions

$$\int^x -f(\_a)\, d\_a + \int_0^y \frac{1}{g(\_a)} d\_a = c_1$$

Verified OK.

1.3.4 Maple step by step solution

Let's solve

1.4 problem 1.1.4

Internal problem ID [10328]
Internal file name [`OUTPUT/9275_Monday_June_06_2022_01_45_20_PM_51267741/index.tex`]

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, First-Order differential equations
Problem number: 1.1.4.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"linear", "exactWithIntegrationFactor", "first_order_ode_lie_symmetry_lookup"**

Maple gives the following as the ode type

`[_linear]`

$$\boxed{g(x)\,y' - f_1(x)\,y = f_0(x)}$$

1.4.1 Solving as linear ode

Entering Linear first order ODE solver. In canonical form a linear first order is

$$y' + p(x)y = q(x)$$

Where here

$$p(x) = -\frac{f_1(x)}{g\,(x)}$$
$$q(x) = \frac{f_0(x)}{g\,(x)}$$

Hence the ode is

$$y' - \frac{f_1(x)\,y}{g\,(x)} = \frac{f_0(x)}{g\,(x)}$$

The integrating factor μ is

$$\mu = \mathrm{e}^{\int -\frac{f_1(x)}{g(x)}dx}$$

The ode becomes

$$\frac{\mathrm{d}}{\mathrm{d}x}(\mu y) = (\mu)\left(\frac{f_0(x)}{g(x)}\right)$$

$$\frac{\mathrm{d}}{\mathrm{d}x}\left(\mathrm{e}^{\int -\frac{f_1(x)}{g(x)}dx} y\right) = \left(\mathrm{e}^{\int -\frac{f_1(x)}{g(x)}dx}\right)\left(\frac{f_0(x)}{g(x)}\right)$$

$$\mathrm{d}\left(\mathrm{e}^{\int -\frac{f_1(x)}{g(x)}dx} y\right) = \left(\frac{f_0(x)\,\mathrm{e}^{-\left(\int \frac{f_1(x)}{g(x)}dx\right)}}{g(x)}\right)\mathrm{d}x$$

Integrating gives

$$\mathrm{e}^{\int -\frac{f_1(x)}{g(x)}dx} y = \int \frac{f_0(x)\,\mathrm{e}^{-\left(\int \frac{f_1(x)}{g(x)}dx\right)}}{g(x)}\,\mathrm{d}x$$

$$\mathrm{e}^{\int -\frac{f_1(x)}{g(x)}dx} y = \int \frac{f_0(x)\,\mathrm{e}^{-\left(\int \frac{f_1(x)}{g(x)}dx\right)}}{g(x)}dx + c_1$$

Dividing both sides by the integrating factor $\mu = \mathrm{e}^{\int -\frac{f_1(x)}{g(x)}dx}$ results in

$$y = \mathrm{e}^{\int \frac{f_1(x)}{g(x)}dx}\left(\int \frac{f_0(x)\,\mathrm{e}^{-\left(\int \frac{f_1(x)}{g(x)}dx\right)}}{g(x)}dx\right) + c_1 \mathrm{e}^{\int \frac{f_1(x)}{g(x)}dx}$$

which simplifies to

$$y = \mathrm{e}^{\int \frac{f_1(x)}{g(x)}dx}\left(\int \frac{f_0(x)\,\mathrm{e}^{-\left(\int \frac{f_1(x)}{g(x)}dx\right)}}{g(x)}dx + c_1\right)$$

Summary

The solution(s) found are the following

$$y = \mathrm{e}^{\int \frac{f_1(x)}{g(x)}dx}\left(\int \frac{f_0(x)\,\mathrm{e}^{-\left(\int \frac{f_1(x)}{g(x)}dx\right)}}{g(x)}dx + c_1\right) \tag{1}$$

Verification of solutions

$$y = \mathrm{e}^{\int \frac{f_1(x)}{g(x)}dx}\left(\int \frac{f_0(x)\,\mathrm{e}^{-\left(\int \frac{f_1(x)}{g(x)}dx\right)}}{g(x)}dx + c_1\right)$$

Verified OK.

1.4.2 Solving as first order ode lie symmetry lookup ode

Writing the ode as

$$
\begin{aligned}
y' &= \frac{f_1(x)\, y + f_0(x)}{g\,(x)} \\
y' &= \omega(x, y)
\end{aligned}
$$

The condition of Lie symmetry is the linearized PDE given by

$$
\eta_x + \omega(\eta_y - \xi_x) - \omega^2 \xi_y - \omega_x \xi - \omega_y \eta = 0 \tag{A}
$$

The type of this ode is known. It is of type `linear`. Therefore we do not need to solve the PDE (A), and can just use the lookup table shown below to find ξ, η

Table 6: Lie symmetry infinitesimal lookup table for known first order ODE's

ODE class	Form	ξ	η
linear ode	$y' = f(x)y(x) + g(x)$	0	$e^{\int f dx}$
separable ode	$y' = f(x)\, g(y)$	$\frac{1}{f}$	0
quadrature ode	$y' = f(x)$	0	1
quadrature ode	$y' = g(y)$	1	0
homogeneous ODEs of Class A	$y' = f\left(\frac{y}{x}\right)$	x	y
homogeneous ODEs of Class C	$y' = (a + bx + cy)^{\frac{n}{m}}$	1	$-\frac{b}{c}$
homogeneous class D	$y' = \frac{y}{x} + g(x)\, F\left(\frac{y}{x}\right)$	x^2	xy
First order special form ID 1	$y' = g(x)\, e^{h(x)+by} + f(x)$	$\frac{e^{-\int bf(x)dx - h(x)}}{g(x)}$	$\frac{f(x)e^{-\int bf(x)dx - h(x)}}{g(x)}$
polynomial type ode	$y' = \frac{a_1x+b_1y+c_1}{a_2x+b_2y+c_2}$	$\frac{a_1b_2x - a_2b_1x - b_1c_2 + b_2c_1}{a_1b_2 - a_2b_1}$	$\frac{a_1b_2y - a_2b_1y - a_1c_2 - a_2c_1}{a_1b_2 - a_2b_1}$
Bernoulli ode	$y' = f(x)\, y + g(x)\, y^n$	0	$e^{-\int (n-1)f(x)dx} y^n$
Reduced Riccati	$y' = f_1(x)\, y + f_2(x)\, y^2$	0	$e^{-\int f_1 dx}$

The above table shows that

$$\begin{aligned}\xi(x,y) &= 0\\ \eta(x,y) &= \mathrm{e}^{\int \frac{f_1(x)}{g(x)}dx}\end{aligned}\tag{A1}$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x,y)\to(R,S)$ where (R,S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}$$

The above comes from the requirements that $\left(\xi\frac{\partial}{\partial x} + \eta\frac{\partial}{\partial y}\right)S(x,y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$R = x$$

S is found from

$$\begin{aligned}S &= \int \frac{1}{\eta}dy\\ &= \int \frac{1}{\mathrm{e}^{\int \frac{f_1(x)}{g(x)}dx}}dy\end{aligned}$$

1.4.3 Solving as exact ode

Entering Exact first order ODE solver. (Form one type)

To solve an ode of the form

$$M(x,y) + N(x,y)\frac{dy}{dx} = 0 \tag{A}$$

We assume there exists a function $\phi(x,y) = c$ where c is constant, that satisfies the ode. Taking derivative of ϕ w.r.t. x gives

$$\frac{d}{dx}\phi(x,y) = 0$$

Hence

$$\frac{\partial\phi}{\partial x} + \frac{\partial\phi}{\partial y}\frac{dy}{dx} = 0 \tag{B}$$

Comparing (A,B) shows that

$$
\begin{aligned}
\frac{\partial \phi}{\partial x} &= M \\
\frac{\partial \phi}{\partial y} &= N
\end{aligned}
$$

But since $\frac{\partial^2 \phi}{\partial x \partial y} = \frac{\partial^2 \phi}{\partial y \partial x}$ then for the above to be valid, we require that

$$
\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}
$$

If the above condition is satisfied, then the original ode is called exact. We still need to determine $\phi(x, y)$ but at least we know now that we can do that since the condition $\frac{\partial^2 \phi}{\partial x \partial y} = \frac{\partial^2 \phi}{\partial y \partial x}$ is satisfied. If this condition is not satisfied then this method will not work and we have to now look for an integrating factor to force this condition, which might or might not exist. The first step is to write the ODE in standard form to check for exactness, which is

$$
M(x, y) \, \mathrm{d}x + N(x, y) \, \mathrm{d}y = 0 \tag{1A}
$$

Therefore

$$
\begin{aligned}
(g(x)) \, \mathrm{d}y &= (f_1(x) \, y + f_0(x)) \, \mathrm{d}x \\
(-f_1(x) \, y - f_0(x)) \, \mathrm{d}x + (g(x)) \, \mathrm{d}y &= 0 \qquad (2A)
\end{aligned}
$$

Comparing (1A) and (2A) shows that

$$
\begin{aligned}
M(x, y) &= -f_1(x) \, y - f_0(x) \\
N(x, y) &= g(x)
\end{aligned}
$$

The next step is to determine if the ODE is is exact or not. The ODE is exact when the following condition is satisfied

$$
\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}
$$

Using result found above gives

$$
\begin{aligned}
\frac{\partial M}{\partial y} &= \frac{\partial}{\partial y}(-f_1(x) \, y - f_0(x)) \\
&= -f_1(x)
\end{aligned}
$$

And

$$
\begin{aligned}
\frac{\partial N}{\partial x} &= \frac{\partial}{\partial x}(g(x)) \\
&= g'(x)
\end{aligned}
$$

Since $\frac{\partial M}{\partial y} \neq \frac{\partial N}{\partial x}$, then the ODE is not exact. Since the ODE is not exact, we will try to find an integrating factor to make it exact. Let

$$\begin{aligned} A &= \frac{1}{N}\left(\frac{\partial M}{\partial y} - \frac{\partial N}{\partial x}\right) \\ &= \frac{1}{g(x)}\left((-f_1(x)) - (g'(x))\right) \\ &= \frac{-f_1(x) - g'(x)}{g(x)} \end{aligned}$$

Since A does not depend on y, then it can be used to find an integrating factor. The integrating factor μ is

$$\begin{aligned} \mu &= e^{\int A \, \mathrm{d}x} \\ &= e^{\int \frac{-f_1(x) - g'(x)}{g(x)} \, \mathrm{d}x} \end{aligned}$$

The result of integrating gives

$$\begin{aligned} \mu &= e^{\int \frac{-f_1(x) - g'(x)}{g(x)} dx} \\ &= \mathrm{e}^{-\left(\int \frac{f_1(x) + g'(x)}{g(x)} dx\right)} \end{aligned}$$

M and N are multiplied by this integrating factor, giving new M and new N which are called $\overline{M}$ and $\overline{N}$ for now so not to confuse them with the original M and N.

$$\begin{aligned} \overline{M} &= \mu M \\ &= \mathrm{e}^{-\left(\int \frac{f_1(x) + g'(x)}{g(x)} dx\right)} (-f_1(x)\, y - f_0(x)) \\ &= -(f_1(x)\, y + f_0(x))\, \mathrm{e}^{-\left(\int \frac{f_1(x) + g'(x)}{g(x)} dx\right)} \end{aligned}$$

And

$$\begin{aligned} \overline{N} &= \mu N \\ &= \mathrm{e}^{-\left(\int \frac{f_1(x) + g'(x)}{g(x)} dx\right)} (g(x)) \\ &= g(x)\, \mathrm{e}^{-\left(\int \frac{f_1(x) + g'(x)}{g(x)} dx\right)} \end{aligned}$$

Now a modified ODE is ontained from the original ODE, which is exact and can be solved. The modified ODE is

$$\begin{aligned} \overline{M} + \overline{N}\frac{\mathrm{d}y}{\mathrm{d}x} &= 0 \\ \left(-(f_1(x)\, y + f_0(x))\, \mathrm{e}^{-\left(\int \frac{f_1(x) + g'(x)}{g(x)} dx\right)}\right) + \left(g(x)\, \mathrm{e}^{-\left(\int \frac{f_1(x) + g'(x)}{g(x)} dx\right)}\right)\frac{\mathrm{d}y}{\mathrm{d}x} &= 0 \end{aligned}$$

The following equations are now set up to solve for the function $\phi(x,y)$

$$\frac{\partial \phi}{\partial x} = \overline{M} \tag{1}$$
$$\frac{\partial \phi}{\partial y} = \overline{N} \tag{2}$$

Integrating (1) w.r.t. x gives

$$\int \frac{\partial \phi}{\partial x}\, \mathrm{d}x = \int \overline{M}\, \mathrm{d}x$$

$$\int \frac{\partial \phi}{\partial x}\, \mathrm{d}x = \int -(f_1(x)\, y + f_0(x))\, \mathrm{e}^{-\left(\int \frac{f_1(x)+g'(x)}{g(x)} dx\right)}\, \mathrm{d}x$$

$$\phi = \int^x -(f_1(\_a)\, y + f_0(\_a))\, \mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a} g(\_a)}{g(\_a)} d\_a\right)} d\_a + f(y) \tag{3}$$

Where $f(y)$ is used for the constant of integration since ϕ is a function of both x and y. Taking derivative of equation (3) w.r.t y gives

$$\frac{\partial \phi}{\partial y} = -\left(\int^x f_1(\_a)\, \mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a} g(\_a)}{g(\_a)} d\_a\right)} d\_a\right) + f'(y) \tag{4}$$

But equation (2) says that $\frac{\partial \phi}{\partial y} = g(x)\, \mathrm{e}^{-\left(\int \frac{f_1(x)+g'(x)}{g(x)} dx\right)}$. Therefore equation (4) becomes

$$g(x)\, \mathrm{e}^{-\left(\int \frac{f_1(x)+g'(x)}{g(x)} dx\right)} = -\left(\int^x f_1(\_a)\, \mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a} g(\_a)}{g(\_a)} d\_a\right)} d\_a\right) + f'(y) \tag{5}$$

Solving equation (5) for $f'(y)$ gives

$$f'(y) = g(x)\, \mathrm{e}^{-\left(\int \frac{f_1(x)+g'(x)}{g(x)} dx\right)} + \int^x f_1(\_a)\, \mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a} g(\_a)}{g(\_a)} d\_a\right)} d\_a$$

Integrating the above w.r.t y gives

$$\int f'(y)\,\mathrm{d}y = \int \left(g(x)\,\mathrm{e}^{-\left(\int \frac{f_1(x)+g'(x)}{g(x)}dx\right)} + \int^{x} f_1(\_a)\,\mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a}g(\_a)}{g(\_a)}d\_a\right)}d\_a\right)\mathrm{d}y$$

$$f(y) = \int_0^y \left(g(x)\,\mathrm{e}^{-\left(\int \frac{f_1(x)+g'(x)}{g(x)}dx\right)} + \int^{x} f_1(\_a)\,\mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a}g(\_a)}{g(\_a)}d\_a\right)}d\_a\right)d\_a + c_1$$

Where c_1 is constant of integration. Substituting result found above for $f(y)$ into equation (3) gives ϕ

$$\phi = \int^{x} -(f_1(\_a)\,y + f_0(\_a))\,\mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a}g(\_a)}{g(\_a)}d\_a\right)}d\_a + \int_0^y \left(g(x)\,\mathrm{e}^{-\left(\int \frac{f_1(x)+g'(x)}{g(x)}dx\right)} + \int^{x} f_1(\_a)\,\mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a}g(\_a)}{g(\_a)}d\_a\right)}d\_a\right)d\_a + c_1$$

But since ϕ itself is a constant function, then let $\phi = c_2$ where c_2 is new constant and combining c_1 and c_2 constants into new constant c_1 gives the solution as

$$c_1 = \int^{x} -(f_1(\_a)\,y + f_0(\_a))\,\mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a}g(\_a)}{g(\_a)}d\_a\right)}d\_a + \int_0^y \left(g(x)\,\mathrm{e}^{-\left(\int \frac{f_1(x)+g'(x)}{g(x)}dx\right)} + \int^{x} f_1(\_a)\,\mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a}g(\_a)}{g(\_a)}d\_a\right)}d\_a\right)d\_a$$

Summary

The solution(s) found are the following

$$\int^{x} -(f_1(\_a)\,y + f_0(\_a))\,\mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a}g(\_a)}{g(\_a)}d\_a\right)}d\_a + \int_0^y \left(g(x)\,\mathrm{e}^{-\left(\int \frac{f_1(x)+g'(x)}{g(x)}dx\right)} + \int^{x} f_1(\_a)\,\mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a}g(\_a)}{g(\_a)}d\_a\right)}d\_a\right)d\_a = c_1 \tag{1}$$

Verification of solutions

$$\int^{x} -(f_1(\_a)\, y+f_0(\_a))\, \mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a}g(\_a)}{g(\_a)}d\_a\right)}d\_a + \int_0^{y}\left(g(x)\, \mathrm{e}^{-\left(\int \frac{f_1(x)+g'(x)}{g(x)}dx\right)}+\int^{x} f_1(\_a)\, \mathrm{e}^{-\left(\int \frac{f_1(\_a)+\frac{d}{d\_a}g(\_a)}{g(\_a)}d\_a\right)}d\_a\right)d\_a = c_1$$

Verified OK.

1.4.4 Maple step by step solution

Let's solve

$g(x)\, y'-f_1(x)\, y=f_0(x)$

- Highest derivative means the order of the ODE is 1

  y'

- Isolate the derivative

  $y'=\frac{f_1(x)y}{g(x)}+\frac{f_0(x)}{g(x)}$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE

  $y'-\frac{f_1(x)y}{g(x)}=\frac{f_0(x)}{g(x)}$

- The ODE is linear; multiply by an integrating factor $\mu(x)$

  $\mu(x)\left(y'-\frac{f_1(x)y}{g(x)}\right)=\frac{\mu(x)f_0(x)}{g(x)}$

- Assume the lhs of the ODE is the total derivative $\frac{d}{dx}(\mu(x)\, y)$

  $\mu(x)\left(y'-\frac{f_1(x)y}{g(x)}\right)=\mu'(x)\, y+\mu(x)\, y'$

- Isolate $\mu'(x)$

  $\mu'(x)=-\frac{\mu(x)f_1(x)}{g(x)}$

- Solve to find the integrating factor

  $\mu(x)=\mathrm{e}^{\int -\frac{f_1(x)}{g(x)}dx}$

- Integrate both sides with respect to x

  $\int \left(\frac{d}{dx}(\mu(x)\, y)\right)dx=\int \frac{\mu(x)f_0(x)}{g(x)}dx+c_1$

- Evaluate the integral on the lhs

  $\mu(x)\, y=\int \frac{\mu(x)f_0(x)}{g(x)}dx+c_1$

- Solve for y

$$y = \frac{\int \frac{\mu(x) f_0(x)}{g(x)}dx + c_1}{\mu(x)}$$

- Substitute $\mu(x) = e^{\int -\frac{f_1(x)}{g(x)}dx}$

$$y = \frac{\int \frac{f_0(x) e^{\int -\frac{f_1(x)}{g(x)}dx}}{g(x)}dx + c_1}{e^{\int -\frac{f_1(x)}{g(x)}dx}}$$

- Simplify

$$y = e^{\int \frac{f_1(x)}{g(x)}dx} \left(\int \frac{f_0(x) e^{-\left(\int \frac{f_1(x)}{g(x)}dx\right)}}{g(x)}dx + c_1 \right)$$

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, First-Order differential equations
Problem number: 1.1.5.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"bernoulli", "first_order_ode_lie_symmetry_lookup"**

Maple gives the following as the ode type

```
[_Bernoulli]
```

$$\boxed{g(x)\,y' - f_1(x)\,y - f_n(x)\,y^n = 0}$$

1.5.1 Solving as first order ode lie symmetry lookup ode

Writing the ode as

$$y' = \frac{f_1(x)\,y + f_n(x)\,y^n}{g\,(x)}$$
$$y' = \omega(x,y)$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x + \omega(\eta_y - \xi_x) - \omega^2\xi_y - \omega_x\xi - \omega_y\eta = 0 \tag{A}$$

The type of this ode is known. It is of type `Bernoulli`. Therefore we do not need to solve the PDE (A), and can just use the lookup table shown below to find ξ, η

Table 9: Lie symmetry infinitesimal lookup table for known first order ODE's

ODE class	Form	ξ	η
linear ode	$y' = f(x)y(x) + g(x)$	0	$e^{\int f dx}$
separable ode	$y' = f(x)\, g(y)$	$\frac{1}{f}$	0
quadrature ode	$y' = f(x)$	0	1
quadrature ode	$y' = g(y)$	1	0
homogeneous ODEs of Class A	$y' = f\left(\frac{y}{x}\right)$	x	y
homogeneous ODEs of Class C	$y' = (a + bx + cy)^{\frac{n}{m}}$	1	$-\frac{b}{c}$
homogeneous class D	$y' = \frac{y}{x} + g(x)\, F\left(\frac{y}{x}\right)$	x^2	xy
First order special form ID 1	$y' = g(x)\, e^{h(x)+by} + f(x)$	$\frac{e^{-\int bf(x)dx - h(x)}}{g(x)}$	$\frac{f(x)e^{-\int bf(x)dx - h(x)}}{g(x)}$
polynomial type ode	$y' = \frac{a_1x+b_1y+c_1}{a_2x+b_2y+c_2}$	$\frac{a_1b_2x - a_2b_1x - b_1c_2 + b_2c_1}{a_1b_2 - a_2b_1}$	$\frac{a_1b_2y - a_2b_1y - a_1c_2 - a_2c_1}{a_1b_2 - a_2b_1}$
Bernoulli ode	$y' = f(x)\, y + g(x)\, y^n$	0	$e^{-\int (n-1)f(x)dx} y^n$
Reduced Riccati	$y' = f_1(x)\, y + f_2(x)\, y^2$	0	$e^{-\int f_1 dx}$

The above table shows that

$$
\begin{aligned}
\xi(x, y) &= 0 \\
\eta(x, y) &= y^n \mathrm{e}^{(n-1)\left(\int -\frac{f_1(x)}{g(x)} dx\right)}
\end{aligned}
\tag{A1}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x, y) \to (R, S)$ where (R, S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$
\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}
$$

The above comes from the requirements that $\left(\xi \frac{\partial}{\partial x} + \eta \frac{\partial}{\partial y}\right) S(x, y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$R = x$$

S is found from

$$\begin{aligned}
S &= \int \frac{1}{\eta} dy \\
&= \int \frac{1}{y^n e^{(n-1)\left(\int -\frac{f_1(x)}{g(x)} dx\right)}} dy
\end{aligned}$$

1.5.2 Solving as bernoulli ode

In canonical form, the ODE is

$$\begin{aligned}
y' &= F(x, y) \\
&= \frac{f_1(x)\, y + f_n(x)\, y^n}{g\,(x)}
\end{aligned}$$

This is a Bernoulli ODE.

$$y' = \frac{f_1(x)}{g\,(x)} y + \frac{f_n(x)}{g\,(x)} y^n \tag{1}$$

The standard Bernoulli ODE has the form

$$y' = f_0(x) y + f_1(x) y^n \tag{2}$$

The first step is to divide the above equation by y^n which gives

$$\frac{y'}{y^n} = f_0(x) y^{1-n} + f_1(x) \tag{3}$$

The next step is use the substitution $w = y^{1-n}$ in equation (3) which generates a new ODE in $w(x)$ which will be linear and can be easily solved using an integrating factor. Backsubstitution then gives the solution $y(x)$ which is what we want.

This method is now applied to the ODE at hand. Comparing the ODE (1) With (2) Shows that

$$\begin{aligned}
f_0(x) &= \frac{f_1(x)}{g\,(x)} \\
f_1(x) &= \frac{f_n(x)}{g\,(x)} \\
n &= n
\end{aligned}$$

Dividing both sides of ODE (1) by $y^n = y^n$ gives

$$y'y^{-n} = \frac{f_1(x)\, y^{1-n}}{g(x)} + \frac{f_n(x)}{g(x)} \tag{4}$$

Let

$$\begin{aligned} w &= y^{1-n} \\ &= y^{1-n} \end{aligned} \tag{5}$$

Taking derivative of equation (5) w.r.t x gives

$$w' = (1-n)\, y^{-n} y' \tag{6}$$

Substituting equations (5) and (6) into equation (4) gives

$$\begin{aligned} \frac{w'(x)}{1-n} &= \frac{f_1(x)\, w(x)}{g(x)} + \frac{f_n(x)}{g(x)} \\ w' &= \frac{(1-n)\, f_1(x)\, w}{g(x)} + \frac{(1-n)\, f_n(x)}{g(x)} \end{aligned} \tag{7}$$

The above now is a linear ODE in $w(x)$ which is now solved.

Entering Linear first order ODE solver. In canonical form a linear first order is

$$w'(x) + p(x)w(x) = q(x)$$

Where here

$$\begin{aligned} p(x) &= \frac{(n-1)\, f_1(x)}{g(x)} \\ q(x) &= -\frac{(n-1)\, f_n(x)}{g(x)} \end{aligned}$$

Hence the ode is

$$w'(x) + \frac{(n-1)\, f_1(x)\, w(x)}{g(x)} = -\frac{(n-1)\, f_n(x)}{g(x)}$$

The integrating factor μ is

$$\mu = e^{\int \frac{(n-1) f_1(x)}{g(x)} dx}$$

The ode becomes

$$\begin{aligned} \frac{d}{dx}(\mu w) &= (\mu)\left(-\frac{(n-1)\, f_n(x)}{g(x)}\right) \\ \frac{d}{dx}\left(e^{\int \frac{(n-1) f_1(x)}{g(x)} dx} w\right) &= \left(e^{\int \frac{(n-1) f_1(x)}{g(x)} dx}\right)\left(-\frac{(n-1)\, f_n(x)}{g(x)}\right) \\ d\left(e^{\int \frac{(n-1) f_1(x)}{g(x)} dx} w\right) &= \left(-\frac{(n-1)\, f_n(x)\, e^{(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)}}{g(x)}\right) dx \end{aligned}$$

Integrating gives

$$
\begin{aligned}
\mathrm{e}^{\int \frac{(n-1) f_1(x)}{g(x)} dx} w &= \int -\frac{(n-1)\, f_n(x)\, \mathrm{e}^{(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)}}{g\,(x)}\, \mathrm{d}x \\
\mathrm{e}^{\int \frac{(n-1) f_1(x)}{g(x)} dx} w &= \int -\frac{(n-1)\, f_n(x)\, \mathrm{e}^{(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)}}{g\,(x)} dx + c_1
\end{aligned}
$$

Dividing both sides by the integrating factor $\mu = \mathrm{e}^{\int \frac{(n-1) f_1(x)}{g(x)} dx}$ results in

$$
w(x) = \mathrm{e}^{-(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)} \left(\int -\frac{(n-1)\, f_n(x)\, \mathrm{e}^{(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)}}{g\,(x)} dx\right) + c_1 \mathrm{e}^{-(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)}
$$

which simplifies to

$$
w(x) = -\mathrm{e}^{-(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)} \left((n-1)\left(\int \frac{f_n(x)\, \mathrm{e}^{(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)}}{g\,(x)} dx\right) - c_1\right)
$$

Replacing w in the above by y^{1-n} using equation (5) gives the final solution.

$$
y^{1-n} = -\mathrm{e}^{-(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)} \left((n-1)\left(\int \frac{f_n(x)\, \mathrm{e}^{(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)}}{g\,(x)} dx\right) - c_1\right)
$$

Summary

The solution(s) found are the following

$$
y^{1-n} = -\mathrm{e}^{-(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)} \left((n-1)\left(\int \frac{f_n(x)\, \mathrm{e}^{(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)}}{g\,(x)} dx\right) - c_1\right) \tag{1}
$$

Verification of solutions

$$
y^{1-n} = -\mathrm{e}^{-(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)} \left((n-1)\left(\int \frac{f_n(x)\, \mathrm{e}^{(n-1)\left(\int \frac{f_1(x)}{g(x)} dx\right)}}{g\,(x)} dx\right) - c_1\right)
$$

Verified OK.

1.6 problem 1.1.6

Internal problem ID [10330]
Internal file name [`OUTPUT/9277_Monday_June_06_2022_01_45_23_PM_73837130/index.tex`]

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, First-Order differential equations
Problem number: 1.1.6.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"homogeneousTypeD2", "first_order_ode_lie_symmetry_calculated"**

Maple gives the following as the ode type

```
[[_homogeneous, `class A`], _dAlembert]
```

$$\boxed{y' - f\left(\frac{y}{x}\right) = 0}$$

1.6.1 Solving as homogeneousTypeD2 ode

Using the change of variables $y = u(x)\,x$ on the above ode results in new ode in $u(x)$

$$u'(x)\,x + u(x) - f(u(x)) = 0$$

In canonical form the ODE is

$$\begin{aligned}u' &= F(x,u)\\ &= f(x)g(u)\\ &= \frac{-u + f(u)}{x}\end{aligned}$$

Where $f(x) = \frac{1}{x}$ and $g(u) = -u + f(u)$. Integrating both sides gives

$$\frac{1}{-u + f(u)} \, du = \frac{1}{x} \, dx$$

$$\int \frac{1}{-u + f(u)} \, du = \int \frac{1}{x} \, dx$$

$$\int^{u} \frac{1}{-\_a + f(\_a)} d\_a = c_2 + \ln(x)$$

Which results in

$$\int^{u} \frac{1}{-\_a + f(\_a)} d\_a = c_2 + \ln(x)$$

The solution is

$$\int^{u(x)} \frac{1}{-\_a + f(\_a)} d\_a - c_2 - \ln(x) = 0$$

Replacing $u(x)$ in the above solution by $\frac{y}{x}$ results in the solution for y in implicit form

$$\int^{\frac{y}{x}} \frac{1}{-\_a + f(\_a)} d\_a - c_2 - \ln(x) = 0$$

$$\int^{\frac{y}{x}} \frac{1}{-\_a + f(\_a)} d\_a - c_2 - \ln(x) = 0$$

Summary

The solution(s) found are the following

$$\int^{\frac{y}{x}} \frac{1}{-\_a + f(\_a)} d\_a - c_2 - \ln(x) = 0 \tag{1}$$

Verification of solutions

$$\int^{\frac{y}{x}} \frac{1}{-\_a + f(\_a)} d\_a - c_2 - \ln(x) = 0$$

Verified OK.

1.6.2 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$
\begin{aligned}
y' &= f\left(\frac{y}{x}\right)\\
y' &= \omega(x,y)
\end{aligned}
$$

The condition of Lie symmetry is the linearized PDE given by

$$
\eta_x + \omega(\eta_y - \xi_x) - \omega^2\xi_y - \omega_x\xi - \omega_y\eta = 0 \tag{A}
$$

The type of this ode is not in the lookup table. To determine ξ, η then (A) is solved using ansatz. Making bivariate polynomials of degree 1 to use as anstaz gives

$$
\xi = x a_2 + y a_3 + a_1 \tag{1E}
$$

$$
\eta = x b_2 + y b_3 + b_1 \tag{2E}
$$

Where the unknown coefficients are

$$
\{a_1, a_2, a_3, b_1, b_2, b_3\}
$$

Substituting equations (1E,2E) and ω into (A) gives

$$
\begin{aligned}
&b_2 + f\left(\frac{y}{x}\right)(b_3 - a_2) - f\left(\frac{y}{x}\right)^2 a_3 + \frac{D(f)\left(\frac{y}{x}\right) y(x a_2 + y a_3 + a_1)}{x^2}\\
&- \frac{D(f)\left(\frac{y}{x}\right)(x b_2 + y b_3 + b_1)}{x} = 0
\end{aligned} \tag{5E}
$$

Putting the above in normal form gives

$$
-\frac{f\left(\frac{y}{x}\right)^2 a_3 x^2 + D(f)\left(\frac{y}{x}\right) x^2 b_2 - D(f)\left(\frac{y}{x}\right) x y a_2 + D(f)\left(\frac{y}{x}\right) x y b_3 - D(f)\left(\frac{y}{x}\right) y^2 a_3 + x^2 f\left(\frac{y}{x}\right) a_2 - x^2 f\left(\frac{y}{x}\right) b \cdots}{x^2}
$$

$$
= 0
$$

Setting the numerator to zero gives

$$
\begin{aligned}
&-f\left(\frac{y}{x}\right)^2 a_3 x^2 - D(f)\left(\frac{y}{x}\right) x^2 b_2 + D(f)\left(\frac{y}{x}\right) x y a_2\\
&- D(f)\left(\frac{y}{x}\right) x y b_3 + D(f)\left(\frac{y}{x}\right) y^2 a_3 - x^2 f\left(\frac{y}{x}\right) a_2\\
&+ x^2 f\left(\frac{y}{x}\right) b_3 - D(f)\left(\frac{y}{x}\right) x b_1 + D(f)\left(\frac{y}{x}\right) y a_1 + b_2 x^2 = 0
\end{aligned} \tag{6E}
$$

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\left\{x, y, f\left(\frac{y}{x}\right), D(f)\left(\frac{y}{x}\right)\right\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\left\{x = v_1, y = v_2, f\left(\frac{y}{x}\right) = v_3, D(f)\left(\frac{y}{x}\right) = v_4\right\}$$

The above PDE (6E) now becomes

$$\begin{aligned} &-v_3^2 a_3 v_1^2 - v_1^2 v_3 a_2 + v_4 v_1 v_2 a_2 + v_4 v_2^2 a_3 - v_4 v_1^2 b_2 \\ &+ v_1^2 v_3 b_3 - v_4 v_1 v_2 b_3 + v_4 v_2 a_1 - v_4 v_1 b_1 + b_2 v_1^2 = 0 \end{aligned} \tag{7E}$$

Collecting the above on the terms v_i introduced, and these are

$$\{v_1, v_2, v_3, v_4\}$$

Equation (7E) now becomes

$$\begin{aligned} &-v_3^2 a_3 v_1^2 + (b_3 - a_2) v_1^2 v_3 - v_4 v_1^2 b_2 + b_2 v_1^2 \\ &+ (-b_3 + a_2) v_1 v_2 v_4 - v_4 v_1 b_1 + v_4 v_2^2 a_3 + v_4 v_2 a_1 = 0 \end{aligned} \tag{8E}$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$\begin{aligned} a_1 &= 0 \\ a_3 &= 0 \\ b_2 &= 0 \\ -a_3 &= 0 \\ -b_1 &= 0 \\ -b_2 &= 0 \\ -b_3 + a_2 &= 0 \\ b_3 - a_2 &= 0 \end{aligned}$$

Solving the above equations for the unknowns gives

$$
\begin{aligned}
a_1 &= 0 \\
a_2 &= b_3 \\
a_3 &= 0 \\
b_1 &= 0 \\
b_2 &= 0 \\
b_3 &= b_3
\end{aligned}
$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$
\begin{aligned}
\xi &= x \\
\eta &= y
\end{aligned}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x, y) \to (R, S)$ where (R, S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$
\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}
$$

The above comes from the requirements that $\left(\xi \frac{\partial}{\partial x} + \eta \frac{\partial}{\partial y}\right) S(x, y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Therefore

$$
\begin{aligned}
\frac{dy}{dx} &= \frac{\eta}{\xi} \\
&= \frac{y}{x} \\
&= \frac{y}{x}
\end{aligned}
$$

This is easily solved to give

$$
y = c_1 x
$$

Where now the coordinate R is taken as the constant of integration. Hence

$$
R = \frac{y}{x}
$$

And S is found from

$$
\begin{aligned}
dS &= \frac{dx}{\xi} \\
&= \frac{dx}{x}
\end{aligned}
$$

Integrating gives

$$
\begin{aligned}
S &= \int \frac{dx}{T} \\
&= \ln(x)
\end{aligned}
$$

Where the constant of integration is set to zero as we just need one solution. Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$
\frac{dS}{dR} = \frac{S_x + \omega(x,y)S_y}{R_x + \omega(x,y)R_y} \tag{2}
$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x,y)$ is the right hand side of the original ode given by

$$
\omega(x,y) = f\left(\frac{y}{x}\right)
$$

Evaluating all the partial derivatives gives

$$
\begin{aligned}
R_x &= -\frac{y}{x^2} \\
R_y &= \frac{1}{x} \\
S_x &= \frac{1}{x} \\
S_y &= 0
\end{aligned}
$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$
\frac{dS}{dR} = \frac{x}{xf\left(\frac{y}{x}\right) - y} \tag{2A}
$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$
\frac{dS}{dR} = \frac{1}{f(R) - R}
$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = \int \frac{1}{f(R) - R} dR + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$\ln(x) = \int^{\frac{y}{x}} \frac{1}{f(\_a) - \_a} d\_a + c_1$$

Which simplifies to

$$\ln(x) = \int^{\frac{y}{x}} \frac{1}{f(\_a) - \_a} d\_a + c_1$$

Summary

The solution(s) found are the following

$$\ln(x) = \int^{\frac{y}{x}} \frac{1}{f(\_a) - \_a} d\_a + c_1 \tag{1}$$

Verification of solutions

$$\ln(x) = \int^{\frac{y}{x}} \frac{1}{f(\_a) - \_a} d\_a + c_1$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - ay^2 = bx + c}$$

2.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= a\,y^2 + bx + c \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,y^2 + bx + c$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = bx + c$, $f_1(x) = 0$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= a^2(bx+c) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$au''(x) + a^2(bx+c)\,u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \operatorname{AiryAi}\left(-\frac{(ab)^{\frac{1}{3}}\,(bx+c)}{b}\right) + c_2 \operatorname{AiryBi}\left(-\frac{(ab)^{\frac{1}{3}}\,(bx+c)}{b}\right)$$

The above shows that

$$u'(x) = \left(-\operatorname{AiryBi}\left(1, -\frac{(ab)^{\frac{1}{3}}\,(bx+c)}{b}\right)c_2 - \operatorname{AiryAi}\left(1, -\frac{(ab)^{\frac{1}{3}}\,(bx+c)}{b}\right)c_1\right)(ab)^{\frac{1}{3}}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-\operatorname{AiryBi}\left(1, -\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right)c_2 - \operatorname{AiryAi}\left(1, -\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right)c_1\right)(ab)^{\frac{1}{3}}}{a\left(c_1 \operatorname{AiryAi}\left(-\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right) + c_2 \operatorname{AiryBi}\left(-\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\operatorname{AiryAi}\left(1, -\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right)c_3 + \operatorname{AiryBi}\left(1, -\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right)\right)(ab)^{\frac{1}{3}}}{a\left(c_3 \operatorname{AiryAi}\left(-\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right) + \operatorname{AiryBi}\left(-\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right)\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(\operatorname{AiryAi}\left(1, -\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right)c_3 + \operatorname{AiryBi}\left(1, -\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right)\right)(ab)^{\frac{1}{3}}}{a\left(c_3 \operatorname{AiryAi}\left(-\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right) + \operatorname{AiryBi}\left(-\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right)\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\operatorname{AiryAi}\left(1, -\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right)c_3 + \operatorname{AiryBi}\left(1, -\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right)\right)(ab)^{\frac{1}{3}}}{a\left(c_3 \operatorname{AiryAi}\left(-\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right) + \operatorname{AiryBi}\left(-\frac{(ab)^{\frac{1}{3}}(bx+c)}{b}\right)\right)}$$

Verified OK.

Problem number: 2.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 = -a^2x^2 + 3a}$$

2.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= -a^2x^2 + y^2 + 3a \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2x^2 + y^2 + 3a$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2x^2 + 3a$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= -a^2x^2 + 3a \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-a^2x^2 + 3a\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x\left(\sqrt{\pi}\ \mathrm{erf}\left(x\sqrt{-a}\right)\sqrt{-a}\,c_2 + c_1\right)\mathrm{e}^{-\frac{a\,x^2}{2}} + c_2\mathrm{e}^{\frac{a\,x^2}{2}}$$

The above shows that

$$u'(x) = \left(c_2\sqrt{\pi}\left(x^2(-a)^{\frac{3}{2}} + \sqrt{-a}\right)\mathrm{erf}\left(x\sqrt{-a}\right) - c_1a\,x^2 + c_1\right)\mathrm{e}^{-\frac{a\,x^2}{2}} - c_2xa\,\mathrm{e}^{\frac{a\,x^2}{2}}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(c_2\sqrt{\pi}\left(x^2(-a)^{\frac{3}{2}} + \sqrt{-a}\right)\mathrm{erf}\left(x\sqrt{-a}\right) - c_1a\,x^2 + c_1\right)\mathrm{e}^{-\frac{a\,x^2}{2}} - c_2xa\,\mathrm{e}^{\frac{a\,x^2}{2}}}{x\left(\sqrt{\pi}\ \mathrm{erf}\left(x\sqrt{-a}\right)\sqrt{-a}\,c_2 + c_1\right)\mathrm{e}^{-\frac{a\,x^2}{2}} + c_2\mathrm{e}^{\frac{a\,x^2}{2}}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{xa\,\mathrm{e}^{a\,x^2} - \sqrt{\pi}\left(x^2(-a)^{\frac{3}{2}} + \sqrt{-a}\right)\mathrm{erf}\left(x\sqrt{-a}\right) + c_3(a\,x^2 - 1)}{\sqrt{\pi}\,\sqrt{-a}\ \mathrm{erf}\left(x\sqrt{-a}\right)x + \mathrm{e}^{a\,x^2} + c_3x}$$

Summary

The solution(s) found are the following

$$y = \frac{xa\,\mathrm{e}^{a\,x^2} - \sqrt{\pi}\left(x^2(-a)^{\frac{3}{2}} + \sqrt{-a}\right)\mathrm{erf}\left(x\sqrt{-a}\right) + c_3(a\,x^2 - 1)}{\sqrt{\pi}\,\sqrt{-a}\ \mathrm{erf}\left(x\sqrt{-a}\right)x + \mathrm{e}^{a\,x^2} + c_3x} \tag{1}$$

Verification of solutions

$$y = \frac{xa\,\mathrm{e}^{a\,x^2} - \sqrt{\pi}\left(x^2(-a)^{\frac{3}{2}} + \sqrt{-a}\right)\mathrm{erf}\left(x\sqrt{-a}\right) + c_3(a\,x^2 - 1)}{\sqrt{\pi}\,\sqrt{-a}\ \mathrm{erf}\left(x\sqrt{-a}\right)x + \mathrm{e}^{a\,x^2} + c_3 x}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = a^2x^2 + bx + c}$$

2.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= a^2x^2 + bx + y^2 + c \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a^2x^2 + bx + y^2 + c$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a^2x^2 + bx + c$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= a^2x^2 + bx + c \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(a^2x^2 + bx + c\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = \mathrm{e}^{-\frac{ix\left(a^2x+b\right)}{2a}} \Bigg(&2x\, a^2 c_2 \,\mathrm{hypergeom}\left(\left[\frac{4ia^2c + 12a^3 - ib^2}{16a^3}\right], \left[\frac{3}{2}\right], \frac{i(2a^2x+b)^2}{4a^3}\right) \\ &+ bc_2 \,\mathrm{hypergeom}\left(\left[\frac{4ia^2c + 12a^3 - ib^2}{16a^3}\right], \left[\frac{3}{2}\right], \frac{i(2a^2x+b)^2}{4a^3}\right) \\ &+ \mathrm{hypergeom}\left(\left[\frac{4ia^2c + 4a^3 - ib^2}{16a^3}\right], \left[\frac{1}{2}\right], \frac{i(2a^2x+b)^2}{4a^3}\right) c_1\Bigg) \end{aligned}$$

The above shows that

$$u'(x) = \frac{2\left(\left(a^2x + \frac{b}{2}\right)^2 \left(ia^3 - \frac{1}{3}a^2c + \frac{1}{12}b^2\right) c_2 \,\mathrm{hypergeom}\left(\left[\frac{4ia^2c+28a^3-ib^2}{16a^3}\right], \left[\frac{5}{2}\right], \frac{i(2a^2x+b)^2}{4a^3}\right) + \frac{c_1\left(-a^2c+\frac{1}{4}b^2+ia^3\right)\left(a^2x\right.}{}\right.}{}$$

Using the above in (1) gives the solution

$$y = -\frac{2\left(\left(a^2x + \frac{b}{2}\right)^2 \left(ia^3 - \frac{1}{3}a^2c + \frac{1}{12}b^2\right) c_2 \,\mathrm{hypergeom}\left(\left[\frac{4ia^2c+28a^3-ib^2}{16a^3}\right], \left[\frac{5}{2}\right], \frac{i(2a^2x+b)^2}{4a^3}\right) + \frac{c_1\left(-a^2c+\frac{1}{4}b^2+ia^3\right)\left(\right.}{}\right.}{a^4\left(2x\, a^2 c_2 \,\mathrm{hypergeom}\left(\left[\frac{4ia^2c+12a^3-ib^2}{16a^3}\right]\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{4\left(-i a^3 + \frac{1}{3} a^2 c - \frac{1}{12} b^2\right) \left(a^2 x + \frac{b}{2}\right)^2 \text{hypergeom}\left(\left[\frac{4 i a^2 c + 28 a^3 - i b^2}{16 a^3}\right], \left[\frac{5}{2}\right], \frac{i \left(2 a^2 x + b\right)^2}{4 a^3}\right) + \left(4 i a^7 x^2 + 4 i a^5 b x - 4\right.}{4 a^4 \left(\left(a^2\right.\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{4\left(-i a^3 + \frac{1}{3} a^2 c - \frac{1}{12} b^2\right) \left(a^2 x + \frac{b}{2}\right)^2 \text{hypergeom}\left(\left[\frac{4 i a^2 c + 28 a^3 - i b^2}{16 a^3}\right], \left[\frac{5}{2}\right], \frac{i \left(2 a^2 x + b\right)^2}{4 a^3}\right) + \left(4 i a^7 x^2 + 4 i a^5 b x - 4\right.}{4 a^4 \left(\left(a^2\right.\right.} \tag{1}$$

Verification of solutions

$$y = \frac{4\left(-i a^3 + \frac{1}{3} a^2 c - \frac{1}{12} b^2\right) \left(a^2 x + \frac{b}{2}\right)^2 \text{hypergeom}\left(\left[\frac{4 i a^2 c + 28 a^3 - i b^2}{16 a^3}\right], \left[\frac{5}{2}\right], \frac{i \left(2 a^2 x + b\right)^2}{4 a^3}\right) + \left(4 i a^7 x^2 + 4 i a^5 b x - 4\right.}{4 a^4 \left(\left(a^2\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[[_Riccati, _special]]`

$$\boxed{y' - a y^2 = b\,x^n}$$

2.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,y^2 + b\,x^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,y^2 + b\,x^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\,x^n$, $f_1(x) = 0$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= b\,x^n a^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$a u''(x) + b\,x^n a^2 u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\text{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\,x^{1+\frac{n}{2}}}{2+n}\right) c_1 + \text{BesselY}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\,x^{1+\frac{n}{2}}}{2+n}\right) c_2\right)\sqrt{x}$$

The above shows that

$$u'(x) = \frac{-\text{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{ab}\,x^{1+\frac{n}{2}}}{2+n}\right)\sqrt{ab}\,x^{1+\frac{n}{2}} c_1 - \text{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{ab}\,x^{1+\frac{n}{2}}}{2+n}\right)\sqrt{ab}\,x^{1+\frac{n}{2}} c_2 + \text{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\,x^{1+}}{2+n}\right.}{\sqrt{x}}$$

Using the above in (1) gives the solution

$$y = -\frac{-\text{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{ab}\,x^{1+\frac{n}{2}}}{2+n}\right)\sqrt{ab}\,x^{1+\frac{n}{2}} c_1 - \text{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{ab}\,x^{1+\frac{n}{2}}}{2+n}\right)\sqrt{ab}\,x^{1+\frac{n}{2}} c_2 + \text{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\,x}{2+}\right.}{xa\left(\text{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\,x^{1+\frac{n}{2}}}{2+n}\right) c_1 + \text{BesselY}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\,x^{1+\frac{n}{2}}}{2+n}\right) c_2\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\text{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{ab}\,x^{1+\frac{n}{2}}}{2+n}\right) c_3 + \text{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{ab}\,x^{1+\frac{n}{2}}}{2+n}\right)\right)\sqrt{ab}\,x^{1+\frac{n}{2}} - \text{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\,x^{1+\frac{n}{2}}}{2+n}\right) c_3 - \text{Be}}{xa\left(\text{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\,x^{1+\frac{n}{2}}}{2+n}\right) c_3 + \text{BesselY}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\,x^{1+\frac{n}{2}}}{2+n}\right)\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{\left(\mathrm{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{ab}\, x^{1+\frac{n}{2}}}{2+n}\right) c_3 + \mathrm{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{ab}\, x^{1+\frac{n}{2}}}{2+n}\right)\right) \sqrt{ab}\, x^{1+\frac{n}{2}} - \mathrm{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\, x^{1+\frac{n}{2}}}{2+n}\right) c_3 - \mathrm{Be}}{xa \left(\mathrm{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\, x^{1+\frac{n}{2}}}{2+n}\right) c_3 + \mathrm{BesselY}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\, x^{1+\frac{n}{2}}}{2+n}\right)\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\mathrm{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{ab}\, x^{1+\frac{n}{2}}}{2+n}\right) c_3 + \mathrm{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{ab}\, x^{1+\frac{n}{2}}}{2+n}\right)\right) \sqrt{ab}\, x^{1+\frac{n}{2}} - \mathrm{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\, x^{1+\frac{n}{2}}}{2+n}\right) c_3 - \mathrm{Be}}{xa \left(\mathrm{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\, x^{1+\frac{n}{2}}}{2+n}\right) c_3 + \mathrm{BesselY}\left(\frac{1}{2+n}, \frac{2\sqrt{ab}\, x^{1+\frac{n}{2}}}{2+n}\right)\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = an\,x^{n-1} - a^2x^{2n}}$$

2.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + an\,x^{n-1} - a^2x^{2n} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \frac{an\,x^n}{x} - a^2x^{2n}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = an\,x^{n-1} - a^2x^{2n}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= an\, x^{n-1} - a^2 x^{2n} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(an\, x^{n-1} - a^2 x^{2n}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = -\frac{c_2 x^{-1-\frac{3n}{2}} (2+n)^2 \operatorname{WhittakerM}\left(\frac{2+n}{2+2n}, \frac{3+2n}{2+2n}, -\frac{2x^{n+1}a}{n+1}\right)}{2} + c_2\left(\left(-\frac{n}{2} - 1\right) x^{-1-\frac{3n}{2}} + a\, x^{-\frac{n}{2}}\right) (n+1) \operatorname{WhittakerM}\left(-\frac{n}{2+2n}, \frac{3+2n}{2+2n}, -\frac{2x^{n+1}a}{n+1}\right) + c_1 \mathrm{e}^{-\frac{x^{n+1}a}{n+1}}$$

The above shows that

$$u'(x) = -\frac{\left(-\frac{3c_2\left(\left(\frac{1}{3}n^2+n+\frac{2}{3}\right)x^{-\frac{n}{2}}+ax\,x^{\frac{n}{2}}\left(n+\frac{4}{3}\right)\right)(2+n)\operatorname{WhittakerM}\left(\frac{2+n}{2+2n},\frac{3+2n}{2+2n},-\frac{2x^n xa}{n+1}\right)}{2} + c_2\left(\left(-\frac{1}{2}n^2 - \frac{3}{2}n - 1\right) x^{-\frac{n}{2}} + ax\left(\left(\cdots\right.\right.\right.\right.}{\cdots}$$

Using the above in (1) gives the solution

$$y = \frac{\left(-\frac{3c_2\left(\left(\frac{1}{3}n^2+n+\frac{2}{3}\right)x^{-\frac{n}{2}}+ax\,x^{\frac{n}{2}}\left(n+\frac{4}{3}\right)\right)(2+n)\operatorname{WhittakerM}\left(\frac{2+n}{2+2n},\frac{3+2n}{2+2n},-\frac{2x^n xa}{n+1}\right)}{2} + c_2\left(\left(-\frac{1}{2}n^2 - \frac{3}{2}n - 1\right) x^{-\frac{n}{2}} + ax\left(\left(-\frac{n}{2}\cdots\right.\right.\right.\right.}{x^2\left(-\frac{c_2 x^{-1-\frac{3n}{2}}(2+n)^2\operatorname{WhittakerM}\left(\frac{2+n}{2+2n},\frac{3+2n}{2+2n},-\frac{2x^{n+1}a}{n+1}\right)}{2} + c_2\left(\left(\cdots\right.\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-\frac{3\,\mathrm{e}^{\frac{x^{n} x a}{n+1}} \left(\left(\frac{1}{3}n^{2}+n+\frac{2}{3}\right)x^{-\frac{n}{2}}+a x\, x^{\frac{n}{2}} \left(n+\frac{4}{3}\right)\right)(2+n)\, \mathrm{WhittakerM}\left(\frac{2+n}{2+2n},\frac{3+2n}{2+2n},-\frac{2x^{n} x a}{n+1}\right)}{2}+\mathrm{e}^{\frac{x^{n} x a}{n+1}} \left(\left(-\frac{1}{2}n^{2}-\frac{3}{2}n-1\right) x^{-\frac{n}{2}}+a \cdots\right.\right.}{x \left(-\frac{x^{-\frac{3n}{2}}\, \mathrm{e}^{\frac{x^{n} x a}{n+1}} (2+n)^{2}\, \mathrm{WhittakerM}\left(\frac{2+n}{2+2n},\frac{3+2n}{2+2n},-\frac{2x^{n} x a}{n+1}\right)}{2}+\mathrm{e} \cdots\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(-\frac{3\,\mathrm{e}^{\frac{x^{n} x a}{n+1}} \left(\left(\frac{1}{3}n^{2}+n+\frac{2}{3}\right)x^{-\frac{n}{2}}+a x\, x^{\frac{n}{2}} \left(n+\frac{4}{3}\right)\right)(2+n)\, \mathrm{WhittakerM}\left(\frac{2+n}{2+2n},\frac{3+2n}{2+2n},-\frac{2x^{n} x a}{n+1}\right)}{2}+\mathrm{e}^{\frac{x^{n} x a}{n+1}} \left(\left(-\frac{1}{2}n^{2}-\frac{3}{2}n-1\right) x^{-\frac{n}{2}}+a \cdots\right.\right.}{x \left(-\frac{x^{-\frac{3n}{2}}\, \mathrm{e}^{\frac{x^{n} x a}{n+1}} (2+n)^{2}\, \mathrm{WhittakerM}\left(\frac{2+n}{2+2n},\frac{3+2n}{2+2n},-\frac{2x^{n} x a}{n+1}\right)}{2}+\mathrm{e} \cdots\right.} \tag{1}$$

Verification of solutions

$$y = \frac{\left(-\frac{3\,\mathrm{e}^{\frac{x^{n} x a}{n+1}} \left(\left(\frac{1}{3}n^{2}+n+\frac{2}{3}\right)x^{-\frac{n}{2}}+a x\, x^{\frac{n}{2}} \left(n+\frac{4}{3}\right)\right)(2+n)\, \mathrm{WhittakerM}\left(\frac{2+n}{2+2n},\frac{3+2n}{2+2n},-\frac{2x^{n} x a}{n+1}\right)}{2}+\mathrm{e}^{\frac{x^{n} x a}{n+1}} \left(\left(-\frac{1}{2}n^{2}-\frac{3}{2}n-1\right) x^{-\frac{n}{2}}+a \cdots\right.\right.}{x \left(-\frac{x^{-\frac{3n}{2}}\, \mathrm{e}^{\frac{x^{n} x a}{n+1}} (2+n)^{2}\, \mathrm{WhittakerM}\left(\frac{2+n}{2+2n},\frac{3+2n}{2+2n},-\frac{2x^{n} x a}{n+1}\right)}{2}+\mathrm{e} \cdots\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - ay^2 = b\,x^{2n} + c\,x^{n-1}}$$

2.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,y^2 + b\,x^{2n} + c\,x^{n-1} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,y^2 + b\,x^{2n} + \frac{c\,x^n}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\,x^{2n} + c\,x^{n-1}$, $f_1(x) = 0$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= a^2 \left(b\, x^{2n} + c\, x^{n-1}\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$a u''(x) + a^2 \left(b\, x^{2n} + c\, x^{n-1}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{-\frac{n}{2}} \left(c_1 \,\text{WhittakerM}\left(-\frac{i\sqrt{a}\, c}{\sqrt{b}\,(2+2n)}, \frac{1}{2+2n}, \frac{2i\sqrt{a}\,\sqrt{b}\, x^n x}{n+1}\right) + c_2 \,\text{WhittakerW}\left(-\frac{i\sqrt{a}\, c}{\sqrt{b}\,(2+2n)}, \frac{1}{2+2n}, \frac{2i\sqrt{a}\,\sqrt{b}\, x^n x}{n+1}\right)\right)$$

The above shows that

$$u'(x) = \frac{\left(-\left(i\sqrt{a}\,\sqrt{b}\, c - b(2+n)\right) c_1 \,\text{WhittakerM}\left(-\frac{(-2n-2)\sqrt{b}+i\sqrt{a}\, c}{\sqrt{b}\,(2+2n)}, \frac{1}{2+2n}, \frac{2i\sqrt{a}\,\sqrt{b}\, x^n x}{n+1}\right) - 2c_2 b(n+1)\,\text{Whittaker}\right.}{}$$

Using the above in (1) gives the solution

$$y = -\frac{-\left(i\sqrt{a}\,\sqrt{b}\, c - b(2+n)\right) c_1 \,\text{WhittakerM}\left(-\frac{(-2n-2)\sqrt{b}+i\sqrt{a}\, c}{\sqrt{b}\,(2+2n)}, \frac{1}{2+2n}, \frac{2i\sqrt{a}\,\sqrt{b}\, x^n x}{n+1}\right) - 2c_2 b(n+1)\,\text{Whittake}}{2bxa\left(c_1 \,\text{Whitt}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(i\sqrt{a}\,\sqrt{b}\, c - b(2+n)\right) c_3 \,\text{WhittakerM}\left(-\frac{(-2n-2)\sqrt{b}+i\sqrt{a}\, c}{\sqrt{b}\,(2+2n)}, \frac{1}{2+2n}, \frac{2i\sqrt{a}\,\sqrt{b}\, x^n x}{n+1}\right) + 2b(n+1)\,\text{WhittakerW}\left(-\right.}{2bxa\left(c_3 \,\text{WhittakerI}\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(i\sqrt{a}\,\sqrt{b}\,c - b(2+n)\right) c_3 \,\mathrm{WhittakerM}\left(-\frac{(-2n-2)\sqrt{b}+i\sqrt{a}\,c}{\sqrt{b}\,(2+2n)}, \frac{1}{2+2n}, \frac{2i\sqrt{a}\,\sqrt{b}\,x^n x}{n+1}\right) + 2b(n+1)\,\mathrm{WhittakerW}\left(-\cdots\right.}{2bxa\left(c_3 \,\mathrm{WhittakerM}\cdots\right.} \tag{1}$$

Verification of solutions

$$y = \frac{\left(i\sqrt{a}\,\sqrt{b}\,c - b(2+n)\right) c_3 \,\mathrm{WhittakerM}\left(-\frac{(-2n-2)\sqrt{b}+i\sqrt{a}\,c}{\sqrt{b}\,(2+2n)}, \frac{1}{2+2n}, \frac{2i\sqrt{a}\,\sqrt{b}\,x^n x}{n+1}\right) + 2b(n+1)\,\mathrm{WhittakerW}\left(-\cdots\right.}{2bxa\left(c_3 \,\mathrm{WhittakerM}\cdots\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati", "first_order_ode_lie_symmetry_calculated"**

Maple gives the following as the ode type

```
[[_homogeneous, `class G`], _Riccati]
```

$$\boxed{y' - a\,x^n y^2 = b\,x^{-n-2}}$$

2.7.1 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$\begin{aligned} y' &= a\,x^n y^2 + b\,x^{-n-2} \\ y' &= \omega(x,y) \end{aligned}$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x + \omega(\eta_y - \xi_x) - \omega^2 \xi_y - \omega_x \xi - \omega_y \eta = 0 \tag{A}$$

The type of this ode is not in the lookup table. To determine ξ, η then (A) is solved using ansatz. Making bivariate polynomials of degree 1 to use as anstaz gives

$$\xi = xa_2 + ya_3 + a_1 \tag{1E}$$

$$\eta = xb_2 + yb_3 + b_1 \tag{2E}$$

Where the unknown coefficients are

$$\{a_1, a_2, a_3, b_1, b_2, b_3\}$$

Substituting equations (1E,2E) and ω into (A) gives

$$b_2 + \left(a\,x^n y^2 + b\,x^{-n-2}\right)(b_3 - a_2) - \left(a\,x^n y^2 + b\,x^{-n-2}\right)^2 a_3 - \left(\frac{a\,x^n n\,y^2}{x} + \frac{b\,x^{-n-2}(-n-2)}{x}\right)(xa_2 + ya_3 + a_1) - 2a\,x^n y(xb_2 + yb_3 + b_1) = 0 \tag{5E}$$

Putting the above in normal form gives

$$-\frac{x^{2n}a^2x\,y^4a_3 + 2x^nx^{-n-2}abx\,y^2a_3 + x^nanx\,y^2a_2 + x^nan\,y^3a_3 + x^nan\,y^2a_1 + 2x^na\,x^2yb_2 + x^nax\,y^2a_2 + x^n}{}$$
$$= 0$$

Setting the numerator to zero gives

$$\begin{aligned}&-x^{2n}a^2x\,y^4a_3 - 2x^nx^{-n-2}abx\,y^2a_3 - x^nanx\,y^2a_2 - x^nan\,y^3a_3\\ &- x^nan\,y^2a_1 - 2x^na\,x^2yb_2 - x^nax\,y^2a_2 - x^nax\,y^2b_3 - x^{-4-2n}b^2xa_3\\ &- 2x^naxyb_1 + x^{-n-2}bnxa_2 + x^{-n-2}bnya_3 + x^{-n-2}bna_1\\ &+ x^{-n-2}bxa_2 + x^{-n-2}bxb_3 + 2x^{-n-2}bya_3 + 2x^{-n-2}ba_1 + xb_2 = 0\end{aligned} \tag{6E}$$

Simplifying the above gives

$$-\frac{(x^{4n}a^2x^4y^4a_3 + x^{3n}an\,x^4y^2a_2 + x^{3n}an\,y^3a_3x^3 + x^{3n}an\,y^2a_1x^3 + 2x^{3n}a\,x^5yb_2 + x^{3n}a\,x^4y^2a_2 + x^{3n}a\,x^4y^2b_3}{} \tag{6E}$$
$$= 0$$

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\{x, y, x^n\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\{x = v_1, y = v_2, x^n = v_3\}$$

The above PDE (6E) now becomes

$$-\frac{v_3^4 a^2 v_1^4 v_2^4 a_3 + v_3^3 a n v_1^4 v_2^2 a_2 + v_3^3 a n v_2^3 a_3 v_1^3 + v_3^3 a n v_2^2 a_1 v_1^3 + v_3^3 a v_1^4 v_2^2 a_2 + 2 v_3^3 a v_1^5 v_2 b_2 + v_3^3 a v_1^4 v_2^2 b_3 + 2 v_3^3 a v_1^4 v}{} \tag{7E}$$

$$= 0$$

Collecting the above on the terms v_i introduced, and these are

$$\{v_1, v_2, v_3\}$$

Equation (7E) now becomes

$$\begin{aligned} &-2ab_2v_2v_3v_1^2 - a^2a_3v_3^2v_1v_2^4 + (-ana_2 - aa_2 - ab_3)\,v_1v_2^2v_3 \\ &- 2ab_1v_3v_1v_2 + b_2v_1 - ana_3v_3v_2^3 - ana_1v_3v_2^2 - \frac{2aba_3v_2^2}{v_1} \\ &+ \frac{bna_2 + ba_2 + bb_3}{v_1v_3} + \frac{(bna_3 + 2ba_3)\,v_2}{v_1^2v_3} + \frac{bna_1 + 2ba_1}{v_1^2v_3} - \frac{b^2a_3}{v_3^2v_1^3} = 0 \end{aligned} \tag{8E}$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$\begin{aligned} b_2 &= 0 \\ -2ab_1 &= 0 \\ -2ab_2 &= 0 \\ -a^2a_3 &= 0 \\ -b^2a_3 &= 0 \\ -2aba_3 &= 0 \\ -ana_1 &= 0 \\ -ana_3 &= 0 \\ bna_1 + 2ba_1 &= 0 \\ bna_3 + 2ba_3 &= 0 \\ -ana_2 - aa_2 - ab_3 &= 0 \\ bna_2 + ba_2 + bb_3 &= 0 \end{aligned}$$

Solving the above equations for the unknowns gives

$$
\begin{aligned}
a_1 &= 0\\
a_2 &= a_2\\
a_3 &= 0\\
b_1 &= 0\\
b_2 &= 0\\
b_3 &= -(n+1)\, a_2
\end{aligned}
$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$
\begin{aligned}
\xi &= x\\
\eta &= -y(n+1)
\end{aligned}
$$

Shifting is now applied to make $\xi = 0$ in order to simplify the rest of the computation

$$
\begin{aligned}
\eta &= \eta - \omega(x,y)\,\xi\\
&= -y(n+1) - \left(a\,x^n y^2 + b\,x^{-n-2}\right)(x)\\
&= -x^n a x\, y^2 - \frac{b\,x^{-n}}{x} - ny - y\\
\xi &= 0
\end{aligned}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x,y) \to (R,S)$ where (R,S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$
\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}
$$

The above comes from the requirements that $\left(\xi\frac{\partial}{\partial x} + \eta\frac{\partial}{\partial y}\right) S(x,y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$
R = x
$$

S is found from

$$
\begin{aligned}
S &= \int \frac{1}{\eta} dy\\
&= \int \frac{1}{-x^n a x\, y^2 - \frac{b\,x^{-n}}{x} - ny - y} dy
\end{aligned}
$$

Which results in

$$S = -\frac{2x^{n} x \arctan\left(\frac{2a\,x^{2+2n} y + x^{n+1} n + x^{n+1}}{\sqrt{-x^{2+2n} n^{2} + 4a\,x^{2+2n} b - 2x^{2+2n} n - x^{2+2n}}}\right)}{\sqrt{-x^{2+2n} n^{2} + 4a\,x^{2+2n} b - 2x^{2+2n} n - x^{2+2n}}}$$

Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$\frac{dS}{dR} = \frac{S_x + \omega(x,y) S_y}{R_x + \omega(x,y) R_y} \tag{2}$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x,y)$ is the right hand side of the original ode given by

$$\omega(x,y) = a\,x^{n} y^{2} + b\,x^{-n-2}$$

Evaluating all the partial derivatives gives

$$\begin{aligned}
R_x &= 1 \\
R_y &= 0 \\
S_x &= -\frac{y\,x^{n}(n+1)}{a\,x^{2+2n} y^{2} + y\,(n+1)\,x^{n+1} + b} \\
S_y &= -\frac{x^{n+1}}{a\,x^{2+2n} y^{2} + y\,(n+1)\,x^{n+1} + b}
\end{aligned}$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$\frac{dS}{dR} = -\frac{1}{x} \tag{2A}$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$\frac{dS}{dR} = -\frac{1}{R}$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = -\ln(R) + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$-\frac{2\arctan\left(\frac{2a\,x^{n+1} y + n + 1}{\sqrt{4ab - n^{2} - 2n - 1}}\right)}{\sqrt{4ab - n^{2} - 2n - 1}} = -\ln(x) + c_1$$

Which simplifies to

$$-\frac{2\arctan\left(\frac{2a\,x^{n+1}y+n+1}{\sqrt{4ab-n^2-2n-1}}\right)}{\sqrt{4ab-n^2-2n-1}} = -\ln(x)+c_1$$

Which gives

$$y = -\frac{\left(\tan\left(-\frac{\ln(x)\sqrt{4ab-n^2-2n-1}}{2}+\frac{c_1\sqrt{4ab-n^2-2n-1}}{2}\right)\sqrt{4ab-n^2-2n-1}+n+1\right)x^{-n-1}}{2a}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\tan\left(-\frac{\ln(x)\sqrt{4ab-n^2-2n-1}}{2}+\frac{c_1\sqrt{4ab-n^2-2n-1}}{2}\right)\sqrt{4ab-n^2-2n-1}+n+1\right)x^{-n-1}}{2a} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\tan\left(-\frac{\ln(x)\sqrt{4ab-n^2-2n-1}}{2}+\frac{c_1\sqrt{4ab-n^2-2n-1}}{2}\right)\sqrt{4ab-n^2-2n-1}+n+1\right)x^{-n-1}}{2a}$$

Verified OK.

2.7.2 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,x^n y^2 + b\,x^{-n-2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,x^n y^2 + \frac{b\,x^{-n}}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\,x^{-n-2}$, $f_1(x) = 0$ and $f_2(x) = x^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{x^n a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{an\, x^n}{x} \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= x^{2n} a^2 b\, x^{-n-2} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^n a u''(x) - \frac{an\, x^n u'(x)}{x} + x^{2n} a^2 b\, x^{-n-2} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{\frac{n}{2}} \sqrt{x} \left(x^{\frac{\sqrt{-4ab+n^2+2n+1}}{2}} c_1 + x^{-\frac{\sqrt{-4ab+n^2+2n+1}}{2}} c_2 \right)$$

The above shows that

$$u'(x) = \frac{\Big(c_2 \big(n+1-\sqrt{-4ab+n^2+2n+1}\big)\, x^{-\frac{\sqrt{-4ab+n^2+2n+1}}{2}} + x^{\frac{\sqrt{-4ab+n^2+2n+1}}{2}} c_1 \big(n+1+\sqrt{-4ab+n^2+2n+1}\big)}{2\sqrt{x}}$$

Using the above in (1) gives the solution

$$y = -\frac{\Big(c_2 \big(n+1-\sqrt{-4ab+n^2+2n+1}\big)\, x^{-\frac{\sqrt{-4ab+n^2+2n+1}}{2}} + x^{\frac{\sqrt{-4ab+n^2+2n+1}}{2}} c_1 \big(n+1+\sqrt{-4ab+n^2+2n+}}{2xa \left(x^{\frac{\sqrt{-4ab+n^2+2n+1}}{2}} c_1 + x^{-\frac{\sqrt{-4ab+n^2+2n+1}}{2}} c_2 \right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\Big(\big(-n-1+\sqrt{-4ab+n^2+2n+1}\big)\, x^{-\frac{\sqrt{-4ab+n^2+2n+1}}{2}} - x^{\frac{\sqrt{-4ab+n^2+2n+1}}{2}} c_3 \big(n+1+\sqrt{-4ab+n^2+2n+1}\big)}{2xa \left(x^{\frac{\sqrt{-4ab+n^2+2n+1}}{2}} c_3 + x^{-\frac{\sqrt{-4ab+n^2+2n+1}}{2}} \right)}$$

Summary

The solution(s) found are the following

$$
y = \frac{\left(\left(-n-1+\sqrt{-4ab+n^2+2n+1}\right)x^{-\frac{\sqrt{-4ab+n^2+2n+1}}{2}} - x^{\frac{\sqrt{-4ab+n^2+2n+1}}{2}} c_3 \left(n+1+\sqrt{-4ab+n^2+2n+1}\right)}{2xa\left(x^{\frac{\sqrt{-4ab+n^2+2n+1}}{2}} c_3 + x^{-\frac{\sqrt{-4ab+n^2+2n+1}}{2}}\right)} \tag{1}
$$

Verification of solutions

$$
y = \frac{\left(\left(-n-1+\sqrt{-4ab+n^2+2n+1}\right)x^{-\frac{\sqrt{-4ab+n^2+2n+1}}{2}} - x^{\frac{\sqrt{-4ab+n^2+2n+1}}{2}} c_3 \left(n+1+\sqrt{-4ab+n^2+2n+1}\right)}{2xa\left(x^{\frac{\sqrt{-4ab+n^2+2n+1}}{2}} c_3 + x^{-\frac{\sqrt{-4ab+n^2+2n+1}}{2}}\right)}
$$

Verified OK.

Problem number: 8.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - a\,x^n y^2 = b\,x^m}$$

2.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,x^n y^2 + b\,x^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,x^n y^2 + b\,x^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\,x^m$, $f_1(x) = 0$ and $f_2(x) = x^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{x^n a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{an\,x^n}{x} \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= b\,x^m a^2 x^{2n} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^n a u''(x) - \frac{an\,x^n u'(x)}{x} + b\,x^m a^2 x^{2n} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\mathrm{BesselY}\left(\frac{-n-1}{m+n+2}, \frac{2\sqrt{ab}\,x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_2 + \mathrm{BesselJ}\left(\frac{-n-1}{m+n+2}, \frac{2\sqrt{ab}\,x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_1\right) x^{\frac{n}{2}+\frac{1}{2}}$$

The above shows that

$$u'(x) = x^{\frac{1}{2}+n+\frac{m}{2}}\sqrt{ab}\left(-\mathrm{BesselY}\left(\frac{m+1}{m+n+2}, \frac{2\sqrt{ab}\,x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_2 - \mathrm{BesselJ}\left(\frac{m+1}{m+n+2}, \frac{2\sqrt{ab}\,x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_1\right)$$

Using the above in (1) gives the solution

$$y = -\frac{x^{\frac{1}{2}+n+\frac{m}{2}}\sqrt{ab}\left(-\mathrm{BesselY}\left(\frac{m+1}{m+n+2}, \frac{2\sqrt{ab}\,x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_2 - \mathrm{BesselJ}\left(\frac{m+1}{m+n+2}, \frac{2\sqrt{ab}\,x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_1\right) x^{-n} x^{-\frac{n}{2}-\frac{1}{2}}}{a\left(\mathrm{BesselY}\left(\frac{-n-1}{m+n+2}, \frac{2\sqrt{ab}\,x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_2 + \mathrm{BesselJ}\left(\frac{-n-1}{m+n+2}, \frac{2\sqrt{ab}\,x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_1\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{x^{\frac{m}{2}-\frac{n}{2}}\sqrt{ab}\left(\mathrm{BesselJ}\left(\frac{m+1}{m+n+2}, \frac{2\sqrt{ab}\, x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_3 + \mathrm{BesselY}\left(\frac{m+1}{m+n+2}, \frac{2\sqrt{ab}\, x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right)\right)}{a\left(\mathrm{BesselY}\left(\frac{-n-1}{m+n+2}, \frac{2\sqrt{ab}\, x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) + \mathrm{BesselJ}\left(\frac{-n-1}{m+n+2}, \frac{2\sqrt{ab}\, x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_3\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{x^{\frac{m}{2}-\frac{n}{2}}\sqrt{ab}\left(\mathrm{BesselJ}\left(\frac{m+1}{m+n+2}, \frac{2\sqrt{ab}\, x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_3 + \mathrm{BesselY}\left(\frac{m+1}{m+n+2}, \frac{2\sqrt{ab}\, x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right)\right)}{a\left(\mathrm{BesselY}\left(\frac{-n-1}{m+n+2}, \frac{2\sqrt{ab}\, x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) + \mathrm{BesselJ}\left(\frac{-n-1}{m+n+2}, \frac{2\sqrt{ab}\, x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{x^{\frac{m}{2}-\frac{n}{2}}\sqrt{ab}\left(\mathrm{BesselJ}\left(\frac{m+1}{m+n+2}, \frac{2\sqrt{ab}\, x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_3 + \mathrm{BesselY}\left(\frac{m+1}{m+n+2}, \frac{2\sqrt{ab}\, x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right)\right)}{a\left(\mathrm{BesselY}\left(\frac{-n-1}{m+n+2}, \frac{2\sqrt{ab}\, x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) + \mathrm{BesselJ}\left(\frac{-n-1}{m+n+2}, \frac{2\sqrt{ab}\, x^{\frac{m}{2}+\frac{n}{2}+1}}{m+n+2}\right) c_3\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 = k(xa+b)^n (cx+d)^{-n-4}}$$

2.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + k(xa+b)^n (cx+d)^{-n-4} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \frac{k(xa+b)^n (cx+d)^{-n}}{(cx+d)^4}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = k(xa+b)^n (cx+d)^{-n-4}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= k(xa+b)^n\,(cx+d)^{-n-4} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + k(xa+b)^n\,(cx+d)^{-n-4}\,u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) + k(xa+b)^n\,(cx+d)^{-n-4}\,\_Y(x)\right\}, \left\{\_Y(x)\right\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + k(xa+b)^n\,(cx+d)^{-n-4}\,\_Y(x)\right\}, \left\{\_Y(x)\right\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + k(xa+b)^n\,(cx+d)^{-n-4}\,\_Y(x)\right\}, \left\{\_Y(x)\right\}\right)}{\mathrm{DESol}\left(\left\{\_Y''(x) + k(xa+b)^n\,(cx+d)^{-n-4}\,\_Y(x)\right\}, \left\{\_Y(x)\right\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + k(xa+b)^n\,(cx+d)^{-n-4}\,\_Y(x)\right\}, \left\{\_Y(x)\right\}\right)}{\mathrm{DESol}\left(\left\{\_Y''(x) + k(xa+b)^n\,(cx+d)^{-n-4}\,\_Y(x)\right\}, \left\{\_Y(x)\right\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + k(xa+b)^n\,(cx+d)^{-n-4}\,\_Y(x)\right\}, \left\{\_Y(x)\right\}\right)}{\mathrm{DESol}\left(\left\{\_Y''(x) + k(xa+b)^n\,(cx+d)^{-n-4}\,\_Y(x)\right\}, \left\{\_Y(x)\right\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\_Y''(x) + k(xa+b)^n\,(cx+d)^{-n-4}\,\_Y(x)\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\_Y''(x) + k\,(xa+b)^n\,(cx+d)^{-n-4}\,\_Y(x)\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 10.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,x^n y^2 = bm\,x^{m-1} - a\,b^2 x^{n+2m}}$$

2.10.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,x^n y^2 + bm\,x^{m-1} - a\,b^2 x^{n+2m} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,x^n y^2 + \frac{b\,x^m m}{x} - a\,b^2 x^n x^{2m}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = bm\,x^{m-1} - a\,b^2 x^{n+2m}$, $f_1(x) = 0$ and $f_2(x) = x^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{x^n a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{an\,x^n}{x} \\
f_1 f_2 &= 0 \\
f_2^2 f_0 &= x^{2n} a^2 \left(bm\,x^{m-1} - a\,b^2 x^{n+2m}\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^n a u''(x) - \frac{an\,x^n u'(x)}{x} + x^{2n} a^2 \left(bm\,x^{m-1} - a\,b^2 x^{n+2m}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) = &-\frac{x^{-\frac{3m}{2}-1-n} c_2 (m+2n+2)^2 \operatorname{WhittakerM}\left(\frac{m+2n+2}{2+2m+2n}, \frac{2m+3n+3}{2+2m+2n}, -\frac{2ab\,x^{1+m+n}}{1+m+n}\right)}{2} \\
&+ (1+m+n)\,c_2 \left(\left(-\frac{m}{2} - n - 1\right) x^{-\frac{3m}{2}-1-n} \right. \\
&\quad \left. + x^{-\frac{m}{2}} ab\right) \operatorname{WhittakerM}\left(-\frac{m}{2+2m+2n}, \frac{2m+3n+3}{2+2m+2n}, -\frac{2ab\,x^{1+m+n}}{1+m+n}\right) \\
&+ c_1 e^{-\frac{ab\,x^{1+m+n}}{1+m+n}}
\end{aligned}$$

The above shows that

$$u'(x) = -x^{-m-2-n}\left(-\frac{3(m+2n+2)\left(ab\left(m+\frac{4n}{3}+\frac{4}{3}\right)x^{n+1+\frac{m}{2}}+\frac{x^{-\frac{m}{2}}(m+2n+2)(1+m+n)}{3}\right)c_2 \operatorname{WhittakerM}\left(\frac{m+2n}{2+2m+}\right.}{2}\right.$$

$$+(1+m+n)\left(a^2x^{\frac{3m}{2}+2n+2}b^2\right.$$

$$\left.-\frac{\left(ab\,x^{n+1+\frac{m}{2}}+x^{-\frac{m}{2}}(1+m+n)\right)(m+2n+2)}{2}\right)c_2 \operatorname{WhittakerM}\left(-\frac{m}{2+2m+2n}, \frac{2m+3n+3}{2+2m+2n},\right.$$

$$\left.-\frac{2ab\,x^{1+m+n}}{1+m+n}\right)$$

$$+\left(m+\frac{3n}{2}+\frac{3}{2}\right)(m+2n+2)^2 x^{-\frac{m}{2}} c_2 e^{\frac{ab\,x^{1+m+n}}{1+m+n}}\left(-\frac{2ab\,x^{1+m+n}}{1+m+n}\right)^{\frac{3m+4n+4}{2+2m+2n}}$$

$$\left.+abc_1x^{2+2m+2n}e^{-\frac{ab\,x^{1+m+n}}{1+m+n}}\right)$$

Using the above in (1) gives the solution

$$y = \frac{x^{-m-2-n}\left(-\frac{3(m+2n+2)\left(ab\left(m+\frac{4n}{3}+\frac{4}{3}\right)x^{n+1+\frac{m}{2}}+\frac{x^{-\frac{m}{2}}(m+2n+2)(1+m+n)}{3}\right)c_2 \operatorname{WhittakerM}\left(\frac{m+2n+2}{2+2m+2n}, \frac{2m+3n+3}{2+2m+2n}, -\frac{2ab\,x^{1+m+n}}{1+m+n}\right)}{2}+\right.}{a\left(-\frac{x^{-\frac{3m}{2}-1-n}c_2(m+2n+2)^2 \operatorname{WhittakerM}}{2}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{x^{-1-m-n}\left(-\frac{3\,e^{\frac{ab\,x^{1+m+n}}{1+m+n}}(m+2n+2)\left(ab\left(m+\frac{4n}{3}+\frac{4}{3}\right)x^{n+1+\frac{m}{2}}+\frac{x^{-\frac{m}{2}}(m+2n+2)(1+m+n)}{3}\right)\operatorname{WhittakerM}\left(\frac{m+2n+2}{2+2m+2n}, \frac{2m+3n+3}{2+2m+2n}, -\frac{2ab\,x^{1+}}{1+m}\right.}{2}\right.}{\left(-\frac{x^{-\frac{3m}{2}}e^{\frac{ab\,x^{1+m+n}}{1+m+n}}(m+2n+2)^2 \operatorname{Whittak}}{}\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{x^{-1-m-n}\left(-\frac{3\,\mathrm{e}^{\frac{ab\,x^{1+m+n}}{1+m+n}}(m+2n+2)\left(ab\left(m+\frac{4n}{3}+\frac{4}{3}\right)x^{n+1+\frac{m}{2}}+\frac{x^{-\frac{m}{2}}(m+2n+2)(1+m+n)}{3}\right)\mathrm{WhittakerM}\left(\frac{m+2n+2}{2+2m+2n},\frac{2m+3n+3}{2+2m+2n},-\frac{2ab\,x^{1+\cdots}}{1+m\cdots}\right.\cdots}{2}\cdots\right.}{\left(-\frac{x^{-\frac{3m}{2}}\mathrm{e}^{\frac{ab\,x^{1+m+n}}{1+m+n}}(m+2n+2)^2\,\mathrm{Whittak}\cdots}{\cdots}\right.\cdots} \tag{1}$$

Verification of solutions

$$y = \frac{x^{-1-m-n}\left(-\frac{3\,\mathrm{e}^{\frac{ab\,x^{1+m+n}}{1+m+n}}(m+2n+2)\left(ab\left(m+\frac{4n}{3}+\frac{4}{3}\right)x^{n+1+\frac{m}{2}}+\frac{x^{-\frac{m}{2}}(m+2n+2)(1+m+n)}{3}\right)\mathrm{WhittakerM}\left(\frac{m+2n+2}{2+2m+2n},\frac{2m+3n+3}{2+2m+2n},-\frac{2ab\,x^{1+\cdots}}{1+m\cdots}\right.\cdots}{2}\cdots\right.}{\left(-\frac{x^{-\frac{3m}{2}}\mathrm{e}^{\frac{ab\,x^{1+m+n}}{1+m+n}}(m+2n+2)^2\,\mathrm{Whittak}\cdots}{\cdots}\right.\cdots}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \left(a\,x^{2n} + b\,x^{n-1}\right) y^2 = c}$$

2.11.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= x^{2n} a\,y^2 + x^{n-1} b\,y^2 + c \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^{2n} a\,y^2 + \frac{x^n b\,y^2}{x} + c$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = c$, $f_1(x) = 0$ and $f_2(x) = a\,x^{2n} + b\,x^{n-1}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\left(a\,x^{2n} + b\,x^{n-1}\right) u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{2a\,x^{2n} n}{x} + \frac{b\,x^{n-1}(n-1)}{x} \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \left(a\,x^{2n} + b\,x^{n-1}\right)^2 c \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\left(a\,x^{2n} + b\,x^{n-1}\right) u''(x) - \left(\frac{2a\,x^{2n} n}{x} + \frac{b\,x^{n-1}(n-1)}{x}\right) u'(x) + \left(a\,x^{2n} + b\,x^{n-1}\right)^2 c u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{-\mathrm{e}^{-\frac{i\sqrt{c}\,\sqrt{a}\,x^{n+1}}{n+1}} (2+n)\, c_1 \left(\left(2ia^{\frac{3}{2}}bn - 2a\sqrt{c}\,b^2\right) x^{1+2n} + \left(-a^2\sqrt{c}\,b + ia^{\frac{5}{2}}n\right) x^{2+3n} + x^n \left(-\sqrt{c}\,b + i\sqrt{a}\,n\right) b^2 \cdots}{\cdots}$$

The above shows that

$$u'(x) = \frac{\mathrm{e}^{\frac{i\left(-4\sqrt{c}\,\sqrt{a}\,x^{n+1} + \pi(2+n)\right)}{4n+4}} c c_2 (x^{5+5n} a^4 + 4a^3 b\, x^{4n+4} + 6a^2 x^{3n+3} b^2 + 4x^{2+2n} a\, b^3 + x^{n+1} b^4) \operatorname{hypergeom}\left(\left[\frac{(2+n)\sqrt{a}\cdots}{\sqrt{a}\,(2\cdots}\right.\right.\cdots}{\cdots}$$

Using the above in (1) gives the solution

$$y = -\frac{\cdots}{x\left(a\,x^{n+1} + b\right)\left(a\,x^{2n} + b\,x^{n-1}\right)\left(-\mathrm{e}^{-\frac{i\sqrt{c}\,\sqrt{a}\,x^{n+1}}{n+1}} (2+n)\, c_1 \left(\left(2ia^{\frac{3}{2}}bn - 2a\sqrt{c}\,b^2\right) x^{1+2n} + \left(-a^2\sqrt{c}\,b + i\cdots\right.\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$
y
$$

$$
= \frac{}{\left(\left(2\left(i a^{\frac{3}{2}} b n - a\sqrt{c}\, b^{2}\right) x^{1+2n} + \left(-a^{2}\sqrt{c}\, b + i a^{\frac{5}{2}} n\right) x^{2+3n} + x^{n}\left(-\sqrt{c}\, b + i\sqrt{a}\, n\right) b^{2}\right)(2+n)\, \mathrm{e}^{-\frac{i\sqrt{c}\,\sqrt{a}\, x^{n+1}}{n+1}}}
$$

Summary

The solution(s) found are the following

$$
y \tag{1}
$$

$$
= \frac{}{\left(\left(2\left(i a^{\frac{3}{2}} b n - a\sqrt{c}\, b^{2}\right) x^{1+2n} + \left(-a^{2}\sqrt{c}\, b + i a^{\frac{5}{2}} n\right) x^{2+3n} + x^{n}\left(-\sqrt{c}\, b + i\sqrt{a}\, n\right) b^{2}\right)(2+n)\, \mathrm{e}^{-\frac{i\sqrt{c}\,\sqrt{a}\, x^{n+1}}{n+1}}}
$$

Verification of solutions

$$
y
$$

$$
= \frac{}{\left(\left(2\left(i a^{\frac{3}{2}} b n - a\sqrt{c}\, b^{2}\right) x^{1+2n} + \left(-a^{2}\sqrt{c}\, b + i a^{\frac{5}{2}} n\right) x^{2+3n} + x^{n}\left(-\sqrt{c}\, b + i\sqrt{a}\, n\right) b^{2}\right)(2+n)\, \mathrm{e}^{-\frac{i\sqrt{c}\,\sqrt{a}\, x^{n+1}}{n+1}}}
$$

Verified OK.

2.12 problem 12

Internal problem ID [10342]
Internal file name [`OUTPUT/9289_Monday_June_06_2022_01_49_06_PM_3413175/index.tex`]

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 12.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{(a_2x + b_2)\left(y' + \lambda y^2\right) = -a_0x - b_0}$$

2.12.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{y^2a_2\lambda x + y^2b_2\lambda + a_0x + b_0}{a_2x + b_2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{y^2a_2\lambda x}{a_2x + b_2} - \frac{y^2b_2\lambda}{a_2x + b_2} - \frac{a_0x}{a_2x + b_2} - \frac{b_0}{a_2x + b_2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{a_0x+b_0}{a_2x+b_2}$, $f_1(x) = 0$ and $f_2(x) = -\frac{\lambda a_2x+\lambda b_2}{a_2x+b_2}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{-\frac{(\lambda a_2x+\lambda b_2)u}{a_2x+b_2}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{\lambda a_2}{a_2x + b_2} + \frac{(\lambda a_2x + \lambda b_2)\,a_2}{(a_2x + b_2)^2}\\
f_1f_2 &= 0\\
f_2^2f_0 &= -\frac{(\lambda a_2x + \lambda b_2)^2\,(a_0x + b_0)}{(a_2x + b_2)^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$-\frac{(\lambda a_2x + \lambda b_2)\,u''(x)}{a_2x + b_2} - \left(-\frac{\lambda a_2}{a_2x + b_2} + \frac{(\lambda a_2x + \lambda b_2)\,a_2}{(a_2x + b_2)^2}\right)u'(x) - \frac{(\lambda a_2x + \lambda b_2)^2\,(a_0x + b_0)\,u(x)}{(a_2x + b_2)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) = c_1 \operatorname{WhittakerM}&\left(\frac{i\sqrt{\lambda}\,(a_0b_2 - a_2b_0)}{2a_2^{\frac{3}{2}}\sqrt{a_0}}, \frac{1}{2}, \frac{2i\sqrt{a_0}\,\sqrt{\lambda}\,(a_2x + b_2)}{a_2^{\frac{3}{2}}}\right)\\
&+ c_2 \operatorname{WhittakerW}\left(\frac{i\sqrt{\lambda}\,(a_0b_2 - a_2b_0)}{2a_2^{\frac{3}{2}}\sqrt{a_0}}, \frac{1}{2}, \frac{2i\sqrt{a_0}\,\sqrt{\lambda}\,(a_2x + b_2)}{a_2^{\frac{3}{2}}}\right)
\end{aligned}$$

The above shows that

$$u'(x) = \frac{\frac{\left(2a_2^{\frac{3}{2}}a_0^{\frac{3}{2}} + i(a_0b_2 - a_2b_0)a_0\sqrt{\lambda}\right)c_1 \operatorname{WhittakerM}\left(\frac{i\sqrt{\lambda}\,(a_0b_2 - a_2b_0)}{2a_2^{\frac{3}{2}}\sqrt{a_0}} + 1, \frac{1}{2}, \frac{2i\sqrt{a_0}\,\sqrt{\lambda}\,(a_2x+b_2)}{a_2^{\frac{3}{2}}}\right)}{2} - a_2^{\frac{3}{2}}a_0^{\frac{3}{2}} \operatorname{WhittakerW}\left(\frac{i\sqrt{\lambda}\,(a_0b_2 - a_2b_0)}{2a_2^{\frac{3}{2}}\sqrt{a_0}}\right.}{}$$

Using the above in (1) gives the solution

$$y = \frac{\frac{\left(2a_2^{\frac{3}{2}}a_0^{\frac{3}{2}} + i(a_0b_2 - a_2b_0)a_0\sqrt{\lambda}\right)c_1 \operatorname{WhittakerM}\left(\frac{i\sqrt{\lambda}\,(a_0b_2 - a_2b_0)}{2a_2^{\frac{3}{2}}\sqrt{a_0}} + 1, \frac{1}{2}, \frac{2i\sqrt{a_0}\,\sqrt{\lambda}\,(a_2x+b_2)}{a_2^{\frac{3}{2}}}\right)}{2} - a_2^{\frac{3}{2}}a_0^{\frac{3}{2}} \operatorname{WhittakerW}\left(\frac{i\sqrt{\lambda}\,(a_0b_2 - a_2b_0)}{2a_2^{\frac{3}{2}}\sqrt{a_0}}\right.}{\sqrt{a_2}\,a_0^{\frac{3}{2}}\,(\lambda a_2x + \lambda b_2)\left(c_1 \operatorname{Whitta}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$
y = \frac{\frac{c_3\left(2a_2^{\frac{3}{2}}\sqrt{a_0}+i\sqrt{\lambda}\,(a_0b_2-a_2b_0)\right)\operatorname{WhittakerM}\left(\frac{2a_2^{\frac{3}{2}}\sqrt{a_0}+i\sqrt{\lambda}\,(a_0b_2-a_2b_0)}{2a_2^{\frac{3}{2}}\sqrt{a_0}},\frac{1}{2},\frac{2i\sqrt{a_0}\,\sqrt{\lambda}\,(a_2x+b_2)}{a_2^{\frac{3}{2}}}\right)}{2} - a_2^{\frac{3}{2}}\operatorname{WhittakerW}\left(\frac{2a_2^{\frac{3}{2}}\sqrt{a_0}+i\sqrt{\lambda}\cdots}{2a_2^{\frac{3}{2}}\cdots}\right.\cdots}{\sqrt{a_0}\,\sqrt{a_2}\,\lambda\,(a_2x+b_2)\left(c_3\operatorname{Whi}\cdots\right.}
$$

Summary

The solution(s) found are the following

$$
y = \frac{\frac{c_3\left(2a_2^{\frac{3}{2}}\sqrt{a_0}+i\sqrt{\lambda}\,(a_0b_2-a_2b_0)\right)\operatorname{WhittakerM}\left(\frac{2a_2^{\frac{3}{2}}\sqrt{a_0}+i\sqrt{\lambda}\,(a_0b_2-a_2b_0)}{2a_2^{\frac{3}{2}}\sqrt{a_0}},\frac{1}{2},\frac{2i\sqrt{a_0}\,\sqrt{\lambda}\,(a_2x+b_2)}{a_2^{\frac{3}{2}}}\right)}{2} - a_2^{\frac{3}{2}}\operatorname{WhittakerW}\left(\frac{2a_2^{\frac{3}{2}}\sqrt{a_0}+i\sqrt{\lambda}\cdots}{2a_2^{\frac{3}{2}}\cdots}\right.\cdots}{\sqrt{a_0}\,\sqrt{a_2}\,\lambda\,(a_2x+b_2)\left(c_3\operatorname{Whi}\cdots\right.} \tag{1}
$$

Verification of solutions

$$
y = \frac{\frac{c_3\left(2a_2^{\frac{3}{2}}\sqrt{a_0}+i\sqrt{\lambda}\,(a_0b_2-a_2b_0)\right)\operatorname{WhittakerM}\left(\frac{2a_2^{\frac{3}{2}}\sqrt{a_0}+i\sqrt{\lambda}\,(a_0b_2-a_2b_0)}{2a_2^{\frac{3}{2}}\sqrt{a_0}},\frac{1}{2},\frac{2i\sqrt{a_0}\,\sqrt{\lambda}\,(a_2x+b_2)}{a_2^{\frac{3}{2}}}\right)}{2} - a_2^{\frac{3}{2}}\operatorname{WhittakerW}\left(\frac{2a_2^{\frac{3}{2}}\sqrt{a_0}+i\sqrt{\lambda}\cdots}{2a_2^{\frac{3}{2}}\cdots}\right.\cdots}{\sqrt{a_0}\,\sqrt{a_2}\,\lambda\,(a_2x+b_2)\left(c_3\operatorname{Whi}\cdots\right.}
$$

The type(s) of ODE detected by this program : **"riccati", "exactWithIntegrationFactor", "first_order_ode_lie_symmetry_calculated"**

Maple gives the following as the ode type

```
[[_homogeneous, `class G`], _rational, [_Riccati, _special]]
```

$$\boxed{x^2y' - a\,x^2y^2 = b}$$

2.13.1 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$y' = \frac{a\,x^2y^2 + b}{x^2}$$
$$y' = \omega(x, y)$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x + \omega(\eta_y - \xi_x) - \omega^2\xi_y - \omega_x\xi - \omega_y\eta = 0 \tag{A}$$

The type of this ode is not in the lookup table. To determine ξ, η then (A) is solved using ansatz. Making bivariate polynomials of degree 1 to use as anstaz gives

$$\xi = xa_2 + ya_3 + a_1 \tag{1E}$$
$$\eta = xb_2 + yb_3 + b_1 \tag{2E}$$

Where the unknown coefficients are

$$\{a_1, a_2, a_3, b_1, b_2, b_3\}$$

Substituting equations (1E,2E) and ω into (A) gives

$$\begin{aligned} & b_2 + \frac{(a\,x^2y^2+b)\,(b_3-a_2)}{x^2} - \frac{(a\,x^2y^2+b)^2\,a_3}{x^4} \\ & - \left(\frac{2a\,y^2}{x} - \frac{2(a\,x^2y^2+b)}{x^3}\right)(xa_2+ya_3+a_1) - 2ya(xb_2+yb_3+b_1) = 0 \end{aligned} \tag{5E}$$

Putting the above in normal form gives

$$-\frac{a^2x^4y^4a_3 + 2a\,x^5yb_2 + a\,x^4y^2a_2 + a\,x^4y^2b_3 + 2ab\,x^2y^2a_3 + 2a\,x^4yb_1 - b_2x^4 - b\,x^2a_2 - b\,x^2b_3 - 2bxya_3 +}{x^4}$$
$$= 0$$

Setting the numerator to zero gives

$$\begin{aligned} & -a^2x^4y^4a_3 - 2a\,x^5yb_2 - a\,x^4y^2a_2 - a\,x^4y^2b_3 - 2ab\,x^2y^2a_3 \\ & - 2a\,x^4yb_1 + b_2x^4 + b\,x^2a_2 + b\,x^2b_3 + 2bxya_3 - b^2a_3 + 2bxa_1 = 0 \end{aligned} \tag{6E}$$

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\{x, y\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\{x = v_1, y = v_2\}$$

The above PDE (6E) now becomes

$$\begin{aligned} & -a^2a_3v_1^4v_2^4 - aa_2v_1^4v_2^2 - 2ab_2v_1^5v_2 - ab_3v_1^4v_2^2 - 2aba_3v_1^2v_2^2 - 2ab_1v_1^4v_2 \\ & + b_2v_1^4 + ba_2v_1^2 + 2ba_3v_1v_2 + bb_3v_1^2 - b^2a_3 + 2ba_1v_1 = 0 \end{aligned} \tag{7E}$$

Collecting the above on the terms v_i introduced, and these are

$$\{v_1, v_2\}$$

Equation (7E) now becomes

$$
\begin{aligned}
&-2ab_2v_1^5v_2 - a^2a_3v_1^4v_2^4 + (-aa_2 - ab_3)\,v_1^4v_2^2 - 2ab_1v_1^4v_2 + b_2v_1^4 \\
&- 2aba_3v_1^2v_2^2 + (ba_2 + bb_3)\,v_1^2 + 2ba_3v_1v_2 + 2ba_1v_1 - b^2a_3 = 0
\end{aligned} \tag{8E}
$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$
\begin{aligned}
b_2 &= 0 \\
-2ab_1 &= 0 \\
-2ab_2 &= 0 \\
-a^2a_3 &= 0 \\
2ba_1 &= 0 \\
2ba_3 &= 0 \\
-b^2a_3 &= 0 \\
-2aba_3 &= 0 \\
-aa_2 - ab_3 &= 0 \\
ba_2 + bb_3 &= 0
\end{aligned}
$$

Solving the above equations for the unknowns gives

$$
\begin{aligned}
a_1 &= 0 \\
a_2 &= -b_3 \\
a_3 &= 0 \\
b_1 &= 0 \\
b_2 &= 0 \\
b_3 &= b_3
\end{aligned}
$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$
\begin{aligned}
\xi &= -x \\
\eta &= y
\end{aligned}
$$

Shifting is now applied to make $\xi = 0$ in order to simplify the rest of the computation

$$
\begin{aligned}
\eta &= \eta - \omega(x,y)\,\xi \\
&= y - \left(\frac{a\,x^2y^2 + b}{x^2}\right)(-x) \\
&= \frac{a\,x^2y^2 + yx + b}{x} \\
\xi &= 0
\end{aligned}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x,y) \to (R,S)$ where (R,S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}$$

The above comes from the requirements that $\left(\xi\frac{\partial}{\partial x} + \eta\frac{\partial}{\partial y}\right) S(x,y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$R = x$$

S is found from

$$\begin{aligned} S &= \int \frac{1}{\eta} dy \\ &= \int \frac{1}{\frac{a\,x^2y^2+yx+b}{x}} dy \end{aligned}$$

Which results in

$$S = \frac{2x \arctan\left(\frac{2a\,x^2y+x}{\sqrt{4ab\,x^2-x^2}}\right)}{\sqrt{4ab\,x^2-x^2}}$$

Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$\frac{dS}{dR} = \frac{S_x + \omega(x,y)S_y}{R_x + \omega(x,y)R_y} \tag{2}$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x,y)$ is the right hand side of the original ode given by

$$\omega(x,y) = \frac{a\,x^2y^2+b}{x^2}$$

Evaluating all the partial derivatives gives

$$\begin{aligned} R_x &= 1 \\ R_y &= 0 \\ S_x &= \frac{y}{a\,x^2y^2+yx+b} \\ S_y &= \frac{x}{a\,x^2y^2+yx+b} \end{aligned}$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$\frac{dS}{dR} = \frac{1}{x} \tag{2A}$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$\frac{dS}{dR} = \frac{1}{R}$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = \ln(R) + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$\frac{2\arctan\left(\frac{2yax+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}} = \ln(x) + c_1$$

Which simplifies to

$$\frac{2\arctan\left(\frac{2yax+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}} = \ln(x) + c_1$$

Which gives

$$y = \frac{\tan\left(\frac{\ln(x)\sqrt{4ab-1}}{2} + \frac{c_1\sqrt{4ab-1}}{2}\right)\sqrt{4ab-1} - 1}{2xa}$$

Summary

The solution(s) found are the following

$$y = \frac{\tan\left(\frac{\ln(x)\sqrt{4ab-1}}{2} + \frac{c_1\sqrt{4ab-1}}{2}\right)\sqrt{4ab-1} - 1}{2xa} \tag{1}$$

Verification of solutions

$$y = \frac{\tan\left(\frac{\ln(x)\sqrt{4ab-1}}{2} + \frac{c_1\sqrt{4ab-1}}{2}\right)\sqrt{4ab-1} - 1}{2xa}$$

Verified OK.

2.13.2 Solving as exact ode

Entering Exact first order ODE solver. (Form one type)

To solve an ode of the form

$$M(x,y)+N(x,y)\frac{dy}{dx}=0 \tag{A}$$

We assume there exists a function $\phi(x,y)=c$ where c is constant, that satisfies the ode. Taking derivative of ϕ w.r.t. x gives

$$\frac{d}{dx}\phi(x,y)=0$$

Hence

$$\frac{\partial\phi}{\partial x}+\frac{\partial\phi}{\partial y}\frac{dy}{dx}=0 \tag{B}$$

Comparing (A,B) shows that

$$\begin{aligned}\frac{\partial\phi}{\partial x}&=M\\ \frac{\partial\phi}{\partial y}&=N\end{aligned}$$

But since $\frac{\partial^2\phi}{\partial x\partial y}=\frac{\partial^2\phi}{\partial y\partial x}$ then for the above to be valid, we require that

$$\frac{\partial M}{\partial y}=\frac{\partial N}{\partial x}$$

If the above condition is satisfied, then the original ode is called exact. We still need to determine $\phi(x,y)$ but at least we know now that we can do that since the condition $\frac{\partial^2\phi}{\partial x\partial y}=\frac{\partial^2\phi}{\partial y\partial x}$ is satisfied. If this condition is not satisfied then this method will not work and we have to now look for an integrating factor to force this condition, which might or might not exist. The first step is to write the ODE in standard form to check for exactness, which is

$$M(x,y)\,\mathrm{d}x+N(x,y)\,\mathrm{d}y=0 \tag{1A}$$

Therefore

$$\begin{aligned}\left(x^2\right)\mathrm{d}y&=\left(a\,x^2y^2+b\right)\mathrm{d}x\\ \left(-a\,x^2y^2-b\right)\mathrm{d}x+\left(x^2\right)\mathrm{d}y&=0 \qquad\qquad (2A)\end{aligned}$$

Comparing (1A) and (2A) shows that

$$\begin{aligned}M(x,y)&=-a\,x^2y^2-b\\ N(x,y)&=x^2\end{aligned}$$

The next step is to determine if the ODE is is exact or not. The ODE is exact when the following condition is satisfied

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$$

Using result found above gives

$$\begin{aligned}\frac{\partial M}{\partial y} &= \frac{\partial}{\partial y}\left(-a\,x^2y^2 - b\right)\\ &= -2a\,x^2y\end{aligned}$$

And

$$\begin{aligned}\frac{\partial N}{\partial x} &= \frac{\partial}{\partial x}\left(x^2\right)\\ &= 2x\end{aligned}$$

Since $\frac{\partial M}{\partial y} \neq \frac{\partial N}{\partial x}$, then the ODE is not exact. Since the ODE is not exact, we will try to find an integrating factor to make it exact. Let

$$\begin{aligned}A &= \frac{1}{N}\left(\frac{\partial M}{\partial y} - \frac{\partial N}{\partial x}\right)\\ &= \frac{1}{x^2}\left(\left(-2a\,x^2y\right) - (2x)\right)\\ &= \frac{-2axy - 2}{x}\end{aligned}$$

Since A depends on y, it can not be used to obtain an integrating factor. We will now try a second method to find an integrating factor. Let

$$\begin{aligned}B &= \frac{1}{M}\left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right)\\ &= -\frac{1}{a\,x^2y^2 + b}\left((2x) - \left(-2a\,x^2y\right)\right)\\ &= -\frac{2x(axy + 1)}{a\,x^2y^2 + b}\end{aligned}$$

Since B depends on x, it can not be used to obtain an integrating factor.We will now try a third method to find an integrating factor. Let

$$R = \frac{\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}}{xM - yN}$$

R is now checked to see if it is a function of only $t = xy$. Therefore

$$\begin{aligned}
R &= \frac{\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}}{xM - yN} \\
&= \frac{(2x) - (-2a\,x^2 y)}{x\,(-a\,x^2y^2 - b) - y\,(x^2)} \\
&= \frac{-2axy - 2}{a\,x^2y^2 + yx + b}
\end{aligned}$$

Replacing all powers of terms xy by t gives

$$R = \frac{-2at - 2}{a\,t^2 + b + t}$$

Since R depends on t only, then it can be used to find an integrating factor. Let the integrating factor be μ then

$$\begin{aligned}
\mu &= e^{\int R \,\mathrm{d}t} \\
&= e^{\int \left(\frac{-2at-2}{a\,t^2+b+t}\right) \mathrm{d}t}
\end{aligned}$$

The result of integrating gives

$$\begin{aligned}
\mu &= e^{-\ln\left(a\,t^2+b+t\right) - \frac{2\arctan\left(\frac{2at+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}} \\
&= \frac{\mathrm{e}^{-\frac{2\arctan\left(\frac{2at+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{a\,t^2 + b + t}
\end{aligned}$$

Now t is replaced back with xy giving

$$\mu = \frac{\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{a\,x^2y^2 + yx + b}$$

Multiplying M and N by this integrating factor gives new M and new N which are called $\overline{M}$ and $\overline{N}$ so not to confuse them with the original M and N

$$\begin{aligned}
\overline{M} &= \mu M \\
&= \frac{\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{a\,x^2y^2 + yx + b}\left(-a\,x^2y^2 - b\right) \\
&= \frac{\left(-a\,x^2y^2 - b\right)\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{a\,x^2y^2 + yx + b}
\end{aligned}$$

And

$$
\begin{aligned}
\overline{N} &= \mu N \\
&= \frac{\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{a\,x^2y^2+yx+b}\left(x^2\right) \\
&= \frac{x^2\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{a\,x^2y^2+yx+b}
\end{aligned}
$$

A modified ODE is now obtained from the original ODE, which is exact and can solved. The modified ODE is

$$
\overline{M}+\overline{N}\frac{\mathrm{d}y}{\mathrm{d}x}=0
$$

$$
\left(\frac{\left(-a\,x^2y^2-b\right)\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{a\,x^2y^2+yx+b}\right)+\left(\frac{x^2\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{a\,x^2y^2+yx+b}\right)\frac{\mathrm{d}y}{\mathrm{d}x}=0
$$

The following equations are now set up to solve for the function $\phi(x,y)$

$$
\frac{\partial\phi}{\partial x}=\overline{M} \tag{1}
$$

$$
\frac{\partial\phi}{\partial y}=\overline{N} \tag{2}
$$

Integrating (1) w.r.t. x gives

$$
\int\frac{\partial\phi}{\partial x}\,\mathrm{d}x=\int\overline{M}\,\mathrm{d}x
$$

$$
\int\frac{\partial\phi}{\partial x}\,\mathrm{d}x=\int\frac{\left(-a\,x^2y^2-b\right)\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{a\,x^2y^2+yx+b}\,\mathrm{d}x
$$

$$
\phi=-\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}x+f(y) \tag{3}
$$

Where $f(y)$ is used for the constant of integration since ϕ is a function of both x and y. Taking derivative of equation (3) w.r.t y gives

$$
\frac{\partial\phi}{\partial y}=\frac{4x^2a\,\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{(4ab-1)\left(\frac{(2axy+1)^2}{4ab-1}+1\right)}+f'(y) \tag{4}
$$

$$= \frac{x^2 e^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{a\,x^2y^2 + yx + b} + f'(y)$$

But equation (2) says that $\frac{\partial \phi}{\partial y} = \frac{x^2 e^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{a\,x^2y^2+yx+b}$. Therefore equation (4) becomes

$$\frac{x^2 e^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{a\,x^2y^2 + yx + b} = \frac{x^2 e^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}}}{a\,x^2y^2 + yx + b} + f'(y) \tag{5}$$

Solving equation (5) for $f'(y)$ gives

$$f'(y) = 0$$

Therefore

$$f(y) = c_1$$

Where c_1 is constant of integration. Substituting this result for $f(y)$ into equation (3) gives ϕ

$$\phi = -e^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}} x + c_1$$

But since ϕ itself is a constant function, then let $\phi = c_2$ where c_2 is new constant and combining c_1 and c_2 constants into new constant c_1 gives the solution as

$$c_1 = -e^{-\frac{2\arctan\left(\frac{2axy+1}{\sqrt{4ab-1}}\right)}{\sqrt{4ab-1}}} x$$

The solution becomes

$$y = -\frac{\tan\left(\frac{\ln\left(-\frac{c_1}{x}\right)\sqrt{4ab-1}}{2}\right)\sqrt{4ab-1} + 1}{2xa}$$

Summary

The solution(s) found are the following

$$y = -\frac{\tan\left(\frac{\ln\left(-\frac{c_1}{x}\right)\sqrt{4ab-1}}{2}\right)\sqrt{4ab-1} + 1}{2xa} \tag{1}$$

Verification of solutions

$$y = -\frac{\tan\left(\frac{\ln\left(-\frac{c_1}{x}\right)\sqrt{4ab-1}}{2}\right)\sqrt{4ab-1} + 1}{2xa}$$

Verified OK.

2.13.3 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^2y^2+b}{x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,y^2 + \frac{b}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{b}{x^2}$, $f_1(x) = 0$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= \frac{a^2b}{x^2} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$au''(x) + \frac{a^2bu(x)}{x^2} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \sqrt{x}\left(c_1x^{\frac{\sqrt{-4ab+1}}{2}} + c_2x^{-\frac{\sqrt{-4ab+1}}{2}}\right)$$

The above shows that

$$u'(x) = \frac{-c_2\left(-1+\sqrt{-4ab+1}\right) x^{-\frac{\sqrt{-4ab+1}}{2}} + c_1 x^{\frac{\sqrt{-4ab+1}}{2}}\left(1+\sqrt{-4ab+1}\right)}{2\sqrt{x}}$$

Using the above in (1) gives the solution

$$y = -\frac{-c_2\left(-1+\sqrt{-4ab+1}\right) x^{-\frac{\sqrt{-4ab+1}}{2}} + c_1 x^{\frac{\sqrt{-4ab+1}}{2}}\left(1+\sqrt{-4ab+1}\right)}{2xa\left(c_1 x^{\frac{\sqrt{-4ab+1}}{2}} + c_2 x^{-\frac{\sqrt{-4ab+1}}{2}}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-1+\sqrt{-4ab+1}\right) x^{-\frac{\sqrt{-4ab+1}}{2}} - c_3 x^{\frac{\sqrt{-4ab+1}}{2}}\left(1+\sqrt{-4ab+1}\right)}{2xa\left(c_3 x^{\frac{\sqrt{-4ab+1}}{2}} + x^{-\frac{\sqrt{-4ab+1}}{2}}\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(-1+\sqrt{-4ab+1}\right) x^{-\frac{\sqrt{-4ab+1}}{2}} - c_3 x^{\frac{\sqrt{-4ab+1}}{2}}\left(1+\sqrt{-4ab+1}\right)}{2xa\left(c_3 x^{\frac{\sqrt{-4ab+1}}{2}} + x^{-\frac{\sqrt{-4ab+1}}{2}}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(-1+\sqrt{-4ab+1}\right) x^{-\frac{\sqrt{-4ab+1}}{2}} - c_3 x^{\frac{\sqrt{-4ab+1}}{2}}\left(1+\sqrt{-4ab+1}\right)}{2xa\left(c_3 x^{\frac{\sqrt{-4ab+1}}{2}} + x^{-\frac{\sqrt{-4ab+1}}{2}}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 14.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{x^2y' - x^2y^2 = -a^2x^4 + a(1-2b)\,x^2 - b(b+1)}$$

2.14.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{-a^2x^4 - 2ab\,x^2 + x^2y^2 + a\,x^2 - b^2 - b}{x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2x^2 - 2ab + y^2 + a - \frac{b^2}{x^2} - \frac{b}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{-a^2x^4 - 2ab\,x^2 + a\,x^2 - b^2 - b}{x^2}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x)-(f_2'+f_1f_2)\,u'(x)+f_2^2f_0u(x)=0 \tag{2}$$

But

$$\begin{aligned}f_2'&=0\\ f_1f_2&=0\\ f_2^2f_0&=\frac{-a^2x^4-2ab\,x^2+a\,x^2-b^2-b}{x^2}\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x)+\frac{(-a^2x^4-2ab\,x^2+a\,x^2-b^2-b)\,u(x)}{x^2}=0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x)=x^{-b}\mathrm{e}^{-\frac{a\,x^2}{2}}\left(c_2\Gamma\left(b+\frac{1}{2}\right)-c_2\Gamma\left(b+\frac{1}{2},-a\,x^2\right)+c_1\right)$$

The above shows that

$$u'(x)=-2\left(-\frac{\left(-c_2\Gamma\left(b+\frac{1}{2}\right)+c_2\Gamma\left(b+\frac{1}{2},-a\,x^2\right)-c_1\right)(a\,x^2+b)\,\mathrm{e}^{-\frac{a\,x^2}{2}}}{2}+\mathrm{e}^{\frac{a\,x^2}{2}}\left(-a\,x^2\right)^{b-\frac{1}{2}}c_2a\,x^2\right)x^{-1-b}$$

Using the above in (1) gives the solution

$$y=\frac{2\left(-\frac{\left(-c_2\Gamma\left(b+\frac{1}{2}\right)+c_2\Gamma\left(b+\frac{1}{2},-a\,x^2\right)-c_1\right)(a\,x^2+b)\mathrm{e}^{-\frac{a\,x^2}{2}}}{2}+\mathrm{e}^{\frac{a\,x^2}{2}}\left(-a\,x^2\right)^{b-\frac{1}{2}}c_2a\,x^2\right)x^{-1-b}x^b\mathrm{e}^{\frac{a\,x^2}{2}}}{c_2\Gamma\left(b+\frac{1}{2}\right)-c_2\Gamma\left(b+\frac{1}{2},-a\,x^2\right)+c_1}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1}=c_3$ the following solution

$$y=\frac{-2x^2a(-a\,x^2)^{b-\frac{1}{2}}\,\mathrm{e}^{a\,x^2}+(a\,x^2+b)\left(-\Gamma\left(b+\frac{1}{2}\right)+\Gamma\left(b+\frac{1}{2},-a\,x^2\right)-c_3\right)}{x\left(-\Gamma\left(b+\frac{1}{2}\right)+\Gamma\left(b+\frac{1}{2},-a\,x^2\right)-c_3\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{-2x^2 a(-a\,x^2)^{b-\frac{1}{2}}\,\mathrm{e}^{a\,x^2} + (a\,x^2+b)\left(-\Gamma\left(b+\frac{1}{2}\right)+\Gamma\left(b+\frac{1}{2}, -a\,x^2\right)-c_3\right)}{x\left(-\Gamma\left(b+\frac{1}{2}\right)+\Gamma\left(b+\frac{1}{2}, -a\,x^2\right)-c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-2x^2 a(-a\,x^2)^{b-\frac{1}{2}}\,\mathrm{e}^{a\,x^2} + (a\,x^2+b)\left(-\Gamma\left(b+\frac{1}{2}\right)+\Gamma\left(b+\frac{1}{2}, -a\,x^2\right)-c_3\right)}{x\left(-\Gamma\left(b+\frac{1}{2}\right)+\Gamma\left(b+\frac{1}{2}, -a\,x^2\right)-c_3\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{x^2y' - a\,x^2y^2 = b\,x^n + c}$$

2.15.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^2y^2 + b\,x^n + c}{x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,y^2 + \frac{b\,x^n}{x^2} + \frac{c}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{b\,x^n + c}{x^2}$, $f_1(x) = 0$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= \frac{a^2(b\,x^n + c)}{x^2} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$au''(x) + \frac{a^2(b\,x^n + c)\,u(x)}{x^2} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\text{BesselY}\left(\frac{\sqrt{-4ca+1}}{n}, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right)c_2 + \text{BesselJ}\left(\frac{\sqrt{-4ca+1}}{n}, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right)c_1\right)\sqrt{x}$$

The above shows that

$$u'(x) = \frac{-2\sqrt{ab}\left(\text{BesselJ}\left(\frac{\sqrt{-4ca+1}+n}{n}, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right)c_1 + \text{BesselY}\left(\frac{\sqrt{-4ca+1}+n}{n}, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right)c_2\right)x^{\frac{n}{2}} + \left(\text{BesselY}\left(\frac{\sqrt{-4ca+1}}{n},\right.\right.}{2\sqrt{x}}$$

Using the above in (1) gives the solution

$$y = -\frac{-2\sqrt{ab}\left(\text{BesselJ}\left(\frac{\sqrt{-4ca+1}+n}{n}, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right)c_1 + \text{BesselY}\left(\frac{\sqrt{-4ca+1}+n}{n}, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right)c_2\right)x^{\frac{n}{2}} + \left(\text{BesselY}\left(\frac{\sqrt{-4ca+}}{n}\right.\right.}{2xa\left(\text{BesselY}\left(\frac{\sqrt{-4ca+1}}{n}, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right)c_2 + \text{BesselJ}\left(\frac{\sqrt{-4c}}{n}\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{2\sqrt{ab}\left(\text{BesselJ}\left(\frac{\sqrt{-4ca+1}}{n} + 1, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right)c_3 + \text{BesselY}\left(\frac{\sqrt{-4ca+1}}{n} + 1, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right)\right)x^{\frac{n}{2}} - \left(\text{BesselY}\left(\frac{\sqrt{-4ca+1}}{n},\right.\right.}{2xa\left(\text{BesselY}\left(\frac{\sqrt{-4ca+1}}{n}, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right) + \text{BesselJ}\left(\frac{\sqrt{-4ca+1}}{n},\right.\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{2\sqrt{ab}\left(\text{BesselJ}\left(\frac{\sqrt{-4ca+1}}{n}+1, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right)c_3 + \text{BesselY}\left(\frac{\sqrt{-4ca+1}}{n}+1, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right)\right)x^{\frac{n}{2}} - \left(\text{BesselY}\left(\frac{\sqrt{-4ca+1}}{n}, \cdots\right.\right.}{2xa\left(\text{BesselY}\left(\frac{\sqrt{-4ca+1}}{n}, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right) + \text{BesselJ}\left(\frac{\sqrt{-4ca+1}}{n}, \cdots\right.\right.} \tag{1}$$

Verification of solutions

$$y = \frac{2\sqrt{ab}\left(\text{BesselJ}\left(\frac{\sqrt{-4ca+1}}{n}+1, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right)c_3 + \text{BesselY}\left(\frac{\sqrt{-4ca+1}}{n}+1, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right)\right)x^{\frac{n}{2}} - \left(\text{BesselY}\left(\frac{\sqrt{-4ca+1}}{n}, \cdots\right.\right.}{2xa\left(\text{BesselY}\left(\frac{\sqrt{-4ca+1}}{n}, \frac{2\sqrt{ab}\,x^{\frac{n}{2}}}{n}\right) + \text{BesselJ}\left(\frac{\sqrt{-4ca+1}}{n}, \cdots\right.\right.}$$

Verified OK.

Problem number: 16.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{x^2y' - x^2y^2 = a\,x^{2m}(b\,x^m + c)^n - \frac{n^2}{4} + \frac{1}{4}}$$

2.16.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{4x^2y^2 + 4a\,x^{2m}(b\,x^m + c)^n - n^2 + 1}{4x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \frac{a\,x^{2m}(b\,x^m + c)^n}{x^2} - \frac{n^2}{4x^2} + \frac{1}{4x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{4a\,x^{2m}(b\,x^m+c)^n - n^2+1}{4x^2}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2 f_0 &= \frac{4a\,x^{2m}(b\,x^m + c)^n - n^2 + 1}{4x^2} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \frac{(4a\,x^{2m}(b\,x^m + c)^n - n^2 + 1)\,u(x)}{4x^2} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) + \frac{(4a\,x^{2m}(b\,x^m + c)^n - n^2 + 1)\_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{(4a\,x^{2m}(b\,x^m + c)^n - n^2 + 1)\_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{(4a\,x^{2m}(b\,x^m+c)^n - n^2+1)\_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{(4a\,x^{2m}(b\,x^m+c)^n - n^2+1)\_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{4x^{2m}(b\,x^m+c)^n\_Y(x)a + 4\_Y''(x)x^2 - \_Y(x)n^2 + \_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\frac{4x^{2m}(b\,x^m+c)^n\_Y(x)a + 4\_Y''(x)x^2 - \_Y(x)n^2 + \_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)}$$

Summary
The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{4x^{2m}(b\,x^m+c)^n\_\_Y(x)a+4\_\_Y''(x)x^2-\_\_Y(x)n^2+\_\_Y(x)}{4x^2}\right\},\{\_\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\frac{4x^{2m}(b\,x^m+c)^n\_\_Y(x)a+4\_\_Y''(x)x^2-\_\_Y(x)n^2+\_\_Y(x)}{4x^2}\right\},\{\_\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{4x^{2m}(b\,x^m+c)^n\_\_Y(x)a+4\_\_Y''(x)x^2-\_\_Y(x)n^2+\_\_Y(x)}{4x^2}\right\},\{\_\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\frac{4x^{2m}(b\,x^m+c)^n\_\_Y(x)a+4\_\_Y''(x)x^2-\_\_Y(x)n^2+\_\_Y(x)}{4x^2}\right\},\{\_\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 17.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{(c_2x^2+b_2x+a_2)\left(y'+\lambda y^2\right)=-a_0}$$

2.17.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y' &= F(x,y)\\ &= -\frac{c_2\lambda\,x^2y^2+y^2b_2\lambda x+y^2a_2\lambda+a_0}{c_2x^2+b_2x+a_2}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{y^2c_2\lambda\,x^2}{c_2x^2+b_2x+a_2}-\frac{y^2b_2\lambda x}{c_2x^2+b_2x+a_2}-\frac{y^2a_2\lambda}{c_2x^2+b_2x+a_2}-\frac{a_0}{c_2x^2+b_2x+a_2}$$

With Riccati ODE standard form

$$y' = f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=-\frac{a_0}{c_2x^2+b_2x+a_2}$, $f_1(x)=0$ and $f_2(x)=-\frac{c_2\lambda\,x^2+\lambda b_2x+\lambda a_2}{c_2x^2+b_2x+a_2}$. Let

$$\begin{aligned}y &= \frac{-u'}{f_2u}\\ &= \frac{-u'}{-\frac{(c_2\lambda\,x^2+\lambda b_2x+\lambda a_2)u}{c_2x^2+b_2x+a_2}}\end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$f_2' = -\frac{2c_2\lambda x + \lambda b_2}{c_2 x^2 + b_2 x + a_2} + \frac{(c_2\lambda\, x^2 + \lambda b_2 x + \lambda a_2)\,(2c_2 x + b_2)}{(c_2 x^2 + b_2 x + a_2)^2}$$

$$f_1 f_2 = 0$$

$$f_2^2 f_0 = -\frac{(c_2\lambda\, x^2 + \lambda b_2 x + \lambda a_2)^2\, a_0}{(c_2 x^2 + b_2 x + a_2)^3}$$

Substituting the above terms back in equation (2) gives

$$-\frac{(c_2\lambda\, x^2 + \lambda b_2 x + \lambda a_2)\, u''(x)}{c_2 x^2 + b_2 x + a_2} - \left(-\frac{2c_2\lambda x + \lambda b_2}{c_2 x^2 + b_2 x + a_2} + \frac{(c_2\lambda\, x^2 + \lambda b_2 x + \lambda a_2)\,(2c_2 x + b_2)}{(c_2 x^2 + b_2 x + a_2)^2}\right) u'(x) - \frac{(c_2\lambda\, x}{}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = -2\left(c_2 x - \frac{\sqrt{-4a_2c_2 + b_2^2}}{2} + \frac{b_2}{2}\right)\left(c_3\left(2c_2 x + b_2\right.\right.$$
$$\left.+\sqrt{-4a_2c_2 + b_2^2}\right)^{\frac{-\sqrt{c_2}+\sqrt{-4a_0\lambda+c_2}}{2\sqrt{c_2}}} \text{hypergeom}\left(\left[-\frac{-\sqrt{c_2}+\sqrt{-4a_0\lambda+c_2}}{2\sqrt{c_2}}, -\frac{-3\sqrt{c_2}+\sqrt{-4a_0\lambda+c_2}}{2\sqrt{c_2}}\right], \left[\right.\right.$$
$$+ c_4\left(2c_2 x + b_2\right.$$
$$\left.+\sqrt{-4a_2c_2 + b_2^2}\right)^{-\frac{\sqrt{c_2}+\sqrt{-4a_0\lambda+c_2}}{2\sqrt{c_2}}} \text{hypergeom}\left(\left[\frac{\sqrt{c_2}+\sqrt{-4a_0\lambda+c_2}}{2\sqrt{c_2}}, \frac{3\sqrt{c_2}+\sqrt{-4a_0\lambda+c_2}}{2\sqrt{c_2}}\right], \left[\frac{\sqrt{c_2}+}{}\right.\right.$$

The above shows that

$$u'(x) =$$
$$-\frac{4\sqrt{c_2}\left(\left(2c_2 x + b_2 + \sqrt{-4a_2c_2 + b_2^2}\right)^{\frac{-\sqrt{c_2}+\sqrt{-4a_0\lambda+c_2}}{2\sqrt{c_2}}}\left(\left(\left(c_2 x + \frac{b_2}{2}\right)\sqrt{-4a_0\lambda + c_2} + c_2^{\frac{3}{2}} x + \frac{\sqrt{c_2}\, b_2}{2}\right)\sqrt{-4\right.\right.\right.}{}$$

Using the above in (1) gives the solution

Expression too large to display

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{4\left(\operatorname{hypergeom}\left(\left[\frac{1}{2}+\frac{\sqrt{-4a_0\lambda+1}}{2}, \frac{1}{2}+\frac{\sqrt{-4a_0\lambda+1}}{2}\right], \left[1+\sqrt{-4a_0\lambda+1}\right], \frac{2\sqrt{b_2^2-4a_2}}{2x+b_2+\sqrt{b_2^2-4a_2}}\right) c_4\left(-1+\sqrt{-4a_0\lambda\right.\right.}{\left(2x+b_2+\sqrt{b_2^2-4a_2}\right)^2\left(-\sqrt{b_2^2-4a_2}+2x+b_2\right)\lambda\left(c_3\left(2x+b_2+\sqrt{b_2^2-4a_2}\right)^{\sqrt{-4}}\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{4\left(\operatorname{hypergeom}\left(\left[\frac{1}{2}+\frac{\sqrt{-4a_0\lambda+1}}{2}, \frac{1}{2}+\frac{\sqrt{-4a_0\lambda+1}}{2}\right], \left[1+\sqrt{-4a_0\lambda+1}\right], \frac{2\sqrt{b_2^2-4a_2}}{2x+b_2+\sqrt{b_2^2-4a_2}}\right) c_4\left(-1+\sqrt{-4a_0\lambda\right.\right.}{\left(2x+b_2+\sqrt{b_2^2-4a_2}\right)^2\left(-\sqrt{b_2^2-4a_2}+2x+b_2\right)\lambda\left(c_3\left(2x+b_2+\sqrt{b_2^2-4a_2}\right)^{\sqrt{-4}}\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{4\left(\operatorname{hypergeom}\left(\left[\frac{1}{2}+\frac{\sqrt{-4a_0\lambda+1}}{2}, \frac{1}{2}+\frac{\sqrt{-4a_0\lambda+1}}{2}\right], \left[1+\sqrt{-4a_0\lambda+1}\right], \frac{2\sqrt{b_2^2-4a_2}}{2x+b_2+\sqrt{b_2^2-4a_2}}\right) c_4\left(-1+\sqrt{-4a_0\lambda\right.\right.}{\left(2x+b_2+\sqrt{b_2^2-4a_2}\right)^2\left(-\sqrt{b_2^2-4a_2}+2x+b_2\right)\lambda\left(c_3\left(2x+b_2+\sqrt{b_2^2-4a_2}\right)^{\sqrt{-4}}\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati", "first_order_ode_lie_symmetry_calculated"**

Maple gives the following as the ode type

```
[_rational, [_Riccati, _special]]
```

$$\boxed{x^4y' + x^4y^2 = -a^2}$$

2.18.1 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$y' = -\frac{x^4y^2 + a^2}{x^4}$$
$$y' = \omega(x, y)$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x + \omega(\eta_y - \xi_x) - \omega^2\xi_y - \omega_x\xi - \omega_y\eta = 0 \tag{A}$$

The type of this ode is not in the lookup table. To determine ξ, η then (A) is solved using ansatz. Making bivariate polynomials of degree 2 to use as anstaz gives

$$\xi = x^2a_4 + yxa_5 + y^2a_6 + xa_2 + ya_3 + a_1 \tag{1E}$$
$$\eta = x^2b_4 + yxb_5 + y^2b_6 + xb_2 + yb_3 + b_1 \tag{2E}$$

Where the unknown coefficients are

$$\{a_1, a_2, a_3, a_4, a_5, a_6, b_1, b_2, b_3, b_4, b_5, b_6\}$$

Substituting equations (1E,2E) and ω into (A) gives

$$\begin{aligned} &2xb_4 + yb_5 + b_2 - \frac{(x^4y^2 + a^2)(-2xa_4 + xb_5 - ya_5 + 2yb_6 - a_2 + b_3)}{x^4} \\ &- \frac{(x^4y^2 + a^2)^2 (xa_5 + 2ya_6 + a_3)}{x^8} \\ &- \left(-\frac{4y^2}{x} + \frac{4x^4y^2 + 4a^2}{x^5}\right)(x^2a_4 + yxa_5 + y^2a_6 + xa_2 + ya_3 + a_1) \\ &+ 2y\left(x^2b_4 + yxb_5 + y^2b_6 + xb_2 + yb_3 + b_1\right) = 0 \end{aligned} \tag{5E}$$

Putting the above in normal form gives

$$-\frac{x^9y^4a_5 + 2x^8y^5a_6 + x^8y^4a_3 - 2x^{10}yb_4 - 2x^9y^2a_4 - x^9y^2b_5 - x^8y^3a_5 - 2x^9yb_2 - x^8y^2a_2 - x^8y^2b_3 + 2a^2x^5}{}$$

$$= 0$$

Setting the numerator to zero gives

$$\begin{aligned} &-x^9y^4a_5 - 2x^8y^5a_6 - x^8y^4a_3 + 2x^{10}yb_4 + 2x^9y^2a_4 + x^9y^2b_5 + x^8y^3a_5 + 2x^9yb_2 \\ &+ x^8y^2a_2 + x^8y^2b_3 - 2a^2x^5y^2a_5 - 4a^2x^4y^3a_6 + 2x^9b_4 + 2x^8yb_1 + yb_5x^8 \\ &- 2a^2x^4y^2a_3 + b_2x^8 - 2a^2x^5a_4 - a^2x^5b_5 - 3a^2x^4ya_5 - 2a^2x^4yb_6 - 4a^2x^3y^2a_6 \\ &- 3a^2x^4a_2 - a^2x^4b_3 - 4a^2x^3ya_3 - a^4xa_5 - 2a^4ya_6 - 4a^2x^3a_1 - a^4a_3 = 0 \end{aligned} \tag{6E}$$

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\{x, y\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\{x = v_1, y = v_2\}$$

The above PDE (6E) now becomes

$$\begin{aligned} &-a_5v_1^9v_2^4 - 2a_6v_1^8v_2^5 - a_3v_1^8v_2^4 + 2a_4v_1^9v_2^2 + a_5v_1^8v_2^3 + 2b_4v_1^{10}v_2 + b_5v_1^9v_2^2 + a_2v_1^8v_2^2 \\ &+ 2b_2v_1^9v_2 + b_3v_1^8v_2^2 - 2a^2a_5v_1^5v_2^2 - 4a^2a_6v_1^4v_2^3 + 2b_1v_1^8v_2 + 2b_4v_1^9 + b_5v_1^8v_2 \\ &- 2a^2a_3v_1^4v_2^2 + b_2v_1^8 - 2a^2a_4v_1^5 - 3a^2a_5v_1^4v_2 - 4a^2a_6v_1^3v_2^2 - a^2b_5v_1^5 - 2a^2b_6v_1^4v_2 \\ &- 3a^2a_2v_1^4 - 4a^2a_3v_1^3v_2 - a^2b_3v_1^4 - a^4a_5v_1 - 2a^4a_6v_2 - 4a^2a_1v_1^3 - a^4a_3 = 0 \end{aligned} \tag{7E}$$

Collecting the above on the terms v_i introduced, and these are

$$\{v_1, v_2\}$$

Equation (7E) now becomes

$$\begin{aligned} &2b_4v_1^{10}v_2 - a_5v_1^9v_2^4 + (2a_4 + b_5)\,v_1^9v_2^2 + 2b_2v_1^9v_2 + 2b_4v_1^9 - 2a_6v_1^8v_2^5 \\ &- a_3v_1^8v_2^4 + a_5v_1^8v_2^3 + (a_2 + b_3)\,v_1^8v_2^2 + (2b_1 + b_5)\,v_1^8v_2 + b_2v_1^8 \\ &- 2a^2a_5v_1^5v_2^2 + \left(-2a^2a_4 - a^2b_5\right)v_1^5 - 4a^2a_6v_1^4v_2^3 - 2a^2a_3v_1^4v_2^2 \\ &+ \left(-3a^2a_5 - 2a^2b_6\right)v_1^4v_2 + \left(-3a^2a_2 - a^2b_3\right)v_1^4 - 4a^2a_6v_1^3v_2^2 \\ &- 4a^2a_3v_1^3v_2 - 4a^2a_1v_1^3 - a^4a_5v_1 - 2a^4a_6v_2 - a^4a_3 = 0 \end{aligned} \tag{8E}$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$\begin{aligned} a_5 &= 0 \\ b_2 &= 0 \\ -a_3 &= 0 \\ -a_5 &= 0 \\ -2a_6 &= 0 \\ 2b_2 &= 0 \\ 2b_4 &= 0 \\ -4a^2a_1 &= 0 \\ -4a^2a_3 &= 0 \\ -2a^2a_3 &= 0 \\ -2a^2a_5 &= 0 \\ -4a^2a_6 &= 0 \\ -a^4a_3 &= 0 \\ -a^4a_5 &= 0 \\ -2a^4a_6 &= 0 \\ a_2 + b_3 &= 0 \\ 2a_4 + b_5 &= 0 \\ 2b_1 + b_5 &= 0 \\ -3a^2a_2 - a^2b_3 &= 0 \\ -2a^2a_4 - a^2b_5 &= 0 \\ -3a^2a_5 - 2a^2b_6 &= 0 \end{aligned}$$

Solving the above equations for the unknowns gives

$$\begin{aligned}
a_1 &= 0 \\
a_2 &= 0 \\
a_3 &= 0 \\
a_4 &= b_1 \\
a_5 &= 0 \\
a_6 &= 0 \\
b_1 &= b_1 \\
b_2 &= 0 \\
b_3 &= 0 \\
b_4 &= 0 \\
b_5 &= -2b_1 \\
b_6 &= 0
\end{aligned}$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$\begin{aligned}
\xi &= x^2 \\
\eta &= -2yx + 1
\end{aligned}$$

Shifting is now applied to make $\xi = 0$ in order to simplify the rest of the computation

$$\begin{aligned}
\eta &= \eta - \omega(x, y)\,\xi \\
&= -2yx + 1 - \left(-\frac{x^4y^2 + a^2}{x^4}\right)\left(x^2\right) \\
&= \frac{x^4y^2 - 2y\,x^3 + a^2 + x^2}{x^2} \\
\xi &= 0
\end{aligned}$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x, y) \to (R, S)$ where (R, S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}$$

The above comes from the requirements that $\left(\xi \frac{\partial}{\partial x} + \eta \frac{\partial}{\partial y}\right) S(x,y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$R = x$$

S is found from

$$\begin{aligned} S &= \int \frac{1}{\eta} dy \\ &= \int \frac{1}{\frac{x^4y^2 - 2y\,x^3 + a^2 + x^2}{x^2}} dy \end{aligned}$$

Which results in

$$S = \frac{\arctan\left(\frac{2x^4y - 2x^3}{2a\,x^2}\right)}{a}$$

Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$\frac{dS}{dR} = \frac{S_x + \omega(x,y) S_y}{R_x + \omega(x,y) R_y} \tag{2}$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x,y)$ is the right hand side of the original ode given by

$$\omega(x,y) = -\frac{x^4y^2 + a^2}{x^4}$$

Evaluating all the partial derivatives gives

$$\begin{aligned} R_x &= 1 \\ R_y &= 0 \\ S_x &= \frac{2yx - 1}{x^4y^2 - 2y\,x^3 + a^2 + x^2} \\ S_y &= \frac{x^2}{x^4y^2 - 2y\,x^3 + a^2 + x^2} \end{aligned}$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$\frac{dS}{dR} = -\frac{1}{x^2} \tag{2A}$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$\frac{dS}{dR} = -\frac{1}{R^2}$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = \frac{1}{R} + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$\frac{\arctan\left(\frac{x(xy-1)}{a}\right)}{a} = \frac{1}{x} + c_1$$

Which simplifies to

$$\frac{\arctan\left(\frac{x(xy-1)}{a}\right)}{a} = \frac{1}{x} + c_1$$

Which gives

$$y = \frac{\tan\left(\frac{a(c_1x+1)}{x}\right)a + x}{x^2}$$

Summary
The solution(s) found are the following

$$y = \frac{\tan\left(\frac{a(c_1x+1)}{x}\right)a + x}{x^2} \tag{1}$$

Verification of solutions

$$y = \frac{\tan\left(\frac{a(c_1x+1)}{x}\right)a + x}{x^2}$$

Verified OK.

2.18.2 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= -\frac{x^4y^2 + a^2}{x^4} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -y^2 - \frac{a^2}{x^4}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{a^2}{x^4}$, $f_1(x) = 0$ and $f_2(x) = -1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{-u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= -\frac{a^2}{x^4} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$-u''(x) - \frac{a^2 u(x)}{x^4} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x\left(c_1 \sin\left(\frac{a}{x}\right) + c_2 \cos\left(\frac{a}{x}\right)\right)$$

The above shows that

$$u'(x) = c_1 \sin\left(\frac{a}{x}\right) + c_2 \cos\left(\frac{a}{x}\right) + \frac{a\left(-c_1 \cos\left(\frac{a}{x}\right) + c_2 \sin\left(\frac{a}{x}\right)\right)}{x}$$

Using the above in (1) gives the solution

$$y = \frac{c_1 \sin\left(\frac{a}{x}\right) + c_2 \cos\left(\frac{a}{x}\right) + \frac{a\left(-c_1 \cos\left(\frac{a}{x}\right) + c_2 \sin\left(\frac{a}{x}\right)\right)}{x}}{x\left(c_1 \sin\left(\frac{a}{x}\right) + c_2 \cos\left(\frac{a}{x}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{(-a c_3 + x) \cos\left(\frac{a}{x}\right) + \sin\left(\frac{a}{x}\right)(c_3 x + a)}{x^2 \left(c_3 \sin\left(\frac{a}{x}\right) + \cos\left(\frac{a}{x}\right)\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{(-a c_3 + x) \cos\left(\frac{a}{x}\right) + \sin\left(\frac{a}{x}\right)(c_3 x + a)}{x^2 \left(c_3 \sin\left(\frac{a}{x}\right) + \cos\left(\frac{a}{x}\right)\right)} \tag{1}$$

Verification of solutions

$$y = \frac{(-a c_3 + x) \cos\left(\frac{a}{x}\right) + \sin\left(\frac{a}{x}\right)(c_3 x + a)}{x^2 \left(c_3 \sin\left(\frac{a}{x}\right) + \cos\left(\frac{a}{x}\right)\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 19.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{a\,x^2(x-1)^2\left(y'+\lambda y^2\right)=-b\,x^2-cx-s}$$

2.19.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y'&=F(x,y)\\&=-\frac{y^2a\lambda\,x^4-2y^2a\lambda\,x^3+y^2a\lambda\,x^2+b\,x^2+cx+s}{a\,x^2\,(x-1)^2}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=-\frac{x^2y^2\lambda}{(x-1)^2}+\frac{2x\,y^2\lambda}{(x-1)^2}-\frac{y^2\lambda}{(x-1)^2}-\frac{b}{a\,(x-1)^2}-\frac{c}{ax\,(x-1)^2}-\frac{s}{a\,x^2\,(x-1)^2}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x) = -\frac{b\,x^2+cx+s}{a\,x^2(x-1)^2}$, $f_1(x) = 0$ and $f_2(x) = -\frac{\lambda a\,x^4-2\lambda a\,x^3+\lambda a\,x^2}{a\,x^2(x-1)^2}$. Let

$$
\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{-\frac{(\lambda a\,x^4-2\lambda a\,x^3+\lambda a\,x^2)u}{a\,x^2(x-1)^2}}
\end{aligned} \tag{1}
$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$
f_2 u''(x) - (f_2' + f_1 f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}
$$

But

$$
f_2' = -\frac{4\lambda a\,x^3 - 6\lambda a\,x^2 + 2a\lambda x}{a\,x^2\,(x-1)^2} + \frac{2\lambda a\,x^4 - 4\lambda a\,x^3 + 2\lambda a\,x^2}{a\,x^3\,(x-1)^2} + \frac{2\lambda a\,x^4 - 4\lambda a\,x^3 + 2\lambda a\,x^2}{a\,x^2\,(x-1)^3}
$$

$$
f_1 f_2 = 0
$$

$$
f_2^2 f_0 = -\frac{(\lambda a\,x^4 - 2\lambda a\,x^3 + \lambda a\,x^2)^2\,(b\,x^2 + cx + s)}{a^3 x^6\,(x-1)^6}
$$

Substituting the above terms back in equation (2) gives

$$
-\frac{(\lambda a\,x^4 - 2\lambda a\,x^3 + \lambda a\,x^2)\,u''(x)}{a\,x^2\,(x-1)^2} - \left(-\frac{4\lambda a\,x^3 - 6\lambda a\,x^2 + 2a\lambda x}{a\,x^2\,(x-1)^2} + \frac{2\lambda a\,x^4 - 4\lambda a\,x^3 + 2\lambda a\,x^2}{a\,x^3\,(x-1)^2} + \frac{2\lambda a\,x^4 - \cdots}{a\,x^2 \cdots}\right.
$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$
\begin{aligned}
u(x) &= (x \\
&\quad -1)^{\frac{\sqrt{a}-\sqrt{(-4b-4c-4s)\lambda+a}}{2\sqrt{a}}} \left(c_2 x^{-\frac{-\sqrt{a}+\sqrt{-4\lambda s+a}}{2\sqrt{a}}} \operatorname{hypergeom}\left(\left[-\frac{\sqrt{(-4b-4c-4s)\lambda+a}-\sqrt{a}+\sqrt{-4\lambda s+a}\cdots}{2\sqrt{a}}\right.\right.\right. \\
&\quad +c_1 x^{\frac{\sqrt{-4\lambda s+a}+\sqrt{a}}{2\sqrt{a}}} \operatorname{hypergeom}\left(\left[\frac{-\sqrt{(-4b-4c-4s)\lambda+a}+\sqrt{a}+\sqrt{-4\lambda s+a}-\sqrt{-4b\lambda+a}}{2\sqrt{a}}, \frac{-\sqrt{(-4\cdots}}{}\right.\right.
\end{aligned}
$$

The above shows that

$$
\begin{aligned}
u'(x) &= \\
&\quad -\frac{x^{\frac{\sqrt{-4\lambda s+a}+\sqrt{a}}{2\sqrt{a}}}(x-1)^{\frac{\sqrt{a}-\sqrt{(-4b-4c-4s)\lambda+a}}{2\sqrt{a}}}\left(2s\sqrt{(-4b-4c-4s)\lambda+a}+(-c-2s)\sqrt{-4\lambda s+a}+\sqrt{a}\,c\right)c_1\cdots}{\cdots}
\end{aligned}
$$

Using the above in (1) gives the solution

Expression too large to display

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

The type(s) of ODE detected by this program : **"riccati", "first_order_ode_lie_symmetry_calculated"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{\left(a\,x^{2}+bx+c\right)^{2}\left(y'+y^{2}\right)=-A}$$

2.20.1 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$y'=-\frac{y^{2}a^{2}x^{4}+2y^{2}ab\,x^{3}+2a\,x^{2}y^{2}c+y^{2}b^{2}x^{2}+2y^{2}bcx+c^{2}y^{2}+A}{\left(a\,x^{2}+bx+c\right)^{2}}$$
$$y'=\omega(x,y)$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x+\omega(\eta_y-\xi_x)-\omega^2\xi_y-\omega_x\xi-\omega_y\eta=0 \tag{A}$$

The type of this ode is not in the lookup table. To determine ξ,η then (A) is solved using ansatz. Making bivariate polynomials of degree 2 to use as anstaz gives

$$\xi=x^{2}a_4+yxa_5+y^{2}a_6+xa_2+ya_3+a_1 \tag{1E}$$
$$\eta=x^{2}b_4+yxb_5+y^{2}b_6+xb_2+yb_3+b_1 \tag{2E}$$

Where the unknown coefficients are

$$\{a_1, a_2, a_3, a_4, a_5, a_6, b_1, b_2, b_3, b_4, b_5, b_6\}$$

Substituting equations (1E,2E) and ω into (A) gives

$$\begin{aligned}
&2xb_4 + yb_5 + b_2 \\
&- \frac{(y^2a^2x^4 + 2y^2ab\,x^3 + 2a\,x^2y^2c + y^2b^2x^2 + 2y^2bcx + c^2y^2 + A)\,(-2xa_4 + xb_5 - ya_5 + 2yb_6 - a_2 + b_3)}{(a\,x^2 + bx + c)^2} \\
&- \frac{(y^2a^2x^4 + 2y^2ab\,x^3 + 2a\,x^2y^2c + y^2b^2x^2 + 2y^2bcx + c^2y^2 + A)^2\,(xa_5 + 2ya_6 + a_3)}{(a\,x^2 + bx + c)^4} \\
&- \left(-\frac{4a^2x^3y^2 + 6ab\,x^2y^2 + 4acx\,y^2 + 2b^2x\,y^2 + 2bc\,y^2}{(a\,x^2 + bx + c)^2}\right. \\
&\left.+ \frac{2(y^2a^2x^4 + 2y^2ab\,x^3 + 2a\,x^2y^2c + y^2b^2x^2 + 2y^2bcx + c^2y^2 + A)\,(2xa + b)}{(a\,x^2 + bx + c)^3}\right)(x^2a_4 \\
&+ yxa_5 + y^2a_6 + xa_2 + ya_3 + a_1) \\
&+ \frac{(2a^2x^4y + 4ab\,x^3y + 4ac\,x^2y + 2b^2x^2y + 4bcxy + 2c^2y)\,(x^2b_4 + yxb_5 + y^2b_6 + xb_2 + yb_3 + b_1)}{(a\,x^2 + bx + c)^2} \\
&= 0
\end{aligned} \tag{5E}$$

Putting the above in normal form gives

Expression too large to display

Setting the numerator to zero gives

Expression too large to display (6E)

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\{x, y\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\{x = v_1, y = v_2\}$$

The above PDE (6E) now becomes

Expression too large to display (7E)

Collecting the above on the terms v_i introduced, and these are

$$\{v_1, v_2\}$$

Equation (7E) now becomes

$$\text{Expression too large to display} \tag{8E}$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$12$$
$$4$$
$$-8a$$
$$-24$$
$$-24$$
$$-8a$$

$$4$$
$$-12a^2c^2a_6 - 2$$
$$-4a\,c^3a_3 - 6$$
$$-4a^3ba_3 - 4$$
$$4a^3bb_2 + 8$$
$$12ab\,c^2a_5 + 4$$
$$-12ab\,c^2a_3 - 4a\,c^3a_5 - 4$$
$$-4a^3ca_3 - 6a^2b^2a_3 - 12$$
$$4a^3cb_2 + 6a^2b^2b_2 + 24$$
$$4a\,c^3a_5 + 6b^2c^2a_5 - 8$$
$$6a^2c^2a_5 + 12a\,b^2ca_5 +$$
$$a^4a_2 + a^4b_3 +$$
$$c^4a_2 + c^4b_3 - 2$$
$$-6a^2c^2a_3 - 12a\,b^2ca_3 - 12ab\,c^2a_5$$
$$-12a^2bca_3 - 6a^2c^2a_5 - 4a\,b^3a_3 -$$

Solving the above equations for the unknowns gives

$$
\begin{aligned}
a_1 &= -\frac{cb_3}{b} \\
a_2 &= -b_3 \\
a_3 &= 0 \\
a_4 &= -\frac{ab_3}{b} \\
a_5 &= 0 \\
a_6 &= 0 \\
b_1 &= -\frac{ab_3}{b} \\
b_2 &= 0 \\
b_3 &= b_3 \\
b_4 &= 0 \\
b_5 &= \frac{2ab_3}{b} \\
b_6 &= 0
\end{aligned}
$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$
\begin{aligned}
\xi &= -\frac{a\,x^2 + bx + c}{b} \\
\eta &= \frac{2axy + by - a}{b}
\end{aligned}
$$

Shifting is now applied to make $\xi = 0$ in order to simplify the rest of the computation

$$
\begin{aligned}
\eta &= \eta - \omega(x,y)\,\xi \\
&= \frac{2axy + by - a}{b} - \left(-\frac{y^2a^2x^4 + 2y^2ab\,x^3 + 2a\,x^2y^2c + y^2b^2x^2 + 2y^2bcx + c^2y^2 + A}{(a\,x^2 + bx + c)^2}\right)\left(-\frac{a\,x^2 + bx + c}{b}\right. \\
&= \frac{-y^2a^2x^4 - 2y^2ab\,x^3 + 2a^2x^3y - 2a\,x^2y^2c - y^2b^2x^2 + 3ab\,x^2y - 2y^2bcx - a^2x^2 + 2acxy + b^2xy - c^2y^2}{ab\,x^2 + b^2x + bc} \\
\xi &= 0
\end{aligned}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x, y) \to (R, S)$ where (R, S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}$$

The above comes from the requirements that $\left(\xi \frac{\partial}{\partial x} + \eta \frac{\partial}{\partial y}\right) S(x,y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$R = x$$

S is found from

$$\begin{aligned} S &= \int \frac{1}{\eta} dy \\ &= \int \frac{1}{\frac{-y^2a^2x^4-2y^2ab\,x^3+2a^2x^3y-2a\,x^2y^2c-y^2b^2x^2+3ab\,x^2y-2y^2bcx-a^2x^2+2acxy+b^2xy-c^2y^2-abx+ybc-ca-A}{ab\,x^2+b^2x+bc}} dy \end{aligned}$$

Which results in

$$S = -\frac{2(ab\,x^2+b^2x+bc)\arctan\left(\frac{2y(a^2x^4+2b\,x^3a+2ac\,x^2+b^2x^2+2bxc+c^2)-}{\sqrt{4a^3c\,x^4-a^2b^2x^4+4A\,a^2x^4+8a^2bc\,x^3-2a\,b^3x^3+8Aab\,x^3+8a^2c^2x^2+2a\,b^2c\,x^2-b}}\right.}{\sqrt{4a^3c\,x^4-a^2b^2x^4+4A\,a^2x^4+8a^2bc\,x^3-2a\,b^3x^3+8Aab\,x^3+8a^2c^2x^2+2a\,b^2c\,x^2-b^4x^2+8Aac}}$$

Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$\frac{dS}{dR} = \frac{S_x + \omega(x,y)S_y}{R_x + \omega(x,y)R_y} \tag{2}$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x,y)$ is the right hand side of the original ode given by

$$\omega(x,y) = -\frac{y^2a^2x^4 + 2y^2ab\,x^3 + 2a\,x^2y^2c + y^2b^2x^2 + 2y^2bcx + c^2y^2 + A}{(a\,x^2+bx+c)^2}$$

Evaluating all the partial derivatives gives

$$\begin{aligned} R_x &= 1 \\ R_y &= 0 \\ S_x &= -\frac{2(4axy+2by-2a)\,b}{(4ca-b^2+4A)\left(\frac{(2a\,x^2y+2bxy-2xa+2yc-b)^2}{4ca-b^2+4A}+1\right)} \\ S_y &= -\frac{2(2a\,x^2+2bx+2c)\,b}{(4ca-b^2+4A)\left(\frac{(2a\,x^2y+2bxy-2xa+2yc-b)^2}{4ca-b^2+4A}+1\right)} \end{aligned}$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$\frac{dS}{dR} = \frac{b}{a\,x^2 + bx + c} \tag{2A}$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$\frac{dS}{dR} = \frac{b}{R^2 a + Rb + c}$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = \frac{2b \arctan\left(\frac{2Ra+b}{\sqrt{4ca-b^2}}\right)}{\sqrt{4ca-b^2}} + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$-\frac{2\arctan\left(\frac{2a\,x^2y+2ybx-2xa+2yc-b}{\sqrt{4ca-b^2+4A}}\right)b}{\sqrt{4ca-b^2+4A}} = \frac{2b\arctan\left(\frac{2xa+b}{\sqrt{4ca-b^2}}\right)}{\sqrt{4ca-b^2}} + c_1$$

Which simplifies to

$$-\frac{2\arctan\left(\frac{2a\,x^2y+2ybx-2xa+2yc-b}{\sqrt{4ca-b^2+4A}}\right)b}{\sqrt{4ca-b^2+4A}} = \frac{2b\arctan\left(\frac{2xa+b}{\sqrt{4ca-b^2}}\right)}{\sqrt{4ca-b^2}} + c_1$$

Which gives

$$y = -\frac{\tan\left(\frac{\sqrt{4ca-b^2+4A}\left(\sqrt{4ca-b^2}\,c_1+2b\arctan\left(\frac{2xa+b}{\sqrt{4ca-b^2}}\right)\right)}{2\sqrt{4ca-b^2}\,b}\right)\sqrt{4ca-b^2+4A} - 2xa - b}{2\left(a\,x^2+bx+c\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\tan\left(\frac{\sqrt{4ca-b^2+4A}\left(\sqrt{4ca-b^2}\,c_1+2b\arctan\left(\frac{2xa+b}{\sqrt{4ca-b^2}}\right)\right)}{2\sqrt{4ca-b^2}\,b}\right)\sqrt{4ca-b^2+4A} - 2xa - b}{2\left(a\,x^2+bx+c\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\tan\left(\frac{\sqrt{4ca-b^2+4A}\left(\sqrt{4ca-b^2}\,c_1+2b\arctan\left(\frac{2xa+b}{\sqrt{4ca-b^2}}\right)\right)}{2\sqrt{4ca-b^2}\,b}\right)\sqrt{4ca-b^2+4A}-2xa-b}{2\left(a\,x^2+bx+c\right)}$$

Verified OK.

2.20.2 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{y^2a^2x^4+2y^2ab\,x^3+2a\,x^2y^2c+y^2b^2x^2+2y^2bcx+c^2y^2+A}{\left(a\,x^2+bx+c\right)^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{y^2a^2x^4}{\left(a\,x^2+bx+c\right)^2}-\frac{2y^2ab\,x^3}{\left(a\,x^2+bx+c\right)^2}-\frac{2a\,x^2y^2c}{\left(a\,x^2+bx+c\right)^2}-\frac{y^2b^2x^2}{\left(a\,x^2+bx+c\right)^2}-\frac{2y^2bcx}{\left(a\,x^2+bx+c\right)^2}-\frac{c^2}{\left(a\,x^2+\right.}$$

With Riccati ODE standard form

$$y' = f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x) = -\frac{A}{\left(a\,x^2+bx+c\right)^2}$, $f_1(x) = 0$ and $f_2(x) = -\frac{a^2x^4+2b\,x^3a+2ac\,x^2+b^2x^2+2bxc+c^2}{\left(a\,x^2+bx+c\right)^2}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{-\frac{\left(a^2x^4+2b\,x^3a+2ac\,x^2+b^2x^2+2bxc+c^2\right)u}{\left(a\,x^2+bx+c\right)^2}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x)-\left(f_2'+f_1f_2\right)u'(x)+f_2^2f_0u(x) = 0 \tag{2}$$

But

$$f_2' = -\frac{4a^2x^3+6ab\,x^2+4acx+2b^2x+2bc}{\left(a\,x^2+bx+c\right)^2}+\frac{2\left(a^2x^4+2b\,x^3a+2ac\,x^2+b^2x^2+2bxc+c^2\right)\left(2xa+b\right)}{\left(a\,x^2+bx+c\right)^3}$$

$$f_1f_2 = 0$$

$$f_2^2f_0 = -\frac{\left(a^2x^4+2b\,x^3a+2ac\,x^2+b^2x^2+2bxc+c^2\right)^2A}{\left(a\,x^2+bx+c\right)^6}$$

Substituting the above terms back in equation (2) gives

$$-\frac{(a^2x^4+2b\,x^3a+2ac\,x^2+b^2x^2+2bxc+c^2)\,u''(x)}{(a\,x^2+bx+c)^2}-\left(-\frac{4a^2x^3+6ab\,x^2+4acx+2b^2x+2bc}{(a\,x^2+bx+c)^2}+\frac{2(a^2x^4 \cdots}{}\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x)=\left(\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{\frac{a\sqrt{\frac{-4ca+b^2-4A}{a^2}}}{2\sqrt{-4ca+b^2}}}c_1+\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{-4ca+b^2-4A}{a^2}}}{2\sqrt{-4ca+b^2}}}c_2\right)\sqrt{a\,x^2+bx+c}$$

The above shows that

$$u'(x)=\frac{2\left(c_2\left(i\sqrt{4ca-b^2}\,\sqrt{\frac{-4ca+b^2-4A}{a^2}}\,a-2\sqrt{-4ca+b^2}\,\left(xa+\frac{b}{2}\right)\right)\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{-4ca+b^2-4A}{a^2}}}{2\sqrt{-4ca+b^2}}}-\left(i\sqrt{4ca \cdots\right.\right.}{\sqrt{-4ca+b^2}\,\left(-b+i\sqrt{4ca-b^2}- \cdots\right.}$$

Using the above in (1) gives the solution

$$y=\frac{2\left(c_2\left(i\sqrt{4ca-b^2}\,\sqrt{\frac{-4ca+b^2-4A}{a^2}}\,a-2\sqrt{-4ca+b^2}\,\left(xa+\frac{b}{2}\right)\right)\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{-4ca+b^2-4A}{a^2}}}{2\sqrt{-4ca+b^2}}}-\left(i\sqrt{4ca \cdots\right.\right.}{\sqrt{-4ca+b^2}\,\left(-b+i\sqrt{4ca-b^2}-2xa\right)\left(b+i\sqrt{4ca-b^2}+2xa\right)\left(a^2x^4+2b\,x^3a+2ac\,x^2+b^2 \cdots\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1}=c_3$ the following solution

$$
y = \frac{2\left(\left(i\sqrt{4ca-b^2}\,\sqrt{\frac{-4ca+b^2-4A}{a^2}}\,a-2\sqrt{-4ca+b^2}\,\left(xa+\frac{b}{2}\right)\right)\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{-4ca+b^2-4A}{a^2}}}{2\sqrt{-4ca+b^2}}}-\left(i\sqrt{4ca-\cdots}\right.\right.}{\sqrt{-4ca+b^2}\,\left(\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{\frac{a\sqrt{\frac{-4ca+b^2-4A}{a^2}}}{2\sqrt{-4ca+b^2}}}c_3+\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{-4ca+b^{\cdots}}{a^2}}}{2\sqrt{-4ca\cdots}}}\cdots\right.}
$$

Summary

The solution(s) found are the following

$$
y = \frac{2\left(\left(i\sqrt{4ca-b^2}\,\sqrt{\frac{-4ca+b^2-4A}{a^2}}\,a-2\sqrt{-4ca+b^2}\,\left(xa+\frac{b}{2}\right)\right)\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{-4ca+b^2-4A}{a^2}}}{2\sqrt{-4ca+b^2}}}-\left(i\sqrt{4ca-\cdots}\right.\right.}{\sqrt{-4ca+b^2}\,\left(\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{\frac{a\sqrt{\frac{-4ca+b^2-4A}{a^2}}}{2\sqrt{-4ca+b^2}}}c_3+\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{-4ca+b^{\cdots}}{a^2}}}{2\sqrt{-4ca\cdots}}}\cdots\right.} \quad (1)
$$

Verification of solutions

$$
y = \frac{2\left(\left(i\sqrt{4ca-b^2}\,\sqrt{\frac{-4ca+b^2-4A}{a^2}}\,a-2\sqrt{-4ca+b^2}\,\left(xa+\frac{b}{2}\right)\right)\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{-4ca+b^2-4A}{a^2}}}{2\sqrt{-4ca+b^2}}}-\left(i\sqrt{4ca-\cdots}\right.\right.}{\sqrt{-4ca+b^2}\,\left(\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{\frac{a\sqrt{\frac{-4ca+b^2-4A}{a^2}}}{2\sqrt{-4ca+b^2}}}c_3+\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{-4ca+b^{\cdots}}{a^2}}}{2\sqrt{-4ca\cdots}}}\cdots\right.}
$$

Problem number: 21.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{x^{n+1}y' - x^{2n}y^2 a = c\,x^m + d}$$

2.21.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \left(x^{2n} a\, y^2 + c\, x^m + d\right) x^{-n-1} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{x^n a\, y^2}{x} + \frac{x^{-n} c\, x^m}{x} + \frac{x^{-n} d}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = (c\, x^m + d)\, x^{-n-1}$, $f_1(x) = 0$ and $f_2(x) = x^{2n} a\, x^{-n-1}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{x^{2n} a\, x^{-n-1} u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$f_2' = \frac{2x^{2n} na\, x^{-n-1}}{x} - \frac{x^{2n} a\, x^{-n-1}(n+1)}{x}$$
$$f_1 f_2 = 0$$
$$f_2^2 f_0 = x^{4n} a^2 x^{-3n-3}(c\, x^m + d)$$

Substituting the above terms back in equation (2) gives

$$x^{2n} a\, x^{-n-1} u''(x) - \left(\frac{2x^{2n} na\, x^{-n-1}}{x} - \frac{x^{2n} a\, x^{-n-1}(n+1)}{x}\right) u'(x) + x^{4n} a^2 x^{-3n-3}(c\, x^m + d)\, u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{\frac{n}{2}} \left(\text{BesselY}\left(\frac{\sqrt{-4ad+n^2}}{m}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}}}{m}\right) c_2 + \text{BesselJ}\left(\frac{\sqrt{-4ad+n^2}}{m}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}}}{m}\right) c_1\right)$$

The above shows that

$$u'(x) = \frac{x^{-1+\frac{n}{2}} \left(-2\left(\text{BesselJ}\left(\frac{\sqrt{-4ad+n^2}}{m} + 1, \frac{2\sqrt{ca}\, x^{\frac{m}{2}}}{m}\right) c_1 + \text{BesselY}\left(\frac{\sqrt{-4ad+n^2}}{m} + 1, \frac{2\sqrt{ca}\, x^{\frac{m}{2}}}{m}\right) c_2\right) \sqrt{ca}\, x^{\frac{m}{2}} + \left(\text{Bes}\right.\right.}{2}$$

Using the above in (1) gives the solution

$$y = -\frac{x^{-1+\frac{n}{2}} \left(-2\left(\text{BesselJ}\left(\frac{\sqrt{-4ad+n^2}}{m} + 1, \frac{2\sqrt{ca}\, x^{\frac{m}{2}}}{m}\right) c_1 + \text{BesselY}\left(\frac{\sqrt{-4ad+n^2}}{m} + 1, \frac{2\sqrt{ca}\, x^{\frac{m}{2}}}{m}\right) c_2\right) \sqrt{ca}\, x^{\frac{m}{2}} + \left(\text{B}\right.\right.}{2a\left(\text{BesselY}\left(\frac{\sqrt{-4ad+n^2}}{m}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}}}{m}\right) c_2\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(-2\left(\mathrm{BesselJ}\left(\frac{\sqrt{-4ad+n^2}}{m}+1, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right)c_3 + \mathrm{BesselY}\left(\frac{\sqrt{-4ad+n^2}}{m}+1, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right)\right)\sqrt{ca}\,x^{\frac{m}{2}} + \left(\mathrm{BesselY}\left(\right.\right.\right.}{2a\left(\mathrm{BesselY}\left(\frac{\sqrt{-4ad+n^2}}{m}, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right) + \mathrm{BesselJ}\left(\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(-2\left(\mathrm{BesselJ}\left(\frac{\sqrt{-4ad+n^2}}{m}+1, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right)c_3 + \mathrm{BesselY}\left(\frac{\sqrt{-4ad+n^2}}{m}+1, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right)\right)\sqrt{ca}\,x^{\frac{m}{2}} + \left(\mathrm{BesselY}\left(\right.\right.\right.}{2a\left(\mathrm{BesselY}\left(\frac{\sqrt{-4ad+n^2}}{m}, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right) + \mathrm{BesselJ}\left(\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(-2\left(\mathrm{BesselJ}\left(\frac{\sqrt{-4ad+n^2}}{m}+1, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right)c_3 + \mathrm{BesselY}\left(\frac{\sqrt{-4ad+n^2}}{m}+1, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right)\right)\sqrt{ca}\,x^{\frac{m}{2}} + \left(\mathrm{BesselY}\left(\right.\right.\right.}{2a\left(\mathrm{BesselY}\left(\frac{\sqrt{-4ad+n^2}}{m}, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right) + \mathrm{BesselJ}\left(\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{(x^n a + b)\, y' - b y^2 = a\, x^{-2+n}}$$

2.22.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{y^2 b + a\, x^{-2+n}}{x^n a + b} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{y^2 b}{x^n a + b} + \frac{a\, x^n}{(x^n a + b)\, x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = \frac{a\, x^{-2+n}}{x^n a+b}$, $f_1(x) = 0$ and $f_2(x) = \frac{b}{x^n a+b}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{bu}{x^n a+b}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$f_2' = -\frac{ban\, x^n}{(x^n a + b)^2 x}$$
$$f_1 f_2 = 0$$
$$f_2^2 f_0 = \frac{b^2 a\, x^{-2+n}}{(x^n a + b)^3}$$

Substituting the above terms back in equation (2) gives

$$\frac{bu''(x)}{x^n a + b} + \frac{ban\, x^n u'(x)}{(x^n a + b)^2 x} + \frac{b^2 a\, x^{-2+n} u(x)}{(x^n a + b)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\left(\frac{x^n a + b}{b}\right)^{-\frac{2}{n}} c_1 x + \text{hypergeom}\left(\left[1, \frac{1}{n}\right], \left[1 - \frac{1}{n}\right], -\frac{a\, x^n}{b}\right) c_2\right) (x^n a + b)^{\frac{1}{n}}$$

The above shows that

$$u'(x) = \left(-\frac{2\left(\frac{x^n a+b}{b}\right)^{-\frac{2}{n}} a\, x^n c_1}{x^n a + b} + \left(\frac{x^n a + b}{b}\right)^{-\frac{2}{n}} c_1 - \frac{anc_2 x^{n-1}\, \text{hypergeom}\left(\left[2, 1 + \frac{1}{n}\right], \left[2 - \frac{1}{n}\right], -\frac{a\, x^n}{b}\right)}{b\,(n-1)}\right) (x^n a + b)^{\frac{1}{n}} + a(x^n a + b)^{-\frac{n-1}{n}} x^n \left(\left(\frac{x^n a + b}{b}\right)^{-\frac{2}{n}} c_1 + \frac{\text{hypergeom}\left(\left[1, \frac{1}{n}\right], \left[1 - \frac{1}{n}\right], -\frac{a\, x^n}{b}\right) c_2}{x}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\left(-\frac{2\left(\frac{x^n a+b}{b}\right)^{-\frac{2}{n}} a\, x^n c_1}{x^n a+b} + \left(\frac{x^n a+b}{b}\right)^{-\frac{2}{n}} c_1 - \frac{anc_2 x^{n-1}\, \text{hypergeom}\left(\left[2,1+\frac{1}{n}\right],\left[2-\frac{1}{n}\right],-\frac{a\, x^n}{b}\right)}{b(n-1)}\right) (x^n a + b)^{\frac{1}{n}} + a(x^n a + b}{b\left(\left(\frac{x^n a+b}{b}\right)^{-\frac{2}{n}} c_1 x + \text{hypergeom}\left(\left[1, \frac{1}{n}\right],\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{a\left(\frac{x^n a+b}{b}\right)^{\frac{2}{n}} n(a^2 x^{3n} + 2ab\, x^{2n} + x^n b^2) \operatorname{hypergeom}\left(\left[2, \frac{n+1}{n}\right], \left[\frac{2n-1}{n}\right], -\frac{a\, x^n}{b}\right) - b\Big(a\left(\frac{x^n a+b}{b}\right)^{\frac{2}{n}} (a\, x^{2n} + b\, x^n)}{b^2 (n-1)\, x \left(c_3 x + \operatorname{hypergeom}\left(\left[1, \frac{1}{n}\right], \left[\frac{n-1}{n}\right], -\frac{a\, x^n}{b}\right) \left(\frac{x^n}{}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{a\left(\frac{x^n a+b}{b}\right)^{\frac{2}{n}} n(a^2 x^{3n} + 2ab\, x^{2n} + x^n b^2) \operatorname{hypergeom}\left(\left[2, \frac{n+1}{n}\right], \left[\frac{2n-1}{n}\right], -\frac{a\, x^n}{b}\right) - b\Big(a\left(\frac{x^n a+b}{b}\right)^{\frac{2}{n}} (a\, x^{2n} + b\, x^n)}{b^2 (n-1)\, x \left(c_3 x + \operatorname{hypergeom}\left(\left[1, \frac{1}{n}\right], \left[\frac{n-1}{n}\right], -\frac{a\, x^n}{b}\right) \left(\frac{x^n}{}\right.\right.} \quad (1)$$

Verification of solutions

$$y = \frac{a\left(\frac{x^n a+b}{b}\right)^{\frac{2}{n}} n(a^2 x^{3n} + 2ab\, x^{2n} + x^n b^2) \operatorname{hypergeom}\left(\left[2, \frac{n+1}{n}\right], \left[\frac{2n-1}{n}\right], -\frac{a\, x^n}{b}\right) - b\Big(a\left(\frac{x^n a+b}{b}\right)^{\frac{2}{n}} (a\, x^{2n} + b\, x^n)}{b^2 (n-1)\, x \left(c_3 x + \operatorname{hypergeom}\left(\left[1, \frac{1}{n}\right], \left[\frac{n-1}{n}\right], -\frac{a\, x^n}{b}\right) \left(\frac{x^n}{}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 23.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{(x^n a + b\,x^m + c)\left(y' - y^2\right) = -an(n-1)\,x^{-2+n} - bm(m-1)\,x^{m-2}}$$

2.23.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^n y^2 + x^m y^2 b - a\,n^2 x^{-2+n} - b\,m^2 x^{m-2} + c\,y^2 + an\,x^{-2+n} + bm\,x^{m-2}}{x^n a + b\,x^m + c} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,x^n y^2}{x^n a + b\,x^m + c} + \frac{x^m y^2 b}{x^n a + b\,x^m + c} - \frac{a\,n^2 x^n}{(x^n a + b\,x^m + c)\,x^2} - \frac{b\,m^2 x^m}{(x^n a + b\,x^m + c)\,x^2} + \frac{c\,y^2}{x^n a + b\,x^m + c} + \frac{}{(x^n a}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{-a\,n^2 x^{-2+n} - b\,m^2 x^{m-2} + an\,x^{-2+n} + bm\,x^{m-2}}{x^n a + b\,x^m + c}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \frac{-a\, n^2 x^{-2+n} - b\, m^2 x^{m-2} + an\, x^{-2+n} + bm\, x^{m-2}}{x^n a + b\, x^m + c} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \frac{(-a\, n^2 x^{-2+n} - b\, m^2 x^{m-2} + an\, x^{-2+n} + bm\, x^{m-2})\, u(x)}{x^n a + b\, x^m + c} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\left(\int \frac{1}{(x^n a + b\, x^m + c)^2} dx\right) c_1 + c_2\right) (x^n a + b\, x^m + c)$$

The above shows that

$$u'(x) = \frac{c_1}{x^n a + b\, x^m + c} + \frac{\left(\left(\int \frac{1}{(x^n a + b\, x^m + c)^2} dx\right) c_1 + c_2\right) (x^n n a + b\, x^m m)}{x}$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{c_1}{x^n a + b\, x^m + c} + \frac{\left(\left(\int \frac{1}{(x^n a + b\, x^m + c)^2} dx\right) c_1 + c_2\right) (x^n n a + b\, x^m m)}{x}}{\left(\left(\int \frac{1}{(x^n a + b\, x^m + c)^2} dx\right) c_1 + c_2\right) (x^n a + b\, x^m + c)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\frac{c_3}{x^n a + b\, x^m + c} - \frac{\left(\left(\int \frac{1}{(x^n a + b\, x^m + c)^2} dx\right) c_3 + 1\right) (x^n n a + b\, x^m m)}{x}}{\left(\left(\int \frac{1}{(x^n a + b\, x^m + c)^2} dx\right) c_3 + 1\right) (x^n a + b\, x^m + c)}$$

Summary
The solution(s) found are the following

$$y = \frac{-\frac{c_3}{x^n a+b\,x^m+c}-\frac{\left(\left(\int \frac{1}{(x^n a+b\,x^m+c)^2}dx\right)c_3+1\right)(x^n n a+b\,x^m m)}{x}}{\left(\left(\int \frac{1}{(x^n a+b\,x^m+c)^2}dx\right)c_3+1\right)(x^n a+b\,x^m+c)} \tag{1}$$

Verification of solutions

$$y = \frac{-\frac{c_3}{x^n a+b\,x^m+c}-\frac{\left(\left(\int \frac{1}{(x^n a+b\,x^m+c)^2}dx\right)c_3+1\right)(x^n n a+b\,x^m m)}{x}}{\left(\left(\int \frac{1}{(x^n a+b\,x^m+c)^2}dx\right)c_3+1\right)(x^n a+b\,x^m+c)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 24.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a y^2 - y b = c x + k}$$

2.24.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= a\, y^2 + b y + c x + k \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\, y^2 + b y + c x + k$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = c x + k$, $f_1(x) = b$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= ab \\ f_2^2f_0 &= a^2(cx+k) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$au''(x) - abu'(x) + a^2(cx+k)\,u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = e^{\frac{bx}{2}}\left(\operatorname{AiryAi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)\,a - \frac{b^2}{4}\right)}{ac}\right)c_1 + \operatorname{AiryBi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)\,a - \frac{b^2}{4}\right)}{ac}\right)c_2\right)$$

The above shows that

$$u'(x) = \frac{e^{\frac{bx}{2}}\left(-2(ca)^{\frac{1}{3}}\operatorname{AiryAi}\left(1, -\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right)c_1 - 2(ca)^{\frac{1}{3}}\operatorname{AiryBi}\left(1, -\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right)c_2 + b\Big(\operatorname{AiryAi}\right.}{2}$$

Using the above in (1) gives the solution

$$y = -\frac{-2(ca)^{\frac{1}{3}}\operatorname{AiryAi}\left(1, -\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right)c_1 - 2(ca)^{\frac{1}{3}}\operatorname{AiryBi}\left(1, -\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right)c_2 + b\Big(\operatorname{AiryAi}\Big(}{2a\left(\operatorname{AiryAi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right)c_1 + \operatorname{AiryBi}\Big(-\frac{(ca)^{\frac{1}{3}}\left((c\right.}{}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\operatorname{AiryAi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right)c_3b - b\operatorname{AiryBi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right) + 2(ca)^{\frac{1}{3}}\left(\operatorname{AiryAi}\left(1, -\frac{(ca)^{\frac{1}{3}}\left((cx+k\right.}{ac}\right.\right.}{2a\left(\operatorname{AiryAi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right)c_3 + \operatorname{AiryBi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\right.}{ac}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{-\operatorname{AiryAi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right)c_3b - b\operatorname{AiryBi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right) + 2(ca)^{\frac{1}{3}}\left(\operatorname{AiryAi}\left(1, -\frac{(ca)^{\frac{1}{3}}\left((cx+k\right.}{ac}\right.\right.}{2a\left(\operatorname{AiryAi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right)c_3 + \operatorname{AiryBi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\right.}{ac}\right.\right.} \quad (1)$$

Verification of solutions

$$y = \frac{-\operatorname{AiryAi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right)c_3b - b\operatorname{AiryBi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right) + 2(ca)^{\frac{1}{3}}\left(\operatorname{AiryAi}\left(1, -\frac{(ca)^{\frac{1}{3}}\left((cx+k\right.}{ac}\right.\right.}{2a\left(\operatorname{AiryAi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\frac{b^2}{4}\right)}{ac}\right)c_3 + \operatorname{AiryBi}\left(-\frac{(ca)^{\frac{1}{3}}\left((cx+k)a-\right.}{ac}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 25.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - a\,x^n y = a\,x^{n-1}}$$

2.25.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + a\,x^n y + a\,x^{n-1} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\,x^n y + \frac{a\,x^n}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\,x^{n-1}$, $f_1(x) = x^n a$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= x^n a \\ f_2^2 f_0 &= a\, x^{n-1} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - x^n a u'(x) + a\, x^{n-1} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_2 \mathrm{e}^{\frac{a\, x^{n+1}}{2+2n}} (n+1) \left(a\, x^{-\frac{n}{2}} - n\, x^{-1-\frac{3n}{2}}\right) \mathrm{WhittakerM}\left(\frac{-n-2}{2+2n}, \frac{1+2n}{2+2n}, -\frac{x^{n+1} a}{n+1}\right) - x^{-1-\frac{3n}{2}} \mathrm{e}^{\frac{a\, x^{n+1}}{2+2n}} \mathrm{WhittakerM}\left(\frac{n}{2+2n}, \frac{1+2n}{2+2n}, -\frac{x^{n+1} a}{n+1}\right) c_2 n^2 + c_1 x$$

The above shows that

$$u'(x) = \frac{\left(\mathrm{e}^{\frac{x^n a x}{2+2n}} c_2 (n+1) \left(a x\, x^{\frac{n}{2}} + x^{-\frac{n}{2}} n^2\right) \mathrm{WhittakerM}\left(\frac{-n-2}{2+2n}, \frac{1+2n}{2+2n}, -\frac{x^n x a}{n+1}\right) + c_2 n \left(x^{-\frac{n}{2}} n^2 + a x\, x^{\frac{n}{2}} (n+1)\right) \mathrm{e}^{\frac{x^n a x}{2+2n}} \cdots}{x^2}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\mathrm{e}^{\frac{x^n a x}{2+2n}} c_2 (n+1) \left(a x\, x^{\frac{n}{2}} + x^{-\frac{n}{2}} n^2\right) \mathrm{WhittakerM}\left(\frac{-n-2}{2+2n}, \frac{1+2n}{2+2n}, -\frac{x^n x a}{n+1}\right) + c_2 n \left(x^{-\frac{n}{2}} n^2 + a x\, x^{\frac{n}{2}} (n+1)\right) \mathrm{e}^{\cdots}}{x^2 \left(c_2 \mathrm{e}^{\frac{a\, x^{n+1}}{2+2n}} (n+1) \left(a\, x^{-\frac{n}{2}} - n\, x^{-1-\frac{3n}{2}}\right) \mathrm{WhittakerM}\left(\frac{-n-2}{2+2n}, \frac{1+2n}{2+2n}, -\frac{x^{n+1} a}{n+1}\right) \cdots\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\mathrm{e}^{\frac{x^n a x}{2+2n}} (n+1) \left(a x\, x^{\frac{n}{2}} + x^{-\frac{n}{2}} n^2\right) \mathrm{WhittakerM}\left(\frac{-n-2}{2+2n}, \frac{1+2n}{2+2n}, -\frac{x^n x a}{n+1}\right) + n \left(x^{-\frac{n}{2}} n^2 + a x\, x^{\frac{n}{2}} (n+1)\right) \mathrm{e}^{\frac{x^n a x}{2+2n}} \cdots}{x \left(\mathrm{e}^{\frac{x^n a x}{2+2n}} (n+1) \left(x^{-\frac{n}{2}} a x - n\, x^{-\frac{3n}{2}}\right) \mathrm{WhittakerM}\left(\frac{-n-2}{2+2n}, \frac{1+2n}{2+2n}, -\frac{x^n x a}{n+1}\right) - \cdots\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(e^{\frac{x^n a x}{2+2n}}(n+1)\left(a x\, x^{\frac{n}{2}}+x^{-\frac{n}{2}} n^2\right) \mathrm{WhittakerM}\left(\frac{-n-2}{2+2n}, \frac{1+2n}{2+2n}, -\frac{x^n x a}{n+1}\right)+n\left(x^{-\frac{n}{2}} n^2+a x\, x^{\frac{n}{2}}(n+1)\right) e^{\frac{x^n a x}{2+2n}} \cdots\right.}{x\left(e^{\frac{x^n a x}{2+2n}}(n+1)\left(x^{-\frac{n}{2}} a x-n\, x^{-\frac{3n}{2}}\right) \mathrm{WhittakerM}\left(\frac{-n-2}{2+2n}, \frac{1+2n}{2+2n}, -\frac{x^n x a}{n+1}\right)- \cdots\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(e^{\frac{x^n a x}{2+2n}}(n+1)\left(a x\, x^{\frac{n}{2}}+x^{-\frac{n}{2}} n^2\right) \mathrm{WhittakerM}\left(\frac{-n-2}{2+2n}, \frac{1+2n}{2+2n}, -\frac{x^n x a}{n+1}\right)+n\left(x^{-\frac{n}{2}} n^2+a x\, x^{\frac{n}{2}}(n+1)\right) e^{\frac{x^n a x}{2+2n}} \cdots\right.}{x\left(e^{\frac{x^n a x}{2+2n}}(n+1)\left(x^{-\frac{n}{2}} a x-n\, x^{-\frac{3n}{2}}\right) \mathrm{WhittakerM}\left(\frac{-n-2}{2+2n}, \frac{1+2n}{2+2n}, -\frac{x^n x a}{n+1}\right)- \cdots\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - a\,x^n y = b\,x^{n-1}}$$

2.26.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + a\,x^n y + b\,x^{n-1} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\,x^n y + \frac{b\,x^n}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\,x^{n-1}$, $f_1(x) = x^n a$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= x^n a \\ f_2^2 f_0 &= b\, x^{n-1} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - x^n a u'(x) + b\, x^{n-1} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x\left(\text{KummerM}\left(\frac{a-b}{a\,(n+1)}, \frac{2+n}{n+1}, \frac{x^{n+1}a}{n+1}\right) c_1 + \text{KummerU}\left(\frac{a-b}{a\,(n+1)}, \frac{2+n}{n+1}, \frac{x^{n+1}a}{n+1}\right) c_2\right)$$

The above shows that

$$u'(x) = \frac{ac_1(n+1)\,(a-b)\,\text{KummerM}\left(-\frac{an+b}{a(n+1)} + 2, \frac{2+n}{n+1}, \frac{x^{n+1}a}{n+1}\right) - b\Big(c_2(a-b)\,\text{KummerU}\left(\frac{(2+n)a-b}{a(n+1)}, \frac{2+n}{n+1}, \frac{x^{n+1}a}{n+1}\right)}{a^2\,(n+1)}$$

Using the above in (1) gives the solution

$$y = -\frac{ac_1(n+1)\,(a-b)\,\text{KummerM}\left(-\frac{an+b}{a(n+1)} + 2, \frac{2+n}{n+1}, \frac{x^{n+1}a}{n+1}\right) - b\Big(c_2(a-b)\,\text{KummerU}\left(\frac{(2+n)a-b}{a(n+1)}, \frac{2+n}{n+1}, \frac{x^{n+1}}{n+1}\right.}{a^2\,(n+1)\,x\left(\text{KummerM}\left(\frac{a-b}{a(n+1)}, \frac{2+n}{n+1}, \frac{x^{n+1}a}{n+1}\right) c_1 +\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-ac_3(n+1)\,(a-b)\,\text{KummerM}\left(\frac{2+n-\frac{b}{a}}{n+1}, \frac{2+n}{n+1}, \frac{x^n xa}{n+1}\right) + b\Big((a-b)\,\text{KummerU}\left(\frac{2+n-\frac{b}{a}}{n+1}, \frac{2+n}{n+1}, \frac{x^n xa}{n+1}\right) - a\Big(\text{Ku}}{a^2\,(n+1)\,x\left(\text{KummerM}\left(\frac{a-b}{a(n+1)}, \frac{2+n}{n+1}, \frac{x^n xa}{n+1}\right) c_3 + \text{Kumm}\right.}$$

Summary
The solution(s) found are the following

$$y = \frac{-a c_3 (n+1)(a-b)\,\mathrm{KummerM}\left(\frac{2+n-\frac{b}{a}}{n+1}, \frac{2+n}{n+1}, \frac{x^n x a}{n+1}\right) + b\Big((a-b)\,\mathrm{KummerU}\left(\frac{2+n-\frac{b}{a}}{n+1}, \frac{2+n}{n+1}, \frac{x^n x a}{n+1}\right) - a\Big(\mathrm{Ku}}{a^2 (n+1)\, x \left(\mathrm{KummerM}\left(\frac{a-b}{a(n+1)}, \frac{2+n}{n+1}, \frac{x^n x a}{n+1}\right) c_3 + \mathrm{Kumm}\right.} \tag{1}$$

Verification of solutions

$$y = \frac{-a c_3 (n+1)(a-b)\,\mathrm{KummerM}\left(\frac{2+n-\frac{b}{a}}{n+1}, \frac{2+n}{n+1}, \frac{x^n x a}{n+1}\right) + b\Big((a-b)\,\mathrm{KummerU}\left(\frac{2+n-\frac{b}{a}}{n+1}, \frac{2+n}{n+1}, \frac{x^n x a}{n+1}\right) - a\Big(\mathrm{Ku}}{a^2 (n+1)\, x \left(\mathrm{KummerM}\left(\frac{a-b}{a(n+1)}, \frac{2+n}{n+1}, \frac{x^n x a}{n+1}\right) c_3 + \mathrm{Kumm}\right.}$$

Verified OK.

Problem number: 27.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - (\alpha x + \beta)\, y = a\, x^2 + bx + c}$$

2.27.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= a\, x^2 + \alpha xy + bx + \beta y + y^2 + c \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\, x^2 + \alpha xy + bx + \beta y + y^2 + c$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\, x^2 + bx + c$, $f_1(x) = \alpha x + \beta$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= \alpha x + \beta \\ f_2^2 f_0 &= a\,x^2 + bx + c \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - (\alpha x + \beta)\,u'(x) + \left(a\,x^2 + bx + c\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = 4\left(c_2\left(-\frac{1}{4}\alpha^2 x + xa - \frac{1}{4}\alpha\beta + \frac{1}{2}b\right)\text{hypergeom}\left(\left[\frac{\left(-\alpha^3 - 2\alpha^2 c + (2\beta b + 4a)\,\alpha + (-2\beta^2 + 8c)\,a - 2b^2\right)\sqrt{\alpha^2 - 4a} + 48\left(-\frac{\alpha^2}{4} + a\right)^2}{4\left(-\alpha^2 + 4a\right)^2}\right. \right.\right.$$

$$+ \frac{\text{hypergeom}\left(\left[\frac{\left(-\alpha^3 - 2\alpha^2c + (2\beta b + 4a)\alpha + (-2\beta^2 + 8c)a - 2b^2\right)\sqrt{\alpha^2 - 4a} + 16\left(-\frac{\alpha^2}{4} + a\right)^2}{4(-\alpha^2 + 4a)^2}\right], \left[\frac{1}{2}\right], \frac{\left(-\alpha^2 x + 4xa - \alpha\beta + 2b\right)^2}{2(\alpha^2 - 4a)^{\frac{3}{2}}}\right) c_1}{4}\Bigg) \mathrm{e}$$

The above shows that

Expression too large to display

Using the above in (1) gives the solution

Expression too large to display

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

Expression too large to display

Summary

The solution(s) found are the following

Expression too large to display (1)

Problem number: 28.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - a\,x^n y = -a\,x^n b - b^2}$$

2.28.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + a\,x^n y - a\,x^n b - b^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\,x^n y - a\,x^n b - b^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a\,x^n b - b^2$, $f_1(x) = x^n a$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= x^n a \\ f_2^2 f_0 &= -a\, x^n b - b^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - x^n a u'(x) + \left(-a\, x^n b - b^2\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\int \frac{-\left(\int \mathrm{e}^{\frac{a\, x^{n+1}+2bx(n+1)}{n+1}} dx\right) b + c_1 b + \mathrm{e}^{\frac{a\, x^{n+1}+2bx(n+1)}{n+1}}}{\int \mathrm{e}^{\frac{x(x^n a+2b(n+1))}{n+1}} dx - c_1} dx} c_2$$

The above shows that

$$u'(x) = - \frac{c_2 \left(-\left(\int \mathrm{e}^{\frac{x(x^n a+2b(n+1))}{n+1}} dx\right) b + c_1 b + \mathrm{e}^{\frac{x(x^n a+2b(n+1))}{n+1}}\right) \mathrm{e}^{\int \frac{-\left(\int \mathrm{e}^{\frac{x(x^n a+2b(n+1))}{n+1}} dx\right) b + c_1 b + \mathrm{e}^{\frac{x(x^n a+2b(n+1))}{n+1}}}{\int \mathrm{e}^{\frac{x(x^n a+2b(n+1))}{n+1}} dx - c_1} dx}}{-\left(\int \mathrm{e}^{\frac{x(x^n a+2b(n+1))}{n+1}} dx\right) + c_1}$$

Using the above in (1) gives the solution

$$y = \frac{\left(-\left(\int \mathrm{e}^{\frac{x(x^n a+2b(n+1))}{n+1}} dx\right) b + c_1 b + \mathrm{e}^{\frac{x(x^n a+2b(n+1))}{n+1}}\right) \mathrm{e}^{\int \frac{-\left(\int \mathrm{e}^{\frac{x(x^n a+2b(n+1))}{n+1}} dx\right) b + c_1 b + \mathrm{e}^{\frac{x(x^n a+2b(n+1))}{n+1}}}{\int \mathrm{e}^{\frac{x(x^n a+2b(n+1))}{n+1}} dx - c_1} dx}\ \mathrm{e}^{\int - \frac{\int -b\, \mathrm{e}^{\frac{a\, x^{n+ \cdots}}{}}}{}}}{-\left(\int \mathrm{e}^{\frac{x(x^n a+2b(n+1))}{n+1}} dx\right) + c_1}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\int e^{\frac{a\,x^{n+1}+2bx(n+1)}{n+1}}dx - c_3\right)b - e^{\frac{a\,x^{n+1}+2bx(n+1)}{n+1}}}{\int e^{\frac{x(x^n a+2b(n+1))}{n+1}}dx - c_3}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(\int e^{\frac{a\,x^{n+1}+2bx(n+1)}{n+1}}dx - c_3\right)b - e^{\frac{a\,x^{n+1}+2bx(n+1)}{n+1}}}{\int e^{\frac{x(x^n a+2b(n+1))}{n+1}}dx - c_3} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\int e^{\frac{a\,x^{n+1}+2bx(n+1)}{n+1}}dx - c_3\right)b - e^{\frac{a\,x^{n+1}+2bx(n+1)}{n+1}}}{\int e^{\frac{x(x^n a+2b(n+1))}{n+1}}dx - c_3}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + (n+1)\, x^n y^2 = a\, x^{1+m+n} - a\, x^m}$$

2.29.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -x^n n\, y^2 - x^n y^2 + a\, x^{1+m+n} - a\, x^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -x^n n\, y^2 - x^n y^2 + ax\, x^m x^n - a\, x^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\, x^{1+m+n} - a\, x^m$, $f_1(x) = 0$ and $f_2(x) = -n\, x^n - x^n$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{(-n\, x^n - x^n)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{n^2x^n}{x} - \frac{x^n n}{x} \\ f_1f_2 &= 0 \\ f_2^2f_0 &= (-n\,x^n - x^n)^2\left(a\,x^{1+m+n} - a\,x^m\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$(-n\,x^n - x^n)\,u''(x) - \left(-\frac{n^2x^n}{x} - \frac{x^n n}{x}\right)u'(x) + (-n\,x^n - x^n)^2\left(a\,x^{1+m+n} - a\,x^m\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{-a\_Y(x)\,(n+1)\,x^{m+2n+2} + a\_Y(x)\,(n+1)\,x^{1+m+n} - n\_Y'(x) + \_Y''(x)\,x}{x}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-a\_Y(x)\,(n+1)\,x^{m+2n+2} + a\_Y(x)\,(n+1)\,x^{1+m+n} - n\_Y'(x) + \_Y''(x)\,x}{x}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-a\_Y(x)(n+1)x^{m+2n+2}+a\_Y(x)(n+1)x^{1+m+n}-n\_Y'(x)+\_Y''(x)x}{x}\right\}, \{\_Y(x)\}\right)}{(-n\,x^n - x^n)\,\mathrm{DESol}\left(\left\{\frac{-a\_Y(x)(n+1)x^{m+2n+2}+a\_Y(x)(n+1)x^{1+m+n}-n\_Y'(x)+\_Y''(x)x}{x}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-a\_Y(x)(n+1)x^{m+2n+2}+a\_Y(x)(n+1)x^{1+m+n}-n\_Y'(x)+\_Y''(x)x}{x}\right\}, \{\_Y(x)\}\right)\right)x^{-n}}{(n+1)\,\mathrm{DESol}\left(\left\{\frac{-a\_Y(x)(n+1)x^{m+2n+2}+a\_Y(x)(n+1)x^{1+m+n}-n\_Y'(x)+\_Y''(x)x}{x}\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{-a\_\_Y(x)(n+1)x^{m+2n+2}+a\_\_Y(x)(n+1)x^{1+m+n}-n\_\_Y'(x)+\_\_Y''(x)x}{x}\right\},\{\_\_Y(x)\}\right)\right)x^{-n}}{(n+1)\,\mathrm{DESol}\left(\left\{\frac{-a\_\_Y(x)(n+1)x^{m+2n+2}+a\_\_Y(x)(n+1)x^{1+m+n}-n\_\_Y'(x)+\_\_Y''(x)x}{x}\right\},\{\_\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{-a\_\_Y(x)(n+1)x^{m+2n+2}+a\_\_Y(x)(n+1)x^{1+m+n}-n\_\_Y'(x)+\_\_Y''(x)x}{x}\right\},\{\_\_Y(x)\}\right)\right)x^{-n}}{(n+1)\,\mathrm{DESol}\left(\left\{\frac{-a\_\_Y(x)(n+1)x^{m+2n+2}+a\_\_Y(x)(n+1)x^{1+m+n}-n\_\_Y'(x)+\_\_Y''(x)x}{x}\right\},\{\_\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 30.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,x^n y^2 - b\,x^m y = bc\,x^m - a\,c^2 x^n}$$

2.30.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,x^n y^2 + x^m b y + bc\,x^m - a\,c^2 x^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,x^n y^2 + x^m b y + bc\,x^m - a\,c^2 x^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = bc\,x^m - a\,c^2 x^n$, $f_1(x) = b\,x^m$ and $f_2(x) = x^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{x^n a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{an\, x^n}{x} \\ f_1 f_2 &= b\, x^m x^n a \\ f_2^2 f_0 &= x^{2n} a^2 \left(bc\, x^m - a\, c^2 x^n\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^n a u''(x) - \left(\frac{an\, x^n}{x} + b\, x^m x^n a\right) u'(x) + x^{2n} a^2 \left(bc\, x^m - a\, c^2 x^n\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \text{DESol}\left(\left\{\_Y''(x) - \_Y'(x)\left(\frac{n}{x} + b\, x^m\right) + a\_Y(x)\left(bc\, x^{m+n} - a\, c^2 x^{2n}\right)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$\begin{aligned} u'(x) = \frac{\partial}{\partial x} \text{DESol}\bigg(\bigg\{&\_Y''(x) - \_Y'(x)\left(\frac{n}{x} + b\, x^m\right) \\ &+ a\_Y(x)\left(bc\, x^{m+n} - a\, c^2 x^{2n}\right)\bigg\}, \{\_Y(x)\}\bigg) \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \text{DESol}\left(\left\{\_Y''(x) - \_Y'(x)\left(\frac{n}{x} + b\, x^m\right) + a\_Y(x)\left(bc\, x^{m+n} - a\, c^2 x^{2n}\right)\right\}, \{\_Y(x)\}\right)\right) x^{-n}}{a\, \text{DESol}\left(\left\{\_Y''(x) - \_Y'(x)\left(\frac{n}{x} + b\, x^m\right) + a\_Y(x)\left(bc\, x^{m+n} - a\, c^2 x^{2n}\right)\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \text{DESol}\left(\left\{\frac{-x^{2n}\_Y(x) a^2 c^2 x + x^{m+n}\_Y(x) abcx - x^{m+1}\_Y'(x) b + \_Y''(x) x - n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)\right) x^{-n}}{a\, \text{DESol}\left(\left\{\frac{-x^{1+2n} a^2 c^2\_Y(x) + abc\, x^{1+m+n}\_Y(x) + \_Y''(x) x - \_Y'(x)(x^{m+1} b + n)}{x}\right\}, \{\_Y(x)\}\right)}$$

Summary
The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-x^{2n}\_Y(x)a^2c^2x+x^{m+n}\_Y(x)abcx-x^{m+1}\_Y'(x)b+\_Y''(x)x-n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)\right)x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{-x^{1+2n}a^2c^2\_Y(x)+abc\,x^{1+m+n}\_Y(x)+\_Y''(x)x-\_Y'(x)(x^{m+1}b+n)}{x}\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-x^{2n}\_Y(x)a^2c^2x+x^{m+n}\_Y(x)abcx-x^{m+1}\_Y'(x)b+\_Y''(x)x-n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)\right)x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{-x^{1+2n}a^2c^2\_Y(x)+abc\,x^{1+m+n}\_Y(x)+\_Y''(x)x-\_Y'(x)(x^{m+1}b+n)}{x}\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 31.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - a\,x^n y^2 + a\,x^n (b\,x^m + c)\,y = bm\,x^{m-1}}$$

2.31.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -x^n x^m aby - x^n acy + a\,x^n y^2 + bm\,x^{m-1} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -x^n x^m aby - x^n acy + a\,x^n y^2 + \frac{b\,x^m m}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = bm\,x^{m-1}$, $f_1(x) = -b\,x^m x^n a - x^n ac$ and $f_2(x) = x^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{x^n au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{an\, x^n}{x} \\ f_1f_2 &= (-b\, x^m x^n a - x^n ac)\, x^n a \\ f_2^2 f_0 &= x^{2n} a^2 bm\, x^{m-1} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^n au''(x) - \left((-b\, x^m x^n a - x^n ac)\, x^n a + \frac{an\, x^n}{x}\right) u'(x) + x^{2n} a^2 bm\, x^{m-1} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{\_Y'(x)\, x^{1+m+n} ab + \_Y''(x)\, x + abm\, x^{m+n}\_Y(x) + \_Y'(x)\,(a\, x^{n+1} c - n)}{x}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_Y'(x)\, x^{1+m+n} ab + \_Y''(x)\, x + abm\, x^{m+n}\_Y(x) + \_Y'(x)\,(a\, x^{n+1} c - n)}{x}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_Y'(x) x^{1+m+n} ab + \_Y''(x) x + abm\, x^{m+n}\_Y(x) + \_Y'(x)(a\, x^{n+1} c - n)}{x}\right\}, \{\_Y(x)\}\right)\right) x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{\_Y'(x) x^{1+m+n} ab + \_Y''(x) x + abm\, x^{m+n}\_Y(x) + \_Y'(x)(a\, x^{n+1} c - n)}{x}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_Y'(x) x^{1+m+n} ab + \_Y''(x) x + abm\, x^{m+n}\_Y(x) + \_Y'(x)(a\, x^{n+1} c - n)}{x}\right\}, \{\_Y(x)\}\right)\right) x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{\_Y'(x) x^{1+m+n} ab + \_Y''(x) x + abm\, x^{m+n}\_Y(x) + \_Y'(x)(a\, x^{n+1} c - n)}{x}\right\}, \{\_Y(x)\}\right)}$$

Summary
The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_Y'(x)x^{1+m+n}ab+\_Y''(x)x+abm\,x^{m+n}\_Y(x)+\_Y'(x)(a\,x^{n+1}c-n)}{x}\right\},\{\_Y(x)\}\right)\right)x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{\_Y'(x)x^{1+m+n}ab+\_Y''(x)x+abm\,x^{m+n}\_Y(x)+\_Y'(x)(a\,x^{n+1}c-n)}{x}\right\},\{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_Y'(x)x^{1+m+n}ab+\_Y''(x)x+abm\,x^{m+n}\_Y(x)+\_Y'(x)(a\,x^{n+1}c-n)}{x}\right\},\{\_Y(x)\}\right)\right)x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{\_Y'(x)x^{1+m+n}ab+\_Y''(x)x+abm\,x^{m+n}\_Y(x)+\_Y'(x)(a\,x^{n+1}c-n)}{x}\right\},\{\_Y(x)\}\right)}$$

Verified OK.

Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 32.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + an\,x^{n-1}y^2 - c\,x^m(x^n a + b)\,y = -c\,x^m}$$

2.32.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -x^{n-1}an\,y^2 + x^m x^n acy + x^m bcy - c\,x^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{x^n an\,y^2}{x} + x^m x^n acy + x^m bcy - c\,x^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -c\,x^m$, $f_1(x) = ac\,x^m x^n + bc\,x^m$ and $f_2(x) = -an\,x^{n-1}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{-an\,x^{n-1}u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{an\,x^{n-1}(n-1)}{x} \\
f_1 f_2 &= -(ac\,x^m x^n + bc\,x^m)\,an\,x^{n-1} \\
f_2^2 f_0 &= -a^2 n^2 x^{2n-2} c\,x^m
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$-an\,x^{n-1}u''(x) - \left(-\frac{an\,x^{n-1}(n-1)}{x} - (ac\,x^m x^n + bc\,x^m)\,an\,x^{n-1}\right)u'(x) - a^2 n^2 x^{2n-2} c\,x^m u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\left(\int \frac{x^{n-1} e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}}}{(x^n a + b)^2} dx\right) c_2 + c_1\right)(x^n a + b)$$

The above shows that

$$u'(x) = \frac{\left(anc_2(x^n a + b)\left(\int \frac{x^n e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}}}{x(x^n a+b)^2} dx\right) + e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}} c_2 + anc_1(x^n a + b)\right) x^n}{x\,(x^n a + b)}$$

Using the above in (1) gives the solution

$$y = \frac{\left(anc_2(x^n a + b)\left(\int \frac{x^n e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}}}{x(x^n a+b)^2} dx\right) + e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}} c_2 + anc_1(x^n a + b)\right) x^n x^{1-n}}{x\,(x^n a + b)^2 an\left(\left(\int \frac{x^{n-1} e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}}}{(x^n a+b)^2} dx\right) c_2 + c_1\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{an(x^n a + b)\left(\int \frac{x^n e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}}}{x(x^n a+b)^2}dx\right) + a^2 n c_3 x^n + a n c_3 b + e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}}}{an\,(x^n a + b)^2\left(\int \frac{x^n e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}}}{x(x^n a+b)^2}dx + c_3\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{an(x^n a + b)\left(\int \frac{x^n e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}}}{x(x^n a+b)^2}dx\right) + a^2 n c_3 x^n + a n c_3 b + e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}}}{an\,(x^n a + b)^2\left(\int \frac{x^n e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}}}{x(x^n a+b)^2}dx + c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{an(x^n a + b)\left(\int \frac{x^n e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}}}{x(x^n a+b)^2}dx\right) + a^2 n c_3 x^n + a n c_3 b + e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}}}{an\,(x^n a + b)^2\left(\int \frac{x^n e^{\frac{(a(m+1)x^n + b(1+m+n))c\,x^m x}{(m+1)(1+m+n)}}}{x(x^n a+b)^2}dx + c_3\right)}$$

Verified OK.

$$\boxed{y' - a\,x^n y^2 - b\,x^m y = ck\,x^{k-1} - bc\,x^{k+m} - a\,c^2 x^{n+2k}}$$

2.33.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,x^n y^2 + x^m b y + ck\,x^{k-1} - bc\,x^{k+m} - a\,c^2 x^{n+2k} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,x^n y^2 + x^m b y + \frac{ck\,x^k}{x} - bc\,x^k x^m - a\,c^2 x^n x^{2k}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = ck\,x^{k-1} - bc\,x^{k+m} - a\,c^2 x^{n+2k}$, $f_1(x) = b\,x^m$ and $f_2(x) = x^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{x^n a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{an\,x^n}{x} \\
f_1f_2 &= b\,x^m x^n a \\
f_2^2f_0 &= x^{2n}a^2\left(ck\,x^{k-1} - bc\,x^{k+m} - a\,c^2x^{n+2k}\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^n a u''(x) - \left(\frac{an\,x^n}{x} + b\,x^m x^n a\right)u'(x) + x^{2n}a^2\left(ck\,x^{k-1} - bc\,x^{k+m} - a\,c^2x^{n+2k}\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \_Y'(x)\left(\frac{n}{x} + b\,x^m\right) + x^n a\left(ck\,x^{k-1} - bc\,x^{k+m} - a\,c^2x^{n+2k}\right)\_Y(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \_Y'(x)\left(\frac{n}{x} + b\,x^m\right) + x^n a\left(ck\,x^{k-1} - bc\,x^{k+m} - a\,c^2x^{n+2k}\right)\_Y(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \_Y'(x)\left(\frac{n}{x} + b\,x^m\right) + x^n a\left(ck\,x^{k-1} - bc\,x^{k+m} - a\,c^2x^{n+2k}\right)\_Y(x)\right\}, \{\_Y(x)\}\right)\right.}{a\,\mathrm{DESol}\left(\left\{\_Y''(x) - \_Y'(x)\left(\frac{n}{x} + b\,x^m\right) + x^n a\left(ck\,x^{k-1} - bc\,x^{k+m} - a\,c^2x^{n+2k}\right)\_Y(x)\right\}, \{\_Y(x)\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-x^{n+2k}x^{n+1}\_Y(x)a^2c^2 - ac\_Y(x)(-k\,x^{k-1} + x^{k+m}b)x^{n+1} + \_Y''(x)x - \_Y'(x)(x^{m+1}b + n)}{x}\right\}, \{\_Y(x)\}\right)\right.}{a\,\mathrm{DESol}\left(\left\{\frac{-x^{2n+2k+1}\_Y(x)a^2c^2 - x^{k+1+m+n}\_Y(x)abc + \_Y''(x)x + x^{k+n}\_Y(x)ack - \_Y'(x)(x^{m+1}b+n)}{x}\right\}, \{\_Y(x\right.}$$

Summary
The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-x^{n+2k}x^{n+1}\_\_Y(x)a^2c^2 - ac\_\_Y(x)(-k\,x^{k-1}+x^{k+m}b)x^{n+1} + \_\_Y''(x)x - \_\_Y'(x)(x^{m+1}b+n)}{x}\right\}, \{\_\_Y(x)\}\right)}{a\,\mathrm{DESol}\left(\left\{\frac{-x^{2n+2k+1}\_\_Y(x)a^2c^2 - x^{k+1+m+n}\_\_Y(x)abc + \_\_Y''(x)x + x^{k+n}\_\_Y(x)ack - \_\_Y'(x)(x^{m+1}b+n)}{x}\right\}, \{\_\_Y(x)}\tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-x^{n+2k}x^{n+1}\_\_Y(x)a^2c^2 - ac\_\_Y(x)(-k\,x^{k-1}+x^{k+m}b)x^{n+1} + \_\_Y''(x)x - \_\_Y'(x)(x^{m+1}b+n)}{x}\right\}, \{\_\_Y(x)\}\right)}{a\,\mathrm{DESol}\left(\left\{\frac{-x^{2n+2k+1}\_\_Y(x)a^2c^2 - x^{k+1+m+n}\_\_Y(x)abc + \_\_Y''(x)x + x^{k+n}\_\_Y(x)ack - \_\_Y'(x)(x^{m+1}b+n)}{x}\right\}, \{\_\_Y(x)}$$

Verified OK.

Problem number: 34.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{y'x - a y^2 - yb = c\,x^{2b}}$$

2.34.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,y^2 + by + c\,x^{2b}}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,y^2}{x} + \frac{c\,x^{2b}}{x} + \frac{by}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{c\,x^{2b}}{x}$, $f_1(x) = \frac{b}{x}$ and $f_2(x) = \frac{a}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{au}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{a}{x^2} \\ f_1 f_2 &= \frac{ab}{x^2} \\ f_2^2 f_0 &= \frac{a^2 c\, x^{2b}}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a u''(x)}{x} - \left(-\frac{a}{x^2} + \frac{ab}{x^2}\right) u'(x) + \frac{a^2 c\, x^{2b} u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \sin\left(\frac{x^b \sqrt{ca}}{b}\right) + c_2 \cos\left(\frac{x^b \sqrt{ca}}{b}\right)$$

The above shows that

$$u'(x) = \frac{x^b \sqrt{ca}\left(c_1 \cos\left(\frac{x^b \sqrt{ca}}{b}\right) - c_2 \sin\left(\frac{x^b \sqrt{ca}}{b}\right)\right)}{x}$$

Using the above in (1) gives the solution

$$y = -\frac{x^b \sqrt{ca}\left(c_1 \cos\left(\frac{x^b \sqrt{ca}}{b}\right) - c_2 \sin\left(\frac{x^b \sqrt{ca}}{b}\right)\right)}{a\left(c_1 \sin\left(\frac{x^b \sqrt{ca}}{b}\right) + c_2 \cos\left(\frac{x^b \sqrt{ca}}{b}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-c_3 \cos\left(\frac{x^b \sqrt{ca}}{b}\right) + \sin\left(\frac{x^b \sqrt{ca}}{b}\right)\right) x^b \sqrt{ca}}{\left(c_3 \sin\left(\frac{x^b \sqrt{ca}}{b}\right) + \cos\left(\frac{x^b \sqrt{ca}}{b}\right)\right) a}$$

Summary
The solution(s) found are the following

$$y = \frac{\left(-c_3 \cos\left(\frac{x^b \sqrt{ca}}{b}\right) + \sin\left(\frac{x^b \sqrt{ca}}{b}\right)\right) x^b \sqrt{ca}}{\left(c_3 \sin\left(\frac{x^b \sqrt{ca}}{b}\right) + \cos\left(\frac{x^b \sqrt{ca}}{b}\right)\right) a} \tag{1}$$

Verification of solutions

$$y = \frac{\left(-c_3 \cos\left(\frac{x^b \sqrt{ca}}{b}\right) + \sin\left(\frac{x^b \sqrt{ca}}{b}\right)\right) x^b \sqrt{ca}}{\left(c_3 \sin\left(\frac{x^b \sqrt{ca}}{b}\right) + \cos\left(\frac{x^b \sqrt{ca}}{b}\right)\right) a}$$

Verified OK.

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{y'x - ay^2 - yb = c\,x^n}$$

2.35.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,y^2 + by + c\,x^n}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,y^2}{x} + \frac{c\,x^n}{x} + \frac{by}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{c\,x^n}{x}$, $f_1(x) = \frac{b}{x}$ and $f_2(x) = \frac{a}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{au}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{a}{x^2} \\ f_1f_2 &= \frac{ab}{x^2} \\ f_2^2 f_0 &= \frac{a^2 c\, x^n}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{au''(x)}{x} - \left(-\frac{a}{x^2} + \frac{ab}{x^2}\right) u'(x) + \frac{a^2 c\, x^n u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\text{BesselJ}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_1 + \text{BesselY}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_2\right) x^{\frac{b}{2}}$$

The above shows that

$$\begin{aligned} u'(x) = -x^{-1+\frac{b}{2}}\Bigg(\sqrt{ca}\, x^{\frac{n}{2}} \,\text{BesselJ}\left(\frac{b+n}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_1 \\ + \text{BesselY}\left(\frac{b+n}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) \sqrt{ca}\, x^{\frac{n}{2}} c_2 \\ - b\left(\text{BesselJ}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_1 + \text{BesselY}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_2\right)\Bigg) \end{aligned}$$

Using the above in (1) gives the solution

$$y = \frac{x^{-1+\frac{b}{2}}\left(\sqrt{ca}\, x^{\frac{n}{2}} \,\text{BesselJ}\left(\frac{b+n}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_1 + \text{BesselY}\left(\frac{b+n}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) \sqrt{ca}\, x^{\frac{n}{2}} c_2 - b\left(\text{BesselJ}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c\right.\right.}{a\left(\text{BesselJ}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_1 + \text{BesselY}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_2\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\mathrm{BesselJ}\left(\frac{b+n}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 + \mathrm{BesselY}\left(\frac{b+n}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right)\right)\sqrt{ca}\, x^{\frac{n}{2}} - b\left(\mathrm{BesselJ}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 + \mathrm{BesselY}\left(\cdots\right.\right.}{a\left(\mathrm{BesselJ}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 + \mathrm{BesselY}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right)\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(\mathrm{BesselJ}\left(\frac{b+n}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 + \mathrm{BesselY}\left(\frac{b+n}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right)\right)\sqrt{ca}\, x^{\frac{n}{2}} - b\left(\mathrm{BesselJ}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 + \mathrm{BesselY}\left(\cdots\right.\right.}{a\left(\mathrm{BesselJ}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 + \mathrm{BesselY}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right)\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\mathrm{BesselJ}\left(\frac{b+n}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 + \mathrm{BesselY}\left(\frac{b+n}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right)\right)\sqrt{ca}\, x^{\frac{n}{2}} - b\left(\mathrm{BesselJ}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 + \mathrm{BesselY}\left(\cdots\right.\right.}{a\left(\mathrm{BesselJ}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 + \mathrm{BesselY}\left(\frac{b}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right)\right)}$$

Verified OK.

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{y'x - ay^2 - (n + b\,x^n)\,y = c\,x^{2n}}$$

2.36.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{x^n by + a\,y^2 + c\,x^{2n} + ny}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{x^n by}{x} + \frac{a\,y^2}{x} + \frac{c\,x^{2n}}{x} + \frac{ny}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{c\,x^{2n}}{x}$, $f_1(x) = \frac{n+b\,x^n}{x}$ and $f_2(x) = \frac{a}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{au}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{a}{x^2} \\ f_1 f_2 &= \frac{(n + b\,x^n)\,a}{x^2} \\ f_2^2 f_0 &= \frac{a^2 c\,x^{2n}}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a u''(x)}{x} - \left(-\frac{a}{x^2} + \frac{(n + b\,x^n)\,a}{x^2}\right) u'(x) + \frac{a^2 c\,x^{2n} u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\frac{x^n b}{2n}} \left(c_1 \sinh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + c_2 \cosh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right)\right)$$

The above shows that

$$u'(x) = \frac{\left(\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n c_1 + c_2 b\right) \cosh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + \sinh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) \left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n c_2 + c_1 b\right)\right) x^{n-1} \mathrm{e}^{\frac{x^n b}{2n}}}{2}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n c_1 + c_2 b\right) \cosh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + \sinh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) \left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n c_2 + c_1 b\right)\right) x^{n-1} x}{2a \left(c_1 \sinh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + c_2 \cosh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{x^n \left(\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n c_3 + b \right) \cosh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2} \right) + \sinh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2} \right) \left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n + b c_3 \right) \right)}{2a \left(c_3 \sinh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2} \right) + \cosh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2} \right) \right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{x^n \left(\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n c_3 + b \right) \cosh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2} \right) + \sinh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2} \right) \left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n + b c_3 \right) \right)}{2a \left(c_3 \sinh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2} \right) + \cosh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2} \right) \right)} \tag{1}$$

Verification of solutions

$$y = -\frac{x^n \left(\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n c_3 + b \right) \cosh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2} \right) + \sinh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2} \right) \left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n + b c_3 \right) \right)}{2a \left(c_3 \sinh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2} \right) + \cosh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2} \right) \right)}$$

Verified OK.

Problem number: 37.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{y'x - y^2x - ay = b\,x^n}$$

2.37.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{x\,y^2 + ya + b\,x^n}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \frac{b\,x^n}{x} + \frac{ya}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{b\,x^n}{x}$, $f_1(x) = \frac{a}{x}$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \frac{a}{x} \\ f_2^2 f_0 &= \frac{b\, x^n}{x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \frac{a u'(x)}{x} + \frac{b\, x^n u(x)}{x} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\text{BesselY}\left(\frac{-1-a}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_2 + \text{BesselJ}\left(\frac{-1-a}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_1\right) x^{\frac{1}{2}+\frac{a}{2}}$$

The above shows that

$$\begin{aligned} u'(x) = x^{\frac{a}{2}+\frac{n}{2}} \sqrt{b} \Bigg(&- \text{BesselJ}\left(\frac{-a+n}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_1 \\ &- \text{BesselY}\left(\frac{-a+n}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_2 \Bigg) \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{x^{\frac{a}{2}+\frac{n}{2}} \sqrt{b} \left(-\text{BesselJ}\left(\frac{-a+n}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_1 - \text{BesselY}\left(\frac{-a+n}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_2\right) x^{-\frac{1}{2}-\frac{a}{2}}}{\text{BesselY}\left(\frac{-1-a}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_2 + \text{BesselJ}\left(\frac{-1-a}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_1}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\sqrt{b}\, x^{-\frac{1}{2}+\frac{n}{2}} \left(\text{BesselJ}\left(\frac{-a+n}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_3 + \text{BesselY}\left(\frac{-a+n}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right)\right)}{\text{BesselY}\left(\frac{-1-a}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) + \text{BesselJ}\left(\frac{-1-a}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_3}$$

Summary

The solution(s) found are the following

$$
y = \frac{\sqrt{b}\, x^{-\frac{1}{2}+\frac{n}{2}} \left(\operatorname{BesselJ}\left(\frac{-a+n}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_3 + \operatorname{BesselY}\left(\frac{-a+n}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right)\right)}{\operatorname{BesselY}\left(\frac{-1-a}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) + \operatorname{BesselJ}\left(\frac{-1-a}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_3} \tag{1}
$$

Verification of solutions

$$
y = \frac{\sqrt{b}\, x^{-\frac{1}{2}+\frac{n}{2}} \left(\operatorname{BesselJ}\left(\frac{-a+n}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_3 + \operatorname{BesselY}\left(\frac{-a+n}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right)\right)}{\operatorname{BesselY}\left(\frac{-1-a}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) + \operatorname{BesselJ}\left(\frac{-1-a}{n+1}, \frac{2\sqrt{b}\, x^{\frac{n}{2}+\frac{1}{2}}}{n+1}\right) c_3}
$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{y'x + a_3 x y^2 + a_2 y = -a_1 x - a_0}$$

2.38.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{a_3 x\, y^2 + a_1 x + a_2 y + a_0}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a_3 y^2 - a_1 - \frac{a_2 y}{x} - \frac{a_0}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{a_1 x + a_0}{x}$, $f_1(x) = -\frac{a_2}{x}$ and $f_2(x) = -a_3$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{-a_3 u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \frac{a_2 a_3}{x} \\ f_2^2 f_0 &= -\frac{a_3^2 (a_1 x + a_0)}{x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$-a_3 u''(x) - \frac{a_2 a_3 u'(x)}{x} - \frac{a_3^2 (a_1 x + a_0) u(x)}{x} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = e^{-i\sqrt{a_1}\,\sqrt{a_3}\,x} \left(\text{KummerM}\left(\frac{i a_0 \sqrt{a_3} + a_2 \sqrt{a_1}}{2\sqrt{a_1}}, a_2, 2i\sqrt{a_1}\,\sqrt{a_3}\,x\right) c_1 + \text{KummerU}\left(\frac{i a_0 \sqrt{a_3} + a_2 \sqrt{a_1}}{2\sqrt{a_1}}, a_2, 2i\sqrt{a_1}\,\sqrt{a_3}\,x\right) c_2\right)$$

The above shows that

$$u'(x) = -\frac{\left(-\frac{\left(\left(-\frac{1}{2}a_2^2 + a_2\right) a_1^{\frac{3}{2}} + a_0 \left(i\sqrt{a_3}\, a_1 - \frac{a_0 a_3 \sqrt{a_1}}{2}\right)\right) c_2 \,\text{KummerU}\left(\frac{(a_2+2)\sqrt{a_1} + i a_0 \sqrt{a_3}}{2\sqrt{a_1}}, a_2, 2i\sqrt{a_1}\,\sqrt{a_3}\,x\right)}{2} - \frac{c_1 \left(i a_1 \sqrt{a_3}\, a_0 + a_1^{\frac{3}{2}} a_2\right) \text{Kumme}}{}\right.}{}$$

Using the above in (1) gives the solution

$$y = -\frac{-\frac{\left(\left(-\frac{1}{2}a_2^2 + a_2\right) a_1^{\frac{3}{2}} + a_0 \left(i\sqrt{a_3}\, a_1 - \frac{a_0 a_3 \sqrt{a_1}}{2}\right)\right) c_2 \,\text{KummerU}\left(\frac{(a_2+2)\sqrt{a_1} + i a_0 \sqrt{a_3}}{2\sqrt{a_1}}, a_2, 2i\sqrt{a_1}\,\sqrt{a_3}\,x\right)}{2} - \frac{c_1 \left(i a_1 \sqrt{a_3}\, a_0 + a_1^{\frac{3}{2}} a_2\right) \text{KummerM}}{}}{a_1^{\frac{3}{2}} x a_3 \left(\text{KummerM}\left(\frac{ia_0}{}\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\frac{\left(-\left(\frac{1}{2}a_2^2-a_2\right)a_1^{\frac{3}{2}}+ia_1\sqrt{a_3}\,a_0-\frac{a_0^2a_3\sqrt{a_1}}{2}\right)\mathrm{KummerU}\left(\frac{(a_2+2)\sqrt{a_1}+ia_0\sqrt{a_3}}{2\sqrt{a_1}},a_2,2i\sqrt{a_1}\,\sqrt{a_3}\,x\right)}{2}+\frac{c_3\left(ia_1\sqrt{a_3}\,a_0+a_1^{\frac{3}{2}}a_2\right)\mathrm{KummerM}\left(\frac{(a_2+2)\sqrt{a}}{2\sqrt{}}\right.}{2}}{a_1^{\frac{3}{2}}xa_3\left(\mathrm{KummerM}\left(\frac{ia_0\sqrt{a_3}+}{2\sqrt{a}}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{\frac{\left(-\left(\frac{1}{2}a_2^2-a_2\right)a_1^{\frac{3}{2}}+ia_1\sqrt{a_3}\,a_0-\frac{a_0^2a_3\sqrt{a_1}}{2}\right)\mathrm{KummerU}\left(\frac{(a_2+2)\sqrt{a_1}+ia_0\sqrt{a_3}}{2\sqrt{a_1}},a_2,2i\sqrt{a_1}\,\sqrt{a_3}\,x\right)}{2}+\frac{c_3\left(ia_1\sqrt{a_3}\,a_0+a_1^{\frac{3}{2}}a_2\right)\mathrm{KummerM}\left(\frac{(a_2+2)\sqrt{a}}{2\sqrt{}}\right.}{2}}{a_1^{\frac{3}{2}}xa_3\left(\mathrm{KummerM}\left(\frac{ia_0\sqrt{a_3}+}{2\sqrt{a}}\right.\right.} \quad (1)$$

Verification of solutions

$$y = \frac{\frac{\left(-\left(\frac{1}{2}a_2^2-a_2\right)a_1^{\frac{3}{2}}+ia_1\sqrt{a_3}\,a_0-\frac{a_0^2a_3\sqrt{a_1}}{2}\right)\mathrm{KummerU}\left(\frac{(a_2+2)\sqrt{a_1}+ia_0\sqrt{a_3}}{2\sqrt{a_1}},a_2,2i\sqrt{a_1}\,\sqrt{a_3}\,x\right)}{2}+\frac{c_3\left(ia_1\sqrt{a_3}\,a_0+a_1^{\frac{3}{2}}a_2\right)\mathrm{KummerM}\left(\frac{(a_2+2)\sqrt{a}}{2\sqrt{}}\right.}{2}}{a_1^{\frac{3}{2}}xa_3\left(\mathrm{KummerM}\left(\frac{ia_0\sqrt{a_3}+}{2\sqrt{a}}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 39.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati", "first_order_ode_lie_symmetry_calculated"**

Maple gives the following as the ode type

```
[[_homogeneous, `class G`], _rational, _Riccati]
```

$$\boxed{y'x - a\,x^n y^2 - yb = c\,x^{-n}}$$

2.39.1 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$y' = \frac{a\,x^n y^2 + by + c\,x^{-n}}{x}$$
$$y' = \omega(x, y)$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x + \omega(\eta_y - \xi_x) - \omega^2 \xi_y - \omega_x \xi - \omega_y \eta = 0 \tag{A}$$

The type of this ode is not in the lookup table. To determine ξ, η then (A) is solved using ansatz. Making bivariate polynomials of degree 1 to use as anstaz gives

$$\xi = xa_2 + ya_3 + a_1 \tag{1E}$$
$$\eta = xb_2 + yb_3 + b_1 \tag{2E}$$

Where the unknown coefficients are

$$\{a_1, a_2, a_3, b_1, b_2, b_3\}$$

Substituting equations (1E,2E) and ω into (A) gives

$$\begin{aligned}&b_2 + \frac{(a\,x^n y^2 + by + c\,x^{-n})\,(b_3 - a_2)}{x} - \frac{(a\,x^n y^2 + by + c\,x^{-n})^2\, a_3}{x^2} \\ &- \left(\frac{\frac{x^n a n\, y^2}{x} - \frac{c\,x^{-n} n}{x}}{x} - \frac{a\,x^n y^2 + by + c\,x^{-n}}{x^2}\right)(x a_2 + y a_3 + a_1) \\ &- \frac{(2a\,x^n y + b)\,(x b_2 + y b_3 + b_1)}{x} = 0\end{aligned} \tag{5E}$$

Putting the above in normal form gives

$$-\frac{2x^n x^{-n} ac\,y^2 a_3 + x^n anx\,y^2 a_2 + x^{2n} a^2 y^4 a_3 - x^n a\,y^3 a_3 - x^n a\,y^2 a_1 - x^{-n} cna_1 - x^{-n} cxb_3 - x^{-n} cya_3 - b_2 x}{}$$
$$= 0$$

Setting the numerator to zero gives

$$\begin{aligned}&-2x^n x^{-n} ac\,y^2 a_3 - x^n anx\,y^2 a_2 - x^{2n} a^2 y^4 a_3 + x^n a\,y^3 a_3 + x^n a\,y^2 a_1 \\ &+ x^{-n} cna_1 + x^{-n} cxb_3 + x^{-n} cya_3 + b_2 x^2 - 2x^n ab\,y^3 a_3 - x^n an\,y^3 a_3 \\ &- x^n an\,y^2 a_1 - 2x^n a\,x^2 y b_2 - x^n ax\,y^2 b_3 - 2x^n axyb_1 - 2x^{-n} bcya_3 + x^{-n} cnxa_2 \\ &+ x^{-n} cnya_3 - b^2 y^2 a_3 - b\,x^2 b_2 + b\,y^2 a_3 - x^{-2n} c^2 a_3 - bxb_1 + bya_1 + x^{-n} ca_1 = 0\end{aligned} \tag{6E}$$

Simplifying the above gives

$$\begin{aligned}&-\big(x^{3n} anx\,y^2 a_2 - b_2 x^2 x^{2n} - cna_1 x^n - cxb_3 x^n - cya_3 x^n + x^{4n} a^2 y^4 a_3 \\ &- x^{3n} a\,y^3 a_3 - x^{3n} a\,y^2 a_1 + b^2 y^2 a_3 x^{2n} + b\,x^2 b_2 x^{2n} - b\,y^2 a_3 x^{2n} \\ &+ bxb_1 x^{2n} - bya_1 x^{2n} + 2bcya_3 x^n - cnxa_2 x^n - cnya_3 x^n \\ &+ 2x^{3n} ab\,y^3 a_3 + x^{3n} an\,y^3 a_3 + x^{3n} an\,y^2 a_1 + 2x^{3n} a\,x^2 y b_2 \\ &+ x^{3n} ax\,y^2 b_3 + 2x^{3n} axyb_1 + 2ac\,y^2 a_3 x^{2n} + c^2 a_3 - ca_1 x^n\big)\, x^{-2n} = 0\end{aligned} \tag{6E}$$

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\{x, y, x^n\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\{x = v_1, y = v_2, x^n = v_3\}$$

The above PDE (6E) now becomes

$$-\frac{v_3^4 a^2 v_2^4 a_3 + 2v_3^3 abv_2^3 a_3 + v_3^3 anv_1 v_2^2 a_2 + v_3^3 anv_2^3 a_3 + v_3^3 anv_2^2 a_1 - v_3^3 av_2^3 a_3 + 2v_3^3 av_1^2 v_2 b_2 + v_3^3 av_1 v_2^2 b_3 + 2ac}{} \tag{7E}$$

$$= 0$$

Collecting the above on the terms v_i introduced, and these are

$$\{v_1, v_2, v_3\}$$

Equation (7E) now becomes

$$\begin{aligned} &-2ab_2 v_3 v_1^2 v_2 + (-bb_2 + b_2) v_1^2 + (-ana_2 - ab_3) v_1 v_2^2 v_3 - 2ab_1 v_3 v_1 v_2 \\ &- bb_1 v_1 + \frac{(cna_2 + cb_3) v_1}{v_3} - a^2 a_3 v_3^2 v_2^4 + (-2aba_3 - ana_3 + aa_3) v_2^3 v_3 \\ &+ (-ana_1 + aa_1) v_2^2 v_3 + \left(-2aca_3 - b^2 a_3 + ba_3\right) v_2^2 + ba_1 v_2 \\ &+ \frac{(-2bca_3 + cna_3 + ca_3) v_2}{v_3} + \frac{cna_1 + ca_1}{v_3} - \frac{c^2 a_3}{v_3^2} = 0 \end{aligned} \tag{8E}$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$\begin{aligned} ba_1 &= 0 \\ -2ab_1 &= 0 \\ -2ab_2 &= 0 \\ -a^2 a_3 &= 0 \\ -bb_1 &= 0 \\ -c^2 a_3 &= 0 \\ -bb_2 + b_2 &= 0 \\ -ana_1 + aa_1 &= 0 \\ cna_1 + ca_1 &= 0 \\ -ana_2 - ab_3 &= 0 \\ cna_2 + cb_3 &= 0 \\ -2aca_3 - b^2 a_3 + ba_3 &= 0 \\ -2aba_3 - ana_3 + aa_3 &= 0 \\ -2bca_3 + cna_3 + ca_3 &= 0 \end{aligned}$$

Solving the above equations for the unknowns gives

$$
\begin{aligned}
a_1 &= 0 \\
a_2 &= a_2 \\
a_3 &= 0 \\
b_1 &= 0 \\
b_2 &= 0 \\
b_3 &= -n a_2
\end{aligned}
$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$
\begin{aligned}
\xi &= x \\
\eta &= -ny
\end{aligned}
$$

Shifting is now applied to make $\xi = 0$ in order to simplify the rest of the computation

$$
\begin{aligned}
\eta &= \eta - \omega(x,y)\,\xi \\
&= -ny - \left(\frac{a\,x^n y^2 + by + c\,x^{-n}}{x}\right)(x) \\
&= -a\,x^n y^2 - by - c\,x^{-n} - ny \\
\xi &= 0
\end{aligned}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x,y) \to (R,S)$ where (R,S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$
\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}
$$

The above comes from the requirements that $\left(\xi \frac{\partial}{\partial x} + \eta \frac{\partial}{\partial y}\right) S(x,y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$
R = x
$$

S is found from

$$
\begin{aligned}
S &= \int \frac{1}{\eta} dy \\
&= \int \frac{1}{-a\,x^n y^2 - by - c\,x^{-n} - ny} dy
\end{aligned}
$$

Which results in

$$S = -\frac{2x^n \arctan\left(\frac{2x^{2n}ay+b\,x^n+n\,x^n}{\sqrt{-x^{2n}b^2-2x^{2n}bn-x^{2n}n^2+4ca\,x^{2n}}}\right)}{\sqrt{-x^{2n}b^2-2x^{2n}bn-x^{2n}n^2+4ca\,x^{2n}}}$$

Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$\frac{dS}{dR} = \frac{S_x + \omega(x,y)S_y}{R_x + \omega(x,y)R_y} \tag{2}$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x,y)$ is the right hand side of the original ode given by

$$\omega(x,y) = \frac{a\,x^n y^2 + by + c\,x^{-n}}{x}$$

Evaluating all the partial derivatives gives

$$\begin{aligned}
R_x &= 1 \\
R_y &= 0 \\
S_x &= -\frac{ny\,x^{n-1}}{x^{2n}a\,y^2 + y\,(b+n)\,x^n + c} \\
S_y &= -\frac{x^n}{x^{2n}a\,y^2 + y\,(b+n)\,x^n + c}
\end{aligned}$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$\frac{dS}{dR} = -\frac{1}{x} \tag{2A}$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$\frac{dS}{dR} = -\frac{1}{R}$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = -\ln(R) + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$-\frac{2\arctan\left(\frac{2a\,x^n y+b+n}{\sqrt{4ca-b^2-2bn-n^2}}\right)}{\sqrt{4ca-b^2-2bn-n^2}} = -\ln(x)+c_1$$

Which simplifies to

$$-\frac{2\arctan\left(\frac{2a\,x^n y+b+n}{\sqrt{4ca-b^2-2bn-n^2}}\right)}{\sqrt{4ca-b^2-2bn-n^2}} = -\ln(x)+c_1$$

Which gives

$$y = -\frac{\left(\tan\left(-\frac{\ln(x)\sqrt{4ca-b^2-2bn-n^2}}{2}+\frac{c_1\sqrt{4ca-b^2-2bn-n^2}}{2}\right)\sqrt{4ca-b^2-2bn-n^2}+b+n\right)x^{-n}}{2a}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\tan\left(-\frac{\ln(x)\sqrt{4ca-b^2-2bn-n^2}}{2}+\frac{c_1\sqrt{4ca-b^2-2bn-n^2}}{2}\right)\sqrt{4ca-b^2-2bn-n^2}+b+n\right)x^{-n}}{2a} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\tan\left(-\frac{\ln(x)\sqrt{4ca-b^2-2bn-n^2}}{2}+\frac{c_1\sqrt{4ca-b^2-2bn-n^2}}{2}\right)\sqrt{4ca-b^2-2bn-n^2}+b+n\right)x^{-n}}{2a}$$

Verified OK.

2.39.2 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^n y^2+by+c\,x^{-n}}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{x^n a\,y^2}{x}+\frac{c\,x^{-n}}{x}+\frac{by}{x}$$

With Riccati ODE standard form

$$y' = f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x) = \frac{c\,x^{-n}}{x}$, $f_1(x) = \frac{b}{x}$ and $f_2(x) = \frac{a\,x^n}{x}$. Let

$$
\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{\frac{a\,x^n u}{x}}
\end{aligned}
\tag{1}
$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$
f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}
$$

But

$$
\begin{aligned}
f_2' &= \frac{an\,x^n}{x^2} - \frac{a\,x^n}{x^2} \\
f_1 f_2 &= \frac{ba\,x^n}{x^2} \\
f_2^2 f_0 &= \frac{a^2 x^{2n} c\,x^{-n}}{x^3}
\end{aligned}
$$

Substituting the above terms back in equation (2) gives

$$
\frac{a\,x^n u''(x)}{x} - \left(\frac{an\,x^n}{x^2} - \frac{a\,x^n}{x^2} + \frac{ba\,x^n}{x^2}\right) u'(x) + \frac{a^2 x^{2n} c\,x^{-n} u(x)}{x^3} = 0
$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$
u(x) = x^{\frac{b}{2}} x^{\frac{n}{2}} \left(x^{\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}} c_1 + x^{-\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}} c_2\right)
$$

The above shows that

$$
u'(x) = -\frac{x^{\frac{n}{2}} \left(c_2 \left(-b-n+\sqrt{-4ca+b^2+2bn+n^2}\right) x^{-\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}} - x^{\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}} c_1 \left(b+n+\sqrt{-4ca+b\right.\right.}{2x}
$$

Using the above in (1) gives the solution

$$
y = \frac{\left(c_2 \left(-b-n+\sqrt{-4ca+b^2+2bn+n^2}\right) x^{-\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}} - x^{\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}} c_1 \left(b+n+\sqrt{-4ca+b^2+2\right.\right.}{2a \left(x^{\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}} c_1 + x^{-\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}} c_2\right)}
$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\left(-b-n+\sqrt{-4ca+b^2+2bn+n^2}\right)x^{-\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}} - x^{\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}}c_3\left(b+n+\sqrt{-4ca+b^2+2bn\right.\right.}{2a\left(x^{\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}}c_3+x^{-\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}}\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{\left(\left(-b-n+\sqrt{-4ca+b^2+2bn+n^2}\right)x^{-\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}} - x^{\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}}c_3\left(b+n+\sqrt{-4ca+b^2+2bn\right.\right.}{2a\left(x^{\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}}c_3+x^{-\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\left(-b-n+\sqrt{-4ca+b^2+2bn+n^2}\right)x^{-\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}} - x^{\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}}c_3\left(b+n+\sqrt{-4ca+b^2+2bn\right.\right.}{2a\left(x^{\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}}c_3+x^{-\frac{\sqrt{-4ca+b^2+2bn+n^2}}{2}}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 40.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{y'x - a\,x^n y^2 - ym = -a\,b^2 x^{n+2m}}$$

2.40.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^n y^2 + ym - a\,b^2 x^{n+2m}}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{x^n a\,y^2}{x} + \frac{ym}{x} - \frac{a\,b^2 x^n x^{2m}}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{a\,b^2 x^{n+2m}}{x}$, $f_1(x) = \frac{m}{x}$ and $f_2(x) = \frac{a\,x^n}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{a\,x^n u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{an\,x^n}{x^2} - \frac{a\,x^n}{x^2}\\
f_1f_2 &= \frac{ma\,x^n}{x^2}\\
f_2^2f_0 &= -\frac{a^3x^{2n}b^2x^{n+2m}}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a\,x^n u''(x)}{x} - \left(\frac{an\,x^n}{x^2} - \frac{a\,x^n}{x^2} + \frac{ma\,x^n}{x^2}\right)u'(x) - \frac{a^3x^{2n}b^2x^{n+2m}u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1\sinh\left(\frac{ab\,x^{m+n}}{m+n}\right) + c_2\cosh\left(\frac{ab\,x^{m+n}}{m+n}\right)$$

The above shows that

$$u'(x) = ab\,x^{m+n-1}\left(c_1\cosh\left(\frac{ab\,x^{m+n}}{m+n}\right) + c_2\sinh\left(\frac{ab\,x^{m+n}}{m+n}\right)\right)$$

Using the above in (1) gives the solution

$$y = -\frac{b\,x^{m+n-1}\left(c_1\cosh\left(\frac{ab\,x^{m+n}}{m+n}\right) + c_2\sinh\left(\frac{ab\,x^{m+n}}{m+n}\right)\right)x^{-n}x}{c_1\sinh\left(\frac{ab\,x^{m+n}}{m+n}\right) + c_2\cosh\left(\frac{ab\,x^{m+n}}{m+n}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{b\,x^m\left(c_3\cosh\left(\frac{ab\,x^{m+n}}{m+n}\right) + \sinh\left(\frac{ab\,x^{m+n}}{m+n}\right)\right)}{c_3\sinh\left(\frac{ab\,x^{m+n}}{m+n}\right) + \cosh\left(\frac{ab\,x^{m+n}}{m+n}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{b\,x^{m}\left(c_{3} \cosh\left(\frac{a b\,x^{m+n}}{m+n}\right)+\sinh\left(\frac{a b\,x^{m+n}}{m+n}\right)\right)}{c_{3} \sinh\left(\frac{a b\,x^{m+n}}{m+n}\right)+\cosh\left(\frac{a b\,x^{m+n}}{m+n}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{b\,x^{m}\left(c_{3} \cosh\left(\frac{a b\,x^{m+n}}{m+n}\right)+\sinh\left(\frac{a b\,x^{m+n}}{m+n}\right)\right)}{c_{3} \sinh\left(\frac{a b\,x^{m+n}}{m+n}\right)+\cosh\left(\frac{a b\,x^{m+n}}{m+n}\right)}$$

Verified OK.

Problem number: 41.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{y'x - x^{2n}y^2 - (m-n)\,y = x^{2m}}$$

2.41.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{x^{2n}y^2 + ym - ny + x^{2m}}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{x^{2n}y^2}{x} + \frac{ym}{x} - \frac{ny}{x} + \frac{x^{2m}}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{x^{2m}}{x}$, $f_1(x) = \frac{m-n}{x}$ and $f_2(x) = \frac{x^{2n}}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{x^{2n}u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{2x^{2n}n}{x^2} - \frac{x^{2n}}{x^2} \\ f_1f_2 &= \frac{(m-n)\,x^{2n}}{x^2} \\ f_2^2f_0 &= \frac{x^{4n}x^{2m}}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{x^{2n}u''(x)}{x} - \left(\frac{2x^{2n}n}{x^2} - \frac{x^{2n}}{x^2} + \frac{(m-n)\,x^{2n}}{x^2}\right)u'(x) + \frac{x^{4n}x^{2m}u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \sin\left(\frac{x^{m+n}}{m+n}\right) + c_2 \cos\left(\frac{x^{m+n}}{m+n}\right)$$

The above shows that

$$u'(x) = x^{m+n-1}\left(c_1 \cos\left(\frac{x^{m+n}}{m+n}\right) - c_2 \sin\left(\frac{x^{m+n}}{m+n}\right)\right)$$

Using the above in (1) gives the solution

$$y = -\frac{x^{m+n-1}\left(c_1 \cos\left(\frac{x^{m+n}}{m+n}\right) - c_2 \sin\left(\frac{x^{m+n}}{m+n}\right)\right)x^{-2n}x}{c_1 \sin\left(\frac{x^{m+n}}{m+n}\right) + c_2 \cos\left(\frac{x^{m+n}}{m+n}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{x^{m-n}\left(-c_3 \cos\left(\frac{x^{m+n}}{m+n}\right) + \sin\left(\frac{x^{m+n}}{m+n}\right)\right)}{c_3 \sin\left(\frac{x^{m+n}}{m+n}\right) + \cos\left(\frac{x^{m+n}}{m+n}\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{x^{m-n}\left(-c_3 \cos\left(\frac{x^{m+n}}{m+n}\right) + \sin\left(\frac{x^{m+n}}{m+n}\right)\right)}{c_3 \sin\left(\frac{x^{m+n}}{m+n}\right) + \cos\left(\frac{x^{m+n}}{m+n}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{x^{m-n}\left(-c_3 \cos\left(\frac{x^{m+n}}{m+n}\right) + \sin\left(\frac{x^{m+n}}{m+n}\right)\right)}{c_3 \sin\left(\frac{x^{m+n}}{m+n}\right) + \cos\left(\frac{x^{m+n}}{m+n}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 42.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{y'x - a\,x^n y^2 - yb = c\,x^m}$$

2.42.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^n y^2 + by + c\,x^m}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{x^n a\,y^2}{x} + \frac{c\,x^m}{x} + \frac{by}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{c\,x^m}{x}$, $f_1(x) = \frac{b}{x}$ and $f_2(x) = \frac{a\,x^n}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{a\,x^n u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{an\, x^n}{x^2} - \frac{a\, x^n}{x^2} \\
f_1 f_2 &= \frac{ba\, x^n}{x^2} \\
f_2^2 f_0 &= \frac{a^2 x^{2n} c\, x^m}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a\, x^n u''(x)}{x} - \left(\frac{an\, x^n}{x^2} - \frac{a\, x^n}{x^2} + \frac{ba\, x^n}{x^2}\right) u'(x) + \frac{a^2 x^{2n} c\, x^m u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\text{BesselJ}\left(\frac{-b-n}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_1 + \text{BesselY}\left(\frac{-b-n}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_2\right) x^{\frac{b}{2}+\frac{n}{2}}$$

The above shows that

$$\begin{aligned}
u'(x) = x^{-1+\frac{b}{2}+n+\frac{m}{2}} \sqrt{ca} \Bigg(&-\text{BesselY}\left(\frac{-b+m}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_2 \\
&- \text{BesselJ}\left(\frac{-b+m}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_1\Bigg)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{x^{-1+\frac{b}{2}+n+\frac{m}{2}} \sqrt{ca} \left(-\text{BesselY}\left(\frac{-b+m}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_2 - \text{BesselJ}\left(\frac{-b+m}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_1\right) x^{-n} x\, x^{-\frac{b}{2}-\frac{n}{2}}}{a \left(\text{BesselJ}\left(\frac{-b-n}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_1 + \text{BesselY}\left(\frac{-b-n}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_2\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{x^{\frac{m}{2}-\frac{n}{2}} \sqrt{ca} \left(\text{BesselJ}\left(\frac{-b+m}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_3 + \text{BesselY}\left(\frac{-b+m}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right)\right)}{a \left(\text{BesselJ}\left(\frac{-b-n}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_3 + \text{BesselY}\left(\frac{-b-n}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right)\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{x^{\frac{m}{2}-\frac{n}{2}} \sqrt{ca}\left(\mathrm{BesselJ}\left(\frac{-b+m}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_3 + \mathrm{BesselY}\left(\frac{-b+m}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right)\right)}{a\left(\mathrm{BesselJ}\left(\frac{-b-n}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_3 + \mathrm{BesselY}\left(\frac{-b-n}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right)\right)} \tag{1}$$

Verification of solutions

$$y = \frac{x^{\frac{m}{2}-\frac{n}{2}} \sqrt{ca}\left(\mathrm{BesselJ}\left(\frac{-b+m}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_3 + \mathrm{BesselY}\left(\frac{-b+m}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right)\right)}{a\left(\mathrm{BesselJ}\left(\frac{-b-n}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right) c_3 + \mathrm{BesselY}\left(\frac{-b-n}{m+n}, \frac{2\sqrt{ca}\, x^{\frac{m}{2}+\frac{n}{2}}}{m+n}\right)\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 43.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{y'x - x^{2n}y^2a - (b\,x^n - n)\,y = c}$$

2.43.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{x^{2n}a\,y^2 + x^n by - ny + c}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{x^{2n}a\,y^2}{x} + \frac{x^n by}{x} - \frac{ny}{x} + \frac{c}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{c}{x}$, $f_1(x) = \frac{b\,x^n - n}{x}$ and $f_2(x) = \frac{x^{2n}a}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{x^{2n}au}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{2x^{2n}na}{x^2} - \frac{a\,x^{2n}}{x^2}\\
f_1 f_2 &= \frac{(b\,x^n - n)\,x^{2n}a}{x^2}\\
f_2^2 f_0 &= \frac{x^{4n}a^2 c}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{x^{2n}au''(x)}{x} - \left(\frac{2x^{2n}na}{x^2} - \frac{a\,x^{2n}}{x^2} + \frac{(b\,x^n - n)\,x^{2n}a}{x^2}\right) u'(x) + \frac{x^{4n}a^2cu(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\frac{x^n b}{2n}} \left(c_1 \sinh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + c_2 \cosh\left(\frac{x^n \sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right)\right)$$

The above shows that

$$u'(x) = \frac{x^{n-1}\mathrm{e}^{\frac{x^n b}{2n}}\left(\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, nc_1 + c_2 b\right)\cosh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + \sinh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right)\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, nc_2 + c_1 b\right)\right)}{2}$$

Using the above in (1) gives the solution

$$y = -\frac{x^{n-1}\left(\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, nc_1 + c_2 b\right)\cosh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + \sinh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right)\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, nc_2 + c_1 b\right)\right) x^{-2n}}{2a\left(c_1 \sinh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + c_2\cosh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{x^{-n}\left(\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n c_3 + b\right)\cosh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + \sinh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right)\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n + b c_3\right)\right)}{2a\left(c_3\sinh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + \cosh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right)\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{x^{-n}\left(\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n c_3 + b\right)\cosh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + \sinh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right)\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n + b c_3\right)\right)}{2a\left(c_3\sinh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + \cosh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right)\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{x^{-n}\left(\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n c_3 + b\right)\cosh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + \sinh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right)\left(\sqrt{\frac{-4ca+b^2}{n^2}}\, n + b c_3\right)\right)}{2a\left(c_3\sinh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right) + \cosh\left(\frac{x^n\sqrt{\frac{-4ca+b^2}{n^2}}}{2}\right)\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 44.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{y'x - a\,x^{m+2n}y^2 - \left(b\,x^{m+n} - n\right)y = c\,x^m}$$

2.44.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \frac{a\,x^{m+2n}y^2 + x^{m+n}by + c\,x^m - ny}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,x^m x^{2n}y^2}{x} + \frac{x^m x^n by}{x} + \frac{c\,x^m}{x} - \frac{ny}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{c\,x^m}{x}$, $f_1(x) = \frac{b\,x^{m+n}-n}{x}$ and $f_2(x) = \frac{x^{m+2n}a}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{x^{m+2n}au}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{x^{m+2n}(m+2n)\, a}{x^2} - \frac{a\, x^{m+2n}}{x^2} \\ f_1 f_2 &= \frac{(b\, x^{m+n} - n)\, x^{m+2n} a}{x^2} \\ f_2^2 f_0 &= \frac{x^{2m+4n} a^2 c\, x^m}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{x^{m+2n} a u''(x)}{x} - \left(\frac{x^{m+2n}(m+2n)\, a}{x^2} - \frac{a\, x^{m+2n}}{x^2} + \frac{(b\, x^{m+n} - n)\, x^{m+2n} a}{x^2}\right) u'(x) + \frac{x^{2m+4n} a^2 c\, x^m u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = e^{\frac{b\, x^{m+n}}{2m+2n}} \left(c_1 \sinh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right) + c_2 \cosh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)\right)$$

The above shows that

$$u'(x) = \frac{e^{\frac{b\, x^{m+n}}{2m+2n}} x^{m+n-1} \left(\left(c_1 (m+n)\sqrt{\frac{-4ca+b^2}{(m+n)^2}} + c_2 b\right) \cosh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right) + \left(c_2 (m+n)\sqrt{\frac{-4ca+b^2}{(m+n)^2}} + c_1 b\right) \sinh \cdots\right.}{2}$$

Using the above in (1) gives the solution

$$y = -\frac{x^{m+n-1}\left(\left(c_1 (m+n)\sqrt{\frac{-4ca+b^2}{(m+n)^2}} + c_2 b\right) \cosh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right) + \left(c_2 (m+n)\sqrt{\frac{-4ca+b^2}{(m+n)^2}} + c_1 b\right) \sinh\left(\cdots\right.\right.}{2a\left(c_1 \sinh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right) + c_2 \cosh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\left(c_3(m+n)\sqrt{\frac{-4ca+b^2}{(m+n)^2}}+b\right)\cosh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)+\left((m+n)\sqrt{\frac{-4ca+b^2}{(m+n)^2}}+bc_3\right)\sinh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)\right)}{2a\left(c_3\sinh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)+\cosh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\left(c_3(m+n)\sqrt{\frac{-4ca+b^2}{(m+n)^2}}+b\right)\cosh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)+\left((m+n)\sqrt{\frac{-4ca+b^2}{(m+n)^2}}+bc_3\right)\sinh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)\right)}{2a\left(c_3\sinh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)+\cosh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)\right)} \quad (1)$$

Verification of solutions

$$y = -\frac{\left(\left(c_3(m+n)\sqrt{\frac{-4ca+b^2}{(m+n)^2}}+b\right)\cosh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)+\left((m+n)\sqrt{\frac{-4ca+b^2}{(m+n)^2}}+bc_3\right)\sinh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)\right)}{2a\left(c_3\sinh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)+\cosh\left(\frac{x^{m+n}\sqrt{\frac{-4ca+b^2}{(m+n)^2}}}{2}\right)\right)}$$

Verified OK.

Problem number: 45.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{(a_2x+b_2)\left(y'+\lambda y^2\right)+(a_1x+b_1)\,y=-a_0x-b_0}$$

2.45.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{y^2a_2\lambda x+y^2b_2\lambda+ya_1x+a_0x+yb_1+b_0}{a_2x+b_2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=-\frac{y^2a_2\lambda x}{a_2x+b_2}-\frac{y^2b_2\lambda}{a_2x+b_2}-\frac{ya_1x}{a_2x+b_2}-\frac{a_0x}{a_2x+b_2}-\frac{yb_1}{a_2x+b_2}-\frac{b_0}{a_2x+b_2}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=-\frac{a_0x+b_0}{a_2x+b_2}$, $f_1(x)=-\frac{a_1x+b_1}{a_2x+b_2}$ and $f_2(x)=-\frac{\lambda a_2x+\lambda b_2}{a_2x+b_2}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{-\frac{(\lambda a_2x+\lambda b_2)u}{a_2x+b_2}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{\lambda a_2}{a_2 x + b_2} + \frac{(\lambda a_2 x + \lambda b_2) a_2}{(a_2 x + b_2)^2} \\ f_1 f_2 &= \frac{(a_1 x + b_1)(\lambda a_2 x + \lambda b_2)}{(a_2 x + b_2)^2} \\ f_2^2 f_0 &= -\frac{(\lambda a_2 x + \lambda b_2)^2 (a_0 x + b_0)}{(a_2 x + b_2)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$-\frac{(\lambda a_2 x + \lambda b_2) u''(x)}{a_2 x + b_2} - \left(-\frac{\lambda a_2}{a_2 x + b_2} + \frac{(\lambda a_2 x + \lambda b_2) a_2}{(a_2 x + b_2)^2} + \frac{(a_1 x + b_1)(\lambda a_2 x + \lambda b_2)}{(a_2 x + b_2)^2}\right) u'(x) - \frac{(\lambda a_2 x + \lambda b_2)}{(a_2}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{-\frac{\left(\sqrt{-4a_0 a_2 \lambda + a_1^2} + a_1\right) x}{2a_2}} (a_2 x + b_2)^{\frac{b_2 a_1 + a_2^2 - a_2 b_1}{a_2^2}} \left(\mathrm{KummerM}\left(\frac{(b_2 a_1 + 2a_2^2 - a_2 b_1)\sqrt{-4a_0 a_2 \lambda + a_1^2} - 2a_2^2 b_0 \lambda + (2a_0 \lambda b_2 + a_1 b_1) a_2 - a_1^2}{2\sqrt{-4a_0 a_2 \lambda + a_1^2}\, a_2^2}\right.\right.$$
$$+\mathrm{KummerU}\left(\frac{(b_2 a_1 + 2a_2^2 - a_2 b_1)\sqrt{-4a_0 a_2 \lambda + a_1^2} - 2a_2^2 b_0 \lambda + (2a_0 \lambda b_2 + a_1 b_1) a_2 - a_1^2 b_2}{2\sqrt{-4a_0 a_2 \lambda + a_1^2}\, a_2^2}, \frac{b_2 a_1 + 2a_2^2 -}{a_2^2}\right.$$

The above shows that

$$u'(x) = -\frac{2\left(\left(\frac{(a_1 x + b_1)\sqrt{-4a_0 a_2 \lambda + a_1^2}}{4} + \lambda\left(a_0 x + \frac{b_0}{2}\right) a_2 - \frac{x a_1^2}{4} + \frac{a_0 \lambda b_2}{2} - \frac{a_1 b_1}{4}\right) c_1 a_2 \,\mathrm{KummerM}\left(\frac{(b_2 a_1 + 2a_2^2 - a_2 b_1)\sqrt{-4a}}{2}\right.\right.}{}$$

Using the above in (1) gives the solution

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 46.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati", "first_order_ode_lie_symmetry_calculated"**

Maple gives the following as the ode type

```
[[_1st_order, _with_linear_symmetries], _rational, _Riccati]
```

$$\boxed{(xa+c)\,y'-\alpha(ay+bx)^2-\beta(ay+bx)=-bx+\gamma}$$

2.46.1 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$y' = \frac{a^2\alpha\,y^2+2a\alpha bxy+\alpha\,b^2x^2+a\beta y+b\beta x-bx+\gamma}{xa+c}$$
$$y' = \omega(x,y)$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x+\omega(\eta_y-\xi_x)-\omega^2\xi_y-\omega_x\xi-\omega_y\eta=0 \tag{A}$$

The type of this ode is not in the lookup table. To determine ξ,η then (A) is solved using ansatz. Making bivariate polynomials of degree 1 to use as anstaz gives

$$\xi = xa_2+ya_3+a_1 \tag{1E}$$
$$\eta = xb_2+yb_3+b_1 \tag{2E}$$

Where the unknown coefficients are

$$\{a_1, a_2, a_3, b_1, b_2, b_3\}$$

Substituting equations (1E,2E) and ω into (A) gives

$$\begin{aligned}
& b_2+\frac{\left(a^2 \alpha y^2+2 a \alpha b x y+\alpha b^2 x^2+a \beta y+b \beta x-b x+\gamma\right)\left(b_3-a_2\right)}{x a+c} \\
& -\frac{\left(a^2 \alpha y^2+2 a \alpha b x y+\alpha b^2 x^2+a \beta y+b \beta x-b x+\gamma\right)^2 a_3}{(x a+c)^2} \\
& -\left(\frac{2 a \alpha b y+2 \alpha b^2 x+\beta b-b}{x a+c}\right. \\
& \left.-\frac{\left(a^2 \alpha y^2+2 a \alpha b x y+\alpha b^2 x^2+a \beta y+b \beta x-b x+\gamma\right) a}{(x a+c)^2}\right)\left(x a_2+y a_3+a_1\right) \\
& -\frac{\left(2 a^2 \alpha y+2 \alpha a x b+\beta a\right)\left(x b_2+y b_3+b_1\right)}{x a+c}=0
\end{aligned} \tag{5E}$$

Putting the above in normal form gives

$$-\frac{a^4\alpha^2y^4a_3+4a^3\alpha^2bx\,y^3a_3+6a^2\alpha^2b^2x^2y^2a_3+4a\,\alpha^2b^3x^3ya_3+\alpha^2b^4x^4a_3+2a^3\alpha\beta\,y^3a_3+6a^2\alpha b\beta x\,y^2a_3+6}{}$$

$$=0$$

Setting the numerator to zero gives

$$\begin{aligned}
& -a^4 \alpha^2 y^4 a_3-4 a^3 \alpha^2 b x\, y^3 a_3-6 a^2 \alpha^2 b^2 x^2 y^2 a_3-4 a\, \alpha^2 b^3 x^3 y a_3 \\
& -\alpha^2 b^4 x^4 a_3-2 a^3 \alpha \beta\, y^3 a_3-6 a^2 \alpha b \beta x\, y^2 a_3-6 a \alpha\, b^2 \beta\, x^2 y a_3 \\
& -2 \alpha\, b^3 \beta\, x^3 a_3-2 a^3 \alpha\, x^2 y b_2-a^3 \alpha x\, y^2 b_3+a^3 \alpha\, y^3 a_3-2 a^2 \alpha b\, x^3 b_2 \\
& -2 a^2 \alpha b\, x^2 y a_2+2 a^2 \alpha b x\, y^2 a_3-2 a \alpha\, b^2 x^3 a_2+a \alpha\, b^2 x^3 b_3 \\
& +3 a \alpha\, b^2 x^2 y a_3+2 \alpha\, b^3 x^3 a_3-2 a^3 \alpha x y b_1+a^3 \alpha\, y^2 a_1-2 a^2 \alpha b\, x^2 b_1 \\
& -2 a^2 \alpha c x y b_2-a^2 \alpha c\, y^2 a_2-a^2 \alpha c\, y^2 b_3-2 a^2 \alpha \gamma\, y^2 a_3-a^2 \beta^2 y^2 a_3 \\
& -a \alpha\, b^2 x^2 a_1-2 a \alpha b c\, x^2 b_2-4 a \alpha b c x y a_2-2 a \alpha b c\, y^2 a_3 \\
& -4 a \alpha b \gamma x y a_3-2 a b\, \beta^2 x y a_3-3 \alpha\, b^2 c\, x^2 a_2+\alpha\, b^2 c\, x^2 b_3 \\
& -2 \alpha\, b^2 c x y a_3-2 \alpha\, b^2 \gamma\, x^2 a_3-b^2 \beta^2 x^2 a_3-2 a^2 \alpha c y b_1-a^2 \beta\, x^2 b_2 \\
& +a^2 \beta\, y^2 a_3-2 a \alpha b c x b_1-2 a \alpha b c y a_1-a b \beta\, x^2 a_2+a b \beta\, x^2 b_3 \\
& +2 a b \beta x y a_3-2 \alpha\, b^2 c x a_1+2 b^2 \beta\, x^2 a_3-a^2 \beta x b_1+a^2 \beta y a_1 \\
& +a^2 x^2 b_2+a b\, x^2 a_2-a b\, x^2 b_3-a \beta c x b_2-a \beta c y a_2-2 a \beta \gamma y a_3 \\
& -b^2 x^2 a_3-2 b \beta c x a_2+b \beta c x b_3-b \beta c y a_3-2 b \beta \gamma x a_3-a \beta c b_1 \\
& +2 a c x b_2+a \gamma x b_3+a \gamma y a_3-b \beta c a_1+2 b c x a_2-b c x b_3+b c y a_3 \\
& +2 b \gamma x a_3+a \gamma a_1+b c a_1+c^2 b_2-c \gamma a_2+c \gamma b_3-\gamma^2 a_3=0
\end{aligned} \tag{6E}$$

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\{x, y\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\{x = v_1, y = v_2\}$$

The above PDE (6E) now becomes

$$\begin{aligned}
&-a^4\alpha^2a_3v_2^4 - 4a^3\alpha^2ba_3v_1v_2^3 - 6a^2\alpha^2b^2a_3v_1^2v_2^2 - 4a\,\alpha^2b^3a_3v_1^3v_2 \\
&- \alpha^2b^4a_3v_1^4 - 2a^3\alpha\beta a_3v_2^3 - 6a^2\alpha b\beta a_3v_1v_2^2 - 6a\alpha\,b^2\beta a_3v_1^2v_2 \\
&- 2\alpha\,b^3\beta a_3v_1^3 + a^3\alpha a_3v_2^3 - 2a^3\alpha b_2v_1^2v_2 - a^3\alpha b_3v_1v_2^2 \\

&- a^2\beta b_2v_1^2 - 2a\alpha bca_1v_2 - 2a\alpha bcb_1v_1 - ab\beta a_2v_1^2 + 2ab\beta a_3v_1v_2 \\
&+ ab\beta b_3v_1^2 - 2\alpha\,b^2ca_1v_1 + 2b^2\beta a_3v_1^2 + a^2\beta a_1v_2 - a^2\beta b_1v_1 \\
&+ a^2b_2v_1^2 + aba_2v_1^2 - abb_3v_1^2 - a\beta ca_2v_2 - a\beta cb_2v_1 - 2a\beta\gamma a_3v_2 \\
&- b^2a_3v_1^2 - 2b\beta ca_2v_1 - b\beta ca_3v_2 + b\beta cb_3v_1 - 2b\beta\gamma a_3v_1 - a\beta cb_1 \\
&+ 2acb_2v_1 + a\gamma a_3v_2 + a\gamma b_3v_1 - b\beta ca_1 + 2bca_2v_1 + bca_3v_2 - bcb_3v_1 \\
&+ 2b\gamma a_3v_1 + a\gamma a_1 + bca_1 + c^2b_2 - c\gamma a_2 + c\gamma b_3 - \gamma^2a_3 = 0
\end{aligned} \tag{7E}$$

Collecting the above on the terms v_i introduced, and these are

$$\{v_1, v_2\}$$

Equation (7E) now becomes

$$
\begin{aligned}
&-\alpha^2 b^4 a_3 v_1^4 - 4a\,\alpha^2 b^3 a_3 v_1^3 v_2 \\
&+ \left(-2\alpha\, b^3 \beta a_3 - 2a^2\alpha b b_2 - 2a\alpha\, b^2 a_2 + a\alpha\, b^2 b_3 + 2\alpha\, b^3 a_3\right) v_1^3 \\
&- 6a^2\alpha^2 b^2 a_3 v_1^2 v_2^2 \\
&+ \left(-6a\alpha\, b^2 \beta a_3 - 2a^3\alpha b_2 - 2a^2\alpha b a_2 + 3a\alpha\, b^2 a_3\right) v_1^2 v_2 + \left(-2a^2\alpha b b_1\right. \\
&- a\alpha\, b^2 a_1 - 2a\alpha b c b_2 - 3\alpha\, b^2 c a_2 + \alpha\, b^2 c b_3 - 2\alpha\, b^2 \gamma a_3 - b^2\beta^2 a_3 \\
&\left. - a^2\beta b_2 - ab\beta a_2 + ab\beta b_3 + 2b^2\beta a_3 + a^2 b_2 + aba_2 - abb_3 - b^2 a_3\right) v_1^2 \\
&- 4a^3\alpha^2 b a_3 v_1 v_2^3 + \left(-6a^2\alpha b\beta a_3 - a^3\alpha b_3 + 2a^2\alpha b a_3\right) v_1 v_2^2 \\
&+ \left(-2a^3\alpha b_1 - 2a^2\alpha c b_2 - 4a\alpha b c a_2 - 4a\alpha b\gamma a_3 - 2ab\,\beta^2 a_3 - 2\alpha\, b^2 c a_3\right. \\
&\left. + 2ab\beta a_3\right) v_1 v_2 + \left(-2a\alpha b c b_1 - 2\alpha\, b^2 c a_1 - a^2\beta b_1 - a\beta c b_2 - 2b\beta c a_2\right. \\
&\left. + b\beta c b_3 - 2b\beta\gamma a_3 + 2acb_2 + a\gamma b_3 + 2bca_2 - bcb_3 + 2b\gamma a_3\right) v_1 \\
&- a^4\alpha^2 a_3 v_2^4 + \left(-2a^3\alpha\beta a_3 + a^3\alpha a_3\right) v_2^3 + \left(a^3\alpha a_1 - a^2\alpha c a_2\right. \\
&\left. - a^2\alpha c b_3 - 2a^2\alpha\gamma a_3 - a^2\beta^2 a_3 - 2a\alpha b c a_3 + a^2\beta a_3\right) v_2^2 + \left(-2a^2\alpha c b_1\right. \\
&\left. - 2a\alpha b c a_1 + a^2\beta a_1 - a\beta c a_2 - 2a\beta\gamma a_3 - b\beta c a_3 + a\gamma a_3 + bca_3\right) v_2 \\
&- a\beta c b_1 - b\beta c a_1 + a\gamma a_1 + bca_1 + c^2 b_2 - c\gamma a_2 + c\gamma b_3 - \gamma^2 a_3 = 0
\end{aligned}
\tag{8E}
$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$-6a\alpha\, b^2\beta a_3 +$$

$$-2\alpha\, b^3\beta a_3 - 2a^2\alpha b b_2$$

$$a^3\alpha a_1 - a^2\alpha c a_2 - a^2\alpha c b_3 - 2a^2\alpha\gamma a$$

$$-2a^3\alpha b_1 - 2a^2\alpha c b_2 - 4a\alpha b c a_2 - 4a\alpha b\gamma a_3 -$$

$$-2a^2\alpha c b_1 - 2a\alpha b c a_1 + a^2\beta a_1 - a\beta c a_2 -$$

$$-a\beta c b_1 - b\beta c a_1 + a\gamma a_1 + bc$$

$$-2a\alpha b c b_1 - 2\alpha\, b^2 c a_1 - a^2\beta b_1 - a\beta c b_2 - 2b\beta c a_2 + b\beta c b_3 - 2b\beta\gamma a_3 + 2acb_2$$

$$-2a^2\alpha b b_1 - a\alpha\, b^2 a_1 - 2a\alpha b c b_2 - 3\alpha\, b^2 c a_2 + \alpha\, b^2 c b_3 - 2\alpha\, b^2\gamma a_3 - b^2\beta^2 a_3 - a^2\beta b_2 - ab\beta a_2 + ab\beta b_3 + 2b^2\beta$$

Solving the above equations for the unknowns gives

$$\begin{aligned}
a_1 &= -\frac{b_1 a}{b} \\
a_2 &= -\frac{b_1 a^2}{cb} \\
a_3 &= 0 \\
b_1 &= b_1 \\
b_2 &= \frac{b_1 a}{c} \\
b_3 &= 0
\end{aligned}$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$\begin{aligned}
\xi &= -\frac{a(xa+c)}{bc} \\
\eta &= \frac{xa+c}{c}
\end{aligned}$$

Shifting is now applied to make $\xi = 0$ in order to simplify the rest of the computation

$$\begin{aligned}
\eta &= \eta - \omega(x,y)\,\xi \\
&= \frac{xa+c}{c} - \left(\frac{a^2\alpha\, y^2 + 2a\alpha bxy + \alpha\, b^2x^2 + a\beta y + b\beta x - bx + \gamma}{xa+c}\right)\left(-\frac{a(xa+c)}{bc}\right) \\
&= \frac{a^3\alpha\, y^2 + 2a^2\alpha bxy + a\alpha\, b^2x^2 + a^2\beta y + ab\beta x + a\gamma + bc}{bc} \\
\xi &= 0
\end{aligned}$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x,y) \to (R,S)$ where (R,S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}$$

The above comes from the requirements that $\left(\xi \frac{\partial}{\partial x} + \eta \frac{\partial}{\partial y}\right) S(x,y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$R = x$$

S is found from

$$
\begin{aligned}
S &= \int \frac{1}{\eta} dy \\
&= \int \frac{1}{\frac{a^3\alpha\, y^2+2a^2\alpha bxy+a\alpha\, b^2x^2+a^2\beta y+ab\beta x+a\gamma+bc}{bc}} dy
\end{aligned}
$$

Which results in

$$
S = \frac{2bc \arctan\left(\frac{2a^3\alpha y+2\alpha\, a^2xb+a^2\beta}{\sqrt{4a^4\alpha\gamma-a^4\beta^2+4a^3\alpha bc}}\right)}{\sqrt{4a^4\alpha\gamma - a^4\beta^2 + 4a^3\alpha bc}}
$$

Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$
\frac{dS}{dR} = \frac{S_x + \omega(x,y)S_y}{R_x + \omega(x,y)R_y} \tag{2}
$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x,y)$ is the right hand side of the original ode given by

$$
\omega(x,y) = \frac{a^2\alpha\, y^2 + 2a\alpha bxy + \alpha\, b^2x^2 + a\beta y + b\beta x - bx + \gamma}{xa + c}
$$

Evaluating all the partial derivatives gives

$$
\begin{aligned}
R_x &= 1 \\
R_y &= 0 \\
S_x &= \frac{b^2c}{a\left(a^3\alpha\, y^2 + 2y\left(bx\alpha + \frac{\beta}{2}\right)a^2 + \left(\alpha\, b^2x^2 + b\beta x + \gamma\right)a + bc\right)} \\
S_y &= \frac{bc}{a^3\alpha\, y^2 + 2y\left(bx\alpha + \frac{\beta}{2}\right)a^2 + \left(\alpha\, b^2x^2 + b\beta x + \gamma\right)a + bc}
\end{aligned}
$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$
\frac{dS}{dR} = \frac{bc}{a\,(xa + c)} \tag{2A}
$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$
\frac{dS}{dR} = \frac{bc}{a\,(Ra + c)}
$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by

integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = \frac{bc \ln(Ra + c)}{a^2} + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$\frac{2bc \arctan\left(\frac{\sqrt{a}\,(2a\alpha y+2bx\alpha+\beta)}{\sqrt{(4\alpha\gamma-\beta^2)a+4bc\alpha}}\right)}{a^{\frac{3}{2}}\sqrt{(4\alpha\gamma-\beta^2)\,a+4bc\alpha}} = \frac{bc \ln(xa+c)}{a^2} + c_1$$

Which simplifies to

$$\frac{2bc \arctan\left(\frac{\sqrt{a}\,(2a\alpha y+2bx\alpha+\beta)}{\sqrt{(4\alpha\gamma-\beta^2)a+4bc\alpha}}\right)}{a^{\frac{3}{2}}\sqrt{(4\alpha\gamma-\beta^2)\,a+4bc\alpha}} = \frac{bc \ln(xa+c)}{a^2} + c_1$$

Which gives

$$y = \frac{-2\sqrt{a}\,\alpha b x + \tan\left(\frac{\sqrt{4\alpha\gamma a-a\,\beta^2+4bc\alpha}\,(c_1 a^2+bc\ln(xa+c))}{2\sqrt{a}\,bc}\right)\sqrt{4\alpha\gamma a-a\,\beta^2+4bc\alpha}-\sqrt{a}\,\beta}{2a^{\frac{3}{2}}\alpha}$$

Summary

The solution(s) found are the following

$$y = \frac{-2\sqrt{a}\,\alpha b x + \tan\left(\frac{\sqrt{4\alpha\gamma a-a\,\beta^2+4bc\alpha}\,(c_1 a^2+bc\ln(xa+c))}{2\sqrt{a}\,bc}\right)\sqrt{4\alpha\gamma a-a\,\beta^2+4bc\alpha}-\sqrt{a}\,\beta}{2a^{\frac{3}{2}}\alpha} \tag{1}$$

Verification of solutions

$$y = \frac{-2\sqrt{a}\,\alpha b x + \tan\left(\frac{\sqrt{4\alpha\gamma a-a\,\beta^2+4bc\alpha}\,(c_1 a^2+bc\ln(xa+c))}{2\sqrt{a}\,bc}\right)\sqrt{4\alpha\gamma a-a\,\beta^2+4bc\alpha}-\sqrt{a}\,\beta}{2a^{\frac{3}{2}}\alpha}$$

Verified OK.

2.46.2 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a^2\alpha\,y^2+2a\alpha bxy+\alpha\,b^2x^2+a\beta y+b\beta x-bx+\gamma}{xa+c} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a^2\alpha\, y^2}{xa+c} + \frac{2a\alpha bxy}{xa+c} + \frac{\alpha\, b^2x^2}{xa+c} + \frac{a\beta y}{xa+c} + \frac{b\beta x}{xa+c} - \frac{bx}{xa+c} + \frac{\gamma}{xa+c}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{\alpha\, b^2x^2+b\beta x-bx+\gamma}{xa+c}$, $f_1(x) = \frac{2\alpha axb+\beta a}{xa+c}$ and $f_2(x) = \frac{\alpha\, a^2}{xa+c}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{\frac{\alpha\, a^2u}{xa+c}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{\alpha\, a^3}{(xa+c)^2} \\ f_1f_2 &= \frac{(2\alpha axb+\beta a)\,\alpha\, a^2}{(xa+c)^2} \\ f_2^2f_0 &= \frac{\alpha^2a^4(\alpha\, b^2x^2+b\beta x-bx+\gamma)}{(xa+c)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{\alpha\, a^2u''(x)}{xa+c} - \left(-\frac{\alpha\, a^3}{(xa+c)^2} + \frac{(2\alpha axb+\beta a)\,\alpha\, a^2}{(xa+c)^2}\right)u'(x) + \frac{\alpha^2a^4(\alpha\, b^2x^2+b\beta x-bx+\gamma)\, u(x)}{(xa+c)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{bx\alpha}\left((xa+c)^{\frac{-2bc\alpha+\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}\,a+\beta a}{2a}}c_1 + (xa+c)^{-\frac{2bc\alpha+\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}\,a-\beta a}{2a}}c_2\right)$$

The above shows that

$$u'(x) = \frac{a\,\mathrm{e}^{bx\alpha}\left(-c_2\left(-2bx\alpha+\sqrt{\frac{(-4\alpha\gamma+\beta^2)a-4bc\alpha}{a}}-\beta\right)(xa+c)^{-\frac{2bc\alpha+\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}\,a-\beta a}{2a}} + (xa+c)^{\frac{-2bc\alpha+\sqrt{\frac{\left(-4\alpha\gamma\right.}{}}}{}}\right.}{2xa+2c}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-c_2\left(-2bx\alpha+\sqrt{\frac{(-4\alpha\gamma+\beta^2)a-4bc\alpha}{a}}-\beta\right)(xa+c)^{-\frac{2bc\alpha+\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}\,a-\beta a}{2a}}+(xa+c)^{\frac{-2bc\alpha+\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)}{a}}}{2a}}\right.}{a\,(2xa+2c)\,\alpha\left((xa+c)^{\frac{-2bc\alpha+\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}\,a+\beta a}{2a}}c_1+(xa+c)^{-\frac{2bc\alpha+}{}}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1}=c_3$ the following solution

$$y = \frac{\left(-2bx\alpha+\sqrt{\frac{(-4\alpha\gamma+\beta^2)a-4bc\alpha}{a}}-\beta\right)(xa+c)^{-\frac{\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}}{2}}-2c_3\left(bx\alpha+\frac{\beta}{2}+\frac{\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}}{2}\right)(xa-}{2\alpha a\left((xa+c)^{\frac{\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}}{2}}c_3+(xa+c)^{-\frac{\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}}{2}}\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(-2bx\alpha+\sqrt{\frac{(-4\alpha\gamma+\beta^2)a-4bc\alpha}{a}}-\beta\right)(xa+c)^{-\frac{\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}}{2}}-2c_3\left(bx\alpha+\frac{\beta}{2}+\frac{\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}}{2}\right)(xa-}{2\alpha a\left((xa+c)^{\frac{\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}}{2}}c_3+(xa+c)^{-\frac{\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}}{2}}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(-2bx\alpha+\sqrt{\frac{(-4\alpha\gamma+\beta^2)a-4bc\alpha}{a}}-\beta\right)(xa+c)^{-\frac{\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}}{2}}-2c_3\left(bx\alpha+\frac{\beta}{2}+\frac{\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}}{2}\right)(xa-}{2\alpha a\left((xa+c)^{\frac{\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}}{2}}c_3+(xa+c)^{-\frac{\sqrt{\frac{\left(-4\alpha\gamma+\beta^2\right)a-4bc\alpha}{a}}}{2}}\right)}$$

Verified OK.

Problem number: 47.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{2x^2y' - 2y^2 - xy = -2a^2x}$$

2.47.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{-2a^2x + yx + 2y^2}{2x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{a^2}{x} + \frac{y}{2x} + \frac{y^2}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{a^2}{x}$, $f_1(x) = \frac{1}{2x}$ and $f_2(x) = \frac{1}{x^2}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{\frac{u}{x^2}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{2}{x^3} \\ f_1 f_2 &= \frac{1}{2x^3} \\ f_2^2 f_0 &= -\frac{a^2}{x^5} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{u''(x)}{x^2} + \frac{3u'(x)}{2x^3} - \frac{a^2 u(x)}{x^5} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \sinh\left(\frac{2a}{\sqrt{x}}\right) + c_2 \cosh\left(\frac{2a}{\sqrt{x}}\right)$$

The above shows that

$$u'(x) = \frac{a\left(-c_1 \cosh\left(\frac{2a}{\sqrt{x}}\right) - c_2 \sinh\left(\frac{2a}{\sqrt{x}}\right)\right)}{x^{\frac{3}{2}}}$$

Using the above in (1) gives the solution

$$y = -\frac{a\sqrt{x}\left(-c_1 \cosh\left(\frac{2a}{\sqrt{x}}\right) - c_2 \sinh\left(\frac{2a}{\sqrt{x}}\right)\right)}{c_1 \sinh\left(\frac{2a}{\sqrt{x}}\right) + c_2 \cosh\left(\frac{2a}{\sqrt{x}}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(c_3 \cosh\left(\frac{2a}{\sqrt{x}}\right) + \sinh\left(\frac{2a}{\sqrt{x}}\right)\right) a\sqrt{x}}{c_3 \sinh\left(\frac{2a}{\sqrt{x}}\right) + \cosh\left(\frac{2a}{\sqrt{x}}\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(c_3 \cosh\left(\frac{2a}{\sqrt{x}}\right) + \sinh\left(\frac{2a}{\sqrt{x}}\right)\right) a\sqrt{x}}{c_3 \sinh\left(\frac{2a}{\sqrt{x}}\right) + \cosh\left(\frac{2a}{\sqrt{x}}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(c_3 \cosh\left(\frac{2a}{\sqrt{x}}\right) + \sinh\left(\frac{2a}{\sqrt{x}}\right)\right) a\sqrt{x}}{c_3 \sinh\left(\frac{2a}{\sqrt{x}}\right) + \cosh\left(\frac{2a}{\sqrt{x}}\right)}$$

Verified OK.

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{2x^2y' - 2y^2 - 3xy = -2a^2x}$$

2.48.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{-2a^2x + 3yx + 2y^2}{2x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{a^2}{x} + \frac{3y}{2x} + \frac{y^2}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{a^2}{x}$, $f_1(x) = \frac{3}{2x}$ and $f_2(x) = \frac{1}{x^2}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{u}{x^2}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{2}{x^3} \\ f_1f_2 &= \frac{3}{2x^3} \\ f_2^2f_0 &= -\frac{a^2}{x^5} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{u''(x)}{x^2} + \frac{u'(x)}{2x^3} - \frac{a^2u(x)}{x^5} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \sqrt{x}\left(c_1 \sinh\left(\frac{2a}{\sqrt{x}}\right) + c_2\cosh\left(\frac{2a}{\sqrt{x}}\right)\right)$$

The above shows that

$$u'(x) = \frac{\left(-2\sqrt{x}\, c_1a + c_2x\right)\cosh\left(\frac{2a}{\sqrt{x}}\right) + \left(-2\sqrt{x}\, c_2a + c_1x\right)\sinh\left(\frac{2a}{\sqrt{x}}\right)}{2x^{\frac{3}{2}}}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-2\sqrt{x}\, c_1a + c_2x\right)\cosh\left(\frac{2a}{\sqrt{x}}\right) + \left(-2\sqrt{x}\, c_2a + c_1x\right)\sinh\left(\frac{2a}{\sqrt{x}}\right)}{2\left(c_1\sinh\left(\frac{2a}{\sqrt{x}}\right) + c_2\cosh\left(\frac{2a}{\sqrt{x}}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\sinh\left(\frac{2a}{\sqrt{x}}\right)\left(2a\sqrt{x} - c_3x\right) + 2\left(\sqrt{x}\, c_3a - \frac{x}{2}\right)\cosh\left(\frac{2a}{\sqrt{x}}\right)}{2c_3\sinh\left(\frac{2a}{\sqrt{x}}\right) + 2\cosh\left(\frac{2a}{\sqrt{x}}\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{\sinh\left(\frac{2a}{\sqrt{x}}\right)\left(2a\sqrt{x}-c_3x\right)+2\left(\sqrt{x}\,c_3a-\frac{x}{2}\right)\cosh\left(\frac{2a}{\sqrt{x}}\right)}{2c_3\sinh\left(\frac{2a}{\sqrt{x}}\right)+2\cosh\left(\frac{2a}{\sqrt{x}}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\sinh\left(\frac{2a}{\sqrt{x}}\right)\left(2a\sqrt{x}-c_3x\right)+2\left(\sqrt{x}\,c_3a-\frac{x}{2}\right)\cosh\left(\frac{2a}{\sqrt{x}}\right)}{2c_3\sinh\left(\frac{2a}{\sqrt{x}}\right)+2\cosh\left(\frac{2a}{\sqrt{x}}\right)}$$

Verified OK.

Maple gives the following as the ode type

```
[[_homogeneous, `class G`], _rational, _Riccati]
```

$$\boxed{x^2y' - a\,x^2y^2 - ybx = c}$$

2.49.1 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$y' = \frac{a\,x^2y^2 + bxy + c}{x^2}$$
$$y' = \omega(x,y)$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x + \omega(\eta_y - \xi_x) - \omega^2\xi_y - \omega_x\xi - \omega_y\eta = 0 \tag{A}$$

The type of this ode is not in the lookup table. To determine ξ, η then (A) is solved using ansatz. Making bivariate polynomials of degree 1 to use as anstaz gives

$$\xi = xa_2 + ya_3 + a_1 \tag{1E}$$

$$\eta = xb_2 + yb_3 + b_1 \tag{2E}$$

Where the unknown coefficients are

$$\{a_1, a_2, a_3, b_1, b_2, b_3\}$$

Substituting equations (1E,2E) and ω into (A) gives

$$\begin{aligned} &b_2 + \frac{(a\,x^2y^2 + bxy + c)\,(b_3 - a_2)}{x^2} - \frac{(a\,x^2y^2 + bxy + c)^2\,a_3}{x^4} \\ &- \left(\frac{2ax\,y^2 + by}{x^2} - \frac{2(a\,x^2y^2 + bxy + c)}{x^3}\right)(xa_2 + ya_3 + a_1) \\ &- \frac{(2a\,x^2y + bx)\,(xb_2 + yb_3 + b_1)}{x^2} = 0 \end{aligned} \tag{5E}$$

Putting the above in normal form gives

$$-\frac{a^2x^4y^4a_3 + 2ab\,x^3y^3a_3 + 2a\,x^5yb_2 + a\,x^4y^2a_2 + a\,x^4y^2b_3 + 2ac\,x^2y^2a_3 + 2a\,x^4yb_1 + b^2x^2y^2a_3 + b\,x^4b_2 - b}{x^4} = 0$$

Setting the numerator to zero gives

$$\begin{aligned} &-a^2x^4y^4a_3 - 2ab\,x^3y^3a_3 - 2a\,x^5yb_2 - a\,x^4y^2a_2 - a\,x^4y^2b_3 - 2ac\,x^2y^2a_3 \\ &- 2a\,x^4yb_1 - b^2x^2y^2a_3 - b\,x^4b_2 + b\,x^2y^2a_3 - 2bcxya_3 - b\,x^3b_1 \\ &+ b\,x^2ya_1 + b_2x^4 + c\,x^2a_2 + c\,x^2b_3 + 2cxya_3 - c^2a_3 + 2cxa_1 = 0 \end{aligned} \tag{6E}$$

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\{x, y\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\{x = v_1, y = v_2\}$$

The above PDE (6E) now becomes

$$\begin{aligned} &-a^2a_3v_1^4v_2^4 - 2aba_3v_1^3v_2^3 - aa_2v_1^4v_2^2 - 2ab_2v_1^5v_2 - ab_3v_1^4v_2^2 - 2aca_3v_1^2v_2^2 \\ &- 2ab_1v_1^4v_2 - b^2a_3v_1^2v_2^2 + ba_3v_1^2v_2^2 - bb_2v_1^4 - 2bca_3v_1v_2 + ba_1v_1^2v_2 \\ &- bb_1v_1^3 + b_2v_1^4 + ca_2v_1^2 + 2ca_3v_1v_2 + cb_3v_1^2 - c^2a_3 + 2ca_1v_1 = 0 \end{aligned} \tag{7E}$$

Collecting the above on the terms v_i introduced, and these are

$$\{v_1, v_2\}$$

Equation (7E) now becomes

$$\begin{aligned}
&-2ab_2v_1^5v_2 - a^2a_3v_1^4v_2^4 + (-aa_2 - ab_3)\, v_1^4v_2^2 - 2ab_1v_1^4v_2 + (-bb_2 + b_2)\, v_1^4 \\
&- 2aba_3v_1^3v_2^3 - bb_1v_1^3 + \left(-2aca_3 - b^2a_3 + ba_3\right) v_1^2v_2^2 + ba_1v_1^2v_2 \\
&+ (ca_2 + cb_3)\, v_1^2 + (-2bca_3 + 2ca_3)\, v_1v_2 + 2ca_1v_1 - c^2a_3 = 0
\end{aligned} \tag{8E}$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$\begin{aligned}
ba_1 &= 0 \\
-2ab_1 &= 0 \\
-2ab_2 &= 0 \\
-a^2a_3 &= 0 \\
-bb_1 &= 0 \\
2ca_1 &= 0 \\
-c^2a_3 &= 0 \\
-2aba_3 &= 0 \\
-bb_2 + b_2 &= 0 \\
-aa_2 - ab_3 &= 0 \\
-2bca_3 + 2ca_3 &= 0 \\
ca_2 + cb_3 &= 0 \\
-2aca_3 - b^2a_3 + ba_3 &= 0
\end{aligned}$$

Solving the above equations for the unknowns gives

$$\begin{aligned}
a_1 &= 0 \\
a_2 &= -b_3 \\
a_3 &= 0 \\
b_1 &= 0 \\
b_2 &= 0 \\
b_3 &= b_3
\end{aligned}$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$
\begin{aligned}
\xi &= -x \\
\eta &= y
\end{aligned}
$$

Shifting is now applied to make $\xi = 0$ in order to simplify the rest of the computation

$$
\begin{aligned}
\eta &= \eta - \omega(x, y)\,\xi \\
&= y - \left(\frac{a\,x^2y^2 + bxy + c}{x^2}\right)(-x) \\
&= \frac{a\,x^2y^2 + bxy + yx + c}{x} \\
\xi &= 0
\end{aligned}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x, y) \to (R, S)$ where (R, S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$
\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}
$$

The above comes from the requirements that $\left(\xi\frac{\partial}{\partial x} + \eta\frac{\partial}{\partial y}\right)S(x, y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$
R = x
$$

S is found from

$$
\begin{aligned}
S &= \int \frac{1}{\eta} dy \\
&= \int \frac{1}{\frac{a\,x^2y^2+bxy+yx+c}{x}} dy
\end{aligned}
$$

Which results in

$$
S = \frac{2x \arctan\left(\frac{2a\,x^2y+bx+x}{\sqrt{4ac\,x^2-b^2x^2-2b\,x^2-x^2}}\right)}{\sqrt{4ac\,x^2 - b^2x^2 - 2b\,x^2 - x^2}}
$$

Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$
\frac{dS}{dR} = \frac{S_x + \omega(x, y)S_y}{R_x + \omega(x, y)R_y} \tag{2}
$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x,y)$ is the right hand side of the original ode given by

$$\omega(x,y) = \frac{a\,x^2y^2 + bxy + c}{x^2}$$

Evaluating all the partial derivatives gives

$$\begin{aligned}
R_x &= 1\\
R_y &= 0\\
S_x &= \frac{y}{a\,x^2y^2 + y\,(b+1)\,x + c}\\
S_y &= \frac{x}{a\,x^2y^2 + y\,(b+1)\,x + c}
\end{aligned}$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$\frac{dS}{dR} = \frac{1}{x} \tag{2A}$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$\frac{dS}{dR} = \frac{1}{R}$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = \ln(R) + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$\frac{2\arctan\left(\frac{2yax+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}} = \ln(x) + c_1$$

Which simplifies to

$$\frac{2\arctan\left(\frac{2yax+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}} = \ln(x) + c_1$$

Which gives

$$y = \frac{\tan\left(\frac{\ln(x)\sqrt{4ca-b^2-2b-1}}{2} + \frac{c_1\sqrt{4ca-b^2-2b-1}}{2}\right)\sqrt{4ca-b^2-2b-1} - b - 1}{2xa}$$

Summary

The solution(s) found are the following

$$y = \frac{\tan\left(\frac{\ln(x)\sqrt{4ca-b^2-2b-1}}{2} + \frac{c_1\sqrt{4ca-b^2-2b-1}}{2}\right)\sqrt{4ca-b^2-2b-1} - b - 1}{2xa} \tag{1}$$

Verification of solutions

$$y = \frac{\tan\left(\frac{\ln(x)\sqrt{4ca-b^2-2b-1}}{2} + \frac{c_1\sqrt{4ca-b^2-2b-1}}{2}\right)\sqrt{4ca-b^2-2b-1} - b - 1}{2xa}$$

Verified OK.

2.49.2 Solving as exact ode

Entering Exact first order ODE solver. (Form one type)

To solve an ode of the form

$$M(x,y) + N(x,y)\frac{dy}{dx} = 0 \tag{A}$$

We assume there exists a function $\phi(x,y) = c$ where c is constant, that satisfies the ode. Taking derivative of ϕ w.r.t. x gives

$$\frac{d}{dx}\phi(x,y) = 0$$

Hence

$$\frac{\partial\phi}{\partial x} + \frac{\partial\phi}{\partial y}\frac{dy}{dx} = 0 \tag{B}$$

Comparing (A,B) shows that

$$\frac{\partial\phi}{\partial x} = M$$
$$\frac{\partial\phi}{\partial y} = N$$

But since $\frac{\partial^2\phi}{\partial x\partial y} = \frac{\partial^2\phi}{\partial y\partial x}$ then for the above to be valid, we require that

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$$

If the above condition is satisfied, then the original ode is called exact. We still need to determine $\phi(x,y)$ but at least we know now that we can do that since the condition $\frac{\partial^2\phi}{\partial x\partial y}=\frac{\partial^2\phi}{\partial y\partial x}$ is satisfied. If this condition is not satisfied then this method will not work and we have to now look for an integrating factor to force this condition, which might or might not exist. The first step is to write the ODE in standard form to check for exactness, which is

$$M(x,y)\,\mathrm{d}x+N(x,y)\,\mathrm{d}y=0 \tag{1A}$$

Therefore

$$\begin{aligned}\left(x^{2}\right)\mathrm{d}y&=\left(a\,x^{2}y^{2}+bxy+c\right)\mathrm{d}x\\ \left(-a\,x^{2}y^{2}-bxy-c\right)\mathrm{d}x+\left(x^{2}\right)\mathrm{d}y&=0 \qquad (2A)\end{aligned}$$

Comparing (1A) and (2A) shows that

$$\begin{aligned}M(x,y)&=-a\,x^{2}y^{2}-bxy-c\\ N(x,y)&=x^{2}\end{aligned}$$

The next step is to determine if the ODE is is exact or not. The ODE is exact when the following condition is satisfied

$$\frac{\partial M}{\partial y}=\frac{\partial N}{\partial x}$$

Using result found above gives

$$\begin{aligned}\frac{\partial M}{\partial y}&=\frac{\partial}{\partial y}\left(-a\,x^{2}y^{2}-bxy-c\right)\\ &=-2a\,x^{2}y-bx\end{aligned}$$

And

$$\begin{aligned}\frac{\partial N}{\partial x}&=\frac{\partial}{\partial x}\left(x^{2}\right)\\ &=2x\end{aligned}$$

Since $\frac{\partial M}{\partial y}\neq\frac{\partial N}{\partial x}$, then the ODE is <u>not exact</u>. Since the ODE is not exact, we will try to find an integrating factor to make it exact. Let

$$\begin{aligned}A&=\frac{1}{N}\left(\frac{\partial M}{\partial y}-\frac{\partial N}{\partial x}\right)\\ &=\frac{1}{x^{2}}\left(\left(-2a\,x^{2}y-bx\right)-(2x)\right)\\ &=\frac{-2axy-b-2}{x}\end{aligned}$$

Since A depends on y, it can not be used to obtain an integrating factor. We will now try a second method to find an integrating factor. Let

$$
\begin{aligned}
B &= \frac{1}{M}\left(\frac{\partial N}{\partial x}-\frac{\partial M}{\partial y}\right) \\
&= -\frac{1}{a\,x^{2}y^{2}+bxy+c}\left((2x)-\left(-2a\,x^{2}y-bx\right)\right) \\
&= -\frac{x(2axy+b+2)}{a\,x^{2}y^{2}+bxy+c}
\end{aligned}
$$

Since B depends on x, it can not be used to obtain an integrating factor.We will now try a third method to find an integrating factor. Let

$$
R=\frac{\frac{\partial N}{\partial x}-\frac{\partial M}{\partial y}}{xM-yN}
$$

R is now checked to see if it is a function of only $t=xy$. Therefore

$$
\begin{aligned}
R &= \frac{\frac{\partial N}{\partial x}-\frac{\partial M}{\partial y}}{xM-yN} \\
&= \frac{(2x)-\left(-2a\,x^{2}y-bx\right)}{x\left(-a\,x^{2}y^{2}-bxy-c\right)-y\left(x^{2}\right)} \\
&= \frac{-2axy-b-2}{a\,x^{2}y^{2}+y\left(b+1\right)x+c}
\end{aligned}
$$

Replacing all powers of terms xy by t gives

$$
R=\frac{-2at-b-2}{a\,t^{2}+\left(b+1\right)t+c}
$$

Since R depends on t only, then it can be used to find an integrating factor. Let the integrating factor be μ then

$$
\begin{aligned}
\mu &= e^{\int R\,\mathrm{d}t} \\
&= e^{\int \left(\frac{-2at-b-2}{a\,t^{2}+(b+1)t+c}\right)\mathrm{d}t}
\end{aligned}
$$

The result of integrating gives

$$
\begin{aligned}
\mu &= e^{-\ln\left(a\,t^{2}+tb+c+t\right)-\frac{2\arctan\left(\frac{2at+b+1}{\sqrt{4ca-b^{2}-2b-1}}\right)}{\sqrt{4ca-b^{2}-2b-1}}} \\
&= \frac{\mathrm{e}^{-\frac{2\arctan\left(\frac{2at+b+1}{\sqrt{4ca-b^{2}-2b-1}}\right)}{\sqrt{4ca-b^{2}-2b-1}}}}{a\,t^{2}+tb+c+t}
\end{aligned}
$$

Now t is replaced back with xy giving

$$\mu = \frac{e^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}}}{a\,x^2y^2+bxy+yx+c}$$

Multiplying M and N by this integrating factor gives new M and new N which are called $\overline{M}$ and $\overline{N}$ so not to confuse them with the original M and N

$$\begin{aligned}\overline{M} &= \mu M \\ &= \frac{e^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}}}{a\,x^2y^2+bxy+yx+c}(-a\,x^2y^2-bxy-c) \\ &= -\frac{(a\,x^2y^2+bxy+c)\,e^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}}}{a\,x^2y^2+y\,(b+1)\,x+c}\end{aligned}$$

And

$$\begin{aligned}\overline{N} &= \mu N \\ &= \frac{e^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}}}{a\,x^2y^2+bxy+yx+c}(x^2) \\ &= \frac{x^2 e^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}}}{a\,x^2y^2+y\,(b+1)\,x+c}\end{aligned}$$

A modified ODE is now obtained from the original ODE, which is exact and can solved. The modified ODE is

$$\overline{M} + \overline{N}\frac{\mathrm{d}y}{\mathrm{d}x} = 0$$

$$\left(-\frac{(a\,x^2y^2+bxy+c)\,e^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}}}{a\,x^2y^2+y\,(b+1)\,x+c}\right) + \left(\frac{x^2 e^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}}}{a\,x^2y^2+y\,(b+1)\,x+c}\right)\frac{\mathrm{d}y}{\mathrm{d}x} = 0$$

The following equations are now set up to solve for the function $\phi(x,y)$

$$\frac{\partial \phi}{\partial x} = \overline{M} \tag{1}$$

$$\frac{\partial \phi}{\partial y} = \overline{N} \tag{2}$$

Integrating (1) w.r.t. x gives

$$\int \frac{\partial \phi}{\partial x} \mathrm{d}x = \int \overline{M} \,\mathrm{d}x$$

$$\int \frac{\partial \phi}{\partial x} \mathrm{d}x = \int -\frac{\left(a\,x^2y^2+bxy+c\right) \mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}}}{a\,x^2y^2+y\,(b+1)\,x+c} \mathrm{d}x$$

$$\phi = -\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}} x + f(y) \tag{3}$$

Where $f(y)$ is used for the constant of integration since ϕ is a function of both x and y. Taking derivative of equation (3) w.r.t y gives

$$\begin{aligned} \frac{\partial \phi}{\partial y} &= \frac{4x^2 a\,\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}}}{\left(4ca-b^2-2b-1\right)\left(\frac{(2axy+b+1)^2}{4ca-b^2-2b-1}+1\right)} + f'(y) \\ &= \frac{x^2 \mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}}}{a\,x^2y^2+y\,(b+1)\,x+c} + f'(y) \end{aligned} \tag{4}$$

But equation (2) says that $\frac{\partial \phi}{\partial y} = \frac{x^2 \mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}}}{a\,x^2y^2+y(b+1)x+c}$. Therefore equation (4) becomes

$$\frac{x^2 \mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}}}{a\,x^2y^2+y\,(b+1)\,x+c} = \frac{x^2 \mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}}}{a\,x^2y^2+y\,(b+1)\,x+c} + f'(y) \tag{5}$$

Solving equation (5) for $f'(y)$ gives

$$f'(y) = 0$$

Therefore

$$f(y) = c_1$$

Where c_1 is constant of integration. Substituting this result for $f(y)$ into equation (3) gives ϕ

$$\phi = -\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}} x + c_1$$

But since ϕ itself is a constant function, then let $\phi = c_2$ where c_2 is new constant and combining c_1 and c_2 constants into new constant c_1 gives the solution as

$$c_1 = -\mathrm{e}^{-\frac{2\arctan\left(\frac{2axy+b+1}{\sqrt{4ca-b^2-2b-1}}\right)}{\sqrt{4ca-b^2-2b-1}}} x$$

The solution becomes

$$y = -\frac{\tan\left(\frac{\ln\left(-\frac{c_1}{x}\right)\sqrt{4ca-b^2-2b-1}}{2}\right)\sqrt{4ca-b^2-2b-1}+b+1}{2xa}$$

Summary

The solution(s) found are the following

$$y = -\frac{\tan\left(\frac{\ln\left(-\frac{c_1}{x}\right)\sqrt{4ca-b^2-2b-1}}{2}\right)\sqrt{4ca-b^2-2b-1}+b+1}{2xa} \tag{1}$$

Verification of solutions

$$y = -\frac{\tan\left(\frac{\ln\left(-\frac{c_1}{x}\right)\sqrt{4ca-b^2-2b-1}}{2}\right)\sqrt{4ca-b^2-2b-1}+b+1}{2xa}$$

Verified OK.

2.49.3 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^2y^2+bxy+c}{x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,y^2 + \frac{by}{x} + \frac{c}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{c}{x^2}$, $f_1(x) = \frac{b}{x}$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= \frac{ab}{x} \\ f_2^2f_0 &= \frac{a^2c}{x^2} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$au''(x) - \frac{abu'(x)}{x} + \frac{a^2cu(x)}{x^2} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{\frac{b}{2}}\sqrt{x}\left(x^{\frac{\sqrt{-4ca+b^2+2b+1}}{2}}c_1 + x^{-\frac{\sqrt{-4ca+b^2+2b+1}}{2}}c_2\right)$$

The above shows that

$$u'(x) = \frac{\left(c_2\left(1+b-\sqrt{-4ca+b^2+2b+1}\right)x^{-\frac{\sqrt{-4ca+b^2+2b+1}}{2}} + x^{\frac{\sqrt{-4ca+b^2+2b+1}}{2}}c_1\left(1+b+\sqrt{-4ca+b^2+2b+1}\right)\right)x}{2\sqrt{x}}$$

Using the above in (1) gives the solution

$$y = -\frac{c_2\left(1+b-\sqrt{-4ca+b^2+2b+1}\right)x^{-\frac{\sqrt{-4ca+b^2+2b+1}}{2}} + x^{\frac{\sqrt{-4ca+b^2+2b+1}}{2}}c_1\left(1+b+\sqrt{-4ca+b^2+2b+1}\right)}{2xa\left(x^{\frac{\sqrt{-4ca+b^2+2b+1}}{2}}c_1 + x^{-\frac{\sqrt{-4ca+b^2+2b+1}}{2}}c_2\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-1-b+\sqrt{-4ca+b^2+2b+1}\right)x^{-\frac{\sqrt{-4ca+b^2+2b+1}}{2}} - x^{\frac{\sqrt{-4ca+b^2+2b+1}}{2}}c_3\left(1+b+\sqrt{-4ca+b^2+2b+1}\right)}{2xa\left(x^{\frac{\sqrt{-4ca+b^2+2b+1}}{2}}c_3 + x^{-\frac{\sqrt{-4ca+b^2+2b+1}}{2}}\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{\left(-1-b+\sqrt{-4ca+b^2+2b+1}\right) x^{-\frac{\sqrt{-4ca+b^2+2b+1}}{2}} - x^{\frac{\sqrt{-4ca+b^2+2b+1}}{2}} c_3 \left(1+b+\sqrt{-4ca+b^2+2b+1}\right)}{2xa \left(x^{\frac{\sqrt{-4ca+b^2+2b+1}}{2}} c_3 + x^{-\frac{\sqrt{-4ca+b^2+2b+1}}{2}}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(-1-b+\sqrt{-4ca+b^2+2b+1}\right) x^{-\frac{\sqrt{-4ca+b^2+2b+1}}{2}} - x^{\frac{\sqrt{-4ca+b^2+2b+1}}{2}} c_3 \left(1+b+\sqrt{-4ca+b^2+2b+1}\right)}{2xa \left(x^{\frac{\sqrt{-4ca+b^2+2b+1}}{2}} c_3 + x^{-\frac{\sqrt{-4ca+b^2+2b+1}}{2}}\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{x^2y' - y^2c\,x^2 - \left(a\,x^2 + bx\right)y = \alpha\,x^2 + \beta x + \gamma}$$

2.50.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{y^2c\,x^2 + a\,x^2y + \alpha\,x^2 + bxy + \beta x + \gamma}{x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = c\,y^2 + ya + \alpha + \frac{by}{x} + \frac{\beta}{x} + \frac{\gamma}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{\alpha\,x^2+\beta x+\gamma}{x^2}$, $f_1(x) = \frac{a\,x^2+bx}{x^2}$ and $f_2(x) = c$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{cu} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \frac{(a\,x^2 + bx)\,c}{x^2} \\ f_2^2 f_0 &= \frac{c^2(\alpha\,x^2 + \beta x + \gamma)}{x^2} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$c u''(x) - \frac{(a\,x^2 + bx)\,c u'(x)}{x^2} + \frac{c^2(\alpha\,x^2 + \beta x + \gamma)\,u(x)}{x^2} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = x^{\frac{b}{2}} \mathrm{e}^{\frac{xa}{2}} \Bigg(&c_1 \operatorname{WhittakerM}\left(-\frac{ab - 2\beta c}{2\sqrt{a^2 - 4\alpha c}}, \frac{\sqrt{b^2 - 4c\gamma + 2b + 1}}{2}, \sqrt{a^2 - 4\alpha c}\,x\right) \\ &+ c_2 \operatorname{WhittakerW}\left(-\frac{ab - 2\beta c}{2\sqrt{a^2 - 4\alpha c}}, \frac{\sqrt{b^2 - 4c\gamma + 2b + 1}}{2}, \sqrt{a^2 - 4\alpha c}\,x\right)\Bigg) \end{aligned}$$

The above shows that

$$u'(x) = \frac{\left(-c_1\left(ab - 2\beta c - \sqrt{b^2 - 4c\gamma + 2b + 1}\,\sqrt{a^2 - 4\alpha c} - \sqrt{a^2 - 4\alpha c}\right) \operatorname{WhittakerM}\left(-\frac{ab - 2\beta c - 2\sqrt{a^2 - 4\alpha c}}{2\sqrt{a^2 - 4\alpha c}}, \frac{\sqrt{b^2 - 4c}}{}\right.\right.}{}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-c_1\left(ab - 2\beta c - \sqrt{b^2 - 4c\gamma + 2b + 1}\,\sqrt{a^2 - 4\alpha c} - \sqrt{a^2 - 4\alpha c}\right) \operatorname{WhittakerM}\left(-\frac{ab - 2\beta c - 2\sqrt{a^2 - 4\alpha c}}{2\sqrt{a^2 - 4\alpha c}}, \frac{\sqrt{b^2}}{}\right.\right.}{}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{-c_3\left(ab - 2\beta c - \sqrt{b^2 - 4c\gamma + 2b + 1}\,\sqrt{a^2 - 4\alpha c} - \sqrt{a^2 - 4\alpha c}\right)\mathrm{WhittakerM}\left(-\frac{ab-2\beta c-2\sqrt{a^2-4\alpha c}}{2\sqrt{a^2-4\alpha c}}, \frac{\sqrt{b^2-\cdots}}{}\right.}{}$$

Summary

The solution(s) found are the following

$$y = -\frac{-c_3\left(ab - 2\beta c - \sqrt{b^2 - 4c\gamma + 2b + 1}\,\sqrt{a^2 - 4\alpha c} - \sqrt{a^2 - 4\alpha c}\right)\mathrm{WhittakerM}\left(-\frac{ab-2\beta c-2\sqrt{a^2-4\alpha c}}{2\sqrt{a^2-4\alpha c}}, \frac{\sqrt{b^2-\cdots}}{}\right.}{} \tag{1}$$

Verification of solutions

$$y = -\frac{-c_3\left(ab - 2\beta c - \sqrt{b^2 - 4c\gamma + 2b + 1}\,\sqrt{a^2 - 4\alpha c} - \sqrt{a^2 - 4\alpha c}\right)\mathrm{WhittakerM}\left(-\frac{ab-2\beta c-2\sqrt{a^2-4\alpha c}}{2\sqrt{a^2-4\alpha c}}, \frac{\sqrt{b^2-\cdots}}{}\right.}{}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{x^2y' - a\,x^2y^2 - ybx = c\,x^n + s}$$

2.51.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^2y^2 + bxy + c\,x^n + s}{x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,y^2 + \frac{by}{x} + \frac{c\,x^n}{x^2} + \frac{s}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{c\,x^n+s}{x^2}$, $f_1(x) = \frac{b}{x}$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \frac{ab}{x} \\ f_2^2 f_0 &= \frac{a^2(c\,x^n + s)}{x^2} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$a u''(x) - \frac{abu'(x)}{x} + \frac{a^2(c\,x^n + s)\,u(x)}{x^2} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{\frac{b}{2}}\sqrt{x}\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}, \frac{2\sqrt{ca}\,x^{\frac{n}{2}}}{n}\right)c_1 + \operatorname{BesselY}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}, \frac{2\sqrt{ca}\,x^{\frac{n}{2}}}{n}\right)c_2\right)$$

The above shows that

$$u'(x) = \frac{\left(-2\sqrt{ca}\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}+1, \frac{2\sqrt{ca}\,x^{\frac{n}{2}}}{n}\right)c_1 + \operatorname{BesselY}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}+1, \frac{2\sqrt{ca}\,x^{\frac{n}{2}}}{n}\right)c_2\right)x^{\frac{n}{2}} + \left(\mathrm{Be}\right.\right.}{}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-2\sqrt{ca}\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}+1, \frac{2\sqrt{ca}\,x^{\frac{n}{2}}}{n}\right)c_1 + \operatorname{BesselY}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}+1, \frac{2\sqrt{ca}\,x^{\frac{n}{2}}}{n}\right)c_2\right)x^{\frac{n}{2}} + \left(\right.\right.}{2a\sqrt{x}\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}, \right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{2\sqrt{ca}\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}+1, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 + \operatorname{BesselY}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}+1, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right)\right) x^{\frac{n}{2}} - \left(\operatorname{BesselJ}\right.}{2ax\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 +\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{2\sqrt{ca}\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}+1, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 + \operatorname{BesselY}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}+1, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right)\right) x^{\frac{n}{2}} - \left(\operatorname{BesselJ}\right.}{2ax\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 +\right.} \tag{1}$$

Verification of solutions

$$y = \frac{2\sqrt{ca}\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}+1, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 + \operatorname{BesselY}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}+1, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right)\right) x^{\frac{n}{2}} - \left(\operatorname{BesselJ}\right.}{2ax\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4as+b^2+2b+1}}{n}, \frac{2\sqrt{ca}\, x^{\frac{n}{2}}}{n}\right) c_3 +\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 52.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{x^2y' - a\,x^2y^2 - ybx = c\,x^{2n} + s\,x^n}$$

2.52.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^2y^2 + bxy + c\,x^{2n} + s\,x^n}{x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,y^2 + \frac{by}{x} + \frac{c\,x^{2n}}{x^2} + \frac{s\,x^n}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{c\,x^{2n}+s\,x^n}{x^2}$, $f_1(x) = \frac{b}{x}$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= 0 \\
f_1 f_2 &= \frac{ab}{x} \\
f_2^2 f_0 &= \frac{a^2(c\,x^{2n} + s\,x^n)}{x^2}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$au''(x) - \frac{abu'(x)}{x} + \frac{a^2(c\,x^{2n} + s\,x^n)\,u(x)}{x^2} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) = \Bigg(&\mathrm{WhittakerW}\left(-\frac{i\sqrt{a}\,s}{2n\sqrt{c}}, \frac{b+1}{2n}, \frac{2i\sqrt{c}\,\sqrt{a}\,x^n}{n}\right) c_2 \\
&+ \mathrm{WhittakerM}\left(-\frac{i\sqrt{a}\,s}{2n\sqrt{c}}, \frac{b+1}{2n}, \frac{2i\sqrt{c}\,\sqrt{a}\,x^n}{n}\right) c_1\Bigg)\, x^{\frac{b}{2}-\frac{n}{2}+\frac{1}{2}}
\end{aligned}$$

The above shows that

$$u'(x) = \frac{\left(-\left(i\sqrt{a}\,\sqrt{c}\,s - c(1+b+n)\right) c_1\,\mathrm{WhittakerM}\left(-\frac{i\sqrt{a}\,s-2n\sqrt{c}}{2n\sqrt{c}}, \frac{b+1}{2n}, \frac{2i\sqrt{c}\,\sqrt{a}\,x^n}{n}\right) - 2cnc_2\,\mathrm{WhittakerW}\left(-\frac{i\sqrt{a}\cdots}{\cdots}\right.\right.}{\cdots}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-\left(i\sqrt{a}\,\sqrt{c}\,s - c(1+b+n)\right) c_1\,\mathrm{WhittakerM}\left(-\frac{i\sqrt{a}\,s-2n\sqrt{c}}{2n\sqrt{c}}, \frac{b+1}{2n}, \frac{2i\sqrt{c}\,\sqrt{a}\,x^n}{n}\right) - 2cnc_2\,\mathrm{WhittakerW}\left(-\cdots\right.\right.}{2ca\left(\mathrm{Wh}\cdots\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(i\sqrt{a}\,\sqrt{c}\,s - c(1+b+n)\right) c_3 \,\mathrm{WhittakerM}\left(-\frac{i\sqrt{a}\,s}{2n\sqrt{c}}+1, \frac{b+1}{2n}, \frac{2i\sqrt{c}\,\sqrt{a}\,x^n}{n}\right) + 2\,\mathrm{WhittakerW}\left(-\frac{i\sqrt{a}\,s}{2n\sqrt{c}}+1, \cdots\right.}{2acx\left(\mathrm{WhittakerW}\left(-\cdots\right.\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(i\sqrt{a}\,\sqrt{c}\,s - c(1+b+n)\right) c_3 \,\mathrm{WhittakerM}\left(-\frac{i\sqrt{a}\,s}{2n\sqrt{c}}+1, \frac{b+1}{2n}, \frac{2i\sqrt{c}\,\sqrt{a}\,x^n}{n}\right) + 2\,\mathrm{WhittakerW}\left(-\frac{i\sqrt{a}\,s}{2n\sqrt{c}}+1, \cdots\right.}{2acx\left(\mathrm{WhittakerW}\left(-\cdots\right.\right.} \tag{1}$$

Verification of solutions

$$y = \frac{\left(i\sqrt{a}\,\sqrt{c}\,s - c(1+b+n)\right) c_3 \,\mathrm{WhittakerM}\left(-\frac{i\sqrt{a}\,s}{2n\sqrt{c}}+1, \frac{b+1}{2n}, \frac{2i\sqrt{c}\,\sqrt{a}\,x^n}{n}\right) + 2\,\mathrm{WhittakerW}\left(-\frac{i\sqrt{a}\,s}{2n\sqrt{c}}+1, \cdots\right.}{2acx\left(\mathrm{WhittakerW}\left(-\cdots\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{x^2y' - y^2c\,x^2 - (x^n a + b)\,xy = \alpha\,x^{2n} + \beta\,x^n + \gamma}$$

2.53.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{y^2c\,x^2 + a\,x^nxy + bxy + \beta\,x^n + \alpha\,x^{2n} + \gamma}{x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = c\,y^2 + \frac{x^nay}{x} + \frac{by}{x} + \frac{\beta\,x^n}{x^2} + \frac{\alpha\,x^{2n}}{x^2} + \frac{\gamma}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{\alpha\,x^{2n}+\beta\,x^n+\gamma}{x^2}$, $f_1(x) = \frac{x^nax+bx}{x^2}$ and $f_2(x) = c$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{cu} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= 0\\
f_1f_2 &= \frac{(x^n a x + b x)\,c}{x^2}\\
f_2^2 f_0 &= \frac{c^2(\alpha\,x^{2n} + \beta\,x^n + \gamma)}{x^2}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$cu''(x) - \frac{(x^n a x + b x)\,c u'(x)}{x^2} + \frac{c^2(\alpha\,x^{2n} + \beta\,x^n + \gamma)\,u(x)}{x^2} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
&u(x)\\
&= x^{\frac{b}{2}-\frac{n}{2}+\frac{1}{2}} \mathrm{e}^{\frac{x^n a}{2n}} \left(c_1 \,\mathrm{WhittakerM}\left(-\frac{(b-n+1)\,a - 2\beta c}{2\sqrt{a^2-4\alpha c}\,n}, \frac{\sqrt{b^2-4c\gamma+2b+1}}{2n}, \frac{\sqrt{a^2-4\alpha c}\,x^n}{n}\right)\right.\\
&\quad \left. + c_2 \,\mathrm{WhittakerW}\left(-\frac{(b-n+1)\,a - 2\beta c}{2\sqrt{a^2-4\alpha c}\,n}, \frac{\sqrt{b^2-4c\gamma+2b+1}}{2n}, \frac{\sqrt{a^2-4\alpha c}\,x^n}{n}\right)\right)
\end{aligned}$$

The above shows that

$$\begin{aligned}
&u'(x)\\
&= \frac{\left(-x^{\frac{n}{2}}\left(-\sqrt{b^2-4c\gamma+2b+1}\,\sqrt{a^2-4\alpha c} - \sqrt{a^2-4\alpha c}\,n + (b-n+1)\,a - 2\beta c\right) c_1 \,\mathrm{WhittakerM}\left(-\frac{-2\sqrt{a^2}}{}\right.\right.}{}
\end{aligned}$$

Using the above in (1) gives the solution

$$\begin{aligned}
&y =\\
&-\frac{\left(-x^{\frac{n}{2}}\left(-\sqrt{b^2-4c\gamma+2b+1}\,\sqrt{a^2-4\alpha c} - \sqrt{a^2-4\alpha c}\,n + (b-n+1)\,a - 2\beta c\right) c_1 \,\mathrm{WhittakerM}\left(-\frac{-2}{}\right.\right.}{}
\end{aligned}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$y =$

$$-\frac{\left(-x^{\frac{n}{2}}\left(-\sqrt{b^2-4c\gamma+2b+1}\,\sqrt{a^2-4\alpha c}-\sqrt{a^2-4\alpha c}\,n+(b-n+1)\,a-2\beta c\right)c_3\,\text{WhittakerM}\left(-\frac{-2\cdots}{}\right.\right.}{}$$

Summary

The solution(s) found are the following

$y =$ (1)

$$-\frac{\left(-x^{\frac{n}{2}}\left(-\sqrt{b^2-4c\gamma+2b+1}\,\sqrt{a^2-4\alpha c}-\sqrt{a^2-4\alpha c}\,n+(b-n+1)\,a-2\beta c\right)c_3\,\text{WhittakerM}\left(-\frac{-2\cdots}{}\right.\right.}{}$$

Verification of solutions

$y =$

$$-\frac{\left(-x^{\frac{n}{2}}\left(-\sqrt{b^2-4c\gamma+2b+1}\,\sqrt{a^2-4\alpha c}-\sqrt{a^2-4\alpha c}\,n+(b-n+1)\,a-2\beta c\right)c_3\,\text{WhittakerM}\left(-\frac{-2\cdots}{}\right.\right.}{}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 54.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{x^2y' - \left(\alpha\, x^{2n} + \beta\, x^n + \gamma\right) y^2 - (x^n a + b)\, xy = c\, x^2}$$

2.54.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{x^{2n}\alpha\, y^2 + a\, x^n xy + x^n \beta\, y^2 + bxy + c\, x^2 + \gamma\, y^2}{x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{x^{2n}\alpha\, y^2}{x^2} + \frac{x^n ay}{x} + \frac{x^n \beta\, y^2}{x^2} + \frac{by}{x} + c + \frac{\gamma\, y^2}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = c$, $f_1(x) = \frac{x^n ax + bx}{x^2}$ and $f_2(x) = \frac{\alpha\, x^{2n} + \beta\, x^n + \gamma}{x^2}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{(\alpha\, x^{2n} + \beta\, x^n + \gamma)u}{x^2}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{\frac{2\alpha\, x^{2n} n}{x} + \frac{\beta\, x^n n}{x}}{x^2} - \frac{2(\alpha\, x^{2n} + \beta\, x^n + \gamma)}{x^3} \\
f_1 f_2 &= \frac{(x^n a x + b x)\,(\alpha\, x^{2n} + \beta\, x^n + \gamma)}{x^4} \\
f_2^2 f_0 &= \frac{(\alpha\, x^{2n} + \beta\, x^n + \gamma)^2\, c}{x^4}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{(\alpha\, x^{2n} + \beta\, x^n + \gamma)\, u''(x)}{x^2} - \left(\frac{\frac{2\alpha\, x^{2n} n}{x} + \frac{\beta\, x^n n}{x}}{x^2} - \frac{2(\alpha\, x^{2n} + \beta\, x^n + \gamma)}{x^3} + \frac{(x^n a x + b x)\,(\alpha\, x^{2n} + \beta\, x^n + \gamma)}{x^4}\right) u$$

Solving the above ODE (this ode solved using Maple, not this program), gives

Expression too large to display

The above shows that

$$u'(x) = \frac{c\, x^{-\frac{3}{2}+\frac{b}{2}} \left(\left(-n + \sqrt{b^2 - 4c\gamma - 2b + 1}\right) \left((3\gamma^2\alpha + 3\beta^2\gamma)\, x^{2n - \frac{\sqrt{b^2-4c\gamma-2b+1}}{2}} + (6\beta\gamma\alpha + \beta^3)\, x^{3n - \frac{\sqrt{b^2-4c\gamma-2b+1}}{2}}\right.\right.}{}$$

Using the above in (1) gives the solution

Expression too large to display

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

Expression too large to display

Summary

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 55.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{(x^2-1)\,y'+\lambda(y^2-2xy+1)=0}$$

2.55.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y' &= F(x,y)\\ &= -\frac{\lambda(-2yx+y^2+1)}{x^2-1}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=\frac{2\lambda yx}{x^2-1}-\frac{\lambda\,y^2}{x^2-1}-\frac{\lambda}{x^2-1}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=-\frac{\lambda}{x^2-1}$, $f_1(x)=\frac{2\lambda x}{x^2-1}$ and $f_2(x)=-\frac{\lambda}{x^2-1}$. Let

$$\begin{aligned}y &= \frac{-u'}{f_2u}\\ &= \frac{-u'}{-\frac{\lambda u}{x^2-1}}\end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{2\lambda x}{(x^2-1)^2} \\ f_1 f_2 &= -\frac{2\lambda^2 x}{(x^2-1)^2} \\ f_2^2 f_0 &= -\frac{\lambda^3}{(x^2-1)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$-\frac{\lambda u''(x)}{x^2-1} - \left(-\frac{2\lambda^2 x}{(x^2-1)^2} + \frac{2\lambda x}{(x^2-1)^2}\right) u'(x) - \frac{\lambda^3 u(x)}{(x^2-1)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = (\mathrm{LegendreP}\,(\lambda-1, x)\, c_1 + \mathrm{LegendreQ}\,(\lambda-1, x)\, c_2)\, (x^2-1)^{\frac{\lambda}{2}}$$

The above shows that

$$u'(x) = \lambda (x^2-1)^{-1+\frac{\lambda}{2}}\, (\mathrm{LegendreP}\,(\lambda, x)\, c_1 + \mathrm{LegendreQ}\,(\lambda, x)\, c_2)$$

Using the above in (1) gives the solution

$$y = \frac{(x^2-1)^{-1+\frac{\lambda}{2}}\, (\mathrm{LegendreP}\,(\lambda, x)\, c_1 + \mathrm{LegendreQ}\,(\lambda, x)\, c_2)\, (x^2-1)\, (x^2-1)^{-\frac{\lambda}{2}}}{\mathrm{LegendreP}\,(\lambda-1, x)\, c_1 + \mathrm{LegendreQ}\,(\lambda-1, x)\, c_2}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\mathrm{LegendreP}\,(\lambda, x)\, c_3 + \mathrm{LegendreQ}\,(\lambda, x)}{\mathrm{LegendreP}\,(\lambda-1, x)\, c_3 + \mathrm{LegendreQ}\,(\lambda-1, x)}$$

Summary

The solution(s) found are the following

$$y = \frac{\mathrm{LegendreP}\,(\lambda, x)\, c_3 + \mathrm{LegendreQ}\,(\lambda, x)}{\mathrm{LegendreP}\,(\lambda-1, x)\, c_3 + \mathrm{LegendreQ}\,(\lambda-1, x)} \tag{1}$$

Verification of solutions

$$y = \frac{\text{LegendreP}(\lambda, x)\, c_3 + \text{LegendreQ}(\lambda, x)}{\text{LegendreP}(\lambda - 1, x)\, c_3 + \text{LegendreQ}(\lambda - 1, x)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 56.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{\left(a\,x^2+b\right)y'+\alpha y^2+\beta x y=-\frac{b(a+\beta)}{\alpha}}$$

2.56.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{\alpha^2 y^2+\beta x y \alpha+ab+\beta b}{\left(a\,x^2+b\right)\alpha} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=-\frac{\alpha\,y^2}{a\,x^2+b}-\frac{\beta x y}{a\,x^2+b}-\frac{ba}{\left(a\,x^2+b\right)\alpha}-\frac{b\beta}{\left(a\,x^2+b\right)\alpha}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x) = -\frac{ab+\beta b}{(a\,x^2+b)\alpha}$, $f_1(x) = -\frac{\beta x}{a\,x^2+b}$ and $f_2(x) = -\frac{\alpha}{a\,x^2+b}$. Let

$$
\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{-\frac{\alpha u}{a\,x^2+b}}
\end{aligned}
\tag{1}
$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$
f_2 u''(x) - (f_2' + f_1 f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}
$$

But

$$
\begin{aligned}
f_2' &= \frac{2\alpha x a}{\left(a\,x^2+b\right)^2} \\
f_1 f_2 &= \frac{\beta x \alpha}{\left(a\,x^2+b\right)^2} \\
f_2^2 f_0 &= -\frac{\alpha(ab+\beta b)}{\left(a\,x^2+b\right)^3}
\end{aligned}
$$

Substituting the above terms back in equation (2) gives

$$
-\frac{\alpha u''(x)}{a\,x^2+b} - \left(\frac{\beta x \alpha}{\left(a\,x^2+b\right)^2} + \frac{2\alpha x a}{\left(a\,x^2+b\right)^2}\right) u'(x) - \frac{\alpha(ab+\beta b)\,u(x)}{\left(a\,x^2+b\right)^3} = 0
$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$
\begin{aligned}
u(x) = \left(a\,x^2+b\right)^{-\frac{\beta}{4a}} \Bigg(&\mathrm{LegendreQ}\left(\frac{\beta}{2a}, \frac{2a+\beta}{2a}, \frac{ax}{\sqrt{-ab}}\right) c_2 \\
&+ \mathrm{LegendreP}\left(\frac{\beta}{2a}, \frac{2a+\beta}{2a}, \frac{ax}{\sqrt{-ab}}\right) c_1\Bigg)
\end{aligned}
$$

The above shows that

$$
\begin{aligned}
u'(x) = x(a+\beta)\left(a\,x^2+b\right)^{-\frac{4a+\beta}{4a}} \Bigg(&-\mathrm{LegendreQ}\left(\frac{\beta}{2a}, \frac{2a+\beta}{2a}, \frac{ax}{\sqrt{-ab}}\right) c_2 \\
&- \mathrm{LegendreP}\left(\frac{\beta}{2a}, \frac{2a+\beta}{2a}, \frac{ax}{\sqrt{-ab}}\right) c_1\Bigg)
\end{aligned}
$$

Using the above in (1) gives the solution

$$
y = \frac{x(a+\beta)\left(a\,x^2+b\right)^{-\frac{4a+\beta}{4a}} \left(-\mathrm{LegendreQ}\left(\frac{\beta}{2a}, \frac{2a+\beta}{2a}, \frac{ax}{\sqrt{-ab}}\right) c_2 - \mathrm{LegendreP}\left(\frac{\beta}{2a}, \frac{2a+\beta}{2a}, \frac{ax}{\sqrt{-ab}}\right) c_1\right) \left(a\,x^2+b\right.}{\alpha\left(\mathrm{LegendreQ}\left(\frac{\beta}{2a}, \frac{2a+\beta}{2a}, \frac{ax}{\sqrt{-ab}}\right) c_2 + \mathrm{LegendreP}\left(\frac{\beta}{2a}, \frac{2a+\beta}{2a}, \frac{ax}{\sqrt{-ab}}\right) c_1\right)}
$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{(a+\beta)\,x}{\alpha}$$

Summary

The solution(s) found are the following

$$y = -\frac{(a+\beta)\,x}{\alpha} \tag{1}$$

Verification of solutions

$$y = -\frac{(a+\beta)\,x}{\alpha}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{\left(a\,x^2+b\right)y'+\alpha y^2+\beta xy=-\gamma}$$

2.57.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{\alpha\,y^2+\beta xy+\gamma}{a\,x^2+b} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=-\frac{\alpha\,y^2}{a\,x^2+b}-\frac{\beta xy}{a\,x^2+b}-\frac{\gamma}{a\,x^2+b}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=-\frac{\gamma}{a\,x^2+b}$, $f_1(x)=-\frac{\beta x}{a\,x^2+b}$ and $f_2(x)=-\frac{\alpha}{a\,x^2+b}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{-\frac{\alpha u}{a\,x^2+b}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{2\alpha x a}{(a\,x^2+b)^2} \\ f_1f_2 &= \frac{\beta x \alpha}{(a\,x^2+b)^2} \\ f_2^2 f_0 &= -\frac{\alpha^2\gamma}{(a\,x^2+b)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$-\frac{\alpha u''(x)}{a\,x^2+b} - \left(\frac{\beta x\alpha}{(a\,x^2+b)^2} + \frac{2\alpha x a}{(a\,x^2+b)^2}\right) u'(x) - \frac{\alpha^2\gamma u(x)}{(a\,x^2+b)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = (a\,x^2+b)^{-\frac{\beta}{4a}} \left(\mathrm{LegendreP}\left(\frac{\beta}{2a}, \frac{\sqrt{4\alpha\gamma a + b\,\beta^2}}{2a\sqrt{b}}, \frac{ax}{\sqrt{-ab}}\right) c_1 + \mathrm{LegendreQ}\left(\frac{\beta}{2a}, \frac{\sqrt{4\alpha\gamma a + b\,\beta^2}}{2a\sqrt{b}}, \frac{ax}{\sqrt{-ab}}\right) c_2\right)$$

The above shows that

$$u'(x) = \frac{(a\,x^2+b)^{-\frac{4a+\beta}{4a}} \left(\left(\left(-\frac{\sqrt{4\alpha\gamma a+b\,\beta^2}\, b}{2} + b^{\frac{3}{2}}\left(a+\frac{\beta}{2}\right)\right) c_1\sqrt{-ab}\, \mathrm{LegendreP}\left(\frac{2a+\beta}{2a}, \frac{\sqrt{4\alpha\gamma a+b\,\beta^2}}{2a\sqrt{b}}, \frac{ax}{\sqrt{-ab}}\right) + \left(-\frac{\sqrt{4\alpha\gamma a}}{2}\right.\right.\right.}{}$$

Using the above in (1) gives the solution

$$y = \frac{(a\,x^2+b)^{-\frac{4a+\beta}{4a}} \left(\left(\left(-\frac{\sqrt{4\alpha\gamma a+b\,\beta^2}\, b}{2} + b^{\frac{3}{2}}\left(a+\frac{\beta}{2}\right)\right) c_1\sqrt{-ab}\, \mathrm{LegendreP}\left(\frac{2a+\beta}{2a}, \frac{\sqrt{4\alpha\gamma a+b\,\beta^2}}{2a\sqrt{b}}, \frac{ax}{\sqrt{-ab}}\right) + \left(-\frac{\sqrt{4\alpha\gamma a}}{2}\right.\right.\right.}{a}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\left(-2a-\beta\right)\sqrt{b}+\sqrt{4\alpha\gamma a+b\,\beta^{2}}\right)\left(\mathrm{LegendreP}\left(\frac{2a+\beta}{2a},\frac{\sqrt{4\alpha\gamma a+b\,\beta^{2}}}{2a\sqrt{b}},\frac{ax}{\sqrt{-ab}}\right)c_{3}+\mathrm{LegendreQ}\left(\frac{2a+\beta}{2a},\frac{\sqrt{4\alpha\gamma}}{2a}\right.\right.}{2\sqrt{b}\,a\alpha\left(\mathrm{LegendreP}\left(\frac{\beta}{2a},\frac{\sqrt{4\alpha\gamma a+b\,\beta^{2}}}{2a\sqrt{b}}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\left(-2a-\beta\right)\sqrt{b}+\sqrt{4\alpha\gamma a+b\,\beta^{2}}\right)\left(\mathrm{LegendreP}\left(\frac{2a+\beta}{2a},\frac{\sqrt{4\alpha\gamma a+b\,\beta^{2}}}{2a\sqrt{b}},\frac{ax}{\sqrt{-ab}}\right)c_{3}+\mathrm{LegendreQ}\left(\frac{2a+\beta}{2a},\frac{\sqrt{4\alpha\gamma}}{2a}\right.\right.}{2\sqrt{b}\,a\alpha\left(\mathrm{LegendreP}\left(\frac{\beta}{2a},\frac{\sqrt{4\alpha\gamma a+b\,\beta^{2}}}{2a\sqrt{b}}\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\left(-2a-\beta\right)\sqrt{b}+\sqrt{4\alpha\gamma a+b\,\beta^{2}}\right)\left(\mathrm{LegendreP}\left(\frac{2a+\beta}{2a},\frac{\sqrt{4\alpha\gamma a+b\,\beta^{2}}}{2a\sqrt{b}},\frac{ax}{\sqrt{-ab}}\right)c_{3}+\mathrm{LegendreQ}\left(\frac{2a+\beta}{2a},\frac{\sqrt{4\alpha\gamma}}{2a}\right.\right.}{2\sqrt{b}\,a\alpha\left(\mathrm{LegendreP}\left(\frac{\beta}{2a},\frac{\sqrt{4\alpha\gamma a+b\,\beta^{2}}}{2a\sqrt{b}}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 58.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati", "first_order_ode_lie_symmetry_calculated"**

Maple gives the following as the ode type

```
[_rational, [_1st_order, `_with_symmetry_[F(x),G(x)]`],
   _Riccati]
```

$$\boxed{\left(a\,x^2+b\right)y'+y^2-2xy=-(1-a)\,x^2+b}$$

2.58.1 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$\begin{aligned}
y' &= -\frac{-a\,x^2+x^2-2yx+y^2-b}{a\,x^2+b}\\
y' &= \omega(x,y)
\end{aligned}$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x+\omega(\eta_y-\xi_x)-\omega^2\xi_y-\omega_x\xi-\omega_y\eta=0 \tag{A}$$

The type of this ode is not in the lookup table. To determine ξ,η then (A) is solved using ansatz. Making bivariate polynomials of degree 2 to use as anstaz gives

$$\xi = x^2a_4+yxa_5+y^2a_6+xa_2+ya_3+a_1 \tag{1E}$$

$$\eta = x^2b_4+yxb_5+y^2b_6+xb_2+yb_3+b_1 \tag{2E}$$

Where the unknown coefficients are

$$\{a_1, a_2, a_3, a_4, a_5, a_6, b_1, b_2, b_3, b_4, b_5, b_6\}$$

Substituting equations (1E,2E) and ω into (A) gives

$$\begin{aligned}
&2xb_4 + yb_5 + b_2 \\
&- \frac{(-a\,x^2 + x^2 - 2yx + y^2 - b)\,(-2xa_4 + xb_5 - ya_5 + 2yb_6 - a_2 + b_3)}{a\,x^2 + b} \\
&- \frac{(-a\,x^2 + x^2 - 2yx + y^2 - b)^2\,(xa_5 + 2ya_6 + a_3)}{(a\,x^2 + b)^2} - \left(-\frac{-2xa + 2x - 2y}{a\,x^2 + b}\right. \\
&\left. + \frac{2(-a\,x^2 + x^2 - 2yx + y^2 - b)\,xa}{(a\,x^2 + b)^2}\right)\left(x^2a_4 + yxa_5 + y^2a_6 + xa_2 + ya_3 + a_1\right) \\
&+ \frac{(-2x + 2y)\,(x^2b_4 + yxb_5 + y^2b_6 + xb_2 + yb_3 + b_1)}{a\,x^2 + b} = 0
\end{aligned} \tag{5E}$$

Putting the above in normal form gives

$$-\frac{2a^2x^5a_4 + a^2x^5a_5 - 2a^2x^5b_4 - a^2x^5b_5 + a^2x^4ya_5 + 2a^2x^4ya_6 - a^2x^4yb_5 - 2a^2x^4yb_6 + a^2x^4a_2 + a^2x^4a_3 -}{}$$

$$= 0$$

Setting the numerator to zero gives

$$
\begin{aligned}
&-2a^2x^5a_4 - a^2x^5a_5 + 2a^2x^5b_4 + a^2x^5b_5 - a^2x^4ya_5 \\

\end{aligned} \tag{6E}
$$

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\{x, y\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\{x = v_1, y = v_2\}$$

The above PDE (6E) now becomes

$$
\begin{aligned}
&-2a^2a_4v_1^5 - a^2a_5v_1^5 - a^2a_5v_1^4v_2 - 2a^2a_6v_1^4v_2 + 2a^2b_4v_1^5 + a^2b_5v_1^5 + a^2b_5v_1^4v_2 + 2a^2b_6v_1^4v_2 \\
&- a^2a_2v_1^4 - a^2a_3v_1^4 + a^2b_2v_1^4 + a^2b_3v_1^4 + 2aa_4v_1^5 - 2aa_4v_1^4v_2 + 2aa_5v_1^5 - 3aa_5v_1^4v_2 \\
&+ 2aa_5v_1^3v_2^2 - aa_5v_1^2v_2^3 + 4aa_6v_1^4v_2 - 8aa_6v_1^3v_2^2 + 6aa_6v_1^2v_2^3 - 2aa_6v_1v_2^4 - 2ab_4v_1^5 + 2ab_4v_1^4v_2 \\
&- ab_5v_1^5 + ab_5v_1^3v_2^2 - 2ab_6v_1^4v_2 + 2ab_6v_1^3v_2^2 - 4aba_4v_1^3 - 2aba_5v_1^3 - 2aba_5v_1^2v_2 - 4aba_6v_1^2v_2 \\
&+ 4abb_4v_1^3 + 2abb_5v_1^3 + 2abb_5v_1^2v_2 + 4abb_6v_1^2v_2 + aa_2v_1^4 - aa_2v_1^2v_2^2 + 2aa_3v_1^4 - 4aa_3v_1^3v_2 \\
&+ 4aa_3v_1^2v_2^2 - 2aa_3v_1v_2^3 - 2ab_2v_1^4 + 2ab_2v_1^3v_2 - ab_3v_1^4 + ab_3v_1^2v_2^2 - a_5v_1^5 + 4a_5v_1^4v_2 - 6a_5v_1^3v_2^2 \\
&+ 4a_5v_1^2v_2^3 - a_5v_1v_2^4 - 2a_6v_1^4v_2 + 8a_6v_1^3v_2^2 - 12a_6v_1^2v_2^3 + 8a_6v_1v_2^4 - 2a_6v_2^5 - 2aba_2v_1^2 \\
&- 2aba_3v_1^2 + 2abb_2v_1^2 + 2abb_3v_1^2 + 2aa_1v_1^2v_2 - 2aa_1v_1v_2^2 - 2ab_1v_1^3 + 2ab_1v_1^2v_2 + 4ba_4v_1^3 \\
&- 6ba_4v_1^2v_2 + 2ba_4v_1v_2^2 + 2ba_5v_1^3 - ba_5v_1^2v_2 - 2ba_5v_1v_2^2 + ba_5v_2^3 + 4ba_6v_1^2v_2 - 6ba_6v_1v_2^2 \\
&+ 2ba_6v_2^3 - 2bb_4v_1^3 + 2bb_4v_1^2v_2 - bb_5v_1^3 + bb_5v_1v_2^2 - 2bb_6v_1^2v_2 + 2bb_6v_1v_2^2 - a_3v_1^4 + 4a_3v_1^3v_2 \\
&- 6a_3v_1^2v_2^2 + 4a_3v_1v_2^3 - a_3v_2^4 - 2b^2a_4v_1 - b^2a_5v_1 - b^2a_5v_2 - 2b^2a_6v_2 + 2b^2b_4v_1 + b^2b_5v_1 \\
&+ b^2b_5v_2 + 2b^2b_6v_2 + 3ba_2v_1^2 - 4ba_2v_1v_2 + ba_2v_2^2 + 2ba_3v_1^2 - 2ba_3v_1v_2 - 2bb_2v_1^2 + 2bb_2v_1v_2 \\
&- bb_3v_1^2 + bb_3v_2^2 - b^2a_2 - b^2a_3 + b^2b_2 + b^2b_3 + 2ba_1v_1 - 2ba_1v_2 - 2bb_1v_1 + 2bb_1v_2 = 0
\end{aligned}
\tag{7E}
$$

Collecting the above on the terms v_i introduced, and these are

$$
\{v_1, v_2\}
$$

Equation (7E) now becomes

$$\begin{aligned}
&\left(-2a^2a_4 - a^2a_5 + 2a^2b_4 + a^2b_5 + 2aa_4 + 2aa_5 - 2ab_4 - ab_5 - a_5\right) v_1^5 \\
&+ \left(-a^2a_5 - 2a^2a_6 + a^2b_5 + 2a^2b_6 - 2aa_4\right. \\
&\left.- 3aa_5 + 4aa_6 + 2ab_4 - 2ab_6 + 4a_5 - 2a_6\right) v_1^4 v_2 \\
&+ \left(-a^2a_2 - a^2a_3 + a^2b_2 + a^2b_3 + aa_2 + 2aa_3 - 2ab_2 - ab_3 - a_3\right) v_1^4 \\
&+ (2aa_5 - 8aa_6 + ab_5 + 2ab_6 - 6a_5 + 8a_6)\, v_1^3 v_2^2 \\
&+ (-4aa_3 + 2ab_2 + 4a_3)\, v_1^3 v_2 + (-4aba_4 - 2aba_5 \\
&+ 4abb_4 + 2abb_5 - 2ab_1 + 4ba_4 + 2ba_5 - 2bb_4 - bb_5)\, v_1^3 \\
&+ (-aa_5 + 6aa_6 + 4a_5 - 12a_6)\, v_1^2 v_2^3 \\
&+ (-aa_2 + 4aa_3 + ab_3 - 6a_3)\, v_1^2 v_2^2 + (-2aba_5 - 4aba_6 + 2abb_5 \\
&+ 4abb_6 + 2aa_1 + 2ab_1 - 6ba_4 - ba_5 + 4ba_6 + 2bb_4 - 2bb_6)\, v_1^2 v_2 \\
&+ (-2aba_2 - 2aba_3 + 2abb_2 + 2abb_3 + 3ba_2 + 2ba_3 - 2bb_2 - bb_3)\, v_1^2 \\
&+ (-2aa_6 - a_5 + 8a_6)\, v_1 v_2^4 + (-2aa_3 + 4a_3)\, v_1 v_2^3 \\
&+ (-2aa_1 + 2ba_4 - 2ba_5 - 6ba_6 + bb_5 + 2bb_6)\, v_1 v_2^2 \\
&+ (-4ba_2 - 2ba_3 + 2bb_2)\, v_1 v_2 \\
&+ \left(-2b^2a_4 - b^2a_5 + 2b^2b_4 + b^2b_5 + 2ba_1 - 2bb_1\right) v_1 \\
&- 2a_6 v_2^5 - a_3 v_2^4 + (ba_5 + 2ba_6)\, v_2^3 + (ba_2 + bb_3)\, v_2^2 \\
&+ \left(-b^2a_5 - 2b^2a_6 + b^2b_5 + 2b^2b_6 - 2ba_1 + 2bb_1\right) v_2 \\
&- b^2a_2 - b^2a_3 + b^2b_2 + b^2b_3 = 0
\end{aligned} \tag{8E}$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$
\begin{aligned}
-a_3 &= 0\\
-2a_6 &= 0\\
-2aa_3 + 4a_3 &= 0\\
ba_2 + bb_3 &= 0\\
ba_5 + 2ba_6 &= 0\\
-4aa_3 + 2ab_2 + 4a_3 &= 0\\
-2aa_6 - a_5 + 8a_6 &= 0\\
-4ba_2 - 2ba_3 + 2bb_2 &= 0\\
-aa_5 + 6aa_6 + 4a_5 - 12a_6 &= 0\\
-aa_2 + 4aa_3 + ab_3 - 6a_3 &= 0\\
-b^2a_2 - b^2a_3 + b^2b_2 + b^2b_3 &= 0\\
2aa_5 - 8aa_6 + ab_5 + 2ab_6 - 6a_5 + 8a_6 &= 0\\
-2b^2a_4 - b^2a_5 + 2b^2b_4 + b^2b_5 + 2ba_1 - 2bb_1 &= 0\\
-b^2a_5 - 2b^2a_6 + b^2b_5 + 2b^2b_6 - 2ba_1 + 2bb_1 &= 0\\
-2aa_1 + 2ba_4 - 2ba_5 - 6ba_6 + bb_5 + 2bb_6 &= 0\\
-2aba_2 - 2aba_3 + 2abb_2 + 2abb_3 + 3ba_2 + 2ba_3 - 2bb_2 - bb_3 &= 0\\
-a^2a_2 - a^2a_3 + a^2b_2 + a^2b_3 + aa_2 + 2aa_3 - 2ab_2 - ab_3 - a_3 &= 0\\
-2a^2a_4 - a^2a_5 + 2a^2b_4 + a^2b_5 + 2aa_4 + 2aa_5 - 2ab_4 - ab_5 - a_5 &= 0\\
-4aba_4 - 2aba_5 + 4abb_4 + 2abb_5 - 2ab_1 + 4ba_4 + 2ba_5 - 2bb_4 - bb_5 &= 0\\
-a^2a_5 - 2a^2a_6 + a^2b_5 + 2a^2b_6 - 2aa_4 - 3aa_5 + 4aa_6 + 2ab_4 - 2ab_6 + 4a_5 - 2a_6 &= 0\\
-2aba_5 - 4aba_6 + 2abb_5 + 4abb_6 + 2aa_1 + 2ab_1 - 6ba_4 - ba_5 + 4ba_6 + 2bb_4 - 2bb_6 &= 0
\end{aligned}
$$

Solving the above equations for the unknowns gives

$$
\begin{aligned}
a_1 &= b_1 \\
a_2 &= 0 \\
a_3 &= 0 \\
a_4 &= \frac{ab_1}{b} \\
a_5 &= 0 \\
a_6 &= 0 \\
b_1 &= b_1 \\
b_2 &= 0 \\
b_3 &= 0 \\
b_4 &= \frac{ab_1 + bb_6}{b} \\
b_5 &= -2b_6 \\
b_6 &= b_6
\end{aligned}
$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$
\begin{aligned}
\xi &= 0 \\
\eta &= x^2 - 2yx + y^2
\end{aligned}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x, y) \to (R, S)$ where (R, S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$
\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}
$$

The above comes from the requirements that $\left(\xi \frac{\partial}{\partial x} + \eta \frac{\partial}{\partial y}\right) S(x, y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$
R = x
$$

S is found from

$$
\begin{aligned}
S &= \int \frac{1}{\eta} dy \\
&= \int \frac{1}{x^2 - 2yx + y^2} dy
\end{aligned}
$$

Which results in

$$
S = -\frac{1}{-x + y}
$$

Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$
\frac{dS}{dR} = \frac{S_x + \omega(x, y) S_y}{R_x + \omega(x, y) R_y} \tag{2}
$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x, y)$ is the right hand side of the original ode given by

$$
\omega(x, y) = -\frac{-a\, x^2 + x^2 - 2yx + y^2 - b}{a\, x^2 + b}
$$

Evaluating all the partial derivatives gives

$$
\begin{aligned}
R_x &= 1 \\
R_y &= 0 \\
S_x &= -\frac{1}{(x - y)^2} \\
S_y &= \frac{1}{(x - y)^2}
\end{aligned}
$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$
\frac{dS}{dR} = -\frac{1}{a\, x^2 + b} \tag{2A}
$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$
\frac{dS}{dR} = -\frac{1}{R^2 a + b}
$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by

integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = -\frac{\arctan\left(\frac{aR}{\sqrt{ab}}\right)}{\sqrt{ab}} + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$\frac{1}{x-y} = -\frac{\arctan\left(\frac{ax}{\sqrt{ab}}\right)}{\sqrt{ab}} + c_1$$

Which simplifies to

$$\frac{1}{x-y} = -\frac{\arctan\left(\frac{ax}{\sqrt{ab}}\right)}{\sqrt{ab}} + c_1$$

Which gives

$$y = \frac{c_1\sqrt{ab}\,x - \arctan\left(\frac{ax}{\sqrt{ab}}\right)x - \sqrt{ab}}{c_1\sqrt{ab} - \arctan\left(\frac{ax}{\sqrt{ab}}\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{c_1\sqrt{ab}\,x - \arctan\left(\frac{ax}{\sqrt{ab}}\right)x - \sqrt{ab}}{c_1\sqrt{ab} - \arctan\left(\frac{ax}{\sqrt{ab}}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{c_1\sqrt{ab}\,x - \arctan\left(\frac{ax}{\sqrt{ab}}\right)x - \sqrt{ab}}{c_1\sqrt{ab} - \arctan\left(\frac{ax}{\sqrt{ab}}\right)}$$

Verified OK.

2.58.2 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{-a\,x^2+x^2-2yx+y^2-b}{a\,x^2+b} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,x^2}{a\,x^2+b} - \frac{x^2}{a\,x^2+b} + \frac{2yx}{a\,x^2+b} - \frac{y^2}{a\,x^2+b} + \frac{b}{a\,x^2+b}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{-a\,x^2+x^2-b}{a\,x^2+b}$, $f_1(x) = \frac{2x}{a\,x^2+b}$ and $f_2(x) = -\frac{1}{a\,x^2+b}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{-\frac{u}{a\,x^2+b}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{2xa}{(a\,x^2+b)^2} \\ f_1 f_2 &= -\frac{2x}{(a\,x^2+b)^2} \\ f_2^2 f_0 &= -\frac{-a\,x^2+x^2-b}{(a\,x^2+b)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$-\frac{u''(x)}{a\,x^2+b} - \left(\frac{2xa}{(a\,x^2+b)^2} - \frac{2x}{(a\,x^2+b)^2}\right)u'(x) - \frac{(-a\,x^2+x^2-b)\,u(x)}{(a\,x^2+b)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\arctan\left(\frac{\sqrt{ab}\, x}{b}\right) c_2 + c_1\right) \left(a\, x^2 + b\right)^{\frac{1}{2a}}$$

The above shows that

$$u'(x) = \left(a\, x^2 + b\right)^{-\frac{2a-1}{2a}} \left(\arctan\left(\frac{\sqrt{ab}\, x}{b}\right) c_2 x + \sqrt{ab}\, c_2 + c_1 x\right)$$

Using the above in (1) gives the solution

$$y = \frac{\left(a\, x^2 + b\right)^{-\frac{2a-1}{2a}} \left(\arctan\left(\frac{\sqrt{ab}\, x}{b}\right) c_2 x + \sqrt{ab}\, c_2 + c_1 x\right) \left(a\, x^2 + b\right) \left(a\, x^2 + b\right)^{-\frac{1}{2a}}}{\arctan\left(\frac{\sqrt{ab}\, x}{b}\right) c_2 + c_1}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\arctan\left(\frac{\sqrt{ab}\, x}{b}\right) x + \sqrt{ab} + c_3 x}{\arctan\left(\frac{\sqrt{ab}\, x}{b}\right) + c_3}$$

<u>Summary</u>
The solution(s) found are the following

$$y = \frac{\arctan\left(\frac{\sqrt{ab}\, x}{b}\right) x + \sqrt{ab} + c_3 x}{\arctan\left(\frac{\sqrt{ab}\, x}{b}\right) + c_3} \tag{1}$$

<u>Verification of solutions</u>

$$y = \frac{\arctan\left(\frac{\sqrt{ab}\, x}{b}\right) x + \sqrt{ab} + c_3 x}{\arctan\left(\frac{\sqrt{ab}\, x}{b}\right) + c_3}$$

Verified OK.

Problem number: 59.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati", "first_order_ode_lie_symmetry_calculated"**

Maple gives the following as the ode type

```
[_rational, [_1st_order, `_with_symmetry_[F(x),G(x)]`],
   _Riccati]
```

$$\boxed{\left(a\,x^2+bx+c\right)y'-y^2-(2\lambda x+b)\,y=\lambda(\lambda-a)\,x^2+\mu}$$

2.59.1 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$y'=\frac{-\lambda\,x^2a+\lambda^2x^2+2\lambda xy+by+y^2+\mu}{a\,x^2+bx+c}$$
$$y'=\omega(x,y)$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x+\omega(\eta_y-\xi_x)-\omega^2\xi_y-\omega_x\xi-\omega_y\eta=0 \tag{A}$$

The type of this ode is not in the lookup table. To determine ξ,η then (A) is solved using ansatz. Making bivariate polynomials of degree 2 to use as anstaz gives

$$\xi=x^2a_4+yxa_5+y^2a_6+xa_2+ya_3+a_1 \tag{1E}$$

$$\eta=x^2b_4+yxb_5+y^2b_6+xb_2+yb_3+b_1 \tag{2E}$$

Where the unknown coefficients are

$$\{a_1, a_2, a_3, a_4, a_5, a_6, b_1, b_2, b_3, b_4, b_5, b_6\}$$

Substituting equations (1E,2E) and ω into (A) gives

$$\begin{aligned}
&2xb_4 + yb_5 + b_2 \\
&+ \frac{(-\lambda\, x^2 a + \lambda^2 x^2 + 2\lambda xy + by + y^2 + \mu)\,(-2xa_4 + xb_5 - ya_5 + 2yb_6 - a_2 + b_3)}{a\,x^2 + bx + c} \\
&- \frac{(-\lambda\, x^2 a + \lambda^2 x^2 + 2\lambda xy + by + y^2 + \mu)^2\,(xa_5 + 2ya_6 + a_3)}{(a\,x^2 + bx + c)^2} \\
&- \left(\frac{-2a\lambda x + 2\lambda^2 x + 2\lambda y}{a\,x^2 + bx + c} - \frac{(-\lambda\, x^2 a + \lambda^2 x^2 + 2\lambda xy + by + y^2 + \mu)\,(2xa + b)}{(a\,x^2 + bx + c)^2}\right)(x^2 a_4 \\
&+ yxa_5 + y^2 a_6 + xa_2 + ya_3 + a_1) - \frac{(2\lambda x + b + 2y)\,(x^2 b_4 + yxb_5 + y^2 b_6 + xb_2 + yb_3 + b_1)}{a\,x^2 + bx + c} \\
&= 0
\end{aligned} \tag{5E}$$

Putting the above in normal form gives

Expression too large to display

Setting the numerator to zero gives

Expression too large to display (6E)

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\{x, y\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\{x = v_1, y = v_2\}$$

The above PDE (6E) now becomes

Expression too large to display (7E)

Collecting the above on the terms v_i introduced, and these are

$$\{v_1, v_2\}$$

Equation (7E) now becomes

$$\text{Expression too large to display} \tag{8E}$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$-a^2\lambda^2$$

$$4ab\lambda a_5 - 2a$$

$$-2a^2\lambda^2 a_6 + 4a\lambda^3 a_6 - 2\lambda$$

$$2ac\lambda a_1 - 2c$$

$$5ab\lambda a_6 - 5b\lambda^2 a$$

$$2ac\lambda a_3 - 2c\lambda^2 a_3 + 2aba_1$$

$$-a^2\lambda^2 a_3 + 2a\lambda^3 a_3 - \lambda^4 a_3 + a^2\lambda a_2 - a^2\lambda b_3 + 3ab\lambda a_4 -$$

$$2ac\lambda a_6 - 2c\lambda^2 a_6 + 2aba_3 + 2a\mu a_6 - b^2 a_5 +$$

$$2ab\lambda a_2 - ab\lambda b_3 + 4ac\lambda a_4 - ac\lambda b_5 + 2a\lambda\mu a_5 - 2b\lambda^2 a_2 + b\lambda^2 b_3 - 4c\lambda^2 a_4$$

$$ab\lambda a_1 + 3ac\lambda a_2 - ac\lambda b_3 + 2a\lambda\mu a_3 - b\lambda^2 a_1 - 3c\lambda^2 a_2 + c\lambda^2 b_3 - 2\lambda^2$$

$$3ab\lambda a_3 + 3ac\lambda a_5 - 2ac\lambda b_6 + 4a\lambda\mu a_6 - 3b\lambda^2 a_3 - 3c\lambda^2 a_5 + 2c\lambda^2 b_6 - 4\lambda^2\mu a_6 + aba_2 + 2acb_5 + 2a\lambda a_1 + a$$

Solving the above equations for the unknowns gives

$$
\begin{aligned}
a_1 &= \frac{ca_2}{b} \\
a_2 &= a_2 \\
a_3 &= 0 \\
a_4 &= \frac{aa_2}{b} \\
a_5 &= 0 \\
a_6 &= 0 \\
b_1 &= \frac{bc\lambda b_6 + b\mu b_6 - c\lambda a_2}{b} \\
b_2 &= \lambda(bb_6 - a_2) \\
b_3 &= bb_6 \\
b_4 &= -\frac{\lambda(-b\lambda b_6 + aa_2)}{b} \\
b_5 &= 2\lambda b_6 \\
b_6 &= b_6
\end{aligned}
$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$
\begin{aligned}
\xi &= 0 \\
\eta &= \lambda^2 x^2 + b\lambda x + 2\lambda xy + by + c\lambda + y^2 + \mu
\end{aligned}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x, y) \to (R, S)$ where (R, S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$
\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}
$$

The above comes from the requirements that $\left(\xi \frac{\partial}{\partial x} + \eta \frac{\partial}{\partial y}\right) S(x, y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$
R = x
$$

S is found from

$$
\begin{aligned}
S &= \int \frac{1}{\eta} dy \\
&= \int \frac{1}{\lambda^2 x^2 + b\lambda x + 2\lambda xy + by + c\lambda + y^2 + \mu} dy
\end{aligned}
$$

Which results in

$$
S = \frac{2 \arctan\left(\frac{2\lambda x + b + 2y}{\sqrt{-b^2 + 4c\lambda + 4\mu}}\right)}{\sqrt{-b^2 + 4c\lambda + 4\mu}}
$$

Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$
\frac{dS}{dR} = \frac{S_x + \omega(x, y) S_y}{R_x + \omega(x, y) R_y} \tag{2}
$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x, y)$ is the right hand side of the original ode given by

$$
\omega(x, y) = \frac{-\lambda\, x^2 a + \lambda^2 x^2 + 2\lambda xy + by + y^2 + \mu}{a\, x^2 + bx + c}
$$

Evaluating all the partial derivatives gives

$$
\begin{aligned}
R_x &= 1 \\
R_y &= 0 \\
S_x &= \frac{\lambda}{\lambda^2 x^2 + ((b + 2y)\, x + c)\, \lambda + by + y^2 + \mu} \\
S_y &= \frac{1}{\lambda^2 x^2 + ((b + 2y)\, x + c)\, \lambda + by + y^2 + \mu}
\end{aligned}
$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$
\frac{dS}{dR} = \frac{1}{a\, x^2 + bx + c} \tag{2A}
$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$
\frac{dS}{dR} = \frac{1}{R^2 a + Rb + c}
$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by

integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = \frac{2\arctan\left(\frac{2Ra+b}{\sqrt{4ca-b^2}}\right)}{\sqrt{4ca-b^2}} + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$\frac{2\arctan\left(\frac{2\lambda x+b+2y}{\sqrt{-b^2+4c\lambda+4\mu}}\right)}{\sqrt{-b^2+4c\lambda+4\mu}} = \frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ca-b^2}}\right)}{\sqrt{4ca-b^2}} + c_1$$

Which simplifies to

$$\frac{2\arctan\left(\frac{2\lambda x+b+2y}{\sqrt{-b^2+4c\lambda+4\mu}}\right)}{\sqrt{-b^2+4c\lambda+4\mu}} = \frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ca-b^2}}\right)}{\sqrt{4ca-b^2}} + c_1$$

Which gives

$$y = \frac{\tan\left(\frac{\sqrt{-b^2+4c\lambda+4\mu}\left(\sqrt{4ca-b^2}\,c_1+2\arctan\left(\frac{2xa+b}{\sqrt{4ca-b^2}}\right)\right)}{2\sqrt{4ca-b^2}}\right)\sqrt{-b^2+4c\lambda+4\mu}}{2} - \lambda x - \frac{b}{2}$$

Summary

The solution(s) found are the following

$$y = \frac{\tan\left(\frac{\sqrt{-b^2+4c\lambda+4\mu}\left(\sqrt{4ca-b^2}\,c_1+2\arctan\left(\frac{2xa+b}{\sqrt{4ca-b^2}}\right)\right)}{2\sqrt{4ca-b^2}}\right)\sqrt{-b^2+4c\lambda+4\mu}}{2} - \lambda x - \frac{b}{2} \tag{1}$$

Verification of solutions

$$y = \frac{\tan\left(\frac{\sqrt{-b^2+4c\lambda+4\mu}\left(\sqrt{4ca-b^2}\,c_1+2\arctan\left(\frac{2xa+b}{\sqrt{4ca-b^2}}\right)\right)}{2\sqrt{4ca-b^2}}\right)\sqrt{-b^2+4c\lambda+4\mu}}{2} - \lambda x - \frac{b}{2}$$

Verified OK.

2.59.2 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{-\lambda\, x^2 a+\lambda^2 x^2+2\lambda x y+b y+y^2+\mu}{a\, x^2+b x+c} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{\lambda\, x^2 a}{a\, x^2+b x+c}+\frac{\lambda^2 x^2}{a\, x^2+b x+c}+\frac{2\lambda x y}{a\, x^2+b x+c}+\frac{b y}{a\, x^2+b x+c}+\frac{y^2}{a\, x^2+b x+c}+\frac{\mu}{a\, x^2+b x+c}$$

With Riccati ODE standard form

$$y' = f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=\frac{-\lambda\, x^2 a+\lambda^2 x^2+\mu}{a\, x^2+b x+c}$, $f_1(x)=\frac{2\lambda x+b}{a\, x^2+b x+c}$ and $f_2(x)=\frac{1}{a\, x^2+b x+c}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{u}{a\, x^2+b x+c}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x)-\left(f_2'+f_1 f_2\right)u'(x)+f_2^2 f_0 u(x)=0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{2 x a+b}{\left(a\, x^2+b x+c\right)^2} \\ f_1 f_2 &= \frac{2\lambda x+b}{\left(a\, x^2+b x+c\right)^2} \\ f_2^2 f_0 &= \frac{-\lambda\, x^2 a+\lambda^2 x^2+\mu}{\left(a\, x^2+b x+c\right)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{u''(x)}{a\, x^2+b x+c}-\left(-\frac{2 x a+b}{\left(a\, x^2+b x+c\right)^2}+\frac{2\lambda x+b}{\left(a\, x^2+b x+c\right)^2}\right)u'(x)+\frac{\left(-\lambda\, x^2 a+\lambda^2 x^2+\mu\right)u(x)}{\left(a\, x^2+b x+c\right)^3}=0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\frac{2xa+b+\sqrt{-4ca+b^2}}{-2xa-b+\sqrt{-4ca+b^2}}\right)^{-\frac{b}{2\sqrt{-4ca+b^2}}} \left(\frac{-2xa-b+\sqrt{-4ca+b^2}}{2xa+b+\sqrt{-4ca+b^2}}\right)^{-\frac{\lambda b}{2a\sqrt{-4ca+b^2}}} \left(a\,x^2 + bx + c\right)^{\frac{\lambda}{2a}} \left(c_1 \left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{\frac{a\sqrt{\frac{b^2-4c\lambda-4\mu}{a^2}}}{2\sqrt{-4ca+b^2}}} + c_2 \left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{b^2-4c\lambda-4\mu}{a^2}}}{2\sqrt{-4ca+b^2}}}\right)$$

The above shows that

$$u'(x) = \frac{8\left(\left(ia\sqrt{4ca-b^2}\,\sqrt{\frac{b^2-4c\lambda-4\mu}{a^2}} - \sqrt{-4ca+b^2}\,(2\lambda x+b)\right) c_2 \left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{b^2-4c\lambda-4\mu}{a^2}}}{2\sqrt{-4ca+b^2}}} - \left(\frac{-b+i\sqrt{4ca-b}}{b+i\sqrt{4ca-b^2}}\right.\right.}{\sqrt{-4ca+b^2}\,\left(2xa+b-\right.}$$

Using the above in (1) gives the solution

$$y = -\frac{8\left(\left(ia\sqrt{4ca-b^2}\,\sqrt{\frac{b^2-4c\lambda-4\mu}{a^2}} - \sqrt{-4ca+b^2}\,(2\lambda x+b)\right) c_2 \left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{b^2-4c\lambda-4\mu}{a^2}}}{2\sqrt{-4ca+b^2}}} - \left(\frac{-b+i\sqrt{4c}}{b+i\sqrt{4ca}}\right.\right.}{\sqrt{-4ca+b^2}\,\left(2xa+b-\sqrt{-4ca+b^2}\right)\left(2xa+b+\sqrt{-4ca+b^2}\right)\left(b+i\sqrt{4ca-b^2}+2xa\right)\left(-b+\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{8\left(\left(ia\sqrt{4ca-b^2}\,\sqrt{\frac{b^2-4c\lambda-4\mu}{a^2}} - \sqrt{-4ca+b^2}\,(2\lambda x+b)\right)\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{b^2-4c\lambda-4\mu}{a^2}}}{2\sqrt{-4ca+b^2}}} - \left(\frac{-b+i\sqrt{4ca-}}{b+i\sqrt{4ca-b}}\right.}{\sqrt{-4ca+b^2}\,\left(2xa+b-\sqrt{-4ca+b^2}\right)\left(2xa+b+\sqrt{-4ca+b^2}\right)\left(b+i\sqrt{4ca-b^2}+2xa\right)\left(-b+\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{8\left(\left(ia\sqrt{4ca-b^2}\,\sqrt{\frac{b^2-4c\lambda-4\mu}{a^2}} - \sqrt{-4ca+b^2}\,(2\lambda x+b)\right)\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{b^2-4c\lambda-4\mu}{a^2}}}{2\sqrt{-4ca+b^2}}} - \left(\frac{-b+i\sqrt{4ca-}}{b+i\sqrt{4ca-b}}\right.}{\sqrt{-4ca+b^2}\,\left(2xa+b-\sqrt{-4ca+b^2}\right)\left(2xa+b+\sqrt{-4ca+b^2}\right)\left(b+i\sqrt{4ca-b^2}+2xa\right)\left(-b+\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{8\left(\left(ia\sqrt{4ca-b^2}\,\sqrt{\frac{b^2-4c\lambda-4\mu}{a^2}} - \sqrt{-4ca+b^2}\,(2\lambda x+b)\right)\left(\frac{-b+i\sqrt{4ca-b^2}-2xa}{b+i\sqrt{4ca-b^2}+2xa}\right)^{-\frac{a\sqrt{\frac{b^2-4c\lambda-4\mu}{a^2}}}{2\sqrt{-4ca+b^2}}} - \left(\frac{-b+i\sqrt{4ca-}}{b+i\sqrt{4ca-b}}\right.}{\sqrt{-4ca+b^2}\,\left(2xa+b-\sqrt{-4ca+b^2}\right)\left(2xa+b+\sqrt{-4ca+b^2}\right)\left(b+i\sqrt{4ca-b^2}+2xa\right)\left(-b+\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{\left(a\,x^{2}+bx+c\right)y'-y^{2}-\left(xa+\mu\right)y=-\lambda^{2}x^{2}+\lambda(b-\mu)\,x+c\lambda}$$

2.60.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y' &= F(x,y)\\ &= \frac{-\lambda^{2}x^{2}+axy+b\lambda x-\lambda x\mu+c\lambda+\mu y+y^{2}}{a\,x^{2}+bx+c}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{\lambda^{2}x^{2}}{a\,x^{2}+bx+c}+\frac{axy}{a\,x^{2}+bx+c}+\frac{b\lambda x}{a\,x^{2}+bx+c}-\frac{\lambda x\mu}{a\,x^{2}+bx+c}+\frac{c\lambda}{a\,x^{2}+bx+c}+\frac{\mu y}{a\,x^{2}+bx+c}+\frac{y}{a\,x^{2}+}$$

With Riccati ODE standard form

$$y' = f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=\frac{-\lambda^2x^2+b\lambda x-\lambda x\mu+c\lambda}{a\,x^2+bx+c}$, $f_1(x)=\frac{xa+\mu}{a\,x^2+bx+c}$ and $f_2(x)=\frac{1}{a\,x^2+bx+c}$. Let

$$\begin{aligned}y &= \frac{-u'}{f_2u}\\ &= \frac{-u'}{\frac{u}{a\,x^2+bx+c}}\end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$f_2' = -\frac{2xa + b}{(a\,x^2 + bx + c)^2}$$
$$f_1f_2 = \frac{xa + \mu}{(a\,x^2 + bx + c)^2}$$
$$f_2^2f_0 = \frac{-\lambda^2x^2 + b\lambda x - \lambda x\mu + c\lambda}{(a\,x^2 + bx + c)^3}$$

Substituting the above terms back in equation (2) gives

$$\frac{u''(x)}{a\,x^2 + bx + c} - \left(-\frac{2xa + b}{(a\,x^2 + bx + c)^2} + \frac{xa + \mu}{(a\,x^2 + bx + c)^2}\right)u'(x) + \frac{(-\lambda^2x^2 + b\lambda x - \lambda x\mu + c\lambda)\,u(x)}{(a\,x^2 + bx + c)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 61.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\left(a_2x^2+b_2x+c_2\right)y'-y^2-\left(a_1x+b_1\right)y=-\lambda(\lambda+a_1-a_2)\,x^2+\lambda(b_2-b_1)\,x+\lambda c_2$$

2.61.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y' &= F(x,y)\\ &= \frac{-\lambda\,x^2a_1+\lambda\,x^2a_2-\lambda^2x^2+a_1xy-\lambda xb_1+\lambda xb_2+b_1y+c_2\lambda+y^2}{a_2x^2+b_2x+c_2}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=-\frac{\lambda\,x^2a_1}{a_2x^2+b_2x+c_2}+\frac{\lambda\,x^2a_2}{a_2x^2+b_2x+c_2}-\frac{\lambda^2x^2}{a_2x^2+b_2x+c_2}+\frac{a_1xy}{a_2x^2+b_2x+c_2}-\frac{\lambda xb_1}{a_2x^2+b_2x+c_2}+\frac{\lambda xb_2}{a_2x^2+b_2}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x) = \frac{-\lambda x^2 a_1 + \lambda x^2 a_2 - \lambda^2 x^2 - \lambda x b_1 + \lambda x b_2 + c_2 \lambda}{a_2 x^2 + b_2 x + c_2}$, $f_1(x) = \frac{a_1 x + b_1}{a_2 x^2 + b_2 x + c_2}$ and $f_2(x) = \frac{1}{a_2 x^2 + b_2 x + c_2}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{u}{a_2 x^2 + b_2 x + c_2}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - \left(f_2' + f_1 f_2\right) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{2a_2 x + b_2}{\left(a_2 x^2 + b_2 x + c_2\right)^2} \\ f_1 f_2 &= \frac{a_1 x + b_1}{\left(a_2 x^2 + b_2 x + c_2\right)^2} \\ f_2^2 f_0 &= \frac{-\lambda x^2 a_1 + \lambda x^2 a_2 - \lambda^2 x^2 - \lambda x b_1 + \lambda x b_2 + c_2 \lambda}{\left(a_2 x^2 + b_2 x + c_2\right)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{u''(x)}{a_2 x^2 + b_2 x + c_2} - \left(-\frac{2a_2 x + b_2}{\left(a_2 x^2 + b_2 x + c_2\right)^2} + \frac{a_1 x + b_1}{\left(a_2 x^2 + b_2 x + c_2\right)^2}\right) u'(x) + \frac{\left(-\lambda x^2 a_1 + \lambda x^2 a_2 - \lambda^2 x^2 - \lambda x b\right.}{\left(a_2 x^2 + b_2 x + c\right.}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{(a_2x^2+b_2x+c_2)\,y'-y^2-(a_1x+b_1)\,y=a_0x^2+b_0x+c_0}$$

2.62.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y' &= F(x,y)\\ &= \frac{a_0x^2+a_1xy+b_0x+b_1y+y^2+c_0}{a_2x^2+b_2x+c_2}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=\frac{a_0x^2}{a_2x^2+b_2x+c_2}+\frac{a_1xy}{a_2x^2+b_2x+c_2}+\frac{b_0x}{a_2x^2+b_2x+c_2}+\frac{b_1y}{a_2x^2+b_2x+c_2}+\frac{y^2}{a_2x^2+b_2x+c_2}+\frac{c_0}{a_2x^2+b_2x}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=\frac{a_0x^2+b_0x+c_0}{a_2x^2+b_2x+c_2}$, $f_1(x)=\frac{a_1x+b_1}{a_2x^2+b_2x+c_2}$ and $f_2(x)=\frac{1}{a_2x^2+b_2x+c_2}$. Let

$$\begin{aligned}y &= \frac{-u'}{f_2u}\\ &= \frac{-u'}{\frac{u}{a_2x^2+b_2x+c_2}}\end{aligned}\tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$f_2' = -\frac{2a_2 x + b_2}{(a_2 x^2 + b_2 x + c_2)^2}$$
$$f_1 f_2 = \frac{a_1 x + b_1}{(a_2 x^2 + b_2 x + c_2)^2}$$
$$f_2^2 f_0 = \frac{a_0 x^2 + b_0 x + c_0}{(a_2 x^2 + b_2 x + c_2)^3}$$

Substituting the above terms back in equation (2) gives

$$\frac{u''(x)}{a_2 x^2 + b_2 x + c_2} - \left(-\frac{2a_2 x + b_2}{(a_2 x^2 + b_2 x + c_2)^2} + \frac{a_1 x + b_1}{(a_2 x^2 + b_2 x + c_2)^2}\right) u'(x) + \frac{(a_0 x^2 + b_0 x + c_0) u(x)}{(a_2 x^2 + b_2 x + c_2)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 63.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati", "first_order_ode_lie_symmetry_calculated"**

Maple gives the following as the ode type

```
[_rational, [_1st_order, `_with_symmetry_[F(x),G(x)]`],
  _Riccati]
```

$$\boxed{(x-a)(x-b)y'+y^2+k(y+x-a)(y+x-b)=0}$$

2.63.1 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$\begin{aligned}
y' &= -\frac{abk-akx-aky-bkx-bky+k\,x^2+2kxy+k\,y^2+y^2}{(a-x)(b-x)}\\
y' &= \omega(x,y)
\end{aligned}$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x+\omega(\eta_y-\xi_x)-\omega^2\xi_y-\omega_x\xi-\omega_y\eta=0 \tag{A}$$

The type of this ode is not in the lookup table. To determine ξ,η then (A) is solved using ansatz. Making bivariate polynomials of degree 2 to use as anstaz gives

$$\xi = x^2a_4+yxa_5+y^2a_6+xa_2+ya_3+a_1 \tag{1E}$$

$$\eta = x^2b_4+yxb_5+y^2b_6+xb_2+yb_3+b_1 \tag{2E}$$

Where the unknown coefficients are

$$\{a_1, a_2, a_3, a_4, a_5, a_6, b_1, b_2, b_3, b_4, b_5, b_6\}$$

Substituting equations (1E,2E) and ω into (A) gives

$$
\begin{aligned}
&2xb_4 + yb_5 + b_2 \\
&- \frac{(abk - akx - aky - bkx - bky + k\,x^2 + 2kxy + k\,y^2 + y^2)\,(-2xa_4 + xb_5 - ya_5 + 2yb_6 - a_2 + b_3)}{(a-x)\,(b-x)} \\
&- \frac{(abk - akx - aky - bkx - bky + k\,x^2 + 2kxy + k\,y^2 + y^2)^2\,(xa_5 + 2ya_6 + a_3)}{(a-x)^2\,(b-x)^2} \\
&- \left(-\frac{-ak - bk + 2kx + 2ky}{(a-x)\,(b-x)} \right.\\
&- \frac{abk - akx - aky - bkx - bky + k\,x^2 + 2kxy + k\,y^2 + y^2}{(a-x)^2\,(b-x)} \\
&\left. - \frac{abk - akx - aky - bkx - bky + k\,x^2 + 2kxy + k\,y^2 + y^2}{(a-x)\,(b-x)^2}\right)(x^2a_4 \\
&+ yxa_5 + y^2a_6 + xa_2 + ya_3 + a_1) \\
&+ \frac{(-ak - bk + 2kx + 2ky + 2y)\,(x^2b_4 + yxb_5 + y^2b_6 + xb_2 + yb_3 + b_1)}{(a-x)\,(b-x)} = 0
\end{aligned}
\tag{5E}
$$

Putting the above in normal form gives

Expression too large to display

Setting the numerator to zero gives

$$\text{Expression too large to display} \tag{6E}$$

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\{x, y\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\{x = v_1, y = v_2\}$$

The above PDE (6E) now becomes

$$\text{Expression too large to display} \tag{7E}$$

Collecting the above on the terms v_i introduced, and these are

$$\{v_1, v_2\}$$

Equation (7E) now becomes

$$\text{Expression too large to display} \tag{8E}$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$-a^2b^2k$$

$$4a^2b\,k^2a$$

$$-a^2k^2a_5 - 4a^2k^2a_6 - 4ab\,k^2a_5 - 16ab\,k^2a_6$$
$$2a^2b\,k^2a_5 + 4a^2b\,k^2a_6 + 2a\,b^2k^2a_5 + 4a\,b^2k^2a_6 - 2a^2bka_4 - 2a^2bka_5 + 4$$
$$-a^2k^2a_5 - 4ab\,k^2a_5 - b^2k^2a_5 + 2a^2ka_4 + a^2kb_4 - a^2kb_5 + 8a$$
$$2a^2b\,k^2a_5 + 2a\,b^2k^2a_5 - 4a^2bka_4 - a^2bkb_4 + 2a^2bkb_5 - a^2k^2a_3 - 4a\,b^2ka_4 - a\,b^2kb_4$$
$$-2a^2k^2a_5 - 2a^2k^2a_6 - 8ab\,k^2a_5 - 8ab\,k^2a_6 - 2b^2k^2a_5 - 2b^2k^2a_6 + a^2ka_4 + a^2ka_5 - 2a^2kb_6 + 8abka_4 + 4a$$

Solving the above equations for the unknowns gives

$$
\begin{aligned}
a_1 &= ab a_4 \\
a_2 &= -(a+b)\, a_4 \\
a_3 &= 0 \\
a_4 &= a_4 \\
a_5 &= 0 \\
a_6 &= 0 \\
b_1 &= ab b_4 \\
b_2 &= -(a+b)\, b_4 \\
b_3 &= -\frac{aka_4 + akb_4 + bka_4 + bkb_4 + ab_4 + bb_4}{k} \\
b_4 &= b_4 \\
b_5 &= \frac{2ka_4 + 2kb_4 + 2b_4}{k} \\
b_6 &= \frac{(k+1)\,(ka_4 + kb_4 + b_4)}{k^2}
\end{aligned}
$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$
\begin{aligned}
\xi &= 0 \\
\eta &= \frac{ab\,k^2 - a\,k^2 x - a\,k^2 y - b\,k^2 x - b\,k^2 y + x^2 k^2 + 2yx\,k^2 + y^2 k^2 - aky - bky + 2kxy + 2k\,y^2 + y^2}{k^2}
\end{aligned}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x,y) \to (R,S)$ where (R,S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$
\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}
$$

The above comes from the requirements that $\left(\xi \frac{\partial}{\partial x} + \eta \frac{\partial}{\partial y}\right) S(x,y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$
R = x
$$

S is found from

$$\begin{aligned}
S &= \int \frac{1}{\eta} dy \\
&= \int \frac{1}{\frac{ab\,k^2 - a\,k^2 x - a\,k^2 y - b\,k^2 x - b\,k^2 y + x^2 k^2 + 2yx\,k^2 + y^2 k^2 - aky - bky + 2kxy + 2k\,y^2 + y^2}{k^2}} dy
\end{aligned}$$

Which results in

$$S = \frac{k \ln(-ak + kx + ky + y)}{(a-b)(k+1)} - \frac{k \ln(-bk + kx + ky + y)}{(a-b)(k+1)}$$

Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$\frac{dS}{dR} = \frac{S_x + \omega(x,y) S_y}{R_x + \omega(x,y) R_y} \tag{2}$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x,y)$ is the right hand side of the original ode given by

$$\omega(x,y) = -\frac{abk - akx - aky - bkx - bky + k\,x^2 + 2kxy + k\,y^2 + y^2}{(a-x)(b-x)}$$

Evaluating all the partial derivatives gives

$$\begin{aligned}
R_x &= 1 \\
R_y &= 0 \\
S_x &= \frac{k^3}{(k+1)((a-x-y)k - y)(k(b-x-y) - y)} \\
S_y &= \frac{k^2}{((a-x-y)k - y)(k(b-x-y) - y)}
\end{aligned}$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$\frac{dS}{dR} = -\frac{k^2}{(a-x)(b-x)(k+1)} \tag{2A}$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$\frac{dS}{dR} = -\frac{k^2}{(-R+a)(-R+b)(k+1)}$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by

integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = -\frac{k^2\left(-\frac{\ln(R-b)}{a-b} + \frac{\ln(R-a)}{a-b}\right)}{k+1} + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$\frac{k(\ln(k(y+x-a)+y) - \ln(k(y+x-b)+y))}{(a-b)(k+1)} = -\frac{k^2\left(-\frac{\ln(x-b)}{a-b} + \frac{\ln(x-a)}{a-b}\right)}{k+1} + c_1$$

Which simplifies to

$$\frac{k\ln(k(y+x-a)+y) - k\ln(k(y+x-b)+y) + k^2\ln(x-a) - k^2\ln(x-b) - c_1(a-b)(k+1)}{(a-b)(k+1)} = 0$$

Summary

The solution(s) found are the following

$$\frac{k\ln(k(y+x-a)+y) - k\ln(k(y+x-b)+y) + k^2\ln(x-a) - k^2\ln(x-b) - c_1(a-b)(k+1)}{(a-b)(k+1)} = 0 \tag{1}$$

Verification of solutions

$$\frac{k\ln(k(y+x-a)+y) - k\ln(k(y+x-b)+y) + k^2\ln(x-a) - k^2\ln(x-b) - c_1(a-b)(k+1)}{(a-b)(k+1)} = 0$$

Verified OK.

2.63.2 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{abk - akx - aky - bkx - bky + k\,x^2 + 2kxy + k\,y^2 + y^2}{(a-x)(b-x)} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{abk}{(a-x)(b-x)} + \frac{akx}{(a-x)(b-x)} + \frac{aky}{(a-x)(b-x)} + \frac{bkx}{(a-x)(b-x)} + \frac{bky}{(a-x)(b-x)} - \frac{k\,x^2}{(a-x)(b-}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{abk-akx-bkx+k\,x^2}{(a-x)(b-x)}$, $f_1(x) = -\frac{-ak-bk+2kx}{(a-x)(b-x)}$ and $f_2(x) = -\frac{k+1}{(a-x)(b-x)}$. Let

$$
\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{-\frac{(k+1)u}{(a-x)(b-x)}}
\end{aligned}
\tag{1}
$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$
f_2 u''(x) - (f_2' + f_1 f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}
$$

But

$$
\begin{aligned}
f_2' &= -\frac{k+1}{(a-x)^2\,(b-x)} - \frac{k+1}{(a-x)\,(b-x)^2} \\
f_1 f_2 &= \frac{(-ak-bk+2kx)\,(k+1)}{(a-x)^2\,(b-x)^2} \\
f_2^2 f_0 &= -\frac{(k+1)^2\,(abk-akx-bkx+k\,x^2)}{(a-x)^3\,(b-x)^3}
\end{aligned}
$$

Substituting the above terms back in equation (2) gives

$$
-\frac{(k+1)\,u''(x)}{(a-x)\,(b-x)} - \left(-\frac{k+1}{(a-x)^2\,(b-x)} - \frac{k+1}{(a-x)\,(b-x)^2} + \frac{(-ak-bk+2kx)\,(k+1)}{(a-x)^2\,(b-x)^2}\right)u'(x) - \frac{(k+1)
$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$
u(x) = c_1(b-x)^{-k} + c_2(a-x)^{-k}
$$

The above shows that

$$
u'(x) = k\Big(c_1(b-x)^{-k-1} + c_2(a-x)^{-k-1}\Big)
$$

Using the above in (1) gives the solution

$$
y = \frac{k\Big(c_1(b-x)^{-k-1} + c_2(a-x)^{-k-1}\Big)\,(a-x)\,(b-x)}{(k+1)\,\Big(c_1\,(b-x)^{-k} + c_2\,(a-x)^{-k}\Big)}
$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{k(a-x)^{k+1} (b-x)^{k+1} \left(c_3(b-x)^{-k-1} + (a-x)^{-k-1}\right)}{(k+1)\left(c_3 (a-x)^k + (b-x)^k\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{k(a-x)^{k+1} (b-x)^{k+1} \left(c_3(b-x)^{-k-1} + (a-x)^{-k-1}\right)}{(k+1)\left(c_3 (a-x)^k + (b-x)^k\right)} \tag{1}$$

Verification of solutions

$$y = \frac{k(a-x)^{k+1} (b-x)^{k+1} \left(c_3(b-x)^{-k-1} + (a-x)^{-k-1}\right)}{(k+1)\left(c_3 (a-x)^k + (b-x)^k\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 64.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{(c_2x^2 + b_2x + a_2)(y' + \lambda y^2) + (b_1x + a_1)y = -a_0}$$

2.64.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= -\frac{c_2\lambda x^2y^2 + y^2b_2\lambda x + y^2a_2\lambda + yb_1x + ya_1 + a_0}{c_2x^2 + b_2x + a_2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{y^2c_2\lambda x^2}{c_2x^2 + b_2x + a_2} - \frac{y^2b_2\lambda x}{c_2x^2 + b_2x + a_2} - \frac{y^2a_2\lambda}{c_2x^2 + b_2x + a_2} - \frac{yb_1x}{c_2x^2 + b_2x + a_2} - \frac{ya_1}{c_2x^2 + b_2x + a_2} - \frac{a_0}{c_2x^2 + b_2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{a_0}{c_2 x^2+b_2 x+a_2}$, $f_1(x) = -\frac{b_1 x+a_1}{c_2 x^2+b_2 x+a_2}$ and $f_2(x) = -\frac{c_2\lambda\, x^2+\lambda x b_2+\lambda a_2}{c_2 x^2+b_2 x+a_2}$. Let

$$
\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{-\frac{(c_2\lambda\, x^2+\lambda x b_2+\lambda a_2)u}{c_2 x^2+b_2 x+a_2}}
\end{aligned} \tag{1}
$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$
f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}
$$

But

$$
\begin{aligned}
f_2' &= -\frac{2c_2\lambda x + \lambda b_2}{c_2 x^2 + b_2 x + a_2} + \frac{(c_2\lambda\, x^2 + \lambda x b_2 + \lambda a_2)(2c_2 x + b_2)}{(c_2 x^2 + b_2 x + a_2)^2} \\
f_1 f_2 &= \frac{(b_1 x + a_1)(c_2\lambda\, x^2 + \lambda x b_2 + \lambda a_2)}{(c_2 x^2 + b_2 x + a_2)^2} \\
f_2^2 f_0 &= -\frac{(c_2\lambda\, x^2 + \lambda x b_2 + \lambda a_2)^2 a_0}{(c_2 x^2 + b_2 x + a_2)^3}
\end{aligned}
$$

Substituting the above terms back in equation (2) gives

$$
-\frac{(c_2\lambda\, x^2 + \lambda x b_2 + \lambda a_2)\, u''(x)}{c_2 x^2 + b_2 x + a_2} - \left(-\frac{2c_2\lambda x + \lambda b_2}{c_2 x^2 + b_2 x + a_2} + \frac{(c_2\lambda\, x^2 + \lambda x b_2 + \lambda a_2)(2c_2 x + b_2)}{(c_2 x^2 + b_2 x + a_2)^2} + \frac{(b_1 x + a_1)(c_2}{(c_2 x^2}\right.
$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$
\begin{aligned}
&u(x) \\
&= c_3 \operatorname{hypergeom}\left(\left[-\frac{c_2 - b_1 + \sqrt{c_2^2 + (-4a_0\lambda - 2b_1)\, c_2 + b_1^2}}{2c_2}, \frac{-c_2 + b_1 + \sqrt{c_2^2 + (-4a_0\lambda - 2b_1)\, c_2 + b_1^2}}{2c_2}\right],\right. \\
&\quad + c_4 \left(2\sqrt{\frac{-4c_2 a_2 + b_2^2}{c_2^2}}\, x\, c_2^2 + \sqrt{\frac{-4c_2 a_2 + b_2^2}{c_2^2}}\, b_2 c_2 - 4c_2 a_2 + b_2^2\right)^{\frac{c_2\left(c_2 - \frac{b_1}{2}\right)\sqrt{\frac{-4c_2 a_2 + b_2^2}{c_2^2}} + c_2 a_1 - \frac{b_1 b_2}{2}}{\sqrt{\frac{-4c_2 a_2 + b_2^2}{c_2^2}}\, c_2^2}} \operatorname{hypergeom}\Big(
\end{aligned}
$$

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{x^3y' - a\,x^3y^2 - \left(b\,x^2 + c\right)y = sx}$$

2.65.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^3y^2 + b\,x^2y + yc + sx}{x^3} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,y^2 + \frac{by}{x} + \frac{yc}{x^3} + \frac{s}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{s}{x^2}$, $f_1(x) = \frac{b\,x^2+c}{x^3}$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= \frac{(b\, x^2 + c)\, a}{x^3} \\ f_2^2 f_0 &= \frac{a^2 s}{x^2} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$au''(x) - \frac{(b\, x^2 + c)\, au'(x)}{x^3} + \frac{a^2 su(x)}{x^2} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{4\left(\frac{((b-1)x^2+c)\left(1-\sqrt{-4as+b^2+2b+1}+b\right)c_1 \operatorname{KummerM}\left(\frac{\sqrt{-4as+b^2+2b+1}}{4}+\frac{b}{4}+\frac{1}{4}, 1+\frac{\sqrt{-4as+b^2+2b+1}}{2}, \frac{c}{2x^2}\right)}{2} + x^2\left(\frac{1}{2} + \frac{(b-1)\sqrt{-4as+b}}{2}\right.\right.}{}$$

The above shows that

$$u'(x) = \frac{8s^2\left(c_1\left(1 - \sqrt{-4as + b^2 + 2b + 1} + b\right) \operatorname{KummerM}\left(\frac{\sqrt{-4as+b^2+2b+1}}{4} + \frac{b}{4} + \frac{1}{4}, 1 + \frac{\sqrt{-4as+b^2+2b+1}}{2}, \frac{c}{2x^2}\right) + 4\right.}{\left(1 - \sqrt{-4as + b^2 + 2b + 1} + b\right)^2 \left(\sqrt{-4\right.}$$

Using the above in (1) gives the solution

$$y = -\frac{2s^2\left(c_1\left(1 - \sqrt{\right.\right.}}{\left(1 - \sqrt{-4as + b^2 + 2b + 1} + b\right)\left(\sqrt{-4as + b^2 + 2b + 1} + b + 1\right)\left(\frac{((b-1)x^2+c)\left(1-\sqrt{-4as+b^2+2b+1}+b\right)c_1 \operatorname{Kum}}{}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y =$$

$$-\frac{}{\left(\frac{((b-1)x^2+c)\left(1-\sqrt{-4as+b^2+2b+1}+b\right)c_3 \operatorname{KummerM}\left(\frac{\sqrt{-4as+b^2+2b+1}}{4}+\frac{b}{4}+\frac{1}{4}, 1+\frac{\sqrt{-4as+b^2+2b+1}}{2}, \frac{c}{2x^2}\right)}{2} + x^2\left(\frac{1}{2}+\frac{(b-1)\sqrt{-4as-}}{2}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = \tag{1}$$

$$-\frac{}{\left(\frac{((b-1)x^2+c)\left(1-\sqrt{-4as+b^2+2b+1}+b\right)c_3 \operatorname{KummerM}\left(\frac{\sqrt{-4as+b^2+2b+1}}{4}+\frac{b}{4}+\frac{1}{4}, 1+\frac{\sqrt{-4as+b^2+2b+1}}{2}, \frac{c}{2x^2}\right)}{2} + x^2\left(\frac{1}{2}+\frac{(b-1)\sqrt{-4as-}}{2}\right.\right.}$$

Verification of solutions

$$y =$$

$$-\frac{}{\left(\frac{((b-1)x^2+c)\left(1-\sqrt{-4as+b^2+2b+1}+b\right)c_3 \operatorname{KummerM}\left(\frac{\sqrt{-4as+b^2+2b+1}}{4}+\frac{b}{4}+\frac{1}{4}, 1+\frac{\sqrt{-4as+b^2+2b+1}}{2}, \frac{c}{2x^2}\right)}{2} + x^2\left(\frac{1}{2}+\frac{(b-1)\sqrt{-4as-}}{2}\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{x^3y' - a\,x^3y^2 - x(bx + c)\,y = \alpha x + \beta}$$

2.66.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \frac{a\,x^3y^2 + b\,x^2y + ycx + \alpha x + \beta}{x^3} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,y^2 + \frac{by}{x} + \frac{yc}{x^2} + \frac{\alpha}{x^2} + \frac{\beta}{x^3}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{\alpha x+\beta}{x^3}$, $f_1(x) = \frac{b\,x^2+cx}{x^3}$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= \frac{(b\,x^2 + cx)\,a}{x^3} \\ f_2^2f_0 &= \frac{a^2(\alpha x + \beta)}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$au''(x) - \frac{(b\,x^2 + cx)\,au'(x)}{x^3} + \frac{a^2(\alpha x + \beta)\,u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) &= x^{\frac{b}{2}+\frac{1}{2}-\frac{\sqrt{-4\alpha a+b^2+2b+1}}{2}}\mathrm{e}^{-\frac{c}{x}}\left(\mathrm{KummerU}\left(\frac{\sqrt{-4\alpha a + b^2 + 2b + 1}\,c + (3 + b)\,c - 2\beta a}{2c}, 1\right.\right. \\ &\left.+ \sqrt{-4\alpha a + b^2 + 2b + 1}, \frac{c}{x}\right)c_2 \\ &+ \mathrm{KummerM}\left(\frac{\sqrt{-4\alpha a + b^2 + 2b + 1}\,c + (3 + b)\,c - 2\beta a}{2c}, 1\right. \\ &\left.\left.+ \sqrt{-4\alpha a + b^2 + 2b + 1}, \frac{c}{x}\right)c_1\right) \end{aligned}$$

The above shows that

$$u'(x) = -\frac{\left(x((\alpha a + b + 2)\,c^2 - a\beta(3 + b)\,c + a^2\beta^2)\,c_2\,\mathrm{KummerU}\left(\frac{\sqrt{-4\alpha a+b^2+2b+1}\,c+(b+5)c-2\beta a}{2c}, 1 + \sqrt{-4\alpha a + b^2 + \cdots}\right.\right.}{\cdots}$$

Using the above in (1) gives the solution

$$y = \frac{\left(x((\alpha a + b + 2)\,c^2 - a\beta(3 + b)\,c + a^2\beta^2)\,c_2\,\mathrm{KummerU}\left(\frac{\sqrt{-4\alpha a+b^2+2b+1}\,c+(b+5)c-2\beta a}{2c}, 1 + \sqrt{-4\alpha a + b^2 + 2\cdots}\right.\right.}{\cdots}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{x\left(\left(\alpha a+b+2\right)c^2-a\beta(3+b)\,c+a^2\beta^2\right)\mathrm{KummerU}\left(\frac{\sqrt{-4\alpha a+b^2+2b+1}\,c+(b+5)c-2\beta a}{2c}, 1+\sqrt{-4\alpha a+b^2+2b+}\right.}{}$$

Summary

The solution(s) found are the following

$$y = \frac{x\left(\left(\alpha a+b+2\right)c^2-a\beta(3+b)\,c+a^2\beta^2\right)\mathrm{KummerU}\left(\frac{\sqrt{-4\alpha a+b^2+2b+1}\,c+(b+5)c-2\beta a}{2c}, 1+\sqrt{-4\alpha a+b^2+2b+}\right.}{} \quad (1)$$

Verification of solutions

$$y = \frac{x\left(\left(\alpha a+b+2\right)c^2-a\beta(3+b)\,c+a^2\beta^2\right)\mathrm{KummerU}\left(\frac{\sqrt{-4\alpha a+b^2+2b+1}\,c+(b+5)c-2\beta a}{2c}, 1+\sqrt{-4\alpha a+b^2+2b+}\right.}{}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 67.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{x(x^2+a)\left(y'+\lambda y^2\right)+\left(b\,x^2+c\right)y=-sx}$$

2.67.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y)\\ &= -\frac{y^2\lambda\,x^3+y^2a\lambda x+b\,x^2y+yc+sx}{x\,(x^2+a)} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{x^2y^2\lambda}{x^2+a}-\frac{y^2a\lambda}{x^2+a}-\frac{xby}{x^2+a}-\frac{yc}{x\,(x^2+a)}-\frac{s}{x^2+a}$$

With Riccati ODE standard form

$$y' = f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=-\frac{s}{x^2+a}$, $f_1(x)=-\frac{b\,x^2+c}{x(x^2+a)}$ and $f_2(x)=-\frac{\lambda\,x^3+a\lambda x}{x(x^2+a)}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u}\\ &= \frac{-u'}{-\frac{(\lambda\,x^3+a\lambda x)u}{x(x^2+a)}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{3\lambda x^2 + \lambda a}{x\,(x^2+a)} + \frac{\lambda x^3 + a\lambda x}{x^2\,(x^2+a)} + \frac{2\lambda x^3 + 2a\lambda x}{(x^2+a)^2} \\
f_1 f_2 &= \frac{(b\,x^2 + c)\,(\lambda x^3 + a\lambda x)}{x^2\,(x^2+a)^2} \\
f_2^2 f_0 &= -\frac{(\lambda x^3 + a\lambda x)^2\, s}{x^2\,(x^2+a)^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$-\frac{(\lambda x^3 + a\lambda x)\, u''(x)}{x\,(x^2+a)} - \left(-\frac{3\lambda x^2 + \lambda a}{x\,(x^2+a)} + \frac{\lambda x^3 + a\lambda x}{x^2\,(x^2+a)} + \frac{2\lambda x^3 + 2a\lambda x}{(x^2+a)^2} + \frac{(b\,x^2+c)\,(\lambda x^3 + a\lambda x)}{x^2\,(x^2+a)^2}\right) u'(x) -$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = (x^2 + a)^{\frac{(2-b)a+c}{2a}} \left(x^{\frac{a-c}{a}} \operatorname{hypergeom}\left(\left[-\frac{b}{4}+\frac{5}{4}+\frac{\sqrt{b^2-4\lambda s-2b+1}}{4}, -\frac{b}{4}+\frac{5}{4}-\frac{\sqrt{b^2-4\lambda s-2b+1}}{4}\right], \left[\frac{3a-}{2a}\right.\right.\right.$$
$$\left.\left. -\frac{x^2}{a}\right) c_1$$
$$+\operatorname{hypergeom}\left(\left[-\frac{\sqrt{b^2-4\lambda s-2b+1}}{4}-\frac{b}{4}+\frac{3}{4}+\frac{c}{2a}, \frac{\sqrt{b^2-4\lambda s-2b+1}}{4}-\frac{b}{4}+\frac{3}{4}+\frac{c}{2a}\right], \left[\frac{1}{2}+\frac{c}{2a}\right],\right.$$
$$\left.\left. -\frac{x^2}{a}\right) c_2\right)$$

The above shows that

$$u'(x) = \frac{3\left((x^2+a)\, x^2\left((-\lambda s + b - 2)\, a^2 + c(-3+b)\, a - c^2\right)\left(a - \frac{c}{3}\right) c_2 \operatorname{hypergeom}\left(\left[\frac{\sqrt{b^2-4\lambda s-2b+1}}{4} - \frac{b}{4} + \frac{7}{4} + \frac{c}{2a}\right.\right.\right.}{}$$

Using the above in (1) gives the solution

$$y = \frac{3\left(\left(x^2+a\right)x^2\left(\left(-\lambda s+b-2\right)a^2+c(-3+b)\,a-c^2\right)\left(a-\frac{c}{3}\right)c_2 \operatorname{hypergeom}\left(\left[\frac{\sqrt{b^2-4\lambda s-2b+1}}{4}-\frac{b}{4}+\frac{7}{4}+\frac{c}{2a}\right.\right.\right.}{}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1}=c_3$ the following solution

$$y = \frac{\left(\left(-\lambda s+b-2\right)a^2+c(-3+b)\,a-c^2\right)\left(a-\frac{c}{3}\right)\left(a\,x^{\frac{a+c}{a}}+x^{\frac{3a+c}{a}}\right)\operatorname{hypergeom}\left(\left[-\frac{\sqrt{b^2-4\lambda s-2b+1}\,a+ab-7a-2c}{4a},\right.\right.}{}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(\left(-\lambda s+b-2\right)a^2+c(-3+b)\,a-c^2\right)\left(a-\frac{c}{3}\right)\left(a\,x^{\frac{a+c}{a}}+x^{\frac{3a+c}{a}}\right)\operatorname{hypergeom}\left(\left[-\frac{\sqrt{b^2-4\lambda s-2b+1}\,a+ab-7a-2c}{4a},\right.\right.}{} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\left(-\lambda s+b-2\right)a^2+c(-3+b)\,a-c^2\right)\left(a-\frac{c}{3}\right)\left(a\,x^{\frac{a+c}{a}}+x^{\frac{3a+c}{a}}\right)\operatorname{hypergeom}\left(\left[-\frac{\sqrt{b^2-4\lambda s-2b+1}\,a+ab-7a-2c}{4a},\right.\right.}{}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 68.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{x^2(x+a)\left(y'+\lambda y^2\right)+x(bx+c)\,y=-\alpha x-\beta}$$

2.68.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{y^2 a\lambda\, x^2+y^2\lambda\, x^3+b\, x^2 y+ycx+\alpha x+\beta}{x^2\,(x+a)} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{y^2 a\lambda}{x+a}-\frac{x\, y^2\lambda}{x+a}-\frac{by}{x+a}-\frac{yc}{x\,(x+a)}-\frac{\alpha}{x\,(x+a)}-\frac{\beta}{x^2\,(x+a)}$$

With Riccati ODE standard form

$$y' = f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=-\frac{\alpha x+\beta}{x^2(x+a)}$, $f_1(x)=-\frac{b\, x^2+cx}{x^2(x+a)}$ and $f_2(x)=-\frac{\lambda\, x^2 a+\lambda\, x^3}{x^2(x+a)}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{-\frac{(\lambda\, x^2 a+\lambda\, x^3)u}{x^2(x+a)}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$f_2' = -\frac{2a\lambda x + 3\lambda\, x^2}{x^2\,(x+a)} + \frac{2\lambda\, x^2a + 2\lambda\, x^3}{x^3\,(x+a)} + \frac{\lambda\, x^2a + \lambda\, x^3}{x^2\,(x+a)^2}$$
$$f_1f_2 = \frac{(b\,x^2+cx)\,(\lambda\, x^2a+\lambda\, x^3)}{x^4\,(x+a)^2}$$
$$f_2^2f_0 = -\frac{(\lambda\, x^2a+\lambda\, x^3)^2\,(\alpha x+\beta)}{x^6\,(x+a)^3}$$

Substituting the above terms back in equation (2) gives

$$-\frac{(\lambda\, x^2a+\lambda\, x^3)\, u''(x)}{x^2\,(x+a)} - \left(-\frac{2a\lambda x + 3\lambda\, x^2}{x^2\,(x+a)} + \frac{2\lambda\, x^2a + 2\lambda\, x^3}{x^3\,(x+a)} + \frac{\lambda\, x^2a + \lambda\, x^3}{x^2\,(x+a)^2} + \frac{(b\,x^2+cx)\,(\lambda\, x^2a+\lambda\, x^3)}{x^4\,(x+a)^2}\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = (x+a)^{\frac{(-b+1)a+c}{a}}\left(c_2x^{-\frac{-a+c+\sqrt{a^2+(-4\beta\lambda-2c)a+c^2}}{2a}}\operatorname{hypergeom}\left(\left[-\frac{\sqrt{-4\alpha\lambda+b^2-2b+1}\,a+ab+\sqrt{a^2+(-4\beta\lambda}}{2a}\right.\right.\right.$$
$$\left.-\frac{x}{a}\right)$$
$$+c_1x^{\frac{a-c+\sqrt{a^2+(-4\beta\lambda-2c)a+c^2}}{2a}}\operatorname{hypergeom}\left(\left[\frac{-ab+\sqrt{-4\alpha\lambda+b^2-2b+1}\,a+2a+c+\sqrt{a^2+(-4\beta\lambda-2c)}}{2a}\right.\right.$$
$$\left.\left.-\frac{x}{a}\right)\right)$$

The above shows that

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 69.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati", "homogeneousTypeD2"**

Maple gives the following as the ode type

```
[[_homogeneous, `class D`], _rational, _Riccati]
```

$$\boxed{(a\,x^2+bx+e)\,(y'x-y)-y^2=-x^2}$$

2.69.1 Solving as homogeneousTypeD2 ode

Using the change of variables $y=u(x)\,x$ on the above ode results in new ode in $u(x)$

$$(a\,x^2+bx+e)\,((u'(x)\,x+u(x))\,x-u(x)\,x)-u(x)^2\,x^2=-x^2$$

In canonical form the ODE is

$$\begin{aligned}
u' &= F(x,u)\\
&= f(x)g(u)\\
&= \frac{u^2-1}{a\,x^2+bx+e}
\end{aligned}$$

Where $f(x)=\frac{1}{a\,x^2+bx+e}$ and $g(u)=u^2-1$. Integrating both sides gives

$$\frac{1}{u^2-1}\,du=\frac{1}{a\,x^2+bx+e}\,dx$$

$$\int \frac{1}{u^2-1}\,du = \int \frac{1}{a\,x^2+bx+e}\,dx$$

$$-\operatorname{arctanh}(u) = \frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}} + c_2$$

The solution is

$$-\operatorname{arctanh}(u(x)) - \frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}} - c_2 = 0$$

Replacing $u(x)$ in the above solution by $\frac{y}{x}$ results in the solution for y in implicit form

$$-\operatorname{arctanh}\left(\frac{y}{x}\right) - \frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}} - c_2 = 0$$

$$-\operatorname{arctanh}\left(\frac{y}{x}\right) - \frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}} - c_2 = 0$$

Summary

The solution(s) found are the following

$$-\operatorname{arctanh}\left(\frac{y}{x}\right) - \frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}} - c_2 = 0 \tag{1}$$

Verification of solutions

$$-\operatorname{arctanh}\left(\frac{y}{x}\right) - \frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}} - c_2 = 0$$

Verified OK.

2.69.2 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^2y+bxy+ye-x^2+y^2}{(a\,x^2+bx+e)\,x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{xay}{a\,x^2+bx+e} + \frac{by}{a\,x^2+bx+e} + \frac{ye}{(a\,x^2+bx+e)\,x} - \frac{x}{a\,x^2+bx+e} + \frac{y^2}{(a\,x^2+bx+e)\,x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{x}{a\,x^2+bx+e}$, $f_1(x) = \frac{1}{x}$ and $f_2(x) = \frac{1}{(a\,x^2+bx+e)x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{u}{(a\,x^2+bx+e)x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{2xa+b}{(a\,x^2+bx+e)^2\,x} - \frac{1}{(a\,x^2+bx+e)\,x^2} \\ f_1 f_2 &= \frac{1}{(a\,x^2+bx+e)\,x^2} \\ f_2^2 f_0 &= -\frac{1}{(a\,x^2+bx+e)^3\,x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{u''(x)}{(a\,x^2+bx+e)\,x} + \frac{(2xa+b)\,u'(x)}{(a\,x^2+bx+e)^2\,x} - \frac{u(x)}{(a\,x^2+bx+e)^3\,x} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \sinh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right) + c_2 \cosh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right)$$

The above shows that

$$u'(x) = \frac{c_1 \cosh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right) + c_2 \sinh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right)}{a\,x^2+bx+e}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(c_1 \cosh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right) + c_2 \sinh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right)\right)x}{c_1 \sinh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right) + c_2 \cosh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(c_3 \cosh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right) + \sinh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right)\right)x}{c_3 \sinh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right) + \cosh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(c_3 \cosh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right) + \sinh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right)\right)x}{c_3 \sinh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right) + \cosh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(c_3 \cosh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right) + \sinh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right)\right)x}{c_3 \sinh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right) + \cosh\left(\frac{2\arctan\left(\frac{2xa+b}{\sqrt{4ae-b^2}}\right)}{\sqrt{4ae-b^2}}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 70.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{x^2(x^2+a)\left(y'+\lambda y^2\right)+x\left(b\,x^2+c\right)y=-s}$$

2.70.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{y^2\lambda\,x^4+y^2a\lambda\,x^2+b\,x^3y+ycx+s}{x^2\,(x^2+a)} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{x^2y^2\lambda}{x^2+a}-\frac{y^2a\lambda}{x^2+a}-\frac{xby}{x^2+a}-\frac{yc}{x\,(x^2+a)}-\frac{s}{x^2\,(x^2+a)}$$

With Riccati ODE standard form

$$y' = f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=-\frac{s}{x^2(x^2+a)}$, $f_1(x)=-\frac{b\,x^3+cx}{x^2(x^2+a)}$ and $f_2(x)=-\frac{\lambda\,x^4+\lambda\,x^2a}{x^2(x^2+a)}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{-\frac{(\lambda\,x^4+\lambda\,x^2a)u}{x^2(x^2+a)}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$f_2' = -\frac{4\lambda x^3 + 2a\lambda x}{x^2 (x^2+a)} + \frac{2\lambda x^4 + 2\lambda x^2 a}{x^3 (x^2+a)} + \frac{2\lambda x^4 + 2\lambda x^2 a}{x (x^2+a)^2}$$

$$f_1 f_2 = \frac{(b x^3 + cx)(\lambda x^4 + \lambda x^2 a)}{x^4 (x^2+a)^2}$$

$$f_2^2 f_0 = -\frac{(\lambda x^4 + \lambda x^2 a)^2 s}{x^6 (x^2+a)^3}$$

Substituting the above terms back in equation (2) gives

$$-\frac{(\lambda x^4 + \lambda x^2 a) u''(x)}{x^2 (x^2+a)} - \left(-\frac{4\lambda x^3 + 2a\lambda x}{x^2 (x^2+a)} + \frac{2\lambda x^4 + 2\lambda x^2 a}{x^3 (x^2+a)} + \frac{2\lambda x^4 + 2\lambda x^2 a}{x (x^2+a)^2} + \frac{(b x^3 + cx)(\lambda x^4 + \lambda x^2 c}{x^4 (x^2+a)^2}\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = (x^2 + a)^{\frac{(2-b)a+c}{2a}} \left(c_2 x^{-\frac{-a+c+\sqrt{a^2+(-4\lambda s-2c)a+c^2}}{2a}} \operatorname{hypergeom}\left(\left[-\frac{-3a-c+\sqrt{a^2+(-4\lambda s-2c)a+c^2}}{4a}, \frac{-2ab+}{} \right.\right.\right.$$
$$\left.\left. -\frac{x^2}{a}\right)$$
$$+ c_1 x^{\frac{a-c+\sqrt{a^2+(-4\lambda s-2c)a+c^2}}{2a}} \operatorname{hypergeom}\left(\left[\frac{3a+c+\sqrt{a^2+(-4\lambda s-2c)a+c^2}}{4a}, \frac{-2ab+5a+c+\sqrt{a^2+(}}{4a}\right.\right.$$
$$\left.\left.\left. -\frac{x^2}{a}\right)\right)$$

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{a(x^2-1)\left(y'+\lambda y^2\right)+bx(x^2-1)\,y=-c\,x^2-dx-s}$$

2.71.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y' &= F(x,y)\\ &= -\frac{y^2a\lambda\,x^2+b\,x^3y-y^2a\lambda-bxy+c\,x^2+dx+s}{a\,(x^2-1)}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{y^2\lambda\,x^2}{x^2-1}-\frac{b\,x^3y}{a\,(x^2-1)}+\frac{\lambda\,y^2}{x^2-1}+\frac{bxy}{a\,(x^2-1)}-\frac{c\,x^2}{a\,(x^2-1)}-\frac{dx}{a\,(x^2-1)}-\frac{s}{a\,(x^2-1)}$$

With Riccati ODE standard form

$$y' = f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=-\frac{c\,x^2+dx+s}{a(x^2-1)}$, $f_1(x)=-\frac{b\,x^3-bx}{a(x^2-1)}$ and $f_2(x)=-\frac{\lambda\,x^2a-\lambda a}{a(x^2-1)}$. Let

$$\begin{aligned}y &= \frac{-u'}{f_2u}\\ &= \frac{-u'}{-\frac{(\lambda\,x^2a-\lambda a)u}{a(x^2-1)}}\end{aligned}\tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{2\lambda x}{x^2-1} + \frac{2(\lambda\,x^2a-\lambda a)\,x}{a\,(x^2-1)^2} \\
f_1f_2 &= \frac{(b\,x^3-bx)\,(\lambda\,x^2a-\lambda a)}{a^2\,(x^2-1)^2} \\
f_2^2f_0 &= -\frac{(\lambda\,x^2a-\lambda a)^2\,(c\,x^2+dx+s)}{a^3\,(x^2-1)^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$-\frac{(\lambda\,x^2a-\lambda a)\,u''(x)}{a\,(x^2-1)} - \left(-\frac{2\lambda x}{x^2-1} + \frac{2(\lambda\,x^2a-\lambda a)\,x}{a\,(x^2-1)^2} + \frac{(b\,x^3-bx)\,(\lambda\,x^2a-\lambda a)}{a^2\,(x^2-1)^2}\right)u'(x) - \frac{(\lambda\,x^2a-\lambda a)^2\,(}{a^3\,(}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(-x^3+x)\,b\_Y'(x)}{a\,(x^2-1)} - \frac{(-c\,x^2-dx-s)\,\lambda\_Y(x)}{a\,(x^2-1)}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(-x^3+x)\,b\_Y'(x)}{a\,(x^2-1)} - \frac{(-c\,x^2-dx-s)\,\lambda\_Y(x)}{a\,(x^2-1)}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = \frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(-x^3+x)b\_Y'(x)}{a(x^2-1)} - \frac{(-c\,x^2-dx-s)\lambda\_Y(x)}{a(x^2-1)}\right\}, \{\_Y(x)\}\right)\right)a(x^2-1)}{(\lambda\,x^2a-\lambda a)\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(-x^3+x)b\_Y'(x)}{a(x^2-1)} - \frac{(-c\,x^2-dx-s)\lambda\_Y(x)}{a(x^2-1)}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\frac{\partial}{\partial x} \operatorname{DESol}\left(\left\{\frac{\_Y''(x) a(x^2-1)+b(x^3-x) \_Y'(x)+(c x^2+d x+s) \lambda \_Y(x)}{a(x^2-1)}\right\}, \{\_Y(x)\}\right)}{\lambda \operatorname{DESol}\left(\left\{\frac{\_Y''(x) a(x^2-1)+b(x^3-x) \_Y'(x)+(c x^2+d x+s) \lambda \_Y(x)}{a(x^2-1)}\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{\frac{\partial}{\partial x} \operatorname{DESol}\left(\left\{\frac{\_Y''(x) a(x^2-1)+b(x^3-x) \_Y'(x)+(c x^2+d x+s) \lambda \_Y(x)}{a(x^2-1)}\right\}, \{\_Y(x)\}\right)}{\lambda \operatorname{DESol}\left(\left\{\frac{\_Y''(x) a(x^2-1)+b(x^3-x) \_Y'(x)+(c x^2+d x+s) \lambda \_Y(x)}{a(x^2-1)}\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\frac{\partial}{\partial x} \operatorname{DESol}\left(\left\{\frac{\_Y''(x) a(x^2-1)+b(x^3-x) \_Y'(x)+(c x^2+d x+s) \lambda \_Y(x)}{a(x^2-1)}\right\}, \{\_Y(x)\}\right)}{\lambda \operatorname{DESol}\left(\left\{\frac{\_Y''(x) a(x^2-1)+b(x^3-x) \_Y'(x)+(c x^2+d x+s) \lambda \_Y(x)}{a(x^2-1)}\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 72.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{x^{n+1}y' - x^{2n}y^2a - yx^nb = c\,x^m + d}$$

2.72.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \left(x^{2n}a\,y^2 + x^nby + c\,x^m + d\right)x^{-n-1} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{x^n a\,y^2}{x} + \frac{by}{x} + \frac{x^{-n}c\,x^m}{x} + \frac{x^{-n}d}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = (c\,x^m + d)\,x^{-n-1}$, $f_1(x) = x^nb\,x^{-n-1}$ and $f_2(x) = x^{2n}a\,x^{-n-1}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{x^{2n}a\,x^{-n-1}u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{2x^{2n}na\,x^{-n-1}}{x} - \frac{x^{2n}a\,x^{-n-1}(n+1)}{x} \\ f_1f_2 &= x^nb\,x^{-2n-2}x^{2n}a \\ f_2^2f_0 &= x^{4n}a^2x^{-3n-3}(c\,x^m + d) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^{2n}a\,x^{-n-1}u''(x) - \left(\frac{2x^{2n}na\,x^{-n-1}}{x} - \frac{x^{2n}a\,x^{-n-1}(n+1)}{x} + x^nb\,x^{-2n-2}x^{2n}a\right)u'(x) + x^{4n}a^2x^{-3n-3}(c\,x^m +$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{\frac{b}{2}}x^{\frac{n}{2}}\left(\text{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m}, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right)c_2 + \text{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m}, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right)c_1\right)$$

The above shows that

$$u'(x) = \frac{x^{-1+\frac{b}{2}+\frac{n}{2}}\left(-2\left(\text{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m}+1, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right)c_1 + \text{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m}+1, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right)c_2\right)\right.}{}$$

Using the above in (1) gives the solution

$$y = -\frac{x^{-1+\frac{b}{2}+\frac{n}{2}}\left(-2\left(\text{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m}+1, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right)c_1 + \text{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m}+1, \frac{2\sqrt{ca}\,x^{\frac{m}{2}}}{m}\right)c\right.\right.}{2a\left(\text{BesselY}\left(\sqrt{-4\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{x^{-n}\left(-2\left(\mathrm{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m}+1, \frac{2\sqrt{ca}\, x^{\frac{m}{2}}}{m}\right) c_3 + \mathrm{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m}+1, \frac{2\sqrt{ca}\, x^{\frac{m}{2}}}{m}\right)\right)\sqrt{ca}\,}{2a\left(\mathrm{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m},\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{x^{-n}\left(-2\left(\mathrm{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m}+1, \frac{2\sqrt{ca}\, x^{\frac{m}{2}}}{m}\right) c_3 + \mathrm{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m}+1, \frac{2\sqrt{ca}\, x^{\frac{m}{2}}}{m}\right)\right)\sqrt{ca}\,}{2a\left(\mathrm{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m},\right.\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{x^{-n}\left(-2\left(\mathrm{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m}+1, \frac{2\sqrt{ca}\, x^{\frac{m}{2}}}{m}\right) c_3 + \mathrm{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m}+1, \frac{2\sqrt{ca}\, x^{\frac{m}{2}}}{m}\right)\right)\sqrt{ca}\,}{2a\left(\mathrm{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bn+n^2}}{m},\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{x\left(a\,x^{k}+b\right)y'-\alpha\,x^{n}y^{2}-\left(\beta-an\,x^{k}\right)y=\gamma\,x^{-n}}$$

2.73.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y' &= F(x,y)\\ &= -\frac{x^{k}any-\alpha\,x^{n}y^{2}-\gamma\,x^{-n}-\beta y}{x\left(a\,x^{k}+b\right)}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=-\frac{x^{k}any}{x\left(a\,x^{k}+b\right)}+\frac{\alpha\,x^{n}y^{2}}{x\left(a\,x^{k}+b\right)}+\frac{\gamma\,x^{-n}}{x\left(a\,x^{k}+b\right)}+\frac{\beta y}{x\left(a\,x^{k}+b\right)}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=\frac{\gamma\,x^{-n}}{x(a\,x^{k}+b)}$, $f_1(x)=-\frac{an\,x^{k}-\beta}{x(a\,x^{k}+b)}$ and $f_2(x)=\frac{\alpha\,x^{n}}{x(a\,x^{k}+b)}$. Let

$$\begin{aligned}y &= \frac{-u'}{f_2u}\\ &= \frac{-u'}{\frac{\alpha\,x^{n}u}{x(a\,x^{k}+b)}}\end{aligned}\tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$f_2' = \frac{\alpha\, x^n n}{x^2 (a\, x^k + b)} - \frac{\alpha\, x^n}{x^2 (a\, x^k + b)} - \frac{\alpha\, x^n a k\, x^k}{x^2 (a\, x^k + b)^2}$$
$$f_1 f_2 = -\frac{(an\, x^k - \beta)\, \alpha\, x^n}{x^2 (a\, x^k + b)^2}$$
$$f_2^2 f_0 = \frac{\alpha^2 x^{2n} \gamma\, x^{-n}}{x^3 (a\, x^k + b)^3}$$

Substituting the above terms back in equation (2) gives

$$\frac{\alpha\, x^n u''(x)}{x (a\, x^k + b)} - \left(\frac{\alpha\, x^n n}{x^2 (a\, x^k + b)} - \frac{\alpha\, x^n}{x^2 (a\, x^k + b)} - \frac{\alpha\, x^n a k\, x^k}{x^2 (a\, x^k + b)^2} - \frac{(an\, x^k - \beta)\, \alpha\, x^n}{x^2 (a\, x^k + b)^2}\right) u'(x) + \frac{\alpha^2 x^{2n} \gamma\, x^{-n} u}{x^3 (a\, x^k + b}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 x^{\frac{k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\, a+bn+\beta}{2b}} (a\, x^k + b)^{-\frac{k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\, a+bn+\beta}{2bk}} + c_2 x^{\frac{-k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\, a+bn+\beta}{2b}} (a\, x^k + b)^{\frac{k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\, a-bn-\beta}{2bk}}$$

The above shows that

$$u'(x) = \frac{-x^{\frac{-k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\, a+bn+\beta}{2b}} c_2 \left(k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\, a - bn - \beta\right) (a\, x^k + b)^{\frac{k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\, a-bn-\beta}{2bk}} + c_1}{2x (a\, x^k +}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-x^{\frac{-k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\, a+bn+\beta}{2b}} c_2 \left(k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\, a - bn - \beta\right) (a\, x^k + b)^{\frac{k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\, a-bn-\beta}{2bk}}\right.}{2\alpha \left(c_1 x^{\frac{k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\, a+bn+\beta}{2b}} (a\, x^k + b)^{-\frac{k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\, a+bn}{2bk}}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(x^{\frac{-k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\,a+bn+\beta}{2b}}\left(k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\,a-bn-\beta\right)\left(a\,x^k+b\right)^{\frac{k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\,a-bn-\beta}{2bk}} - c_3 x}{2\alpha\left(x^{\frac{k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\,a}{2b}}\left(a\,x^k+b\right)^{-\frac{\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}}{2b}}}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(x^{\frac{-k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\,a+bn+\beta}{2b}}\left(k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\,a-bn-\beta\right)\left(a\,x^k+b\right)^{\frac{k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\,a-bn-\beta}{2bk}} - c_3 x}{2\alpha\left(x^{\frac{k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\,a}{2b}}\left(a\,x^k+b\right)^{-\frac{\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}}{2b}}} \quad (1)$$

Verification of solutions

$$y = \frac{\left(x^{\frac{-k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\,a+bn+\beta}{2b}}\left(k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\,a-bn-\beta\right)\left(a\,x^k+b\right)^{\frac{k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\,a-bn-\beta}{2bk}} - c_3 x}{2\alpha\left(x^{\frac{k\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}\,a}{2b}}\left(a\,x^k+b\right)^{-\frac{\sqrt{\frac{b^2n^2+2\beta nb-4\alpha\gamma+\beta^2}{k^2a^2}}}{2b}}}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_rational, _Riccati]`

$$\boxed{x^2(x^n a-1)\left(y'+\lambda y^2\right)+(p\,x^n+q)\,xy=-r\,x^n-s}$$

2.74.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y' &= F(x,y)\\ &= -\frac{x^n y^2 a\lambda\,x^2-y^2\lambda\,x^2+x^n ypx+yqx+r\,x^n+s}{x^2\,(x^n a-1)}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=-\frac{x^n y^2 a\lambda}{x^n a-1}+\frac{y^2\lambda}{x^n a-1}-\frac{x^n yp}{x\,(x^n a-1)}-\frac{yq}{x\,(x^n a-1)}-\frac{r\,x^n}{x^2\,(x^n a-1)}-\frac{s}{x^2\,(x^n a-1)}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=-\frac{r\,x^n+s}{x^2(x^n a-1)}$, $f_1(x)=-\frac{x^n px+qx}{x^2(x^n a-1)}$ and $f_2(x)=-\frac{x^n a\lambda\,x^2-\lambda\,x^2}{x^2(x^n a-1)}$. Let

$$\begin{aligned}y &= \frac{-u'}{f_2 u}\\ &= \frac{-u'}{-\frac{(x^n a\lambda\,x^2-\lambda\,x^2)u}{x^2(x^n a-1)}}\end{aligned}\tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$f_2' = -\frac{x^nnxa\lambda + 2x^na\lambda x - 2\lambda x}{x^2(x^na-1)} + \frac{2x^na\lambda\,x^2 - 2\lambda\,x^2}{x^3(x^na-1)} + \frac{(x^na\lambda\,x^2 - \lambda\,x^2)\,x^nna}{x^3(x^na-1)^2}$$

$$f_1f_2 = \frac{(x^npx+qx)\,(x^na\lambda\,x^2 - \lambda\,x^2)}{x^4(x^na-1)^2}$$

$$f_2^2f_0 = -\frac{(x^na\lambda\,x^2 - \lambda\,x^2)^2\,(r\,x^n+s)}{x^6(x^na-1)^3}$$

Substituting the above terms back in equation (2) gives

$$-\frac{(x^na\lambda\,x^2 - \lambda\,x^2)\,u''(x)}{x^2(x^na-1)} - \left(-\frac{x^nnxa\lambda + 2x^na\lambda x - 2\lambda x}{x^2(x^na-1)} + \frac{2x^na\lambda\,x^2 - 2\lambda\,x^2}{x^3(x^na-1)} + \frac{(x^na\lambda\,x^2 - \lambda\,x^2)\,x^nna}{x^3(x^na-1)^2} + \right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{\frac{1}{2}+\frac{q}{2}}\left(c_2x^{-\frac{\sqrt{4\lambda s+q^2+2q+1}}{2}}\,\text{hypergeom}\left(\left[\frac{-a\sqrt{4\lambda s+q^2+2q+1}+aq+\sqrt{a^2+(-4\lambda r-2p)\,a+p^2}+p}{2an}, -\right.\right.\right.$$
$$\left. + c_1x^{\frac{\sqrt{4\lambda s+q^2+2q+1}}{2}}\,\text{hypergeom}\left(\left[\frac{a\sqrt{4\lambda s+q^2+2q+1}+aq+\sqrt{a^2+(-4\lambda r-2p)\,a+p^2}+p}{2an}, \frac{a\sqrt{4\lambda s+}}{}\right.\right.\right.$$

The above shows that

$$u'(x) = -\frac{x^{\frac{q}{2}-\frac{1}{2}}\left(x^{n-\frac{\sqrt{4\lambda s+q^2+2q+1}}{2}}c_2\left(\left(\frac{a\,q^2}{2}+\frac{(-an+a+p)q}{2}+a\lambda s+\lambda r-\frac{pn}{2}+\frac{p}{2}\right)\sqrt{4\lambda s+q^2+2q+1}-\frac{a\,q^3}{2}+\left(\frac{1}{2}an\right.\right.\right.}{}$$

Using the above in (1) gives the solution

Expression too large to display

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$\text{Expression too large to display}$$

Summary

The solution(s) found are the following

$$\text{Expression too large to display} \tag{1}$$

Verification of solutions

$$\text{Expression too large to display}$$

Warning, solution could not be verified

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. 1.2.2. Equations Containing Power Functions
Problem number: 75.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{(x^n a + b\,x^m + c)\,y' - cy^2 + b\,x^{m-1}y = a\,x^{-2+n}}$$

2.75.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{b\,x^{m-1}y - c\,y^2 - a\,x^{-2+n}}{x^n a + b\,x^m + c} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{b\,x^m y}{(x^n a + b\,x^m + c)\,x} + \frac{c\,y^2}{x^n a + b\,x^m + c} + \frac{a\,x^n}{(x^n a + b\,x^m + c)\,x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{a\,x^{-2+n}}{x^n a + b\,x^m + c}$, $f_1(x) = -\frac{x^{m-1}b}{x^n a + b\,x^m + c}$ and $f_2(x) = \frac{c}{x^n a + b\,x^m + c}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{cu}{x^n a + b\,x^m + c}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{c\left(\frac{x^n n a}{x} + \frac{b\, x^m m}{x}\right)}{\left(x^n a + b\, x^m + c\right)^2} \\ f_1 f_2 &= -\frac{x^{m-1} b c}{\left(x^n a + b\, x^m + c\right)^2} \\ f_2^2 f_0 &= \frac{c^2 a\, x^{-2+n}}{\left(x^n a + b\, x^m + c\right)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{c u''(x)}{x^n a + b\, x^m + c} - \left(-\frac{c\left(\frac{x^n n a}{x} + \frac{b\, x^m m}{x}\right)}{\left(x^n a + b\, x^m + c\right)^2} - \frac{x^{m-1} b c}{\left(x^n a + b\, x^m + c\right)^2}\right) u'(x) + \frac{c^2 a\, x^{-2+n} u(x)}{\left(x^n a + b\, x^m + c\right)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\_Y'(x)\left(-x^n n a - b m\, x^m - b\, x^m\right)}{\left(x^n a + b\, x^m + c\right) x} + \frac{c a\, x^{-2+n} \_Y(x)}{\left(x^n a + b\, x^m + c\right)^2}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\_Y'(x)\left(-x^n n a - b m\, x^m - b\, x^m\right)}{\left(x^n a + b\, x^m + c\right) x} + \frac{c a\, x^{-2+n} \_Y(x)}{\left(x^n a + b\, x^m + c\right)^2}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\_Y'(x)(-x^n n a - b m\, x^m - b\, x^m)}{(x^n a + b\, x^m + c) x} + \frac{c a\, x^{-2+n} \_Y(x)}{(x^n a + b\, x^m + c)^2}\right\}, \{\_Y(x)\}\right)\right) \left(x^n a + b\, x^m + c\right)}{c\, \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\_Y'(x)(-x^n n a - b m\, x^m - b\, x^m)}{(x^n a + b\, x^m + c) x} + \frac{c a\, x^{-2+n} \_Y(x)}{(x^n a + b\, x^m + c)^2}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$y =$

$$-\frac{(x^n a + b x^m + c) \left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{x^2(x^n a+b x^m+c)^2 \_\_Y''(x)+(x^n a+b x^m+c)(b(m+1)x^m+x^n n a)x\_\_Y}{x^2(x^n a+b x^m+c)^2}\right.\right.\right.}{c\,\mathrm{DESol}\left(\left\{\frac{(x^{2m}b^2+a^2x^{2n}+2b(x^n a+c)x^m+2x^n ac+c^2)x^2\_\_Y''(x)+\_\_Y'(x)b^2x(m+1)x^{2m}+\_\_Y'(x)x^{2n}a^2nx+((a(1+m+n)x^n+c(r}{x^2(x^n a+b x^m+c)^2}\right.\right.}$$

Summary

The solution(s) found are the following

$y =$ (1)

$$-\frac{(x^n a + b x^m + c) \left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{x^2(x^n a+b x^m+c)^2 \_\_Y''(x)+(x^n a+b x^m+c)(b(m+1)x^m+x^n n a)x\_\_Y}{x^2(x^n a+b x^m+c)^2}\right.\right.\right.}{c\,\mathrm{DESol}\left(\left\{\frac{(x^{2m}b^2+a^2x^{2n}+2b(x^n a+c)x^m+2x^n ac+c^2)x^2\_\_Y''(x)+\_\_Y'(x)b^2x(m+1)x^{2m}+\_\_Y'(x)x^{2n}a^2nx+((a(1+m+n)x^n+c(r}{x^2(x^n a+b x^m+c)^2}\right.\right.}$$

Verification of solutions

$y =$

$$-\frac{(x^n a + b x^m + c) \left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{x^2(x^n a+b x^m+c)^2 \_\_Y''(x)+(x^n a+b x^m+c)(b(m+1)x^m+x^n n a)x\_\_Y}{x^2(x^n a+b x^m+c)^2}\right.\right.\right.}{c\,\mathrm{DESol}\left(\left\{\frac{(x^{2m}b^2+a^2x^{2n}+2b(x^n a+c)x^m+2x^n ac+c^2)x^2\_\_Y''(x)+\_\_Y'(x)b^2x(m+1)x^{2m}+\_\_Y'(x)x^{2n}a^2nx+((a(1+m+n)x^n+c(r}{x^2(x^n a+b x^m+c)^2}\right.\right.}$$

Verified OK.

Problem number: 76.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

$$\boxed{(x^n a + b\,x^m + c)\,y' - a\,x^{-2+n}y^2 - b\,x^{m-1}y = c}$$

2.76.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^{-2+n}y^2 + b\,x^{m-1}y + c}{x^n a + b\,x^m + c} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,x^n y^2}{(x^n a + b\,x^m + c)\,x^2} + \frac{b\,x^m y}{(x^n a + b\,x^m + c)\,x} + \frac{c}{x^n a + b\,x^m + c}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{c}{x^n a + b\,x^m + c}$, $f_1(x) = \frac{x^{m-1}b}{x^n a + b\,x^m + c}$ and $f_2(x) = \frac{a\,x^{-2+n}}{x^n a + b\,x^m + c}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{a\,x^{-2+n}u}{x^n a + b\,x^m + c}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$f_2' = -\frac{a\,x^{-2+n}\left(\frac{x^n na}{x} + \frac{b\,x^m m}{x}\right)}{(x^na + b\,x^m + c)^2} + \frac{a\,x^{-2+n}(-2+n)}{(x^na + b\,x^m + c)\,x}$$
$$f_1f_2 = \frac{x^{m-1}ba\,x^{-2+n}}{(x^na + b\,x^m + c)^2}$$
$$f_2^2f_0 = \frac{a^2x^{-4+2n}c}{(x^na + b\,x^m + c)^3}$$

Substituting the above terms back in equation (2) gives

$$\frac{a\,x^{-2+n}u''(x)}{x^na + b\,x^m + c} - \left(-\frac{a\,x^{-2+n}\left(\frac{x^n na}{x} + \frac{b\,x^m m}{x}\right)}{(x^na + b\,x^m + c)^2} + \frac{a\,x^{-2+n}(-2+n)}{(x^na + b\,x^m + c)\,x} + \frac{x^{m-1}ba\,x^{-2+n}}{(x^na + b\,x^m + c)^2}\right)u'(x) + \frac{a^2x^{-4}}{(x^na +}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{\_Y''(x)\,(x^na + b\,x^m + c)^2\,x + ac\,x^{-2+n}\_Y(x)\,x + 2\left(\frac{b(m-n+1)x^m}{2} + x^na - \frac{c(-2+n)}{2}\right)(x^na + b\,x}{x\,(x^na + b\,x^m + c)^2}\right.\right.$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_Y''(x)\,(x^na + b\,x^m + c)^2\,x + ac\,x^{n-1}\_Y(x) + 2\left(\frac{b(m-n+1)x^m}{2} + x^na - \frac{c(-2+n)}{2}\right)(x^na + b\,}{x\,(x^na + b\,x^m + c)^2}\right.\right.$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_Y''(x)(x^na+b\,x^m+c)^2x+ac\,x^{n-1}\_Y(x)+2\left(\frac{b(m-n+1)x^m}{2}+x^na-\frac{c(-2+n)}{2}\right)(x^na+b\,x^m+c)\_Y'(x)}{x(x^na+b\,x^m+c)^2}\right\},\{\_Y(x\right.\right.}{a\,\mathrm{DESol}\left(\left\{\frac{\_Y''(x)(x^na+b\,x^m+c)^2x+ac\,x^{-2+n}\_Y(x)x+2\left(\frac{b(m-n+1)x^m}{2}+x^na-\frac{c(-2+n)}{2}\right)(x^na+b\,x^m+c)\_Y'(}{x(x^na+b\,x^m+c)^2}\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{x^{2-n}(x^n a + b\,x^m + c)\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{x^{1+2m}b^2\_\_Y''(x) + x^{1+2n}a^2\_\_Y''(x) + 2ab\,x^{1+m+n}\_\_Y''(x) + 2c\left(a\,x^{n+1} + x^{m+1}b + \frac{cx}{2}\right. \cdots}{\cdots}\right.\right.\right.}{a\,\mathrm{DESol}\left(\left\{\frac{x^2(x^n a + b\,x^m + c)^2\_\_Y''(x) + 2\left(\frac{b(m-n+1)}{2} \cdots\right.}{\cdots}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{x^{2-n}(x^n a + b\,x^m + c)\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{x^{1+2m}b^2\_\_Y''(x) + x^{1+2n}a^2\_\_Y''(x) + 2ab\,x^{1+m+n}\_\_Y''(x) + 2c\left(a\,x^{n+1} + x^{m+1}b + \frac{cx}{2}\right. \cdots}{\cdots}\right.\right.\right.}{a\,\mathrm{DESol}\left(\left\{\frac{x^2(x^n a + b\,x^m + c)^2\_\_Y''(x) + 2\left(\frac{b(m-n+1)}{2} \cdots\right.}{\cdots}\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{x^{2-n}(x^n a + b\,x^m + c)\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{x^{1+2m}b^2\_\_Y''(x) + x^{1+2n}a^2\_\_Y''(x) + 2ab\,x^{1+m+n}\_\_Y''(x) + 2c\left(a\,x^{n+1} + x^{m+1}b + \frac{cx}{2}\right. \cdots}{\cdots}\right.\right.\right.}{a\,\mathrm{DESol}\left(\left\{\frac{x^2(x^n a + b\,x^m + c)^2\_\_Y''(x) + 2\left(\frac{b(m-n+1)}{2} \cdots\right.}{\cdots}\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_rational, _Riccati]
```

Unable to solve or complete the solution.

$$\boxed{(x^n a + b\,x^m + c)\,y' - \alpha\,x^k y^2 - \beta\,x^s y = -\alpha\,\lambda^2 x^k + \beta\lambda\,x^s}$$

2.77.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{\alpha\,x^k y^2 + \beta\,x^s y - \alpha\,\lambda^2 x^k + \beta\lambda\,x^s}{x^n a + b\,x^m + c} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{\alpha\,\lambda^2 x^k}{x^n a + b\,x^m + c} + \frac{\alpha\,x^k y^2}{x^n a + b\,x^m + c} + \frac{\beta\lambda\,x^s}{x^n a + b\,x^m + c} + \frac{\beta\,x^s y}{x^n a + b\,x^m + c}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{-\alpha\,\lambda^2 x^k + \beta\lambda\,x^s}{x^n a + b\,x^m + c}$, $f_1(x) = \frac{\beta\,x^s}{x^n a + b\,x^m + c}$ and $f_2(x) = \frac{\alpha\,x^k}{x^n a + b\,x^m + c}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{\alpha\,x^k u}{x^n a + b\,x^m + c}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{\alpha k\,x^k}{x\,(x^n a + b\,x^m + c)} - \frac{\alpha\,x^k \left(\frac{x^n n a}{x} + \frac{b\,x^m m}{x}\right)}{(x^n a + b\,x^m + c)^2} \\ f_1 f_2 &= \frac{\beta\,x^s \alpha\,x^k}{(x^n a + b\,x^m + c)^2} \\ f_2^2 f_0 &= \frac{\alpha^2 x^{2k} \left(-\alpha\,\lambda^2 x^k + \beta\lambda\,x^s\right)}{(x^n a + b\,x^m + c)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{\alpha\,x^k u''(x)}{x^n a + b\,x^m + c} - \left(\frac{\alpha k\,x^k}{x\,(x^n a + b\,x^m + c)} - \frac{\alpha\,x^k \left(\frac{x^n n a}{x} + \frac{b\,x^m m}{x}\right)}{(x^n a + b\,x^m + c)^2} + \frac{\beta\,x^s \alpha\,x^k}{(x^n a + b\,x^m + c)^2}\right) u'(x) + \frac{\alpha^2 x^{2k} (-\alpha\,\lambda^2}{(x^n a +}$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

The type(s) of ODE detected by this program : **"riccati", "homogeneousTypeD2"**

Maple gives the following as the ode type

```
[[_homogeneous, `class D`], _rational, _Riccati]
```

$$\boxed{(x^n a + b\,x^m + c)\,(y'x - y) + s\,x^k\left(y^2 - \lambda\,x^2\right) = 0}$$

2.78.1 Solving as homogeneousTypeD2 ode

Using the change of variables $y = u(x)\,x$ on the above ode results in new ode in $u(x)$

$$(x^n a + b\,x^m + c)\,((u'(x)\,x + u(x))\,x - u(x)\,x) + s\,x^k\left(u(x)^2\,x^2 - \lambda\,x^2\right) = 0$$

In canonical form the ODE is

$$\begin{aligned} u' &= F(x,u) \\ &= f(x)g(u) \\ &= -\frac{s\,x^k(u^2-\lambda)}{x^n a + b\,x^m + c} \end{aligned}$$

Where $f(x) = -\frac{s\,x^k}{x^n a + b\,x^m + c}$ and $g(u) = u^2 - \lambda$. Integrating both sides gives

$$\frac{1}{u^2-\lambda}\,du = -\frac{s\,x^k}{x^n a + b\,x^m + c}\,dx$$

$$\int \frac{1}{u^2-\lambda}du = \int -\frac{s\,x^k}{x^n a + b\,x^m + c}dx$$
$$-\frac{\operatorname{arctanh}\left(\frac{u}{\sqrt{\lambda}}\right)}{\sqrt{\lambda}} = \int -\frac{s\,x^k}{x^n a + b\,x^m + c}dx + c_2$$

The solution is

$$-\frac{\operatorname{arctanh}\left(\frac{u(x)}{\sqrt{\lambda}}\right)}{\sqrt{\lambda}} - \left(\int -\frac{s\,x^k}{x^n a + b\,x^m + c}dx\right) - c_2 = 0$$

Replacing $u(x)$ in the above solution by $\frac{y}{x}$ results in the solution for y in implicit form

$$-\frac{\operatorname{arctanh}\left(\frac{y}{x\sqrt{\lambda}}\right)}{\sqrt{\lambda}} - \left(\int -\frac{s\,x^k}{x^n a + b\,x^m + c}dx\right) - c_2 = 0$$
$$-\frac{\operatorname{arctanh}\left(\frac{y}{x\sqrt{\lambda}}\right)}{\sqrt{\lambda}} + s\left(\int \frac{x^k}{x^n a + b\,x^m + c}dx\right) - c_2 = 0$$

Summary

The solution(s) found are the following

$$-\frac{\operatorname{arctanh}\left(\frac{y}{x\sqrt{\lambda}}\right)}{\sqrt{\lambda}} + s\left(\int \frac{x^k}{x^n a + b\,x^m + c}dx\right) - c_2 = 0 \tag{1}$$

Verification of solutions

$$-\frac{\operatorname{arctanh}\left(\frac{y}{x\sqrt{\lambda}}\right)}{\sqrt{\lambda}} + s\left(\int \frac{x^k}{x^n a + b\,x^m + c}dx\right) - c_2 = 0$$

Verified OK.

2.78.2 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{-x^k\lambda s\,x^2 + y^2x^k s - a\,x^n y - b\,x^m y - yc}{x\,(x^n a + b\,x^m + c)} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{x\,x^k\lambda s}{x^n a + b\,x^m + c} - \frac{y^2 x^k s}{x\,(x^n a + b\,x^m + c)} + \frac{a\,x^n y}{x\,(x^n a + b\,x^m + c)} + \frac{b\,x^m y}{(x^n a + b\,x^m + c)\,x} + \frac{yc}{x\,(x^n a + b\,x^m + c)}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{x\,x^k\lambda s}{x^n a+b\,x^m+c}$, $f_1(x) = -\frac{-x^n a-b\,x^m-c}{x(x^n a+b\,x^m+c)}$ and $f_2(x) = -\frac{s\,x^k}{x(x^n a+b\,x^m+c)}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{-\frac{s\,x^k u}{x(x^n a+b\,x^m+c)}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{sk\,x^k}{x^2\,(x^n a+b\,x^m+c)} + \frac{s\,x^k}{x^2\,(x^n a+b\,x^m+c)} + \frac{s\,x^k\left(\frac{x^n na}{x}+\frac{b\,x^m m}{x}\right)}{x\,(x^n a+b\,x^m+c)^2} \\ f_1 f_2 &= \frac{(-x^n a-b\,x^m-c)\,s\,x^k}{x^2\,(x^n a+b\,x^m+c)^2} \\ f_2^2 f_0 &= \frac{s^3 x^{3k}\lambda}{x\,(x^n a+b\,x^m+c)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$-\frac{s\,x^k u''(x)}{x\,(x^n a+b\,x^m+c)} - \left(-\frac{sk\,x^k}{x^2\,(x^n a+b\,x^m+c)} + \frac{s\,x^k}{x^2\,(x^n a+b\,x^m+c)} + \frac{s\,x^k\left(\frac{x^n na}{x}+\frac{b\,x^m m}{x}\right)}{x\,(x^n a+b\,x^m+c)^2} + \frac{(-x^n a -}{x^2\,(x^n a +}\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = {} & c_1 \mathrm{e}^{is\left(\int x^k\sqrt{-\frac{\lambda}{a^2x^{2n}+2a\,x^{m+n}b+2x^n ac+x^{2m}b^2+2bc\,x^m+c^2}}dx\right)} \\ & + c_2 \mathrm{e}^{-is\left(\int x^k\sqrt{-\frac{\lambda}{a^2x^{2n}+2a\,x^{m+n}b+2x^n ac+x^{2m}b^2+2bc\,x^m+c^2}}dx\right)} \end{aligned}$$

The above shows that

$$\begin{aligned} & u'(x) \\ & = is\,x^k\sqrt{-\frac{\lambda}{a^2x^{2n}+2a\,x^{m+n}b+2x^n ac+x^{2m}b^2+2bc\,x^m+c^2}}\left(c_1 \mathrm{e}^{is\left(\int x^k\sqrt{-\frac{\lambda}{a^2x^{2n}+2a\,x^{m+n}b+2x^n ac+x^{2m}b^2+2bc\,x^m+c^2}}dx\right)}\right. \\ & \left. \quad - c_2 \mathrm{e}^{-is\left(\int x^k\sqrt{-\frac{\lambda}{a^2x^{2n}+2a\,x^{m+n}b+2x^n ac+x^{2m}b^2+2bc\,x^m+c^2}}dx\right)}\right) \end{aligned}$$

Using the above in (1) gives the solution

$$y = \frac{i\sqrt{-\frac{\lambda}{a^{2} x^{2 n}+2 a \,x^{m+n} b+2 x^{n} a c+x^{2 m} b^{2}+2 b c \,x^{m}+c^{2}}}\, \left(c_{1} e^{i s \left(\int x^{k} \sqrt{-\frac{\lambda}{a^{2} x^{2 n}+2 a \,x^{m+n} b+2 x^{n} a c+x^{2 m} b^{2}+2 b c \,x^{m}+c^{2}}}d x \right)}-c_{2} e^{-i s \left(\int x^{k} \sqrt{-\cdots}\right.}\cdots\right.}{c_{1} e^{i s \left(\int x^{k} \sqrt{-\frac{\lambda}{a^{2} x^{2 n}+2 a \,x^{m+n} b+2 x^{n} a c+x^{2 m} b^{2}+2 b c \,x^{m}+c^{2}}}d x \right)}+c_{2} e^{-i s \left(\int x^{k} \sqrt{-\frac{\lambda}{a^{2} x^{2 n}+2 a \,x^{m-\cdots}}}\right.}\cdots}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{i\sqrt{-\frac{\lambda}{a^{2} x^{2 n}+2 a \,x^{m+n} b+2 x^{n} a c+x^{2 m} b^{2}+2 b c \,x^{m}+c^{2}}}\, \left(c_{3} e^{i s \left(\int x^{k} \sqrt{-\frac{\lambda}{a^{2} x^{2 n}+2 a \,x^{m+n} b+2 x^{n} a c+x^{2 m} b^{2}+2 b c \,x^{m}+c^{2}}}d x \right)}-e^{-i s \left(\int x^{k} \sqrt{-\frac{\cdots}{a\cdots}}\right.}\cdots\right.}{c_{3} e^{i s \left(\int x^{k} \sqrt{-\frac{\lambda}{a^{2} x^{2 n}+2 a \,x^{m+n} b+2 x^{n} a c+x^{2 m} b^{2}+2 b c \,x^{m}+c^{2}}}d x \right)}+e^{-i s \left(\int x^{k} \sqrt{-\frac{\cdots}{a^{2} x^{2 n}+2 a \,x^{m+n}\cdots}}\right.}\cdots}$$

Summary

The solution(s) found are the following

$$y = \frac{i\sqrt{-\frac{\lambda}{a^{2} x^{2 n}+2 a \,x^{m+n} b+2 x^{n} a c+x^{2 m} b^{2}+2 b c \,x^{m}+c^{2}}}\, \left(c_{3} e^{i s \left(\int x^{k} \sqrt{-\frac{\lambda}{a^{2} x^{2 n}+2 a \,x^{m+n} b+2 x^{n} a c+x^{2 m} b^{2}+2 b c \,x^{m}+c^{2}}}d x \right)}-e^{-i s \left(\int x^{k} \sqrt{-\frac{\cdots}{a\cdots}}\right.}\cdots\right.}{c_{3} e^{i s \left(\int x^{k} \sqrt{-\frac{\lambda}{a^{2} x^{2 n}+2 a \,x^{m+n} b+2 x^{n} a c+x^{2 m} b^{2}+2 b c \,x^{m}+c^{2}}}d x \right)}+e^{-i s \left(\int x^{k} \sqrt{-\frac{\cdots}{a^{2} x^{2 n}+2 a \,x^{m+n}\cdots}}\right.}\cdots} \tag{1}$$

Verification of solutions

$$y = \frac{i\sqrt{-\frac{\lambda}{a^{2} x^{2 n}+2 a \,x^{m+n} b+2 x^{n} a c+x^{2 m} b^{2}+2 b c \,x^{m}+c^{2}}}\, \left(c_{3} e^{i s \left(\int x^{k} \sqrt{-\frac{\lambda}{a^{2} x^{2 n}+2 a \,x^{m+n} b+2 x^{n} a c+x^{2 m} b^{2}+2 b c \,x^{m}+c^{2}}}d x \right)}-e^{-i s \left(\int x^{k} \sqrt{-\frac{\cdots}{a\cdots}}\right.}\cdots\right.}{c_{3} e^{i s \left(\int x^{k} \sqrt{-\frac{\lambda}{a^{2} x^{2 n}+2 a \,x^{m+n} b+2 x^{n} a c+x^{2 m} b^{2}+2 b c \,x^{m}+c^{2}}}d x \right)}+e^{-i s \left(\int x^{k} \sqrt{-\frac{\cdots}{a^{2} x^{2 n}+2 a \,x^{m+n}\cdots}}\right.}\cdots}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a y^2 = b\,\mathrm{e}^{\lambda x}}$$

3.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,y^2 + b\,\mathrm{e}^{\lambda x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,y^2 + b\,\mathrm{e}^{\lambda x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\,\mathrm{e}^{\lambda x}$, $f_1(x) = 0$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= \mathrm{e}^{\lambda x}a^2b \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$au''(x) + \mathrm{e}^{\lambda x}a^2bu(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \,\mathrm{BesselJ}\left(0, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right) + c_2 \,\mathrm{BesselY}\left(0, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right)$$

The above shows that

$$u'(x) = \sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}\left(-\mathrm{BesselJ}\left(1, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right)c_1 - \mathrm{BesselY}\left(1, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right)c_2\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}\left(-\mathrm{BesselJ}\left(1, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right)c_1 - \mathrm{BesselY}\left(1, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right)c_2\right)}{\sqrt{a}\left(c_1 \,\mathrm{BesselJ}\left(0, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right) + c_2 \,\mathrm{BesselY}\left(0, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}\left(\mathrm{BesselJ}\left(1, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right)c_3 + \mathrm{BesselY}\left(1, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right)\right)}{\sqrt{a}\left(c_3 \,\mathrm{BesselJ}\left(0, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right) + \mathrm{BesselY}\left(0, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right)\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}} \left(\mathrm{BesselJ}\left(1, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right) c_3 + \mathrm{BesselY}\left(1, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right)\right)}{\sqrt{a}\, \left(c_3 \,\mathrm{BesselJ}\left(0, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right) + \mathrm{BesselY}\left(0, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right)\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}} \left(\mathrm{BesselJ}\left(1, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right) c_3 + \mathrm{BesselY}\left(1, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right)\right)}{\sqrt{a}\, \left(c_3 \,\mathrm{BesselJ}\left(0, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right) + \mathrm{BesselY}\left(0, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{\lambda x}{2}}}{\lambda}\right)\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3. Equations Containing Exponential Functions
Problem number: 2.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 = a\lambda\,\mathrm{e}^{\lambda x} - a^2\mathrm{e}^{2\lambda x}}$$

3.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + a\lambda\,\mathrm{e}^{\lambda x} - a^2\mathrm{e}^{2\lambda x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\lambda\,\mathrm{e}^{\lambda x} - a^2\mathrm{e}^{2\lambda x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\lambda\,\mathrm{e}^{\lambda x} - a^2\mathrm{e}^{2\lambda x}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2 f_0 &= a\lambda\,\mathrm{e}^{\lambda x} - a^2\mathrm{e}^{2\lambda x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(a\lambda\,\mathrm{e}^{\lambda x} - a^2\mathrm{e}^{2\lambda x}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{-\frac{a\,\mathrm{e}^{\lambda x}}{\lambda}} \left(c_1 + \mathrm{expIntegral}_1\left(-\frac{2a\,\mathrm{e}^{\lambda x}}{\lambda}\right) c_2\right)$$

The above shows that

$$u'(x) = -\left(\mathrm{e}^{\lambda x}\,\mathrm{expIntegral}_1\left(-\frac{2a\,\mathrm{e}^{\lambda x}}{\lambda}\right) c_2 a + \mathrm{e}^{\frac{2a\,\mathrm{e}^{\lambda x}}{\lambda}}\lambda c_2 + \mathrm{e}^{\lambda x} c_1 a\right) \mathrm{e}^{-\frac{a\,\mathrm{e}^{\lambda x}}{\lambda}}$$

Using the above in (1) gives the solution

$$y = \frac{\mathrm{e}^{\lambda x}\,\mathrm{expIntegral}_1\left(-\frac{2a\,\mathrm{e}^{\lambda x}}{\lambda}\right) c_2 a + \mathrm{e}^{\frac{2a\,\mathrm{e}^{\lambda x}}{\lambda}}\lambda c_2 + \mathrm{e}^{\lambda x} c_1 a}{c_1 + \mathrm{expIntegral}_1\left(-\frac{2a\,\mathrm{e}^{\lambda x}}{\lambda}\right) c_2}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\mathrm{expIntegral}_1\left(-\frac{2a\,\mathrm{e}^{\lambda x}}{\lambda}\right) \mathrm{e}^{\lambda x} a + \mathrm{e}^{\frac{2a\,\mathrm{e}^{\lambda x}}{\lambda}}\lambda + \mathrm{e}^{\lambda x} c_3 a}{c_3 + \mathrm{expIntegral}_1\left(-\frac{2a\,\mathrm{e}^{\lambda x}}{\lambda}\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{\operatorname{expIntegral}_1\left(-\frac{2a\,e^{\lambda x}}{\lambda}\right) e^{\lambda x} a + e^{\frac{2a\,e^{\lambda x}}{\lambda}} \lambda + e^{\lambda x} c_3 a}{c_3 + \operatorname{expIntegral}_1\left(-\frac{2a\,e^{\lambda x}}{\lambda}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\operatorname{expIntegral}_1\left(-\frac{2a\,e^{\lambda x}}{\lambda}\right) e^{\lambda x} a + e^{\frac{2a\,e^{\lambda x}}{\lambda}} \lambda + e^{\lambda x} c_3 a}{c_3 + \operatorname{expIntegral}_1\left(-\frac{2a\,e^{\lambda x}}{\lambda}\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - \sigma y^2 = a + b\,\mathrm{e}^{\lambda x} + c\,\mathrm{e}^{2\lambda x}}$$

3.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \sigma\, y^2 + a + b\,\mathrm{e}^{\lambda x} + c\,\mathrm{e}^{2\lambda x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \sigma\, y^2 + a + b\,\mathrm{e}^{\lambda x} + c\,\mathrm{e}^{2\lambda x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a + b\,\mathrm{e}^{\lambda x} + c\,\mathrm{e}^{2\lambda x}$, $f_1(x) = 0$ and $f_2(x) = \sigma$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\sigma u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \sigma^2 (a + b\,\mathrm{e}^{\lambda x} + c\,\mathrm{e}^{2\lambda x}) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\sigma u''(x) + \sigma^2 (a + b\,\mathrm{e}^{\lambda x} + c\,\mathrm{e}^{2\lambda x}) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{-\frac{\lambda x}{2}} \left(\mathrm{WhittakerM}\left(-\frac{i\sqrt{\sigma}\, b}{2\lambda\sqrt{c}}, \frac{i\sqrt{\sigma}\,\sqrt{a}}{\lambda}, \frac{2i\sqrt{\sigma}\,\sqrt{c}\,\mathrm{e}^{\lambda x}}{\lambda} \right) c_1 + \mathrm{WhittakerW}\left(-\frac{i\sqrt{\sigma}\, b}{2\lambda\sqrt{c}}, \frac{i\sqrt{\sigma}\,\sqrt{a}}{\lambda}, \frac{2i\sqrt{\sigma}\,\sqrt{c}\,\mathrm{e}^{\lambda x}}{\lambda} \right) c_2 \right)$$

The above shows that

$$u'(x) = \frac{\mathrm{e}^{-\frac{\lambda x}{2}} \left(c_1 \,\mathrm{WhittakerM}\left(-\frac{i\sqrt{\sigma}\, b - 2\lambda\sqrt{c}}{2\lambda\sqrt{c}}, \frac{i\sqrt{\sigma}\,\sqrt{a}}{\lambda}, \frac{2i\sqrt{\sigma}\,\sqrt{c}\,\mathrm{e}^{\lambda x}}{\lambda} \right) \left(i\left(\sqrt{c}\,\sqrt{a} - \frac{b}{2}\right)\sqrt{\sigma} + \frac{\lambda\sqrt{c}}{2} \right) - \mathrm{WhittakerW}\left(-\frac{i\sqrt{}}{} \right.\right.}{}$$

Using the above in (1) gives the solution

$$y = -\frac{c_1 \,\mathrm{WhittakerM}\left(-\frac{i\sqrt{\sigma}\, b - 2\lambda\sqrt{c}}{2\lambda\sqrt{c}}, \frac{i\sqrt{\sigma}\,\sqrt{a}}{\lambda}, \frac{2i\sqrt{\sigma}\,\sqrt{c}\,\mathrm{e}^{\lambda x}}{\lambda} \right) \left(i\left(\sqrt{c}\,\sqrt{a} - \frac{b}{2}\right)\sqrt{\sigma} + \frac{\lambda\sqrt{c}}{2} \right) - \mathrm{WhittakerW}\left(-\frac{i\sqrt{\sigma}\, b -}{2\lambda\sqrt{}} \right.}{\sqrt{c}\,\sigma \left(\mathrm{WhittakerM}\left(- \right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-c_3 \,\mathrm{WhittakerM}\left(-\frac{i\sqrt{\sigma}\, b - 2\lambda\sqrt{c}}{2\lambda\sqrt{c}}, \frac{i\sqrt{\sigma}\,\sqrt{a}}{\lambda}, \frac{2i\sqrt{\sigma}\,\sqrt{c}\,\mathrm{e}^{\lambda x}}{\lambda} \right) \left(i\left(\sqrt{c}\,\sqrt{a} - \frac{b}{2}\right)\sqrt{\sigma} + \frac{\lambda\sqrt{c}}{2} \right) + \lambda \,\mathrm{WhittakerW}\left(-\frac{i\sqrt{\sigma}\, b}{2\lambda} \right.}{\sqrt{c}\,\sigma \left(\mathrm{WhittakerM}\left(-\frac{i}{2\lambda} \right.\right.}$$

Summary
The solution(s) found are the following

$$y = \frac{-c_3 \operatorname{WhittakerM}\left(-\frac{i\sqrt{\sigma}\, b-2\lambda\sqrt{c}}{2\lambda\sqrt{c}}, \frac{i\sqrt{\sigma}\,\sqrt{a}}{\lambda}, \frac{2i\sqrt{\sigma}\,\sqrt{c}\,\mathrm{e}^{\lambda x}}{\lambda}\right)\left(i\left(\sqrt{c}\,\sqrt{a}-\frac{b}{2}\right)\sqrt{\sigma}+\frac{\lambda\sqrt{c}}{2}\right)+\lambda \operatorname{WhittakerW}\left(-\frac{i\sqrt{\sigma}\, b}{2\lambda}\right.}{\sqrt{c}\,\sigma\left(\operatorname{WhittakerM}\left(-\frac{i\sqrt{}}{2\lambda}\right.\right.} \tag{1}$$

Verification of solutions

$$y = \frac{-c_3 \operatorname{WhittakerM}\left(-\frac{i\sqrt{\sigma}\, b-2\lambda\sqrt{c}}{2\lambda\sqrt{c}}, \frac{i\sqrt{\sigma}\,\sqrt{a}}{\lambda}, \frac{2i\sqrt{\sigma}\,\sqrt{c}\,\mathrm{e}^{\lambda x}}{\lambda}\right)\left(i\left(\sqrt{c}\,\sqrt{a}-\frac{b}{2}\right)\sqrt{\sigma}+\frac{\lambda\sqrt{c}}{2}\right)+\lambda \operatorname{WhittakerW}\left(-\frac{i\sqrt{\sigma}\, b}{2\lambda}\right.}{\sqrt{c}\,\sigma\left(\operatorname{WhittakerM}\left(-\frac{i\sqrt{}}{2\lambda}\right.\right.}$$

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3. Equations Containing Exponential Functions
Problem number: 4.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \sigma y^2 - a y = b\,\mathrm{e}^{x} + c}$$

3.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \sigma\,y^2 + ya + b\,\mathrm{e}^{x} + c \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \sigma\,y^2 + ya + b\,\mathrm{e}^{x} + c$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\,\mathrm{e}^{x} + c$, $f_1(x) = a$ and $f_2(x) = \sigma$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\sigma u} \qquad (1) \end{aligned}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \sigma a \\ f_2^2 f_0 &= \sigma^2 (b\, \mathrm{e}^x + c) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\sigma u''(x) - \sigma a u'(x) + \sigma^2 (b\,\mathrm{e}^x + c)\, u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\frac{xa}{2}} \left(\mathrm{BesselJ}\left(\sqrt{a^2 - 4\sigma c}, 2\sqrt{\sigma}\,\sqrt{b}\,\mathrm{e}^{\frac{x}{2}}\right) c_1 + \mathrm{BesselY}\left(\sqrt{a^2 - 4\sigma c}, 2\sqrt{\sigma}\,\sqrt{b}\,\mathrm{e}^{\frac{x}{2}}\right) c_2\right)$$

The above shows that

$$\begin{aligned} u'(x) = &-c_1 \sqrt{b}\,\sqrt{\sigma}\,\mathrm{e}^{\frac{(1+a)x}{2}}\,\mathrm{BesselJ}\left(\sqrt{a^2 - 4\sigma c} + 1, 2\sqrt{\sigma}\,\sqrt{b}\,\mathrm{e}^{\frac{x}{2}}\right) \\ &- c_2 \sqrt{b}\,\sqrt{\sigma}\,\mathrm{e}^{\frac{(1+a)x}{2}}\,\mathrm{BesselY}\left(\sqrt{a^2 - 4\sigma c} + 1, 2\sqrt{\sigma}\,\sqrt{b}\,\mathrm{e}^{\frac{x}{2}}\right) \\ &+ \frac{\mathrm{e}^{\frac{xa}{2}} \left(\mathrm{BesselJ}\left(\sqrt{a^2 - 4\sigma c}, 2\sqrt{\sigma}\,\sqrt{b}\,\mathrm{e}^{\frac{x}{2}}\right) c_1 + \mathrm{BesselY}\left(\sqrt{a^2 - 4\sigma c}, 2\sqrt{\sigma}\,\sqrt{b}\,\mathrm{e}^{\frac{x}{2}}\right) c_2\right) \left(\sqrt{a^2 - 4\sigma c} + a\right)}{2} \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-c_1 \sqrt{b}\,\sqrt{\sigma}\,\mathrm{e}^{\frac{(1+a)x}{2}}\,\mathrm{BesselJ}\left(\sqrt{a^2 - 4\sigma c} + 1, 2\sqrt{\sigma}\,\sqrt{b}\,\mathrm{e}^{\frac{x}{2}}\right) - c_2 \sqrt{b}\,\sqrt{\sigma}\,\mathrm{e}^{\frac{(1+a)x}{2}}\,\mathrm{BesselY}\left(\sqrt{a^2 - 4\sigma c} + 1\right.\right.}{\sigma \left(\mathrm{BesselJ}\left(\sqrt{a^2 - 4\sigma c}, 2\sqrt{\sigma}\,\sqrt{b}\,\mathrm{e}^{\frac{x}{2}}\right) c_1 + \mathrm{Be}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{2c_3 \sqrt{b}\,\sqrt{\sigma}\,\mathrm{e}^{\frac{x}{2}}\,\mathrm{BesselJ}\left(\sqrt{a^2 - 4\sigma c} + 1, 2\sqrt{\sigma}\,\sqrt{b}\,\mathrm{e}^{\frac{x}{2}}\right) + 2\,\mathrm{BesselY}\left(\sqrt{a^2 - 4\sigma c} + 1, 2\sqrt{\sigma}\,\sqrt{b}\,\mathrm{e}^{\frac{x}{2}}\right) \sqrt{\sigma}\,\sqrt{b}\,\mathrm{e}^{\frac{x}{2}}}{2\sigma \left(\mathrm{BesselJ}\left(\sqrt{a^2 - 4\sigma c}, 2\sqrt{\sigma}\,\sqrt{b}\,\mathrm{e}^{\frac{x}{2}}\right) c_3 + \right.}$$

Summary
The solution(s) found are the following

$$y = \frac{2c_3\sqrt{b}\,\sqrt{\sigma}\,e^{\frac{x}{2}}\,\text{BesselJ}\left(\sqrt{a^2-4\sigma c}+1, 2\sqrt{\sigma}\,\sqrt{b}\,e^{\frac{x}{2}}\right) + 2\,\text{BesselY}\left(\sqrt{a^2-4\sigma c}+1, 2\sqrt{\sigma}\,\sqrt{b}\,e^{\frac{x}{2}}\right)\sqrt{\sigma}\,\sqrt{b}\,e^{\frac{x}{2}}}{2\sigma\left(\text{BesselJ}\left(\sqrt{a^2-4\sigma c}, 2\sqrt{\sigma}\,\sqrt{b}\,e^{\frac{x}{2}}\right)c_3 +\right.} \tag{1}$$

Verification of solutions

$$y = \frac{2c_3\sqrt{b}\,\sqrt{\sigma}\,e^{\frac{x}{2}}\,\text{BesselJ}\left(\sqrt{a^2-4\sigma c}+1, 2\sqrt{\sigma}\,\sqrt{b}\,e^{\frac{x}{2}}\right) + 2\,\text{BesselY}\left(\sqrt{a^2-4\sigma c}+1, 2\sqrt{\sigma}\,\sqrt{b}\,e^{\frac{x}{2}}\right)\sqrt{\sigma}\,\sqrt{b}\,e^{\frac{x}{2}}}{2\sigma\left(\text{BesselJ}\left(\sqrt{a^2-4\sigma c}, 2\sqrt{\sigma}\,\sqrt{b}\,e^{\frac{x}{2}}\right)c_3 +\right.}$$

Verified OK.

Problem number: 5.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - yb = a(\lambda - b)\,\mathrm{e}^{\lambda x} - a^2\mathrm{e}^{2\lambda x}}$$

3.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -a\,\mathrm{e}^{\lambda x}b + a\lambda\,\mathrm{e}^{\lambda x} - a^2\mathrm{e}^{2\lambda x} + by + y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a\,\mathrm{e}^{\lambda x}b + a\lambda\,\mathrm{e}^{\lambda x} - a^2\mathrm{e}^{2\lambda x} + by + y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a\,\mathrm{e}^{\lambda x}b + a\lambda\,\mathrm{e}^{\lambda x} - a^2\mathrm{e}^{2\lambda x}$, $f_1(x) = b$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= b \\ f_2^2 f_0 &= -a\,\mathrm{e}^{\lambda x} b + a\lambda\,\mathrm{e}^{\lambda x} - a^2 \mathrm{e}^{2\lambda x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - bu'(x) + \left(-a\,\mathrm{e}^{\lambda x} b + a\lambda\,\mathrm{e}^{\lambda x} - a^2 \mathrm{e}^{2\lambda x}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\left(\int \mathrm{e}^{\frac{b\lambda x + 2\,\mathrm{e}^{\lambda x} a}{\lambda}} dx\right) c_1 + c_2\right) \mathrm{e}^{-\frac{a\,\mathrm{e}^{\lambda x}}{\lambda}}$$

The above shows that

$$u'(x) = -a\left(\left(\int \mathrm{e}^{\frac{b\lambda x + 2\,\mathrm{e}^{\lambda x} a}{\lambda}} dx\right) c_1 + c_2\right) \mathrm{e}^{\frac{\lambda^2 x - \mathrm{e}^{\lambda x} a}{\lambda}} + c_1 \mathrm{e}^{\frac{b\lambda x + \mathrm{e}^{\lambda x} a}{\lambda}}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-a\left(\left(\int \mathrm{e}^{\frac{b\lambda x + 2\,\mathrm{e}^{\lambda x} a}{\lambda}} dx\right) c_1 + c_2\right) \mathrm{e}^{\frac{\lambda^2 x - \mathrm{e}^{\lambda x} a}{\lambda}} + c_1 \mathrm{e}^{\frac{b\lambda x + \mathrm{e}^{\lambda x} a}{\lambda}}\right) \mathrm{e}^{\frac{a\,\mathrm{e}^{\lambda x}}{\lambda}}}{\left(\int \mathrm{e}^{\frac{b\lambda x + 2\,\mathrm{e}^{\lambda x} a}{\lambda}} dx\right) c_1 + c_2}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\mathrm{e}^{\frac{a\,\mathrm{e}^{\lambda x}}{\lambda}} \left(a\left(\left(\int \mathrm{e}^{\frac{b\lambda x + 2\,\mathrm{e}^{\lambda x} a}{\lambda}} dx\right) c_3 + 1\right) \mathrm{e}^{\frac{\lambda^2 x - \mathrm{e}^{\lambda x} a}{\lambda}} - c_3 \mathrm{e}^{\frac{b\lambda x + \mathrm{e}^{\lambda x} a}{\lambda}}\right)}{\left(\int \mathrm{e}^{\frac{b\lambda x + 2\,\mathrm{e}^{\lambda x} a}{\lambda}} dx\right) c_3 + 1}$$

Summary

The solution(s) found are the following

$$y = \frac{e^{\frac{a\,e^{\lambda x}}{\lambda}} \left(a\left(\left(\int e^{\frac{b\lambda x+2\,e^{\lambda x} a}{\lambda}}dx\right) c_3 + 1\right) e^{\frac{\lambda^2 x - e^{\lambda x} a}{\lambda}} - c_3 e^{\frac{b\lambda x + e^{\lambda x} a}{\lambda}}\right)}{\left(\int e^{\frac{b\lambda x+2\,e^{\lambda x} a}{\lambda}}dx\right) c_3 + 1} \tag{1}$$

Verification of solutions

$$y = \frac{e^{\frac{a\,e^{\lambda x}}{\lambda}} \left(a\left(\left(\int e^{\frac{b\lambda x+2\,e^{\lambda x} a}{\lambda}}dx\right) c_3 + 1\right) e^{\frac{\lambda^2 x - e^{\lambda x} a}{\lambda}} - c_3 e^{\frac{b\lambda x + e^{\lambda x} a}{\lambda}}\right)}{\left(\int e^{\frac{b\lambda x+2\,e^{\lambda x} a}{\lambda}}dx\right) c_3 + 1}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3. Equations Containing Exponential Functions
Problem number: 6.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 - a\,\mathrm{e}^{\lambda x} y = -a\,\mathrm{e}^{\lambda x} b - b^2}$$

3.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + a\,\mathrm{e}^{\lambda x} y - a\,\mathrm{e}^{\lambda x} b - b^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\,\mathrm{e}^{\lambda x} y - a\,\mathrm{e}^{\lambda x} b - b^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a\,\mathrm{e}^{\lambda x} b - b^2$, $f_1(x) = \mathrm{e}^{\lambda x} a$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= \mathrm{e}^{\lambda x}a \\ f_2^2f_0 &= -a\,\mathrm{e}^{\lambda x}b - b^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \mathrm{e}^{\lambda x}au'(x) + \left(-a\,\mathrm{e}^{\lambda x}b - b^2\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\frac{-\lambda^2x+\mathrm{e}^{\lambda x}a}{2\lambda}}\left(\mathrm{WhittakerM}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)c_1 + \mathrm{WhittakerW}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)c_2\right)$$

The above shows that

$$u'(x) = 2\left(c_2\left(\mathrm{e}^{\lambda x}a + \frac{3b}{2} - \lambda\right)\mathrm{WhittakerW}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right) - \frac{bc_1\left(-2\,\mathrm{e}^{\frac{a\,\mathrm{e}^{\lambda x}}{2\lambda}}\left(\frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)^{\frac{2b+\lambda}{2\lambda}} + \mathrm{WhittakerM}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)\right)}{2}\right)\mathrm{e}^{\frac{-\lambda^2x+\mathrm{e}^{\lambda x}a}{2\lambda}}$$

Using the above in (1) gives the solution

$$y = -\frac{2\left(c_2\left(\mathrm{e}^{\lambda x}a + \frac{3b}{2} - \lambda\right)\mathrm{WhittakerW}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right) - \frac{bc_1\left(-2\,\mathrm{e}^{\frac{a\,\mathrm{e}^{\lambda x}}{2\lambda}}\left(\frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)^{\frac{2b+\lambda}{2\lambda}} + \mathrm{WhittakerM}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)\right)}{2}\right)}{\mathrm{WhittakerM}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)c_1 + \mathrm{WhittakerW}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)c_2}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-2\,\mathrm{e}^{\lambda x} a - 3b + 2\lambda\right) \mathrm{WhittakerW}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right) - 2c_3\left(\mathrm{e}^{\frac{a\,\mathrm{e}^{\lambda x}}{2\lambda}} \left(\frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)^{\frac{2b+\lambda}{2\lambda}} - \frac{\mathrm{WhittakerM}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)}{2}\right)}{\mathrm{WhittakerM}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right) c_3 + \mathrm{WhittakerW}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{\left(-2\,\mathrm{e}^{\lambda x} a - 3b + 2\lambda\right) \mathrm{WhittakerW}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right) - 2c_3\left(\mathrm{e}^{\frac{a\,\mathrm{e}^{\lambda x}}{2\lambda}} \left(\frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)^{\frac{2b+\lambda}{2\lambda}} - \frac{\mathrm{WhittakerM}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)}{2}\right)}{\mathrm{WhittakerM}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right) c_3 + \mathrm{WhittakerW}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(-2\,\mathrm{e}^{\lambda x} a - 3b + 2\lambda\right) \mathrm{WhittakerW}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right) - 2c_3\left(\mathrm{e}^{\frac{a\,\mathrm{e}^{\lambda x}}{2\lambda}} \left(\frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)^{\frac{2b+\lambda}{2\lambda}} - \frac{\mathrm{WhittakerM}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)}{2}\right)}{\mathrm{WhittakerM}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right) c_3 + \mathrm{WhittakerW}\left(\frac{-2b+\lambda}{2\lambda}, \frac{b}{\lambda}, \frac{a\,\mathrm{e}^{\lambda x}}{\lambda}\right)}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\,\mathrm{e}^{2\lambda x}\left(\mathrm{e}^{\lambda x} + b\right)^n - \frac{\lambda^2}{4}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= a\, e^{2\lambda x} \left(e^{\lambda x} + b\right)^n - \frac{\lambda^2}{4} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(a\, e^{2\lambda x} \left(e^{\lambda x} + b\right)^n - \frac{\lambda^2}{4}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{-\csc\left(\frac{\pi(n+3)}{2+n}\right) c_1 \operatorname{BesselI}\left(-\frac{1}{2+n}, 2\sqrt{-\frac{a\left(e^{\lambda x}+b\right)^{2+n}}{\lambda^2(2+n)^2}}\right) \pi \left(-\frac{a\left(e^{\lambda x}+b\right)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{1}{4+2n}} e^{-\frac{\lambda x}{2}} + \Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{a\left(e^{\lambda x}+b\right)^{2+n}}{\lambda^2(2+n)^2}\right.}{(2+n)\,\Gamma\left(\frac{n+3}{2+n}\right)}$$

The above shows that

$$u'(x) = -\frac{\lambda\left(-2\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{a\left(e^{\lambda x}+b\right)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} c_2 (2+n)^2 \left(e^{\frac{\lambda x}{2}} b + e^{\frac{3\lambda x}{2}}\right) \operatorname{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{a\left(e^{\lambda x}+b\right)^{2+n}}{\lambda^2(2+n)^2}}\right) + \Gamma\left(\frac{n+3}{2+n}\right.\right.}{}$$

Using the above in (1) gives the solution

$$y = \frac{\lambda\left(-2\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{a\left(e^{\lambda x}+b\right)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} c_2 (2+n)^2 \left(e^{\frac{\lambda x}{2}} b + e^{\frac{3\lambda x}{2}}\right) \operatorname{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{a\left(e^{\lambda x}+b\right)^{2+n}}{\lambda^2(2+n)^2}}\right) + \Gamma\left(\frac{n+3}{2+n}\right)^2\right.}{2\left(e^{\lambda x}+b\right)\left(-\csc\left(\frac{\pi(n}{2}\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-2\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{a\left(e^{\lambda x}+b\right)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} (2+n)^2 \left(b\,e^{\lambda x}+e^{2\lambda x}\right) \mathrm{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{a\left(e^{\lambda x}+b\right)^{2+n}}{\lambda^2(2+n)^2}}\right) + \Gamma\left(\frac{n+3}{2+n}\right)^2 \left(- \cdots\right.\right.}{2\left(e^{\lambda x}+b\right)\left(-c_3 \csc\left(\frac{\pi(\cdots}{2\cdots}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(-2\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{a\left(e^{\lambda x}+b\right)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} (2+n)^2 \left(b\,e^{\lambda x}+e^{2\lambda x}\right) \mathrm{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{a\left(e^{\lambda x}+b\right)^{2+n}}{\lambda^2(2+n)^2}}\right) + \Gamma\left(\frac{n+3}{2+n}\right)^2 \left(- \cdots\right.\right.}{2\left(e^{\lambda x}+b\right)\left(-c_3 \csc\left(\frac{\pi(\cdots}{2\cdots}\right.\right.} \quad (1)$$

Verification of solutions

$$y = \frac{\left(-2\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{a\left(e^{\lambda x}+b\right)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} (2+n)^2 \left(b\,e^{\lambda x}+e^{2\lambda x}\right) \mathrm{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{a\left(e^{\lambda x}+b\right)^{2+n}}{\lambda^2(2+n)^2}}\right) + \Gamma\left(\frac{n+3}{2+n}\right)^2 \left(- \cdots\right.\right.}{2\left(e^{\lambda x}+b\right)\left(-c_3 \csc\left(\frac{\pi(\cdots}{2\cdots}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3. Equations Containing Exponential Functions
Problem number: 8.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = a\,e^{8\lambda x} + b\,e^{6\lambda x} + c\,e^{4\lambda x} - \lambda^2}$$

3.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + a\,e^{8\lambda x} + b\,e^{6\lambda x} + c\,e^{4\lambda x} - \lambda^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\,e^{8\lambda x} + b\,e^{6\lambda x} + c\,e^{4\lambda x} - \lambda^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\,e^{8\lambda x} + b\,e^{6\lambda x} + c\,e^{4\lambda x} - \lambda^2$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= a\,\mathrm{e}^{8\lambda x} + b\,\mathrm{e}^{6\lambda x} + c\,\mathrm{e}^{4\lambda x} - \lambda^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(a\,\mathrm{e}^{8\lambda x} + b\,\mathrm{e}^{6\lambda x} + c\,\mathrm{e}^{4\lambda x} - \lambda^2\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = {} & c_1\mathrm{e}^{-\frac{i\mathrm{e}^{4\lambda x}a+4\lambda^2x\sqrt{a}+i\mathrm{e}^{2\lambda x}b}{4\lambda\sqrt{a}}}\,\mathrm{hypergeom}\left(\left[\frac{8\lambda\,a^{\frac{3}{2}} + 4ica - ib^2}{32\lambda\,a^{\frac{3}{2}}}\right], \left[\frac{1}{2}\right], \frac{i\left(2\,\mathrm{e}^{2\lambda x}a + b\right)^2}{8\lambda\,a^{\frac{3}{2}}}\right) \\ & + c_2\,\mathrm{hypergeom}\left(\left[\frac{24\lambda\,a^{\frac{3}{2}} + 4ica - ib^2}{32\lambda\,a^{\frac{3}{2}}}\right], \left[\frac{3}{2}\right], \frac{i\left(2\,\mathrm{e}^{2\lambda x}a + b\right)^2}{8\lambda\,a^{\frac{3}{2}}}\right)\left(2a\,\mathrm{e}^{-\frac{-4\lambda^2x\sqrt{a}+i\mathrm{e}^{4\lambda x}a+i\mathrm{e}^{2\lambda x}b}{4\lambda\sqrt{a}}} \right. \\ & \left. + \mathrm{e}^{-\frac{i\mathrm{e}^{4\lambda x}a+4\lambda^2x\sqrt{a}+i\mathrm{e}^{2\lambda x}b}{4\lambda\sqrt{a}}}b\right) \end{aligned}$$

The above shows that

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3. Equations Containing Exponential Functions
Problem number: 9.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - a\,e^{kx}y^2 = b\,e^{sx}}$$

3.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,e^{kx}y^2 + b\,e^{sx} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,e^{kx}y^2 + b\,e^{sx}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\,e^{sx}$, $f_1(x) = 0$ and $f_2(x) = a\,e^{kx}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{a\,e^{kx}u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= ak\,\mathrm{e}^{kx} \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \mathrm{e}^{2kx}\mathrm{e}^{sx} a^2 b \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$a\,\mathrm{e}^{kx} u''(x) - ak\,\mathrm{e}^{kx} u'(x) + \mathrm{e}^{2kx}\mathrm{e}^{sx} a^2 b u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = -\frac{\mathrm{e}^{-\frac{sx}{2}}\left(\mathrm{e}^{\frac{x(k+s)}{2}} \operatorname{BesselJ}\left(\frac{k+2s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)\sqrt{a}\,\sqrt{b}\,c_1 + \operatorname{BesselY}\left(\frac{k+2s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)\mathrm{e}^{\frac{x(k+s)}{2}}\sqrt{a}\,\sqrt{b}\,c_2 +}{\sqrt{b}\,\sqrt{a}}$$

The above shows that

$$u'(x) = \left(-c_1 \operatorname{BesselJ}\left(\frac{s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right) - c_2 \operatorname{BesselY}\left(\frac{s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)\right)\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(2k+s)}{2}}$$

Using the above in (1) gives the solution

$$y = \frac{\left(-c_1 \operatorname{BesselJ}\left(\frac{s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right) - c_2 \operatorname{BesselY}\left(\frac{s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(}{}}}{k+s}\right.\right.}{\mathrm{e}^{\frac{x(k+s)}{2}} \operatorname{BesselJ}\left(\frac{k+2s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)\sqrt{a}\,\sqrt{b}\,c_1 + \operatorname{BesselY}\left(\frac{k+2s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)\mathrm{e}^{\frac{x(k+s)}{2}}\sqrt{a}\,\sqrt{b}\,c_2 - s\left(c_1 \mathrm{B}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{b\,\mathrm{e}^{sx}\left(c_3\,\mathrm{BesselJ}\left(\frac{s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)+\mathrm{BesselY}\left(\frac{s}{k+s}, \right.\right.}{\mathrm{e}^{\frac{x(k+s)}{2}}\,\mathrm{BesselJ}\left(\frac{k+2s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)\sqrt{a}\,\sqrt{b}\,c_3+\mathrm{BesselY}\left(\frac{k+2s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}-s\left(c_3\,\mathrm{B}\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{b\,\mathrm{e}^{sx}\left(c_3\,\mathrm{BesselJ}\left(\frac{s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)+\mathrm{BesselY}\left(\frac{s}{k+s}, \right.\right.}{\mathrm{e}^{\frac{x(k+s)}{2}}\,\mathrm{BesselJ}\left(\frac{k+2s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)\sqrt{a}\,\sqrt{b}\,c_3+\mathrm{BesselY}\left(\frac{k+2s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}-s\left(c_3\,\mathrm{B}\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{b\,\mathrm{e}^{sx}\left(c_3\,\mathrm{BesselJ}\left(\frac{s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)+\mathrm{BesselY}\left(\frac{s}{k+s}, \right.\right.}{\mathrm{e}^{\frac{x(k+s)}{2}}\,\mathrm{BesselJ}\left(\frac{k+2s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)\sqrt{a}\,\sqrt{b}\,c_3+\mathrm{BesselY}\left(\frac{k+2s}{k+s}, \frac{2\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}}{k+s}\right)\sqrt{a}\,\sqrt{b}\,\mathrm{e}^{\frac{x(k+s)}{2}}-s\left(c_3\,\mathrm{B}\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3. Equations Containing Exponential Functions
Problem number: 10.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - b\,\mathrm{e}^{x\mu} y^2 = a\lambda\,\mathrm{e}^{\lambda x} - a^2 b\,\mathrm{e}^{(\mu+2\lambda)x}}$$

3.10.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= b\,\mathrm{e}^{x\mu} y^2 + a\lambda\,\mathrm{e}^{\lambda x} - a^2 b\,\mathrm{e}^{(\mu+2\lambda)x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = b\,\mathrm{e}^{x\mu} y^2 + a\lambda\,\mathrm{e}^{\lambda x} - a^2 b\,\mathrm{e}^{2\lambda x}\mathrm{e}^{x\mu}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\lambda\,\mathrm{e}^{\lambda x} - a^2 b\,\mathrm{e}^{(\mu+2\lambda)x}$, $f_1(x) = 0$ and $f_2(x) = b\,\mathrm{e}^{x\mu}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{b\,\mathrm{e}^{x\mu} u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= b\mu\, e^{x\mu} \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= b^2 e^{2x\mu}\left(a\lambda\, e^{\lambda x} - a^2 b\, e^{(\mu+2\lambda)x}\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$b\, e^{x\mu} u''(x) - b\mu\, e^{x\mu} u'(x) + b^2 e^{2x\mu}\left(a\lambda\, e^{\lambda x} - a^2 b\, e^{(\mu+2\lambda)x}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \text{DESol}\left(\left\{-e^{2x(\lambda+\mu)}\_Y(x)\, a^2 b^2 + e^{x(\lambda+\mu)}\_Y(x)\, ab\lambda - \mu\_Y'(x) + \_Y''(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\text{DESol}\left(\left\{-e^{2x(\lambda+\mu)}\_Y(x)\, a^2 b^2 + e^{x(\lambda+\mu)}\_Y(x)\, ab\lambda - \mu\_Y'(x) + \_Y''(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\text{DESol}\left(\left\{-e^{2x(\lambda+\mu)}\_Y(x)\, a^2 b^2 + e^{x(\lambda+\mu)}\_Y(x)\, ab\lambda - \mu\_Y'(x) + \_Y''(x)\right\}, \{\_Y(x)\}\right)\right) e^{-x\mu}}{b\,\text{DESol}\left(\left\{-e^{2x(\lambda+\mu)}\_Y(x)\, a^2 b^2 + e^{x(\lambda+\mu)}\_Y(x)\, ab\lambda - \mu\_Y'(x) + \_Y''(x)\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\text{DESol}\left(\left\{-e^{2x(\lambda+\mu)}\_Y(x)\, a^2 b^2 + e^{x(\lambda+\mu)}\_Y(x)\, ab\lambda - \mu\_Y'(x) + \_Y''(x)\right\}, \{\_Y(x)\}\right)\right) e^{-x\mu}}{b\,\text{DESol}\left(\left\{-e^{2x(\lambda+\mu)}\_Y(x)\, a^2 b^2 + e^{x(\lambda+\mu)}\_Y(x)\, ab\lambda - \mu\_Y'(x) + \_Y''(x)\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{-\mathrm{e}^{2x(\lambda+\mu)} \_Y(x)\, a^2 b^2 + \mathrm{e}^{x(\lambda+\mu)} \_Y(x)\, ab\lambda - \mu \_Y'(x) + \_Y''(x)\right\}, \{\_Y(x)\}\right)\right) \mathrm{e}^{-x\mu}}{b\, \mathrm{DESol}\left(\left\{-\mathrm{e}^{2x(\lambda+\mu)} \_Y(x)\, a^2 b^2 + \mathrm{e}^{x(\lambda+\mu)} \_Y(x)\, ab\lambda - \mu \_Y'(x) + \_Y''(x)\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{-\mathrm{e}^{2x(\lambda+\mu)} \_Y(x)\, a^2 b^2 + \mathrm{e}^{x(\lambda+\mu)} \_Y(x)\, ab\lambda - \mu \_Y'(x) + \_Y''(x)\right\}, \{\_Y(x)\}\right)\right) \mathrm{e}^{-x\mu}}{b\, \mathrm{DESol}\left(\left\{-\mathrm{e}^{2x(\lambda+\mu)} \_Y(x)\, a^2 b^2 + \mathrm{e}^{x(\lambda+\mu)} \_Y(x)\, ab\lambda - \mu \_Y'(x) + \_Y''(x)\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati", "first_order_ode_lie_symmetry_calculated"**

Maple gives the following as the ode type

```
[[_1st_order, _with_linear_symmetries], _Riccati]
```

$$\boxed{y' - a\,e^{\lambda x} y^2 - yb = c\,e^{-\lambda x}}$$

3.11.1 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$\begin{aligned} y' &= e^{\lambda x} a\, y^2 + by + c\,e^{-\lambda x} \\ y' &= \omega(x,y) \end{aligned}$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x + \omega(\eta_y - \xi_x) - \omega^2 \xi_y - \omega_x \xi - \omega_y \eta = 0 \tag{A}$$

The type of this ode is not in the lookup table. To determine ξ, η then (A) is solved using ansatz. Making bivariate polynomials of degree 1 to use as anstaz gives

$$\xi = x a_2 + y a_3 + a_1 \tag{1E}$$

$$\eta = x b_2 + y b_3 + b_1 \tag{2E}$$

Where the unknown coefficients are

$$\{a_1, a_2, a_3, b_1, b_2, b_3\}$$

Substituting equations (1E,2E) and ω into (A) gives

$$\begin{aligned} & b_2 + \left(\mathrm{e}^{\lambda x} a\, y^2 + by + c\,\mathrm{e}^{-\lambda x}\right)(b_3 - a_2) - \left(\mathrm{e}^{\lambda x} a\, y^2 + by + c\,\mathrm{e}^{-\lambda x}\right)^2 a_3 \\ & - \left(\lambda\,\mathrm{e}^{\lambda x} a\, y^2 - c\lambda\,\mathrm{e}^{-\lambda x}\right)(xa_2 + ya_3 + a_1) - \left(2a\,\mathrm{e}^{\lambda x} y + b\right)(xb_2 + yb_3 + b_1) = 0 \end{aligned} \tag{5E}$$

Putting the above in normal form gives

$$\begin{aligned} & -\mathrm{e}^{2\lambda x} a^2 y^4 a_3 - 2\,\mathrm{e}^{\lambda x}\mathrm{e}^{-\lambda x} ac\, y^2 a_3 - 2\,\mathrm{e}^{\lambda x} ab\, y^3 a_3 - \mathrm{e}^{\lambda x} a\lambda x\, y^2 a_2 - \mathrm{e}^{\lambda x} a\lambda\, y^3 a_3 \\ & - \mathrm{e}^{\lambda x} a\lambda\, y^2 a_1 - 2\,\mathrm{e}^{\lambda x} axyb_2 - \mathrm{e}^{\lambda x} a\, y^2 a_2 - \mathrm{e}^{\lambda x} a\, y^2 b_3 - \mathrm{e}^{-2\lambda x} c^2 a_3 \\ & - 2\,\mathrm{e}^{-\lambda x} bcya_3 + \mathrm{e}^{-\lambda x} c\lambda x a_2 + \mathrm{e}^{-\lambda x} c\lambda y a_3 - b^2 y^2 a_3 - 2\,\mathrm{e}^{\lambda x} ayb_1 \\ & + \mathrm{e}^{-\lambda x} c\lambda a_1 - \mathrm{e}^{-\lambda x} ca_2 + \mathrm{e}^{-\lambda x} cb_3 - bxb_2 - bya_2 - bb_1 + b_2 = 0 \end{aligned}$$

Setting the numerator to zero gives

$$\begin{aligned} & -\mathrm{e}^{2\lambda x} a^2 y^4 a_3 - 2\,\mathrm{e}^{\lambda x}\mathrm{e}^{-\lambda x} ac\, y^2 a_3 - 2\,\mathrm{e}^{\lambda x} ab\, y^3 a_3 - \mathrm{e}^{\lambda x} a\lambda x\, y^2 a_2 - \mathrm{e}^{\lambda x} a\lambda\, y^3 a_3 \\ & - \mathrm{e}^{\lambda x} a\lambda\, y^2 a_1 - 2\,\mathrm{e}^{\lambda x} axyb_2 - \mathrm{e}^{\lambda x} a\, y^2 a_2 - \mathrm{e}^{\lambda x} a\, y^2 b_3 - \mathrm{e}^{-2\lambda x} c^2 a_3 \\ & - 2\,\mathrm{e}^{-\lambda x} bcya_3 + \mathrm{e}^{-\lambda x} c\lambda x a_2 + \mathrm{e}^{-\lambda x} c\lambda y a_3 - b^2 y^2 a_3 - 2\,\mathrm{e}^{\lambda x} ayb_1 \\ & + \mathrm{e}^{-\lambda x} c\lambda a_1 - \mathrm{e}^{-\lambda x} ca_2 + \mathrm{e}^{-\lambda x} cb_3 - bxb_2 - bya_2 - bb_1 + b_2 = 0 \end{aligned} \tag{6E}$$

Simplifying the above gives

$$\begin{aligned} & -\mathrm{e}^{2\lambda x} a^2 y^4 a_3 - 2ac\, y^2 a_3 - 2\,\mathrm{e}^{\lambda x} ab\, y^3 a_3 - \mathrm{e}^{\lambda x} a\lambda x\, y^2 a_2 - \mathrm{e}^{\lambda x} a\lambda\, y^3 a_3 \\ & - \mathrm{e}^{\lambda x} a\lambda\, y^2 a_1 - 2\,\mathrm{e}^{\lambda x} axyb_2 - \mathrm{e}^{\lambda x} a\, y^2 a_2 - \mathrm{e}^{\lambda x} a\, y^2 b_3 - \mathrm{e}^{-2\lambda x} c^2 a_3 \\ & - 2\,\mathrm{e}^{-\lambda x} bcya_3 + \mathrm{e}^{-\lambda x} c\lambda x a_2 + \mathrm{e}^{-\lambda x} c\lambda y a_3 - b^2 y^2 a_3 - 2\,\mathrm{e}^{\lambda x} ayb_1 \\ & + \mathrm{e}^{-\lambda x} c\lambda a_1 - \mathrm{e}^{-\lambda x} ca_2 + \mathrm{e}^{-\lambda x} cb_3 - bxb_2 - bya_2 - bb_1 + b_2 = 0 \end{aligned} \tag{6E}$$

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\{x, y, \mathrm{e}^{\lambda x}, \mathrm{e}^{-2\lambda x}, \mathrm{e}^{-\lambda x}, \mathrm{e}^{2\lambda x}\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\{x = v_1, y = v_2, \mathrm{e}^{\lambda x} = v_3, \mathrm{e}^{-2\lambda x} = v_4, \mathrm{e}^{-\lambda x} = v_5, \mathrm{e}^{2\lambda x} = v_6\}$$

The above PDE (6E) now becomes

$$
\begin{aligned}
&-v_6 a^2 v_2^4 a_3 - 2v_3 ab v_2^3 a_3 - v_3 a\lambda v_1 v_2^2 a_2 - v_3 a\lambda v_2^3 a_3 - v_3 a\lambda v_2^2 a_1 - 2ac v_2^2 a_3 \\
&- v_3 a v_2^2 a_2 - 2v_3 a v_1 v_2 b_2 - v_3 a v_2^2 b_3 - b^2 v_2^2 a_3 - 2v_5 bc v_2 a_3 + v_5 c\lambda v_1 a_2 + v_5 c\lambda v_2 a_3 \\
&- 2v_3 a v_2 b_1 - v_4 c^2 a_3 + v_5 c\lambda a_1 - b v_2 a_2 - b v_1 b_2 - v_5 c a_2 + v_5 c b_3 - b b_1 + b_2 = 0
\end{aligned} \tag{7E}
$$

Collecting the above on the terms v_i introduced, and these are

$$
\{v_1, v_2, v_3, v_4, v_5, v_6\}
$$

Equation (7E) now becomes

$$
\begin{aligned}
&-v_3 a\lambda v_1 v_2^2 a_2 - 2v_3 a v_1 v_2 b_2 + v_5 c\lambda v_1 a_2 - b v_1 b_2 - v_6 a^2 v_2^4 a_3 \\
&+ (-2a_3 ab - \lambda a_3 a) v_2^3 v_3 + (-a\lambda a_1 - a_2 a - b_3 a) v_2^2 v_3 \\
&+ \left(-2a_3 ac - a_3 b^2\right) v_2^2 - 2v_3 a v_2 b_1 + (-2a_3 bc + \lambda a_3 c) v_2 v_5 \\
&- b v_2 a_2 - v_4 c^2 a_3 + (c\lambda a_1 - c a_2 + c b_3) v_5 - b b_1 + b_2 = 0
\end{aligned} \tag{8E}
$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$
\begin{aligned}
c\lambda a_2 &= 0 \\
-2ab_1 &= 0 \\
-2ab_2 &= 0 \\
-bb_2 &= 0 \\
-c^2 a_3 &= 0 \\
-a_2 b &= 0 \\
-a_3 a^2 &= 0 \\
-\lambda a_2 a &= 0 \\
-bb_1 + b_2 &= 0 \\
-2a_3 ac - a_3 b^2 &= 0 \\
-2a_3 ab - \lambda a_3 a &= 0 \\
-2a_3 bc + \lambda a_3 c &= 0 \\
-a\lambda a_1 - a_2 a - b_3 a &= 0 \\
c\lambda a_1 - c a_2 + c b_3 &= 0
\end{aligned}
$$

Solving the above equations for the unknowns gives

$$
\begin{aligned}
a_1 &= a_1 \\
a_2 &= 0 \\
a_3 &= 0 \\
b_1 &= 0 \\
b_2 &= 0 \\
b_3 &= -\lambda a_1
\end{aligned}
$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$
\begin{aligned}
\xi &= 1 \\
\eta &= -\lambda y
\end{aligned}
$$

Shifting is now applied to make $\xi = 0$ in order to simplify the rest of the computation

$$
\begin{aligned}
\eta &= \eta - \omega(x, y)\,\xi \\
&= -\lambda y - \left(\mathrm{e}^{\lambda x} a\, y^2 + b y + c\,\mathrm{e}^{-\lambda x}\right)(1) \\
&= -\mathrm{e}^{\lambda x} a\, y^2 - b y - \lambda y - c\,\mathrm{e}^{-\lambda x} \\
\xi &= 0
\end{aligned}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x, y) \to (R, S)$ where (R, S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$
\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}
$$

The above comes from the requirements that $\left(\xi \frac{\partial}{\partial x} + \eta \frac{\partial}{\partial y}\right) S(x, y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$
R = x
$$

S is found from

$$
\begin{aligned}
S &= \int \frac{1}{\eta} dy \\
&= \int \frac{1}{-\mathrm{e}^{\lambda x} a\, y^2 - b y - \lambda y - c\,\mathrm{e}^{-\lambda x}} dy
\end{aligned}
$$

Which results in

$$S = -\frac{2\,\mathrm{e}^{\lambda x} \arctan\left(\frac{2\,\mathrm{e}^{2\lambda x} a y + b\,\mathrm{e}^{\lambda x} + \lambda\,\mathrm{e}^{\lambda x}}{\sqrt{-\mathrm{e}^{2\lambda x} b^2 - 2\,\mathrm{e}^{2\lambda x} b\lambda - \mathrm{e}^{2\lambda x}\lambda^2 + 4c\,\mathrm{e}^{2\lambda x} a}}\right)}{\sqrt{-\mathrm{e}^{2\lambda x} b^2 - 2\,\mathrm{e}^{2\lambda x} b\lambda - \mathrm{e}^{2\lambda x}\lambda^2 + 4c\,\mathrm{e}^{2\lambda x} a}}$$

Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$\frac{dS}{dR} = \frac{S_x + \omega(x,y) S_y}{R_x + \omega(x,y) R_y} \tag{2}$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x,y)$ is the right hand side of the original ode given by

$$\omega(x,y) = \mathrm{e}^{\lambda x} a\, y^2 + by + c\,\mathrm{e}^{-\lambda x}$$

Evaluating all the partial derivatives gives

$$\begin{aligned}
R_x &= 1 \\
R_y &= 0 \\
S_x &= -\frac{\mathrm{e}^{\lambda x}\lambda y}{\mathrm{e}^{2\lambda x} a\, y^2 + y\,(b+\lambda)\,\mathrm{e}^{\lambda x} + c} \\
S_y &= -\frac{\mathrm{e}^{\lambda x}}{\mathrm{e}^{2\lambda x} a\, y^2 + y\,(b+\lambda)\,\mathrm{e}^{\lambda x} + c}
\end{aligned}$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$\frac{dS}{dR} = -1 \tag{2A}$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$\frac{dS}{dR} = -1$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = -R + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$-\frac{2\arctan\left(\frac{2a\,\mathrm{e}^{\lambda x}y+b+\lambda}{\sqrt{4ca-b^2-2b\lambda-\lambda^2}}\right)}{\sqrt{4ca-b^2-2b\lambda-\lambda^2}} = c_1 - x$$

Which simplifies to

$$-\frac{2\arctan\left(\frac{2a\,\mathrm{e}^{\lambda x}y+b+\lambda}{\sqrt{4ca-b^2-2b\lambda-\lambda^2}}\right)}{\sqrt{4ca-b^2-2b\lambda-\lambda^2}} = c_1 - x$$

Which gives

$$y = -\frac{\left(\tan\left(\frac{c_1\sqrt{4ca-b^2-2b\lambda-\lambda^2}}{2} - \frac{x\sqrt{4ca-b^2-2b\lambda-\lambda^2}}{2}\right)\sqrt{4ca-b^2-2b\lambda-\lambda^2} + b + \lambda\right)\mathrm{e}^{-\lambda x}}{2a}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\tan\left(\frac{c_1\sqrt{4ca-b^2-2b\lambda-\lambda^2}}{2} - \frac{x\sqrt{4ca-b^2-2b\lambda-\lambda^2}}{2}\right)\sqrt{4ca-b^2-2b\lambda-\lambda^2} + b + \lambda\right)\mathrm{e}^{-\lambda x}}{2a} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\tan\left(\frac{c_1\sqrt{4ca-b^2-2b\lambda-\lambda^2}}{2} - \frac{x\sqrt{4ca-b^2-2b\lambda-\lambda^2}}{2}\right)\sqrt{4ca-b^2-2b\lambda-\lambda^2} + b + \lambda\right)\mathrm{e}^{-\lambda x}}{2a}$$

Verified OK.

3.11.2 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \mathrm{e}^{\lambda x} a\, y^2 + by + c\,\mathrm{e}^{-\lambda x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \mathrm{e}^{\lambda x} a\, y^2 + by + c\,\mathrm{e}^{-\lambda x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = c\,\mathrm{e}^{-\lambda x}$, $f_1(x) = b$ and $f_2(x) = \mathrm{e}^{\lambda x} a$. Let

$$
\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{\mathrm{e}^{\lambda x} a u}
\end{aligned} \tag{1}
$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$
f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}
$$

But

$$
\begin{aligned}
f_2' &= a\lambda\,\mathrm{e}^{\lambda x} \\
f_1 f_2 &= a\,\mathrm{e}^{\lambda x} b \\
f_2^2 f_0 &= \mathrm{e}^{2\lambda x} a^2 c\,\mathrm{e}^{-\lambda x}
\end{aligned}
$$

Substituting the above terms back in equation (2) gives

$$
\mathrm{e}^{\lambda x} a u''(x) - \left(a\lambda\,\mathrm{e}^{\lambda x} + a\,\mathrm{e}^{\lambda x} b\right) u'(x) + \mathrm{e}^{2\lambda x} a^2 c\,\mathrm{e}^{-\lambda x} u(x) = 0
$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$
u(x) = c_1 \mathrm{e}^{\frac{\left(b+\lambda+\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}} + c_2 \mathrm{e}^{\frac{\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}}
$$

The above shows that

$$
u'(x) = \frac{c_2\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)\mathrm{e}^{\frac{\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}}}{2} + \frac{c_1 \mathrm{e}^{\frac{\left(b+\lambda+\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}}\left(b+\lambda+\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)}{2}
$$

Using the above in (1) gives the solution

$$
y = -\frac{\left(\frac{c_2\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)\mathrm{e}^{\frac{\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}}}{2} + \frac{c_1 \mathrm{e}^{\frac{\left(b+\lambda+\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}}\left(b+\lambda+\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)}{2}\right)\mathrm{e}^{-\lambda x}}{a\left(c_1 \mathrm{e}^{\frac{\left(b+\lambda+\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}} + c_2 \mathrm{e}^{\frac{\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}}\right)}
$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right) \mathrm{e}^{\frac{\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}} + c_3 \mathrm{e}^{\frac{\left(b+\lambda+\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}} \left(b+\lambda+\sqrt{-4ca\right.\right.}{2a\left(c_3 \mathrm{e}^{\frac{\left(b+\lambda+\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}} + \mathrm{e}^{\frac{\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right) \mathrm{e}^{\frac{\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}} + c_3 \mathrm{e}^{\frac{\left(b+\lambda+\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}} \left(b+\lambda+\sqrt{-4ca\right.\right.}{2a\left(c_3 \mathrm{e}^{\frac{\left(b+\lambda+\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}} + \mathrm{e}^{\frac{\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}}\right)} \quad (1)$$

Verification of solutions

$$y = -\frac{\left(\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right) \mathrm{e}^{\frac{\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}} + c_3 \mathrm{e}^{\frac{\left(b+\lambda+\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}} \left(b+\lambda+\sqrt{-4ca\right.\right.}{2a\left(c_3 \mathrm{e}^{\frac{\left(b+\lambda+\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}} + \mathrm{e}^{\frac{\left(b+\lambda-\sqrt{-4ca+b^2+2b\lambda+\lambda^2}\right)x}{2}}\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,\mathrm{e}^{x\mu}y^2 - \lambda y = -a\,b^2\mathrm{e}^{(\mu+2\lambda)x}}$$

3.12.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,\mathrm{e}^{x\mu}y^2 + \lambda y - a\,b^2\mathrm{e}^{(\mu+2\lambda)x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,\mathrm{e}^{x\mu}y^2 + \lambda y - a\,b^2\mathrm{e}^{2\lambda x}\mathrm{e}^{x\mu}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a\,b^2\mathrm{e}^{(\mu+2\lambda)x}$, $f_1(x) = \lambda$ and $f_2(x) = a\,\mathrm{e}^{x\mu}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{a\,\mathrm{e}^{x\mu}u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= a\mu\, \mathrm{e}^{x\mu} \\ f_1 f_2 &= \lambda a\, \mathrm{e}^{x\mu} \\ f_2^2 f_0 &= -a^3 \mathrm{e}^{2x\mu} b^2 \mathrm{e}^{(\mu+2\lambda)x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$a\, \mathrm{e}^{x\mu} u''(x) - (a\mu\, \mathrm{e}^{x\mu} + \lambda a\, \mathrm{e}^{x\mu}) u'(x) - a^3 \mathrm{e}^{2x\mu} b^2 \mathrm{e}^{(\mu+2\lambda)x} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \sin\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right) + c_2 \cos\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)$$

The above shows that

$$u'(x) = \frac{ab\, \mathrm{e}^{2x(\lambda+\mu)} \left(-c_1 \cos\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right) + c_2 \sin\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)\right)}{\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}$$

Using the above in (1) gives the solution

$$y = -\frac{b\, \mathrm{e}^{2x(\lambda+\mu)} \left(-c_1 \cos\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right) + c_2 \sin\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)\right) \mathrm{e}^{-x\mu}}{\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}} \left(c_1 \sin\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right) + c_2 \cos\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{b\, \mathrm{e}^{(\mu+2\lambda)x} \left(c_3 \cos\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right) - \sin\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)\right)}{\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}} \left(c_3 \sin\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right) + \cos\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{b\,\mathrm{e}^{(\mu+2\lambda)x}\left(c_3\cos\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)-\sin\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)\right)}{\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}\left(c_3\sin\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)+\cos\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)\right)} \tag{1}$$

Verification of solutions

$$y = \frac{b\,\mathrm{e}^{(\mu+2\lambda)x}\left(c_3\cos\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)-\sin\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)\right)}{\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}\left(c_3\sin\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)+\cos\left(\frac{ab\sqrt{-\mathrm{e}^{2\lambda x}\mathrm{e}^{2x\mu}}}{\lambda+\mu}\right)\right)}$$

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - e^{\lambda x} y^2 - a\, e^{x\mu} y = a\lambda\, e^{(\mu-\lambda)x}}$$

3.13.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= e^{\lambda x} y^2 + a\, e^{x\mu} y + a\lambda\, e^{(\mu-\lambda)x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = e^{\lambda x} y^2 + a\, e^{x\mu} y + a\lambda\, e^{-\lambda x} e^{x\mu}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\lambda\, e^{(\mu-\lambda)x}$, $f_1(x) = a\, e^{x\mu}$ and $f_2(x) = e^{\lambda x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{e^{\lambda x} u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \lambda\,\mathrm{e}^{\lambda x} \\ f_1f_2 &= a\,\mathrm{e}^{x\mu}\mathrm{e}^{\lambda x} \\ f_2^2f_0 &= \mathrm{e}^{2\lambda x}a\lambda\,\mathrm{e}^{(\mu-\lambda)x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\mathrm{e}^{\lambda x}u''(x) - \left(a\,\mathrm{e}^{x\mu}\mathrm{e}^{\lambda x} + \lambda\,\mathrm{e}^{\lambda x}\right)u'(x) + \mathrm{e}^{2\lambda x}a\lambda\,\mathrm{e}^{(\mu-\lambda)x}u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1\mathrm{e}^{\lambda x} + c_2\,\mathrm{hypergeom}\left(\left[-\frac{\lambda}{\mu}\right], \left[\frac{\mu-\lambda}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)$$

The above shows that

$$u'(x) = -\frac{\left(c_2\,\mathrm{hypergeom}\left(\left[\frac{\mu-\lambda}{\mu}\right], \left[\frac{-\lambda+2\mu}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)a\,\mathrm{e}^{x\mu} - \mathrm{e}^{\lambda x}c_1(\mu-\lambda)\right)\lambda}{\mu-\lambda}$$

Using the above in (1) gives the solution

$$y = \frac{\left(c_2\,\mathrm{hypergeom}\left(\left[\frac{\mu-\lambda}{\mu}\right], \left[\frac{-\lambda+2\mu}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)a\,\mathrm{e}^{x\mu} - \mathrm{e}^{\lambda x}c_1(\mu-\lambda)\right)\lambda\,\mathrm{e}^{-\lambda x}}{(\mu-\lambda)\left(c_1\mathrm{e}^{\lambda x} + c_2\,\mathrm{hypergeom}\left(\left[-\frac{\lambda}{\mu}\right], \left[\frac{\mu-\lambda}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\mathrm{hypergeom}\left(\left[\frac{\mu-\lambda}{\mu}\right], \left[\frac{-\lambda+2\mu}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)a\,\mathrm{e}^{(\mu-\lambda)x} - c_3(\mu-\lambda)\right)\lambda}{(\mu-\lambda)\left(c_3\mathrm{e}^{\lambda x} + \mathrm{hypergeom}\left(\left[-\frac{\lambda}{\mu}\right], \left[\frac{\mu-\lambda}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)\right)}$$

Summary

The solution(s) found are the following

$$
y = \frac{\left(\operatorname{hypergeom}\left(\left[\frac{\mu-\lambda}{\mu}\right], \left[\frac{-\lambda+2\mu}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right) a\,\mathrm{e}^{(\mu-\lambda)x} - c_3(\mu-\lambda)\right)\lambda}{(\mu-\lambda)\left(c_3\mathrm{e}^{\lambda x} + \operatorname{hypergeom}\left(\left[-\frac{\lambda}{\mu}\right], \left[\frac{\mu-\lambda}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)\right)} \tag{1}
$$

Verification of solutions

$$
y = \frac{\left(\operatorname{hypergeom}\left(\left[\frac{\mu-\lambda}{\mu}\right], \left[\frac{-\lambda+2\mu}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right) a\,\mathrm{e}^{(\mu-\lambda)x} - c_3(\mu-\lambda)\right)\lambda}{(\mu-\lambda)\left(c_3\mathrm{e}^{\lambda x} + \operatorname{hypergeom}\left(\left[-\frac{\lambda}{\mu}\right], \left[\frac{\mu-\lambda}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)\right)}
$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3. Equations Containing Exponential Functions
Problem number: 14.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + e^{\lambda x} y^2 \lambda - a\,e^{x\mu} y = -a\,e^{(\mu-\lambda)x}}$$

3.14.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\lambda\,e^{\lambda x} y^2 + a\,e^{x\mu} y - a\,e^{(\mu-\lambda)x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\lambda\,e^{\lambda x} y^2 + a\,e^{x\mu} y - a\,e^{-\lambda x} e^{x\mu}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a\,e^{(\mu-\lambda)x}$, $f_1(x) = a\,e^{x\mu}$ and $f_2(x) = -\lambda\,e^{\lambda x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{-\lambda\,e^{\lambda x} u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\mathrm{e}^{\lambda x}\lambda^2 \\ f_1f_2 &= -a\,\mathrm{e}^{x\mu}\lambda\,\mathrm{e}^{\lambda x} \\ f_2^2 f_0 &= -\lambda^2\mathrm{e}^{2\lambda x}a\,\mathrm{e}^{(\mu-\lambda)x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$-\lambda\,\mathrm{e}^{\lambda x}u''(x) - \left(-a\,\mathrm{e}^{x\mu}\lambda\,\mathrm{e}^{\lambda x} - \mathrm{e}^{\lambda x}\lambda^2\right)u'(x) - \lambda^2\mathrm{e}^{2\lambda x}a\,\mathrm{e}^{(\mu-\lambda)x}u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1\mathrm{e}^{\lambda x} + c_2\,\mathrm{hypergeom}\left(\left[-\frac{\lambda}{\mu}\right], \left[\frac{\mu-\lambda}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)$$

The above shows that

$$u'(x) = -\frac{\left(c_2\,\mathrm{hypergeom}\left(\left[\frac{\mu-\lambda}{\mu}\right], \left[\frac{-\lambda+2\mu}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)a\,\mathrm{e}^{x\mu} - \mathrm{e}^{\lambda x}c_1(\mu-\lambda)\right)\lambda}{\mu-\lambda}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(c_2\,\mathrm{hypergeom}\left(\left[\frac{\mu-\lambda}{\mu}\right], \left[\frac{-\lambda+2\mu}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)a\,\mathrm{e}^{x\mu} - \mathrm{e}^{\lambda x}c_1(\mu-\lambda)\right)\mathrm{e}^{-\lambda x}}{(\mu-\lambda)\left(c_1\mathrm{e}^{\lambda x} + c_2\,\mathrm{hypergeom}\left(\left[-\frac{\lambda}{\mu}\right], \left[\frac{\mu-\lambda}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\,\mathrm{hypergeom}\left(\left[\frac{\mu-\lambda}{\mu}\right], \left[\frac{-\lambda+2\mu}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)a\,\mathrm{e}^{(\mu-\lambda)x} + c_3(\mu-\lambda)}{(\mu-\lambda)\left(c_3\mathrm{e}^{\lambda x} + \mathrm{hypergeom}\left(\left[-\frac{\lambda}{\mu}\right], \left[\frac{\mu-\lambda}{\mu}\right], \frac{a\,\mathrm{e}^{x\mu}}{\mu}\right)\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{-\operatorname{hypergeom}\left(\left[\frac{\mu-\lambda}{\mu}\right], \left[\frac{-\lambda+2\mu}{\mu}\right], \frac{a\,e^{x\mu}}{\mu}\right) a\,e^{(\mu-\lambda)x} + c_3(\mu-\lambda)}{(\mu-\lambda)\left(c_3 e^{\lambda x} + \operatorname{hypergeom}\left(\left[-\frac{\lambda}{\mu}\right], \left[\frac{\mu-\lambda}{\mu}\right], \frac{a\,e^{x\mu}}{\mu}\right)\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-\operatorname{hypergeom}\left(\left[\frac{\mu-\lambda}{\mu}\right], \left[\frac{-\lambda+2\mu}{\mu}\right], \frac{a\,e^{x\mu}}{\mu}\right) a\,e^{(\mu-\lambda)x} + c_3(\mu-\lambda)}{(\mu-\lambda)\left(c_3 e^{\lambda x} + \operatorname{hypergeom}\left(\left[-\frac{\lambda}{\mu}\right], \left[\frac{\mu-\lambda}{\mu}\right], \frac{a\,e^{x\mu}}{\mu}\right)\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3. Equations Containing Exponential Functions
Problem number: 15.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,e^{x\mu}y^2 - ab\,e^{x(\lambda+\mu)}y = -b\lambda\,e^{\lambda x}}$$

3.15.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,e^{x\mu}y^2 + ab\,e^{x(\lambda+\mu)}y - b\lambda\,e^{\lambda x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,e^{x\mu}y^2 + ab\,e^{\lambda x}e^{x\mu}y - b\lambda\,e^{\lambda x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -b\lambda\,e^{\lambda x}$, $f_1(x) = e^{x(\lambda+\mu)}ab$ and $f_2(x) = a\,e^{x\mu}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{a\,e^{x\mu}u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - \left(f_2' + f_1 f_2\right) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= a\mu\, e^{x\mu} \\ f_1 f_2 &= e^{x(\lambda+\mu)} a^2 b\, e^{x\mu} \\ f_2^2 f_0 &= -e^{2x\mu} e^{\lambda x} a^2 b \lambda \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$a\, e^{x\mu} u''(x) - \left(a\mu\, e^{x\mu} + e^{x(\lambda+\mu)} a^2 b\, e^{x\mu}\right) u'(x) - e^{2x\mu} e^{\lambda x} a^2 b \lambda u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = {} & 4\left(\mu + \frac{\lambda}{2}\right)^2 e^{\frac{e^{x(\lambda+\mu)} ab - 2(\lambda+\mu)\left(\frac{3\lambda}{2}+\mu\right)x}{2\lambda+2\mu}} c_2 \,\mathrm{WhittakerM}\left(\frac{\lambda+2\mu}{2\lambda+2\mu}, \frac{2\lambda+3\mu}{2\lambda+2\mu}, \frac{ab\, e^{x(\lambda+\mu)}}{\lambda+\mu}\right) \\ & + (\lambda+\mu)\left((\lambda+2\mu)\, e^{\frac{e^{x(\lambda+\mu)} ab - 2(\lambda+\mu)\left(\frac{3\lambda}{2}+\mu\right)x}{2\lambda+2\mu}} \right. \\ & \left. + ba\, e^{\frac{e^{x(\lambda+\mu)} ab - x\lambda(\lambda+\mu)}{2\lambda+2\mu}}\right) c_2 \,\mathrm{WhittakerM}\left(-\frac{\lambda}{2\lambda+2\mu}, \frac{2\lambda+3\mu}{2\lambda+2\mu}, \frac{ab\, e^{x(\lambda+\mu)}}{\lambda+\mu}\right) \\ & + c_1 e^{\frac{ab\, e^{x(\lambda+\mu)}}{\lambda+\mu}} \end{aligned}$$

The above shows that

$$u'(x) = 6\left(-\frac{2\left(\mu+\frac{\lambda}{2}\right)(\lambda+\mu)\,\mathrm{e}^{\frac{\mathrm{e}^{x(\lambda+\mu)}ab-2(\lambda+\mu)\left(\frac{3\lambda}{2}+\mu\right)x}{2\lambda+2\mu}}}{3} + a\,\mathrm{e}^{\frac{\mathrm{e}^{x(\lambda+\mu)}ab-x\lambda(\lambda+\mu)}{2\lambda+2\mu}}b\left(\frac{2\lambda}{3}+\mu\right)\right)\left(\mu+\frac{\lambda}{2}\right)c_2\,\mathrm{WhittakerM}\left(\frac{\lambda+2\mu}{2\lambda+2\mu}, \frac{2\lambda+3\mu}{2\lambda+2\mu}, \frac{ab\,\mathrm{e}^{x(\lambda+\mu)}}{\lambda+\mu}\right) + \left(\left(-\lambda^2-3\lambda\mu-2\mu^2\right)\mathrm{e}^{\frac{\mathrm{e}^{x(\lambda+\mu)}ab-2(\lambda+\mu)\left(\frac{3\lambda}{2}+\mu\right)x}{2\lambda+2\mu}} + \left(a\,\mathrm{e}^{\frac{\mathrm{e}^{x(\lambda+\mu)}ab+2(\lambda+\mu)x\left(\mu+\frac{\lambda}{2}\right)}{2\lambda+2\mu}}b + 2\left(\mu+\frac{\lambda}{2}\right)\mathrm{e}^{\frac{\mathrm{e}^{x(\lambda+\mu)}ab-x\lambda(\lambda+\mu)}{2\lambda+2\mu}}\right)ab\right)(\lambda+\mu)\,c_2\,\mathrm{WhittakerM}\left(-\frac{\lambda}{2\lambda+2\mu}, \frac{2\lambda+3\mu}{2\lambda+2\mu}, \frac{ab\,\mathrm{e}^{x(\lambda+\mu)}}{\lambda+\mu}\right) + 12\,\mathrm{e}^{-\frac{x(3\lambda+2\mu)}{2}}\left(\mu+\frac{\lambda}{2}\right)^2\left(\frac{2\lambda}{3}+\mu\right)c_2\left(\frac{ab\,\mathrm{e}^{x(\lambda+\mu)}}{\lambda+\mu}\right)^{\frac{3\lambda+4\mu}{2\lambda+2\mu}} + abc_1\mathrm{e}^{\frac{\mathrm{e}^{x(\lambda+\mu)}ab+x(\lambda+\mu)^2}{\lambda+\mu}}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(6\left(-\frac{2\left(\mu+\frac{\lambda}{2}\right)(\lambda+\mu)\mathrm{e}^{\frac{\mathrm{e}^{x(\lambda+\mu)}ab-2(\lambda+\mu)\left(\frac{3\lambda}{2}+\mu\right)x}{2\lambda+2\mu}}}{3} + a\,\mathrm{e}^{\frac{\mathrm{e}^{x(\lambda+\mu)}ab-x\lambda(\lambda+\mu)}{2\lambda+2\mu}}b\left(\frac{2\lambda}{3}+\mu\right)\right)\left(\mu+\frac{\lambda}{2}\right)c_2\,\mathrm{WhittakerM}\left(\frac{\lambda+}{2\lambda+}\right.\right.}{a\left(4\left(\mu+\frac{\lambda}{2}\right)^2\mathrm{e}^{\frac{\mathrm{e}^{x(\lambda+}}{}}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\mathrm{e}^{-x\mu}\left(6\left(-\frac{2\left(\mu+\frac{\lambda}{2}\right)(\lambda+\mu)\mathrm{e}^{\frac{\mathrm{e}^{x(\lambda+\mu)}ab-2(\lambda+\mu)\left(\frac{3\lambda}{2}+\mu\right)x}{2\lambda+2\mu}}}{3} + a\,\mathrm{e}^{\frac{\mathrm{e}^{x(\lambda+\mu)}ab-x\lambda(\lambda+\mu)}{2\lambda+2\mu}}b\left(\frac{2\lambda}{3}+\mu\right)\right)\left(\mu+\frac{\lambda}{2}\right)\mathrm{WhittakerM}\left(\right.\right.}{\left(4\left(\mu+\frac{\lambda}{2}\right)^2\mathrm{e}^{\frac{\mathrm{e}^{x(\lambda+\mu)}ab\cdots}{}}\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{e^{-x\mu}\left(6\left(-\frac{2\left(\mu+\frac{\lambda}{2}\right)(\lambda+\mu)e^{\frac{e^{x(\lambda+\mu)}ab-2(\lambda+\mu)\left(\frac{3\lambda}{2}+\mu\right)x}{2\lambda+2\mu}}}{3}+a\,e^{\frac{e^{x(\lambda+\mu)}ab-x\lambda(\lambda+\mu)}{2\lambda+2\mu}}b\left(\frac{2\lambda}{3}+\mu\right)\right)\left(\mu+\frac{\lambda}{2}\right)\mathrm{WhittakerM}\left(\cdots\right.\right.}{\left(4\left(\mu+\frac{\lambda}{2}\right)^{2}e^{\frac{e^{x(\lambda+\mu)}ab\cdots}{\cdots}}\cdots\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{e^{-x\mu}\left(6\left(-\frac{2\left(\mu+\frac{\lambda}{2}\right)(\lambda+\mu)e^{\frac{e^{x(\lambda+\mu)}ab-2(\lambda+\mu)\left(\frac{3\lambda}{2}+\mu\right)x}{2\lambda+2\mu}}}{3}+a\,e^{\frac{e^{x(\lambda+\mu)}ab-x\lambda(\lambda+\mu)}{2\lambda+2\mu}}b\left(\frac{2\lambda}{3}+\mu\right)\right)\left(\mu+\frac{\lambda}{2}\right)\mathrm{WhittakerM}\left(\cdots\right.\right.}{\left(4\left(\mu+\frac{\lambda}{2}\right)^{2}e^{\frac{e^{x(\lambda+\mu)}ab\cdots}{\cdots}}\cdots\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,\mathrm{e}^{kx} y^2 - yb = c\,\mathrm{e}^{sx} + d\,\mathrm{e}^{-kx}}$$

3.16.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,\mathrm{e}^{kx} y^2 + by + c\,\mathrm{e}^{sx} + d\,\mathrm{e}^{-kx} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,\mathrm{e}^{kx} y^2 + by + c\,\mathrm{e}^{sx} + d\,\mathrm{e}^{-kx}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = c\,\mathrm{e}^{sx} + d\,\mathrm{e}^{-kx}$, $f_1(x) = b$ and $f_2(x) = a\,\mathrm{e}^{kx}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{a\,\mathrm{e}^{kx} u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= ak\,e^{kx} \\ f_1f_2 &= ba\,e^{kx} \\ f_2^2f_0 &= a^2e^{2kx}\left(c\,e^{sx} + d\,e^{-kx}\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$a\,e^{kx}u''(x) - \left(ba\,e^{kx} + ak\,e^{kx}\right)u'(x) + a^2e^{2kx}\left(c\,e^{sx} + d\,e^{-kx}\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = e^{\frac{(b+k)x}{2}}\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}}{k+s}, \frac{2\sqrt{c}\,\sqrt{a}\,e^{\frac{x(k+s)}{2}}}{k+s}\right)c_1 + \operatorname{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}}{k+s}, \frac{2\sqrt{c}\,\sqrt{a}\,e^{\frac{x(k+s)}{2}}}{k+s}\right)c_2\right)$$

The above shows that

$$u'(x) = -\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}+k+s}{k+s}, \frac{2\sqrt{c}\,\sqrt{a}\,e^{\frac{x(k+s)}{2}}}{k+s}\right)c_1 + \operatorname{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}+k+s}{k+s}, \frac{2\sqrt{c}\,\sqrt{a}\,e^{\frac{x(k+s)}{2}}}{k+s}\right)c_2\right)\sqrt{a}\,\sqrt{c}\,e^{\frac{x(b+s+2k)}{2}} + \frac{e^{\frac{(b+k)x}{2}}\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}}{k+s}, \frac{2\sqrt{c}\,\sqrt{a}\,e^{\frac{x(k+s)}{2}}}{k+s}\right)c_1 + \operatorname{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}}{k+s}, \frac{2\sqrt{c}\,\sqrt{a}\,e^{\frac{x(k+s)}{2}}}{k+s}\right)c_2\right)(}{2}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}+k+s}{k+s}, \frac{2\sqrt{c}\,\sqrt{a}\,e^{\frac{x(k+s)}{2}}}{k+s}\right)c_1 + \operatorname{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}+k+s}{k+s}, \frac{2\sqrt{c}\,\sqrt{a}\,e^{\frac{x(k+s)}{2}}}{k+s}\right)\right.\right.}{a\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bk+}}{k+s}\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{e^{-\frac{x(3k+b)}{2}} \left(-2\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}+k+s}{k+s}, \frac{2\sqrt{c}\,\sqrt{a}\,e^{\frac{x(k+s)}{2}}}{k+s}\right) c_3 + \operatorname{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}+k+s}{k+s}, \frac{2\sqrt{c}\,\sqrt{\ldots}}{\ldots}\right.\right.\right.}{2a\left(\operatorname{BesselJ}\left(\ldots\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{e^{-\frac{x(3k+b)}{2}} \left(-2\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}+k+s}{k+s}, \frac{2\sqrt{c}\,\sqrt{a}\,e^{\frac{x(k+s)}{2}}}{k+s}\right) c_3 + \operatorname{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}+k+s}{k+s}, \frac{2\sqrt{c}\,\sqrt{\ldots}}{\ldots}\right.\right.\right.}{2a\left(\operatorname{BesselJ}\left(\ldots\right.\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{e^{-\frac{x(3k+b)}{2}} \left(-2\left(\operatorname{BesselJ}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}+k+s}{k+s}, \frac{2\sqrt{c}\,\sqrt{a}\,e^{\frac{x(k+s)}{2}}}{k+s}\right) c_3 + \operatorname{BesselY}\left(\frac{\sqrt{-4ad+b^2+2bk+k^2}+k+s}{k+s}, \frac{2\sqrt{c}\,\sqrt{\ldots}}{\ldots}\right.\right.\right.}{2a\left(\operatorname{BesselJ}\left(\ldots\right.\right.}$$

Verified OK.

Problem number: 17.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$\boxed{y' - a\,\mathrm{e}^{(\mu+2\lambda)x} y^2 - \left(\mathrm{e}^{x(\lambda+\mu)} b - \lambda\right) y = c\,\mathrm{e}^{x\mu}}$$

3.17.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,\mathrm{e}^{(\mu+2\lambda)x} y^2 + \mathrm{e}^{x(\lambda+\mu)} b y + c\,\mathrm{e}^{x\mu} - \lambda y \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,\mathrm{e}^{2\lambda x}\mathrm{e}^{x\mu} y^2 + \mathrm{e}^{\lambda x}\mathrm{e}^{x\mu} b y + c\,\mathrm{e}^{x\mu} - \lambda y$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = c\,\mathrm{e}^{x\mu}$, $f_1(x) = \mathrm{e}^{x(\lambda+\mu)} b - \lambda$ and $f_2(x) = \mathrm{e}^{(\mu+2\lambda)x} a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\mathrm{e}^{(\mu+2\lambda)x} a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - \left(f_2' + f_1 f_2\right) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= (\mu + 2\lambda)\,\mathrm{e}^{(\mu+2\lambda)x} a \\ f_1 f_2 &= \left(\mathrm{e}^{x(\lambda+\mu)} b - \lambda\right) \mathrm{e}^{(\mu+2\lambda)x} a \\ f_2^2 f_0 &= \mathrm{e}^{2(\mu+2\lambda)x} a^2 c\,\mathrm{e}^{x\mu} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\mathrm{e}^{(\mu+2\lambda)x} a u''(x) - \left((\mu + 2\lambda)\,\mathrm{e}^{(\mu+2\lambda)x} a + \left(\mathrm{e}^{x(\lambda+\mu)} b - \lambda\right) \mathrm{e}^{(\mu+2\lambda)x} a\right) u'(x) + \mathrm{e}^{2(\mu+2\lambda)x} a^2 c\,\mathrm{e}^{x\mu} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,\mathrm{e}^{kx} y^2 - yb = c\,\mathrm{e}^{knx} + d\,\mathrm{e}^{k(1+2n)x}}$$

3.18.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,\mathrm{e}^{kx} y^2 + by + c\,\mathrm{e}^{knx} + d\,\mathrm{e}^{k(1+2n)x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,\mathrm{e}^{kx} y^2 + by + c\,\mathrm{e}^{knx} + d\,\mathrm{e}^{2knx}\mathrm{e}^{kx}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = c\,\mathrm{e}^{knx} + d\,\mathrm{e}^{k(1+2n)x}$, $f_1(x) = b$ and $f_2(x) = a\,\mathrm{e}^{kx}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{a\,\mathrm{e}^{kx} u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= ak\,e^{kx} \\ f_1f_2 &= ba\,e^{kx} \\ f_2^2f_0 &= a^2e^{2kx}\left(c\,e^{knx} + d\,e^{k(1+2n)x}\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$a\,e^{kx}u''(x) - \left(ba\,e^{kx} + ak\,e^{kx}\right)u'(x) + a^2e^{2kx}\left(c\,e^{knx} + d\,e^{k(1+2n)x}\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \text{DESol}\left(\left\{e^{2kx(n+1)}\_Y(x)\,ad + e^{kx(n+1)}\_Y(x)\,ac + \_Y''(x) + (-b-k)\_Y'(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\text{DESol}\left(\left\{e^{2kx(n+1)}\_Y(x)\,ad + e^{kx(n+1)}\_Y(x)\,ac + \_Y''(x) + (-b-k)\_Y'(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\text{DESol}\left(\left\{e^{2kx(n+1)}\_Y(x)\,ad + e^{kx(n+1)}\_Y(x)\,ac + \_Y''(x) + (-b-k)\_Y'(x)\right\}, \{\_Y(x)\}\right)\right)e^{-kx}}{a\,\text{DESol}\left(\left\{e^{2kx(n+1)}\_Y(x)\,ad + e^{kx(n+1)}\_Y(x)\,ac + \_Y''(x) + (-b-k)\_Y'(x)\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\text{DESol}\left(\left\{e^{2kx(n+1)}\_Y(x)\,ad + e^{kx(n+1)}\_Y(x)\,ac + \_Y''(x) + (-b-k)\_Y'(x)\right\}, \{\_Y(x)\}\right)\right)e^{-kx}}{a\,\text{DESol}\left(\left\{e^{2kx(n+1)}\_Y(x)\,ad + e^{kx(n+1)}\_Y(x)\,ac + \_Y''(x) + (-b-k)\_Y'(x)\right\}, \{\_Y(x)\}\right)}$$

Summary
The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\mathrm{e}^{2kx(n+1)} \_Y(x)\, ad + \mathrm{e}^{kx(n+1)} \_Y(x)\, ac + \_Y''(x) + (-b-k)\_Y'(x)\right\}, \{\_Y(x)\}\right)\right) \mathrm{e}^{-kx}}{a\, \mathrm{DESol}\left(\left\{\mathrm{e}^{2kx(n+1)} \_Y(x)\, ad + \mathrm{e}^{kx(n+1)} \_Y(x)\, ac + \_Y''(x) + (-b-k)\_Y'(x)\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\mathrm{e}^{2kx(n+1)} \_Y(x)\, ad + \mathrm{e}^{kx(n+1)} \_Y(x)\, ac + \_Y''(x) + (-b-k)\_Y'(x)\right\}, \{\_Y(x)\}\right)\right) \mathrm{e}^{-kx}}{a\, \mathrm{DESol}\left(\left\{\mathrm{e}^{2kx(n+1)} \_Y(x)\, ad + \mathrm{e}^{kx(n+1)} \_Y(x)\, ac + \_Y''(x) + (-b-k)\_Y'(x)\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[[_1st_order, `_with_symmetry_[F(x),G(x)]`], _Riccati]
```

$$\boxed{y' - e^{x\mu}\left(y - b\,e^{\lambda x}\right)^2 = b\lambda\,e^{\lambda x}}$$

3.19.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= e^{x\mu}e^{2\lambda x}b^2 - 2\,e^{\lambda x}e^{x\mu}by + e^{x\mu}y^2 + b\lambda\,e^{\lambda x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = e^{x\mu}e^{2\lambda x}b^2 - 2\,e^{\lambda x}e^{x\mu}by + e^{x\mu}y^2 + b\lambda\,e^{\lambda x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = e^{x\mu}e^{2\lambda x}b^2 + b\lambda\,e^{\lambda x}$, $f_1(x) = -2b\,e^{\lambda x}e^{x\mu}$ and $f_2(x) = e^{x\mu}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{e^{x\mu}u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \mu\,\mathrm{e}^{x\mu} \\ f_1f_2 &= -2b\,\mathrm{e}^{\lambda x}\mathrm{e}^{2x\mu} \\ f_2^2f_0 &= \mathrm{e}^{2x\mu}\left(\mathrm{e}^{x\mu}\mathrm{e}^{2\lambda x}b^2 + b\lambda\,\mathrm{e}^{\lambda x}\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\mathrm{e}^{x\mu}u''(x) - \left(\mu\,\mathrm{e}^{x\mu} - 2b\,\mathrm{e}^{\lambda x}\mathrm{e}^{2x\mu}\right)u'(x) + \mathrm{e}^{2x\mu}\left(\mathrm{e}^{x\mu}\mathrm{e}^{2\lambda x}b^2 + b\lambda\,\mathrm{e}^{\lambda x}\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\frac{-2\,\mathrm{e}^{x(\lambda+\mu)}b + x\mu(\lambda+\mu)}{2\lambda+2\mu}}\left(c_1\sinh\left(\frac{x\mu}{2}\right) + c_2\cosh\left(\frac{x\mu}{2}\right)\right)$$

The above shows that

$$\begin{aligned} u'(x) = -\Bigg(\left(\mathrm{e}^{x(\lambda+\mu)}c_2b - \frac{\mu(c_1+c_2)}{2}\right)\cosh\left(\frac{x\mu}{2}\right) \\ + \left(\mathrm{e}^{x(\lambda+\mu)}bc_1 - \frac{\mu(c_1+c_2)}{2}\right)\sinh\left(\frac{x\mu}{2}\right)\Bigg)\mathrm{e}^{\frac{-2\,\mathrm{e}^{x(\lambda+\mu)}b + x\mu(\lambda+\mu)}{2\lambda+2\mu}} \end{aligned}$$

Using the above in (1) gives the solution

$$y = \frac{\left(\left(\mathrm{e}^{x(\lambda+\mu)}c_2b - \frac{\mu(c_1+c_2)}{2}\right)\cosh\left(\frac{x\mu}{2}\right) + \left(\mathrm{e}^{x(\lambda+\mu)}bc_1 - \frac{\mu(c_1+c_2)}{2}\right)\sinh\left(\frac{x\mu}{2}\right)\right)\mathrm{e}^{-x\mu}}{c_1\sinh\left(\frac{x\mu}{2}\right) + c_2\cosh\left(\frac{x\mu}{2}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\left(\mathrm{e}^{x(\lambda+\mu)}b - \frac{\mu(c_3+1)}{2}\right)\cosh\left(\frac{x\mu}{2}\right) + \left(\mathrm{e}^{x(\lambda+\mu)}bc_3 - \frac{\mu(c_3+1)}{2}\right)\sinh\left(\frac{x\mu}{2}\right)\right)\mathrm{e}^{-x\mu}}{c_3\sinh\left(\frac{x\mu}{2}\right) + \cosh\left(\frac{x\mu}{2}\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(\left(e^{x(\lambda+\mu)}b - \frac{\mu(c_3+1)}{2}\right)\cosh\left(\frac{x\mu}{2}\right) + \left(e^{x(\lambda+\mu)}bc_3 - \frac{\mu(c_3+1)}{2}\right)\sinh\left(\frac{x\mu}{2}\right)\right)e^{-x\mu}}{c_3\sinh\left(\frac{x\mu}{2}\right) + \cosh\left(\frac{x\mu}{2}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\left(e^{x(\lambda+\mu)}b - \frac{\mu(c_3+1)}{2}\right)\cosh\left(\frac{x\mu}{2}\right) + \left(e^{x(\lambda+\mu)}bc_3 - \frac{\mu(c_3+1)}{2}\right)\sinh\left(\frac{x\mu}{2}\right)\right)e^{-x\mu}}{c_3\sinh\left(\frac{x\mu}{2}\right) + \cosh\left(\frac{x\mu}{2}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3. Equations Containing Exponential Functions
Problem number: 20.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{\left(e^{\lambda x} a+b\,e^{x \mu}+c\right) y'-y^{2}-k\,e^{\nu x} y=-m^{2}+k m\,e^{\nu x}}$$

3.20.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}
y' &= F(x,y)\\
&= \frac{y^{2}+k\,e^{\nu x} y-m^{2}+k m\,e^{\nu x}}{e^{\lambda x} a+b\,e^{x \mu}+c}
\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{k m\,e^{\nu x}}{e^{\lambda x} a+b\,e^{x \mu}+c}+\frac{k\,e^{\nu x} y}{e^{\lambda x} a+b\,e^{x \mu}+c}-\frac{m^{2}}{e^{\lambda x} a+b\,e^{x \mu}+c}+\frac{y^{2}}{e^{\lambda x} a+b\,e^{x \mu}+c}$$

With Riccati ODE standard form

$$y' = f_0(x)+ f_1(x)y+f_2(x)y^{2}$$

Shows that $f_0(x)=\frac{-m^{2}+k m\,e^{\nu x}}{e^{\lambda x} a+b\,e^{x \mu}+c}$, $f_1(x)=\frac{k\,e^{\nu x}}{e^{\lambda x} a+b\,e^{x \mu}+c}$ and $f_2(x)=\frac{1}{e^{\lambda x} a+b\,e^{x \mu}+c}$. Let

$$\begin{aligned}
y &= \frac{-u'}{f_2 u}\\
&= \frac{-u'}{\frac{u}{e^{\lambda x} a+b\,e^{x \mu}+c}} \qquad (1)
\end{aligned}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$f_2' = -\frac{a\lambda\,\mathrm{e}^{\lambda x} + b\mu\,\mathrm{e}^{x\mu}}{(\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c)^2}$$
$$f_1f_2 = \frac{k\,\mathrm{e}^{\nu x}}{(\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c)^2}$$
$$f_2^2f_0 = \frac{-m^2 + km\,\mathrm{e}^{\nu x}}{(\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c)^3}$$

Substituting the above terms back in equation (2) gives

$$\frac{u''(x)}{\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c} - \left(-\frac{a\lambda\,\mathrm{e}^{\lambda x} + b\mu\,\mathrm{e}^{x\mu}}{(\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c)^2} + \frac{k\,\mathrm{e}^{\nu x}}{(\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c)^2}\right)u'(x) + \frac{(-m^2 + km\,\mathrm{e}^{\nu x})\,u(x)}{(\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{(2\_Y''(x) + \_Y'(x)\,(\lambda + \mu))\,ab\,\mathrm{e}^{x(\lambda+\mu)} - ka\_Y'(x)\,\mathrm{e}^{x(\lambda+\nu)} - k\_Y'(x)\,b\,\mathrm{e}^{x(\mu+\nu)} + a^2(\_Y'(x)\,\lambda\right.\right.$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{(2\_Y''(x) + \_Y'(x)\,(\lambda + \mu))\,ab\,\mathrm{e}^{x(\lambda+\mu)} - ka\_Y'(x)\,\mathrm{e}^{x(\lambda+\nu)} - k\_Y'(x)\,b\,\mathrm{e}^{x(\mu+\nu)} + a^2(\_Y'(\right.\right.$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(2\_Y''(x)+\_Y'(x)(\lambda+\mu)\right)ab\,\mathrm{e}^{x(\lambda+\mu)}-ka\_Y'(x)\mathrm{e}^{x(\lambda+\nu)}-k\_Y'(x)b\,\mathrm{e}^{x(\mu+\nu)}+a^2\left(\_Y'(x)\lambda+\_Y''(x)\right)\mathrm{e}^{2\lambda x}+}{}\right.\right.\right.}{\mathrm{DESol}\left(\left\{\frac{\left(2\_Y''(x)+\_Y'(x)(\lambda+\mu)\right)ab\,\mathrm{e}^{x(\lambda+\mu)}-ka\_Y'(x)\mathrm{e}^{x(\lambda+\nu)}-k\_Y'(x)b\,\mathrm{e}^{x(\mu+\nu)}+a^2\left(\_Y'(x)\lambda+\_Y''(\right.}{}\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(2\_\_Y''(x)+\_\_Y'(x)(\lambda+\mu)\right)ab\,\mathrm{e}^{x(\lambda+\mu)}-ka\_\_Y'(x)\mathrm{e}^{x(\lambda+\nu)}-k\_\_Y'(x)b\,\mathrm{e}^{x(\mu+\nu)}+a^{2}\left(\_\_Y'(x)\lambda+\_\_Y''(x)\right)\mathrm{e}^{2\lambda x}+ \cdots}{\cdots}\right.\right.\right.}{\mathrm{DESol}\left(\left\{\frac{\left(2\_\_Y''(x)+\_\_Y'(x)(\lambda+\mu)\right)ab\,\mathrm{e}^{x(\lambda+\mu)}-ka\_\_Y'(x)\mathrm{e}^{x(\lambda+\nu)}-k\_\_Y'(x)b\,\mathrm{e}^{x(\mu+\nu)}+a^{2}\left(\_\_Y'(x)\lambda+\_\_Y''(\cdots\right.}{\cdots}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(2\_\_Y''(x)+\_\_Y'(x)(\lambda+\mu)\right)ab\,\mathrm{e}^{x(\lambda+\mu)}-ka\_\_Y'(x)\mathrm{e}^{x(\lambda+\nu)}-k\_\_Y'(x)b\,\mathrm{e}^{x(\mu+\nu)}+a^{2}\left(\_\_Y'(x)\lambda+\_\_Y''(x)\right)\mathrm{e}^{2\lambda x}+ \cdots}{\cdots}\right.\right.\right.}{\mathrm{DESol}\left(\left\{\frac{\left(2\_\_Y''(x)+\_\_Y'(x)(\lambda+\mu)\right)ab\,\mathrm{e}^{x(\lambda+\mu)}-ka\_\_Y'(x)\mathrm{e}^{x(\lambda+\nu)}-k\_\_Y'(x)b\,\mathrm{e}^{x(\mu+\nu)}+a^{2}\left(\_\_Y'(x)\lambda+\_\_Y''(\cdots\right.}{\cdots}\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(2\_\_Y''(x)+\_\_Y'(x)(\lambda+\mu)\right)ab\,\mathrm{e}^{x(\lambda+\mu)}-ka\_\_Y'(x)\mathrm{e}^{x(\lambda+\nu)}-k\_\_Y'(x)b\,\mathrm{e}^{x(\mu+\nu)}+a^{2}\left(\_\_Y'(x)\lambda+\_\_Y''(x)\right)\mathrm{e}^{2\lambda x}+ \cdots}{\cdots}\right.\right.\right.}{\mathrm{DESol}\left(\left\{\frac{\left(2\_\_Y''(x)+\_\_Y'(x)(\lambda+\mu)\right)ab\,\mathrm{e}^{x(\lambda+\mu)}-ka\_\_Y'(x)\mathrm{e}^{x(\lambda+\nu)}-k\_\_Y'(x)b\,\mathrm{e}^{x(\mu+\nu)}+a^{2}\left(\_\_Y'(x)\lambda+\_\_Y''(\cdots\right.}{\cdots}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3. Equations Containing Exponential Functions
Problem number: 21.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{\left(e^{\lambda x} a + b\,e^{x\mu} + c\right)\left(y' - y^2\right) = -a\,\lambda^2 e^{\lambda x} - b\,\mu^2 e^{x\mu}}$$

3.21.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{e^{\lambda x} a\,y^2 - a\,\lambda^2 e^{\lambda x} + b\,e^{x\mu} y^2 - b\,\mu^2 e^{x\mu} + c\,y^2}{e^{\lambda x} a + b\,e^{x\mu} + c} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{a\,\lambda^2 e^{\lambda x}}{e^{\lambda x} a + b\,e^{x\mu} + c} + \frac{e^{\lambda x} a\,y^2}{e^{\lambda x} a + b\,e^{x\mu} + c} - \frac{b\,\mu^2 e^{x\mu}}{e^{\lambda x} a + b\,e^{x\mu} + c} + \frac{b\,e^{x\mu} y^2}{e^{\lambda x} a + b\,e^{x\mu} + c} + \frac{c\,y^2}{e^{\lambda x} a + b\,e^{x\mu} + c}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{-a\,\lambda^2 e^{\lambda x} - b\,\mu^2 e^{x\mu}}{e^{\lambda x} a + b\,e^{x\mu} + c}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2 f_0 &= \frac{-a\,\lambda^2 \mathrm{e}^{\lambda x} - b\,\mu^2 \mathrm{e}^{x\mu}}{\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \frac{\left(-a\,\lambda^2 \mathrm{e}^{\lambda x} - b\,\mu^2 \mathrm{e}^{x\mu}\right) u(x)}{\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\left(\int \frac{1}{\left(\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c\right)^2}dx\right) c_1 + c_2\right) \left(\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c\right)$$

The above shows that

$$u'(x) = \frac{\left((\lambda+\mu)\,\mathrm{e}^{x(\lambda+\mu)}ab + a^2\lambda\,\mathrm{e}^{2\lambda x} + \mathrm{e}^{2x\mu}b^2\mu + c\left(a\lambda\,\mathrm{e}^{\lambda x} + b\mu\,\mathrm{e}^{x\mu}\right)\right) c_1\left(\int \frac{1}{\left(\mathrm{e}^{\lambda x}a+b\,\mathrm{e}^{x\mu}+c\right)^2}dx\right) + abc_2(\lambda+\mu)\,\mathrm{e}^{x(\lambda}}{\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c}$$

Using the above in (1) gives the solution

$$y = -\frac{\left((\lambda+\mu)\,\mathrm{e}^{x(\lambda+\mu)}ab + a^2\lambda\,\mathrm{e}^{2\lambda x} + \mathrm{e}^{2x\mu}b^2\mu + c\left(a\lambda\,\mathrm{e}^{\lambda x} + b\mu\,\mathrm{e}^{x\mu}\right)\right) c_1\left(\int \frac{1}{\left(\mathrm{e}^{\lambda x}a+b\,\mathrm{e}^{x\mu}+c\right)^2}dx\right) + abc_2(\lambda+\mu)\,\mathrm{e}}{\left(\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c\right)^2\left(\left(\int \frac{1}{\left(\mathrm{e}^{\lambda x}a+b\,\mathrm{e}^{x\mu}+c\right)^2}dx\right) c_1 +\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\left((\lambda+\mu)\,\mathrm{e}^{x(\lambda+\mu)}ab + a^2\lambda\,\mathrm{e}^{2\lambda x} + \mathrm{e}^{2x\mu}b^2\mu + c\left(a\lambda\,\mathrm{e}^{\lambda x} + b\mu\,\mathrm{e}^{x\mu}\right)\right) c_3\left(\int \frac{1}{\left(\mathrm{e}^{\lambda x}a+b\,\mathrm{e}^{x\mu}+c\right)^2}dx\right) - (\lambda+\mu)\,\mathrm{e}^{x(\lambda+\mu}}{\left(\mathrm{e}^{\lambda x}a + b\,\mathrm{e}^{x\mu} + c\right)^2\left(\left(\int \frac{1}{\left(\mathrm{e}^{\lambda x}a+b\,\mathrm{e}^{x\mu}+c\right)^2}dx\right) c_3 + 1\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{-\left(\left(\lambda+\mu\right) \mathrm{e}^{x(\lambda+\mu)} a b + a^{2} \lambda \,\mathrm{e}^{2 \lambda x} + \mathrm{e}^{2 x \mu} b^{2} \mu + c \left(a \lambda \,\mathrm{e}^{\lambda x} + b \mu \,\mathrm{e}^{x \mu}\right)\right) c_{3} \left(\int \frac{1}{\left(\mathrm{e}^{\lambda x} a + b \,\mathrm{e}^{x \mu} + c\right)^{2}}d x\right) - \left(\lambda+\mu\right) \mathrm{e}^{x(\lambda+\mu}}{\left(\mathrm{e}^{\lambda x} a + b \,\mathrm{e}^{x \mu} + c\right)^{2} \left(\left(\int \frac{1}{\left(\mathrm{e}^{\lambda x} a + b \,\mathrm{e}^{x \mu} + c\right)^{2}}d x\right) c_{3} + 1\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-\left(\left(\lambda+\mu\right) \mathrm{e}^{x(\lambda+\mu)} a b + a^{2} \lambda \,\mathrm{e}^{2 \lambda x} + \mathrm{e}^{2 x \mu} b^{2} \mu + c \left(a \lambda \,\mathrm{e}^{\lambda x} + b \mu \,\mathrm{e}^{x \mu}\right)\right) c_{3} \left(\int \frac{1}{\left(\mathrm{e}^{\lambda x} a + b \,\mathrm{e}^{x \mu} + c\right)^{2}}d x\right) - \left(\lambda+\mu\right) \mathrm{e}^{x(\lambda+\mu}}{\left(\mathrm{e}^{\lambda x} a + b \,\mathrm{e}^{x \mu} + c\right)^{2} \left(\left(\int \frac{1}{\left(\mathrm{e}^{\lambda x} a + b \,\mathrm{e}^{x \mu} + c\right)^{2}}d x\right) c_{3} + 1\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 - ax\,\mathrm{e}^{\lambda x} y = \mathrm{e}^{\lambda x} a}$$

4.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + \mathrm{e}^{\lambda x} axy + \mathrm{e}^{\lambda x} a \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \mathrm{e}^{\lambda x} axy + \mathrm{e}^{\lambda x} a$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \mathrm{e}^{\lambda x} a$, $f_1(x) = ax\,\mathrm{e}^{\lambda x}$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= ax\, \mathrm{e}^{\lambda x} \\ f_2^2 f_0 &= \mathrm{e}^{\lambda x} a \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - ax\, \mathrm{e}^{\lambda x} u'(x) + \mathrm{e}^{\lambda x} a u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{x \left(c_2 \lambda^2 + \left(\int \frac{\mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}}}{x^2} dx\right) c_1\right)}{\lambda^2}$$

The above shows that

$$u'(x) = \frac{c_2 \lambda^2 x + c_1 \left(\int \frac{\mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}}}{x^2} dx\right) x + \mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}} c_1}{\lambda^2 x}$$

Using the above in (1) gives the solution

$$y = -\frac{c_2 \lambda^2 x + c_1 \left(\int \frac{\mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}}}{x^2} dx\right) x + \mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}} c_1}{x^2 \left(c_2 \lambda^2 + \left(\int \frac{\mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}}}{x^2} dx\right) c_1\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\lambda^2 x - c_3 \left(\int \frac{\mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}}}{x^2} dx\right) x - \mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}} c_3}{x^2 \left(\lambda^2 + \left(\int \frac{\mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}}}{x^2} dx\right) c_3\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{-\lambda^2 x - c_3 \left(\int \frac{\mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}}}{x^2} dx\right) x - \mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}} c_3}{x^2 \left(\lambda^2 + \left(\int \frac{\mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}}}{x^2} dx\right) c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-\lambda^2 x - c_3 \left(\int \frac{\mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}}}{x^2} dx\right) x - \mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}} c_3}{x^2 \left(\lambda^2 + \left(\int \frac{\mathrm{e}^{\frac{(\lambda x-1)\mathrm{e}^{\lambda x} a}{\lambda^2}}}{x^2} dx\right) c_3\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati", "first_order_ode_lie_symmetry_calculated"**

Maple gives the following as the ode type

`[[_1st_order, _with_linear_symmetries], _Riccati]`

$$\boxed{y' - a\,\mathrm{e}^{\lambda x} y^2 = b\,\mathrm{e}^{-\lambda x}}$$

4.2.1 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$\begin{aligned} y' &= \mathrm{e}^{\lambda x} a\,y^2 + b\,\mathrm{e}^{-\lambda x} \\ y' &= \omega(x, y) \end{aligned}$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x + \omega(\eta_y - \xi_x) - \omega^2 \xi_y - \omega_x \xi - \omega_y \eta = 0 \tag{A}$$

The type of this ode is not in the lookup table. To determine ξ, η then (A) is solved using ansatz. Making bivariate polynomials of degree 1 to use as anstaz gives

$$\xi = x a_2 + y a_3 + a_1 \tag{1E}$$

$$\eta = x b_2 + y b_3 + b_1 \tag{2E}$$

Where the unknown coefficients are

$$\{a_1, a_2, a_3, b_1, b_2, b_3\}$$

Substituting equations (1E,2E) and ω into (A) gives

$$b_2 + \left(\mathrm{e}^{\lambda x} a\, y^2 + b\, \mathrm{e}^{-\lambda x}\right)(b_3 - a_2) - \left(\mathrm{e}^{\lambda x} a\, y^2 + b\, \mathrm{e}^{-\lambda x}\right)^2 a_3 - \left(\mathrm{e}^{\lambda x} a\lambda\, y^2 - b\lambda\, \mathrm{e}^{-\lambda x}\right)(x a_2 + y a_3 + a_1) - 2a\, \mathrm{e}^{\lambda x} y(x b_2 + y b_3 + b_1) = 0 \tag{5E}$$

Putting the above in normal form gives

$$-\mathrm{e}^{2\lambda x} a^2 y^4 a_3 - 2\,\mathrm{e}^{\lambda x} \mathrm{e}^{-\lambda x} ab\, y^2 a_3 - \mathrm{e}^{\lambda x} a\lambda x\, y^2 a_2 - \mathrm{e}^{\lambda x} a\lambda\, y^3 a_3 - \mathrm{e}^{\lambda x} a\lambda\, y^2 a_1 - 2\,\mathrm{e}^{\lambda x} axyb_2 - \mathrm{e}^{\lambda x} a\, y^2 a_2 - \mathrm{e}^{\lambda x} a\, y^2 b_3 - \mathrm{e}^{-2\lambda x} b^2 a_3 + \mathrm{e}^{-\lambda x} b\lambda x a_2 + \mathrm{e}^{-\lambda x} b\lambda y a_3 - 2\,\mathrm{e}^{\lambda x} ayb_1 + \mathrm{e}^{-\lambda x} b\lambda a_1 - \mathrm{e}^{-\lambda x} ba_2 + \mathrm{e}^{-\lambda x} bb_3 + b_2 = 0$$

Setting the numerator to zero gives

$$-\mathrm{e}^{2\lambda x} a^2 y^4 a_3 - 2\,\mathrm{e}^{\lambda x} \mathrm{e}^{-\lambda x} ab\, y^2 a_3 - \mathrm{e}^{\lambda x} a\lambda x\, y^2 a_2 - \mathrm{e}^{\lambda x} a\lambda\, y^3 a_3 - \mathrm{e}^{\lambda x} a\lambda\, y^2 a_1 - 2\,\mathrm{e}^{\lambda x} axyb_2 - \mathrm{e}^{\lambda x} a\, y^2 a_2 - \mathrm{e}^{\lambda x} a\, y^2 b_3 - \mathrm{e}^{-2\lambda x} b^2 a_3 + \mathrm{e}^{-\lambda x} b\lambda x a_2 + \mathrm{e}^{-\lambda x} b\lambda y a_3 - 2\,\mathrm{e}^{\lambda x} ayb_1 + \mathrm{e}^{-\lambda x} b\lambda a_1 - \mathrm{e}^{-\lambda x} ba_2 + \mathrm{e}^{-\lambda x} bb_3 + b_2 = 0 \tag{6E}$$

Simplifying the above gives

$$-\mathrm{e}^{2\lambda x} a^2 y^4 a_3 - 2ab\, y^2 a_3 - \mathrm{e}^{\lambda x} a\lambda x\, y^2 a_2 - \mathrm{e}^{\lambda x} a\lambda\, y^3 a_3 - \mathrm{e}^{\lambda x} a\lambda\, y^2 a_1 - 2\,\mathrm{e}^{\lambda x} axyb_2 - \mathrm{e}^{\lambda x} a\, y^2 a_2 - \mathrm{e}^{\lambda x} a\, y^2 b_3 - \mathrm{e}^{-2\lambda x} b^2 a_3 + \mathrm{e}^{-\lambda x} b\lambda x a_2 + \mathrm{e}^{-\lambda x} b\lambda y a_3 - 2\,\mathrm{e}^{\lambda x} ayb_1 + \mathrm{e}^{-\lambda x} b\lambda a_1 - \mathrm{e}^{-\lambda x} ba_2 + \mathrm{e}^{-\lambda x} bb_3 + b_2 = 0 \tag{6E}$$

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\{x, y, \mathrm{e}^{\lambda x}, \mathrm{e}^{-2\lambda x}, \mathrm{e}^{-\lambda x}, \mathrm{e}^{2\lambda x}\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\{x = v_1, y = v_2, \mathrm{e}^{\lambda x} = v_3, \mathrm{e}^{-2\lambda x} = v_4, \mathrm{e}^{-\lambda x} = v_5, \mathrm{e}^{2\lambda x} = v_6\}$$

The above PDE (6E) now becomes

$$\begin{aligned}
&-v_6a^2v_2^4a_3 - v_3a\lambda v_1v_2^2a_2 - v_3a\lambda v_2^3a_3 - v_3a\lambda v_2^2a_1 - 2abv_2^2a_3 \\
&- v_3av_2^2a_2 - 2v_3av_1v_2b_2 - v_3av_2^2b_3 + v_5b\lambda v_1a_2 + v_5b\lambda v_2a_3 \\
&- 2v_3av_2b_1 - v_4b^2a_3 + v_5b\lambda a_1 - v_5ba_2 + v_5bb_3 + b_2 = 0
\end{aligned} \tag{7E}$$

Collecting the above on the terms v_i introduced, and these are

$$\{v_1, v_2, v_3, v_4, v_5, v_6\}$$

Equation (7E) now becomes

$$\begin{aligned}
&-v_3a\lambda v_1v_2^2a_2 - 2v_3av_1v_2b_2 + v_5b\lambda v_1a_2 - v_6a^2v_2^4a_3 - v_3a\lambda v_2^3a_3 \\
&+ (-a\lambda a_1 - aa_2 - ab_3)\, v_2^2v_3 - 2abv_2^2a_3 - 2v_3av_2b_1 \\
&+ v_5b\lambda v_2a_3 - v_4b^2a_3 + (b\lambda a_1 - ba_2 + bb_3)\, v_5 + b_2 = 0
\end{aligned} \tag{8E}$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$\begin{aligned}
b_2 &= 0 \\
b\lambda a_2 &= 0 \\
\lambda a_3 b &= 0 \\
-2ab_1 &= 0 \\
-2ab_2 &= 0 \\
-b^2a_3 &= 0 \\
-a_3a^2 &= 0 \\
-a\lambda a_2 &= 0 \\
-\lambda a_3 a &= 0 \\
-2a_3ab &= 0 \\
-a\lambda a_1 - aa_2 - ab_3 &= 0 \\
b\lambda a_1 - ba_2 + bb_3 &= 0
\end{aligned}$$

Solving the above equations for the unknowns gives

$$\begin{aligned}
a_1 &= a_1 \\
a_2 &= 0 \\
a_3 &= 0 \\
b_1 &= 0 \\
b_2 &= 0 \\
b_3 &= -\lambda a_1
\end{aligned}$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$\xi = 1$$
$$\eta = -\lambda y$$

Shifting is now applied to make $\xi = 0$ in order to simplify the rest of the computation

$$\begin{aligned}\eta &= \eta - \omega(x,y)\,\xi \\ &= -\lambda y - \left(\mathrm{e}^{\lambda x} a\, y^2 + b\,\mathrm{e}^{-\lambda x}\right)(1) \\ &= -\mathrm{e}^{\lambda x} a\, y^2 - \lambda y - b\,\mathrm{e}^{-\lambda x} \\ \xi &= 0\end{aligned}$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x,y) \to (R,S)$ where (R,S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}$$

The above comes from the requirements that $\left(\xi \frac{\partial}{\partial x} + \eta \frac{\partial}{\partial y}\right) S(x,y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$R = x$$

S is found from

$$\begin{aligned}S &= \int \frac{1}{\eta} dy \\ &= \int \frac{1}{-\mathrm{e}^{\lambda x} a\, y^2 - \lambda y - b\,\mathrm{e}^{-\lambda x}} dy\end{aligned}$$

Which results in

$$S = -\frac{2\,\mathrm{e}^{\lambda x} \arctan\left(\frac{2\,\mathrm{e}^{2\lambda x} a y + \lambda\,\mathrm{e}^{\lambda x}}{\sqrt{4\,\mathrm{e}^{2\lambda x} a b - \mathrm{e}^{2\lambda x} \lambda^2}}\right)}{\sqrt{4\,\mathrm{e}^{2\lambda x} a b - \mathrm{e}^{2\lambda x} \lambda^2}}$$

Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$\frac{dS}{dR} = \frac{S_x + \omega(x,y) S_y}{R_x + \omega(x,y) R_y} \tag{2}$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x,y)$ is the right hand side of the original ode given by

$$\omega(x,y) = e^{\lambda x} a\, y^2 + b\, e^{-\lambda x}$$

Evaluating all the partial derivatives gives

$$\begin{aligned} R_x &= 1 \\ R_y &= 0 \\ S_x &= -\frac{e^{\lambda x} \lambda y}{e^{2\lambda x} a\, y^2 + e^{\lambda x} \lambda y + b} \\ S_y &= -\frac{e^{\lambda x}}{e^{2\lambda x} a\, y^2 + e^{\lambda x} \lambda y + b} \end{aligned}$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$\frac{dS}{dR} = -1 \tag{2A}$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$\frac{dS}{dR} = -1$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = -R + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$-\frac{2\arctan\left(\frac{2a\, e^{\lambda x} y + \lambda}{\sqrt{4ab - \lambda^2}}\right)}{\sqrt{4ab - \lambda^2}} = c_1 - x$$

Which simplifies to

$$-\frac{2\arctan\left(\frac{2a\, e^{\lambda x} y + \lambda}{\sqrt{4ab - \lambda^2}}\right)}{\sqrt{4ab - \lambda^2}} = c_1 - x$$

Which gives

$$y = -\frac{\left(\tan\left(\frac{c_1\sqrt{4ab-\lambda^2}}{2} - \frac{x\sqrt{4ab-\lambda^2}}{2}\right)\sqrt{4ab-\lambda^2}+\lambda\right)\mathrm{e}^{-\lambda x}}{2a}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\tan\left(\frac{c_1\sqrt{4ab-\lambda^2}}{2} - \frac{x\sqrt{4ab-\lambda^2}}{2}\right)\sqrt{4ab-\lambda^2}+\lambda\right)\mathrm{e}^{-\lambda x}}{2a} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\tan\left(\frac{c_1\sqrt{4ab-\lambda^2}}{2} - \frac{x\sqrt{4ab-\lambda^2}}{2}\right)\sqrt{4ab-\lambda^2}+\lambda\right)\mathrm{e}^{-\lambda x}}{2a}$$

Verified OK.

4.2.2 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \mathrm{e}^{\lambda x} a\, y^2 + b\,\mathrm{e}^{-\lambda x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \mathrm{e}^{\lambda x} a\, y^2 + b\,\mathrm{e}^{-\lambda x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\,\mathrm{e}^{-\lambda x}$, $f_1(x) = 0$ and $f_2(x) = \mathrm{e}^{\lambda x} a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\mathrm{e}^{\lambda x} a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= a\lambda\,\mathrm{e}^{\lambda x} \\
f_1 f_2 &= 0 \\
f_2^2 f_0 &= \mathrm{e}^{2\lambda x} a^2 b\,\mathrm{e}^{-\lambda x}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\mathrm{e}^{\lambda x} a u''(x) - a\lambda\,\mathrm{e}^{\lambda x} u'(x) + \mathrm{e}^{2\lambda x} a^2 b\,\mathrm{e}^{-\lambda x} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \mathrm{e}^{\frac{\left(\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}} + c_2 \mathrm{e}^{-\frac{\left(-\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}$$

The above shows that

$$u'(x) = \frac{c_2\left(\lambda - \sqrt{-4ab+\lambda^2}\right)\mathrm{e}^{-\frac{\left(-\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}}{2} + \frac{c_1 \mathrm{e}^{\frac{\left(\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}\left(\lambda+\sqrt{-4ab+\lambda^2}\right)}{2}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{c_2\left(\lambda-\sqrt{-4ab+\lambda^2}\right)\mathrm{e}^{-\frac{\left(-\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}}{2} + \frac{c_1\mathrm{e}^{\frac{\left(\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}\left(\lambda+\sqrt{-4ab+\lambda^2}\right)}{2}\right)\mathrm{e}^{-\lambda x}}{a\left(c_1\mathrm{e}^{\frac{\left(\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}} + c_2\mathrm{e}^{-\frac{\left(-\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\left(\lambda-\sqrt{-4ab+\lambda^2}\right)\mathrm{e}^{-\frac{\left(-\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}} + c_3\mathrm{e}^{\frac{\left(\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}\left(\lambda+\sqrt{-4ab+\lambda^2}\right)\right)\mathrm{e}^{-\lambda x}}{2a\left(c_3\mathrm{e}^{\frac{\left(\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}} + \mathrm{e}^{-\frac{\left(-\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}\right)}$$

<u>Summary</u>

The solution(s) found are the following

$$y = -\frac{\left(\left(\lambda-\sqrt{-4ab+\lambda^2}\right)\mathrm{e}^{-\frac{\left(-\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}} + c_3\mathrm{e}^{\frac{\left(\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}\left(\lambda+\sqrt{-4ab+\lambda^2}\right)\right)\mathrm{e}^{-\lambda x}}{2a\left(c_3\mathrm{e}^{\frac{\left(\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}} + \mathrm{e}^{-\frac{\left(-\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\left(\lambda-\sqrt{-4ab+\lambda^2}\right)\mathrm{e}^{-\frac{\left(-\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}+c_3\mathrm{e}^{\frac{\left(\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}\left(\lambda+\sqrt{-4ab+\lambda^2}\right)\right)\mathrm{e}^{-\lambda x}}{2a\left(c_3\mathrm{e}^{\frac{\left(\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}+\mathrm{e}^{-\frac{\left(-\lambda+\sqrt{-4ab+\lambda^2}\right)x}{2}}\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,\mathrm{e}^{\lambda x} y^2 = b\,x^{n-1} n - a\,b^2 \mathrm{e}^{\lambda x} x^{2n}}$$

4.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \mathrm{e}^{\lambda x} a\,y^2 + b\,x^{n-1} n - a\,b^2 \mathrm{e}^{\lambda x} x^{2n} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a\,b^2 \mathrm{e}^{\lambda x} x^{2n} + \mathrm{e}^{\lambda x} a\,y^2 + \frac{b\,x^n n}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\,x^{n-1} n - a\,b^2 \mathrm{e}^{\lambda x} x^{2n}$, $f_1(x) = 0$ and $f_2(x) = \mathrm{e}^{\lambda x} a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\mathrm{e}^{\lambda x} a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= a\lambda\,\mathrm{e}^{\lambda x} \\ f_1f_2 &= 0 \\ f_2^2f_0 &= \mathrm{e}^{2\lambda x}a^2\left(b\,x^{n-1}n - a\,b^2\mathrm{e}^{\lambda x}x^{2n}\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\mathrm{e}^{\lambda x}au''(x) - a\lambda\,\mathrm{e}^{\lambda x}u'(x) + \mathrm{e}^{2\lambda x}a^2\left(b\,x^{n-1}n - a\,b^2\mathrm{e}^{\lambda x}x^{2n}\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{-x^{2n}\mathrm{e}^{2\lambda x}\_Y(x)\,a^2b^2 + \mathrm{e}^{\lambda x}x^{n-1}\_Y(x)\,abn - \_Y'(x)\,\lambda + \_Y''(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{-x^{2n}\mathrm{e}^{2\lambda x}\_Y(x)\,a^2b^2 + \mathrm{e}^{\lambda x}x^{n-1}\_Y(x)\,abn - \_Y'(x)\,\lambda + \_Y''(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{-x^{2n}\mathrm{e}^{2\lambda x}\_Y(x)\,a^2b^2 + \mathrm{e}^{\lambda x}x^{n-1}\_Y(x)\,abn - \_Y'(x)\,\lambda + \_Y''(x)\right\}, \{\_Y(x)\}\right)\right)\mathrm{e}^{-\lambda x}}{a\,\mathrm{DESol}\left(\left\{-x^{2n}\mathrm{e}^{2\lambda x}\_Y(x)\,a^2b^2 + \mathrm{e}^{\lambda x}x^{n-1}\_Y(x)\,abn - \_Y'(x)\,\lambda + \_Y''(x)\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{-x^{2n}\mathrm{e}^{2\lambda x}\_Y(x)\,a^2b^2 + \mathrm{e}^{\lambda x}x^{n-1}\_Y(x)\,abn - \_Y'(x)\,\lambda + \_Y''(x)\right\}, \{\_Y(x)\}\right)\right)\mathrm{e}^{-\lambda x}}{a\,\mathrm{DESol}\left(\left\{-x^{2n}\mathrm{e}^{2\lambda x}\_Y(x)\,a^2b^2 + \mathrm{e}^{\lambda x}x^{n-1}\_Y(x)\,abn - \_Y'(x)\,\lambda + \_Y''(x)\right\}, \{\_Y(x)\}\right)}$$

Summary
The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{-x^{2n}\mathrm{e}^{2\lambda x}\_Y(x)\,a^2b^2+\mathrm{e}^{\lambda x}x^{n-1}\_Y(x)\,abn-\_Y'(x)\,\lambda+\_Y''(x)\right\},\{\_Y(x)\}\right)\right)\mathrm{e}^{-\lambda x}}{a\operatorname{DESol}\left(\left\{-x^{2n}\mathrm{e}^{2\lambda x}\_Y(x)\,a^2b^2+\mathrm{e}^{\lambda x}x^{n-1}\_Y(x)\,abn-\_Y'(x)\,\lambda+\_Y''(x)\right\},\{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{-x^{2n}\mathrm{e}^{2\lambda x}\_Y(x)\,a^2b^2+\mathrm{e}^{\lambda x}x^{n-1}\_Y(x)\,abn-\_Y'(x)\,\lambda+\_Y''(x)\right\},\{\_Y(x)\}\right)\right)\mathrm{e}^{-\lambda x}}{a\operatorname{DESol}\left(\left\{-x^{2n}\mathrm{e}^{2\lambda x}\_Y(x)\,a^2b^2+\mathrm{e}^{\lambda x}x^{n-1}\_Y(x)\,abn-\_Y'(x)\,\lambda+\_Y''(x)\right\},\{\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3-2. Equations with power and exponential functions
Problem number: 25.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \mathrm{e}^{\lambda x} y^2 - a\, x^n y = a\lambda\, x^n \mathrm{e}^{-\lambda x}}$$

4.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \mathrm{e}^{\lambda x} y^2 + a\, x^n y + a\lambda\, x^n \mathrm{e}^{-\lambda x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \mathrm{e}^{\lambda x} y^2 + a\, x^n y + a\lambda\, x^n \mathrm{e}^{-\lambda x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\lambda\, x^n \mathrm{e}^{-\lambda x}$, $f_1(x) = x^n a$ and $f_2(x) = \mathrm{e}^{\lambda x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\mathrm{e}^{\lambda x} u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \lambda\, \mathrm{e}^{\lambda x} \\ f_1 f_2 &= \mathrm{e}^{\lambda x} x^n a \\ f_2^2 f_0 &= \mathrm{e}^{2\lambda x} a\lambda\, x^n \mathrm{e}^{-\lambda x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\mathrm{e}^{\lambda x} u''(x) - \left(\mathrm{e}^{\lambda x} x^n a + \lambda\, \mathrm{e}^{\lambda x}\right) u'(x) + \mathrm{e}^{2\lambda x} a\lambda\, x^n \mathrm{e}^{-\lambda x} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\int \frac{\left(\int \mathrm{e}^{\frac{a\, x^{n+1} - \lambda x(n+1)}{n+1}} dx\right)\lambda - c_1 \lambda + \mathrm{e}^{\frac{a\, x^{n+1} - \lambda x(n+1)}{n+1}}}{\int \mathrm{e}^{\frac{x(x^n a - \lambda(n+1))}{n+1}} dx - c_1} dx} c_2$$

The above shows that

$u'(x)$

$$= \frac{c_2 \left(\left(\int \mathrm{e}^{\frac{x(x^n a - \lambda(n+1))}{n+1}} dx\right)\lambda - c_1\lambda + \mathrm{e}^{\frac{x(x^n a - \lambda(n+1))}{n+1}}\right) \mathrm{e}^{\int \frac{\left(\int \mathrm{e}^{\frac{x(x^n a - \lambda(n+1))}{n+1}} dx\right)\lambda - c_1 \lambda + \mathrm{e}^{\frac{x(x^n a - \lambda(n+1))}{n+1}}}{\int \mathrm{e}^{\frac{x(x^n a - \lambda(n+1))}{n+1}} dx - c_1} dx}}{\int \mathrm{e}^{\frac{x(x^n a - \lambda(n+1))}{n+1}} dx - c_1}$$

Using the above in (1) gives the solution

$y =$

$$-\frac{\left(\left(\int \mathrm{e}^{\frac{x(x^n a - \lambda(n+1))}{n+1}} dx\right)\lambda - c_1\lambda + \mathrm{e}^{\frac{x(x^n a - \lambda(n+1))}{n+1}}\right) \mathrm{e}^{\int \frac{\left(\int \mathrm{e}^{\frac{x(x^n a - \lambda(n+1))}{n+1}} dx\right)\lambda - c_1 \lambda + \mathrm{e}^{\frac{x(x^n a - \lambda(n+1))}{n+1}}}{\int \mathrm{e}^{\frac{x(x^n a - \lambda(n+1))}{n+1}} dx - c_1} dx} \mathrm{e}^{-\lambda x} \mathrm{e}^{\int - \frac{\int \lambda\, \mathrm{e}^{\frac{a\, x}{}}}{}}}{\int \mathrm{e}^{\frac{x(x^n a - \lambda(n+1))}{n+1}} dx - c_1}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{e^{-\lambda x} \left(\left(\int e^{\frac{a\,x^{n+1}-\lambda x(n+1)}{n+1}} dx \right) \lambda - \lambda c_3 + e^{\frac{a\,x^{n+1}-\lambda x(n+1)}{n+1}} \right)}{\int e^{\frac{x(x^n a-\lambda(n+1))}{n+1}} dx - c_3}$$

Summary

The solution(s) found are the following

$$y = -\frac{e^{-\lambda x} \left(\left(\int e^{\frac{a\,x^{n+1}-\lambda x(n+1)}{n+1}} dx \right) \lambda - \lambda c_3 + e^{\frac{a\,x^{n+1}-\lambda x(n+1)}{n+1}} \right)}{\int e^{\frac{x(x^n a-\lambda(n+1))}{n+1}} dx - c_3} \tag{1}$$

Verification of solutions

$$y = -\frac{e^{-\lambda x} \left(\left(\int e^{\frac{a\,x^{n+1}-\lambda x(n+1)}{n+1}} dx \right) \lambda - \lambda c_3 + e^{\frac{a\,x^{n+1}-\lambda x(n+1)}{n+1}} \right)}{\int e^{\frac{x(x^n a-\lambda(n+1))}{n+1}} dx - c_3}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + e^{\lambda x} y^2 \lambda - a\, x^n y\, e^{\lambda x} = -x^n a}$$

4.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\lambda\, e^{\lambda x} y^2 + a\, x^n y\, e^{\lambda x} - x^n a \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\lambda\, e^{\lambda x} y^2 + a\, x^n y\, e^{\lambda x} - x^n a$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -x^n a$, $f_1(x) = e^{\lambda x} x^n a$ and $f_2(x) = -\lambda\, e^{\lambda x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{-\lambda\, e^{\lambda x} u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\mathrm{e}^{\lambda x}\lambda^2 \\ f_1f_2 &= -\mathrm{e}^{2\lambda x}x^n a\lambda \\ f_2^2f_0 &= -\mathrm{e}^{2\lambda x}x^n a\,\lambda^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$-\lambda\,\mathrm{e}^{\lambda x}u''(x) - \left(-\mathrm{e}^{2\lambda x}x^n a\lambda - \mathrm{e}^{\lambda x}\lambda^2\right)u'(x) - \mathrm{e}^{2\lambda x}x^n a\,\lambda^2 u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{\mathrm{e}^{\lambda x}\left(\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}x^n dx\right)}dx\right)c_2 + c_1\lambda\right)}{\lambda}$$

The above shows that

$$u'(x) = \frac{\mathrm{e}^{\lambda x}\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}x^n dx\right)}dx\right)c_2\lambda + \mathrm{e}^{\lambda x}c_1\lambda^2 + c_2\mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x}x^n dx\right)}}{\lambda}$$

Using the above in (1) gives the solution

$$y = \frac{\left(\mathrm{e}^{\lambda x}\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}x^n dx\right)}dx\right)c_2\lambda + \mathrm{e}^{\lambda x}c_1\lambda^2 + c_2\mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x}x^n dx\right)}\right)\mathrm{e}^{-2\lambda x}}{\lambda\left(\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}x^n dx\right)}dx\right)c_2 + c_1\lambda\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\mathrm{e}^{\lambda x}\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}x^n dx\right)}dx\right)\lambda + \mathrm{e}^{\lambda x}c_3\lambda^2 + \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x}x^n dx\right)}\right)\mathrm{e}^{-2\lambda x}}{\lambda\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}x^n dx\right)}dx + \lambda c_3\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(\mathrm{e}^{\lambda x}\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}x^n dx\right)}dx\right)\lambda + \mathrm{e}^{\lambda x}c_3\lambda^2 + \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x}x^n dx\right)}\right)\mathrm{e}^{-2\lambda x}}{\lambda\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}x^n dx\right)}dx + \lambda c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(e^{\lambda x}\left(\int e^{-\lambda x+a\left(\int e^{\lambda x}x^n dx\right)}dx\right)\lambda + e^{\lambda x}c_3\lambda^2 + e^{a\left(\int e^{\lambda x}x^n dx\right)}\right)e^{-2\lambda x}}{\lambda\left(\int e^{-\lambda x+a\left(\int e^{\lambda x}x^n dx\right)}dx + \lambda c_3\right)}$$

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3-2. Equations with power and exponential functions
Problem number: 27.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - a\,\mathrm{e}^{\lambda x} y^2 + ab\,x^n \mathrm{e}^{\lambda x} y = b\,x^{n-1} n}$$

4.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \mathrm{e}^{\lambda x} a\,y^2 - ab\,x^n \mathrm{e}^{\lambda x} y + b\,x^{n-1} n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \mathrm{e}^{\lambda x} a\,y^2 - ab\,x^n \mathrm{e}^{\lambda x} y + \frac{b\,x^n n}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\,x^{n-1} n$, $f_1(x) = -ab\,x^n \mathrm{e}^{\lambda x}$ and $f_2(x) = \mathrm{e}^{\lambda x} a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\mathrm{e}^{\lambda x} a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$f_2' = a\lambda \,\mathrm{e}^{\lambda x}$$
$$f_1 f_2 = -a^2 b\, x^n \mathrm{e}^{2\lambda x}$$
$$f_2^2 f_0 = \mathrm{e}^{2\lambda x} a^2 b\, x^{n-1} n$$

Substituting the above terms back in equation (2) gives

$$\mathrm{e}^{\lambda x} a u''(x) - \left(-a^2 b\, x^n \mathrm{e}^{2\lambda x} + a\lambda\,\mathrm{e}^{\lambda x}\right) u'(x) + \mathrm{e}^{2\lambda x} a^2 b\, x^{n-1} n u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{-ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} \left(c_1 + \left(\int \mathrm{e}^{\lambda x + ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} dx\right) \lambda c_2\right)$$

The above shows that

$$u'(x) = -ab\, x^n \mathrm{e}^{\lambda x - ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} \left(c_1 + \left(\int \mathrm{e}^{\lambda x + ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} dx\right) \lambda c_2\right) + c_2 \lambda\,\mathrm{e}^{\lambda x}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-ab\, x^n \mathrm{e}^{\lambda x - ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} \left(c_1 + \left(\int \mathrm{e}^{\lambda x + ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} dx\right) \lambda c_2\right) + c_2 \lambda\,\mathrm{e}^{\lambda x}\right) \mathrm{e}^{-\lambda x} \mathrm{e}^{\int ab\, x^n \mathrm{e}^{\lambda x} dx}}{a \left(c_1 + \left(\int \mathrm{e}^{\lambda x + ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} dx\right) \lambda c_2\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\mathrm{e}^{-\lambda x + ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} \left(ab\, x^n \mathrm{e}^{\lambda x - ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} \left(c_3 + \lambda\left(\int \mathrm{e}^{\lambda x + ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} dx\right)\right) - \lambda\,\mathrm{e}^{\lambda x}\right)}{a \left(c_3 + \lambda \left(\int \mathrm{e}^{\lambda x + ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} dx\right)\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{\mathrm{e}^{-\lambda x + ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} \left(ab\, x^n \mathrm{e}^{\lambda x - ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} \left(c_3 + \lambda\left(\int \mathrm{e}^{\lambda x + ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} dx\right)\right) - \lambda\,\mathrm{e}^{\lambda x}\right)}{a \left(c_3 + \lambda \left(\int \mathrm{e}^{\lambda x + ab\left(\int \mathrm{e}^{\lambda x} x^n dx\right)} dx\right)\right)} \tag{1}$$

Verification of solutions

$$y = \frac{e^{-\lambda x+ab\left(\int e^{\lambda x} x^n dx\right)} \left(ab\, x^n e^{\lambda x-ab\left(\int e^{\lambda x} x^n dx\right)} \left(c_3 + \lambda\left(\int e^{\lambda x+ab\left(\int e^{\lambda x} x^n dx\right)} dx\right)\right) - \lambda\, e^{\lambda x}\right)}{a\left(c_3 + \lambda\left(\int e^{\lambda x+ab\left(\int e^{\lambda x} x^n dx\right)} dx\right)\right)}$$

Verified OK.

```
[_Riccati]
```

$$\boxed{y' - a\,x^n y^2 = b\lambda\,\mathrm{e}^{\lambda x} - a\,b^2 x^n \mathrm{e}^{2\lambda x}}$$

4.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,x^n y^2 + b\lambda\,\mathrm{e}^{\lambda x} - a\,b^2 x^n \mathrm{e}^{2\lambda x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,x^n y^2 + b\lambda\,\mathrm{e}^{\lambda x} - a\,b^2 x^n \mathrm{e}^{2\lambda x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\lambda\,\mathrm{e}^{\lambda x} - a\,b^2 x^n \mathrm{e}^{2\lambda x}$, $f_1(x) = 0$ and $f_2(x) = x^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{x^n a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{x^n na}{x} \\
f_1f_2 &= 0 \\
f_2^2f_0 &= x^{2n}a^2\left(b\lambda\,\mathrm{e}^{\lambda x} - a\,b^2x^n\mathrm{e}^{2\lambda x}\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^n au''(x) - \frac{x^n nau'(x)}{x} + x^{2n}a^2\left(b\lambda\,\mathrm{e}^{\lambda x} - a\,b^2x^n\mathrm{e}^{2\lambda x}\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{-x^{1+2n}\mathrm{e}^{2\lambda x}\_Y(x)\,a^2b^2 + \mathrm{e}^{\lambda x}x^{n+1}\_Y(x)\,ab\lambda + \_Y''(x)\,x - n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-x^{1+2n}\mathrm{e}^{2\lambda x}\_Y(x)\,a^2b^2 + \mathrm{e}^{\lambda x}x^{n+1}\_Y(x)\,ab\lambda + \_Y''(x)\,x - n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-x^{1+2n}\mathrm{e}^{2\lambda x}\_Y(x)a^2b^2+\mathrm{e}^{\lambda x}x^{n+1}\_Y(x)ab\lambda+\_Y''(x)x-n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)\right)x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{-x^{1+2n}\mathrm{e}^{2\lambda x}\_Y(x)a^2b^2+\mathrm{e}^{\lambda x}x^{n+1}\_Y(x)ab\lambda+\_Y''(x)x-n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-x^{1+2n}\mathrm{e}^{2\lambda x}\_Y(x)a^2b^2+\mathrm{e}^{\lambda x}x^{n+1}\_Y(x)ab\lambda+\_Y''(x)x-n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)\right)x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{-x^{1+2n}\mathrm{e}^{2\lambda x}\_Y(x)a^2b^2+\mathrm{e}^{\lambda x}x^{n+1}\_Y(x)ab\lambda+\_Y''(x)x-n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)}$$

Summary
The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{-x^{1+2n}\mathrm{e}^{2\lambda x}\_Y(x)a^2b^2+\mathrm{e}^{\lambda x}x^{n+1}\_Y(x)ab\lambda+\_Y''(x)x-n\_Y'(x)}{x}\right\},\{\_Y(x)\}\right)\right)x^{-n}}{a\operatorname{DESol}\left(\left\{\frac{-x^{1+2n}\mathrm{e}^{2\lambda x}\_Y(x)a^2b^2+\mathrm{e}^{\lambda x}x^{n+1}\_Y(x)ab\lambda+\_Y''(x)x-n\_Y'(x)}{x}\right\},\{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{-x^{1+2n}\mathrm{e}^{2\lambda x}\_Y(x)a^2b^2+\mathrm{e}^{\lambda x}x^{n+1}\_Y(x)ab\lambda+\_Y''(x)x-n\_Y'(x)}{x}\right\},\{\_Y(x)\}\right)\right)x^{-n}}{a\operatorname{DESol}\left(\left\{\frac{-x^{1+2n}\mathrm{e}^{2\lambda x}\_Y(x)a^2b^2+\mathrm{e}^{\lambda x}x^{n+1}\_Y(x)ab\lambda+\_Y''(x)x-n\_Y'(x)}{x}\right\},\{\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3-2. Equations with power and exponential functions
Problem number: 29.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,x^n y^2 - \lambda y = -a\,b^2 x^n \mathrm{e}^{2\lambda x}}$$

4.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,x^n y^2 + \lambda y - a\,b^2 x^n \mathrm{e}^{2\lambda x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,x^n y^2 + \lambda y - a\,b^2 x^n \mathrm{e}^{2\lambda x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a\,b^2 x^n \mathrm{e}^{2\lambda x}$, $f_1(x) = \lambda$ and $f_2(x) = x^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{x^n a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{x^n na}{x} \\ f_1f_2 &= \lambda a\,x^n \\ f_2^2f_0 &= -x^{3n}a^3b^2\mathrm{e}^{2\lambda x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^n au''(x) - \left(\frac{x^n na}{x} + \lambda a\,x^n\right)u'(x) - x^{3n}a^3b^2\mathrm{e}^{2\lambda x}u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = &-c_1\sinh\left(\frac{x^n ab\big((\Gamma(n,-\lambda x)\,n - \Gamma(n+1))\,(-\lambda x)^{-n} + \mathrm{e}^{\lambda x}\big)}{\lambda}\right) \\ &+ c_2\cosh\left(\frac{x^n ab\big((\Gamma(n,-\lambda x)\,n - \Gamma(n+1))\,(-\lambda x)^{-n} + \mathrm{e}^{\lambda x}\big)}{\lambda}\right) \end{aligned}$$

The above shows that

$$\begin{aligned} u'(x) = ab\,x^n\mathrm{e}^{\lambda x}\Bigg(&c_2\sinh\left(\frac{x^n ab\big((\Gamma(n,-\lambda x)\,n - \Gamma(n+1))\,(-\lambda x)^{-n} + \mathrm{e}^{\lambda x}\big)}{\lambda}\right) \\ &- c_1\cosh\left(\frac{x^n ab\big((\Gamma(n,-\lambda x)\,n - \Gamma(n+1))\,(-\lambda x)^{-n} + \mathrm{e}^{\lambda x}\big)}{\lambda}\right)\Bigg) \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{b\,\mathrm{e}^{\lambda x}\left(c_2\sinh\left(\frac{x^n ab\left((\Gamma(n,-\lambda x)n-\Gamma(n+1))(-\lambda x)^{-n}+\mathrm{e}^{\lambda x}\right)}{\lambda}\right) - c_1\cosh\left(\frac{x^n ab\left((\Gamma(n,-\lambda x)n-\Gamma(n+1))(-\lambda x)^{-n}+\mathrm{e}^{\lambda x}\right)}{\lambda}\right)\right)}{-c_1\sinh\left(\frac{x^n ab\left((\Gamma(n,-\lambda x)n-\Gamma(n+1))(-\lambda x)^{-n}+\mathrm{e}^{\lambda x}\right)}{\lambda}\right) + c_2\cosh\left(\frac{x^n ab\left((\Gamma(n,-\lambda x)n-\Gamma(n+1))(-\lambda x)^{-n}+\mathrm{e}^{\lambda x}\right)}{\lambda}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{b\,e^{\lambda x}\left(\sinh\left(\frac{(-\lambda x)^{-n} x^n a b\left(e^{\lambda x}(-\lambda x)^n+\Gamma(n,-\lambda x)n-\Gamma(n+1)\right)}{\lambda}\right)-c_3\cosh\left(\frac{(-\lambda x)^{-n} x^n a b\left(e^{\lambda x}(-\lambda x)^n+\Gamma(n,-\lambda x)n-\Gamma(n+1)\right)}{\lambda}\right)\right)}{c_3\sinh\left(\frac{(-\lambda x)^{-n} x^n a b\left(e^{\lambda x}(-\lambda x)^n+\Gamma(n,-\lambda x)n-\Gamma(n+1)\right)}{\lambda}\right)-\cosh\left(\frac{(-\lambda x)^{-n} x^n a b\left(e^{\lambda x}(-\lambda x)^n+\Gamma(n,-\lambda x)n-\Gamma(n+1)\right)}{\lambda}\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{b\,e^{\lambda x}\left(\sinh\left(\frac{(-\lambda x)^{-n} x^n a b\left(e^{\lambda x}(-\lambda x)^n+\Gamma(n,-\lambda x)n-\Gamma(n+1)\right)}{\lambda}\right)-c_3\cosh\left(\frac{(-\lambda x)^{-n} x^n a b\left(e^{\lambda x}(-\lambda x)^n+\Gamma(n,-\lambda x)n-\Gamma(n+1)\right)}{\lambda}\right)\right)}{c_3\sinh\left(\frac{(-\lambda x)^{-n} x^n a b\left(e^{\lambda x}(-\lambda x)^n+\Gamma(n,-\lambda x)n-\Gamma(n+1)\right)}{\lambda}\right)-\cosh\left(\frac{(-\lambda x)^{-n} x^n a b\left(e^{\lambda x}(-\lambda x)^n+\Gamma(n,-\lambda x)n-\Gamma(n+1)\right)}{\lambda}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{b\,e^{\lambda x}\left(\sinh\left(\frac{(-\lambda x)^{-n} x^n a b\left(e^{\lambda x}(-\lambda x)^n+\Gamma(n,-\lambda x)n-\Gamma(n+1)\right)}{\lambda}\right)-c_3\cosh\left(\frac{(-\lambda x)^{-n} x^n a b\left(e^{\lambda x}(-\lambda x)^n+\Gamma(n,-\lambda x)n-\Gamma(n+1)\right)}{\lambda}\right)\right)}{c_3\sinh\left(\frac{(-\lambda x)^{-n} x^n a b\left(e^{\lambda x}(-\lambda x)^n+\Gamma(n,-\lambda x)n-\Gamma(n+1)\right)}{\lambda}\right)-\cosh\left(\frac{(-\lambda x)^{-n} x^n a b\left(e^{\lambda x}(-\lambda x)^n+\Gamma(n,-\lambda x)n-\Gamma(n+1)\right)}{\lambda}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3-2. Equations with power and exponential functions
Problem number: 30.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,x^n y^2 + ab\,x^n \mathrm{e}^{\lambda x} y = b\lambda\,\mathrm{e}^{\lambda x}}$$

4.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,x^n y^2 - ab\,x^n \mathrm{e}^{\lambda x} y + b\lambda\,\mathrm{e}^{\lambda x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,x^n y^2 - ab\,x^n \mathrm{e}^{\lambda x} y + b\lambda\,\mathrm{e}^{\lambda x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\lambda\,\mathrm{e}^{\lambda x}$, $f_1(x) = -ab\,x^n \mathrm{e}^{\lambda x}$ and $f_2(x) = x^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{x^n a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{x^n na}{x} \\ f_1f_2 &= -a^2b\,x^{2n}\mathrm{e}^{\lambda x} \\ f_2^2f_0 &= \mathrm{e}^{\lambda x}x^{2n}a^2b\lambda \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^n au''(x) - \left(-a^2b\,x^{2n}\mathrm{e}^{\lambda x} + \frac{x^n na}{x}\right)u'(x) + \mathrm{e}^{\lambda x}x^{2n}a^2b\lambda u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{ab\,\mathrm{e}^{\lambda x}(\lambda\_Y(x) + \_Y'(x))\,x^{n+1} + \_Y''(x)\,x - n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{ab\,\mathrm{e}^{\lambda x}(\lambda\_Y(x) + \_Y'(x))\,x^{n+1} + \_Y''(x)\,x - n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{ab\,\mathrm{e}^{\lambda x}(\lambda\_Y(x)+\_Y'(x))x^{n+1}+\_Y''(x)x-n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)\right)x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{ab\,\mathrm{e}^{\lambda x}(\lambda\_Y(x)+\_Y'(x))x^{n+1}+\_Y''(x)x-n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{ab\,\mathrm{e}^{\lambda x}(\lambda\_Y(x)+\_Y'(x))x^{n+1}+\_Y''(x)x-n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)\right)x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{ab\,\mathrm{e}^{\lambda x}(\lambda\_Y(x)+\_Y'(x))x^{n+1}+\_Y''(x)x-n\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)}$$

Summary
The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{a b\,\mathrm{e}^{\lambda x}\left(\lambda \_\_Y(x)+\_\_Y'(x)\right)x^{n+1}+\_\_Y''(x)x-n\_\_Y'(x)}{x}\right\},\{\_\_Y(x)\}\right)\right)x^{-n}}{a\operatorname{DESol}\left(\left\{\frac{a b\,\mathrm{e}^{\lambda x}\left(\lambda \_\_Y(x)+\_\_Y'(x)\right)x^{n+1}+\_\_Y''(x)x-n\_\_Y'(x)}{x}\right\},\{\_\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{a b\,\mathrm{e}^{\lambda x}\left(\lambda \_\_Y(x)+\_\_Y'(x)\right)x^{n+1}+\_\_Y''(x)x-n\_\_Y'(x)}{x}\right\},\{\_\_Y(x)\}\right)\right)x^{-n}}{a\operatorname{DESol}\left(\left\{\frac{a b\,\mathrm{e}^{\lambda x}\left(\lambda \_\_Y(x)+\_\_Y'(x)\right)x^{n+1}+\_\_Y''(x)x-n\_\_Y'(x)}{x}\right\},\{\_\_Y(x)\}\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + (k+1)\,x^k y^2 - a\,x^{k+1} \mathrm{e}^{\lambda x} y = -\mathrm{e}^{\lambda x} a}$$

4.10.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -x^k y^2 k + a\,x^{k+1} \mathrm{e}^{\lambda x} y - x^k y^2 - \mathrm{e}^{\lambda x} a \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -x^k y^2 k + a\,x^k x\,\mathrm{e}^{\lambda x} y - x^k y^2 - \mathrm{e}^{\lambda x} a$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\mathrm{e}^{\lambda x} a$, $f_1(x) = x^{k+1} \mathrm{e}^{\lambda x} a$ and $f_2(x) = -x^k k - x^k$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{(-x^k k - x^k)\,u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$f_2' = -\frac{k^2x^k}{x} - \frac{k\,x^k}{x}$$
$$f_1f_2 = x^{k+1}\mathrm{e}^{\lambda x}a\left(-x^kk - x^k\right)$$
$$f_2^2f_0 = -\left(-x^kk - x^k\right)^2\mathrm{e}^{\lambda x}a$$

Substituting the above terms back in equation (2) gives

$$\left(-x^kk - x^k\right)u''(x) - \left(-\frac{k^2x^k}{x} - \frac{k\,x^k}{x} + x^{k+1}\mathrm{e}^{\lambda x}a\left(-x^kk - x^k\right)\right)u'(x) - \left(-x^kk - x^k\right)^2\mathrm{e}^{\lambda x}au(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{k+1}\left(\left(\int x^{-2k-2}\mathrm{e}^{\int\left(x^{k+1}\mathrm{e}^{\lambda x}a+\frac{k}{x}\right)dx}dx\right)c_2 + c_1\right)$$

The above shows that

$$u'(x) = c_2x^{-k-1}\mathrm{e}^{\int\frac{a\,x^{k+2}\mathrm{e}^{\lambda x}+k}{x}dx} + x^k(k+1)\left(\left(\int \mathrm{e}^{\int\frac{a\,x^{k+2}\mathrm{e}^{\lambda x}+k}{x}dx}x^{-2k-2}dx\right)c_2 + c_1\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(c_2x^{-k-1}\mathrm{e}^{\int\frac{a\,x^{k+2}\mathrm{e}^{\lambda x}+k}{x}dx} + x^k(k+1)\left(\left(\int \mathrm{e}^{\int\frac{a\,x^{k+2}\mathrm{e}^{\lambda x}+k}{x}dx}x^{-2k-2}dx\right)c_2 + c_1\right)\right)x^{-k-1}}{\left(-x^kk - x^k\right)\left(\left(\int x^{-2k-2}\mathrm{e}^{\int\left(x^{k+1}\mathrm{e}^{\lambda x}a+\frac{k}{x}\right)dx}dx\right)c_2 + c_1\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{(k+1)\left(\int x^{-2k-2}\mathrm{e}^{\int\left(x^{k+1}\mathrm{e}^{\lambda x}a+\frac{k}{x}\right)dx}dx + c_3\right)x^{-k-1} + x^{-3k-2}\mathrm{e}^{\int\left(x^{k+1}\mathrm{e}^{\lambda x}a+\frac{k}{x}\right)dx}}{(k+1)\left(\int \mathrm{e}^{\int\frac{a\,x^{k+2}\mathrm{e}^{\lambda x}+k}{x}dx}x^{-2k-2}dx + c_3\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{(k+1)\left(\int x^{-2k-2} e^{\int \left(x^{k+1} e^{\lambda x} a+\frac{k}{x}\right)dx} dx + c_3\right) x^{-k-1} + x^{-3k-2} e^{\int \left(x^{k+1} e^{\lambda x} a+\frac{k}{x}\right)dx}}{(k+1)\left(\int e^{\int \frac{a\,x^{k+2} e^{\lambda x}+k}{x} dx} x^{-2k-2} dx + c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{(k+1)\left(\int x^{-2k-2} e^{\int \left(x^{k+1} e^{\lambda x} a+\frac{k}{x}\right)dx} dx + c_3\right) x^{-k-1} + x^{-3k-2} e^{\int \left(x^{k+1} e^{\lambda x} a+\frac{k}{x}\right)dx}}{(k+1)\left(\int e^{\int \frac{a\,x^{k+2} e^{\lambda x}+k}{x} dx} x^{-2k-2} dx + c_3\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3-2. Equations with power and exponential functions
Problem number: 32.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,x^n y^2 + a\,x^n \left(b\,\mathrm{e}^{\lambda x} + c\right) y = c\,x^n}$$

4.11.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -ab\,x^n \mathrm{e}^{\lambda x} y - x^n a c y + a\,x^n y^2 + c\,x^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -ab\,x^n \mathrm{e}^{\lambda x} y - x^n a c y + a\,x^n y^2 + c\,x^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = c\,x^n$, $f_1(x) = -ab\,x^n \mathrm{e}^{\lambda x} - x^n a c$ and $f_2(x) = x^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{x^n a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{x^n na}{x} \\ f_1f_2 &= \left(-ab\,x^n\mathrm{e}^{\lambda x} - x^n ac\right)x^n a \\ f_2^2f_0 &= x^{3n}a^2c \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^n au''(x) - \left(\left(-ab\,x^n\mathrm{e}^{\lambda x} - x^n ac\right)x^n a + \frac{x^n na}{x}\right)u'(x) + x^{3n}a^2cu(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{ac\,x^{1+2n}\_Y(x) + \_Y''(x)\,x + \_Y'(x)\left(x^{n+1}\left(b\,\mathrm{e}^{\lambda x}+c\right)a - n\right)}{x}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{ac\,x^{1+2n}\_Y(x) + \_Y''(x)\,x + \_Y'(x)\left(x^{n+1}\left(b\,\mathrm{e}^{\lambda x}+c\right)a - n\right)}{x}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{ac\,x^{1+2n}\_Y(x)+\_Y''(x)x+\_Y'(x)\left(x^{n+1}\left(b\,\mathrm{e}^{\lambda x}+c\right)a-n\right)}{x}\right\}, \{\_Y(x)\}\right)\right)x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{ac\,x^{1+2n}\_Y(x)+\_Y''(x)x+\_Y'(x)\left(x^{n+1}\left(b\,\mathrm{e}^{\lambda x}+c\right)a-n\right)}{x}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{ac\,x^{1+2n}\_Y(x)+\_Y''(x)x+\_Y'(x)\left(x^{n+1}\left(b\,\mathrm{e}^{\lambda x}+c\right)a-n\right)}{x}\right\}, \{\_Y(x)\}\right)\right)x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{ac\,x^{1+2n}\_Y(x)+\_Y''(x)x+\_Y'(x)\left(x^{n+1}\left(b\,\mathrm{e}^{\lambda x}+c\right)a-n\right)}{x}\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{a c\, x^{1+2n} \_\_Y(x)+\_\_Y''(x) x+\_\_Y'(x)\left(x^{n+1}\left(b\,\mathrm{e}^{\lambda x}+c\right) a-n\right)}{x}\right\}, \{\_\_Y(x)\}\right)\right) x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{a c\, x^{1+2n} \_\_Y(x)+\_\_Y''(x) x+\_\_Y'(x)\left(x^{n+1}\left(b\,\mathrm{e}^{\lambda x}+c\right) a-n\right)}{x}\right\}, \{\_\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{a c\, x^{1+2n} \_\_Y(x)+\_\_Y''(x) x+\_\_Y'(x)\left(x^{n+1}\left(b\,\mathrm{e}^{\lambda x}+c\right) a-n\right)}{x}\right\}, \{\_\_Y(x)\}\right)\right) x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{a c\, x^{1+2n} \_\_Y(x)+\_\_Y''(x) x+\_\_Y'(x)\left(x^{n+1}\left(b\,\mathrm{e}^{\lambda x}+c\right) a-n\right)}{x}\right\}, \{\_\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3-2. Equations with power and exponential functions
Problem number: 33.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - a\,x^n \mathrm{e}^{2\lambda x} y^2 - \left(b\,x^n \mathrm{e}^{\lambda x} - \lambda\right) y = c\,x^n}$$

4.12.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,x^n \mathrm{e}^{2\lambda x} y^2 + x^n \mathrm{e}^{\lambda x} b y + c\,x^n - \lambda y \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,x^n \mathrm{e}^{2\lambda x} y^2 + x^n \mathrm{e}^{\lambda x} b y + c\,x^n - \lambda y$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = c\,x^n$, $f_1(x) = b\,x^n \mathrm{e}^{\lambda x} - \lambda$ and $f_2(x) = x^n \mathrm{e}^{2\lambda x} a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{x^n \mathrm{e}^{2\lambda x} a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{x^n n\, e^{2\lambda x} a}{x} + 2\, e^{2\lambda x} x^n a \lambda \\ f_1 f_2 &= \left(b\, x^n e^{\lambda x} - \lambda\right) x^n e^{2\lambda x} a \\ f_2^2 f_0 &= x^{3n} e^{4\lambda x} a^2 c \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^n e^{2\lambda x} a u''(x) - \left(\frac{x^n n\, e^{2\lambda x} a}{x} + 2\, e^{2\lambda x} x^n a \lambda + \left(b\, x^n e^{\lambda x} - \lambda\right) x^n e^{2\lambda x} a\right) u'(x) + x^{3n} e^{4\lambda x} a^2 c u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = e^{-\frac{\int \left(\tan\left(\frac{\sqrt{4a\, b^2 c - b^4}\, \left(\Gamma(n, -\lambda x) x^n b (-\lambda x)^{-n} n - x^n (-\lambda x)^{-n} \Gamma(n+1) b + b\, x^n e^{\lambda x} + c_1 \lambda\right)}{2 b^2 \lambda}\right) \sqrt{4a\, b^2 c - b^4} - b^2\right) x^n e^{\lambda x} dx}{2b}} c_2$$

The above shows that

$$u'(x) = -\frac{c_2 x^n e^{\lambda x - \frac{\int \left(\tan\left(\frac{\sqrt{4a\, b^2 c - b^4}\, \left(\Gamma(n, -\lambda x) x^n b (-\lambda x)^{-n} n - x^n (-\lambda x)^{-n} \Gamma(n+1) b + b\, x^n e^{\lambda x} + c_1 \lambda\right)}{2 b^2 \lambda}\right) \sqrt{4a\, b^2 c - b^4} - b^2\right) x^n e^{\lambda x} dx}{2b}} \left(\tan\left(\frac{\sqrt{4a\, b^2 c - b^4}}{}\right.\right.}{2b}$$

Using the above in (1) gives the solution

$$y = \frac{e^{\lambda x - \frac{\int \left(\tan\left(\frac{\sqrt{4a\, b^2 c - b^4}\, \left(\Gamma(n, -\lambda x) x^n b (-\lambda x)^{-n} n - x^n (-\lambda x)^{-n} \Gamma(n+1) b + b\, x^n e^{\lambda x} + c_1 \lambda\right)}{2 b^2 \lambda}\right) \sqrt{4a\, b^2 c - b^4} - b^2\right) x^n e^{\lambda x} dx}{2b}} \left(\tan\left(\frac{\sqrt{4a\, b^2 c - b^4}\, \left(\Gamma(n, -\lambda\right.}{}\right.\right.}{}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{e^{-\lambda x} \left(\tan\left(\frac{\sqrt{4a\,b^2c-b^4}\,\left(\Gamma(n,-\lambda x)x^n b(-\lambda x)^{-n}n-x^n(-\lambda x)^{-n}\Gamma(n+1)b+b\,x^n e^{\lambda x}+\lambda c_3\right)}{2b^2\lambda}\right)\sqrt{4a\,b^2c-b^4}-b^2\right)}{2ab}$$

Summary

The solution(s) found are the following

$$y = \frac{e^{-\lambda x} \left(\tan\left(\frac{\sqrt{4a\,b^2c-b^4}\,\left(\Gamma(n,-\lambda x)x^n b(-\lambda x)^{-n}n-x^n(-\lambda x)^{-n}\Gamma(n+1)b+b\,x^n e^{\lambda x}+\lambda c_3\right)}{2b^2\lambda}\right)\sqrt{4a\,b^2c-b^4}-b^2\right)}{2ab} \tag{1}$$

Verification of solutions

$$y = \frac{e^{-\lambda x} \left(\tan\left(\frac{\sqrt{4a\,b^2c-b^4}\,\left(\Gamma(n,-\lambda x)x^n b(-\lambda x)^{-n}n-x^n(-\lambda x)^{-n}\Gamma(n+1)b+b\,x^n e^{\lambda x}+\lambda c_3\right)}{2b^2\lambda}\right)\sqrt{4a\,b^2c-b^4}-b^2\right)}{2ab}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[[_1st_order, `_with_symmetry_[F(x),G(x)]`], _Riccati]
```

$$\boxed{y' - a\,\mathrm{e}^{\lambda x}(y - b\,x^n - c)^2 = b\,x^{n-1}n}$$

4.13.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,b^2\mathrm{e}^{\lambda x}x^{2n} + 2x^n\mathrm{e}^{\lambda x}abc - 2ab\,x^n\mathrm{e}^{\lambda x}y + \mathrm{e}^{\lambda x}a\,c^2 - 2\,\mathrm{e}^{\lambda x}acy + \mathrm{e}^{\lambda x}a\,y^2 + b\,x^{n-1}n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,b^2\mathrm{e}^{\lambda x}x^{2n} + 2x^n\mathrm{e}^{\lambda x}abc - 2ab\,x^n\mathrm{e}^{\lambda x}y + \mathrm{e}^{\lambda x}a\,c^2 - 2\,\mathrm{e}^{\lambda x}acy + \mathrm{e}^{\lambda x}a\,y^2 + \frac{b\,x^n n}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\,b^2\mathrm{e}^{\lambda x}x^{2n} + 2x^n\mathrm{e}^{\lambda x}abc + \mathrm{e}^{\lambda x}a\,c^2 + b\,x^{n-1}n$, $f_1(x) = -2ab\,x^n\mathrm{e}^{\lambda x} - 2\,\mathrm{e}^{\lambda x}ac$ and $f_2(x) = \mathrm{e}^{\lambda x}a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\mathrm{e}^{\lambda x}au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= a\lambda\, e^{\lambda x} \\ f_1 f_2 &= \left(-2ab\, x^n e^{\lambda x} - 2\, e^{\lambda x} ac\right) e^{\lambda x} a \\ f_2^2 f_0 &= e^{2\lambda x} a^2 \left(a\, b^2 e^{\lambda x} x^{2n} + 2x^n e^{\lambda x} abc + e^{\lambda x} a\, c^2 + b\, x^{n-1} n\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$e^{\lambda x} a u''(x) - \left(a\lambda\, e^{\lambda x} + \left(-2ab\, x^n e^{\lambda x} - 2\, e^{\lambda x} ac\right) e^{\lambda x} a\right) u'(x) + e^{2\lambda x} a^2 \left(a\, b^2 e^{\lambda x} x^{2n} + 2x^n e^{\lambda x} abc + e^{\lambda x} a\, c^2 + b\, x$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = e^{-\frac{\left(\int \left(2a\left(b\, x^n + c\right) e^{\lambda x} - \lambda\right) dx\right)}{2}} \left(c_1 \sinh\left(\frac{\lambda x}{2}\right) + c_2 \cosh\left(\frac{\lambda x}{2}\right)\right)$$

The above shows that

$$\begin{aligned} u'(x) = -\Bigg(&\left(a c_2 (b\, x^n + c)\, e^{\lambda x} - \frac{\lambda(c_1 + c_2)}{2}\right) \cosh\left(\frac{\lambda x}{2}\right) \\ &+ \sinh\left(\frac{\lambda x}{2}\right) \left(a c_1 (b\, x^n + c)\, e^{\lambda x} - \frac{\lambda(c_1 + c_2)}{2}\right)\Bigg)\, e^{-\frac{\left(\int \left(2a\left(b\, x^n + c\right) e^{\lambda x} - \lambda\right) dx\right)}{2}} \end{aligned}$$

Using the above in (1) gives the solution

$$y = \frac{\left(\left(a c_2 (b\, x^n + c)\, e^{\lambda x} - \frac{\lambda(c_1 + c_2)}{2}\right) \cosh\left(\frac{\lambda x}{2}\right) + \sinh\left(\frac{\lambda x}{2}\right) \left(a c_1 (b\, x^n + c)\, e^{\lambda x} - \frac{\lambda(c_1 + c_2)}{2}\right)\right) e^{-\lambda x}}{a \left(c_1 \sinh\left(\frac{\lambda x}{2}\right) + c_2 \cosh\left(\frac{\lambda x}{2}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-\lambda(c_3 + 1)\, e^{-\lambda x} + 2(b\, x^n + c)\, a\right) \cosh\left(\frac{\lambda x}{2}\right) + 2\left(-\frac{\lambda(c_3+1) e^{-\lambda x}}{2} + (b\, x^n + c)\, c_3 a\right) \sinh\left(\frac{\lambda x}{2}\right)}{2\left(c_3 \sinh\left(\frac{\lambda x}{2}\right) + \cosh\left(\frac{\lambda x}{2}\right)\right) a}$$

Summary
The solution(s) found are the following

$$
y = \frac{\left(-\lambda (c_3+1)\,\mathrm{e}^{-\lambda x}+2(b\,x^{n}+c)\,a\right)\cosh\left(\frac{\lambda x}{2}\right)+2\left(-\frac{\lambda (c_3+1)\,\mathrm{e}^{-\lambda x}}{2}+(b\,x^{n}+c)\,c_3 a\right)\sinh\left(\frac{\lambda x}{2}\right)}{2\left(c_3\sinh\left(\frac{\lambda x}{2}\right)+\cosh\left(\frac{\lambda x}{2}\right)\right)a} \tag{1}
$$

Verification of solutions

$$
y = \frac{\left(-\lambda (c_3+1)\,\mathrm{e}^{-\lambda x}+2(b\,x^{n}+c)\,a\right)\cosh\left(\frac{\lambda x}{2}\right)+2\left(-\frac{\lambda (c_3+1)\,\mathrm{e}^{-\lambda x}}{2}+(b\,x^{n}+c)\,c_3 a\right)\sinh\left(\frac{\lambda x}{2}\right)}{2\left(c_3\sinh\left(\frac{\lambda x}{2}\right)+\cosh\left(\frac{\lambda x}{2}\right)\right)a}
$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3-2. Equations with power and exponential functions
Problem number: 35.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y'x - a\,\mathrm{e}^{\lambda x} y^2 - ky = a\,b^2 x^{2k} \mathrm{e}^{\lambda x}}$$

4.14.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \frac{\mathrm{e}^{\lambda x} a\,y^2 + ky + a\,b^2 x^{2k} \mathrm{e}^{\lambda x}}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,b^2 x^{2k} \mathrm{e}^{\lambda x}}{x} + \frac{\mathrm{e}^{\lambda x} a\,y^2}{x} + \frac{ky}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{a\,b^2 x^{2k} \mathrm{e}^{\lambda x}}{x}$, $f_1(x) = \frac{k}{x}$ and $f_2(x) = \frac{a\,\mathrm{e}^{\lambda x}}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{a\,\mathrm{e}^{\lambda x} u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{a\,\mathrm{e}^{\lambda x}}{x^2} + \frac{a\lambda\,\mathrm{e}^{\lambda x}}{x} \\
f_1 f_2 &= \frac{ka\,\mathrm{e}^{\lambda x}}{x^2} \\
f_2^2 f_0 &= \frac{a^3 \mathrm{e}^{3\lambda x} b^2 x^{2k}}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a\,\mathrm{e}^{\lambda x} u''(x)}{x} - \left(-\frac{a\,\mathrm{e}^{\lambda x}}{x^2} + \frac{a\lambda\,\mathrm{e}^{\lambda x}}{x} + \frac{ka\,\mathrm{e}^{\lambda x}}{x^2}\right) u'(x) + \frac{a^3 \mathrm{e}^{3\lambda x} b^2 x^{2k} u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) = c_1 \sin &\left(ab\, x^k (-\lambda x)^{-k} \left(\Gamma(k) - \Gamma(k, -\lambda x)\right)\right) \\
&+ c_2 \cos \left(ab\, x^k (-\lambda x)^{-k} \left(\Gamma(k) - \Gamma(k, -\lambda x)\right)\right)
\end{aligned}$$

The above shows that

$$\begin{aligned}
u'(x) = \Big(c_1 \cos &\left(ab\, x^k (-\lambda x)^{-k} \left(\Gamma(k) - \Gamma(k, -\lambda x)\right)\right) \\
&- c_2 \sin \left(ab\, x^k (-\lambda x)^{-k} \left(\Gamma(k) - \Gamma(k, -\lambda x)\right)\right)\Big)\, ab\, x^{k-1} \mathrm{e}^{\lambda x}
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(c_1 \cos \left(ab\, x^k (-\lambda x)^{-k} \left(\Gamma(k) - \Gamma(k, -\lambda x)\right)\right) - c_2 \sin \left(ab\, x^k (-\lambda x)^{-k} \left(\Gamma(k) - \Gamma(k, -\lambda x)\right)\right)\right) b\, x^{k-1} x}{c_1 \sin \left(ab\, x^k \left(-\lambda x\right)^{-k} \left(\Gamma\left(k\right) - \Gamma\left(k, -\lambda x\right)\right)\right) + c_2 \cos \left(ab\, x^k \left(-\lambda x\right)^{-k} \left(\Gamma\left(k\right) - \Gamma\left(k, -\lambda x\right)\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{b\,x^{k}\left(-c_3 \cos\left(ab\,x^{k}(-\lambda x)^{-k} \left(\Gamma(k)-\Gamma(k,-\lambda x)\right)\right)+\sin\left(ab\,x^{k}(-\lambda x)^{-k} \left(\Gamma(k)-\Gamma(k,-\lambda x)\right)\right)\right)}{c_3 \sin\left(ab\,x^{k}\left(-\lambda x\right)^{-k} \left(\Gamma\left(k\right)-\Gamma\left(k,-\lambda x\right)\right)\right)+\cos\left(ab\,x^{k}\left(-\lambda x\right)^{-k} \left(\Gamma\left(k\right)-\Gamma\left(k,-\lambda x\right)\right)\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{b\,x^{k}\left(-c_3 \cos\left(ab\,x^{k}(-\lambda x)^{-k} \left(\Gamma(k)-\Gamma(k,-\lambda x)\right)\right)+\sin\left(ab\,x^{k}(-\lambda x)^{-k} \left(\Gamma(k)-\Gamma(k,-\lambda x)\right)\right)\right)}{c_3 \sin\left(ab\,x^{k}\left(-\lambda x\right)^{-k} \left(\Gamma\left(k\right)-\Gamma\left(k,-\lambda x\right)\right)\right)+\cos\left(ab\,x^{k}\left(-\lambda x\right)^{-k} \left(\Gamma\left(k\right)-\Gamma\left(k,-\lambda x\right)\right)\right)} \tag{1}$$

Verification of solutions

$$y = \frac{b\,x^{k}\left(-c_3 \cos\left(ab\,x^{k}(-\lambda x)^{-k} \left(\Gamma(k)-\Gamma(k,-\lambda x)\right)\right)+\sin\left(ab\,x^{k}(-\lambda x)^{-k} \left(\Gamma(k)-\Gamma(k,-\lambda x)\right)\right)\right)}{c_3 \sin\left(ab\,x^{k}\left(-\lambda x\right)^{-k} \left(\Gamma\left(k\right)-\Gamma\left(k,-\lambda x\right)\right)\right)+\cos\left(ab\,x^{k}\left(-\lambda x\right)^{-k} \left(\Gamma\left(k\right)-\Gamma\left(k,-\lambda x\right)\right)\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3-2. Equations with power and exponential functions
Problem number: 36.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - a\,x^{2n}\mathrm{e}^{\lambda x}y^2 - \left(b\,x^n\mathrm{e}^{\lambda x} - n\right)y = \mathrm{e}^{\lambda x}c}$$

4.15.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^{2n}\mathrm{e}^{\lambda x}y^2 + x^n\mathrm{e}^{\lambda x}by + \mathrm{e}^{\lambda x}c - ny}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,x^{2n}\mathrm{e}^{\lambda x}y^2}{x} + \frac{\mathrm{e}^{\lambda x}x^n by}{x} + \frac{\mathrm{e}^{\lambda x}c}{x} - \frac{ny}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{\mathrm{e}^{\lambda x}c}{x}$, $f_1(x) = \frac{b\,x^n\mathrm{e}^{\lambda x}-n}{x}$ and $f_2(x) = \frac{x^{2n}\mathrm{e}^{\lambda x}a}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{x^{2n}\mathrm{e}^{\lambda x}au}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$f_2' = \frac{2x^{2n} n\, e^{\lambda x} a}{x^2} + \frac{x^{2n} \lambda\, e^{\lambda x} a}{x} - \frac{e^{\lambda x} a\, x^{2n}}{x^2}$$
$$f_1 f_2 = \frac{(b\, x^n e^{\lambda x} - n)\, x^{2n} e^{\lambda x} a}{x^2}$$
$$f_2^2 f_0 = \frac{x^{4n} e^{3\lambda x} a^2 c}{x^3}$$

Substituting the above terms back in equation (2) gives

$$\frac{x^{2n} e^{\lambda x} a u''(x)}{x} - \left(\frac{2x^{2n} n\, e^{\lambda x} a}{x^2} + \frac{x^{2n} \lambda\, e^{\lambda x} a}{x} - \frac{e^{\lambda x} a\, x^{2n}}{x^2} + \frac{(b\, x^n e^{\lambda x} - n)\, x^{2n} e^{\lambda x} a}{x^2}\right) u'(x) + \frac{x^{4n} e^{3\lambda x} a^2 c u(x)}{x^3} =$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(c_1 \operatorname{BesselJ}\left(\frac{\sqrt{3}\sqrt{-ca}}{8b}, \frac{\sqrt{3}\sqrt{2}\sqrt{ca\, x^{2n}}\, x^{-n}}{8b}\right) + c_2 \operatorname{BesselY}\left(\frac{\sqrt{3}\sqrt{-ca}}{8b}, \frac{\sqrt{3}\sqrt{2}\sqrt{ca\, x^{2n}}\, x^{-n}}{8b}\right)\right) e^{\frac{\left(\int \left(\frac{b\, x^n e^{\lambda x}}{x} + \lambda + \frac{3n}{x}\right) dx\right)}{2}}$$

The above shows that

$$u'(x) = \frac{e^{\frac{\left(\int \frac{b\, x^n e^{\lambda x} + \lambda x + 3n}{x} dx\right)}{2}} \left(c_1 \operatorname{BesselJ}\left(\frac{\sqrt{3}\sqrt{-ca}}{8b}, \frac{\sqrt{3}\sqrt{2}\sqrt{ca\, x^{2n}}\, x^{-n}}{8b}\right) + c_2 \operatorname{BesselY}\left(\frac{\sqrt{3}\sqrt{-ca}}{8b}, \frac{\sqrt{3}\sqrt{2}\sqrt{ca\, x^{2n}}\, x^{-n}}{8b}\right)\right) (b\, x^n e}{2x}$$

Using the above in (1) gives the solution

$$y = -\frac{e^{\frac{\left(\int \frac{b\, x^n e^{\lambda x} + \lambda x + 3n}{x} dx\right)}{2}} (b\, x^n e^{\lambda x} + \lambda x + 3n)\, x^{-2n} e^{-\lambda x} e^{\int \left(-\frac{b\, x^{n-1} e^{\lambda x}}{2} - \frac{\lambda}{2} - \frac{3n}{2x}\right) dx}}{2a}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left((\lambda x + 3n)\, e^{-\lambda x} + b\, x^{n}\right) x^{-2n}}{2a}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left((\lambda x + 3n)\, e^{-\lambda x} + b\, x^{n}\right) x^{-2n}}{2a} \tag{1}$$

Verification of solutions

$$y = -\frac{\left((\lambda x + 3n)\, e^{-\lambda x} + b\, x^{n}\right) x^{-2n}}{2a}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 = 2a\lambda x\, e^{\lambda x^2} - a^2 e^{2\lambda x^2}}$$

4.16.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + 2a\lambda x\, e^{\lambda x^2} - a^2 e^{2\lambda x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + 2a\lambda x\, e^{\lambda x^2} - a^2 e^{2\lambda x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = 2a\lambda x\, e^{\lambda x^2} - a^2 e^{2\lambda x^2}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= 2a\lambda x\,\mathrm{e}^{\lambda\,x^2} - a^2\mathrm{e}^{2\lambda\,x^2} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(2a\lambda x\,\mathrm{e}^{\lambda\,x^2} - a^2\mathrm{e}^{2\lambda\,x^2}\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{-\mathrm{e}^{2\lambda\,x^2}\_Y(x)\,a^2 + 2\,\mathrm{e}^{\lambda\,x^2}\_Y(x)\,a\lambda x + \_Y''(x)\right\},\{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{-\mathrm{e}^{2\lambda\,x^2}\_Y(x)\,a^2 + 2\,\mathrm{e}^{\lambda\,x^2}\_Y(x)\,a\lambda x + \_Y''(x)\right\},\{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{-\mathrm{e}^{2\lambda\,x^2}\_Y(x)\,a^2 + 2\,\mathrm{e}^{\lambda\,x^2}\_Y(x)\,a\lambda x + \_Y''(x)\right\},\{\_Y(x)\}\right)}{\mathrm{DESol}\left(\{-\mathrm{e}^{2\lambda\,x^2}\_Y(x)\,a^2 + 2\,\mathrm{e}^{\lambda\,x^2}\_Y(x)\,a\lambda x + \_Y''(x)\},\{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{-\mathrm{e}^{2\lambda\,x^2}\_Y(x)\,a^2 + 2\,\mathrm{e}^{\lambda\,x^2}\_Y(x)\,a\lambda x + \_Y''(x)\right\},\{\_Y(x)\}\right)}{\mathrm{DESol}\left(\{-\mathrm{e}^{2\lambda\,x^2}\_Y(x)\,a^2 + 2\,\mathrm{e}^{\lambda\,x^2}\_Y(x)\,a\lambda x + \_Y''(x)\},\{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{-\mathrm{e}^{2\lambda\,x^2}\_Y(x)\,a^2 + 2\,\mathrm{e}^{\lambda\,x^2}\_Y(x)\,a\lambda x + \_Y''(x)\right\},\{\_Y(x)\}\right)}{\mathrm{DESol}\left(\{-\mathrm{e}^{2\lambda\,x^2}\_Y(x)\,a^2 + 2\,\mathrm{e}^{\lambda\,x^2}\_Y(x)\,a\lambda x + \_Y''(x)\},\{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{-\mathrm{e}^{2\lambda\,x^{2}}\_Y(x)\,a^{2}+2\,\mathrm{e}^{\lambda\,x^{2}}\_Y(x)\,a\lambda x+\_Y''(x)\right\},\{\_Y(x)\}\right)}{\mathrm{DESol}\left(\{-\mathrm{e}^{2\lambda\,x^{2}}\_Y(x)\,a^{2}+2\,\mathrm{e}^{\lambda\,x^{2}}\_Y(x)\,a\lambda x+\_Y''(x)\},\{\_Y(x)\}\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,\mathrm{e}^{-\lambda\,x^2} y^2 - y\lambda x = a\,b^2}$$

4.17.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,\mathrm{e}^{-\lambda\,x^2} y^2 + \lambda x y + a\,b^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,\mathrm{e}^{-\lambda\,x^2} y^2 + \lambda x y + a\,b^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\,b^2$, $f_1(x) = \lambda x$ and $f_2(x) = \mathrm{e}^{-\lambda\,x^2} a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\mathrm{e}^{-\lambda\,x^2} a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -2\lambda x\, \mathrm{e}^{-\lambda x^2} a \\ f_1 f_2 &= \lambda x\, \mathrm{e}^{-\lambda x^2} a \\ f_2^2 f_0 &= \mathrm{e}^{-2\lambda x^2} a^3 b^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\mathrm{e}^{-\lambda x^2} a u''(x) + \lambda x\, \mathrm{e}^{-\lambda x^2} a u'(x) + \mathrm{e}^{-2\lambda x^2} a^3 b^2 u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \sin\left(\frac{\sqrt{2}\, ab\sqrt{\pi}\ \mathrm{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right) + c_2 \cos\left(\frac{\sqrt{2}\, ab\sqrt{\pi}\ \mathrm{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)$$

The above shows that

$$u'(x) = ab\, \mathrm{e}^{-\frac{\lambda x^2}{2}} \left(c_1 \cos\left(\frac{\sqrt{2}\, ab\sqrt{\pi}\ \mathrm{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right) - c_2 \sin\left(\frac{\sqrt{2}\, ab\sqrt{\pi}\ \mathrm{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)\right)$$

Using the above in (1) gives the solution

$$y = -\frac{b\, \mathrm{e}^{-\frac{\lambda x^2}{2}} \left(c_1 \cos\left(\frac{\sqrt{2}\, ab\sqrt{\pi}\ \mathrm{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right) - c_2 \sin\left(\frac{\sqrt{2}\, ab\sqrt{\pi}\ \mathrm{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)\right) \mathrm{e}^{\lambda x^2}}{c_1 \sin\left(\frac{\sqrt{2}\, ab\sqrt{\pi}\ \mathrm{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right) + c_2 \cos\left(\frac{\sqrt{2}\, ab\sqrt{\pi}\ \mathrm{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{b\, \mathrm{e}^{\frac{\lambda x^2}{2}} \left(-c_3 \cos\left(\frac{\sqrt{2}\, ab\sqrt{\pi}\ \mathrm{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right) + \sin\left(\frac{\sqrt{2}\, ab\sqrt{\pi}\ \mathrm{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)\right)}{c_3 \sin\left(\frac{\sqrt{2}\, ab\sqrt{\pi}\ \mathrm{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right) + \cos\left(\frac{\sqrt{2}\, ab\sqrt{\pi}\ \mathrm{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)}$$

Summary
The solution(s) found are the following

$$
y = \frac{b\,\mathrm{e}^{\frac{\lambda x^{2}}{2}} \left(-c_3 \cos\left(\frac{\sqrt{2}\,ab\sqrt{\pi}\,\operatorname{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)+\sin\left(\frac{\sqrt{2}\,ab\sqrt{\pi}\,\operatorname{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)\right)}{c_3 \sin\left(\frac{\sqrt{2}\,ab\sqrt{\pi}\,\operatorname{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)+\cos\left(\frac{\sqrt{2}\,ab\sqrt{\pi}\,\operatorname{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)} \tag{1}
$$

Verification of solutions

$$
y = \frac{b\,\mathrm{e}^{\frac{\lambda x^{2}}{2}} \left(-c_3 \cos\left(\frac{\sqrt{2}\,ab\sqrt{\pi}\,\operatorname{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)+\sin\left(\frac{\sqrt{2}\,ab\sqrt{\pi}\,\operatorname{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)\right)}{c_3 \sin\left(\frac{\sqrt{2}\,ab\sqrt{\pi}\,\operatorname{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)+\cos\left(\frac{\sqrt{2}\,ab\sqrt{\pi}\,\operatorname{erf}\left(\frac{x\sqrt{2}\,\sqrt{\lambda}}{2}\right)}{2\sqrt{\lambda}}\right)}
$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.3-2. Equations with power and exponential functions
Problem number: 39.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,x^n y^2 - y\lambda x = a\,b^2 x^n \mathrm{e}^{\lambda\,x^2}}$$

4.18.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y)\\ &= a\,x^n y^2 + \lambda x y + a\,b^2 x^n \mathrm{e}^{\lambda\,x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,x^n y^2 + \lambda x y + a\,b^2 x^n \mathrm{e}^{\lambda\,x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\,b^2 x^n \mathrm{e}^{\lambda\,x^2}$, $f_1(x) = \lambda x$ and $f_2(x) = x^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u}\\ &= \frac{-u'}{x^n a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{x^n na}{x} \\ f_1f_2 &= \lambda x\, x^n a \\ f_2^2 f_0 &= x^{3n} a^3 b^2 \mathrm{e}^{\lambda\, x^2} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^n a u''(x) - \left(\frac{x^n na}{x} + \lambda x\, x^n a\right) u'(x) + x^{3n} a^3 b^2 \mathrm{e}^{\lambda\, x^2} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = c_1 \sin&\left(ab\, x^{n+1} 2^{-\frac{1}{2}+\frac{n}{2}} (-\lambda\, x^2)^{-\frac{n}{2}-\frac{1}{2}} \left(\Gamma\left(\frac{n}{2}+\frac{1}{2}\right) - \Gamma\left(\frac{n}{2}+\frac{1}{2}, -\frac{\lambda\, x^2}{2}\right)\right)\right) \\ &+ c_2 \cos\left(ab\, x^{n+1} 2^{-\frac{1}{2}+\frac{n}{2}} (-\lambda\, x^2)^{-\frac{n}{2}-\frac{1}{2}} \left(\Gamma\left(\frac{n}{2}+\frac{1}{2}\right) - \Gamma\left(\frac{n}{2}+\frac{1}{2}, -\frac{\lambda\, x^2}{2}\right)\right)\right) \end{aligned}$$

The above shows that

$$\begin{aligned} &u'(x) \\ &= ab\, x^n \mathrm{e}^{\frac{\lambda\, x^2}{2}} \left(c_1 \cos\left(ab\, x^{n+1} 2^{-\frac{1}{2}+\frac{n}{2}} (-\lambda\, x^2)^{-\frac{n}{2}-\frac{1}{2}} \left(\Gamma\left(\frac{n}{2}+\frac{1}{2}\right) - \Gamma\left(\frac{n}{2}+\frac{1}{2}, -\frac{\lambda\, x^2}{2}\right)\right)\right)\right. \\ &\quad \left. - c_2 \sin\left(ab\, x^{n+1} 2^{-\frac{1}{2}+\frac{n}{2}} (-\lambda\, x^2)^{-\frac{n}{2}-\frac{1}{2}} \left(\Gamma\left(\frac{n}{2}+\frac{1}{2}\right) - \Gamma\left(\frac{n}{2}+\frac{1}{2}, -\frac{\lambda\, x^2}{2}\right)\right)\right)\right) \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{b\,\mathrm{e}^{\frac{\lambda\, x^2}{2}} \left(c_1 \cos\left(ab\, x^{n+1} 2^{-\frac{1}{2}+\frac{n}{2}} (-\lambda\, x^2)^{-\frac{n}{2}-\frac{1}{2}} \left(\Gamma\left(\frac{n}{2}+\frac{1}{2}\right) - \Gamma\left(\frac{n}{2}+\frac{1}{2}, -\frac{\lambda x^2}{2}\right)\right)\right) - c_2 \sin\left(ab\, x^{n+1} 2^{-\frac{1}{2}+\frac{n}{2}} (-\right.\right.}{c_1 \sin\left(ab\, x^{n+1} 2^{-\frac{1}{2}+\frac{n}{2}} (-\lambda\, x^2)^{-\frac{n}{2}-\frac{1}{2}} \left(\Gamma\left(\frac{n}{2}+\frac{1}{2}\right) - \Gamma\left(\frac{n}{2}+\frac{1}{2}, -\frac{\lambda x^2}{2}\right)\right)\right) + c_2 \cos\left(ab\, x^{n+1} 2^{-\frac{1}{2}+\frac{n}{2}} (-\lambda\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{b\,\mathrm{e}^{\frac{\lambda x^2}{2}}\left(c_3 \cos\left(ab\,x^{n+1}2^{-\frac{1}{2}+\frac{n}{2}}(-\lambda\,x^2)^{-\frac{n}{2}-\frac{1}{2}}\left(\Gamma\left(\frac{n}{2}+\frac{1}{2}\right)-\Gamma\left(\frac{n}{2}+\frac{1}{2},-\frac{\lambda x^2}{2}\right)\right)\right)-\sin\left(ab\,x^{n+1}2^{-\frac{1}{2}+\frac{n}{2}}(-\lambda\right.\right.}{c_3 \sin\left(ab\,x^{n+1}2^{-\frac{1}{2}+\frac{n}{2}}(-\lambda\,x^2)^{-\frac{n}{2}-\frac{1}{2}}\left(\Gamma\left(\frac{n}{2}+\frac{1}{2}\right)-\Gamma\left(\frac{n}{2}+\frac{1}{2},-\frac{\lambda x^2}{2}\right)\right)\right)+\cos\left(ab\,x^{n+1}2^{-\frac{1}{2}+\frac{n}{2}}(-\lambda\,x^2\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{b\,\mathrm{e}^{\frac{\lambda x^2}{2}}\left(c_3 \cos\left(ab\,x^{n+1}2^{-\frac{1}{2}+\frac{n}{2}}(-\lambda\,x^2)^{-\frac{n}{2}-\frac{1}{2}}\left(\Gamma\left(\frac{n}{2}+\frac{1}{2}\right)-\Gamma\left(\frac{n}{2}+\frac{1}{2},-\frac{\lambda x^2}{2}\right)\right)\right)-\sin\left(ab\,x^{n+1}2^{-\frac{1}{2}+\frac{n}{2}}(-\lambda\right.\right.}{c_3 \sin\left(ab\,x^{n+1}2^{-\frac{1}{2}+\frac{n}{2}}(-\lambda\,x^2)^{-\frac{n}{2}-\frac{1}{2}}\left(\Gamma\left(\frac{n}{2}+\frac{1}{2}\right)-\Gamma\left(\frac{n}{2}+\frac{1}{2},-\frac{\lambda x^2}{2}\right)\right)\right)+\cos\left(ab\,x^{n+1}2^{-\frac{1}{2}+\frac{n}{2}}(-\lambda\,x^2\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{b\,\mathrm{e}^{\frac{\lambda x^2}{2}}\left(c_3 \cos\left(ab\,x^{n+1}2^{-\frac{1}{2}+\frac{n}{2}}(-\lambda\,x^2)^{-\frac{n}{2}-\frac{1}{2}}\left(\Gamma\left(\frac{n}{2}+\frac{1}{2}\right)-\Gamma\left(\frac{n}{2}+\frac{1}{2},-\frac{\lambda x^2}{2}\right)\right)\right)-\sin\left(ab\,x^{n+1}2^{-\frac{1}{2}+\frac{n}{2}}(-\lambda\right.\right.}{c_3 \sin\left(ab\,x^{n+1}2^{-\frac{1}{2}+\frac{n}{2}}(-\lambda\,x^2)^{-\frac{n}{2}-\frac{1}{2}}\left(\Gamma\left(\frac{n}{2}+\frac{1}{2}\right)-\Gamma\left(\frac{n}{2}+\frac{1}{2},-\frac{\lambda x^2}{2}\right)\right)\right)+\cos\left(ab\,x^{n+1}2^{-\frac{1}{2}+\frac{n}{2}}(-\lambda\,x^2\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{x^4(y'-y^2) = a + b\,\mathrm{e}^{\frac{k}{x}} + c\,\mathrm{e}^{\frac{2k}{x}}}$$

4.19.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{x^4y^2 + b\,\mathrm{e}^{\frac{k}{x}} + c\,\mathrm{e}^{\frac{2k}{x}} + a}{x^4} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \frac{b\,\mathrm{e}^{\frac{k}{x}}}{x^4} + \frac{c\,\mathrm{e}^{\frac{2k}{x}}}{x^4} + \frac{a}{x^4}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{a+b\,\mathrm{e}^{\frac{k}{x}}+c\,\mathrm{e}^{\frac{2k}{x}}}{x^4}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \frac{a + b\,\mathrm{e}^{\frac{k}{x}} + c\,\mathrm{e}^{\frac{2k}{x}}}{x^4} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \frac{\left(a + b\,\mathrm{e}^{\frac{k}{x}} + c\,\mathrm{e}^{\frac{2k}{x}}\right) u(x)}{x^4} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = x\,\mathrm{e}^{-\frac{k}{2x}} \Bigg(&\mathrm{WhittakerM}\left(-\frac{ib}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,\mathrm{e}^{\frac{k}{x}}}{k}\right) c_1 \\ &+ \mathrm{WhittakerW}\left(-\frac{ib}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,\mathrm{e}^{\frac{k}{x}}}{k}\right) c_2 \Bigg) \end{aligned}$$

The above shows that

$$u'(x) = -\frac{\mathrm{e}^{-\frac{k}{2x}} \left(\left(\left(i\sqrt{a} + \frac{k}{2}\right)\sqrt{c} - \frac{ib}{2}\right) c_1\,\mathrm{WhittakerM}\left(-\frac{ib-2k\sqrt{c}}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,\mathrm{e}^{\frac{k}{x}}}{k}\right) - \mathrm{WhittakerW}\left(-\frac{ib-2k\sqrt{c}}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \right.\right.}{}$$

Using the above in (1) gives the solution

$$y = \frac{\left(\left(i\sqrt{a} + \frac{k}{2}\right)\sqrt{c} - \frac{ib}{2}\right) c_1\,\mathrm{WhittakerM}\left(-\frac{ib-2k\sqrt{c}}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,\mathrm{e}^{\frac{k}{x}}}{k}\right) - \mathrm{WhittakerW}\left(-\frac{ib-2k\sqrt{c}}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,\mathrm{e}^{\frac{k}{x}}}{k}\right) c}{\sqrt{c}\,x^2 \left(\mathrm{WhittakerM}\left(-\frac{ib}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$
y = \frac{-\frac{((-2i\sqrt{a}-k)\sqrt{c}+ib)c_3 \operatorname{WhittakerM}\left(-\frac{ib-2k\sqrt{c}}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,e^{\frac{k}{x}}}{k}\right)}{2} - k \operatorname{WhittakerW}\left(-\frac{ib-2k\sqrt{c}}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,e^{\frac{k}{x}}}{k}\right)\sqrt{c} + (ic\,e^{\frac{k}{x}}}{\sqrt{c}\,x^2 (\operatorname{WhittakerM}\left(-\frac{ib}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,e^{\frac{k}{x}}}{k}\right)}
$$

<u>Summary</u>

The solution(s) found are the following

$$
y = \frac{-\frac{((-2i\sqrt{a}-k)\sqrt{c}+ib)c_3 \operatorname{WhittakerM}\left(-\frac{ib-2k\sqrt{c}}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,e^{\frac{k}{x}}}{k}\right)}{2} - k \operatorname{WhittakerW}\left(-\frac{ib-2k\sqrt{c}}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,e^{\frac{k}{x}}}{k}\right)\sqrt{c} + (ic\,e^{\frac{k}{x}}}{\sqrt{c}\,x^2 (\operatorname{WhittakerM}\left(-\frac{ib}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,e^{\frac{k}{x}}}{k}\right)} \tag{1}
$$

<u>Verification of solutions</u>

$$
y = \frac{-\frac{((-2i\sqrt{a}-k)\sqrt{c}+ib)c_3 \operatorname{WhittakerM}\left(-\frac{ib-2k\sqrt{c}}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,e^{\frac{k}{x}}}{k}\right)}{2} - k \operatorname{WhittakerW}\left(-\frac{ib-2k\sqrt{c}}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,e^{\frac{k}{x}}}{k}\right)\sqrt{c} + (ic\,e^{\frac{k}{x}}}{\sqrt{c}\,x^2 (\operatorname{WhittakerM}\left(-\frac{ib}{2k\sqrt{c}}, \frac{i\sqrt{a}}{k}, \frac{2i\sqrt{c}\,e^{\frac{k}{x}}}{k}\right)}

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 = -a^2 + a\lambda \sinh(\lambda x) - a^2 \sinh(\lambda x)^2}$$

5.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 - a^2 + a\lambda \sinh(\lambda x) - a^2 \sinh(\lambda x)^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 - a^2 + a\lambda \sinh(\lambda x) - a^2 \sinh(\lambda x)^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2 + a\lambda \sinh(\lambda x) - a^2 \sinh(\lambda x)^2$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2 f_0 &= -a^2 + a\lambda \sinh(\lambda x) - a^2 \sinh(\lambda x)^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-a^2 + a\lambda \sinh(\lambda x) - a^2 \sinh(\lambda x)^2\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\frac{a\sinh(\lambda x)}{\lambda}}\left(c_1 \,\mathrm{HeunC}\left(\frac{4ia}{\lambda}, -\frac{1}{2}, -\frac{1}{2}, \frac{2ia}{\lambda}, -\frac{8ia-3\lambda}{8\lambda}, -\frac{i\sinh(\lambda x)}{2} + \frac{1}{2}\right) + c_2 \sinh\left(\frac{i\pi}{4} + \frac{\lambda x}{2}\right) \mathrm{HeunC}\left(\frac{4ia}{\lambda}, \frac{1}{2}, -\frac{1}{2}, \frac{2ia}{\lambda}, -\frac{8ia-3\lambda}{8\lambda}, -\frac{i\sinh(\lambda x)}{2} + \frac{1}{2}\right)\right)$$

The above shows that

$$u'(x) = -\frac{\mathrm{e}^{\frac{a\sinh(\lambda x)}{\lambda}}\left(c_2\left(-2a\sinh\left(\frac{i\pi}{4} + \frac{\lambda x}{2}\right)\cosh(\lambda x) - \lambda\cosh\left(\frac{i\pi}{4} + \frac{\lambda x}{2}\right)\right)\mathrm{HeunC}\left(\frac{4ia}{\lambda}, \frac{1}{2}, -\frac{1}{2}, \frac{2ia}{\lambda}, -\frac{8ia-3\lambda}{8\lambda}, -\frac{i\sinh(}{2}\right.\right.}{}$$

Using the above in (1) gives the solution

$$y = \frac{c_2\left(-2a\sinh\left(\frac{i\pi}{4} + \frac{\lambda x}{2}\right)\cosh(\lambda x) - \lambda\cosh\left(\frac{i\pi}{4} + \frac{\lambda x}{2}\right)\right)\mathrm{HeunC}\left(\frac{4ia}{\lambda}, \frac{1}{2}, -\frac{1}{2}, \frac{2ia}{\lambda}, -\frac{8ia-3\lambda}{8\lambda}, -\frac{i\sinh(\lambda x)}{2} + \frac{1}{2}\right) + }{2c_1\,\mathrm{Heun}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-2a\sinh\left(\frac{i\pi}{4} + \frac{\lambda x}{2}\right)\cosh(\lambda x) - \lambda\cosh\left(\frac{i\pi}{4} + \frac{\lambda x}{2}\right)\right)\mathrm{HeunC}\left(\frac{4ia}{\lambda}, \frac{1}{2}, -\frac{1}{2}, \frac{2ia}{\lambda}, -\frac{8ia-3\lambda}{8\lambda}, -\frac{i\sinh(\lambda x)}{2} + \frac{1}{2}\right) + \left(-\right.}{2\sinh\left(\frac{i\pi}{4}\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(-2a\sinh\left(\frac{i\pi}{4}+\frac{\lambda x}{2}\right)\cosh\left(\lambda x\right)-\lambda\cosh\left(\frac{i\pi}{4}+\frac{\lambda x}{2}\right)\right)\operatorname{HeunC}\left(\frac{4ia}{\lambda},\frac{1}{2},-\frac{1}{2},\frac{2ia}{\lambda},-\frac{8ia-3\lambda}{8\lambda},-\frac{i\sinh(\lambda x)}{2}+\frac{1}{2}\right)+\left(-\right.}{2\sinh\left(\frac{i\pi}{4}\right.} \tag{1}$$

Verification of solutions

$$y = \frac{\left(-2a\sinh\left(\frac{i\pi}{4}+\frac{\lambda x}{2}\right)\cosh\left(\lambda x\right)-\lambda\cosh\left(\frac{i\pi}{4}+\frac{\lambda x}{2}\right)\right)\operatorname{HeunC}\left(\frac{4ia}{\lambda},\frac{1}{2},-\frac{1}{2},\frac{2ia}{\lambda},-\frac{8ia-3\lambda}{8\lambda},-\frac{i\sinh(\lambda x)}{2}+\frac{1}{2}\right)+\left(-\right.}{2\sinh\left(\frac{i\pi}{4}\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - a\sinh(\beta x)\, y = ab\sinh(\beta x) - b^2}$$

5.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + a\sinh(\beta x)\, y + ab\sinh(\beta x) - b^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\sinh(\beta x)\, y + ab\sinh(\beta x) - b^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = ab\sinh(\beta x) - b^2$, $f_1(x) = \sinh(\beta x)\, a$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \sinh(\beta x)\, a \\ f_2^2 f_0 &= ab \sinh(\beta x) - b^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \sinh(\beta x)\, a u'(x) + \left(ab \sinh(\beta x) - b^2\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = e^{bx} \left(c_1 + c_2 \beta \left(\int e^{\frac{-2b\beta x + a\cosh(\beta x)}{\beta}} dx\right)\right)$$

The above shows that

$$u'(x) = e^{bx} \left(\left(\int e^{\frac{-2b\beta x + a\cosh(\beta x)}{\beta}} dx\right) c_2 b \beta + c_2 \beta\, e^{\frac{-2b\beta x + a\cosh(\beta x)}{\beta}} + c_1 b\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\int e^{\frac{-2b\beta x + a\cosh(\beta x)}{\beta}} dx\right) c_2 b \beta + c_2 \beta\, e^{\frac{-2b\beta x + a\cosh(\beta x)}{\beta}} + c_1 b}{c_1 + c_2 \beta \left(\int e^{\frac{-2b\beta x + a\cosh(\beta x)}{\beta}} dx\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\left(\int e^{\frac{-2b\beta x + a\cosh(\beta x)}{\beta}} dx\right) b \beta - e^{\frac{-2b\beta x + a\cosh(\beta x)}{\beta}} \beta - b c_3}{c_3 + \beta \left(\int e^{\frac{-2b\beta x + a\cosh(\beta x)}{\beta}} dx\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{-\left(\int e^{\frac{-2b\beta x+a\cosh(\beta x)}{\beta}}dx\right)b\beta - e^{\frac{-2b\beta x+a\cosh(\beta x)}{\beta}}\beta - bc_3}{c_3+\beta\left(\int e^{\frac{-2b\beta x+a\cosh(\beta x)}{\beta}}dx\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-\left(\int e^{\frac{-2b\beta x+a\cosh(\beta x)}{\beta}}dx\right)b\beta - e^{\frac{-2b\beta x+a\cosh(\beta x)}{\beta}}\beta - bc_3}{c_3+\beta\left(\int e^{\frac{-2b\beta x+a\cosh(\beta x)}{\beta}}dx\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - ax \sinh(bx)^m y = a \sinh(bx)^m}$$

5.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + ax \sinh(bx)^m y + a \sinh(bx)^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + ax \sinh(bx)^m y + a \sinh(bx)^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a \sinh(bx)^m$, $f_1(x) = xa \sinh(bx)^m$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= xa\sinh\left(bx\right)^m \\ f_2^2f_0 &= a\sinh\left(bx\right)^m \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - xa\sinh\left(bx\right)^m u'(x) + a\sinh\left(bx\right)^m u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{x\left(c_2\left(\int \frac{e^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh(bx)}{x^2}dx\right) + c_1b\right)}{b}$$

The above shows that

$$u'(x) = \frac{c_2e^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh\left(bx\right) + c_2\left(\int \frac{e^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh(bx)}{x^2}dx\right)x + c_1bx}{bx}$$

Using the above in (1) gives the solution

$$y = -\frac{c_2e^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh\left(bx\right) + c_2\left(\int \frac{e^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh(bx)}{x^2}dx\right)x + c_1bx}{x^2\left(c_2\left(\int \frac{e^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh(bx)}{x^2}dx\right) + c_1b\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-e^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh\left(bx\right) - \left(\int \frac{e^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh(bx)}{x^2}dx\right)x - c_3bx}{x^2\left(\int \frac{e^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh(bx)}{x^2}dx + bc_3\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{-\mathrm{e}^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh(bx) - \left(\int \frac{\mathrm{e}^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh(bx)}{x^2}dx\right)x - c_3 bx}{x^2\left(\int \frac{\mathrm{e}^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh(bx)}{x^2}dx + bc_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-\mathrm{e}^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh(bx) - \left(\int \frac{\mathrm{e}^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh(bx)}{x^2}dx\right)x - c_3 bx}{x^2\left(\int \frac{\mathrm{e}^{\int (xa\sinh(bx)^m - \tanh(bx)b)dx}\cosh(bx)}{x^2}dx + bc_3\right)}$$

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \sinh(\lambda x) y^2 = -\lambda \sinh(\lambda x)^3}$$

5.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \sinh(\lambda x) \lambda y^2 - \lambda \sinh(\lambda x)^3 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \sinh(\lambda x) \lambda y^2 - \lambda \sinh(\lambda x)^3$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\lambda \sinh(\lambda x)^3$, $f_1(x) = 0$ and $f_2(x) = \lambda \sinh(\lambda x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\lambda \sinh(\lambda x) u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \lambda^2 \cosh(\lambda x) \\ f_1f_2 &= 0 \\ f_2^2f_0 &= -\lambda^3 \sinh(\lambda x)^5 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\lambda \sinh(\lambda x)\,u''(x) - \lambda^2 \cosh(\lambda x)\,u'(x) - \lambda^3 \sinh(\lambda x)^5\,u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{-\frac{\cosh(\lambda x)^2}{2}}\left(c_1 + c_2 \,\mathrm{erfi}\left(\cosh(\lambda x)\right)\right)$$

The above shows that

$$u'(x) = -\frac{\left(\sqrt{\pi}\,\cosh(\lambda x)\left(c_1 + c_2\,\mathrm{erfi}\left(\cosh(\lambda x)\right)\right)\mathrm{e}^{-\frac{\cosh(\lambda x)^2}{2}} - 2c_2\mathrm{e}^{\frac{\cosh(\lambda x)^2}{2}}\right)\lambda \sinh(\lambda x)}{\sqrt{\pi}}$$

Using the above in (1) gives the solution

$$y = \frac{\left(\sqrt{\pi}\,\cosh(\lambda x)\left(c_1 + c_2\,\mathrm{erfi}\left(\cosh(\lambda x)\right)\right)\mathrm{e}^{-\frac{\cosh(\lambda x)^2}{2}} - 2c_2\mathrm{e}^{\frac{\cosh(\lambda x)^2}{2}}\right)\mathrm{e}^{\frac{\cosh(2\lambda x)}{4}+\frac{1}{4}}}{\sqrt{\pi}\,\left(c_1 + c_2\,\mathrm{erfi}\left(\cosh(\lambda x)\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-2\,\mathrm{e}^{\cosh(\lambda x)^2} + \cosh(\lambda x)\sqrt{\pi}\left(c_3 + \mathrm{erfi}\left(\cosh(\lambda x)\right)\right)}{\sqrt{\pi}\,\left(c_3 + \mathrm{erfi}\left(\cosh(\lambda x)\right)\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{-2\,\mathrm{e}^{\cosh(\lambda x)^2} + \cosh(\lambda x)\sqrt{\pi}\left(c_3 + \mathrm{erfi}\left(\cosh(\lambda x)\right)\right)}{\sqrt{\pi}\,\left(c_3 + \mathrm{erfi}\left(\cosh(\lambda x)\right)\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-2\,\mathrm{e}^{\cosh(\lambda x)^2} + \cosh(\lambda x)\sqrt{\pi}\,(c_3 + \operatorname{erfi}(\cosh(\lambda x)))}{\sqrt{\pi}\,(c_3 + \operatorname{erfi}(\cosh(\lambda x)))}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.4-1. Equations with hyperbolic sine and cosine
Problem number: 5.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$y' - \left(a \sinh \left(\lambda x\right)^{2}-\lambda \right) y^{2} = -a \sinh \left(\lambda x\right)^{2}+\lambda -a$$

5.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \sinh \left(\lambda x\right)^{2} a \,y^{2}-a \sinh \left(\lambda x\right)^{2}-\lambda \,y^{2}-a +\lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \sinh \left(\lambda x\right)^{2} a \,y^{2}-a \sinh \left(\lambda x\right)^{2}-\lambda \,y^{2}-a +\lambda$$

With Riccati ODE standard form

$$y' = f_0(x)+ f_1(x)y+f_2(x)y^{2}$$

Shows that $f_0(x)=-a \sinh \left(\lambda x\right)^{2}+\lambda -a$, $f_1(x)=0$ and $f_2(x)=a \sinh \left(\lambda x\right)^{2}-\lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\left(a \sinh \left(\lambda x\right)^{2}-\lambda \right) u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 2a\sinh(\lambda x)\,\lambda\cosh(\lambda x) \\ f_1f_2 &= 0 \\ f_2^2f_0 &= \left(a\sinh(\lambda x)^2 - \lambda\right)^2\left(-a\sinh(\lambda x)^2 + \lambda - a\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\left(a\sinh(\lambda x)^2 - \lambda\right)u''(x) - 2a\sinh(\lambda x)\,\lambda\cosh(\lambda x)\,u'(x) + \left(a\sinh(\lambda x)^2 - \lambda\right)^2\left(-a\sinh(\lambda x)^2 + \lambda - a\right)u($$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = -2\,\mathrm{e}^{-\frac{\cosh(2\lambda x)a}{4\lambda}}\sinh(\lambda x)\left(c_2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a - \operatorname{csch}(\lambda x)^2\lambda\right)dx\right) - \frac{c_1}{2}\right)$$

The above shows that

$$\begin{aligned} u'(x) = &\left(\sinh(2\lambda x)\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a - \operatorname{csch}(\lambda x)^2\lambda\right)dx\right)c_2\lambda\,\mathrm{e}^{-\frac{\cosh(2\lambda x)a}{4\lambda}}\right. \\ &\left.- \frac{\sinh(2\lambda x)\,c_1\mathrm{e}^{-\frac{\cosh(2\lambda x)a}{4\lambda}}}{2} + 2c_2\lambda\,\mathrm{e}^{\frac{\cosh(2\lambda x)a}{4\lambda}}\right)\operatorname{csch}(\lambda x)\left(a\sinh(\lambda x)^2 - \lambda\right) \end{aligned}$$

Using the above in (1) gives the solution

$$y = \frac{\left(\sinh(2\lambda x)\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a - \operatorname{csch}(\lambda x)^2\lambda\right)dx\right)c_2\lambda\,\mathrm{e}^{-\frac{\cosh(2\lambda x)a}{4\lambda}} - \frac{\sinh(2\lambda x)c_1\mathrm{e}^{-\frac{\cosh(2\lambda x)a}{4\lambda}}}{2} + 2c_2\lambda\,\mathrm{e}^{\frac{\cosh(2\lambda x)a}{4\lambda}}\right)}{2\sinh(\lambda x)\left(c_2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a - \operatorname{csch}(\lambda x)^2\lambda\right)dx\right) - \frac{c_1}{2}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-2\,\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\operatorname{csch}(\lambda x)^2\lambda - 2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a - \operatorname{csch}(\lambda x)^2\lambda\right)dx\right)\coth(\lambda x) + c_3\coth(\lambda x)}{-2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a - \operatorname{csch}(\lambda x)^2\lambda\right)dx\right) + c_3}$$

Summary
The solution(s) found are the following

$$y = \frac{-2\,\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\,\mathrm{csch}\left(\lambda x\right)^{2}\lambda-2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a-\mathrm{csch}\left(\lambda x\right)^{2}\lambda\right)dx\right)\coth\left(\lambda x\right)+c_{3}\coth\left(\lambda x\right)}{-2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a-\mathrm{csch}\left(\lambda x\right)^{2}\lambda\right)dx\right)+c_{3}} \tag{1}$$

Verification of solutions

$$y = \frac{-2\,\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\,\mathrm{csch}\left(\lambda x\right)^{2}\lambda-2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a-\mathrm{csch}\left(\lambda x\right)^{2}\lambda\right)dx\right)\coth\left(\lambda x\right)+c_{3}\coth\left(\lambda x\right)}{-2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a-\mathrm{csch}\left(\lambda x\right)^{2}\lambda\right)dx\right)+c_{3}}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.4-1. Equations with hyperbolic sine and cosine
Problem number: 6.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$\boxed{(a\sinh(\lambda x)+b)\,y'-y^2-c\sinh(x\mu)\,y=-d^2+cd\sinh(x\mu)}$$

5.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y)\\ &= \frac{y^2+c\sinh(x\mu)\,y-d^2+cd\sinh(x\mu)}{a\sinh(\lambda x)+b} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=\frac{cd\sinh(x\mu)}{a\sinh(\lambda x)+b}+\frac{c\sinh(x\mu)\,y}{a\sinh(\lambda x)+b}-\frac{d^2}{a\sinh(\lambda x)+b}+\frac{y^2}{a\sinh(\lambda x)+b}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x) = \frac{-d^2+cd\sinh(x\mu)}{a\sinh(\lambda x)+b}$, $f_1(x) = \frac{c\sinh(x\mu)}{a\sinh(\lambda x)+b}$ and $f_2(x) = \frac{1}{a\sinh(\lambda x)+b}$. Let

$$
\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{\frac{u}{a\sinh(\lambda x)+b}}
\end{aligned}
\tag{1}
$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$
f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}
$$

But

$$
\begin{aligned}
f_2' &= -\frac{a\lambda \cosh(\lambda x)}{(a\sinh(\lambda x)+b)^2} \\
f_1 f_2 &= \frac{c\sinh(x\mu)}{(a\sinh(\lambda x)+b)^2} \\
f_2^2 f_0 &= \frac{-d^2+cd\sinh(x\mu)}{(a\sinh(\lambda x)+b)^3}
\end{aligned}
$$

Substituting the above terms back in equation (2) gives

$$
\frac{u''(x)}{a\sinh(\lambda x)+b} - \left(-\frac{a\lambda\cosh(\lambda x)}{(a\sinh(\lambda x)+b)^2} + \frac{c\sinh(x\mu)}{(a\sinh(\lambda x)+b)^2}\right) u'(x) + \frac{(-d^2+cd\sinh(x\mu))\, u(x)}{(a\sinh(\lambda x)+b)^3} = 0
$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.4-1. Equations with hyperbolic sine and cosine
Problem number: 7.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{(a\sinh(\lambda x)+b)\left(y'-y^2\right)=-a\,\lambda^2\sinh(\lambda x)}$$

5.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{\sinh(\lambda x)\,y^2a-a\,\lambda^2\sinh(\lambda x)+y^2b}{a\sinh(\lambda x)+b} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=-\frac{a\,\lambda^2\sinh(\lambda x)}{a\sinh(\lambda x)+b}+\frac{\sinh(\lambda x)\,y^2a}{a\sinh(\lambda x)+b}+\frac{y^2b}{a\sinh(\lambda x)+b}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=-\frac{a\,\lambda^2\sinh(\lambda x)}{a\sinh(\lambda x)+b}$, $f_1(x)=0$ and $f_2(x)=1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$f_2' = 0$$
$$f_1 f_2 = 0$$
$$f_2^2 f_0 = -\frac{a\,\lambda^2 \sinh(\lambda x)}{a \sinh(\lambda x) + b}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \frac{a\,\lambda^2 \sinh(\lambda x)\, u(x)}{a \sinh(\lambda x) + b} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = &-a c_1 \cosh\left(\frac{\lambda x}{2}\right) (a^2+b^2)^{\frac{3}{2}} \left(a \sinh\left(\frac{\lambda x}{2}\right) + b \cosh\left(\frac{\lambda x}{2}\right)\right) \\ &- 2\left(\sinh\left(\frac{\lambda x}{2}\right) a \cosh\left(\frac{\lambda x}{2}\right) + \frac{b}{2}\right) \left(\operatorname{arctanh}\left(\frac{-b \tanh\left(\frac{\lambda x}{2}\right) + a}{\sqrt{a^2+b^2}}\right) a^2 b^2 c_1 \right. \\ &\left. + \operatorname{arctanh}\left(\frac{-b \tanh\left(\frac{\lambda x}{2}\right) + a}{\sqrt{a^2+b^2}}\right) b^4 c_1 - c_2\right) \end{aligned}$$

The above shows that

$$u'(x) = -\frac{4\left(\left(\cosh\left(\frac{\lambda x}{2}\right)^2 + \sinh\left(\frac{\lambda x}{2}\right)^2\right) \left(\operatorname{arctanh}\left(\frac{-b \tanh\left(\frac{\lambda x}{2}\right)+a}{\sqrt{a^2+b^2}}\right) a^2 b^2 c_1 + \operatorname{arctanh}\left(\frac{-b \tanh\left(\frac{\lambda x}{2}\right)+a}{\sqrt{a^2+b^2}}\right) b^4 c_1 - c_2\right)\right.}{}$$

Using the above in (1) gives the solution

$$y = \frac{4\left(\left(\cosh\left(\frac{\lambda x}{2}\right)^2 + \sinh\left(\frac{\lambda x}{2}\right)^2\right) \left(\operatorname{arctanh}\left(\frac{-b \tanh\left(\frac{\lambda x}{2}\right)+a}{\sqrt{a^2+b^2}}\right) a^2 b^2 c_1 + \operatorname{arctanh}\left(\frac{-b \tanh\left(\frac{\lambda x}{2}\right)+a}{\sqrt{a^2+b^2}}\right) b^4 c_1 - c_2\right) a\right.}{\sqrt{a^2+b^2}\, \left(-2 \tanh\left(\frac{\lambda x}{2}\right)^2 b + 4 \tanh\left(\frac{\lambda x}{2}\right) a + 2b\right) \left(-a c_1 \cosh\left(\frac{\lambda x}{2}\right) (a\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{4\left(\left(\operatorname{arctanh}\left(\frac{-b\tanh\left(\frac{\lambda x}{2}\right)+a}{\sqrt{a^2+b^2}}\right)a^2b^2c_3 + \operatorname{arctanh}\left(\frac{-b\tanh\left(\frac{\lambda x}{2}\right)+a}{\sqrt{a^2+b^2}}\right)b^4c_3 - 1\right)a\left(\cosh\left(\frac{\lambda x}{2}\right)^2 - \frac{1}{2}\right)\sqrt{\quad}\right.}{\sqrt{a^2+b^2}\left(2ac_3\cosh\left(\frac{\lambda x}{2}\right)\left(a^2+b^2\right)^{\frac{3}{2}}\left(a\sinh\left(\frac{\lambda x}{2}\right)+b\cosh\left(\frac{\lambda x}{2}\right)\right)+4\left(\sinh\left(\frac{\lambda x}{2}\right)a\cosh\left(\frac{\lambda x}{2}\right)+\frac{b}{2}\right)\left(\mathrm{arc}\right.\right.}$$

<u>Summary</u>

The solution(s) found are the following

$$y = -\frac{4\left(\left(\operatorname{arctanh}\left(\frac{-b\tanh\left(\frac{\lambda x}{2}\right)+a}{\sqrt{a^2+b^2}}\right)a^2b^2c_3 + \operatorname{arctanh}\left(\frac{-b\tanh\left(\frac{\lambda x}{2}\right)+a}{\sqrt{a^2+b^2}}\right)b^4c_3 - 1\right)a\left(\cosh\left(\frac{\lambda x}{2}\right)^2 - \frac{1}{2}\right)\sqrt{\quad}\right.}{\sqrt{a^2+b^2}\left(2ac_3\cosh\left(\frac{\lambda x}{2}\right)\left(a^2+b^2\right)^{\frac{3}{2}}\left(a\sinh\left(\frac{\lambda x}{2}\right)+b\cosh\left(\frac{\lambda x}{2}\right)\right)+4\left(\sinh\left(\frac{\lambda x}{2}\right)a\cosh\left(\frac{\lambda x}{2}\right)+\frac{b}{2}\right)\left(\mathrm{arc}\right.\right.} \tag{1}$$

<u>Verification of solutions</u>

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - \alpha y^2 = \beta + \gamma \cosh(x)}$$

5.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \alpha y^2 + \beta + \gamma \cosh(x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \alpha y^2 + \beta + \gamma \cosh(x)$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \beta + \gamma \cosh(x)$, $f_1(x) = 0$ and $f_2(x) = \alpha$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\alpha u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \alpha^2(\beta + \gamma \cosh(x)) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\alpha u''(x) + \alpha^2(\beta + \gamma \cosh(x)) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \operatorname{MathieuC}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right) + c_2 \operatorname{MathieuS}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right)$$

The above shows that

$$u'(x) = \frac{i\left(c_2 \operatorname{MathieuSPrime}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right) + c_1 \operatorname{MathieuCPrime}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right)\right)}{2}$$

Using the above in (1) gives the solution

$$y = -\frac{i\left(c_2 \operatorname{MathieuSPrime}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right) + c_1 \operatorname{MathieuCPrime}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right)\right)}{2\alpha\left(c_1 \operatorname{MathieuC}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right) + c_2 \operatorname{MathieuS}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{i\left(\operatorname{MathieuSPrime}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right) + c_3 \operatorname{MathieuCPrime}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right)\right)}{2\alpha\left(c_3 \operatorname{MathieuC}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right) + \operatorname{MathieuS}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right)\right)}$$

<u>Summary</u>

The solution(s) found are the following

$$y = -\frac{i\left(\operatorname{MathieuSPrime}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right) + c_3 \operatorname{MathieuCPrime}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right)\right)}{2\alpha\left(c_3 \operatorname{MathieuC}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right) + \operatorname{MathieuS}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right)\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{i\left(\mathrm{MathieuSPrime}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right) + c_3\,\mathrm{MathieuCPrime}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right)\right)}{2\alpha\left(c_3\,\mathrm{MathieuC}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right) + \mathrm{MathieuS}\left(-4\alpha\beta, 2\alpha\gamma, \frac{ix}{2}\right)\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - a\cosh(\beta x)\, y = ab\cosh(\beta x) - b^2}$$

5.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + a\cosh(\beta x)\, y + ab\cosh(\beta x) - b^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\cosh(\beta x)\, y + ab\cosh(\beta x) - b^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = ab\cosh(\beta x) - b^2$, $f_1(x) = a\cosh(\beta x)$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= a \cosh(\beta x) \\ f_2^2 f_0 &= ab \cosh(\beta x) - b^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - a \cosh(\beta x) u'(x) + \left(ab \cosh(\beta x) - b^2\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = {} & c_1 \operatorname{HeunD}\left(-\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right) \\ & + c_2 \operatorname{HeunD}\left(\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right) \mathrm{e}^{\frac{a \sinh(\beta x)}{\beta}} \end{aligned}$$

The above shows that

$$\begin{aligned} u'(x) = {} & -\frac{\operatorname{csch}\left(\frac{\beta x}{2}\right)^2 c_1 \beta \operatorname{HeunDPrime}\left(-\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right)}{2} \\ & + \left(-\frac{\operatorname{csch}\left(\frac{\beta x}{2}\right)^2 \operatorname{HeunDPrime}\left(\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right) \beta}{2} \right. \\ & \left. + a \operatorname{HeunD}\left(\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right) \cosh(\beta x)\right) c_2 \mathrm{e}^{\frac{a \sinh(\beta x)}{\beta}} \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{-\frac{\operatorname{csch}\left(\frac{\beta x}{2}\right)^2 c_1 \beta \operatorname{HeunDPrime}\left(-\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right)}{2} + \left(-\frac{\operatorname{csch}\left(\frac{\beta x}{2}\right)^2 \operatorname{HeunDPrime}\left(\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right)}{2}\right)}{c_1 \operatorname{HeunD}\left(-\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right) + c_2 \operatorname{HeunD}\left(\frac{2a}{\beta}, \ldots\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-2\,\mathrm{e}^{\frac{a\sinh(\beta x)}{\beta}} a\,\mathrm{HeunD}\left(\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right)\cosh(\beta x) + \beta\,\mathrm{csch}\left(\frac{\beta x}{2}\right)^2\left(\mathrm{e}^{\frac{a\sinh(\beta x)}{\beta}}\,\mathrm{HeunDPrime}\right.}{2\,\mathrm{HeunD}\left(\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right)\mathrm{e}^{\frac{a\sinh(\beta x)}{\beta}} + 2c_3}$$

Summary

The solution(s) found are the following

$$y = \frac{-2\,\mathrm{e}^{\frac{a\sinh(\beta x)}{\beta}} a\,\mathrm{HeunD}\left(\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right)\cosh(\beta x) + \beta\,\mathrm{csch}\left(\frac{\beta x}{2}\right)^2\left(\mathrm{e}^{\frac{a\sinh(\beta x)}{\beta}}\,\mathrm{HeunDPrime}\right.}{2\,\mathrm{HeunD}\left(\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right)\mathrm{e}^{\frac{a\sinh(\beta x)}{\beta}} + 2c_3} \tag{1}$$

Verification of solutions

$$y = \frac{-2\,\mathrm{e}^{\frac{a\sinh(\beta x)}{\beta}} a\,\mathrm{HeunD}\left(\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right)\cosh(\beta x) + \beta\,\mathrm{csch}\left(\frac{\beta x}{2}\right)^2\left(\mathrm{e}^{\frac{a\sinh(\beta x)}{\beta}}\,\mathrm{HeunDPrime}\right.}{2\,\mathrm{HeunD}\left(\frac{2a}{\beta}, \frac{4b(a-b)}{\beta^2}, \frac{4a}{\beta}, \frac{4b(a+b)}{\beta^2}, \coth\left(\frac{\beta x}{2}\right)\right)\mathrm{e}^{\frac{a\sinh(\beta x)}{\beta}} + 2c_3}$$

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 - ax\cosh(bx)^m y = a\cosh(bx)^m}$$

5.10.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + ax\cosh(bx)^m y + a\cosh(bx)^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + ax\cosh(bx)^m y + a\cosh(bx)^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\cosh(bx)^m$, $f_1(x) = \cosh(bx)^m ax$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= \cosh(bx)^m\,ax \\ f_2^2f_0 &= a\cosh(bx)^m \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \cosh(bx)^m\,axu'(x) + a\cosh(bx)^m\,u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x\left(c_1\left(\int e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}dx\right) + c_2\right)$$

The above shows that

$$u'(x) = c_1\left(\int e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}dx\right) + c_2 + xc_1e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}$$

Using the above in (1) gives the solution

$$y = -\frac{c_1\left(\int e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}dx\right) + c_2 + xc_1e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}}{x\left(c_1\left(\int e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}dx\right) + c_2\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-c_3\left(\int e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}dx\right) - 1 - xc_3e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}}{x\left(c_3\left(\int e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}dx\right) + 1\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{-c_3\left(\int e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}dx\right)-1-xc_3 e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}}{x\left(c_3\left(\int e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}dx\right)+1\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-c_3\left(\int e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}dx\right)-1-xc_3 e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}}{x\left(c_3\left(\int e^{\int \frac{\cosh(bx)^m a\,x^2-2}{x}dx}dx\right)+1\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.4-1. Equations with hyperbolic sine and cosine
Problem number: 11.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \left(a \cosh\left(\lambda x\right)^{2}-\lambda\right) y^{2} = -a \cosh\left(\lambda x\right)^{2}+a+\lambda}$$

5.11.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y)\\ &= \cosh\left(\lambda x\right)^{2} a\, y^{2}-a \cosh\left(\lambda x\right)^{2}-\lambda\, y^{2}+a+\lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \cosh\left(\lambda x\right)^{2} a\, y^{2}-a \cosh\left(\lambda x\right)^{2}-\lambda\, y^{2}+a+\lambda$$

With Riccati ODE standard form

$$y' = f_0(x)+ f_1(x)y+f_2(x)y^{2}$$

Shows that $f_0(x)=-a \cosh\left(\lambda x\right)^{2}+a+\lambda$, $f_1(x)=0$ and $f_2(x)=a \cosh\left(\lambda x\right)^{2}-\lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u}\\ &= \frac{-u'}{\left(a \cosh\left(\lambda x\right)^{2}-\lambda\right) u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= 2a \sinh(\lambda x)\, \lambda \cosh(\lambda x) \\
f_1 f_2 &= 0 \\
f_2^2 f_0 &= \left(a \cosh(\lambda x)^2 - \lambda\right)^2 \left(-a \cosh(\lambda x)^2 + a + \lambda\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\left(a \cosh(\lambda x)^2 - \lambda\right) u''(x) - 2a \sinh(\lambda x)\, \lambda \cosh(\lambda x)\, u'(x) + \left(a \cosh(\lambda x)^2 - \lambda\right)^2 \left(-a \cosh(\lambda x)^2 + a + \lambda\right) u$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = -2\, \mathrm{e}^{-\frac{\cosh(2\lambda x) a}{4\lambda}} \left(c_2 \lambda \left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x) a}{2\lambda}} \left(a - \operatorname{sech}(\lambda x)^2 \lambda\right) dx\right) - \frac{c_1}{2}\right) \cosh(\lambda x)$$

The above shows that

$$\begin{aligned}
u'(x) = {} & \left(a \cosh(\lambda x)^2\right. \\
& \left. - \lambda\right) \operatorname{sech}(\lambda x) \left(\sinh(2\lambda x) \left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x) a}{2\lambda}} \left(a - \operatorname{sech}(\lambda x)^2 \lambda\right) dx\right) c_2 \lambda\, \mathrm{e}^{-\frac{\cosh(2\lambda x) a}{4\lambda}}\right. \\
& \left. - \frac{\sinh(2\lambda x)\, c_1 \mathrm{e}^{-\frac{\cosh(2\lambda x) a}{4\lambda}}}{2} + 2 c_2 \lambda\, \mathrm{e}^{\frac{\cosh(2\lambda x) a}{4\lambda}}\right)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = \frac{\operatorname{sech}(\lambda x) \left(\sinh(2\lambda x) \left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x) a}{2\lambda}} \left(a - \operatorname{sech}(\lambda x)^2 \lambda\right) dx\right) c_2 \lambda\, \mathrm{e}^{-\frac{\cosh(2\lambda x) a}{4\lambda}} - \frac{\sinh(2\lambda x) c_1 \mathrm{e}^{-\frac{\cosh(2\lambda x) a}{4\lambda}}}{2} + 2 c_2 \lambda\, \mathrm{e}\right.}{2 \left(c_2 \lambda \left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x) a}{2\lambda}} \left(a - \operatorname{sech}(\lambda x)^2 \lambda\right) dx\right) - \frac{c_1}{2}\right) \cosh(\lambda x)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-2\,\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\,\mathrm{sech}\left(\lambda x\right)^{2}\lambda - 2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a-\mathrm{sech}\left(\lambda x\right)^{2}\lambda\right)dx\right)\tanh\left(\lambda x\right) + c_3\tanh\left(\lambda x\right)}{-2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a-\mathrm{sech}\left(\lambda x\right)^{2}\lambda\right)dx\right) + c_3}$$

Summary

The solution(s) found are the following

$$y = \frac{-2\,\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\,\mathrm{sech}\left(\lambda x\right)^{2}\lambda - 2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a-\mathrm{sech}\left(\lambda x\right)^{2}\lambda\right)dx\right)\tanh\left(\lambda x\right) + c_3\tanh\left(\lambda x\right)}{-2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a-\mathrm{sech}\left(\lambda x\right)^{2}\lambda\right)dx\right) + c_3} \tag{1}$$

Verification of solutions

$$y = \frac{-2\,\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\,\mathrm{sech}\left(\lambda x\right)^{2}\lambda - 2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a-\mathrm{sech}\left(\lambda x\right)^{2}\lambda\right)dx\right)\tanh\left(\lambda x\right) + c_3\tanh\left(\lambda x\right)}{-2\lambda\left(\int -\mathrm{e}^{\frac{\cosh(2\lambda x)a}{2\lambda}}\left(a-\mathrm{sech}\left(\lambda x\right)^{2}\lambda\right)dx\right) + c_3}$$

Verified OK.

Problem number: 12.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{2y' - (a-\lambda+a\cosh(\lambda x))\,y^2 = a+\lambda-a\cosh(\lambda x)}$$

5.12.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{\cosh(\lambda x)\,a\,y^2}{2} + \frac{a\,y^2}{2} - \frac{\lambda\,y^2}{2} + \frac{a}{2} + \frac{\lambda}{2} - \frac{a\cosh(\lambda x)}{2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{\cosh(\lambda x)\,a\,y^2}{2} + \frac{a\,y^2}{2} - \frac{\lambda\,y^2}{2} + \frac{a}{2} + \frac{\lambda}{2} - \frac{a\cosh(\lambda x)}{2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{a}{2} + \frac{\lambda}{2} - \frac{a\cosh(\lambda x)}{2}$, $f_1(x) = 0$ and $f_2(x) = \frac{a}{2} - \frac{\lambda}{2} + \frac{a\cosh(\lambda x)}{2}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\left(\frac{a}{2} - \frac{\lambda}{2} + \frac{a\cosh(\lambda x)}{2}\right) u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{a\lambda \sinh(\lambda x)}{2} \\
f_1 f_2 &= 0 \\
f_2^2 f_0 &= \left(\frac{a}{2} - \frac{\lambda}{2} + \frac{a\cosh(\lambda x)}{2}\right)^2 \left(\frac{a}{2} + \frac{\lambda}{2} - \frac{a\cosh(\lambda x)}{2}\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\left(\frac{a}{2} - \frac{\lambda}{2} + \frac{a\cosh(\lambda x)}{2}\right) u''(x) - \frac{a\lambda \sinh(\lambda x) u'(x)}{2} + \left(\frac{a}{2} - \frac{\lambda}{2} + \frac{a\cosh(\lambda x)}{2}\right)^2 \left(\frac{a}{2} + \frac{\lambda}{2} - \frac{a\cosh(\lambda x)}{2}\right) u$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = -\frac{\cosh\left(\frac{\lambda x}{2}\right) e^{-\frac{\cosh(\lambda x)a}{2\lambda}} \left(c_2 \lambda \left(\int e^{\frac{\cosh(\lambda x)a}{\lambda}} \left(-2a + \operatorname{sech}\left(\frac{\lambda x}{2}\right)^2 \lambda\right) dx\right) - 2c_1\right)}{2}$$

The above shows that

$$u'(x) = \frac{\operatorname{sech}\left(\frac{\lambda x}{2}\right) (a - \lambda + a\cosh(\lambda x)) \left(4 e^{\frac{\cosh(\lambda x)a}{2\lambda}} c_2 \lambda + \sinh(\lambda x) \left(\int e^{\frac{\cosh(\lambda x)a}{\lambda}} \left(-2a + \operatorname{sech}\left(\frac{\lambda x}{2}\right)^2 \lambda\right) dx\right) c_2 \lambda e^{-}\right.}{8}$$

Using the above in (1) gives the solution

$$y = \frac{\operatorname{sech}\left(\frac{\lambda x}{2}\right) (a - \lambda + a\cosh(\lambda x)) \left(4 e^{\frac{\cosh(\lambda x)a}{2\lambda}} c_2 \lambda + \sinh(\lambda x) \left(\int e^{\frac{\cosh(\lambda x)a}{\lambda}} \left(-2a + \operatorname{sech}\left(\frac{\lambda x}{2}\right)^2 \lambda\right) dx\right) c_2 \lambda e^{-}\right.}{4 \left(\frac{a}{2} - \frac{\lambda}{2} + \frac{a\cosh(\lambda x)}{2}\right) \cosh\left(\frac{\lambda x}{2}\right) \left(c_2 \lambda \left(\int e^{\frac{\cosh(\lambda x)a}{\lambda}} \left(-2a + \operatorname{sech}\left(\frac{\lambda x}{2}\right)^2 \lambda\right) d\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\operatorname{sech}\left(\frac{\lambda x}{2}\right)^2 \left(4 e^{\frac{\cosh(\lambda x)a}{\lambda}} \lambda + \lambda \left(\int e^{\frac{\cosh(\lambda x)a}{\lambda}} \left(-2a + \operatorname{sech}\left(\frac{\lambda x}{2}\right)^2 \lambda\right) dx\right) \sinh(\lambda x) - 2c_3 \sinh(\lambda x)\right)}{2\lambda \left(\int e^{\frac{\cosh(\lambda x)a}{\lambda}} \left(-2a + \operatorname{sech}\left(\frac{\lambda x}{2}\right)^2 \lambda\right) dx\right) - 4c_3}$$

Summary
The solution(s) found are the following

$$y = \frac{\operatorname{sech}\left(\frac{\lambda x}{2}\right)^{2} \left(4\,{\mathrm e}^{\frac{\cosh(\lambda x) a}{\lambda}} \lambda +\lambda \left(\int {\mathrm e}^{\frac{\cosh(\lambda x) a}{\lambda}} \left(-2 a +\operatorname{sech}\left(\frac{\lambda x}{2}\right)^{2} \lambda \right)d x \right) \sinh\left(\lambda x \right)-2 c_{3} \sinh\left(\lambda x \right)\right)}{2 \lambda \left(\int {\mathrm e}^{\frac{\cosh(\lambda x) a}{\lambda}} \left(-2 a +\operatorname{sech}\left(\frac{\lambda x}{2}\right)^{2} \lambda \right)d x \right)-4 c_{3}} \tag{1}$$

Verification of solutions

$$y = \frac{\operatorname{sech}\left(\frac{\lambda x}{2}\right)^{2} \left(4\,{\mathrm e}^{\frac{\cosh(\lambda x) a}{\lambda}} \lambda +\lambda \left(\int {\mathrm e}^{\frac{\cosh(\lambda x) a}{\lambda}} \left(-2 a +\operatorname{sech}\left(\frac{\lambda x}{2}\right)^{2} \lambda \right)d x \right) \sinh\left(\lambda x \right)-2 c_{3} \sinh\left(\lambda x \right)\right)}{2 \lambda \left(\int {\mathrm e}^{\frac{\cosh(\lambda x) a}{\lambda}} \left(-2 a +\operatorname{sech}\left(\frac{\lambda x}{2}\right)^{2} \lambda \right)d x \right)-4 c_{3}}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = -\lambda^2 + a\cosh(\lambda x)^n \sinh(\lambda x)^{-n-4}}$$

5.13.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 - \lambda^2 + a\cosh(\lambda x)^n \sinh(\lambda x)^{-n-4} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 - \lambda^2 + \frac{a\cosh(\lambda x)^n \sinh(\lambda x)^{-n}}{\sinh(\lambda x)^4}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\lambda^2 + a\cosh(\lambda x)^n \sinh(\lambda x)^{-n-4}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= -\lambda^2 + a \cosh(\lambda x)^n \sinh(\lambda x)^{-n-4} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-\lambda^2 + a \cosh(\lambda x)^n \sinh(\lambda x)^{-n-4}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\cosh(\lambda x)^n \sinh(\lambda x)^{-n-4} \_Y(x)\, a - \_Y(x)\, \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\cosh(\lambda x)^n \sinh(\lambda x)^{-n-4} \_Y(x)\, a - \_Y(x)\, \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\cosh(\lambda x)^n \sinh(\lambda x)^{-n-4} \_Y(x)\, a - \_Y(x)\, \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\cosh(\lambda x)^n \sinh(\lambda x)^{-n-4} \_Y(x)\, a - \_Y(x)\, \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\cosh(\lambda x)^n \sinh(\lambda x)^{-n-4} \_Y(x)\, a - \_Y(x)\, \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\cosh(\lambda x)^n \sinh(\lambda x)^{-n-4} \_Y(x)\, a - \_Y(x)\, \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\cosh(\lambda x)^n \sinh(\lambda x)^{-n-4} \_Y(x)\, a - \_Y(x)\, \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\cosh(\lambda x)^n \sinh(\lambda x)^{-n-4} \_Y(x)\, a - \_Y(x)\, \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x} \operatorname{DESol}\left(\left\{\cosh(\lambda x)^n \sinh(\lambda x)^{-n-4} \_Y(x)\, a - \_Y(x)\, \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}{\operatorname{DESol}\left(\left\{\cosh(\lambda x)^n \sinh(\lambda x)^{-n-4} \_Y(x)\, a - \_Y(x)\, \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \sinh(\lambda x) y^2 a = b \sinh(\lambda x) \cosh(\lambda x)^n}$$

5.14.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \sinh(\lambda x) y^2 a + b \sinh(\lambda x) \cosh(\lambda x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \sinh(\lambda x) y^2 a + b \sinh(\lambda x) \cosh(\lambda x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b \sinh(\lambda x) \cosh(\lambda x)^n$, $f_1(x) = 0$ and $f_2(x) = a \sinh(\lambda x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{a \sinh(\lambda x) u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= a\lambda \cosh(\lambda x) \\ f_1f_2 &= 0 \\ f_2^2 f_0 &= a^2 \sinh(\lambda x)^3\, b\cosh(\lambda x)^n \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$a\sinh(\lambda x)\,u''(x) - a\lambda\cosh(\lambda x)\,u'(x) + a^2\sinh(\lambda x)^3\, b\cosh(\lambda x)^n\, u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \sqrt{\cosh(\lambda x)}\left(c_1 \operatorname{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right) + c_2 \operatorname{BesselY}\left(\frac{1}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right)\right)$$

The above shows that

$$u'(x) = -\frac{\left(\sqrt{a}\,\sqrt{b}\,\operatorname{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right)\cosh(\lambda x)^{1+\frac{n}{2}}\,c_1 + \operatorname{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right)\sqrt{a}\,\sqrt{b}\,\mathrm{c}\right.}{\sqrt{\mathrm{c}}}$$

Using the above in (1) gives the solution

$$y = \frac{\sqrt{a}\,\sqrt{b}\,\operatorname{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right)\cosh(\lambda x)^{1+\frac{n}{2}}\,c_1 + \operatorname{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right)\sqrt{a}\,\sqrt{b}\,\cosh}{\cosh(\lambda x)\,a\left(c_1 \operatorname{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right) + \right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(-\sqrt{b}\left(\text{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right) c_3 + \text{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right)\right) \cosh(\lambda x)^{1+\frac{n}{2}} \sqrt{a} + \lambda}{\left(c_3 \text{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right) + \text{Bessel}}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(-\sqrt{b}\left(\text{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right) c_3 + \text{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right)\right) \cosh(\lambda x)^{1+\frac{n}{2}} \sqrt{a} + \lambda}{\left(c_3 \text{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right) + \text{Bessel}} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(-\sqrt{b}\left(\text{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right) c_3 + \text{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right)\right) \cosh(\lambda x)^{1+\frac{n}{2}} \sqrt{a} + \lambda}{\left(c_3 \text{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{a}\,\sqrt{b}\,\cosh(\lambda x)^{1+\frac{n}{2}}}{\lambda(2+n)}\right) + \text{Bessel}}$$

Verified OK.

ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 \cosh(\lambda x)\, a = b \cosh(\lambda x) \sinh(\lambda x)^n}$$

5.15.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \cosh(\lambda x)\, a\, y^2 + b \cosh(\lambda x) \sinh(\lambda x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \cosh(\lambda x)\, a\, y^2 + b \cosh(\lambda x) \sinh(\lambda x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = b \cosh(\lambda x) \sinh(\lambda x)^n$, $f_1(x) = 0$ and $f_2(x) = a \cosh(\lambda x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{a \cosh(\lambda x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= a\lambda \sinh(\lambda x) \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= a^2 \cosh(\lambda x)^3\, b \sinh(\lambda x)^n \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$a \cosh(\lambda x)\, u''(x) - a\lambda \sinh(\lambda x)\, u'(x) + a^2 \cosh(\lambda x)^3\, b \sinh(\lambda x)^n\, u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{-\csc\left(\frac{\pi(n+3)}{2+n}\right) c_1 \operatorname{BesselI}\left(-\frac{1}{2+n}, 2\sqrt{-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) \pi \left(-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{1}{4+2n}} + c_2 \sinh(\lambda x) \operatorname{BesselI}\left(\frac{1}{2+n}, 2\right.}{(2+n)\,\Gamma\left(\frac{n+3}{2+n}\right)}$$

The above shows that

$$u'(x) = \frac{\left(\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} c_2 \cosh(\lambda x)(2+n) \operatorname{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) + \cosh(\lambda x)\, c_2 \operatorname{Bess}\right.}{}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} c_2 \cosh(\lambda x)(2+n) \operatorname{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) + \cosh(\lambda x)\, c_2 \operatorname{Be}\right.}{a\cosh(\lambda x)\left(-\csc\left(\frac{\pi(n+3)}{2+n}\right) c_1 \operatorname{BesselI}\left(-\frac{1}{2+n}, 2\sqrt{-\frac{ab\sinh(\lambda x)^{2}}{\lambda^2(2+n)^2}}\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\lambda(2+n)\left(\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} (2+n)\,\mathrm{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) - \operatorname{csch}(\lambda x)\,\pi c_3 \csc\left(\right.\right.}{\left(-\csc\left(\frac{\pi(n+3)}{2+n}\right) c_3\,\mathrm{BesselI}\left(-\frac{1}{2+n}, 2\sqrt{-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right)\pi\left(-\frac{ab\sinh(\lambda x)}{\lambda^2(2+n)}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\lambda(2+n)\left(\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} (2+n)\,\mathrm{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) - \operatorname{csch}(\lambda x)\,\pi c_3 \csc\left(\right.\right.}{\left(-\csc\left(\frac{\pi(n+3)}{2+n}\right) c_3\,\mathrm{BesselI}\left(-\frac{1}{2+n}, 2\sqrt{-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right)\pi\left(-\frac{ab\sinh(\lambda x)}{\lambda^2(2+n)}\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\lambda(2+n)\left(\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} (2+n)\,\mathrm{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) - \operatorname{csch}(\lambda x)\,\pi c_3 \csc\left(\right.\right.}{\left(-\csc\left(\frac{\pi(n+3)}{2+n}\right) c_3\,\mathrm{BesselI}\left(-\frac{1}{2+n}, 2\sqrt{-\frac{ab\sinh(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right)\pi\left(-\frac{ab\sinh(\lambda x)}{\lambda^2(2+n)}\right.\right.}$$

Verified OK.

Problem number: 16.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$
\boxed{(a\cosh(\lambda x)+b)\,y'-y^2-c\cosh(x\mu)\,y=-d^2+cd\cosh(x\mu)}
$$

5.16.1 Solving as riccati ode

In canonical form the ODE is

$$
\begin{aligned}
y' &= F(x,y)\\
&= \frac{y^2+c\cosh(x\mu)\,y-d^2+cd\cosh(x\mu)}{a\cosh(\lambda x)+b}
\end{aligned}
$$

This is a Riccati ODE. Comparing the ODE to solve

$$
y'=\frac{cd\cosh(x\mu)}{a\cosh(\lambda x)+b}+\frac{c\cosh(x\mu)\,y}{a\cosh(\lambda x)+b}-\frac{d^2}{a\cosh(\lambda x)+b}+\frac{y^2}{a\cosh(\lambda x)+b}
$$

With Riccati ODE standard form

$$
y'=f_0(x)+f_1(x)y+f_2(x)y^2
$$

Shows that $f_0(x) = \frac{-d^2+cd\cosh(x\mu)}{a\cosh(\lambda x)+b}$, $f_1(x) = \frac{c\cosh(x\mu)}{a\cosh(\lambda x)+b}$ and $f_2(x) = \frac{1}{a\cosh(\lambda x)+b}$. Let

$$
\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{\frac{u}{a\cosh(\lambda x)+b}}
\end{aligned} \tag{1}
$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$
f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}
$$

But

$$
\begin{aligned}
f_2' &= -\frac{a\lambda \sinh(\lambda x)}{(a\cosh(\lambda x)+b)^2} \\
f_1 f_2 &= \frac{c\cosh(x\mu)}{(a\cosh(\lambda x)+b)^2} \\
f_2^2 f_0 &= \frac{-d^2 + cd\cosh(x\mu)}{(a\cosh(\lambda x)+b)^3}
\end{aligned}
$$

Substituting the above terms back in equation (2) gives

$$
\frac{u''(x)}{a\cosh(\lambda x)+b} - \left(-\frac{a\lambda\sinh(\lambda x)}{(a\cosh(\lambda x)+b)^2} + \frac{c\cosh(x\mu)}{(a\cosh(\lambda x)+b)^2}\right) u'(x) + \frac{(-d^2+cd\cosh(x\mu))\, u(x)}{(a\cosh(\lambda x)+b)^3} = 0
$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

Problem number: 17.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

[_Riccati]

$$\boxed{(a\cosh(\lambda x)+b)\left(y'-y^2\right)=-a\,\lambda^2\cosh(\lambda x)}$$

5.17.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{\cosh(\lambda x)\,a\,y^2-a\,\lambda^2\cosh(\lambda x)+y^2b}{a\cosh(\lambda x)+b} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=-\frac{a\,\lambda^2\cosh(\lambda x)}{a\cosh(\lambda x)+b}+\frac{\cosh(\lambda x)\,a\,y^2}{a\cosh(\lambda x)+b}+\frac{y^2b}{a\cosh(\lambda x)+b}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=-\frac{a\,\lambda^2\cosh(\lambda x)}{a\cosh(\lambda x)+b}$, $f_1(x)=0$ and $f_2(x)=1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= -\frac{a\,\lambda^2 \cosh(\lambda x)}{a\cosh(\lambda x) + b} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \frac{a\,\lambda^2 \cosh(\lambda x)\,u(x)}{a\cosh(\lambda x) + b} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = -2c_1\left(a\cosh\left(\frac{\lambda x}{2}\right)^2 - \frac{a}{2} + \frac{b}{2}\right) b \arctan\left(\frac{\tanh\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right) \\ + \sinh\left(\frac{\lambda x}{2}\right)\cosh\left(\frac{\lambda x}{2}\right)\sqrt{a^2-b^2}\,c_1 a + 2c_2\left(a\cosh\left(\frac{\lambda x}{2}\right)^2 - \frac{a}{2} + \frac{b}{2}\right) \end{aligned}$$

The above shows that

$$u'(x) = \frac{\left(-2c_1 a\cosh\left(\frac{\lambda x}{2}\right)\sinh\left(\frac{\lambda x}{2}\right) b\arctan\left(\frac{\tanh\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right)\sqrt{a^2-b^2} + 2\sinh\left(\frac{\lambda x}{2}\right) c_2 a\cosh\left(\frac{\lambda x}{2}\right)\sqrt{a^2-b^2} + c_1}{\sqrt{a^2-b^2}}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-2c_1 a\cosh\left(\frac{\lambda x}{2}\right)\sinh\left(\frac{\lambda x}{2}\right) b\arctan\left(\frac{\tanh\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right)\sqrt{a^2-b^2} + 2\sinh\left(\frac{\lambda x}{2}\right) c_2 a\cosh\left(\frac{\lambda x}{2}\right)\sqrt{a^2-b^2} +}{\sqrt{a^2-b^2}\left(-2c_1\left(a\cosh\left(\frac{\lambda x}{2}\right)^2 - \frac{a}{2} + \frac{b}{2}\right) b\arctan\left(\frac{\tanh\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right) + \sinh\left(\frac{\lambda x}{2}\right)\cosh\left(\frac{\lambda x}{2}\right)\sqrt{a^2 -}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\lambda\left(-2c_3 a\cosh\left(\frac{\lambda x}{2}\right)\sinh\left(\frac{\lambda x}{2}\right) b\arctan\left(\frac{\tanh\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right)\sqrt{a^2-b^2} + 2\sinh\left(\frac{\lambda x}{2}\right)\cosh\left(\frac{\lambda x}{2}\right)\sqrt{a^2-b^2}\, a + c_3(}{\sqrt{a^2-b^2}\,\left(2c_3\left(a\cosh\left(\frac{\lambda x}{2}\right)^2 - \frac{a}{2} + \frac{b}{2}\right) b\arctan\left(\frac{\tanh\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right) - \sinh\left(\frac{\lambda x}{2}\right)\cosh\left(\frac{\lambda x}{2}\right)\sqrt{a^2-b}}$$

Summary

The solution(s) found are the following

$$y = \frac{\lambda\left(-2c_3 a\cosh\left(\frac{\lambda x}{2}\right)\sinh\left(\frac{\lambda x}{2}\right) b\arctan\left(\frac{\tanh\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right)\sqrt{a^2-b^2} + 2\sinh\left(\frac{\lambda x}{2}\right)\cosh\left(\frac{\lambda x}{2}\right)\sqrt{a^2-b^2}\, a + c_3(}{\sqrt{a^2-b^2}\,\left(2c_3\left(a\cosh\left(\frac{\lambda x}{2}\right)^2 - \frac{a}{2} + \frac{b}{2}\right) b\arctan\left(\frac{\tanh\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right) - \sinh\left(\frac{\lambda x}{2}\right)\cosh\left(\frac{\lambda x}{2}\right)\sqrt{a^2-b}} \tag{1}$$

Verification of solutions

$$y = \frac{\lambda\left(-2c_3 a\cosh\left(\frac{\lambda x}{2}\right)\sinh\left(\frac{\lambda x}{2}\right) b\arctan\left(\frac{\tanh\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right)\sqrt{a^2-b^2} + 2\sinh\left(\frac{\lambda x}{2}\right)\cosh\left(\frac{\lambda x}{2}\right)\sqrt{a^2-b^2}\, a + c_3(}{\sqrt{a^2-b^2}\,\left(2c_3\left(a\cosh\left(\frac{\lambda x}{2}\right)^2 - \frac{a}{2} + \frac{b}{2}\right) b\arctan\left(\frac{\tanh\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right) - \sinh\left(\frac{\lambda x}{2}\right)\cosh\left(\frac{\lambda x}{2}\right)\sqrt{a^2-b}}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = \lambda a - a(a+\lambda)\tanh(\lambda x)^2}$$

6.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -a^2 \tanh(\lambda x)^2 - a\tanh(\lambda x)^2 \lambda + \lambda a + y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2 \tanh(\lambda x)^2 - a\tanh(\lambda x)^2 \lambda + \lambda a + y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2 \tanh(\lambda x)^2 - a\tanh(\lambda x)^2 \lambda + \lambda a$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= 0\\
f_1 f_2 &= 0\\
f_2^2 f_0 &= -a^2 \tanh(\lambda x)^2 - a \tanh(\lambda x)^2 \lambda + \lambda a
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-a^2 \tanh(\lambda x)^2 - a \tanh(\lambda x)^2 \lambda + \lambda a\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right) + c_2 \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right)$$

The above shows that

$$\begin{aligned}
u'(x) = &- \operatorname{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right) c_1 \lambda\\
&- \operatorname{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right) c_2 \lambda\\
&+ \tanh(\lambda x) \left(c_1 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right)\right.\\
&\left.\qquad + c_2 \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right)\right) (a+\lambda)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{-\operatorname{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right) c_1 \lambda - \operatorname{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right) c_2 \lambda + \tanh(\lambda x) \left(c_1 \operatorname{LegendreP}\right.}{c_1 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right) + c_2 \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a}{\lambda}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\operatorname{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right) c_3 \lambda + \operatorname{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right) \lambda - \tanh(\lambda x) \left(c_3 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda},\right.\right.}{c_3 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right) + \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \tanh(\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{\operatorname{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right) c_3\lambda + \operatorname{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right)\lambda - \tanh(\lambda x)\left(c_3 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda},\right.\right.}{c_3 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right) + \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \tanh(\right.} \quad (1)$$

Verification of solutions

$$y = \frac{\operatorname{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right) c_3\lambda + \operatorname{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right)\lambda - \tanh(\lambda x)\left(c_3 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda},\right.\right.}{c_3 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \tanh(\lambda x)\right) + \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \tanh(\right.}$$

Verified OK.

Problem number: 19.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = 3\lambda a - \lambda^2 - a(a+\lambda)\tanh(\lambda x)^2}$$

6.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -a^2\tanh(\lambda x)^2 - a\tanh(\lambda x)^2\lambda + 3\lambda a - \lambda^2 + y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2\tanh(\lambda x)^2 - a\tanh(\lambda x)^2\lambda + 3\lambda a - \lambda^2 + y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2\tanh(\lambda x)^2 - a\tanh(\lambda x)^2\lambda + 3\lambda a - \lambda^2$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= 0 \\
f_1 f_2 &= 0 \\
f_2^2 f_0 &= -a^2 \tanh(\lambda x)^2 - a \tanh(\lambda x)^2 \lambda + 3\lambda a - \lambda^2
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-a^2 \tanh(\lambda x)^2 - a \tanh(\lambda x)^2 \lambda + 3\lambda a - \lambda^2\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \,\mathrm{LegendreP}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right) + c_2 \,\mathrm{LegendreQ}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right)$$

The above shows that

$$\begin{aligned}
u'(x) = &-2 \,\mathrm{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right) c_1 \lambda \\
&- 2 \,\mathrm{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right) c_2 \lambda \\
&+ \tanh(\lambda x) \left(c_1 \,\mathrm{LegendreP}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right) \right. \\
&\left. + c_2 \,\mathrm{LegendreQ}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right)\right) (a+\lambda)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{-2 \,\mathrm{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right) c_1 \lambda - 2 \,\mathrm{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right) c_2 \lambda + \tanh(\lambda x) \left(c_1 \,\mathrm{Leg}\right.}{c_1 \,\mathrm{LegendreP}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right) + c_2 \,\mathrm{LegendreQ}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{2\,\mathrm{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right) c_3\lambda + 2\,\mathrm{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right)\lambda - \tanh(\lambda x)\left(c_3\,\mathrm{Legendre}\right.}{c_3\,\mathrm{LegendreP}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right) + \mathrm{LegendreQ}\left(\frac{a}{\lambda}, \frac{a-}{\lambda}\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{2\,\mathrm{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right) c_3\lambda + 2\,\mathrm{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right)\lambda - \tanh(\lambda x)\left(c_3\,\mathrm{Legendre}\right.}{c_3\,\mathrm{LegendreP}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right) + \mathrm{LegendreQ}\left(\frac{a}{\lambda}, \frac{a-}{\lambda}\right.} \tag{1}$$

Verification of solutions

$$y = \frac{2\,\mathrm{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right) c_3\lambda + 2\,\mathrm{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right)\lambda - \tanh(\lambda x)\left(c_3\,\mathrm{Legendre}\right.}{c_3\,\mathrm{LegendreP}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \tanh(\lambda x)\right) + \mathrm{LegendreQ}\left(\frac{a}{\lambda}, \frac{a-}{\lambda}\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.4-2. Equations with hyperbolic tangent and cotangent.
Problem number: 20.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 - ax\tanh(bx)^m y = a\tanh(bx)^m}$$

6.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + ax\tanh(bx)^m y + a\tanh(bx)^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + ax\tanh(bx)^m y + a\tanh(bx)^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\tanh(bx)^m$, $f_1(x) = \tanh(bx)^m ax$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= \tanh(bx)^m ax \\ f_2^2 f_0 &= a\tanh(bx)^m \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \tanh(bx)^m axu'(x) + a\tanh(bx)^m u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x\left(c_1\left(\int e^{\int \frac{\tanh(bx)^m a x^2 - 2}{x}dx}dx\right) + c_2\right)$$

The above shows that

$$u'(x) = c_1\left(\int e^{\int \frac{\tanh(bx)^m a x^2 - 2}{x}dx}dx\right) + c_2 + xc_1 e^{\int \frac{\tanh(bx)^m a x^2 - 2}{x}dx}$$

Using the above in (1) gives the solution

$$y = -\frac{c_1\left(\int e^{\int \frac{\tanh(bx)^m a x^2 - 2}{x}dx}dx\right) + c_2 + xc_1 e^{\int \frac{\tanh(bx)^m a x^2 - 2}{x}dx}}{x\left(c_1\left(\int e^{\int \frac{\tanh(bx)^m a x^2 - 2}{x}dx}dx\right) + c_2\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-c_3\left(\int e^{\int \frac{\tanh(bx)^m a x^2 - 2}{x}dx}dx\right) - 1 - xc_3 e^{\int \frac{\tanh(bx)^m a x^2 - 2}{x}dx}}{x\left(c_3\left(\int e^{\int \frac{\tanh(bx)^m a x^2 - 2}{x}dx}dx\right) + 1\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{-c_3\left(\int e^{\int \frac{\tanh(bx)^m a\,x^2-2}{x}dx}dx\right)-1-xc_3 e^{\int \frac{\tanh(bx)^m a\,x^2-2}{x}dx}}{x\left(c_3\left(\int e^{\int \frac{\tanh(bx)^m a\,x^2-2}{x}dx}dx\right)+1\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-c_3\left(\int e^{\int \frac{\tanh(bx)^m a\,x^2-2}{x}dx}dx\right)-1-xc_3 e^{\int \frac{\tanh(bx)^m a\,x^2-2}{x}dx}}{x\left(c_3\left(\int e^{\int \frac{\tanh(bx)^m a\,x^2-2}{x}dx}dx\right)+1\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.4-2. Equations with hyperbolic tangent and cotangent.
Problem number: 21.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$\boxed{(a\tanh(\lambda x)+b)\,y'-y^2-c\tanh(x\mu)\,y=-d^2+cd\tanh(x\mu)}$$

6.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y)\\ &= \frac{y^2+c\tanh(x\mu)\,y-d^2+cd\tanh(x\mu)}{a\tanh(\lambda x)+b}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=\frac{cd\tanh(x\mu)}{a\tanh(\lambda x)+b}+\frac{c\tanh(x\mu)\,y}{a\tanh(\lambda x)+b}-\frac{d^2}{a\tanh(\lambda x)+b}+\frac{y^2}{a\tanh(\lambda x)+b}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x) = \frac{-d^2+cd\tanh(x\mu)}{a\tanh(\lambda x)+b}$, $f_1(x) = \frac{c\tanh(x\mu)}{a\tanh(\lambda x)+b}$ and $f_2(x) = \frac{1}{a\tanh(\lambda x)+b}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{u}{a\tanh(\lambda x)+b}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{a\lambda\left(1-\tanh(\lambda x)^2\right)}{(a\tanh(\lambda x)+b)^2} \\ f_1 f_2 &= \frac{c\tanh(x\mu)}{(a\tanh(\lambda x)+b)^2} \\ f_2^2 f_0 &= \frac{-d^2+cd\tanh(x\mu)}{(a\tanh(\lambda x)+b)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{u''(x)}{a\tanh(\lambda x)+b} - \left(-\frac{a\lambda\left(1-\tanh(\lambda x)^2\right)}{(a\tanh(\lambda x)+b)^2} + \frac{c\tanh(x\mu)}{(a\tanh(\lambda x)+b)^2}\right) u'(x) + \frac{(-d^2+cd\tanh(x\mu))\, u(x)}{(a\tanh(\lambda x)+b)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 = \lambda a - a(a + \lambda) \coth(\lambda x)^2}$$

6.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= -a^2 \coth(\lambda x)^2 - a \coth(\lambda x)^2 \lambda + \lambda a + y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2 \coth(\lambda x)^2 - a \coth(\lambda x)^2 \lambda + \lambda a + y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2 \coth(\lambda x)^2 - a \coth(\lambda x)^2 \lambda + \lambda a$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2 f_0 &= -a^2\coth(\lambda x)^2 - a\coth(\lambda x)^2\lambda + \lambda a \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-a^2\coth(\lambda x)^2 - a\coth(\lambda x)^2\lambda + \lambda a\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right) + c_2 \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right)$$

The above shows that

$$\begin{aligned} u'(x) = &-\operatorname{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right)c_1\lambda - \operatorname{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right)c_2\lambda \\ &+ \coth(\lambda x)\left(c_1 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right)\right. \\ &\left.+ c_2 \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right)\right)(a+\lambda) \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{-\operatorname{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right)c_1\lambda - \operatorname{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right)c_2\lambda + \coth(\lambda x)\left(c_1 \operatorname{LegendreP}\right.}{c_1 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right) + c_2 \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a}{\lambda},\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\operatorname{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right)c_3\lambda + \operatorname{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right)\lambda - \coth(\lambda x)\left(c_3 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda},\right.\right.}{c_3 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right) + \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \coth(\right.}$$

Summary
The solution(s) found are the following

$$y = \frac{\operatorname{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right) c_3\lambda + \operatorname{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right)\lambda - \coth(\lambda x)\left(c_3 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, c\right.\right.}{c_3 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right) + \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \coth(\lambda\right.} \quad (1)$$

Verification of solutions

$$y = \frac{\operatorname{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right) c_3\lambda + \operatorname{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right)\lambda - \coth(\lambda x)\left(c_3 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, c\right.\right.}{c_3 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \coth(\lambda x)\right) + \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a}{\lambda}, \coth(\lambda\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = 3\lambda a - \lambda^2 - a(a+\lambda)\coth(\lambda x)^2}$$

6.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -a^2\coth(\lambda x)^2 - a\coth(\lambda x)^2\lambda + 3\lambda a - \lambda^2 + y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2\coth(\lambda x)^2 - a\coth(\lambda x)^2\lambda + 3\lambda a - \lambda^2 + y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2\coth(\lambda x)^2 - a\coth(\lambda x)^2\lambda + 3\lambda a - \lambda^2$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= -a^2 \coth(\lambda x)^2 - a \coth(\lambda x)^2 \lambda + 3\lambda a - \lambda^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-a^2 \coth(\lambda x)^2 - a \coth(\lambda x)^2 \lambda + 3\lambda a - \lambda^2\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) + c_2 \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right)$$

The above shows that

$$\begin{aligned} u'(x) = &-2 \operatorname{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) c_1 \lambda \\ &- 2 \operatorname{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) c_2 \lambda \\ &+ \coth(\lambda x) \left(c_1 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) \right. \\ &\left. + c_2 \operatorname{LegendreQ}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right)\right) (a+\lambda) \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{-2 \operatorname{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) c_1 \lambda - 2 \operatorname{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) c_2 \lambda + \coth(\lambda x) \left(c_1 \operatorname{Lege}\right.}{c_1 \operatorname{LegendreP}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) + c_2 \operatorname{LegendreQ}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{2\,\text{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) c_3 \lambda + 2\,\text{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) \lambda - \coth(\lambda x) \left(c_3\,\text{LegendreP}\right.}{c_3\,\text{LegendreP}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) + \text{LegendreQ}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{2\,\text{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) c_3 \lambda + 2\,\text{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) \lambda - \coth(\lambda x) \left(c_3\,\text{LegendreP}\right.}{c_3\,\text{LegendreP}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) + \text{LegendreQ}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}\right.} \tag{1}$$

Verification of solutions

$$y = \frac{2\,\text{LegendreP}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) c_3 \lambda + 2\,\text{LegendreQ}\left(\frac{a+\lambda}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) \lambda - \coth(\lambda x) \left(c_3\,\text{LegendreP}\right.}{c_3\,\text{LegendreP}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}, \coth(\lambda x)\right) + \text{LegendreQ}\left(\frac{a}{\lambda}, \frac{a-\lambda}{\lambda}\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - ax \coth (bx)^m y = a \coth (bx)^m}$$

6.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + ax \coth (bx)^m y + a \coth (bx)^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + ax \coth (bx)^m y + a \coth (bx)^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a \coth (bx)^m$, $f_1(x) = a \coth (bx)^m x$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= a \coth(bx)^m x \\ f_2^2 f_0 &= a \coth(bx)^m \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - a \coth(bx)^m x u'(x) + a \coth(bx)^m u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x \left(\left(\int e^{\int \frac{\coth(bx)^m a\,x^2 - 2}{x} dx} dx \right) c_1 + c_2 \right)$$

The above shows that

$$u'(x) = \left(\int e^{\int \frac{\coth(bx)^m a\,x^2 - 2}{x} dx} dx \right) c_1 + c_2 + x\,e^{\int \frac{\coth(bx)^m a\,x^2 - 2}{x} dx} c_1$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\int e^{\int \frac{\coth(bx)^m a\,x^2 - 2}{x} dx} dx \right) c_1 + c_2 + x\,e^{\int \frac{\coth(bx)^m a\,x^2 - 2}{x} dx} c_1}{x \left(\left(\int e^{\int \frac{\coth(bx)^m a\,x^2 - 2}{x} dx} dx \right) c_1 + c_2 \right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\left(\int e^{\int \frac{\coth(bx)^m a\,x^2 - 2}{x} dx} dx \right) c_3 - 1 - x\,e^{\int \frac{\coth(bx)^m a\,x^2 - 2}{x} dx} c_3}{x \left(\left(\int e^{\int \frac{\coth(bx)^m a\,x^2 - 2}{x} dx} dx \right) c_3 + 1 \right)}$$

Summary
The solution(s) found are the following

$$y = \frac{-\left(\int e^{\int \frac{\coth(bx)^m a\, x^2-2}{x}dx}dx\right) c_3 - 1 - x\, e^{\int \frac{\coth(bx)^m a\, x^2-2}{x}dx} c_3}{x\left(\left(\int e^{\int \frac{\coth(bx)^m a\, x^2-2}{x}dx}dx\right) c_3 + 1\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-\left(\int e^{\int \frac{\coth(bx)^m a\, x^2-2}{x}dx}dx\right) c_3 - 1 - x\, e^{\int \frac{\coth(bx)^m a\, x^2-2}{x}dx} c_3}{x\left(\left(\int e^{\int \frac{\coth(bx)^m a\, x^2-2}{x}dx}dx\right) c_3 + 1\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.4-2. Equations with hyperbolic tangent and cotangent.
Problem number: 25.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$\boxed{(a\coth(\lambda x)+b)\,y'-y^2-c\coth(x\mu)\,y=-d^2+cd\coth(x\mu)}$$

6.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}
y' &= F(x,y)\\
&= \frac{y^2+c\coth(x\mu)\,y-d^2+cd\coth(x\mu)}{a\coth(\lambda x)+b}
\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=\frac{cd\coth(x\mu)}{a\coth(\lambda x)+b}+\frac{c\coth(x\mu)\,y}{a\coth(\lambda x)+b}-\frac{d^2}{a\coth(\lambda x)+b}+\frac{y^2}{a\coth(\lambda x)+b}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x) = \frac{-d^2+cd\coth(x\mu)}{a\coth(\lambda x)+b}$, $f_1(x) = \frac{c\coth(x\mu)}{a\coth(\lambda x)+b}$ and $f_2(x) = \frac{1}{a\coth(\lambda x)+b}$. Let

$$
\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{\frac{u}{a\coth(\lambda x)+b}}
\end{aligned} \tag{1}
$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$
f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}
$$

But

$$
\begin{aligned}
f_2' &= -\frac{a\lambda\left(1-\coth(\lambda x)^2\right)}{(a\coth(\lambda x)+b)^2} \\
f_1 f_2 &= \frac{c\coth(x\mu)}{(a\coth(\lambda x)+b)^2} \\
f_2^2 f_0 &= \frac{-d^2+cd\coth(x\mu)}{(a\coth(\lambda x)+b)^3}
\end{aligned}
$$

Substituting the above terms back in equation (2) gives

$$
\frac{u''(x)}{a\coth(\lambda x)+b} - \left(-\frac{a\lambda\left(1-\coth(\lambda x)^2\right)}{(a\coth(\lambda x)+b)^2} + \frac{c\coth(x\mu)}{(a\coth(\lambda x)+b)^2}\right) u'(x) + \frac{(-d^2+cd\coth(x\mu))\, u(x)}{(a\coth(\lambda x)+b)^3} = 0
$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = -2\tanh(\lambda x)^2 \lambda^2 - 2\lambda^2 \coth(\lambda x)^2}$$

6.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 - 2\tanh(\lambda x)^2 \lambda^2 - 2\lambda^2 \coth(\lambda x)^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 - 2\tanh(\lambda x)^2 \lambda^2 - 2\lambda^2 \coth(\lambda x)^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -2\tanh(\lambda x)^2 \lambda^2 - 2\lambda^2 \coth(\lambda x)^2$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= -2\tanh(\lambda x)^2 \lambda^2 - 2\lambda^2 \coth(\lambda x)^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-2\tanh(\lambda x)^2 \lambda^2 - 2\lambda^2 \coth(\lambda x)^2\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = \operatorname{sech}(\lambda x) \operatorname{csch}(\lambda x) \big(&c_2 \ln(\coth(\lambda x) - 1) - c_2 \ln(\coth(\lambda x) + 1) + c_1 \\ &+ 2\sinh(\lambda x)\cosh(\lambda x)\left(2\cosh(\lambda x)^2 - 1\right) c_2\big) \end{aligned}$$

The above shows that

$$\begin{aligned} u'(x) = -2\lambda \operatorname{sech}(\lambda x)^2 \operatorname{csch}(\lambda x)^2 \Bigg(&c_2\left(\cosh(\lambda x)^2 - \frac{1}{2}\right)\ln(\coth(\lambda x) - 1) \\ &+ c_2\left(-\cosh(\lambda x)^2 + \frac{1}{2}\right)\ln(\coth(\lambda x) + 1) - 4\cosh(\lambda x)^5 \sinh(\lambda x) c_2 \\ &+ 4c_2 \cosh(\lambda x)^3 \sinh(\lambda x) + \cosh(\lambda x)^2 c_1 + c_2 \cosh(\lambda x)\sinh(\lambda x) - \frac{c_1}{2}\Bigg) \end{aligned}$$

Using the above in (1) gives the solution

$$y = \frac{2\lambda \operatorname{sech}(\lambda x) \operatorname{csch}(\lambda x) \left(c_2\left(\cosh(\lambda x)^2 - \frac{1}{2}\right)\ln(\coth(\lambda x) - 1) + c_2\left(-\cosh(\lambda x)^2 + \frac{1}{2}\right)\ln(\coth(\lambda x) + 1)\right.}{c_2 \ln(\coth(\lambda x) - 1) - c_2 \ln(\coth(\lambda x) + 1) + c_1}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\operatorname{sech}(\lambda x) \operatorname{csch}(\lambda x) \left(8\cosh(\lambda x)^5 \sinh(\lambda x) - 8\sinh(\lambda x)\cosh(\lambda x)^3 - 2\cosh(\lambda x)^2 \ln(\coth(\lambda x) - 1) + 2\right.}{-4\sinh(\lambda x)\cosh(\lambda x)^3 + 2\cosh(\lambda x) \mathrm{s}}$$

Summary

The solution(s) found are the following

$$y = \frac{\operatorname{sech}(\lambda x)\operatorname{csch}(\lambda x)\left(8\cosh(\lambda x)^5\sinh(\lambda x) - 8\sinh(\lambda x)\cosh(\lambda x)^3 - 2\cosh(\lambda x)^2\ln(\coth(\lambda x)-1) + 2}{-4\sinh(\lambda x)\cosh(\lambda x)^3 + 2\cosh(\lambda x)\,\mathrm{s}} \tag{1}$$

Verification of solutions

$$y = \frac{\operatorname{sech}(\lambda x)\operatorname{csch}(\lambda x)\left(8\cosh(\lambda x)^5\sinh(\lambda x) - 8\sinh(\lambda x)\cosh(\lambda x)^3 - 2\cosh(\lambda x)^2\ln(\coth(\lambda x)-1) + 2}{-4\sinh(\lambda x)\cosh(\lambda x)^3 + 2\cosh(\lambda x)\,\mathrm{s}}$$

Verified OK.

Problem number: 27.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = -2ab + \lambda a + b\lambda - a(a+\lambda)\tanh(\lambda x)^2 - b(b+\lambda)\coth(\lambda x)^2}$$

6.10.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -b^2\coth(\lambda x)^2 - b\coth(\lambda x)^2\lambda - a^2\tanh(\lambda x)^2 - a\tanh(\lambda x)^2\lambda - 2ab + \lambda a + b\lambda + y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -b^2\coth(\lambda x)^2 - b\coth(\lambda x)^2\lambda - a^2\tanh(\lambda x)^2 - a\tanh(\lambda x)^2\lambda - 2ab + \lambda a + b\lambda + y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -b^2\coth(\lambda x)^2 - b\coth(\lambda x)^2\lambda - a^2\tanh(\lambda x)^2 - a\tanh(\lambda x)^2\lambda - 2ab + \lambda a + b\lambda$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0\\ f_1 f_2 &= 0\\ f_2^2 f_0 &= -b^2 \coth(\lambda x)^2 - b\coth(\lambda x)^2 \lambda - a^2 \tanh(\lambda x)^2 - a\tanh(\lambda x)^2 \lambda - 2ab + \lambda a + b\lambda \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-b^2 \coth(\lambda x)^2 - b\coth(\lambda x)^2 \lambda - a^2 \tanh(\lambda x)^2 - a\tanh(\lambda x)^2 \lambda - 2ab + \lambda a + b\lambda\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = \operatorname{csch}(\lambda x)^{\frac{-a-b}{\lambda}} \Bigg(&c_1 \coth(\lambda x)^{-\frac{a}{\lambda}} \left(-\operatorname{csch}(\lambda x)^2\right)^{\frac{a+b}{\lambda}}\\ &+ c_2 \coth(\lambda x)^{\frac{a+\lambda}{\lambda}} \operatorname{hypergeom}\left(\left[1, \frac{1}{2} - \frac{b}{\lambda}\right], \left[\frac{3}{2} + \frac{a}{\lambda}\right], \coth(\lambda x)^2\right)\Bigg) \end{aligned}$$

The above shows that

$$u'(x) = \frac{4\left(\frac{\coth(\lambda x)^{\frac{a+\lambda}{\lambda}} c_2((b-\lambda)\coth(\lambda x)+\tanh(\lambda x)(a+\lambda))\left(\frac{3\lambda}{2}+a\right) \operatorname{hypergeom}\left(\left[1,\frac{1}{2}-\frac{b}{\lambda}\right],\left[\frac{3}{2}+\frac{a}{\lambda}\right],\coth(\lambda x)^2\right)}{2} + \coth(\lambda x)^{\frac{a+\lambda}{\lambda}} c_2\left(-\frac{\lambda}{2} + b\right.\right.}{}$$

Using the above in (1) gives the solution

$$y = -\frac{4\left(\frac{\coth(\lambda x)^{\frac{a+\lambda}{\lambda}} c_2((b-\lambda)\coth(\lambda x)+\tanh(\lambda x)(a+\lambda))\left(\frac{3\lambda}{2}+a\right) \operatorname{hypergeom}\left(\left[1,\frac{1}{2}-\frac{b}{\lambda}\right],\left[\frac{3}{2}+\frac{a}{\lambda}\right],\coth(\lambda x)^2\right)}{2} + \coth(\lambda x)^{\frac{a+\lambda}{\lambda}} c_2\left(-\frac{\lambda}{2}\right.\right.}{(2a +}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-4 \coth(\lambda x)^{\frac{2a+2\lambda}{\lambda}} \lambda \operatorname{csch}(\lambda x)^2 \left(-\frac{\lambda}{2} + b\right) \operatorname{hypergeom}\left(\left[2, -\frac{2b-3\lambda}{2\lambda}\right], \left[\frac{2a+5\lambda}{2\lambda}\right], \coth(\lambda x)^2\right) + \Big(((-3a-3b)}{\Big(c_3}$$

Summary

The solution(s) found are the following

$$y = \frac{-4 \coth(\lambda x)^{\frac{2a+2\lambda}{\lambda}} \lambda \operatorname{csch}(\lambda x)^2 \left(-\frac{\lambda}{2} + b\right) \operatorname{hypergeom}\left(\left[2, -\frac{2b-3\lambda}{2\lambda}\right], \left[\frac{2a+5\lambda}{2\lambda}\right], \coth(\lambda x)^2\right) + \Big(((-3a-3b)}{\Big(c_3} \quad (1)$$

Verification of solutions

$$y = \frac{-4 \coth(\lambda x)^{\frac{2a+2\lambda}{\lambda}} \lambda \operatorname{csch}(\lambda x)^2 \left(-\frac{\lambda}{2} + b\right) \operatorname{hypergeom}\left(\left[2, -\frac{2b-3\lambda}{2\lambda}\right], \left[\frac{2a+5\lambda}{2\lambda}\right], \coth(\lambda x)^2\right) + \Big(((-3a-3b)}{\Big(c_3}$$

Verified OK.

Problem number: 1.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\ln(x)^n y^2 = bm\, x^{m-1} - a\, b^2 x^{2m} \ln(x)^n}$$

7.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\ln(x)^n y^2 + bm\, x^{m-1} - a\, b^2 x^{2m} \ln(x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a\, b^2 x^{2m} \ln(x)^n + a\ln(x)^n y^2 + \frac{b\, x^m m}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = bm\, x^{m-1} - a\, b^2 x^{2m} \ln(x)^n$, $f_1(x) = 0$ and $f_2(x) = \ln(x)^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\ln(x)^n a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$f_2' = \frac{\ln(x)^n na}{x \ln(x)}$$
$$f_1 f_2 = 0$$
$$f_2^2 f_0 = \ln(x)^{2n} a^2 \left(bm\, x^{m-1} - a\, b^2 x^{2m} \ln(x)^n\right)$$

Substituting the above terms back in equation (2) gives

$$\ln(x)^n au''(x) - \frac{\ln(x)^n nau'(x)}{x \ln(x)} + \ln(x)^{2n} a^2 \left(bm\, x^{m-1} - a\, b^2 x^{2m} \ln(x)^n\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{x \ln(x)} + a\_Y(x) \left(\ln(x)^n bm\, x^{m-1} - a\, b^2 x^{2m} \ln(x)^{2n}\right)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{x \ln(x)} + a\_Y(x) \left(\ln(x)^n bm\, x^{m-1} - a\, b^2 x^{2m} \ln(x)^{2n}\right)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{x \ln(x)} + a\_Y(x) \left(\ln(x)^n bm\, x^{m-1} - a\, b^2 x^{2m} \ln(x)^{2n}\right)\right\}, \{\_Y(x)\}\right)\right) \ln(x)}{a\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{x \ln(x)} + a\_Y(x) \left(\ln(x)^n bm\, x^{m-1} - a\, b^2 x^{2m} \ln(x)^{2n}\right)\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{x \ln(x)} + a\_Y(x) \left(\ln(x)^n bm\, x^{m-1} - a\, b^2 x^{2m} \ln(x)^{2n}\right)\right\}, \{\_Y(x)\}\right)\right) \ln(x)}{a\, \mathrm{DESol}\left(\left\{\frac{-a^2b^2\_Y(x)\ln(x)^{1+2n}x^{1+2m} + abm\, x^m\_Y(x)\ln(x)^{n+1} + \_Y''(x)\ln(x)x - n\_Y'(x)}{\ln(x)x}\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{x \ln(x)} + a\_Y(x) \left(\ln(x)^n bm\, x^{m-1} - a\, b^2 x^{2m} \ln(x)^{2n}\right)\right\}, \{\_Y(x)\}\right)\right) \ln(x)}{a\, \mathrm{DESol}\left(\left\{\frac{-a^2b^2\_Y(x)\ln(x)^{1+2n}x^{1+2m} + abm\, x^m\_Y(x)\ln(x)^{n+1} + \_Y''(x)\ln(x)x - n\_Y'(x)}{\ln(x)x}\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{x \ln(x)} + a\_Y(x) \left(\ln(x)^n bm\, x^{m-1} - a\, b^2 x^{2m} \ln(x)^{2n}\right)\right\}, \{\_Y(x)\}\right)\right) \ln(x)}{a\, \mathrm{DESol}\left(\left\{\frac{-a^2b^2\_Y(x)\ln(x)^{1+2n}x^{1+2m} + abm\, x^m\_Y(x)\ln(x)^{n+1} + \_Y''(x)\ln(x)x - n\_Y'(x)}{\ln(x)x}\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-1. Equations Containing Logarithmic Functions
Problem number: 2.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - a y^2 = b\ln(x) + c}$$

7.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,y^2 + b\ln(x) + c}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,y^2}{x} + \frac{b\ln(x)}{x} + \frac{c}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{b\ln(x)+c}{x}$, $f_1(x) = 0$ and $f_2(x) = \frac{a}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{au}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{a}{x^2} \\ f_1f_2 &= 0 \\ f_2^2 f_0 &= \frac{a^2(b\ln(x) + c)}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{au''(x)}{x} + \frac{au'(x)}{x^2} + \frac{a^2(b\ln(x) + c)\, u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \operatorname{AiryAi}\left(-\frac{(ab)^{\frac{1}{3}}\, (b\ln(x) + c)}{b}\right) + c_2 \operatorname{AiryBi}\left(-\frac{(ab)^{\frac{1}{3}}\, (b\ln(x) + c)}{b}\right)$$

The above shows that

$$u'(x) = \frac{\left(-\operatorname{AiryAi}\left(1, -\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right) c_1 - \operatorname{AiryBi}\left(1, -\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right) c_2\right)(ab)^{\frac{1}{3}}}{x}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-\operatorname{AiryAi}\left(1, -\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right) c_1 - \operatorname{AiryBi}\left(1, -\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right) c_2\right)(ab)^{\frac{1}{3}}}{a\left(c_1 \operatorname{AiryAi}\left(-\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right) + c_2 \operatorname{AiryBi}\left(-\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\operatorname{AiryAi}\left(1, -\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right) c_3 + \operatorname{AiryBi}\left(1, -\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right)\right)(ab)^{\frac{1}{3}}}{a\left(c_3 \operatorname{AiryAi}\left(-\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right) + \operatorname{AiryBi}\left(-\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right)\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{\left(\operatorname{AiryAi}\left(1, -\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right)c_3 + \operatorname{AiryBi}\left(1, -\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right)\right)(ab)^{\frac{1}{3}}}{a\left(c_3 \operatorname{AiryAi}\left(-\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right) + \operatorname{AiryBi}\left(-\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right)\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\operatorname{AiryAi}\left(1, -\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right)c_3 + \operatorname{AiryBi}\left(1, -\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right)\right)(ab)^{\frac{1}{3}}}{a\left(c_3 \operatorname{AiryAi}\left(-\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right) + \operatorname{AiryBi}\left(-\frac{(ab)^{\frac{1}{3}}(b\ln(x)+c)}{b}\right)\right)}$$

Verified OK.

7.3 problem 3

Internal problem ID [10478]
Internal file name [`OUTPUT/9425_Monday_June_06_2022_02_31_57_PM_8846351/index.tex`]

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-1. Equations Containing Logarithmic Functions
Problem number: 3.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - a y^2 = b \ln(x)^k + c \ln(x)^{2k+2}}$$

7.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,y^2 + b\ln(x)^k + c\ln(x)^{2k+2}}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,y^2}{x} + \frac{b\ln(x)^k}{x} + \frac{c\ln(x)^{2k}\ln(x)^2}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{b\ln(x)^k + c\ln(x)^{2k+2}}{x}$, $f_1(x) = 0$ and $f_2(x) = \frac{a}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{au}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{a}{x^2} \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \frac{a^2 \left(b \ln(x)^k + c \ln(x)^{2k+2}\right)}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a u''(x)}{x} + \frac{a u'(x)}{x^2} + \frac{a^2 \left(b \ln(x)^k + c \ln(x)^{2k+2}\right) u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) \\ = \mathrm{e}^{-\frac{i\sqrt{c}\,\sqrt{a}\,\ln(x)^{k+2}}{k+2}} &\left(\mathrm{hypergeom}\left(\left[\frac{(k+1)\sqrt{c} + i\sqrt{a}\, b}{\sqrt{c}\,(4+2k)}\right], \left[\frac{k+1}{k+2}\right], \frac{2i\sqrt{c}\,\sqrt{a}\,\ln(x)^{k+2}}{k+2}\right) c_1\right. \\ &\left. + \mathrm{hypergeom}\left(\left[\frac{(3+k)\sqrt{c} + i\sqrt{a}\, b}{\sqrt{c}\,(4+2k)}\right], \left[\frac{3+k}{k+2}\right], \frac{2i\sqrt{c}\,\sqrt{a}\,\ln(x)^{k+2}}{k+2}\right) c_2 \ln(x)\right) \end{aligned}$$

The above shows that

$$u'(x) = -\frac{\left(-\ln(x)^{k+1} (3+k)\left(i(k+1)\sqrt{c}\,\sqrt{a} - ab\right) c_1\, \mathrm{hypergeom}\left(\left[\frac{(5+3k)\sqrt{c}+i\sqrt{a}\,b}{\sqrt{c}\,(4+2k)}\right], \left[\frac{3+2k}{k+2}\right], \frac{2i\sqrt{c}\,\sqrt{a}\,\ln(x)^{k+2}}{k+2}\right) + \right.}{}$$

Using the above in (1) gives the solution

$$y = \frac{-\ln(x)^{k+1} (3+k)\left(i(k+1)\sqrt{c}\,\sqrt{a} - ab\right) c_1\, \mathrm{hypergeom}\left(\left[\frac{(5+3k)\sqrt{c}+i\sqrt{a}\,b}{\sqrt{c}\,(4+2k)}\right], \left[\frac{3+2k}{k+2}\right], \frac{2i\sqrt{c}\,\sqrt{a}\,\ln(x)^{k+2}}{k+2}\right) + (k}{}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\ln(x)^{k+1}(3+k)\left(i(k+1)\sqrt{c}\sqrt{a}-ab\right)c_3 \operatorname{hypergeom}\left(\left[\frac{(5+3k)\sqrt{c}+i\sqrt{a}\,b}{\sqrt{c}\,(4+2k)}\right],\left[\frac{3+2k}{k+2}\right],\frac{2i\sqrt{c}\sqrt{a}\,\ln(x)^{k+2}}{k+2}\right)+(k\ \cdots}{\cdots}$$

Summary

The solution(s) found are the following

$$y = \frac{-\ln(x)^{k+1}(3+k)\left(i(k+1)\sqrt{c}\sqrt{a}-ab\right)c_3 \operatorname{hypergeom}\left(\left[\frac{(5+3k)\sqrt{c}+i\sqrt{a}\,b}{\sqrt{c}\,(4+2k)}\right],\left[\frac{3+2k}{k+2}\right],\frac{2i\sqrt{c}\sqrt{a}\,\ln(x)^{k+2}}{k+2}\right)+(k\ \cdots}{\cdots} \tag{1}$$

Verification of solutions

$$y = \frac{-\ln(x)^{k+1}(3+k)\left(i(k+1)\sqrt{c}\sqrt{a}-ab\right)c_3 \operatorname{hypergeom}\left(\left[\frac{(5+3k)\sqrt{c}+i\sqrt{a}\,b}{\sqrt{c}\,(4+2k)}\right],\left[\frac{3+2k}{k+2}\right],\frac{2i\sqrt{c}\sqrt{a}\,\ln(x)^{k+2}}{k+2}\right)+(k\ \cdots}{\cdots}$$

Verified OK.

Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-1. Equations Containing Logarithmic Functions
Problem number: 4.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - y^2x = -a^2x\ln\left(\beta x\right)^2 + a}$$

7.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{a^2x\ln\left(\beta x\right)^2 - x\,y^2 - a}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2\ln\left(\beta x\right)^2 + y^2 + \frac{a}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{a^2x\ln(\beta x)^2 - a}{x}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= -\frac{a^2x\ln(\beta x)^2 - a}{x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \frac{(a^2x\ln(\beta x)^2 - a)\,u(x)}{x} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(a^2x\ln(\beta x)^2 - a)\_Y(x)}{x}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(a^2x\ln(\beta x)^2 - a)\_Y(x)}{x}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(a^2x\ln(\beta x)^2 - a)\_Y(x)}{x}\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(a^2x\ln(\beta x)^2 - a)\_Y(x)}{x}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_Y''(x)x - a(\ln(\beta x)^2ax - 1)\_Y(x)}{x}\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\frac{\_Y''(x)x - a(\ln(\beta x)^2ax - 1)\_Y(x)}{x}\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\_Y''(x)x - a\left(\ln(\beta x)^2 a x - 1\right)\_Y(x)}{x}\right\}, \{\_Y(x)\}\right)}{\operatorname{DESol}\left(\left\{\frac{\_Y''(x)x - a\left(\ln(\beta x)^2 a x - 1\right)\_Y(x)}{x}\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\_Y''(x)x - a\left(\ln(\beta x)^2 a x - 1\right)\_Y(x)}{x}\right\}, \{\_Y(x)\}\right)}{\operatorname{DESol}\left(\left\{\frac{\_Y''(x)x - a\left(\ln(\beta x)^2 a x - 1\right)\_Y(x)}{x}\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-1. Equations Containing Logarithmic Functions
Problem number: 5.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - y^2x = -a^2x \ln(\beta x)^{2k} + ak \ln(\beta x)^{k-1}}$$

7.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{-x\,y^2 + a^2x \ln(\beta x)^{2k} - ak \ln(\beta x)^{k-1}}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 - a^2 \ln(\beta x)^{2k} + \frac{ak \ln(\beta x)^k}{x \ln(\beta x)}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{a^2x \ln(\beta x)^{2k} - ak \ln(\beta x)^{k-1}}{x}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= -\frac{a^2 x \ln(\beta x)^{2k} - ak \ln(\beta x)^{k-1}}{x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \frac{\left(a^2 x \ln(\beta x)^{2k} - ak \ln(\beta x)^{k-1}\right) u(x)}{x} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \text{DESol}\left(\left\{\_Y''(x) - \frac{\left(a^2 x \ln(\beta x)^{2k} - ak \ln(\beta x)^{k-1}\right) \_Y(x)}{x}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \text{DESol}\left(\left\{\_Y''(x) - \frac{\left(a^2 x \ln(\beta x)^{2k} - ak \ln(\beta x)^{k-1}\right) \_Y(x)}{x}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x} \text{DESol}\left(\left\{\_Y''(x) - \frac{\left(a^2 x \ln(\beta x)^{2k} - ak \ln(\beta x)^{k-1}\right) \_Y(x)}{x}\right\}, \{\_Y(x)\}\right)}{\text{DESol}\left(\left\{\_Y''(x) - \frac{\left(a^2 x \ln(\beta x)^{2k} - ak \ln(\beta x)^{k-1}\right) \_Y(x)}{x}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x} \text{DESol}\left(\left\{\_Y''(x) - \frac{\left(a^2 x \ln(\beta x)^{2k} - ak \ln(\beta x)^{k-1}\right) \_Y(x)}{x}\right\}, \{\_Y(x)\}\right)}{\text{DESol}\left(\left\{\frac{-\ln(\beta x)^{1+2k} \_Y(x) a^2 x + \ln(\beta x)^k \_Y(x) ak + \_Y''(x) \ln(\beta x) x}{\ln(\beta x) x}\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(a^2 x \ln(\beta x)^{2k} - a k \ln(\beta x)^{k-1}\right)\_Y(x)}{x}\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\frac{-\ln(\beta x)^{1+2k}\_Y(x) a^2 x + \ln(\beta x)^k \_Y(x) a k + \_Y''(x)\ln(\beta x) x}{\ln(\beta x) x}\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(a^2 x \ln(\beta x)^{2k} - a k \ln(\beta x)^{k-1}\right)\_Y(x)}{x}\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\frac{-\ln(\beta x)^{1+2k}\_Y(x) a^2 x + \ln(\beta x)^k \_Y(x) a k + \_Y''(x)\ln(\beta x) x}{\ln(\beta x) x}\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

Internal file name [`OUTPUT/9428_Monday_June_06_2022_02_32_08_PM_61700309/index.tex`]

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-1. Equations Containing Logarithmic Functions
Problem number: 6.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - a\,x^n y^2 = b - a\,b^2 x^n \ln(x)^2}$$

7.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{a\,b^2 x^n \ln(x)^2 - a\,x^n y^2 - b}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{a\,b^2 x^n \ln(x)^2}{x} + \frac{a\,x^n y^2}{x} + \frac{b}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{-b+a\,b^2 x^n \ln(x)^2}{x}$, $f_1(x) = 0$ and $f_2(x) = \frac{a\,x^n}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{a\,x^n u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{a\,x^n n}{x^2} - \frac{a\,x^n}{x^2} \\
f_1f_2 &= 0 \\
f_2^2f_0 &= -\frac{a^2x^{2n}\left(-b + a\,b^2x^n \ln\left(x\right)^2\right)}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a\,x^n u''(x)}{x} - \left(\frac{a\,x^n n}{x^2} - \frac{a\,x^n}{x^2}\right)u'(x) - \frac{a^2x^{2n}\left(-b + a\,b^2x^n \ln\left(x\right)^2\right)u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(n-1)\_Y'(x)}{x} - \frac{a\,x^n\left(-b + a\,b^2x^n\ln\left(x\right)^2\right)\_Y(x)}{x^2}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(n-1)\_Y'(x)}{x} - \frac{a\,x^n\left(-b + a\,b^2x^n\ln\left(x\right)^2\right)\_Y(x)}{x^2}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(n-1)\_Y'(x)}{x} - \frac{a\,x^n\left(-b+a\,b^2x^n\ln(x)^2\right)\_Y(x)}{x^2}\right\}, \{\_Y(x)\}\right)\right)x^{-n}x}{a\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(n-1)\_Y'(x)}{x} - \frac{a\,x^n\left(-b+a\,b^2x^n\ln(x)^2\right)\_Y(x)}{x^2}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{x^{1-n}\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_Y''(x)\,x^2-\ln(x)^2 x^{2n}\_Y(x)\,a^2b^2-(n-1)\_Y'(x)\,x+x^n\_Y(x)\,ab}{x^2}\right\},\{\_Y(x)\}\right)\right)}{a\,\mathrm{DESol}\left(\left\{\frac{\_Y''(x)\,x^2-\ln(x)^2 x^{2n}\_Y(x)\,a^2b^2-(n-1)\_Y'(x)\,x+x^n\_Y(x)\,ab}{x^2}\right\},\{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{x^{1-n}\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_Y''(x)\,x^2-\ln(x)^2 x^{2n}\_Y(x)\,a^2b^2-(n-1)\_Y'(x)\,x+x^n\_Y(x)\,ab}{x^2}\right\},\{\_Y(x)\}\right)\right)}{a\,\mathrm{DESol}\left(\left\{\frac{\_Y''(x)\,x^2-\ln(x)^2 x^{2n}\_Y(x)\,a^2b^2-(n-1)\_Y'(x)\,x+x^n\_Y(x)\,ab}{x^2}\right\},\{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{x^{1-n}\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_Y''(x)\,x^2-\ln(x)^2 x^{2n}\_Y(x)\,a^2b^2-(n-1)\_Y'(x)\,x+x^n\_Y(x)\,ab}{x^2}\right\},\{\_Y(x)\}\right)\right)}{a\,\mathrm{DESol}\left(\left\{\frac{\_Y''(x)\,x^2-\ln(x)^2 x^{2n}\_Y(x)\,a^2b^2-(n-1)\_Y'(x)\,x+x^n\_Y(x)\,ab}{x^2}\right\},\{\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-1. Equations Containing Logarithmic Functions
Problem number: 7.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{x^2y' - x^2y^2 = a\ln(x)^2 + b\ln(x) + c}$$

7.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{x^2y^2 + a\ln(x)^2 + b\ln(x) + c}{x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \frac{a\ln(x)^2}{x^2} + \frac{b\ln(x)}{x^2} + \frac{c}{x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{a\ln(x)^2 + b\ln(x) + c}{x^2}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \frac{a \ln(x)^2 + b \ln(x) + c}{x^2} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \frac{\left(a \ln(x)^2 + b \ln(x) + c\right) u(x)}{x^2} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) &= x^{-\frac{ib-\sqrt{a}}{2\sqrt{a}}} \mathrm{e}^{-\frac{i\ln(x)^2\sqrt{a}}{2}} \left(2\ln(x) \operatorname{hypergeom}\left(\left[\frac{12a^{\frac{3}{2}} + i(4c-1)\,a - ib^2}{16a^{\frac{3}{2}}}\right], \left[\frac{3}{2}\right], \frac{i(2a\ln(x)+b)^2}{4a^{\frac{3}{2}}}\right) c_2 a \right. \\ &\quad + \operatorname{hypergeom}\left(\left[\frac{12a^{\frac{3}{2}} + i(4c-1)\,a - ib^2}{16a^{\frac{3}{2}}}\right], \left[\frac{3}{2}\right], \frac{i(2a\ln(x)+b)^2}{4a^{\frac{3}{2}}}\right) c_2 b \\ &\quad \left. + c_1 \operatorname{hypergeom}\left(\left[\frac{4a^{\frac{3}{2}} + i(4c-1)\,a - ib^2}{16a^{\frac{3}{2}}}\right], \left[\frac{1}{2}\right], \frac{i(2a\ln(x)+b)^2}{4a^{\frac{3}{2}}}\right)\right) \end{aligned}$$

The above shows that

$$u'(x) = -\frac{2x^{-\frac{ib+\sqrt{a}}{2\sqrt{a}}} \left(-\left(\frac{b\ln(x)(b\ln(x)-4c+1)a^{\frac{5}{2}}}{12} + \frac{(b\ln(x)-c+\frac{1}{4})b^2 a^{\frac{3}{2}}}{12} - \frac{\ln(x)^2(c-\frac{1}{4})a^{\frac{7}{2}}}{3} + \frac{b^4\sqrt{a}}{48} + i\left(a\ln(x)+\frac{b}{2}\right)^2 a^2\right) c_2 \text{hy}\right.}{}$$

Using the above in (1) gives the solution

$$y = \frac{2x^{-\frac{ib+\sqrt{a}}{2\sqrt{a}}} \left(-\left(\frac{b\ln(x)(b\ln(x)-4c+1)a^{\frac{5}{2}}}{12} + \frac{(b\ln(x)-c+\frac{1}{4})b^2 a^{\frac{3}{2}}}{12} - \frac{\ln(x)^2(c-\frac{1}{4})a^{\frac{7}{2}}}{3} + \frac{b^4\sqrt{a}}{48} + i\left(a\ln(x)+\frac{b}{2}\right)^2 a^2\right) c_2 \text{hype}\right.}{}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-\frac{b\ln(x)(b\ln(x)-4c+1)a^{\frac{5}{2}}}{12} - \frac{(b\ln(x)-c+\frac{1}{4})b^2a^{\frac{3}{2}}}{12} + \frac{\ln(x)^2(c-\frac{1}{4})a^{\frac{7}{2}}}{3} - \frac{b^4\sqrt{a}}{48} - i\left(a\ln(x)+\frac{b}{2}\right)^2a^2\right)\text{hypergeom}\left(\left[\frac{28a}{}\right.\right.}{}$$

Summary
The solution(s) found are the following

$$y = \frac{\left(-\frac{b\ln(x)(b\ln(x)-4c+1)a^{\frac{5}{2}}}{12} - \frac{(b\ln(x)-c+\frac{1}{4})b^2a^{\frac{3}{2}}}{12} + \frac{\ln(x)^2(c-\frac{1}{4})a^{\frac{7}{2}}}{3} - \frac{b^4\sqrt{a}}{48} - i\left(a\ln(x)+\frac{b}{2}\right)^2a^2\right)\text{hypergeom}\left(\left[\frac{28a}{}\right.\right.}{} \tag{1}$$

Verification of solutions

$$y = \frac{\left(-\frac{b\ln(x)(b\ln(x)-4c+1)a^{\frac{5}{2}}}{12} - \frac{(b\ln(x)-c+\frac{1}{4})b^2a^{\frac{3}{2}}}{12} + \frac{\ln(x)^2(c-\frac{1}{4})a^{\frac{7}{2}}}{3} - \frac{b^4\sqrt{a}}{48} - i\left(a\ln(x)+\frac{b}{2}\right)^2a^2\right)\text{hypergeom}\left(\left[\frac{28a}{}\right.\right.}{}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-1. Equations Containing Logarithmic Functions
Problem number: 8.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{x^2y' - x^2y^2 = a(b\ln(x) + c)^n + \frac{1}{4}}$$

7.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{4x^2y^2 + 4a(b\ln(x) + c)^n + 1}{4x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \frac{a(b\ln(x) + c)^n}{x^2} + \frac{1}{4x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{4a(b\ln(x)+c)^n+1}{4x^2}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= \frac{4a(b\ln(x)+c)^n + 1}{4x^2} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \frac{(4a(b\ln(x)+c)^n + 1)\,u(x)}{4x^2} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \text{DESol}\left(\left\{\_Y''(x) + \frac{(4a(b\ln(x)+c)^n + 1)\_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\text{DESol}\left(\left\{\_Y''(x) + \frac{(4a(b\ln(x)+c)^n + 1)\_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x}\text{DESol}\left(\left\{\_Y''(x) + \frac{(4a(b\ln(x)+c)^n+1)\_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)}{\text{DESol}\left(\left\{\_Y''(x) + \frac{(4a(b\ln(x)+c)^n+1)\_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x}\text{DESol}\left(\left\{\frac{4(b\ln(x)+c)^n\_Y(x)a + 4\_Y''(x)x^2 + \_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)}{\text{DESol}\left(\left\{\frac{4(b\ln(x)+c)^n\_Y(x)a + 4\_Y''(x)x^2 + \_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)}$$

Summary
The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{4(b\ln(x)+c)^n \_Y(x)a+4\_Y''(x)x^2+\_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)}{\operatorname{DESol}\left(\left\{\frac{4(b\ln(x)+c)^n \_Y(x)a+4\_Y''(x)x^2+\_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{4(b\ln(x)+c)^n \_Y(x)a+4\_Y''(x)x^2+\_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)}{\operatorname{DESol}\left(\left\{\frac{4(b\ln(x)+c)^n \_Y(x)a+4\_Y''(x)x^2+\_Y(x)}{4x^2}\right\}, \{\_Y(x)\}\right)}$$

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{x^2 \ln(xa)\left(y' - y^2\right) = 1}$$

7.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{y^2 \ln(xa)\, x^2 + 1}{x^2 \ln(xa)} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \frac{1}{x^2 \ln(xa)}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{1}{x^2 \ln(xa)}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= \frac{1}{x^2\ln(xa)} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \frac{u(x)}{x^2\ln(xa)} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = -\ln(xa)\operatorname{expIntegral}_1(-\ln(xa))\,c_2 - c_2ax + c_1\ln(xa)$$

The above shows that

$$u'(x) = \frac{-\operatorname{expIntegral}_1(-\ln(xa))\,c_2 + c_1}{x}$$

Using the above in (1) gives the solution

$$y = -\frac{-\operatorname{expIntegral}_1(-\ln(xa))\,c_2 + c_1}{x(-\ln(xa)\operatorname{expIntegral}_1(-\ln(xa))\,c_2 - c_2ax + c_1\ln(xa))}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\operatorname{expIntegral}_1(-\ln(xa)) + c_3}{x(\operatorname{expIntegral}_1(-\ln(xa))\ln(xa) - c_3\ln(xa) + xa)}$$

Summary

The solution(s) found are the following

$$y = \frac{-\operatorname{expIntegral}_1(-\ln(xa)) + c_3}{x(\operatorname{expIntegral}_1(-\ln(xa))\ln(xa) - c_3\ln(xa) + xa)} \tag{1}$$

Verification of solutions

$$y = \frac{-\operatorname{expIntegral}_1(-\ln(xa)) + c_3}{x(\operatorname{expIntegral}_1(-\ln(xa))\ln(xa) - c_3\ln(xa) + xa)}$$

Verified OK.

Problem number: 10.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - a\ln(\beta x)\, y = -ab\ln(\beta x) - b^2}$$

8.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + a\ln(\beta x)\, y - ab\ln(\beta x) - b^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\ln(\beta x)\, y - ab\ln(\beta x) - b^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -ab\ln(\beta x) - b^2$, $f_1(x) = \ln(\beta x)\, a$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \ln(\beta x) a \\ f_2^2 f_0 &= -ab \ln(\beta x) - b^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \ln(\beta x) a u'(x) + \left(-ab \ln(\beta x) - b^2\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = -\left(\int (\beta x)^{xa} \mathrm{e}^{-x(a-2b)} dx + c_1\right) c_2 \mathrm{e}^{-bx}$$

The above shows that

$$u'(x) = c_2 \left(b \,\mathrm{e}^{-bx} \left(\int (\beta x)^{xa} \mathrm{e}^{-x(a-2b)} dx\right) + b \,\mathrm{e}^{-bx} c_1 - \mathrm{e}^{-x(a-b)} (\beta x)^{xa}\right)$$

Using the above in (1) gives the solution

$$y = \frac{\left(b \,\mathrm{e}^{-bx} \left(\int (\beta x)^{xa} \mathrm{e}^{-x(a-2b)} dx\right) + b \,\mathrm{e}^{-bx} c_1 - \mathrm{e}^{-x(a-b)} (\beta x)^{xa}\right) \mathrm{e}^{bx}}{\int (\beta x)^{xa} \mathrm{e}^{-x(a-2b)} dx + c_1}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\int (\beta x)^{xa} \mathrm{e}^{-x(a-2b)} dx + c_3\right) b - (\beta x)^{xa} \mathrm{e}^{-x(a-2b)}}{\int (\beta x)^{xa} \mathrm{e}^{-x(a-2b)} dx + c_3}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(\int (\beta x)^{xa} \mathrm{e}^{-x(a-2b)} dx + c_3\right) b - (\beta x)^{xa} \mathrm{e}^{-x(a-2b)}}{\int (\beta x)^{xa} \mathrm{e}^{-x(a-2b)} dx + c_3} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\int (\beta x)^{xa} \mathrm{e}^{-x(a-2b)} dx + c_3\right) b - (\beta x)^{xa} \mathrm{e}^{-x(a-2b)}}{\int (\beta x)^{xa} \mathrm{e}^{-x(a-2b)} dx + c_3}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - ax \ln (bx)^m y = a \ln (bx)^m}$$

8.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + ax \ln (bx)^m y + a \ln (bx)^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + ax \ln (bx)^m y + a \ln (bx)^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a \ln (bx)^m$, $f_1(x) = a \ln (bx)^m x$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= a \ln(bx)^m x \\ f_2^2 f_0 &= a \ln(bx)^m \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - a \ln(bx)^m x u'(x) + a \ln(bx)^m u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x\left(\left(\int e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} dx\right) c_1 + c_2\right)$$

The above shows that

$$u'(x) = \left(\int e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} dx\right) c_1 + c_2 + x\, e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} c_1$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\int e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} dx\right) c_1 + c_2 + x\, e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} c_1}{x\left(\left(\int e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} dx\right) c_1 + c_2\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\left(\int e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} dx\right) c_3 - 1 - x\, e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} c_3}{x\left(\left(\int e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} dx\right) c_3 + 1\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{-\left(\int e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} dx\right) c_3 - 1 - x\, e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} c_3}{x \left(\left(\int e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} dx\right) c_3 + 1\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-\left(\int e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} dx\right) c_3 - 1 - x\, e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} c_3}{x \left(\left(\int e^{\int \frac{\ln(bx)^m a\, x^2 - 2}{x} dx} dx\right) c_3 + 1\right)}$$

Internal file name [`OUTPUT/9434_Monday_June_06_2022_02_32_18_PM_89796833/index.tex`]

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-2
Problem number: 12.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,x^n y^2 + ab\,x^{n+1} \ln(x)\, y = b \ln(x) + b}$$

8.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,x^n y^2 - ab\,x^{n+1} \ln(x)\, y + b \ln(x) + b \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,x^n y^2 - ab\,x^n x \ln(x)\, y + b \ln(x) + b$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\ln(x) + b$, $f_1(x) = -a\ln(x)\,x^{n+1}b$ and $f_2(x) = x^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{x^n a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{x^n n a}{x} \\
f_1 f_2 &= -a^2 \ln(x) x^{n+1} b x^n \\
f_2^2 f_0 &= x^{2n} a^2 (b \ln(x) + b)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$x^n a u''(x) - \left(\frac{x^n n a}{x} - a^2 \ln(x) x^{n+1} b x^n\right) u'(x) + x^{2n} a^2 (b \ln(x) + b) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{a\_Y(x) b(1+\ln(x)) x^{n+1} + \_Y''(x) x + \_Y'(x) (a \ln(x) x^{2+n} b - n)}{x}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{a\_Y(x) b(1+\ln(x)) x^{n+1} + \_Y''(x) x + \_Y'(x) (a \ln(x) x^{2+n} b - n)}{x}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{a\_Y(x) b(1+\ln(x)) x^{n+1} + \_Y''(x) x + \_Y'(x)(a \ln(x) x^{2+n} b - n)}{x}\right\}, \{\_Y(x)\}\right)\right) x^{-n}}{a\, \mathrm{DESol}\left(\left\{\frac{a\_Y(x) b(1+\ln(x)) x^{n+1} + \_Y''(x) x + \_Y'(x)(a \ln(x) x^{2+n} b - n)}{x}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{a\_Y(x) b(1+\ln(x)) x^{n+1} + \_Y''(x) x + \_Y'(x)(a \ln(x) x^{2+n} b - n)}{x}\right\}, \{\_Y(x)\}\right)\right) x^{-n}}{a\, \mathrm{DESol}\left(\left\{\frac{a\_Y(x) b(1+\ln(x)) x^{n+1} + \_Y''(x) x + \_Y'(x)(a \ln(x) x^{2+n} b - n)}{x}\right\}, \{\_Y(x)\}\right)}$$

Summary
The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{a\_Y(x)b(1+\ln(x))x^{n+1}+\_Y''(x)x+\_Y'(x)\left(a\ln(x)x^{2+n}b-n\right)}{x}\right\},\{\_Y(x)\}\right)\right)x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{a\_Y(x)b(1+\ln(x))x^{n+1}+\_Y''(x)x+\_Y'(x)\left(a\ln(x)x^{2+n}b-n\right)}{x}\right\},\{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{a\_Y(x)b(1+\ln(x))x^{n+1}+\_Y''(x)x+\_Y'(x)\left(a\ln(x)x^{2+n}b-n\right)}{x}\right\},\{\_Y(x)\}\right)\right)x^{-n}}{a\,\mathrm{DESol}\left(\left\{\frac{a\_Y(x)b(1+\ln(x))x^{n+1}+\_Y''(x)x+\_Y'(x)\left(a\ln(x)x^{2+n}b-n\right)}{x}\right\},\{\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-2
Problem number: 13.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + (n+1)\,x^n y^2 - a\,x^{n+1}\ln(x)^m\,y = -a\ln(x)^m}$$

8.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,x^{n+1}\ln(x)^m\,y - x^n y^2 n - x^n y^2 - a\ln(x)^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,x^n x\ln(x)^m\,y - x^n y^2 n - x^n y^2 - a\ln(x)^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a\ln(x)^m$, $f_1(x) = a\ln(x)^m\,x^{n+1}$ and $f_2(x) = -n\,x^n - x^n$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{(-n\,x^n - x^n)\,u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{n^2 x^n}{x} - \frac{x^n n}{x} \\
f_1 f_2 &= a \ln(x)^m x^{n+1}(-n\,x^n - x^n) \\
f_2^2 f_0 &= -(-n\,x^n - x^n)^2 a \ln(x)^m
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$(-n\,x^n - x^n)\, u''(x) - \left(-\frac{n^2 x^n}{x} - \frac{x^n n}{x} + a \ln(x)^m x^{n+1}(-n\,x^n - x^n)\right) u'(x) - (-n\,x^n - x^n)^2 a \ln(x)^m u(x$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{n+1}\left(\left(\int x^{-2n-2} e^{\int \left(a \ln(x)^m x^{n+1} + \frac{n}{x}\right)dx} dx\right) c_2 + c_1\right)$$

The above shows that

$$u'(x) = x^n (n+1)\left(\left(\int e^{\int \frac{a \ln(x)^m x^{2+n} + n}{x} dx} x^{-2n-2} dx\right) c_2 + c_1\right) + c_2 x^{-n-1} e^{\int \frac{a \ln(x)^m x^{2+n} + n}{x} dx}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(x^n (n+1)\left(\left(\int e^{\int \frac{a \ln(x)^m x^{2+n} + n}{x} dx} x^{-2n-2} dx\right) c_2 + c_1\right) + c_2 x^{-n-1} e^{\int \frac{a \ln(x)^m x^{2+n} + n}{x} dx}\right) x^{-n-1}}{(-n\,x^n - x^n)\left(\left(\int x^{-2n-2} e^{\int \left(a \ln(x)^m x^{n+1} + \frac{n}{x}\right)dx} dx\right) c_2 + c_1\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\int x^{-2n-2} e^{\int \left(a \ln(x)^m x^{n+1} + \frac{n}{x}\right)dx} dx + c_3\right)(n+1)\, x^{-n-1} + x^{-2-3n} e^{\int \left(a \ln(x)^m x^{n+1} + \frac{n}{x}\right)dx}}{(n+1)\left(\int e^{\int \frac{a \ln(x)^m x^{2+n} + n}{x} dx} x^{-2n-2} dx + c_3\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{\left(\int x^{-2n-2} e^{\int \left(a \ln(x)^m x^{n+1} + \frac{n}{x}\right) dx} dx + c_3\right) (n+1)\, x^{-n-1} + x^{-2-3n} e^{\int \left(a \ln(x)^m x^{n+1} + \frac{n}{x}\right) dx}}{(n+1) \left(\int e^{\int \frac{a \ln(x)^m x^{2+n} + n}{x} dx} x^{-2n-2} dx + c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\int x^{-2n-2} e^{\int \left(a \ln(x)^m x^{n+1} + \frac{n}{x}\right) dx} dx + c_3\right) (n+1)\, x^{-n-1} + x^{-2-3n} e^{\int \left(a \ln(x)^m x^{n+1} + \frac{n}{x}\right) dx}}{(n+1) \left(\int e^{\int \frac{a \ln(x)^m x^{2+n} + n}{x} dx} x^{-2n-2} dx + c_3\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-2
Problem number: 14.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"linear", "exactWithIntegrationFactor", "first_order_ode_lie_symmetry_lookup"**

Maple gives the following as the ode type

`[_linear]`

$$\boxed{y' - a\ln(x)^n y + abx\ln(x)^{n+1} y = b\ln(x) + b}$$

8.5.1 Solving as linear ode

Entering Linear first order ODE solver. In canonical form a linear first order is

$$y' + p(x)y = q(x)$$

Where here

$$\begin{aligned}p(x) &= -\ln(x)^n a(1 - \ln(x) bx)\\ q(x) &= b(1 + \ln(x))\end{aligned}$$

Hence the ode is

$$y' - \ln(x)^n a(1 - \ln(x) bx) y = b(1 + \ln(x))$$

The integrating factor μ is

$$\mu = e^{\int -\ln(x)^n a(1 - \ln(x) bx)dx}$$

The ode becomes

$$\frac{d}{dx}(\mu y) = (\mu)\,(b(1+\ln(x)))$$

$$\frac{d}{dx}\left(e^{\int -\ln(x)^n a(1-\ln(x)bx)dx}y\right) = \left(e^{\int -\ln(x)^n a(1-\ln(x)bx)dx}\right)(b(1+\ln(x)))$$

$$d\left(e^{\int -\ln(x)^n a(1-\ln(x)bx)dx}y\right) = \left(b(1+\ln(x))\,e^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}\right)\,dx$$

Integrating gives

$$e^{\int -\ln(x)^n a(1-\ln(x)bx)dx}y = \int b(1+\ln(x))\,e^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}\,dx$$

$$e^{\int -\ln(x)^n a(1-\ln(x)bx)dx}y = \int b(1+\ln(x))\,e^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}\,dx + c_1$$

Dividing both sides by the integrating factor $\mu = e^{\int -\ln(x)^n a(1-\ln(x)bx)dx}$ results in

$$y = e^{-a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}\left(\int b(1+\ln(x))\,e^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}dx\right) + c_1 e^{-a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}$$

which simplifies to

$$y = e^{-a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}\left(b\left(\int (1+\ln(x))\,e^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}dx\right) + c_1\right)$$

Summary

The solution(s) found are the following

$$y = e^{-a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}\left(b\left(\int (1+\ln(x))\,e^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}dx\right) + c_1\right) \tag{1}$$

Verification of solutions

$$y = e^{-a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}\left(b\left(\int (1+\ln(x))\,e^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}dx\right) + c_1\right)$$

Verified OK.

8.5.2 Solving as first order ode lie symmetry lookup ode

Writing the ode as

$$y' = a\ln(x)^n y - abx\ln(x)^{n+1} y + b\ln(x) + b$$
$$y' = \omega(x,y)$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x + \omega(\eta_y - \xi_x) - \omega^2\xi_y - \omega_x\xi - \omega_y\eta = 0 \tag{A}$$

The type of this ode is known. It is of type `linear`. Therefore we do not need to solve the PDE (A), and can just use the lookup table shown below to find ξ, η

Table 11: Lie symmetry infinitesimal lookup table for known first order ODE's

ODE class	Form	ξ	η
linear ode	$y' = f(x)y(x) + g(x)$	0	$e^{\int f dx}$
separable ode	$y' = f(x)\, g(y)$	$\frac{1}{f}$	0
quadrature ode	$y' = f(x)$	0	1
quadrature ode	$y' = g(y)$	1	0
homogeneous ODEs of Class A	$y' = f\left(\frac{y}{x}\right)$	x	y
homogeneous ODEs of Class C	$y' = (a + bx + cy)^{\frac{n}{m}}$	1	$-\frac{b}{c}$
homogeneous class D	$y' = \frac{y}{x} + g(x)\, F\left(\frac{y}{x}\right)$	x^2	xy
First order special form ID 1	$y' = g(x)\, e^{h(x)+by} + f(x)$	$\frac{e^{-\int bf(x)dx - h(x)}}{g(x)}$	$\frac{f(x)e^{-\int bf(x)dx - h(x)}}{g(x)}$
polynomial type ode	$y' = \frac{a_1x+b_1y+c_1}{a_2x+b_2y+c_2}$	$\frac{a_1b_2x - a_2b_1x - b_1c_2 + b_2c_1}{a_1b_2 - a_2b_1}$	$\frac{a_1b_2y - a_2b_1y - a_1c_2 - a_2c_1}{a_1b_2 - a_2b_1}$
Bernoulli ode	$y' = f(x)\, y + g(x)\, y^n$	0	$e^{-\int (n-1)f(x)dx} y^n$
Reduced Riccati	$y' = f_1(x)\, y + f_2(x)\, y^2$	0	$e^{-\int f_1 dx}$

The above table shows that

$$
\begin{aligned}
\xi(x, y) &= 0 \\
\eta(x, y) &= e^{\int \ln(x)^n a(1 - \ln(x)bx)dx}
\end{aligned}
\tag{A1}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x, y) \to (R, S)$ where (R, S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$
\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}
$$

The above comes from the requirements that $\left(\xi\frac{\partial}{\partial x}+\eta\frac{\partial}{\partial y}\right)S(x,y)=1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi=0$ then in this special case

$$R = x$$

S is found from

$$\begin{aligned}S &= \int \frac{1}{\eta}dy\\ &= \int \frac{1}{e^{\int \ln(x)^n a(1-\ln(x)bx)dx}}dy\end{aligned}$$

8.5.3 Solving as exact ode

Entering Exact first order ODE solver. (Form one type)

To solve an ode of the form

$$M(x,y)+N(x,y)\frac{dy}{dx}=0 \tag{A}$$

We assume there exists a function $\phi(x,y)=c$ where c is constant, that satisfies the ode. Taking derivative of ϕ w.r.t. x gives

$$\frac{d}{dx}\phi(x,y)=0$$

Hence

$$\frac{\partial\phi}{\partial x}+\frac{\partial\phi}{\partial y}\frac{dy}{dx}=0 \tag{B}$$

Comparing (A,B) shows that

$$\begin{aligned}\frac{\partial\phi}{\partial x} &= M\\ \frac{\partial\phi}{\partial y} &= N\end{aligned}$$

But since $\frac{\partial^2\phi}{\partial x\partial y}=\frac{\partial^2\phi}{\partial y\partial x}$ then for the above to be valid, we require that

$$\frac{\partial M}{\partial y}=\frac{\partial N}{\partial x}$$

If the above condition is satisfied, then the original ode is called exact. We still need to determine $\phi(x,y)$ but at least we know now that we can do that since the condition $\frac{\partial^2\phi}{\partial x\partial y}=\frac{\partial^2\phi}{\partial y\partial x}$ is satisfied. If this condition is not satisfied then this method will not work and we have to now look for an integrating factor to force this condition, which might or might not exist. The first step is to write the ODE in standard form to check for exactness, which is

$$M(x,y)\,\mathrm{d}x + N(x,y)\,\mathrm{d}y = 0 \tag{1A}$$

Therefore

$$\mathrm{d}y = \left(a\ln(x)^n y - abx\ln(x)^{n+1} y + b\ln(x) + b\right)\mathrm{d}x$$

$$\left(-a\ln(x)^n y + abx\ln(x)^{n+1} y - b\ln(x) - b\right)\mathrm{d}x + \mathrm{d}y = 0 \tag{2A}$$

Comparing (1A) and (2A) shows that

$$\begin{aligned} M(x,y) &= -a\ln(x)^n y + abx\ln(x)^{n+1} y - b\ln(x) - b \\ N(x,y) &= 1 \end{aligned}$$

The next step is to determine if the ODE is is exact or not. The ODE is exact when the following condition is satisfied

$$\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$$

Using result found above gives

$$\begin{aligned} \frac{\partial M}{\partial y} &= \frac{\partial}{\partial y}\left(-a\ln(x)^n y + abx\ln(x)^{n+1} y - b\ln(x) - b\right) \\ &= \ln(x)^n a(-1 + \ln(x)\,bx) \end{aligned}$$

And

$$\begin{aligned} \frac{\partial N}{\partial x} &= \frac{\partial}{\partial x}(1) \\ &= 0 \end{aligned}$$

Since $\frac{\partial M}{\partial y} \neq \frac{\partial N}{\partial x}$, then the ODE is <u>not exact</u>. Since the ODE is not exact, we will try to find an integrating factor to make it exact. Let

$$\begin{aligned} A &= \frac{1}{N}\left(\frac{\partial M}{\partial y} - \frac{\partial N}{\partial x}\right) \\ &= 1\left(\left(-\ln(x)^n a + \ln(x)^{n+1} axb\right) - (0)\right) \\ &= \ln(x)^n a(-1 + \ln(x)\,bx) \end{aligned}$$

Since A does not depend on y, then it can be used to find an integrating factor. The integrating factor μ is

$$\begin{aligned} \mu &= e^{\int A\,\mathrm{d}x} \\ &= e^{\int \ln(x)^n a(-1+\ln(x)bx)\,\mathrm{d}x} \end{aligned}$$

The result of integrating gives

$$
\begin{aligned}
\mu &= e^{\int \ln(x)^n a(-1+\ln(x)bx)dx} \\
&= \mathrm{e}^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}
\end{aligned}
$$

M and N are multiplied by this integrating factor, giving new M and new N which are called $\overline{M}$ and $\overline{N}$ for now so not to confuse them with the original M and N.

$$
\begin{aligned}
\overline{M} &= \mu M \\
&= \mathrm{e}^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}\left(-a\ln(x)^n y + abx\ln(x)^{n+1} y - b\ln(x) - b\right) \\
&= (ay(-1+\ln(x)\,bx)\ln(x)^n - b(1+\ln(x)))\,\mathrm{e}^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}
\end{aligned}
$$

And

$$
\begin{aligned}
\overline{N} &= \mu N \\
&= \mathrm{e}^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}(1) \\
&= \mathrm{e}^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}
\end{aligned}
$$

Now a modified ODE is ontained from the original ODE, which is exact and can be solved. The modified ODE is

$$
\begin{aligned}
\overline{M} + \overline{N}\frac{\mathrm{d}y}{\mathrm{d}x} &= 0 \\
\left((ay(-1+\ln(x)\,bx)\ln(x)^n - b(1+\ln(x)))\,\mathrm{e}^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}\right) + \left(\mathrm{e}^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}\right)\frac{\mathrm{d}y}{\mathrm{d}x} &= 0
\end{aligned}
$$

The following equations are now set up to solve for the function $\phi(x,y)$

$$
\frac{\partial \phi}{\partial x} = \overline{M} \tag{1}
$$

$$
\frac{\partial \phi}{\partial y} = \overline{N} \tag{2}
$$

Integrating (1) w.r.t. x gives

$$
\begin{aligned}
\int \frac{\partial \phi}{\partial x}\,\mathrm{d}x &= \int \overline{M}\,\mathrm{d}x \\
\int \frac{\partial \phi}{\partial x}\,\mathrm{d}x &= \int (ay(-1+\ln(x)\,bx)\ln(x)^n - b(1+\ln(x)))\,\mathrm{e}^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)}\,\mathrm{d}x
\end{aligned}
$$

$$
\begin{aligned}
\phi = \int^x & (ay(-1+\ln(\_a)\,b\_a)\ln(\_a)^n \\
& - b(1+\ln(\_a)))\,\mathrm{e}^{a\left(\int \ln(\_a)^n(-1+\ln(\_a)b\_a)d\_a\right)}d\_a + f(y)
\end{aligned} \tag{3}
$$

Where $f(y)$ is used for the constant of integration since ϕ is a function of both x and y. Taking derivative of equation (3) w.r.t y gives

$$\frac{\partial \phi}{\partial y} = e^{a\left(\int^{x} \ln(\_a)^{n}(-1+\ln(\_a)b\_a)d\_a\right)} + f'(y) \tag{4}$$

But equation (2) says that $\frac{\partial \phi}{\partial y} = e^{a\left(\int \ln(x)^{n}(-1+\ln(x)bx)dx\right)}$. Therefore equation (4) becomes

$$e^{a\left(\int \ln(x)^{n}(-1+\ln(x)bx)dx\right)} = e^{a\left(\int^{x} \ln(\_a)^{n}(-1+\ln(\_a)b\_a)d\_a\right)} + f'(y) \tag{5}$$

Solving equation (5) for $f'(y)$ gives

$$f'(y) = -e^{a\left(\int^{x} \ln(\_a)^{n}(-1+\ln(\_a)b\_a)d\_a\right)} + e^{a\left(\int \ln(x)^{n}(-1+\ln(x)bx)dx\right)}$$

Integrating the above w.r.t y gives

$$\int f'(y)\,dy = \int \left(-e^{a\left(\int^{x} \ln(\_a)^{n}(-1+\ln(\_a)b\_a)d\_a\right)} + e^{a\left(\int \ln(x)^{n}(-1+\ln(x)bx)dx\right)}\right) dy$$

$$f(y) = \int_{0}^{y} \left(-e^{a\left(\int^{x} \ln(\_a)^{n}(-1+\ln(\_a)b\_a)d\_a\right)} + e^{a\left(\int \ln(x)^{n}(-1+\ln(x)bx)dx\right)}\right) d\_a + c_1$$

Where c_1 is constant of integration. Substituting result found above for $f(y)$ into equation (3) gives ϕ

$$\phi = \int^{x} (ay(-1+\ln(\_a)\,b\_a)\ln(\_a)^{n} - b(1+\ln(\_a)))\,e^{a\left(\int \ln(\_a)^{n}(-1+\ln(\_a)b\_a)d\_a\right)} d\_a + \int_{0}^{y} \left(-e^{a\left(\int^{x} \ln(\_a)^{n}(-1+\ln(\_a)b\_a)d\_a\right)} + e^{a\left(\int \ln(x)^{n}(-1+\ln(x)bx)dx\right)}\right) d\_a + c_1$$

But since ϕ itself is a constant function, then let $\phi = c_2$ where c_2 is new constant and combining c_1 and c_2 constants into new constant c_1 gives the solution as

$$c_1 = \int^{x} (ay(-1+\ln(\_a)\,b\_a)\ln(\_a)^{n} - b(1+\ln(\_a)))\,e^{a\left(\int \ln(\_a)^{n}(-1+\ln(\_a)b\_a)d\_a\right)} d\_a + \int_{0}^{y} \left(-e^{a\left(\int^{x} \ln(\_a)^{n}(-1+\ln(\_a)b\_a)d\_a\right)} + e^{a\left(\int \ln(x)^{n}(-1+\ln(x)bx)dx\right)}\right) d\_a$$

Summary

The solution(s) found are the following

$$
\begin{aligned}
&\int^{x} (ay(-1+\ln(\_a)\, b\_a)\ln(\_a)^{n} \\
&- b(1+\ln(\_a)))\, \mathrm{e}^{a\left(\int \ln(\_a)^{n}(-1+\ln(\_a)b\_a)d\_a\right)} d\_a \\
&+ \int_{0}^{y} \left(-\mathrm{e}^{a\left(\int^{x} \ln(\_a)^{n}(-1+\ln(\_a)b\_a)d\_a\right)} + \mathrm{e}^{a\left(\int \ln(x)^{n}(-1+\ln(x)bx)dx\right)}\right) d\_a = c_{1}
\end{aligned} \tag{1}
$$

Verification of solutions

$$
\begin{aligned}
&\int^{x} (ay(-1+\ln(\_a)\, b\_a)\ln(\_a)^{n} - b(1+\ln(\_a)))\, \mathrm{e}^{a\left(\int \ln(\_a)^{n}(-1+\ln(\_a)b\_a)d\_a\right)} d\_a \\
&+ \int_{0}^{y} \left(-\mathrm{e}^{a\left(\int^{x} \ln(\_a)^{n}(-1+\ln(\_a)b\_a)d\_a\right)} + \mathrm{e}^{a\left(\int \ln(x)^{n}(-1+\ln(x)bx)dx\right)}\right) d\_a = c_{1}
\end{aligned}
$$

Verified OK.

8.5.4 Maple step by step solution

Let's solve

$y' - a\ln(x)^{n} y + abx\ln(x)^{n+1} y = b\ln(x) + b$

- Highest derivative means the order of the ODE is 1

  y'

- Isolate the derivative

  $y' = \left(\ln(x)^{n} a - \ln(x)^{n+1} axb\right) y + b\ln(x) + b$

- Group terms with y on the lhs of the ODE and the rest on the rhs of the ODE

  $y' + \left(-\ln(x)^{n} a + \ln(x)^{n+1} axb\right) y = b\ln(x) + b$

- The ODE is linear; multiply by an integrating factor $\mu(x)$

  $\mu(x)\left(y' + \left(-\ln(x)^{n} a + \ln(x)^{n+1} axb\right) y\right) = \mu(x)\left(b\ln(x) + b\right)$

- Assume the lhs of the ODE is the total derivative $\frac{d}{dx}(\mu(x)\, y)$

  $\mu(x)\left(y' + \left(-\ln(x)^{n} a + \ln(x)^{n+1} axb\right) y\right) = \mu'(x)\, y + \mu(x)\, y'$

- Isolate $\mu'(x)$

  $\mu'(x) = \mu(x)\left(-\ln(x)^{n} a + \ln(x)^{n+1} axb\right)$

- Solve to find the integrating factor

  $\mu(x) = \mathrm{e}^{\int \ln(x)^{n} a(-1+\ln(x)bx)dx}$

- Integrate both sides with respect to x

  $\int \left(\frac{d}{dx}(\mu(x)\, y)\right) dx = \int \mu(x)\,(b \ln(x) + b)\, dx + c_1$
- Evaluate the integral on the lhs

  $\mu(x)\, y = \int \mu(x)\,(b \ln(x) + b)\, dx + c_1$
- Solve for y

  $y = \frac{\int \mu(x)(b \ln(x)+b)dx+c_1}{\mu(x)}$
- Substitute $\mu(x) = \mathrm{e}^{\int \ln(x)^n a(-1+\ln(x)bx)dx}$

  $y = \frac{\int \mathrm{e}^{\int \ln(x)^n a(-1+\ln(x)bx)dx}(b \ln(x)+b)dx+c_1}{\mathrm{e}^{\int \ln(x)^n a(-1+\ln(x)bx)dx}}$
- Simplify

  $y = \mathrm{e}^{-a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)} \left(b\left(\int (1+\ln(x))\, \mathrm{e}^{a\left(\int \ln(x)^n(-1+\ln(x)bx)dx\right)} dx\right) + c_1\right)$

Internal problem ID [10490]
Internal file name [`OUTPUT/9437_Monday_June_06_2022_02_32_25_PM_74432929/index.tex`]

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-2
Problem number: 15.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[[_1st_order, `_with_symmetry_[F(x),G(x)]`], _Riccati]
```

$$\boxed{y' - a\ln(x)^{k}\left(y - b\,x^{n} - c\right)^{2} = b\,x^{n-1}n}$$

8.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= x^{2n}\ln(x)^{k}\,a\,b^{2} + 2x^{n}\ln(x)^{k}\,abc - 2x^{n}\ln(x)^{k}\,aby + \ln(x)^{k}\,a\,c^{2} - 2\ln(x)^{k}\,acy + \ln(x)^{k}\,a\,y^{2} + b\,x^{n-1}n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^{2n}\ln(x)^{k}\,a\,b^{2} + 2x^{n}\ln(x)^{k}\,abc - 2x^{n}\ln(x)^{k}\,aby + \ln(x)^{k}\,a\,c^{2} - 2\ln(x)^{k}\,acy + \ln(x)^{k}\,a\,y^{2} + \frac{b\,x^{n}n}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = x^{2n}\ln(x)^{k}\,a\,b^{2} + 2x^{n}\ln(x)^{k}\,abc + \ln(x)^{k}\,a\,c^{2} + b\,x^{n-1}n$, $f_1(x) = -2\ln(x)^{k}\,a\,x^{n}b - 2\ln(x)^{k}\,ac$ and $f_2(x) = \ln(x)^{k}\,a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\ln(x)^{k}\,au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{\ln(x)^k ka}{x\ln(x)}\\
f_1f_2 &= \left(-2\ln(x)^k a\,x^n b - 2\ln(x)^k ac\right)\ln(x)^k a\\
f_2^2f_0 &= \ln(x)^{2k} a^2\left(x^{2n}\ln(x)^k a\,b^2 + 2x^n\ln(x)^k abc + \ln(x)^k a\,c^2 + b\,x^{n-1}n\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\ln(x)^k au''(x) - \left(\frac{\ln(x)^k ka}{x\ln(x)} + \left(-2\ln(x)^k a\,x^n b - 2\ln(x)^k ac\right)\ln(x)^k a\right)u'(x) + \ln(x)^{2k} a^2\left(x^{2n}\ln(x)^k a$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{(-\ln(x))^{-k}\left(-c_2\left(x(-\ln(x))^k + \Gamma(k,-\ln(x))\,k - \Gamma(k+1)\right)\ln(x)^{\frac{k}{2}} + \ln(x)^{-\frac{k}{2}} c_1(-\ln(x))^k\right)\mathrm{e}^{-\frac{\left(\int\left(2\ln\right.\right.}{}}}{\sqrt{x}}$$

The above shows that

$$u'(x) = \frac{(-\ln(x))^{-k}\left(\left((x^{n+1}b + cx)(-\ln(x))^k - (b\,x^n + c)(-\Gamma(k,-\ln(x))\,k + \Gamma(k+1))\right)ac_2\ln(x)^{\frac{3k}{2}} - (-\ln\right.}{\sqrt{x}}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\left((x^{n+1}b + cx)(-\ln(x))^k - (b\,x^n + c)(-\Gamma(k,-\ln(x))\,k + \Gamma(k+1))\right)ac_2\ln(x)^{\frac{3k}{2}} - (-\ln(x))^k\ln(\right.}{a\left(-c_2\left(x(-\ln(x))^k + \Gamma(k,-\ln(x))\,k - \Gamma(k+1)\right)\ln(x)^{\frac{k}{2}} + \ln(x)^{-\frac{k}{2}} c_1(-\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\ln(x)^{-k}\left(-(-\ln(x))^{k}\ln(x)^{\frac{k}{2}}(x^{n}c_{3}ab + c_{3}ca + 1) + \ln(x)^{\frac{3k}{2}}a\Big((x^{n+1}b + cx)(-\ln(x))^{k} + (\Gamma(k, -\ln(x)\right.}{\left(\left(x(-\ln(x))^{k} + \Gamma(k, -\ln(x))k - \Gamma(k+1)\right)\ln(x)^{\frac{k}{2}} - \ln(x)^{-\frac{k}{2}}c_{3}(-\ln(x))^{k}\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{\ln(x)^{-k}\left(-(-\ln(x))^{k}\ln(x)^{\frac{k}{2}}(x^{n}c_{3}ab + c_{3}ca + 1) + \ln(x)^{\frac{3k}{2}}a\Big((x^{n+1}b + cx)(-\ln(x))^{k} + (\Gamma(k, -\ln(x)\right.}{\left(\left(x(-\ln(x))^{k} + \Gamma(k, -\ln(x))k - \Gamma(k+1)\right)\ln(x)^{\frac{k}{2}} - \ln(x)^{-\frac{k}{2}}c_{3}(-\ln(x))^{k}\right.} \tag{1}$$

Verification of solutions

$$y = \frac{\ln(x)^{-k}\left(-(-\ln(x))^{k}\ln(x)^{\frac{k}{2}}(x^{n}c_{3}ab + c_{3}ca + 1) + \ln(x)^{\frac{3k}{2}}a\Big((x^{n+1}b + cx)(-\ln(x))^{k} + (\Gamma(k, -\ln(x)\right.}{\left(\left(x(-\ln(x))^{k} + \Gamma(k, -\ln(x))k - \Gamma(k+1)\right)\ln(x)^{\frac{k}{2}} - \ln(x)^{-\frac{k}{2}}c_{3}(-\ln(x))^{k}\right.}$$

Verified OK.

8.7 problem 16

Internal problem ID [10491]
Internal file name [`OUTPUT/9438_Monday_June_06_2022_02_32_27_PM_544547/index.tex`]

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-2
Problem number: 16.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\ln (x)^n y^2 - b\ln (x)^m y = bc\ln (x)^m - a\,c^2 \ln (x)^n}$$

8.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\ln (x)^n y^2 + b\ln (x)^m y + bc\ln (x)^m - a\,c^2 \ln (x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\ln (x)^n y^2 + b\ln (x)^m y + bc\ln (x)^m - a\,c^2 \ln (x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = bc\ln (x)^m - a\,c^2 \ln (x)^n$, $f_1(x) = \ln (x)^m b$ and $f_2(x) = \ln (x)^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\ln (x)^n au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{\ln(x)^n n a}{x \ln(x)} \\
f_1 f_2 &= \ln(x)^m b \ln(x)^n a \\
f_2^2 f_0 &= \ln(x)^{2n} a^2 \left(bc \ln(x)^m - a\, c^2 \ln(x)^n\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\ln(x)^n a u''(x) - \left(\frac{\ln(x)^n n a}{x \ln(x)} + \ln(x)^m b \ln(x)^n a\right) u'(x) + \ln(x)^{2n} a^2 \left(bc \ln(x)^m - a\, c^2 \ln(x)^n\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) = \mathrm{DESol}\Bigg(\Bigg\{_Y''(x) - _Y'(x)\left(\frac{n}{x \ln(x)} + \ln(x)^m b\right) \\
+ a_Y(x)\left(bc \ln(x)^{m+n} - a\, c^2 \ln(x)^{2n}\right)\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

The above shows that

$$\begin{aligned}
u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\Bigg(\Bigg\{_Y''(x) - _Y'(x)\left(\frac{n}{x \ln(x)} + \ln(x)^m b\right) \\
+ a_Y(x)\left(bc \ln(x)^{m+n} - a\, c^2 \ln(x)^{2n}\right)\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \_Y'(x)\left(\frac{n}{x \ln(x)} + \ln(x)^m b\right) + a\_Y(x)\left(bc \ln(x)^{m+n} - a\, c^2 \ln(x)^{2n}\right)\right\}, \{\_Y(\right.\right.}{a\, \mathrm{DESol}\left(\left\{\_Y''(x) - \_Y'(x)\left(\frac{n}{x \ln(x)} + \ln(x)^m b\right) + a\_Y(x)\left(bc \ln(x)^{m+n} - a\, c^2 \ln(x)^{2n}\right)\right\}, \{\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-\ln(x)\ln(x)^{2n} \_\_Y(x) a^2 c^2 x + \ln(x)\ln(x)^{m+n} \_\_Y(x) abcx - \ln(x)^{m+1} \_\_Y'(x) bx + \_\_Y''(x)\ln(x) x - n \_\_Y'(x)}{\ln(x) x}\right\}, \{\_\right.\right.}{a\,\mathrm{DESol}\left(\left\{\frac{-x\,a^2 c^2 \_\_Y(x)\ln(x)^{1+2n} + abcx \_\_Y(x)\ln(x)^{1+m+n} - \ln(x)^{m+1} \_\_Y'(x) bx + \_\_Y''(x)\ln(x) x - n \_\_Y'(x)}{x\ln(x)}\right\}, \{\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-\ln(x)\ln(x)^{2n} \_\_Y(x) a^2 c^2 x + \ln(x)\ln(x)^{m+n} \_\_Y(x) abcx - \ln(x)^{m+1} \_\_Y'(x) bx + \_\_Y''(x)\ln(x) x - n \_\_Y'(x)}{\ln(x) x}\right\}, \{\_\right.\right.}{a\,\mathrm{DESol}\left(\left\{\frac{-x\,a^2 c^2 \_\_Y(x)\ln(x)^{1+2n} + abcx \_\_Y(x)\ln(x)^{1+m+n} - \ln(x)^{m+1} \_\_Y'(x) bx + \_\_Y''(x)\ln(x) x - n \_\_Y'(x)}{x\ln(x)}\right\}, \{\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-\ln(x)\ln(x)^{2n} \_\_Y(x) a^2 c^2 x + \ln(x)\ln(x)^{m+n} \_\_Y(x) abcx - \ln(x)^{m+1} \_\_Y'(x) bx + \_\_Y''(x)\ln(x) x - n \_\_Y'(x)}{\ln(x) x}\right\}, \{\_\right.\right.}{a\,\mathrm{DESol}\left(\left\{\frac{-x\,a^2 c^2 \_\_Y(x)\ln(x)^{1+2n} + abcx \_\_Y(x)\ln(x)^{1+m+n} - \ln(x)^{m+1} \_\_Y'(x) bx + \_\_Y''(x)\ln(x) x - n \_\_Y'(x)}{x\ln(x)}\right\}, \{\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-2
Problem number: 17.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati", "first_order_ode_lie_symmetry_calculated"**

Maple gives the following as the ode type

```
[[_1st_order, _with_linear_symmetries], _Riccati]
```

$$\boxed{y'x-(ay+b\ln(x))^2=0}$$

8.8.1 Solving as first order ode lie symmetry calculated ode

Writing the ode as

$$\begin{aligned} y' &= \frac{(ya+b\ln(x))^2}{x} \\ y' &= \omega(x,y) \end{aligned}$$

The condition of Lie symmetry is the linearized PDE given by

$$\eta_x+\omega(\eta_y-\xi_x)-\omega^2\xi_y-\omega_x\xi-\omega_y\eta=0 \tag{A}$$

The type of this ode is not in the lookup table. To determine ξ,η then (A) is solved using ansatz. Making bivariate polynomials of degree 1 to use as anstaz gives

$$\xi = xa_2+ya_3+a_1 \tag{1E}$$

$$\eta = xb_2+yb_3+b_1 \tag{2E}$$

Where the unknown coefficients are

$$\{a_1, a_2, a_3, b_1, b_2, b_3\}$$

Substituting equations (1E,2E) and ω into (A) gives

$$b_2 + \frac{(ya + b\ln(x))^2 (b_3 - a_2)}{x} - \frac{(ya + b\ln(x))^4 a_3}{x^2} - \left(\frac{2(ya + b\ln(x))\, b}{x^2} - \frac{(ya + b\ln(x))^2}{x^2}\right)(xa_2 + ya_3 + a_1) - \frac{2(ya + b\ln(x))\, a(xb_2 + yb_3 + b_1)}{x} = 0 \tag{5E}$$

Putting the above in normal form gives

$$-\frac{\ln(x)^4 b^4 a_3 + 4\ln(x)^3 a\, b^3 y a_3 + 6\ln(x)^2 a^2 b^2 y^2 a_3 + 4\ln(x)\, a^3 b\, y^3 a_3 + a^4 y^4 a_3 - \ln(x)^2 b^2 x b_3 - \ln(x)^2 b^2}{}$$
$$= 0$$

Setting the numerator to zero gives

$$-\ln(x)^4 b^4 a_3 - 4\ln(x)^3 a\, b^3 y a_3 - 6\ln(x)^2 a^2 b^2 y^2 a_3 - 4\ln(x)\, a^3 b\, y^3 a_3 - a^4 y^4 a_3 + \ln(x)^2 b^2 x b_3 + \ln(x)^2 b^2 y a_3 - 2\ln(x)\, ab\, x^2 b_2 + 2\ln(x)\, ab\, y^2 a_3 - 2a^2 x^2 y b_2 - a^2 x\, y^2 b_3 + a^2 y^3 a_3 + \ln(x)^2 b^2 a_1 - 2\ln(x)\, abx b_1 + 2\ln(x)\, aby a_1 - 2\ln(x)\, b^2 x a_2 - 2\ln(x)\, b^2 y a_3 - 2a^2 xy b_1 + a^2 y^2 a_1 - 2abxy a_2 - 2ab\, y^2 a_3 - 2\ln(x)\, b^2 a_1 - 2aby a_1 + b_2 x^2 = 0 \tag{6E}$$

Looking at the above PDE shows the following are all the terms with $\{x, y\}$ in them.

$$\{x, y, \ln(x)\}$$

The following substitution is now made to be able to collect on all terms with $\{x, y\}$ in them

$$\{x = v_1, y = v_2, \ln(x) = v_3\}$$

The above PDE (6E) now becomes

$$-a^4 v_2^4 a_3 - 4v_3 a^3 b v_2^3 a_3 - 6v_3^2 a^2 b^2 v_2^2 a_3 - 4v_3^3 a\, b^3 v_2 a_3 - v_3^4 b^4 a_3 + a^2 v_2^3 a_3 - 2a^2 v_1^2 v_2 b_2 - a^2 v_1 v_2^2 b_3 + 2v_3 ab v_2^2 a_3 - 2v_3 ab v_1^2 b_2 + v_3^2 b^2 v_2 a_3 + v_3^2 b^2 v_1 b_3 + a^2 v_2^2 a_1 - 2a^2 v_1 v_2 b_1 + 2v_3 ab v_2 a_1 - 2ab v_1 v_2 a_2 - 2ab v_2^2 a_3 - 2v_3 ab v_1 b_1 + v_3^2 b^2 a_1 - 2v_3 b^2 v_1 a_2 - 2v_3 b^2 v_2 a_3 - 2ab v_2 a_1 - 2v_3 b^2 a_1 + b_2 v_1^2 = 0 \tag{7E}$$

Collecting the above on the terms v_i introduced, and these are

$$\{v_1, v_2, v_3\}$$

Equation (7E) now becomes

$$\begin{aligned}
&-2a^2v_1^2v_2b_2 - 2v_3abv_1^2b_2 + b_2v_1^2 - a^2v_1v_2^2b_3 + \left(-2a^2b_1 - 2aba_2\right)v_1v_2 \\
&+ v_3^2b^2v_1b_3 + \left(-2abb_1 - 2b^2a_2\right)v_1v_3 - a^4v_2^4a_3 - 4v_3a^3bv_2^3a_3 + a^2v_2^3a_3 \\
&- 6v_3^2a^2b^2v_2^2a_3 + 2v_3abv_2^2a_3 + \left(a^2a_1 - 2aba_3\right)v_2^2 - 4v_3^3a\,b^3v_2a_3 + v_3^2b^2v_2a_3 \\
&+ \left(2aba_1 - 2b^2a_3\right)v_2v_3 - 2abv_2a_1 - v_3^4b^4a_3 + v_3^2b^2a_1 - 2v_3b^2a_1 = 0
\end{aligned} \tag{8E}$$

Setting each coefficients in (8E) to zero gives the following equations to solve

$$\begin{aligned}
b_2 &= 0 \\
a^2a_3 &= 0 \\
b^2a_1 &= 0 \\
b^2a_3 &= 0 \\
b^2b_3 &= 0 \\
-2a^2b_2 &= 0 \\
-a^2b_3 &= 0 \\
-a^4a_3 &= 0 \\
-2b^2a_1 &= 0 \\
-b^4a_3 &= 0 \\
-2aba_1 &= 0 \\
2aba_3 &= 0 \\
-2abb_2 &= 0 \\
-4a\,b^3a_3 &= 0 \\
-6a^2b^2a_3 &= 0 \\
-4a^3ba_3 &= 0 \\
2aba_1 - 2b^2a_3 &= 0 \\
a^2a_1 - 2aba_3 &= 0 \\
-2abb_1 - 2b^2a_2 &= 0 \\
-2a^2b_1 - 2aba_2 &= 0
\end{aligned}$$

Solving the above equations for the unknowns gives

$$
\begin{aligned}
a_1 &= 0 \\
a_2 &= -\frac{ab_1}{b} \\
a_3 &= 0 \\
b_1 &= b_1 \\
b_2 &= 0 \\
b_3 &= 0
\end{aligned}
$$

Substituting the above solution in the anstaz (1E,2E) (using 1 as arbitrary value for any unknown in the RHS) gives

$$
\begin{aligned}
\xi &= -\frac{ax}{b} \\
\eta &= 1
\end{aligned}
$$

Shifting is now applied to make $\xi = 0$ in order to simplify the rest of the computation

$$
\begin{aligned}
\eta &= \eta - \omega(x,y)\,\xi \\
&= 1 - \left(\frac{(ya + b\ln(x))^2}{x}\right)\left(-\frac{ax}{b}\right) \\
&= \frac{\ln(x)^2\, a\, b^2 + 2\ln(x)\, a^2 by + a^3 y^2 + b}{b} \\
\xi &= 0
\end{aligned}
$$

The next step is to determine the canonical coordinates R, S. The canonical coordinates map $(x,y) \to (R,S)$ where (R,S) are the canonical coordinates which make the original ode become a quadrature and hence solved by integration.

The characteristic pde which is used to find the canonical coordinates is

$$
\frac{dx}{\xi} = \frac{dy}{\eta} = dS \tag{1}
$$

The above comes from the requirements that $\left(\xi\frac{\partial}{\partial x} + \eta\frac{\partial}{\partial y}\right) S(x,y) = 1$. Starting with the first pair of ode's in (1) gives an ode to solve for the independent variable R in the canonical coordinates, where $S(R)$. Since $\xi = 0$ then in this special case

$$
R = x
$$

S is found from

$$
\begin{aligned}
S &= \int \frac{1}{\eta} dy \\
&= \int \frac{1}{\frac{\ln(x)^2 a\, b^2 + 2\ln(x) a^2 b y + a^3 y^2 + b}{b}} dy
\end{aligned}
$$

Which results in

$$
S = \frac{b \arctan\left(\frac{2y\, a^3 + 2\ln(x) a^2 b}{2a\sqrt{ab}}\right)}{a\sqrt{ab}}
$$

Now that R, S are found, we need to setup the ode in these coordinates. This is done by evaluating

$$
\frac{dS}{dR} = \frac{S_x + \omega(x, y) S_y}{R_x + \omega(x, y) R_y} \tag{2}
$$

Where in the above R_x, R_y, S_x, S_y are all partial derivatives and $\omega(x, y)$ is the right hand side of the original ode given by

$$
\omega(x, y) = \frac{(ya + b\ln(x))^2}{x}
$$

Evaluating all the partial derivatives gives

$$
\begin{aligned}
R_x &= 1 \\
R_y &= 0 \\
S_x &= \frac{b^2}{ax\left(\ln(x)^2 a\, b^2 + 2\ln(x) a^2 b y + a^3 y^2 + b\right)} \\
S_y &= \frac{b}{\ln(x)^2 a\, b^2 + 2\ln(x) a^2 b y + a^3 y^2 + b}
\end{aligned}
$$

Substituting all the above in (2) and simplifying gives the ode in canonical coordinates.

$$
\frac{dS}{dR} = \frac{b}{ax} \tag{2A}
$$

We now need to express the RHS as function of R only. This is done by solving for x, y in terms of R, S from the result obtained earlier and simplifying. This gives

$$
\frac{dS}{dR} = \frac{b}{aR}
$$

The above is a quadrature ode. This is the whole point of Lie symmetry method. It converts an ode, no matter how complicated it is, to one that can be solved by

integration when the ode is in the canonical coordiates R, S. Integrating the above gives

$$S(R) = \frac{b \ln(R)}{a} + c_1 \tag{4}$$

To complete the solution, we just need to transform (4) back to x, y coordinates. This results in

$$\frac{\sqrt{b}\, \arctan\left(\frac{\sqrt{a}\,(ay+b\ln(x))}{\sqrt{b}}\right)}{a^{\frac{3}{2}}} = \frac{b \ln(x)}{a} + c_1$$

Which simplifies to

$$\frac{\sqrt{b}\, \arctan\left(\frac{\sqrt{a}\,(ay+b\ln(x))}{\sqrt{b}}\right)}{a^{\frac{3}{2}}} = \frac{b \ln(x)}{a} + c_1$$

Which gives

$$y = -\frac{b \ln(x)\sqrt{a} - \tan\left(\frac{\sqrt{a}\,(c_1 a+b\ln(x))}{\sqrt{b}}\right)\sqrt{b}}{a^{\frac{3}{2}}}$$

Summary

The solution(s) found are the following

$$y = -\frac{b \ln(x)\sqrt{a} - \tan\left(\frac{\sqrt{a}\,(c_1 a+b\ln(x))}{\sqrt{b}}\right)\sqrt{b}}{a^{\frac{3}{2}}} \tag{1}$$

Verification of solutions

$$y = -\frac{b \ln(x)\sqrt{a} - \tan\left(\frac{\sqrt{a}\,(c_1 a+b\ln(x))}{\sqrt{b}}\right)\sqrt{b}}{a^{\frac{3}{2}}}$$

Verified OK.

8.8.2 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{(ya + b\ln(x))^2}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{\ln(x)^2 b^2}{x} + \frac{2\ln(x)\, aby}{x} + \frac{a^2 y^2}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{\ln(x)^2 b^2}{x}$, $f_1(x) = \frac{2ab\ln(x)}{x}$ and $f_2(x) = \frac{a^2}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{a^2 u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{a^2}{x^2} \\ f_1 f_2 &= \frac{2a^3 b \ln(x)}{x^2} \\ f_2^2 f_0 &= \frac{a^4 \ln(x)^2 b^2}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a^2 u''(x)}{x} - \left(-\frac{a^2}{x^2} + \frac{2a^3 b \ln(x)}{x^2}\right) u'(x) + \frac{a^4 \ln(x)^2 b^2 u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = e^{\frac{\ln(x)^2 ab}{2}} \left(x^{-\sqrt{-ab}} c_2 + x^{\sqrt{-ab}} c_1\right)$$

The above shows that

$$u'(x) = \frac{e^{\frac{\ln(x)^2 ab}{2}} \left(c_2 \left(a \ln(x) b - \sqrt{-ab}\right) x^{-\sqrt{-ab}} + c_1 x^{\sqrt{-ab}} \left(a \ln(x) b + \sqrt{-ab}\right)\right)}{x}$$

Using the above in (1) gives the solution

$$y = -\frac{c_2 \left(a \ln(x) b - \sqrt{-ab}\right) x^{-\sqrt{-ab}} + c_1 x^{\sqrt{-ab}} \left(a \ln(x) b + \sqrt{-ab}\right)}{a^2 \left(x^{-\sqrt{-ab}} c_2 + x^{\sqrt{-ab}} c_1\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-c_3\left(a\ln\left(x\right)b + \sqrt{-ab}\right)x^{2\sqrt{-ab}} - a\ln\left(x\right)b + \sqrt{-ab}}{a^2\left(1 + x^{2\sqrt{-ab}}c_3\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{-c_3\left(a\ln\left(x\right)b + \sqrt{-ab}\right)x^{2\sqrt{-ab}} - a\ln\left(x\right)b + \sqrt{-ab}}{a^2\left(1 + x^{2\sqrt{-ab}}c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-c_3\left(a\ln\left(x\right)b + \sqrt{-ab}\right)x^{2\sqrt{-ab}} - a\ln\left(x\right)b + \sqrt{-ab}}{a^2\left(1 + x^{2\sqrt{-ab}}c_3\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y'x - a\ln(\lambda x)^m y^2 - ky = a\,b^2x^{2k}\ln(\lambda x)^m}$$

8.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\ln(\lambda x)^m y^2 + ky + a\,b^2x^{2k}\ln(\lambda x)^m}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,b^2x^{2k}\ln(\lambda x)^m}{x} + \frac{a\ln(\lambda x)^m y^2}{x} + \frac{ky}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{a\,b^2x^{2k}\ln(\lambda x)^m}{x}$, $f_1(x) = \frac{k}{x}$ and $f_2(x) = \frac{a\ln(\lambda x)^m}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{a\ln(\lambda x)^m u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{a \ln (\lambda x)^m m}{x^2 \ln (\lambda x)} - \frac{a \ln (\lambda x)^m}{x^2} \\ f_1 f_2 &= \frac{k a \ln (\lambda x)^m}{x^2} \\ f_2^2 f_0 &= \frac{a^3 \ln (\lambda x)^{3m} b^2 x^{2k}}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a \ln (\lambda x)^m u''(x)}{x} - \left(\frac{a \ln (\lambda x)^m m}{x^2 \ln (\lambda x)} - \frac{a \ln (\lambda x)^m}{x^2} + \frac{k a \ln (\lambda x)^m}{x^2}\right) u'(x) + \frac{a^3 \ln (\lambda x)^{3m} b^2 x^{2k} u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \mathrm{e}^{iab\left(\int x^{k-1} \ln(\lambda x)^m dx\right)} + c_2 \mathrm{e}^{-iab\left(\int x^{k-1} \ln(\lambda x)^m dx\right)}$$

The above shows that

$$u'(x) = iab\, x^{k-1} \ln (\lambda x)^m \mathrm{e}^{-iab\left(\int x^{k-1} \ln(\lambda x)^m dx\right)} \left(c_1 \mathrm{e}^{2iab\left(\int x^{k-1} \ln(\lambda x)^m dx\right)} - c_2\right)$$

Using the above in (1) gives the solution

$$y = -\frac{ib\, x^{k-1} \mathrm{e}^{-iab\left(\int x^{k-1} \ln(\lambda x)^m dx\right)} \left(c_1 \mathrm{e}^{2iab\left(\int x^{k-1} \ln(\lambda x)^m dx\right)} - c_2\right) x}{c_1 \mathrm{e}^{iab\left(\int x^{k-1} \ln(\lambda x)^m dx\right)} + c_2 \mathrm{e}^{-iab\left(\int x^{k-1} \ln(\lambda x)^m dx\right)}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{ib\, x^k \left(c_3 \mathrm{e}^{2iab\left(\int x^{k-1} \ln(\lambda x)^m dx\right)} - 1\right)}{c_3 \mathrm{e}^{2iab\left(\int x^{k-1} \ln(\lambda x)^m dx\right)} + 1}$$

Summary
The solution(s) found are the following

$$y = -\frac{ib\,x^k\left(c_3 e^{2iab\left(\int x^{k-1}\ln(\lambda x)^m dx\right)}-1\right)}{c_3 e^{2iab\left(\int x^{k-1}\ln(\lambda x)^m dx\right)}+1} \tag{1}$$

Verification of solutions

$$y = -\frac{ib\,x^k\left(c_3 e^{2iab\left(\int x^{k-1}\ln(\lambda x)^m dx\right)}-1\right)}{c_3 e^{2iab\left(\int x^{k-1}\ln(\lambda x)^m dx\right)}+1}$$

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[[_1st_order, `_with_symmetry_[F(x),G(x)]`], _Riccati]
```

$$\boxed{y'x - a\,x^n(y + b\ln(x))^2 = -b}$$

8.10.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,b^2x^n\ln(x)^2 + 2\ln(x)\,x^n aby + a\,x^n y^2 - b}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{\ln(x)^2\,x^n a\,b^2}{x} + \frac{2\ln(x)\,x^n aby}{x} + \frac{x^n a\,y^2}{x} - \frac{b}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{-b+a\,b^2x^n\ln(x)^2}{x}$, $f_1(x) = \frac{2ab\,x^n\ln(x)}{x}$ and $f_2(x) = \frac{a\,x^n}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{a\,x^n u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{a\,x^n n}{x^2} - \frac{a\,x^n}{x^2} \\ f_1 f_2 &= \frac{2a^2 b\,x^{2n} \ln(x)}{x^2} \\ f_2^2 f_0 &= \frac{a^2 x^{2n} \left(-b + a\,b^2 x^n \ln(x)^2\right)}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a\,x^n u''(x)}{x} - \left(\frac{a\,x^n n}{x^2} - \frac{a\,x^n}{x^2} + \frac{2a^2 b\,x^{2n} \ln(x)}{x^2}\right) u'(x) + \frac{a^2 x^{2n} \left(-b + a\,b^2 x^n \ln(x)^2\right) u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{-\frac{ab\,x^n}{n^2}} \left(x^{\frac{ab\,x^n}{n}} c_1 + x^{\frac{n^2 + a\,x^n b}{n}} c_2\right)$$

The above shows that

$$u'(x) = \frac{\left(\ln(x)\,x^{\frac{2n^2 + a\,x^n b}{n}} c_2 ab + \ln(x)\,x^{\frac{n^2 + a\,x^n b}{n}} c_1 ab + x^{\frac{n^2 + a\,x^n b}{n}} c_2 n\right) \mathrm{e}^{-\frac{ab\,x^n}{n^2}}}{x}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\ln(x)\,x^{\frac{2n^2 + a\,x^n b}{n}} c_2 ab + \ln(x)\,x^{\frac{n^2 + a\,x^n b}{n}} c_1 ab + x^{\frac{n^2 + a\,x^n b}{n}} c_2 n\right) x^{-n}}{a\left(x^{\frac{ab\,x^n}{n}} c_1 + x^{\frac{n^2 + a\,x^n b}{n}} c_2\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{x^{-\frac{ab\,x^n}{n}} \left(ab\,x^{\frac{n^2 + a\,x^n b}{n}} \ln(x) + x^{\frac{ab\,x^n}{n}} (\ln(x)\,c_3 ab + n)\right)}{a\,(x^n + c_3)}$$

Summary

The solution(s) found are the following

$$y = -\frac{x^{-\frac{ab\,x^{n}}{n}} \left(ab\,x^{\frac{n^{2}+a\,x^{n} b}{n}} \ln\left(x\right)+x^{\frac{ab\,x^{n}}{n}} \left(\ln\left(x\right) c_{3} a b +n \right)\right)}{a \left(x^{n}+c_{3}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{x^{-\frac{ab\,x^{n}}{n}} \left(ab\,x^{\frac{n^{2}+a\,x^{n} b}{n}} \ln\left(x\right)+x^{\frac{ab\,x^{n}}{n}} \left(\ln\left(x\right) c_{3} a b +n \right)\right)}{a \left(x^{n}+c_{3}\right)}$$

Verified OK.

ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - a\,x^{2n}\ln(x)\,y^2 - (b\,x^n\ln(x) - n)\,y = c\ln(x)}$$

8.11.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,x^{2n}\ln(x)\,y^2 + x^n\ln(x)\,by + c\ln(x) - ny}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,x^{2n}\ln(x)\,y^2}{x} + \frac{x^n\ln(x)\,by}{x} + \frac{c\ln(x)}{x} - \frac{ny}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{c\ln(x)}{x}$, $f_1(x) = \frac{b\,x^n\ln(x)-n}{x}$ and $f_2(x) = \frac{x^{2n}\ln(x)a}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{\frac{x^{2n}\ln(x)au}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{2x^{2n}n\ln(x)\,a}{x^2} + \frac{a\,x^{2n}}{x^2} - \frac{\ln(x)\,a\,x^{2n}}{x^2} \\ f_1f_2 &= \frac{(b\,x^n\ln(x) - n)\,x^{2n}\ln(x)\,a}{x^2} \\ f_2^2f_0 &= \frac{x^{4n}\ln(x)^3\,a^2c}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{x^{2n}\ln(x)\,au''(x)}{x} - \left(\frac{2x^{2n}n\ln(x)\,a}{x^2} + \frac{a\,x^{2n}}{x^2} - \frac{\ln(x)\,a\,x^{2n}}{x^2} + \frac{(b\,x^n\ln(x) - n)\,x^{2n}\ln(x)\,a}{x^2}\right)u'(x) + \frac{x^{4n}\ln(}{}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(c_1\,\text{BesselJ}\left(\frac{\sqrt{3}\,\sqrt{-ca}}{8b}, \frac{\sqrt{3}\,\sqrt{2}\,\sqrt{ca\,x^{2n}}\,x^{-n}}{8b}\right) + c_2\,\text{BesselY}\left(\frac{\sqrt{3}\,\sqrt{-ca}}{8b}, \frac{\sqrt{3}\,\sqrt{2}\,\sqrt{ca\,x^{2n}}\,x^{-n}}{8b}\right)\right)\sqrt{\ln(x)}\,x^{\frac{b\,x^n+3n^2}{2n}}\,\mathrm{e}^{-\frac{b\,x^n}{2n^2}}$$

The above shows that

$$u'(x) = \frac{x^{\frac{-2n+b\,x^n+3n^2}{2n}}\,\mathrm{e}^{-\frac{b\,x^n}{2n^2}}\left(1 + \ln(x)^2\,x^nb + 3n\ln(x)\right)\left(c_1\,\text{BesselJ}\left(\frac{\sqrt{3}\,\sqrt{-ca}}{8b}, \frac{\sqrt{3}\,\sqrt{2}\,\sqrt{ca\,x^{2n}}\,x^{-n}}{8b}\right) + c_2\,\text{BesselY}\left(\frac{\sqrt{3}\,\sqrt{}}{8}\right.\right.}{2\sqrt{\ln(x)}}$$

Using the above in (1) gives the solution

$$y = -\frac{x^{\frac{-2n+b\,x^n+3n^2}{2n}}\left(1 + \ln(x)^2\,x^nb + 3n\ln(x)\right)x^{-2n}x\,x^{-\frac{b\,x^n+3n^2}{2n}}}{2\ln(x)^2\,a}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{x^{-2n}\left(1+\ln\left(x\right)^{2} x^{n} b+3 n \ln\left(x\right)\right)}{2 a \ln\left(x\right)^{2}}$$

Summary

The solution(s) found are the following

$$y = -\frac{x^{-2n}\left(1+\ln\left(x\right)^{2} x^{n} b+3 n \ln\left(x\right)\right)}{2 a \ln\left(x\right)^{2}} \tag{1}$$

Verification of solutions

$$y = -\frac{x^{-2n}\left(1+\ln\left(x\right)^{2} x^{n} b+3 n \ln\left(x\right)\right)}{2 a \ln\left(x\right)^{2}}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{x^2y' - y^2a^2x^2 + xy = b^2 \ln(x)^n}$$

8.12.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{y^2a^2x^2 - yx + b^2 \ln(x)^n}{x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a^2y^2 + \frac{b^2 \ln(x)^n}{x^2} - \frac{y}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{b^2 \ln(x)^n}{x^2}$, $f_1(x) = -\frac{1}{x}$ and $f_2(x) = a^2$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{a^2u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= -\frac{a^2}{x} \\ f_2^2 f_0 &= \frac{a^4 b^2 \ln(x)^n}{x^2} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$a^2 u''(x) + \frac{a^2 u'(x)}{x} + \frac{a^4 b^2 \ln(x)^n u(x)}{x^2} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\text{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right) c_1 + \text{BesselY}\left(\frac{1}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right) c_2\right) \sqrt{\ln(x)}$$

The above shows that

$$u'(x) = \frac{-\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}\,\text{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right) c_1 - \sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}\,\text{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right) c_2 +}{\sqrt{\ln(x)}\,x}$$

Using the above in (1) gives the solution

$$y = -\frac{-\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}\,\text{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right) c_1 - \sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}\,\text{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right) c}{\ln(x)\,x\,a^2\left(\text{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right) c_1 + \text{BesselY}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\ln(x)^{1+\frac{n}{2}} \left(\operatorname{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right) c_3 + \operatorname{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right)\right)\sqrt{a^2b^2} - \operatorname{BesselJ}\left(\frac{1}{2+n}, 2\sqrt{a \cdots\right.}{\ln(x)\, x\, a^2 \left(\operatorname{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right) c_3 + \operatorname{BesselY}\left(\frac{1}{2+n}, \frac{2\sqrt{a^2b^2}}{2 \cdots}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{\ln(x)^{1+\frac{n}{2}} \left(\operatorname{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right) c_3 + \operatorname{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right)\right)\sqrt{a^2b^2} - \operatorname{BesselJ}\left(\frac{1}{2+n}, 2\sqrt{a \cdots\right.}{\ln(x)\, x\, a^2 \left(\operatorname{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right) c_3 + \operatorname{BesselY}\left(\frac{1}{2+n}, \frac{2\sqrt{a^2b^2}}{2 \cdots}\right.\right.} \tag{1}$$

Verification of solutions

$$y = \frac{\ln(x)^{1+\frac{n}{2}} \left(\operatorname{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right) c_3 + \operatorname{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right)\right)\sqrt{a^2b^2} - \operatorname{BesselJ}\left(\frac{1}{2+n}, 2\sqrt{a \cdots\right.}{\ln(x)\, x\, a^2 \left(\operatorname{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{a^2b^2}\,\ln(x)^{1+\frac{n}{2}}}{2+n}\right) c_3 + \operatorname{BesselY}\left(\frac{1}{2+n}, \frac{2\sqrt{a^2b^2}}{2 \cdots}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.5-2
Problem number: 22.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{(a\ln(x)+b)\,y'-y^2-c\ln(x)^n\,y=-\lambda^2+\lambda c\ln(x)^n}$$

8.13.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{y^2+c\ln(x)^n\,y-\lambda^2+\lambda c\ln(x)^n}{a\ln(x)+b} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=\frac{\lambda c\ln(x)^n}{a\ln(x)+b}+\frac{c\ln(x)^n\,y}{a\ln(x)+b}-\frac{\lambda^2}{a\ln(x)+b}+\frac{y^2}{a\ln(x)+b}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=\frac{-\lambda^2+\lambda c\ln(x)^n}{a\ln(x)+b}$, $f_1(x)=\frac{c\ln(x)^n}{a\ln(x)+b}$ and $f_2(x)=\frac{1}{a\ln(x)+b}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{\frac{u}{a\ln(x)+b}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{a}{(a\ln(x)+b)^2\,x} \\ f_1f_2 &= \frac{c\ln(x)^n}{(a\ln(x)+b)^2} \\ f_2^2f_0 &= \frac{-\lambda^2+\lambda c\ln(x)^n}{(a\ln(x)+b)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{u''(x)}{a\ln(x)+b} - \left(-\frac{a}{(a\ln(x)+b)^2\,x} + \frac{c\ln(x)^n}{(a\ln(x)+b)^2}\right)u'(x) + \frac{(-\lambda^2+\lambda c\ln(x)^n)\,u(x)}{(a\ln(x)+b)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(-\frac{a}{x}+\ln(x)^n c\right)\_Y'(x)}{a\ln(x)+b} + \frac{(-\lambda^2+\lambda c\ln(x)^n)\_Y(x)}{(a\ln(x)+b)^2}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(-\frac{a}{x}+\ln(x)^n c\right)\_Y'(x)}{a\ln(x)+b} + \frac{(-\lambda^2+\lambda c\ln(x)^n)\_Y(x)}{(a\ln(x)+b)^2}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(-\frac{a}{x}+\ln(x)^n c\right)\_Y'(x)}{a\ln(x)+b} + \frac{(-\lambda^2+\lambda c\ln(x)^n)\_Y(x)}{(a\ln(x)+b)^2}\right\}, \{\_Y(x)\}\right)\right)(a\ln(x)+b)}{\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(-\frac{a}{x}+\ln(x)^n c\right)\_Y'(x)}{a\ln(x)+b} + \frac{(-\lambda^2+\lambda c\ln(x)^n)\_Y(x)}{(a\ln(x)+b)^2}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{-acx\ln(x)^{n+1}\_\_Y'(x)+\_\_Y''(x)(a\ln(x)+b)^2x+(-b\ln(x)^n cx+(a\ln(x)+b)a)\_\_Y'(x)+\lambda(\ln(x)^n c-\lambda)\_\_Y(x)x}{(a\ln(x)+b)^2x}\right\},\{\right.\right)}{\operatorname{DESol}\left(\left\{\frac{-acx\ln(x)^{n+1}\_\_Y'(x)+\_\_Y''(x)(a\ln(x)+b)^2x+(-b\ln(x)^n cx+(a\ln(x)+b)a)\_\_Y'(x)+\lambda(\ln(x)^n c-\lambda)\_\_Y(x)x}{(a\ln(x)+b)^2x}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{-acx\ln(x)^{n+1}\_\_Y'(x)+\_\_Y''(x)(a\ln(x)+b)^2x+(-b\ln(x)^n cx+(a\ln(x)+b)a)\_\_Y'(x)+\lambda(\ln(x)^n c-\lambda)\_\_Y(x)x}{(a\ln(x)+b)^2x}\right\},\{\right.\right)}{\operatorname{DESol}\left(\left\{\frac{-acx\ln(x)^{n+1}\_\_Y'(x)+\_\_Y''(x)(a\ln(x)+b)^2x+(-b\ln(x)^n cx+(a\ln(x)+b)a)\_\_Y'(x)+\lambda(\ln(x)^n c-\lambda)\_\_Y(x)x}{(a\ln(x)+b)^2x}\right.\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{-acx\ln(x)^{n+1}\_\_Y'(x)+\_\_Y''(x)(a\ln(x)+b)^2x+(-b\ln(x)^n cx+(a\ln(x)+b)a)\_\_Y'(x)+\lambda(\ln(x)^n c-\lambda)\_\_Y(x)x}{(a\ln(x)+b)^2x}\right\},\{\right.\right)}{\operatorname{DESol}\left(\left\{\frac{-acx\ln(x)^{n+1}\_\_Y'(x)+\_\_Y''(x)(a\ln(x)+b)^2x+(-b\ln(x)^n cx+(a\ln(x)+b)a)\_\_Y'(x)+\lambda(\ln(x)^n c-\lambda)\_\_Y(x)x}{(a\ln(x)+b)^2x}\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{(a\ln(x)+b)\,y'-\ln(x)^n\,y^2-yc=-\lambda^2\ln(x)^n+c\lambda}$$

8.14.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y' &= F(x,y)\\ &= \frac{\ln(x)^n\,y^2+yc-\lambda^2\ln(x)^n+c\lambda}{a\ln(x)+b}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=-\frac{\lambda^2\ln(x)^n}{a\ln(x)+b}+\frac{\ln(x)^n\,y^2}{a\ln(x)+b}+\frac{c\lambda}{a\ln(x)+b}+\frac{yc}{a\ln(x)+b}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=\frac{-\lambda^2\ln(x)^n+c\lambda}{a\ln(x)+b}$, $f_1(x)=\frac{c}{a\ln(x)+b}$ and $f_2(x)=\frac{\ln(x)^n}{a\ln(x)+b}$. Let

$$\begin{aligned}y &= \frac{-u'}{f_2u}\\ &= \frac{-u'}{\frac{\ln(x)^nu}{a\ln(x)+b}}\end{aligned}\tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{\ln(x)^n n}{x \ln(x) (a \ln(x) + b)} - \frac{\ln(x)^n a}{(a \ln(x) + b)^2 x} \\
f_1 f_2 &= \frac{c \ln(x)^n}{(a \ln(x) + b)^2} \\
f_2^2 f_0 &= \frac{\ln(x)^{2n} (-\lambda^2 \ln(x)^n + c\lambda)}{(a \ln(x) + b)^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{\ln(x)^n u''(x)}{a \ln(x) + b} - \left(\frac{\ln(x)^n n}{x \ln(x) (a \ln(x) + b)} - \frac{\ln(x)^n a}{(a \ln(x) + b)^2 x} + \frac{c \ln(x)^n}{(a \ln(x) + b)^2}\right) u'(x) + \frac{\ln(x)^{2n} (-\lambda^2 \ln(x)^n}{(a \ln(x) + b}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
&u(x) \\
&= \mathrm{DESol}\Bigg(\Bigg\{_Y''(x) \\
&\quad - (a \ln(x) + b) _Y'(x) \left(\frac{n}{x \ln(x) (a \ln(x) + b)} - \frac{a}{(a \ln(x) + b)^2 x} + \frac{c}{(a \ln(x) + b)^2}\right) \\
&\quad + \frac{_Y(x) \left(-\ln(x)^{2n} \lambda^2 + \lambda c \ln(x)^n\right)}{(a \ln(x) + b)^2}\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

The above shows that

$$\begin{aligned}
&u'(x) \\
&= \frac{\partial}{\partial x} \mathrm{DESol}\Bigg(\Bigg\{_Y''(x) \\
&\quad - (a \ln(x) + b) _Y'(x) \left(\frac{n}{x \ln(x) (a \ln(x) + b)} - \frac{a}{(a \ln(x) + b)^2 x} + \frac{c}{(a \ln(x) + b)^2}\right) \\
&\quad + \frac{_Y(x) \left(-\ln(x)^{2n} \lambda^2 + \lambda c \ln(x)^n\right)}{(a \ln(x) + b)^2}\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - (a\ln(x)+b)\_Y'(x)\left(\frac{n}{x\ln(x)(a\ln(x)+b)} - \frac{a}{(a\ln(x)+b)^2 x} + \frac{c}{(a\ln(x)+b)^2}\right) + \frac{\_Y(x)\left(-\right.}{(}\right.\right.\right.}{\mathrm{DESol}\left(\left\{\_Y''(x) - (a\ln(x)+b)\_Y'(x)\left(\frac{n}{x\ln(x)(a\ln(x)+b)} - \frac{a}{(a\ln(x)+b)^2 x} + \frac{c}{(a\ln(x)+b)^2}\right) +\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-x\_\_Y(x)\ln(x)^{1+2n}\lambda^2 + cx\lambda\_\_Y(x)\ln(x)^{n+1} + (a\ln(x)+b)\left(x\ln(x)(a\ln(x)+b)\_\_Y''(x) - ((a(n-1)+cx)\ln(x)+bn)\_\right.}{x\ln(x)(a\ln(x)+b)^2}\right.\right.\right.}{\mathrm{DESol}\left(\left\{\frac{-x\_\_Y(x)\ln(x)^{1+2n}\lambda^2 + cx\lambda\_\_Y(x)\ln(x)^{n+1} + (a\ln(x)+b)\left(x\ln(x)(a\ln(x)+b)\_\_Y''(x) - ((a(n-1)+cx)\right.}{x\ln(x)(a\ln(x)+b)^2}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-x\_\_Y(x)\ln(x)^{1+2n}\lambda^2 + cx\lambda\_\_Y(x)\ln(x)^{n+1} + (a\ln(x)+b)\left(x\ln(x)(a\ln(x)+b)\_\_Y''(x) - ((a(n-1)+cx)\ln(x)+bn)\_\right.}{x\ln(x)(a\ln(x)+b)^2}\right.\right.\right.}{\mathrm{DESol}\left(\left\{\frac{-x\_\_Y(x)\ln(x)^{1+2n}\lambda^2 + cx\lambda\_\_Y(x)\ln(x)^{n+1} + (a\ln(x)+b)\left(x\ln(x)(a\ln(x)+b)\_\_Y''(x) - ((a(n-1)+cx)\right.}{x\ln(x)(a\ln(x)+b)^2}\right.\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-x\_\_Y(x)\ln(x)^{1+2n}\lambda^2 + cx\lambda\_\_Y(x)\ln(x)^{n+1} + (a\ln(x)+b)\left(x\ln(x)(a\ln(x)+b)\_\_Y''(x) - ((a(n-1)+cx)\ln(x)+bn)\_\right.}{x\ln(x)(a\ln(x)+b)^2}\right.\right.\right.}{\mathrm{DESol}\left(\left\{\frac{-x\_\_Y(x)\ln(x)^{1+2n}\lambda^2 + cx\lambda\_\_Y(x)\ln(x)^{n+1} + (a\ln(x)+b)\left(x\ln(x)(a\ln(x)+b)\_\_Y''(x) - ((a(n-1)+cx)\right.}{x\ln(x)(a\ln(x)+b)^2}\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \alpha y^2 = \beta + \gamma \sin(\lambda x)}$$

9.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \alpha\, y^2 + \beta + \gamma \sin(\lambda x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \alpha\, y^2 + \beta + \gamma \sin(\lambda x)$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \beta + \gamma \sin(\lambda x)$, $f_1(x) = 0$ and $f_2(x) = \alpha$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\alpha u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= \alpha^2(\beta + \gamma\sin(\lambda x)) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\alpha u''(x) + \alpha^2(\beta + \gamma\sin(\lambda x))\,u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \operatorname{MathieuC}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4} + \frac{\lambda x}{2}\right) + c_2 \operatorname{MathieuS}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4} + \frac{\lambda x}{2}\right)$$

The above shows that

$$u'(x) = \frac{\lambda\left(c_1 \operatorname{MathieuCPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4} + \frac{\lambda x}{2}\right) + c_2 \operatorname{MathieuSPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4} + \frac{\lambda x}{2}\right)\right)}{2}$$

Using the above in (1) gives the solution

$$y = -\frac{\lambda\left(c_1 \operatorname{MathieuCPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4} + \frac{\lambda x}{2}\right) + c_2 \operatorname{MathieuSPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4} + \frac{\lambda x}{2}\right)\right)}{2\alpha\left(c_1 \operatorname{MathieuC}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4} + \frac{\lambda x}{2}\right) + c_2 \operatorname{MathieuS}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4} + \frac{\lambda x}{2}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\lambda\left(c_3 \operatorname{MathieuCPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4} + \frac{\lambda x}{2}\right) + \operatorname{MathieuSPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4} + \frac{\lambda x}{2}\right)\right)}{2\alpha\left(c_3 \operatorname{MathieuC}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4} + \frac{\lambda x}{2}\right) + \operatorname{MathieuS}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4} + \frac{\lambda x}{2}\right)\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\lambda\left(c_3 \,\text{MathieuCPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4}+\frac{\lambda x}{2}\right) + \text{MathieuSPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4}+\frac{\lambda x}{2}\right)\right)}{2\alpha\left(c_3 \,\text{MathieuC}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4}+\frac{\lambda x}{2}\right) + \text{MathieuS}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4}+\frac{\lambda x}{2}\right)\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\lambda\left(c_3 \,\text{MathieuCPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4}+\frac{\lambda x}{2}\right) + \text{MathieuSPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4}+\frac{\lambda x}{2}\right)\right)}{2\alpha\left(c_3 \,\text{MathieuC}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4}+\frac{\lambda x}{2}\right) + \text{MathieuS}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, -\frac{\pi}{4}+\frac{\lambda x}{2}\right)\right)}$$

Verified OK.

Problem number: 2.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = -a^2 + a\lambda \sin(\lambda x) + a^2 \sin(\lambda x)^2}$$

9.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 - a^2 + a\lambda \sin(\lambda x) + a^2 \sin(\lambda x)^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 - a^2 + a\lambda \sin(\lambda x) + a^2 \sin(\lambda x)^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2 + a\lambda \sin(\lambda x) + a^2 \sin(\lambda x)^2$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= -a^2 + a\lambda\sin(\lambda x) + a^2\sin(\lambda x)^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-a^2 + a\lambda\sin(\lambda x) + a^2\sin(\lambda x)^2\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = {}& \mathrm{e}^{\frac{\sin(\lambda x)a}{\lambda}}\left(c_1\,\mathrm{HeunC}\left(\frac{4a}{\lambda}, -\frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\sin(\lambda x)}{2} + \frac{1}{2}\right)\right. \\ &\left. + c_2\,\mathrm{HeunC}\left(\frac{4a}{\lambda}, \frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\sin(\lambda x)}{2} + \frac{1}{2}\right)\sin\left(\frac{\pi}{4} + \frac{\lambda x}{2}\right)\right) \end{aligned}$$

The above shows that

$$\begin{aligned} u'(x) = {}& \left(c_2\left(\cos(\lambda x)\sin\left(\frac{\pi}{4} + \frac{\lambda x}{2}\right)a + \frac{\lambda\cos\left(\frac{\pi}{4} + \frac{\lambda x}{2}\right)}{2}\right)\mathrm{HeunC}\left(\frac{4a}{\lambda}, \frac{1}{2}, -\frac{1}{2},\right.\right. \\ &\left. -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\sin(\lambda x)}{2} + \frac{1}{2}\right) \\ &+ \cos(\lambda x)\left(\frac{c_2\lambda\,\mathrm{HeunCPrime}\left(\frac{4a}{\lambda}, \frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\sin(\lambda x)}{2} + \frac{1}{2}\right)\sin\left(\frac{\pi}{4} + \frac{\lambda x}{2}\right)}{2}\right. \\ &+ \mathrm{HeunC}\left(\frac{4a}{\lambda}, -\frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\sin(\lambda x)}{2} + \frac{1}{2}\right)c_1a \\ &\left.\left. + \frac{c_1\lambda\,\mathrm{HeunCPrime}\left(\frac{4a}{\lambda}, -\frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\sin(\lambda x)}{2} + \frac{1}{2}\right)}{2}\right)\right)\mathrm{e}^{\frac{\sin(\lambda x)a}{\lambda}} \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{c_2\left(\cos(\lambda x)\sin\left(\frac{\pi}{4} + \frac{\lambda x}{2}\right)a + \frac{\lambda\cos\left(\frac{\pi}{4} + \frac{\lambda x}{2}\right)}{2}\right)\mathrm{HeunC}\left(\frac{4a}{\lambda}, \frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\sin(\lambda x)}{2} + \frac{1}{2}\right) + \cos(\lambda x)\left(\frac{c_2\lambda}{}\right.}{c_1\,\mathrm{HeunC}\left(\frac{4a}{\lambda}, -\frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\left(\cos(\lambda x)\sin\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)a+\frac{\lambda\cos\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)}{2}\right)\operatorname{HeunC}\left(\frac{4a}{\lambda},\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\sin(\lambda x)}{2}+\frac{1}{2}\right)-\cos(\lambda x)\left(\frac{\lambda \operatorname{Heun}}{}\right.}{c_3\operatorname{HeunC}\left(\frac{4a}{\lambda},-\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\right.}$$

Summary
The solution(s) found are the following

$$y = \frac{-\left(\cos(\lambda x)\sin\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)a+\frac{\lambda\cos\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)}{2}\right)\operatorname{HeunC}\left(\frac{4a}{\lambda},\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\sin(\lambda x)}{2}+\frac{1}{2}\right)-\cos(\lambda x)\left(\frac{\lambda \operatorname{Heun}}{}\right.}{c_3\operatorname{HeunC}\left(\frac{4a}{\lambda},-\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\right.} \tag{1}$$

Verification of solutions

$$y = \frac{-\left(\cos(\lambda x)\sin\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)a+\frac{\lambda\cos\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)}{2}\right)\operatorname{HeunC}\left(\frac{4a}{\lambda},\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\sin(\lambda x)}{2}+\frac{1}{2}\right)-\cos(\lambda x)\left(\frac{\lambda \operatorname{Heun}}{}\right.}{c_3\operatorname{HeunC}\left(\frac{4a}{\lambda},-\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$\boxed{y' - y^2 = \lambda^2 + c\sin(\lambda x + a)^n \sin(\lambda x + b)^{-n-4}}$$

9.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + \lambda^2 + c\sin(\lambda x + a)^n \sin(\lambda x + b)^{-n-4} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \lambda^2 + \frac{c(\sin(\lambda x)\cos(a) + \cos(\lambda x)\sin(a))^n \sin(\lambda x + b)^{-n}}{(\sin(\lambda x)\cos(b) + \cos(\lambda x)\sin(b))^4}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \lambda^2 + c\sin(\lambda x + a)^n \sin(\lambda x + b)^{-n-4}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \lambda^2 + c\sin(\lambda x + a)^n \sin(\lambda x + b)^{-n-4} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(\lambda^2 + c\sin(\lambda x + a)^n \sin(\lambda x + b)^{-n-4}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

✗ Solution by Maple

```
dsolve(diff(y(x),x)=y(x)^2+lambda^2+c*sin(lambda*x+a)^n*sin(lambda*x+b)^(-n-4),y(x), singsol

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - a\sin(\beta x)\, y = ab\sin(\beta x) - b^2}$$

9.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + a\sin(\beta x)\, y + ab\sin(\beta x) - b^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\sin(\beta x)\, y + ab\sin(\beta x) - b^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = ab\sin(\beta x) - b^2$, $f_1(x) = \sin(\beta x)\, a$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \qquad (1) \end{aligned}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \sin(\beta x) a \\ f_2^2 f_0 &= ab\sin(\beta x) - b^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \sin(\beta x) a u'(x) + (ab\sin(\beta x) - b^2) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(-ic_2\beta\left(\int e^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}}dx\right) + c_1\right) e^{bx}$$

The above shows that

$$u'(x) = \left(-i\left(\int e^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}}dx\right) c_2 b\beta - ic_2\beta\, e^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}} + c_1 b\right) e^{bx}$$

Using the above in (1) gives the solution

$$y = -\frac{-i\left(\int e^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}}dx\right) c_2 b\beta - ic_2\beta\, e^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}} + c_1 b}{-ic_2\beta\left(\int e^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}}dx\right) + c_1}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\left(\int e^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}}dx\right) b\beta - ibc_3 - e^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}}\beta}{\beta\left(\int e^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}}dx\right) + ic_3}$$

Summary

The solution(s) found are the following

$$y = \frac{-\left(\int \mathrm{e}^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}}dx\right)b\beta - ibc_3 - \mathrm{e}^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}}\beta}{\beta\left(\int \mathrm{e}^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}}dx\right) + ic_3} \tag{1}$$

Verification of solutions

$$y = \frac{-\left(\int \mathrm{e}^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}}dx\right)b\beta - ibc_3 - \mathrm{e}^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}}\beta}{\beta\left(\int \mathrm{e}^{\frac{-2b\beta x - a\cos(\beta x)}{\beta}}dx\right) + ic_3}$$

Verified OK.

ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - a\sin(bx)^m y = a\sin(bx)^m}$$

9.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + a\sin(bx)^m y + a\sin(bx)^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\sin(bx)^m y + a\sin(bx)^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\sin(bx)^m$, $f_1(x) = a\sin(bx)^m$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= a\sin(bx)^m \\ f_2^2 f_0 &= a\sin(bx)^m \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - a\sin(bx)^m\, u'(x) + a\sin(bx)^m\, u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) + a\sin(bx)^m\,(-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + a\sin(bx)^m\,(-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + a\sin(bx)^m\,(-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)}{\mathrm{DESol}\left(\left\{\_Y''(x) + a\sin(bx)^m\,(-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + a\sin(bx)^m\,(-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)}{\mathrm{DESol}\left(\left\{\_Y''(x) + a\sin(bx)^m\,(-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + a\sin(bx)^m\,(-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)}{\mathrm{DESol}\left(\left\{\_Y''(x) + a\sin(bx)^m\,(-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\_Y''(x) + a\sin\left(bx\right)^{m}\left(-\_Y'(x) + \_Y(x)\right)\right\}, \left\{\_Y(x)\right\}\right)}{\mathrm{DESol}\left(\left\{\_Y''\left(x\right) + a\sin\left(bx\right)^{m}\left(-\_Y'\left(x\right) + \_Y\left(x\right)\right)\right\}, \left\{\_Y\left(x\right)\right\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-1. Equations with sine
Problem number: 6.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \sin(\lambda x) y^2 = \lambda \sin(\lambda x)^3}$$

9.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \sin(\lambda x) \lambda y^2 + \lambda \sin(\lambda x)^3 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \sin(\lambda x) \lambda y^2 + \lambda \sin(\lambda x)^3$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \lambda \sin(\lambda x)^3$, $f_1(x) = 0$ and $f_2(x) = \lambda \sin(\lambda x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\lambda \sin(\lambda x) u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \lambda^2 \cos(\lambda x) \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \lambda^3 \sin(\lambda x)^5 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\lambda \sin(\lambda x)\, u''(x) - \lambda^2 \cos(\lambda x)\, u'(x) + \lambda^3 \sin(\lambda x)^5 u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{-\frac{\cos(\lambda x)^2}{2}} (c_2 \operatorname{erfi}(\cos(\lambda x)) + c_1)$$

The above shows that

$$u'(x) = \frac{\lambda \sin(\lambda x) \left(\sqrt{\pi}\, \cos(\lambda x)\, (c_2 \operatorname{erfi}(\cos(\lambda x)) + c_1)\, \mathrm{e}^{-\frac{\cos(\lambda x)^2}{2}} - 2c_2 \mathrm{e}^{\frac{\cos(\lambda x)^2}{2}}\right)}{\sqrt{\pi}}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\sqrt{\pi}\, \cos(\lambda x)\, (c_2 \operatorname{erfi}(\cos(\lambda x)) + c_1)\, \mathrm{e}^{-\frac{\cos(\lambda x)^2}{2}} - 2c_2 \mathrm{e}^{\frac{\cos(\lambda x)^2}{2}}\right) \mathrm{e}^{\frac{\cos(2\lambda x)}{4} + \frac{1}{4}}}{\sqrt{\pi}\, (c_2 \operatorname{erfi}(\cos(\lambda x)) + c_1)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{-2\, \mathrm{e}^{\cos(\lambda x)^2} + \cos(\lambda x) \sqrt{\pi}\, (\operatorname{erfi}(\cos(\lambda x)) + c_3)}{\sqrt{\pi}\, (\operatorname{erfi}(\cos(\lambda x)) + c_3)}$$

Summary

The solution(s) found are the following

$$y = -\frac{-2\, \mathrm{e}^{\cos(\lambda x)^2} + \cos(\lambda x) \sqrt{\pi}\, (\operatorname{erfi}(\cos(\lambda x)) + c_3)}{\sqrt{\pi}\, (\operatorname{erfi}(\cos(\lambda x)) + c_3)} \tag{1}$$

Verification of solutions

$$y = -\frac{-2\,e^{\cos(\lambda x)^2} + \cos(\lambda x)\sqrt{\pi}\,(\mathrm{erfi}(\cos(\lambda x)) + c_3)}{\sqrt{\pi}\,(\mathrm{erfi}(\cos(\lambda x)) + c_3)}$$

Verified OK.

Problem number: 7.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{2y' - (\lambda + a - a\sin(\lambda x))\, y^2 = -a + \lambda - a\sin(\lambda x)}$$

9.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{\sin(\lambda x)\, a\, y^2}{2} + \frac{a\, y^2}{2} + \frac{\lambda\, y^2}{2} + \frac{\lambda}{2} - \frac{a}{2} - \frac{a\sin(\lambda x)}{2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{\sin(\lambda x)\, a\, y^2}{2} + \frac{a\, y^2}{2} + \frac{\lambda\, y^2}{2} + \frac{\lambda}{2} - \frac{a}{2} - \frac{a\sin(\lambda x)}{2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{\lambda}{2} - \frac{a}{2} - \frac{a\sin(\lambda x)}{2}$, $f_1(x) = 0$ and $f_2(x) = \frac{a}{2} + \frac{\lambda}{2} - \frac{a\sin(\lambda x)}{2}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\left(\frac{a}{2} + \frac{\lambda}{2} - \frac{a\sin(\lambda x)}{2}\right) u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{a\lambda\cos(\lambda x)}{2} \\
f_1f_2 &= 0 \\
f_2^2f_0 &= \left(\frac{a}{2} + \frac{\lambda}{2} - \frac{a\sin(\lambda x)}{2}\right)^2\left(\frac{\lambda}{2} - \frac{a}{2} - \frac{a\sin(\lambda x)}{2}\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\left(\frac{a}{2} + \frac{\lambda}{2} - \frac{a\sin(\lambda x)}{2}\right)u''(x) + \frac{a\lambda\cos(\lambda x)\,u'(x)}{2} + \left(\frac{a}{2} + \frac{\lambda}{2} - \frac{a\sin(\lambda x)}{2}\right)^2\left(\frac{\lambda}{2} - \frac{a}{2} - \frac{a\sin(\lambda x)}{2}\right)u(x) =$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{\sqrt{\sin(\lambda x)}\,\cos\left(\frac{\pi}{4} + \frac{\lambda x}{2}\right)e^{\frac{-a\sin(\lambda x)+\lambda^2(a+\lambda)\left(\int \frac{\cot(\lambda x)}{a\sin(\lambda x)-a-\lambda}dx\right)}{2\lambda}}\left(c_1 + c_2\left(\int^{\sin(\lambda x)} \frac{((-1+\_a)a-\lambda)e^{-\frac{\_a a}{\lambda}}}{(-1+\_a)^{\frac{3}{2}}\sqrt{\_a+1}}d\_a\right)\right)}{\sqrt{a\sin(\lambda x) - a - \lambda}}$$

The above shows that

$$u'(x) = -\frac{\csc\left(\frac{\pi}{4} + \frac{\lambda x}{2}\right)\sec\left(\frac{\pi}{4} + \frac{\lambda x}{2}\right)^2 e^{\frac{-a\sin(\lambda x)+\lambda^2(a+\lambda)\left(\int \frac{\cot(\lambda x)}{a\sin(\lambda x)-a-\lambda}dx\right)}{2\lambda}}\left(\sin\left(\frac{\pi}{4} + \frac{\lambda x}{2}\right)\left(c_1 + c_2\left(\int^{\sin(\lambda x)} \frac{((-1+\_a)a-}{(-1+\_a)^{\frac{3}{2}}\sqrt{}}\right.\right.\right.}{}$$

Using the above in (1) gives the solution

$$y = \frac{\csc\left(\frac{\pi}{4} + \frac{\lambda x}{2}\right)\sec\left(\frac{\pi}{4} + \frac{\lambda x}{2}\right)^2\left(\sin\left(\frac{\pi}{4} + \frac{\lambda x}{2}\right)\left(c_1 + c_2\left(\int^{\sin(\lambda x)} \frac{((-1+\_a)a-\lambda)e^{-\frac{\_a a}{\lambda}}}{(-1+\_a)^{\frac{3}{2}}\sqrt{\_a+1}}d\_a\right)\right)\left((2a + \lambda)\sin(\lambda x) -\right.\right.}{4\sqrt{}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\sec\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)^2 \sqrt{2}\left(\sqrt{2}\,\sqrt{\sin(\lambda x)-1}\,\left(a\cos(\lambda x)^2+2\left(a+\frac{\lambda}{2}\right)(\sin(\lambda x)-1)\right)\operatorname{csgn}\left(\sin\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)\right)(\cos\dots}{}$$

Simplifying the solution $y = -\frac{\sec\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)^2 \sqrt{2}\left(\sqrt{2}\,\sqrt{\sin(\lambda x)-1}\,\left(a\cos(\lambda x)^2+2\left(a+\frac{\lambda}{2}\right)(\sin(\lambda x)-1)\right)\operatorname{csgn}\left(\sin\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)\right)\left(\cos(\lambda x)a\dots\right.}{}$

to $y = -\frac{\sec\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)^2 \sqrt{2}\left(\sqrt{2}\,\sqrt{\sin(\lambda x)-1}\,\left(a\cos(\lambda x)^2+2\left(a+\frac{\lambda}{2}\right)(\sin(\lambda x)-1)\right)\left(\cos(\lambda x)a+\tan\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)\lambda\right)\left(\int^{\sin(\lambda x)}\frac{((-1+\_a)a-\lambda)e^{-\frac{\_aa}{\lambda}}}{(-1+\_a)^{\frac{3}{2}}\sqrt{\_a+1}}\dots\right.}{4\sqrt{\sin(\lambda x)-1}\,(a\dots}$

Summary

The solution(s) found are the following

$$y = -\frac{\sec\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)^2 \sqrt{2}\left(\sqrt{2}\,\sqrt{\sin(\lambda x)-1}\,\left(a\cos(\lambda x)^2+2\left(a+\frac{\lambda}{2}\right)(\sin(\lambda x)-1)\right)\left(\cos(\lambda x)a+\tan\left(\frac{\pi}{4}+\dots\right.\right.}{} \tag{1}$$

Verification of solutions

$$y = -\frac{\sec\left(\frac{\pi}{4}+\frac{\lambda x}{2}\right)^2 \sqrt{2}\left(\sqrt{2}\,\sqrt{\sin(\lambda x)-1}\,\left(a\cos(\lambda x)^2+2\left(a+\frac{\lambda}{2}\right)(\sin(\lambda x)-1)\right)\left(\cos(\lambda x)a+\tan\left(\frac{\pi}{4}+\dots\right.\right.}{}$$

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-1. Equations with sine
Problem number: 8.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \left(\lambda + \sin\left(\lambda x\right)^{2} a\right) y^{2} = -a + \lambda + \sin\left(\lambda x\right)^{2} a}$$

9.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \sin\left(\lambda x\right)^{2} a\, y^{2} + \sin\left(\lambda x\right)^{2} a + \lambda\, y^{2} - a + \lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \sin\left(\lambda x\right)^{2} a\, y^{2} + \sin\left(\lambda x\right)^{2} a + \lambda\, y^{2} - a + \lambda$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a + \lambda + \sin\left(\lambda x\right)^{2} a$, $f_1(x) = 0$ and $f_2(x) = \lambda + \sin\left(\lambda x\right)^{2} a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\left(\lambda + \sin\left(\lambda x\right)^{2} a\right) u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 2\sin(\lambda x) a\lambda \cos(\lambda x) \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \left(\lambda + \sin(\lambda x)^2 a\right)^2 \left(-a + \lambda + \sin(\lambda x)^2 a\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\left(\lambda + \sin(\lambda x)^2 a\right) u''(x) - 2\sin(\lambda x) a\lambda\cos(\lambda x) u'(x) + \left(\lambda + \sin(\lambda x)^2 a\right)^2 \left(-a + \lambda + \sin(\lambda x)^2 a\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \sin(\lambda x)\, e^{-\frac{\cos(2\lambda x) a}{4\lambda}} \left(c_1 + 2ic_2\lambda\left(\int e^{\frac{\cos(2\lambda x) a}{2\lambda}} \left(\csc(\lambda x)^2 \lambda + a\right) dx\right)\right)$$

The above shows that

$$\begin{aligned} u'(x) = \csc(\lambda x) \Bigg(\lambda &+ \sin(\lambda x)^2 a\Bigg) \left(i\sin(2\lambda x)\left(\int e^{\frac{\cos(2\lambda x) a}{2\lambda}} \left(\csc(\lambda x)^2 \lambda + a\right) dx\right) c_2\lambda\, e^{-\frac{\cos(2\lambda x) a}{4\lambda}}\right. \\ &\left. + 2ic_2\lambda\, e^{\frac{\cos(2\lambda x) a}{4\lambda}} + \frac{\sin(2\lambda x) c_1 e^{-\frac{\cos(2\lambda x) a}{4\lambda}}}{2}\right) \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\csc(\lambda x)\left(i\sin(2\lambda x)\left(\int e^{\frac{\cos(2\lambda x) a}{2\lambda}} \left(\csc(\lambda x)^2 \lambda + a\right) dx\right) c_2\lambda\, e^{-\frac{\cos(2\lambda x) a}{4\lambda}} + 2ic_2\lambda\, e^{\frac{\cos(2\lambda x) a}{4\lambda}} + \frac{\sin(2\lambda x) c_1 e^{-\frac{\cos(2\lambda x) a}{4\lambda}}}{2}\right)}{\sin(\lambda x)\left(c_1 + 2ic_2\lambda\left(\int e^{\frac{\cos(2\lambda x) a}{2\lambda}} \left(\csc(\lambda x)^2 \lambda + a\right) dx\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{2\,\mathrm{e}^{\frac{\cos(2\lambda x)a}{2\lambda}} \csc\left(\lambda x\right)^{2} \lambda - i c_3 \cot\left(\lambda x\right) + 2\lambda\left(\int \mathrm{e}^{\frac{\cos(2\lambda x)a}{2\lambda}} \left(\csc\left(\lambda x\right)^{2} \lambda + a\right) dx\right) \cot\left(\lambda x\right)}{i c_3 - 2\lambda\left(\int \mathrm{e}^{\frac{\cos(2\lambda x)a}{2\lambda}} \left(\csc\left(\lambda x\right)^{2} \lambda + a\right) dx\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{2\,\mathrm{e}^{\frac{\cos(2\lambda x)a}{2\lambda}} \csc\left(\lambda x\right)^{2} \lambda - i c_3 \cot\left(\lambda x\right) + 2\lambda\left(\int \mathrm{e}^{\frac{\cos(2\lambda x)a}{2\lambda}} \left(\csc\left(\lambda x\right)^{2} \lambda + a\right) dx\right) \cot\left(\lambda x\right)}{i c_3 - 2\lambda\left(\int \mathrm{e}^{\frac{\cos(2\lambda x)a}{2\lambda}} \left(\csc\left(\lambda x\right)^{2} \lambda + a\right) dx\right)} \tag{1}$$

Verification of solutions

$$y = \frac{2\,\mathrm{e}^{\frac{\cos(2\lambda x)a}{2\lambda}} \csc\left(\lambda x\right)^{2} \lambda - i c_3 \cot\left(\lambda x\right) + 2\lambda\left(\int \mathrm{e}^{\frac{\cos(2\lambda x)a}{2\lambda}} \left(\csc\left(\lambda x\right)^{2} \lambda + a\right) dx\right) \cot\left(\lambda x\right)}{i c_3 - 2\lambda\left(\int \mathrm{e}^{\frac{\cos(2\lambda x)a}{2\lambda}} \left(\csc\left(\lambda x\right)^{2} \lambda + a\right) dx\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-1. Equations with sine
Problem number: 9.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + (k+1)\, x^{k} y^{2} - a\, x^{k+1} \sin\left(x\right)^{m} y = -a \sin\left(x\right)^{m}}$$

9.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\, x^{k+1} \sin\left(x\right)^{m} y - x^{k} y^{2} k - x^{k} y^{2} - a \sin\left(x\right)^{m} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\, x^{k} x \sin\left(x\right)^{m} y - x^{k} y^{2} k - x^{k} y^{2} - a \sin\left(x\right)^{m}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = -a \sin\left(x\right)^{m}$, $f_1(x) = x^{k+1} \sin\left(x\right)^{m} a$ and $f_2(x) = -x^{k} k - x^{k}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\left(-x^{k} k - x^{k}\right) u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{k^2 x^k}{x} - \frac{k\, x^k}{x} \\
f_1 f_2 &= x^{k+1} \sin(x)^m\, a\left(-x^k k - x^k\right) \\
f_2^2 f_0 &= -\left(-x^k k - x^k\right)^2 a \sin(x)^m
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\left(-x^k k - x^k\right) u''(x) - \left(-\frac{k^2 x^k}{x} - \frac{k\, x^k}{x} + x^{k+1} \sin(x)^m\, a\left(-x^k k - x^k\right)\right) u'(x) - \left(-x^k k - x^k\right)^2 a \sin(x)^m\, u($$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{k+1}\left(c_1 + c_2\left(\int x^{-2k-2} \mathrm{e}^{\int \left(x^{k+1} \sin(x)^m a + \frac{k}{x}\right) dx} dx\right)\right)$$

The above shows that

$$\begin{aligned}
u'(x) = \Bigg(& c_2 x^{-2k-1} \mathrm{e}^{\int \left(x^{k+1} \sin(x)^m a + \frac{k}{x}\right) dx} \\
& + \left(c_1 + c_2\left(\int x^{-2k-2} \mathrm{e}^{\int \left(x^{k+1} \sin(x)^m a + \frac{k}{x}\right) dx} dx\right)\right)(k+1)\Bigg) x^k
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(c_2 x^{-2k-1} \mathrm{e}^{\int \left(x^{k+1} \sin(x)^m a + \frac{k}{x}\right) dx} + \left(c_1 + c_2\left(\int x^{-2k-2} \mathrm{e}^{\int \left(x^{k+1} \sin(x)^m a + \frac{k}{x}\right) dx} dx\right)\right)(k+1)\right) x^k x^{-k-1}}{\left(-x^k k - x^k\right)\left(c_1 + c_2\left(\int x^{-2k-2} \mathrm{e}^{\int \left(x^{k+1} \sin(x)^m a + \frac{k}{x}\right) dx} dx\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{x^{-k-1}\left(x^{-2k-1} \mathrm{e}^{\int \left(x^{k+1} \sin(x)^m a + \frac{k}{x}\right) dx} + \left(c_3 + \int x^{-2k-2} \mathrm{e}^{\int \left(x^{k+1} \sin(x)^m a + \frac{k}{x}\right) dx} dx\right)(k+1)\right)}{(k+1)\left(c_3 + \int \mathrm{e}^{\int \frac{a\, x^{k+2} \sin(x)^m + k}{x} dx} x^{-2k-2} dx\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{x^{-k-1}\left(x^{-2k-1}\mathrm{e}^{\int \left(x^{k+1}\sin(x)^{m} a+\frac{k}{x}\right)dx}+\left(c_3+\int x^{-2k-2}\mathrm{e}^{\int \left(x^{k+1}\sin(x)^{m} a+\frac{k}{x}\right)dx}dx\right)(k+1)\right)}{(k+1)\left(c_3+\int \mathrm{e}^{\int \frac{a\,x^{k+2}\sin(x)^{m}+k}{x}dx}x^{-2k-2}dx\right)} \tag{1}$$

Verification of solutions

$$y = \frac{x^{-k-1}\left(x^{-2k-1}\mathrm{e}^{\int \left(x^{k+1}\sin(x)^{m} a+\frac{k}{x}\right)dx}+\left(c_3+\int x^{-2k-2}\mathrm{e}^{\int \left(x^{k+1}\sin(x)^{m} a+\frac{k}{x}\right)dx}dx\right)(k+1)\right)}{(k+1)\left(c_3+\int \mathrm{e}^{\int \frac{a\,x^{k+2}\sin(x)^{m}+k}{x}dx}x^{-2k-2}dx\right)}$$

Verified OK.

```

$$y' - a\sin(\lambda x+\mu)^k (y - b\,x^n - c)^2 = b\,x^{n-1}n$$

9.10.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y)\\ &= x^{2n}\sin(\lambda x+\mu)^k a\,b^2 + 2x^n\sin(\lambda x+\mu)^k abc - 2x^n\sin(\lambda x+\mu)^k aby + \sin(\lambda x+\mu)^k a\,c^2 - 2\sin(\lambda x \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^{2n}(\sin(\lambda x)\cos(\mu)+\cos(\lambda x)\sin(\mu))^k a\,b^2 + 2x^n(\sin(\lambda x)\cos(\mu)+\cos(\lambda x)\sin(\mu))^k abc - 2x^n(\sin(\lambda x$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = x^{2n}\sin(\lambda x+\mu)^k a\,b^2 + 2x^n\sin(\lambda x+\mu)^k abc + \sin(\lambda x+\mu)^k a\,c^2 + b\,x^{n-1}n$, $f_1(x) = -2\sin(\lambda x+\mu)^k a\,x^n b - 2\sin(\lambda x+\mu)^k ac$ and $f_2(x) = \sin(\lambda x+\mu)^k a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u}\\ &= \frac{-u'}{\sin(\lambda x+\mu)^k au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$
\begin{aligned}
f_2' &= \frac{\sin(\lambda x+\mu)^k k\lambda \cos(\lambda x+\mu)\, a}{\sin(\lambda x+\mu)}\\
f_1f_2 &= \left(-2\sin(\lambda x+\mu)^k a\, x^n b - 2\sin(\lambda x+\mu)^k ac\right)\sin(\lambda x+\mu)^k a\\
f_2^2 f_0 &= \sin(\lambda x+\mu)^{2k} a^2\left(x^{2n}\sin(\lambda x+\mu)^k a\, b^2 + 2x^n \sin(\lambda x+\mu)^k abc + \sin(\lambda x+\mu)^k a\, c^2 + b\, x^{n-1}n\right)
\end{aligned}
$$

Substituting the above terms back in equation (2) gives

$$\sin(\lambda x+\mu)^k a u''(x) - \left(\frac{\sin(\lambda x+\mu)^k k\lambda\cos(\lambda x+\mu)\, a}{\sin(\lambda x+\mu)} + \left(-2\sin(\lambda x+\mu)^k a\, x^n b - 2\sin(\lambda x+\mu)^k ac\right) \mathrm{s}\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$
\begin{aligned}
u(x) = \mathrm{e}^{-\frac{\left(\int\left(2a(b\,x^n+c)\sin(\lambda x+\mu)^k-\cot(\lambda x+\mu)\lambda(k-1)\right)dx\right)}{2}} \sin(\lambda x\\
+\mu)\left(c_1 \operatorname{LegendreP}\left(\frac{k}{2}-\frac{1}{2}, \frac{k}{2}+\frac{1}{2}, \cos(\lambda x+\mu)\right)\right.\\
\left.+ c_2 \operatorname{LegendreQ}\left(\frac{k}{2}-\frac{1}{2}, \frac{k}{2}+\frac{1}{2}, \cos(\lambda x+\mu)\right)\right)
\end{aligned}
$$

The above shows that

$$
\begin{aligned}
u'(x) = -a\sin(\lambda x+\mu)^k \mathrm{e}^{-\frac{\left(\int\left(2a(b\,x^n+c)\sin(\lambda x+\mu)^k-\cot(\lambda x+\mu)\lambda(k-1)\right)dx\right)}{2}} \sin(\lambda x\\
+\mu)\left(c_1 \operatorname{LegendreP}\left(\frac{k}{2}-\frac{1}{2}, \frac{k}{2}+\frac{1}{2}, \cos(\lambda x+\mu)\right)\right.\\
\left.+ c_2 \operatorname{LegendreQ}\left(\frac{k}{2}-\frac{1}{2}, \frac{k}{2}+\frac{1}{2}, \cos(\lambda x+\mu)\right)\right)(b\,x^n+c)
\end{aligned}
$$

Using the above in (1) gives the solution

$$y = b\,x^n + c$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = b\,x^n + c$$

Summary

The solution(s) found are the following

$$y = b\,x^n + c \tag{1}$$

Verification of solutions

$$y = b\,x^n + c$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y'x - a\sin(\lambda x)^m y^2 - ky = a\,b^2x^{2k}\sin(\lambda x)^m}$$

9.11.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}
y' &= F(x,y) \\
&= \frac{a\sin(\lambda x)^m y^2 + ky + a\,b^2x^{2k}\sin(\lambda x)^m}{x}
\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,b^2x^{2k}\sin(\lambda x)^m}{x} + \frac{a\sin(\lambda x)^m y^2}{x} + \frac{ky}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{a\,b^2x^{2k}\sin(\lambda x)^m}{x}$, $f_1(x) = \frac{k}{x}$ and $f_2(x) = \frac{a\sin(\lambda x)^m}{x}$. Let

$$\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{\frac{a\sin(\lambda x)^m u}{x}}
\end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{a \sin(\lambda x)^m m\lambda \cos(\lambda x)}{\sin(\lambda x)\, x} - \frac{a \sin(\lambda x)^m}{x^2} \\
f_1 f_2 &= \frac{ka \sin(\lambda x)^m}{x^2} \\
f_2^2 f_0 &= \frac{a^3 \sin(\lambda x)^{3m} b^2 x^{2k}}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a \sin(\lambda x)^m u''(x)}{x} - \left(\frac{a \sin(\lambda x)^m m\lambda \cos(\lambda x)}{\sin(\lambda x)\, x} - \frac{a \sin(\lambda x)^m}{x^2} + \frac{ka \sin(\lambda x)^m}{x^2}\right) u'(x) + \frac{a^3 \sin(\lambda x)^{3m} b^2 x^{2k}}{x^3}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \mathrm{e}^{iab\left(\int x^{k-1} \sin(\lambda x)^m dx\right)} + c_2 \mathrm{e}^{-iab\left(\int x^{k-1} \sin(\lambda x)^m dx\right)}$$

The above shows that

$$u'(x) = iab\, x^{k-1} \sin(\lambda x)^m \left(c_1 \mathrm{e}^{iab\left(\int x^{k-1} \sin(\lambda x)^m dx\right)} - c_2 \mathrm{e}^{-iab\left(\int x^{k-1} \sin(\lambda x)^m dx\right)}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{ib\, x^{k-1} \left(c_1 \mathrm{e}^{iab\left(\int x^{k-1} \sin(\lambda x)^m dx\right)} - c_2 \mathrm{e}^{-iab\left(\int x^{k-1} \sin(\lambda x)^m dx\right)}\right) x}{c_1 \mathrm{e}^{iab\left(\int x^{k-1} \sin(\lambda x)^m dx\right)} + c_2 \mathrm{e}^{-iab\left(\int x^{k-1} \sin(\lambda x)^m dx\right)}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{ib\, x^{k} \left(c_3 \mathrm{e}^{iab\left(\int x^{k-1} \sin(\lambda x)^m dx\right)} - \mathrm{e}^{-iab\left(\int x^{k-1} \sin(\lambda x)^m dx\right)}\right)}{c_3 \mathrm{e}^{iab\left(\int x^{k-1} \sin(\lambda x)^m dx\right)} + \mathrm{e}^{-iab\left(\int x^{k-1} \sin(\lambda x)^m dx\right)}}$$

Summary
The solution(s) found are the following

$$y = -\frac{ib\,x^k\left(c_3 e^{iab\left(\int x^{k-1}\sin(\lambda x)^m dx\right)} - e^{-iab\left(\int x^{k-1}\sin(\lambda x)^m dx\right)}\right)}{c_3 e^{iab\left(\int x^{k-1}\sin(\lambda x)^m dx\right)} + e^{-iab\left(\int x^{k-1}\sin(\lambda x)^m dx\right)}} \tag{1}$$

Verification of solutions

$$y = -\frac{ib\,x^k\left(c_3 e^{iab\left(\int x^{k-1}\sin(\lambda x)^m dx\right)} - e^{-iab\left(\int x^{k-1}\sin(\lambda x)^m dx\right)}\right)}{c_3 e^{iab\left(\int x^{k-1}\sin(\lambda x)^m dx\right)} + e^{-iab\left(\int x^{k-1}\sin(\lambda x)^m dx\right)}}$$

Verified OK.

Problem number: 12.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$\boxed{(a\sin(\lambda x)+b)\,y'-y^2-c\sin(x\mu)\,y=-d^2+cd\sin(x\mu)}$$

9.12.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y)\\ &= \frac{y^2+c\sin(x\mu)\,y-d^2+cd\sin(x\mu)}{a\sin(\lambda x)+b} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=\frac{cd\sin(x\mu)}{a\sin(\lambda x)+b}+\frac{c\sin(x\mu)\,y}{a\sin(\lambda x)+b}-\frac{d^2}{a\sin(\lambda x)+b}+\frac{y^2}{a\sin(\lambda x)+b}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=\frac{-d^2+cd\sin(x\mu)}{a\sin(\lambda x)+b}$, $f_1(x)=\frac{c\sin(x\mu)}{a\sin(\lambda x)+b}$ and $f_2(x)=\frac{1}{a\sin(\lambda x)+b}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u}\\ &= \frac{-u'}{\frac{u}{a\sin(\lambda x)+b}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{a\lambda\cos(\lambda x)}{(a\sin(\lambda x) + b)^2} \\ f_1f_2 &= \frac{c\sin(x\mu)}{(a\sin(\lambda x) + b)^2} \\ f_2^2f_0 &= \frac{-d^2 + cd\sin(x\mu)}{(a\sin(\lambda x) + b)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{u''(x)}{a\sin(\lambda x) + b} - \left(-\frac{a\lambda\cos(\lambda x)}{(a\sin(\lambda x) + b)^2} + \frac{c\sin(x\mu)}{(a\sin(\lambda x) + b)^2}\right)u'(x) + \frac{(-d^2 + cd\sin(x\mu))\,u(x)}{(a\sin(\lambda x) + b)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-1. Equations with sine
Problem number: 13.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{(a\sin(\lambda x)+b)\left(y'-y^2\right)=a\,\lambda^2\sin(\lambda x)}$$

9.13.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{y^2\sin(\lambda x)\,a+a\,\lambda^2\sin(\lambda x)+y^2b}{a\sin(\lambda x)+b} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=\frac{a\,\lambda^2\sin(\lambda x)}{a\sin(\lambda x)+b}+\frac{y^2\sin(\lambda x)\,a}{a\sin(\lambda x)+b}+\frac{y^2b}{a\sin(\lambda x)+b}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=\frac{a\,\lambda^2\sin(\lambda x)}{a\sin(\lambda x)+b}$, $f_1(x)=0$ and $f_2(x)=1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \frac{a\,\lambda^2 \sin(\lambda x)}{a \sin(\lambda x) + b} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \frac{a\,\lambda^2 \sin(\lambda x)\, u(x)}{a \sin(\lambda x) + b} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = {} & 2c_1(a-b)(a+b)\, b^2 \left(\sin\left(\frac{\lambda x}{2}\right) a \cos\left(\frac{\lambda x}{2}\right) + \frac{b}{2}\right) \arctan\left(\frac{b \tan\left(\frac{\lambda x}{2}\right) + a}{\sqrt{-a^2+b^2}}\right) \\ & + a c_1 \cos\left(\frac{\lambda x}{2}\right)(a-b)(a+b)\left(a \sin\left(\frac{\lambda x}{2}\right) + b \cos\left(\frac{\lambda x}{2}\right)\right)\sqrt{-a^2+b^2} \\ & + 2c_2\left(\sin\left(\frac{\lambda x}{2}\right) a \cos\left(\frac{\lambda x}{2}\right) + \frac{b}{2}\right) \end{aligned}$$

The above shows that

$$u'(x) = -\frac{\left(-2c_1\left(\cos\left(\frac{\lambda x}{2}\right)^2 - \frac{1}{2}\right)(a-b)(a+b)\, a\sqrt{-a^2+b^2}\, b^2 \arctan\left(\frac{b\tan\left(\frac{\lambda x}{2}\right)+a}{\sqrt{-a^2+b^2}}\right) - 2\left(\cos\left(\frac{\lambda x}{2}\right)^2 - \frac{1}{2}\right) c_2 a\sqrt{-}\right.}{\sqrt{-a^2+b^2}}$$

Using the above in (1) gives the solution

$$y = \frac{\left(-2c_1\left(\cos\left(\frac{\lambda x}{2}\right)^2 - \frac{1}{2}\right)(a-b)(a+b)\, a\sqrt{-a^2+b^2}\, b^2 \arctan\left(\frac{b\tan\left(\frac{\lambda x}{2}\right)+a}{\sqrt{-a^2+b^2}}\right) - 2\left(\cos\left(\frac{\lambda x}{2}\right)^2 - \frac{1}{2}\right) c_2 a\sqrt{-a}\right.}{\sqrt{-a^2+b^2}\left(2c_1(a-b)(a+b)\, b^2\left(\sin\left(\frac{\lambda x}{2}\right) a \cos\left(\frac{\lambda x}{2}\right) + \frac{b}{2}\right) \arctan\left(\frac{b\tan\left(\frac{\lambda x}{2}\right)+a}{\sqrt{-a^2+b^2}}\right) + a c_1 \cos\left(\frac{\lambda x}{2}\right)(a-b)\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\lambda\left(-2c_3\left(\cos\left(\frac{\lambda x}{2}\right)^2 - \frac{1}{2}\right)(a-b)(a+b)\,a\sqrt{-a^2+b^2}\,b^2 \arctan\left(\frac{b\tan\left(\frac{\lambda x}{2}\right)+a}{\sqrt{-a^2+b^2}}\right) + a\left(-2\cos\left(\frac{\lambda x}{2}\right)^2+1\right)\sqrt{-}\right.}{\sqrt{-a^2+b^2}\left(2c_3(a-b)(a+b)\,b^2\left(\sin\left(\frac{\lambda x}{2}\right)a\cos\left(\frac{\lambda x}{2}\right)+\frac{b}{2}\right)\arctan\left(\frac{b\tan\left(\frac{\lambda x}{2}\right)+a}{\sqrt{-a^2+b^2}}\right) + ac_3\cos\left(\frac{\lambda x}{2}\right)(a-\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{\lambda\left(-2c_3\left(\cos\left(\frac{\lambda x}{2}\right)^2 - \frac{1}{2}\right)(a-b)(a+b)\,a\sqrt{-a^2+b^2}\,b^2 \arctan\left(\frac{b\tan\left(\frac{\lambda x}{2}\right)+a}{\sqrt{-a^2+b^2}}\right) + a\left(-2\cos\left(\frac{\lambda x}{2}\right)^2+1\right)\sqrt{-}\right.}{\sqrt{-a^2+b^2}\left(2c_3(a-b)(a+b)\,b^2\left(\sin\left(\frac{\lambda x}{2}\right)a\cos\left(\frac{\lambda x}{2}\right)+\frac{b}{2}\right)\arctan\left(\frac{b\tan\left(\frac{\lambda x}{2}\right)+a}{\sqrt{-a^2+b^2}}\right) + ac_3\cos\left(\frac{\lambda x}{2}\right)(a-\right.} \tag{1}$$

Verification of solutions

$$y = \frac{\lambda\left(-2c_3\left(\cos\left(\frac{\lambda x}{2}\right)^2 - \frac{1}{2}\right)(a-b)(a+b)\,a\sqrt{-a^2+b^2}\,b^2 \arctan\left(\frac{b\tan\left(\frac{\lambda x}{2}\right)+a}{\sqrt{-a^2+b^2}}\right) + a\left(-2\cos\left(\frac{\lambda x}{2}\right)^2+1\right)\sqrt{-}\right.}{\sqrt{-a^2+b^2}\left(2c_3(a-b)(a+b)\,b^2\left(\sin\left(\frac{\lambda x}{2}\right)a\cos\left(\frac{\lambda x}{2}\right)+\frac{b}{2}\right)\arctan\left(\frac{b\tan\left(\frac{\lambda x}{2}\right)+a}{\sqrt{-a^2+b^2}}\right) + ac_3\cos\left(\frac{\lambda x}{2}\right)(a-\right.}$$

Verified OK.

Problem number: 14.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \alpha y^2 = \beta + \gamma \cos(\lambda x)}$$

10.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \alpha y^2 + \beta + \gamma \cos(\lambda x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \alpha y^2 + \beta + \gamma \cos(\lambda x)$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \beta + \gamma \cos(\lambda x)$, $f_1(x) = 0$ and $f_2(x) = \alpha$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\alpha u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \alpha^2(\beta + \gamma \cos(\lambda x)) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\alpha u''(x) + \alpha^2(\beta + \gamma \cos(\lambda x)) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \operatorname{MathieuC}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right) + c_2 \operatorname{MathieuS}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right)$$

The above shows that

$$u'(x) = \frac{\lambda\left(c_1 \operatorname{MathieuCPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right) + c_2 \operatorname{MathieuSPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right)\right)}{2}$$

Using the above in (1) gives the solution

$$y = -\frac{\lambda\left(c_1 \operatorname{MathieuCPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right) + c_2 \operatorname{MathieuSPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right)\right)}{2\alpha\left(c_1 \operatorname{MathieuC}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right) + c_2 \operatorname{MathieuS}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\lambda\left(c_3 \operatorname{MathieuCPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right) + \operatorname{MathieuSPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right)\right)}{2\alpha\left(c_3 \operatorname{MathieuC}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right) + \operatorname{MathieuS}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right)\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\lambda\left(c_3 \operatorname{MathieuCPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right) + \operatorname{MathieuSPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right)\right)}{2\alpha\left(c_3 \operatorname{MathieuC}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right) + \operatorname{MathieuS}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right)\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\lambda\left(c_3 \operatorname{MathieuCPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right) + \operatorname{MathieuSPrime}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right)\right)}{2\alpha\left(c_3 \operatorname{MathieuC}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right) + \operatorname{MathieuS}\left(\frac{4\alpha\beta}{\lambda^2}, -\frac{2\alpha\gamma}{\lambda^2}, \frac{\lambda x}{2}\right)\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = -a^2 + a\lambda \cos(\lambda x) + a^2 \cos(\lambda x)^2}$$

10.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 - a^2 + a\lambda \cos(\lambda x) + a^2 \cos(\lambda x)^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 - a^2 + a\lambda \cos(\lambda x) + a^2 \cos(\lambda x)^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2 + a\lambda \cos(\lambda x) + a^2 \cos(\lambda x)^2$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= -a^2 + a\lambda\cos(\lambda x) + a^2\cos(\lambda x)^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-a^2 + a\lambda\cos(\lambda x) + a^2\cos(\lambda x)^2\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\frac{a\cos(\lambda x)}{\lambda}}\left(c_1\,\mathrm{HeunC}\left(\frac{4a}{\lambda}, -\frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\cos(\lambda x)}{2} + \frac{1}{2}\right) + c_2\cos\left(\frac{\lambda x}{2}\right)\mathrm{HeunC}\left(\frac{4a}{\lambda}, \frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\cos(\lambda x)}{2} + \frac{1}{2}\right)\right)$$

The above shows that

$$u'(x) = -2\,\mathrm{e}^{\frac{a\cos(\lambda x)}{\lambda}}\left(\frac{c_2\left(\cos(\lambda x)\,a + a + \frac{\lambda}{2}\right)\mathrm{HeunC}\left(\frac{4a}{\lambda}, \frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\cos(\lambda x)}{2} + \frac{1}{2}\right)}{2} + \frac{(1+\cos(\lambda x))\,c_2\lambda\,\mathrm{HeunCPrime}\left(\frac{4a}{\lambda}, \frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\cos(\lambda x)}{2} + \frac{1}{2}\right)}{4} + c_1\cos\left(\frac{\lambda x}{2}\right)\left(a\,\mathrm{HeunC}\left(\frac{4a}{\lambda}, -\frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\cos(\lambda x)}{2} + \frac{1}{2}\right) + \frac{\lambda\,\mathrm{HeunCPrime}\left(\frac{4a}{\lambda}, -\frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\cos(\lambda x)}{2} + \frac{1}{2}\right)}{2}\right)\right)\sin\left(\frac{\lambda x}{2}\right)$$

Using the above in (1) gives the solution

$$y = \frac{2\left(\frac{c_2\left(\cos(\lambda x)a+a+\frac{\lambda}{2}\right)\mathrm{HeunC}\left(\frac{4a}{\lambda},\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\cos(\lambda x)}{2}+\frac{1}{2}\right)}{2} + \frac{(1+\cos(\lambda x))c_2\lambda\,\mathrm{HeunCPrime}\left(\frac{4a}{\lambda},\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\cos(\lambda x)}{2}+\frac{1}{2}\right)}{4} + \right.}{c_1\,\mathrm{HeunC}\left(\frac{4a}{\lambda}, -\frac{1}{2}, -\frac{1}{2}, -\frac{2a}{\lambda}, \frac{8a+3\lambda}{8\lambda}, \frac{\cos(\lambda x)}{2} + \frac{1}{2}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{2\left(\frac{\left(\cos(\lambda x)a+a+\frac{\lambda}{2}\right)\operatorname{HeunC}\left(\frac{4a}{\lambda},\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\cos(\lambda x)}{2}+\frac{1}{2}\right)}{2}+\frac{(1+\cos(\lambda x))\operatorname{HeunCPrime}\left(\frac{4a}{\lambda},\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\cos(\lambda x)}{2}+\frac{1}{2}\right)\lambda}{4}+c_3 \cdots}{c_3 \operatorname{HeunC}\left(\frac{4a}{\lambda},-\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\cos(\lambda x)}{2}+\frac{1}{2}\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{2\left(\frac{\left(\cos(\lambda x)a+a+\frac{\lambda}{2}\right)\operatorname{HeunC}\left(\frac{4a}{\lambda},\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\cos(\lambda x)}{2}+\frac{1}{2}\right)}{2}+\frac{(1+\cos(\lambda x))\operatorname{HeunCPrime}\left(\frac{4a}{\lambda},\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\cos(\lambda x)}{2}+\frac{1}{2}\right)\lambda}{4}+c_3 \cdots}{c_3 \operatorname{HeunC}\left(\frac{4a}{\lambda},-\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\cos(\lambda x)}{2}+\frac{1}{2}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{2\left(\frac{\left(\cos(\lambda x)a+a+\frac{\lambda}{2}\right)\operatorname{HeunC}\left(\frac{4a}{\lambda},\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\cos(\lambda x)}{2}+\frac{1}{2}\right)}{2}+\frac{(1+\cos(\lambda x))\operatorname{HeunCPrime}\left(\frac{4a}{\lambda},\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\cos(\lambda x)}{2}+\frac{1}{2}\right)\lambda}{4}+c_3 \cdots}{c_3 \operatorname{HeunC}\left(\frac{4a}{\lambda},-\frac{1}{2},-\frac{1}{2},-\frac{2a}{\lambda},\frac{8a+3\lambda}{8\lambda},\frac{\cos(\lambda x)}{2}+\frac{1}{2}\right)}$$

Verified OK.

Problem number: 16.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$\boxed{y' - y^2 = \lambda^2 + c\cos(\lambda x + a)^n \cos(\lambda x + b)^{-n-4}}$$

10.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + \lambda^2 + c\cos(\lambda x + a)^n \cos(\lambda x + b)^{-n-4} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \lambda^2 + \frac{c(\cos(\lambda x)\cos(a) - \sin(\lambda x)\sin(a))^n \cos(\lambda x + b)^{-n}}{(\cos(\lambda x)\cos(b) - \sin(\lambda x)\sin(b))^4}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \lambda^2 + c\cos(\lambda x + a)^n \cos(\lambda x + b)^{-n-4}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= \lambda^2 + c\cos(\lambda x + a)^n \cos(\lambda x + b)^{-n-4} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(\lambda^2 + c\cos(\lambda x + a)^n \cos(\lambda x + b)^{-n-4}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

✗ Solution by Maple

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - a\cos(\beta x)\, y = ab\cos(\beta x) - b^2}$$

10.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}
y' &= F(x, y) \\
&= y^2 + a\cos(\beta x)\, y + ab\cos(\beta x) - b^2
\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\cos(\beta x)\, y + ab\cos(\beta x) - b^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = ab\cos(\beta x) - b^2$, $f_1(x) = a\cos(\beta x)$ and $f_2(x) = 1$. Let

$$\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{u} \qquad (1)
\end{aligned}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= a\cos(\beta x) \\ f_2^2f_0 &= ab\cos(\beta x) - b^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - a\cos(\beta x)\,u'(x) + \left(ab\cos(\beta x) - b^2\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1\mathrm{e}^{-\frac{b(-2\beta x+\pi)}{2\beta}} + ic_2\mathrm{e}^{bx}\beta\left(\int \mathrm{e}^{\frac{-2b\beta x+\sin(\beta x)a+\pi b}{\beta}}dx\right)$$

The above shows that

$$u'(x) = c_1b\,\mathrm{e}^{-\frac{b(-2\beta x+\pi)}{2\beta}} + ic_2b\,\mathrm{e}^{bx}\beta\left(\int \mathrm{e}^{\frac{-2b\beta x+\sin(\beta x)a+\pi b}{\beta}}dx\right) + i\beta c_2\mathrm{e}^{\frac{\sin(\beta x)a-b(\beta x-\pi)}{\beta}}$$

Using the above in (1) gives the solution

$$y = -\frac{c_1b\,\mathrm{e}^{-\frac{b(-2\beta x+\pi)}{2\beta}} + ic_2b\,\mathrm{e}^{bx}\beta\left(\int \mathrm{e}^{\frac{-2b\beta x+\sin(\beta x)a+\pi b}{\beta}}dx\right) + i\beta c_2\mathrm{e}^{\frac{\sin(\beta x)a-b(\beta x-\pi)}{\beta}}}{c_1\mathrm{e}^{-\frac{b(-2\beta x+\pi)}{2\beta}} + ic_2\mathrm{e}^{bx}\beta\left(\int \mathrm{e}^{\frac{-2b\beta x+\sin(\beta x)a+\pi b}{\beta}}dx\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\beta\,\mathrm{e}^{\frac{\sin(\beta x)a-b(\beta x-\pi)}{\beta}} - b\left(ic_3\mathrm{e}^{-\frac{b(-2\beta x+\pi)}{2\beta}} - \mathrm{e}^{bx}\beta\left(\int \mathrm{e}^{\frac{-2b\beta x+\sin(\beta x)a+\pi b}{\beta}}dx\right)\right)}{ic_3\mathrm{e}^{-\frac{b(-2\beta x+\pi)}{2\beta}} - \mathrm{e}^{bx}\beta\left(\int \mathrm{e}^{\frac{-2b\beta x+\sin(\beta x)a+\pi b}{\beta}}dx\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{\beta\, \mathrm{e}^{\frac{\sin(\beta x)a - b(\beta x - \pi)}{\beta}} - b\left(i c_3 \mathrm{e}^{-\frac{b(-2\beta x+\pi)}{2\beta}} - \mathrm{e}^{bx}\beta\left(\int \mathrm{e}^{\frac{-2b\beta x+\sin(\beta x)a+\pi b}{\beta}}dx\right)\right)}{i c_3 \mathrm{e}^{-\frac{b(-2\beta x+\pi)}{2\beta}} - \mathrm{e}^{bx}\beta\left(\int \mathrm{e}^{\frac{-2b\beta x+\sin(\beta x)a+\pi b}{\beta}}dx\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\beta\, \mathrm{e}^{\frac{\sin(\beta x)a - b(\beta x - \pi)}{\beta}} - b\left(i c_3 \mathrm{e}^{-\frac{b(-2\beta x+\pi)}{2\beta}} - \mathrm{e}^{bx}\beta\left(\int \mathrm{e}^{\frac{-2b\beta x+\sin(\beta x)a+\pi b}{\beta}}dx\right)\right)}{i c_3 \mathrm{e}^{-\frac{b(-2\beta x+\pi)}{2\beta}} - \mathrm{e}^{bx}\beta\left(\int \mathrm{e}^{\frac{-2b\beta x+\sin(\beta x)a+\pi b}{\beta}}dx\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - a\cos(bx)^m y = a\cos(bx)^m}$$

10.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + a\cos(bx)^m y + a\cos(bx)^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\cos(bx)^m y + a\cos(bx)^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\cos(bx)^m$, $f_1(x) = a\cos(bx)^m$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= a \cos(bx)^m \\ f_2^2 f_0 &= a \cos(bx)^m \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - a \cos(bx)^m\, u'(x) + a \cos(bx)^m\, u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) + a \cos(bx)^m\, (-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) + a \cos(bx)^m\, (-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) + a \cos(bx)^m\, (-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)}{\mathrm{DESol}\left(\left\{\_Y''(x) + a \cos(bx)^m\, (-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) + a \cos(bx)^m\, (-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)}{\mathrm{DESol}\left(\left\{\_Y''(x) + a \cos(bx)^m\, (-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) + a \cos(bx)^m\, (-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)}{\mathrm{DESol}\left(\left\{\_Y''(x) + a \cos(bx)^m\, (-\_Y'(x) + \_Y(x))\right\}, \left\{\_Y(x)\right\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\_Y''(x) + a\cos\left(bx\right)^{m}\left(-\_Y'(x) + \_Y(x)\right)\right\}, \left\{\_Y(x)\right\}\right)}{\mathrm{DESol}\left(\left\{\_Y''\left(x\right) + a\cos\left(bx\right)^{m}\left(-\_Y'\left(x\right) + \_Y\left(x\right)\right)\right\}, \left\{\_Y\left(x\right)\right\}\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \cos(\lambda x)\, y^2 \lambda = \lambda \cos(\lambda x)^3}$$

10.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \cos(\lambda x)\, \lambda\, y^2 + \lambda \cos(\lambda x)^3 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \cos(\lambda x)\, \lambda\, y^2 + \lambda \cos(\lambda x)^3$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \lambda \cos(\lambda x)^3$, $f_1(x) = 0$ and $f_2(x) = \lambda \cos(\lambda x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\lambda \cos(\lambda x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\sin(\lambda x)\lambda^2 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \lambda^3 \cos(\lambda x)^5 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\lambda \cos(\lambda x) u''(x) + \sin(\lambda x)\lambda^2 u'(x) + \lambda^3 \cos(\lambda x)^5 u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{\mathrm{e}^{-\sin(\lambda x)^2 - \frac{\cos(\lambda x)^2}{2}} \left((c_1 - 2c_2)\operatorname{erf}\left(\sqrt{-\sin(\lambda x)^2}\right) + 2c_2\right)\sin(\lambda x)\sqrt{\pi}}{2\sqrt{-\sin(\lambda x)^2}}$$

The above shows that

$$u'(x) = \frac{\lambda\left(-\frac{\sqrt{\pi}\sin(\lambda x)^2 (c_1-2c_2)\operatorname{erf}\left(\sqrt{-\sin(\lambda x)^2}\right)}{2} + \mathrm{e}^{\sin(\lambda x)^2}(c_1 - 2c_2)\sqrt{-\sin(\lambda x)^2} - \sin(\lambda x)^2\sqrt{\pi}\, c_2\right)\mathrm{e}^{\frac{\cos(\lambda x)^2}{2} - 1}\cos}{\sqrt{-\sin(\lambda x)^2}}$$

Using the above in (1) gives the solution

$$y = -\frac{2\left(-\frac{\sqrt{\pi}\sin(\lambda x)^2 (c_1-2c_2)\operatorname{erf}\left(\sqrt{-\sin(\lambda x)^2}\right)}{2} + \mathrm{e}^{\sin(\lambda x)^2}(c_1 - 2c_2)\sqrt{-\sin(\lambda x)^2} - \sin(\lambda x)^2\sqrt{\pi}\, c_2\right)\mathrm{e}^{\frac{\cos(\lambda x)^2}{2} - 1}\mathrm{e}}{\left((c_1 - 2c_2)\operatorname{erf}\left(\sqrt{-\sin(\lambda x)^2}\right) + 2c_2\right)\sin(\lambda x)\sqrt{\pi}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{2\left(-\frac{\sin(\lambda x)\sqrt{\pi}\,(c_3-2)\,\mathrm{erf}\left(\sqrt{-\sin(\lambda x)^2}\right)}{2}+\csc(\lambda x)\,\mathrm{e}^{\sin(\lambda x)^2}(c_3-2)\sqrt{-\sin(\lambda x)^2}-\sin(\lambda x)\sqrt{\pi}\right)}{\left((c_3-2)\,\mathrm{erf}\left(\sqrt{-\sin(\lambda x)^2}\right)+2\right)\sqrt{\pi}}$$

Summary

The solution(s) found are the following

$$y = -\frac{2\left(-\frac{\sin(\lambda x)\sqrt{\pi}\,(c_3-2)\,\mathrm{erf}\left(\sqrt{-\sin(\lambda x)^2}\right)}{2}+\csc(\lambda x)\,\mathrm{e}^{\sin(\lambda x)^2}(c_3-2)\sqrt{-\sin(\lambda x)^2}-\sin(\lambda x)\sqrt{\pi}\right)}{\left((c_3-2)\,\mathrm{erf}\left(\sqrt{-\sin(\lambda x)^2}\right)+2\right)\sqrt{\pi}} \tag{1}$$

Verification of solutions

$$y = -\frac{2\left(-\frac{\sin(\lambda x)\sqrt{\pi}\,(c_3-2)\,\mathrm{erf}\left(\sqrt{-\sin(\lambda x)^2}\right)}{2}+\csc(\lambda x)\,\mathrm{e}^{\sin(\lambda x)^2}(c_3-2)\sqrt{-\sin(\lambda x)^2}-\sin(\lambda x)\sqrt{\pi}\right)}{\left((c_3-2)\,\mathrm{erf}\left(\sqrt{-\sin(\lambda x)^2}\right)+2\right)\sqrt{\pi}}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-2. Equations with cosine.
Problem number: 20.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{2y' - (\lambda + a - \cos(\lambda x)\, a)\, y^2 = -a + \lambda - \cos(\lambda x)\, a}$$

10.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= -\frac{\cos(\lambda x)\, a\, y^2}{2} + \frac{a\, y^2}{2} + \frac{\lambda\, y^2}{2} + \frac{\lambda}{2} - \frac{a}{2} - \frac{\cos(\lambda x)\, a}{2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{\cos(\lambda x)\, a\, y^2}{2} + \frac{a\, y^2}{2} + \frac{\lambda\, y^2}{2} + \frac{\lambda}{2} - \frac{a}{2} - \frac{\cos(\lambda x)\, a}{2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{\lambda}{2} - \frac{a}{2} - \frac{\cos(\lambda x)a}{2}$, $f_1(x) = 0$ and $f_2(x) = \frac{a}{2} + \frac{\lambda}{2} - \frac{\cos(\lambda x)a}{2}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\left(\frac{a}{2} + \frac{\lambda}{2} - \frac{\cos(\lambda x)a}{2}\right) u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{a\lambda \sin(\lambda x)}{2} \\ f_1f_2 &= 0 \\ f_2^2 f_0 &= \left(\frac{a}{2} + \frac{\lambda}{2} - \frac{\cos(\lambda x)\, a}{2}\right)^2 \left(\frac{\lambda}{2} - \frac{a}{2} - \frac{\cos(\lambda x)\, a}{2}\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\left(\frac{a}{2} + \frac{\lambda}{2} - \frac{\cos(\lambda x)\, a}{2}\right) u''(x) - \frac{a\lambda \sin(\lambda x)\, u'(x)}{2} + \left(\frac{a}{2} + \frac{\lambda}{2} - \frac{\cos(\lambda x)\, a}{2}\right)^2 \left(\frac{\lambda}{2} - \frac{a}{2} - \frac{\cos(\lambda x)\, a}{2}\right) u(x) =$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{\sin\left(\frac{\lambda x}{2}\right) e^{-\frac{a\cos(\lambda x)}{2\lambda}} \left(i c_2 \lambda \left(\int e^{\frac{a\cos(\lambda x)}{\lambda}} \left(2a + \csc\left(\frac{\lambda x}{2}\right)^2 \lambda\right) dx\right) + 2c_1\right)}{2}$$

The above shows that

$$u'(x) = -\frac{\csc\left(\frac{\lambda x}{2}\right) (\cos(\lambda x)\, a - a - \lambda) \left(i \sin(\lambda x) \left(\int e^{\frac{a\cos(\lambda x)}{\lambda}} \left(2a + \csc\left(\frac{\lambda x}{2}\right)^2 \lambda\right) dx\right) c_2 \lambda e^{-\frac{a\cos(\lambda x)}{2\lambda}} + 4i e^{\frac{a\cos(\lambda x)}{2\lambda}} c}{8}$$

Using the above in (1) gives the solution

$$y = \frac{\csc\left(\frac{\lambda x}{2}\right) (\cos(\lambda x)\, a - a - \lambda) \left(i \sin(\lambda x) \left(\int e^{\frac{a\cos(\lambda x)}{\lambda}} \left(2a + \csc\left(\frac{\lambda x}{2}\right)^2 \lambda\right) dx\right) c_2 \lambda e^{-\frac{a\cos(\lambda x)}{2\lambda}} + 4i e^{\frac{a\cos(\lambda x)}{2\lambda}} c_2 \lambda}{4\left(\frac{a}{2} + \frac{\lambda}{2} - \frac{\cos(\lambda x)a}{2}\right) \sin\left(\frac{\lambda x}{2}\right) \left(i c_2 \lambda \left(\int e^{\frac{a\cos(\lambda x)}{\lambda}} \left(2a + \csc\left(\frac{\lambda x}{2}\right)^2 \lambda\right) dx\right) + 2}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{2\left(i \sin(\lambda x)\, c_3 - \frac{\lambda\left(\int e^{\frac{a\cos(\lambda x)}{\lambda}} \left(2a+\csc\left(\frac{\lambda x}{2}\right)^2 \lambda\right) dx\right) \sin(\lambda x)}{2} - 2\lambda e^{\frac{a\cos(\lambda x)}{\lambda}}\right) \csc\left(\frac{\lambda x}{2}\right)^2}{4ic_3 - 2\lambda \left(\int e^{\frac{a\cos(\lambda x)}{\lambda}} \left(2a + \csc\left(\frac{\lambda x}{2}\right)^2 \lambda\right) dx\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{2\left(i\sin\left(\lambda x\right)c_3 - \frac{\lambda\left(\int \mathrm{e}^{\frac{a\cos(\lambda x)}{\lambda}}\left(2a+\csc\left(\frac{\lambda x}{2}\right)^2\lambda\right)dx\right)\sin(\lambda x)}{2} - 2\lambda\,\mathrm{e}^{\frac{a\cos(\lambda x)}{\lambda}}\right)\csc\left(\frac{\lambda x}{2}\right)^2}{4ic_3 - 2\lambda\left(\int \mathrm{e}^{\frac{a\cos(\lambda x)}{\lambda}}\left(2a+\csc\left(\frac{\lambda x}{2}\right)^2\lambda\right)dx\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{2\left(i\sin\left(\lambda x\right)c_3 - \frac{\lambda\left(\int \mathrm{e}^{\frac{a\cos(\lambda x)}{\lambda}}\left(2a+\csc\left(\frac{\lambda x}{2}\right)^2\lambda\right)dx\right)\sin(\lambda x)}{2} - 2\lambda\,\mathrm{e}^{\frac{a\cos(\lambda x)}{\lambda}}\right)\csc\left(\frac{\lambda x}{2}\right)^2}{4ic_3 - 2\lambda\left(\int \mathrm{e}^{\frac{a\cos(\lambda x)}{\lambda}}\left(2a+\csc\left(\frac{\lambda x}{2}\right)^2\lambda\right)dx\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \left(\lambda + a\cos\left(\lambda x\right)^{2}\right) y^{2} = -a + \lambda + a\cos\left(\lambda x\right)^{2}}$$

10.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \cos\left(\lambda x\right)^{2} a\,y^{2} + a\cos\left(\lambda x\right)^{2} + \lambda\,y^{2} - a + \lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \cos\left(\lambda x\right)^{2} a\,y^{2} + a\cos\left(\lambda x\right)^{2} + \lambda\,y^{2} - a + \lambda$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a + \lambda + a\cos\left(\lambda x\right)^{2}$, $f_1(x) = 0$ and $f_2(x) = \lambda + a\cos\left(\lambda x\right)^{2}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\left(\lambda + a\cos\left(\lambda x\right)^{2}\right) u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -2\sin(\lambda x)\, a\lambda \cos(\lambda x) \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \left(\lambda + a\cos(\lambda x)^2\right)^2 \left(-a + \lambda + a\cos(\lambda x)^2\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\left(\lambda + a\cos(\lambda x)^2\right) u''(x) + 2\sin(\lambda x)\, a\lambda\cos(\lambda x)\, u'(x) + \left(\lambda + a\cos(\lambda x)^2\right)^2 \left(-a + \lambda + a\cos(\lambda x)^2\right) u(x) = ($$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \cos(\lambda x)\, \mathrm{e}^{\frac{\cos(2\lambda x) a}{4\lambda}} \left(c_1 + 2ic_2\lambda \left(\int \mathrm{e}^{-\frac{\cos(2\lambda x) a}{2\lambda}} \left(\sec(\lambda x)^2 \lambda + a\right) dx\right)\right)$$

The above shows that

$$u'(x) = -\frac{\sec(\lambda x)\left(\lambda + a\cos(\lambda x)^2\right)\left(2i\sin(2\lambda x)\left(\int \mathrm{e}^{-\frac{\cos(2\lambda x) a}{2\lambda}} \left(\sec(\lambda x)^2 \lambda + a\right) dx\right) c_2\lambda\, \mathrm{e}^{\frac{\cos(2\lambda x) a}{4\lambda}} + \sin(2\lambda x)\, c_1 \mathrm{e}}{2}$$

Using the above in (1) gives the solution

$$y = \frac{\sec(\lambda x)\left(2i\sin(2\lambda x)\left(\int \mathrm{e}^{-\frac{\cos(2\lambda x) a}{2\lambda}} \left(\sec(\lambda x)^2 \lambda + a\right) dx\right) c_2\lambda\, \mathrm{e}^{\frac{\cos(2\lambda x) a}{4\lambda}} + \sin(2\lambda x)\, c_1 \mathrm{e}^{\frac{\cos(2\lambda x) a}{4\lambda}} - 4i\lambda c_2 \mathrm{e}^{-\frac{\cos}{}}}{2\cos(\lambda x)\left(c_1 + 2ic_2\lambda\left(\int \mathrm{e}^{-\frac{\cos(2\lambda x) a}{2\lambda}} \left(\sec(\lambda x)^2 \lambda + a\right) dx\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{ic_3 \tan(\lambda x) - 2\lambda\left(\int \mathrm{e}^{-\frac{\cos(2\lambda x) a}{2\lambda}} \left(\sec(\lambda x)^2 \lambda + a\right) dx\right) \tan(\lambda x) + 2\sec(\lambda x)^2 \mathrm{e}^{-\frac{\cos(2\lambda x) a}{2\lambda}} \lambda}{ic_3 - 2\lambda\left(\int \mathrm{e}^{-\frac{\cos(2\lambda x) a}{2\lambda}} \left(\sec(\lambda x)^2 \lambda + a\right) dx\right)}$$

Summary
The solution(s) found are the following

$$
y = \frac{i c_3 \tan(\lambda x) - 2\lambda \left(\int e^{-\frac{\cos(2\lambda x) a}{2\lambda}} \left(\sec(\lambda x)^2 \lambda + a\right) dx\right) \tan(\lambda x) + 2\sec(\lambda x)^2 e^{-\frac{\cos(2\lambda x) a}{2\lambda}} \lambda}{i c_3 - 2\lambda \left(\int e^{-\frac{\cos(2\lambda x) a}{2\lambda}} \left(\sec(\lambda x)^2 \lambda + a\right) dx\right)} \tag{1}
$$

Verification of solutions

$$
y = \frac{i c_3 \tan(\lambda x) - 2\lambda \left(\int e^{-\frac{\cos(2\lambda x) a}{2\lambda}} \left(\sec(\lambda x)^2 \lambda + a\right) dx\right) \tan(\lambda x) + 2\sec(\lambda x)^2 e^{-\frac{\cos(2\lambda x) a}{2\lambda}} \lambda}{i c_3 - 2\lambda \left(\int e^{-\frac{\cos(2\lambda x) a}{2\lambda}} \left(\sec(\lambda x)^2 \lambda + a\right) dx\right)}
$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + (k+1)\, x^k y^2 - a\, x^{k+1} \cos(x)^m\, y = -a \cos(x)^m}$$

10.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\, x^{k+1} \cos(x)^m\, y - x^k y^2 k - x^k y^2 - a \cos(x)^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\, x^k x \cos(x)^m\, y - x^k y^2 k - x^k y^2 - a \cos(x)^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a\cos(x)^m$, $f_1(x) = a\cos(x)^m\, x^{k+1}$ and $f_2(x) = -x^k k - x^k$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{(-x^k k - x^k)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{k^2x^k}{x} - \frac{k\,x^k}{x} \\
f_1f_2 &= a\cos(x)^m\,x^{k+1}\left(-x^kk - x^k\right) \\
f_2^2f_0 &= -\left(-x^kk - x^k\right)^2 a\cos(x)^m
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\left(-x^kk - x^k\right)u''(x) - \left(-\frac{k^2x^k}{x} - \frac{k\,x^k}{x} + a\cos(x)^m\,x^{k+1}\left(-x^kk - x^k\right)\right)u'(x) - \left(-x^kk - x^k\right)^2 a\cos(x)^m\,u($$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{k+1}\left(c_1 + c_2\left(\int x^{-2k-2}\mathrm{e}^{\int\left(a\cos(x)^m x^{k+1}+\frac{k}{x}\right)dx}dx\right)\right)$$

The above shows that

$$u'(x) = x^k\left(c_2x^{-2k-1}\mathrm{e}^{\int\left(a\cos(x)^m x^{k+1}+\frac{k}{x}\right)dx} + \left(c_1 + c_2\left(\int x^{-2k-2}\mathrm{e}^{\int\left(a\cos(x)^m x^{k+1}+\frac{k}{x}\right)dx}dx\right)\right)(k+1)\right)$$

Using the above in (1) gives the solution

$$y = -\frac{x^k\left(c_2x^{-2k-1}\mathrm{e}^{\int\left(a\cos(x)^m x^{k+1}+\frac{k}{x}\right)dx} + \left(c_1 + c_2\left(\int x^{-2k-2}\mathrm{e}^{\int\left(a\cos(x)^m x^{k+1}+\frac{k}{x}\right)dx}dx\right)\right)(k+1)\right)x^{-k-1}}{\left(-x^kk - x^k\right)\left(c_1 + c_2\left(\int x^{-2k-2}\mathrm{e}^{\int\left(a\cos(x)^m x^{k+1}+\frac{k}{x}\right)dx}dx\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{x^{-k-1}\left(x^{-2k-1}\mathrm{e}^{\int\left(a\cos(x)^m x^{k+1}+\frac{k}{x}\right)dx} + \left(c_3 + \int x^{-2k-2}\mathrm{e}^{\int\left(a\cos(x)^m x^{k+1}+\frac{k}{x}\right)dx}dx\right)(k+1)\right)}{(k+1)\left(c_3 + \int \mathrm{e}^{\int\frac{a\,x^{k+2}\cos(x)^m+k}{x}dx}x^{-2k-2}dx\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{x^{-k-1}\left(x^{-2k-1}\mathrm{e}^{\int \left(a\cos(x)^{m} x^{k+1}+\frac{k}{x}\right)dx}+\left(c_3+\int x^{-2k-2}\mathrm{e}^{\int \left(a\cos(x)^{m} x^{k+1}+\frac{k}{x}\right)dx}dx\right)(k+1)\right)}{(k+1)\left(c_3+\int \mathrm{e}^{\int \frac{a\,x^{k+2}\cos(x)^{m}+k}{x}dx}x^{-2k-2}dx\right)} \tag{1}$$

Verification of solutions

$$y = \frac{x^{-k-1}\left(x^{-2k-1}\mathrm{e}^{\int \left(a\cos(x)^{m} x^{k+1}+\frac{k}{x}\right)dx}+\left(c_3+\int x^{-2k-2}\mathrm{e}^{\int \left(a\cos(x)^{m} x^{k+1}+\frac{k}{x}\right)dx}dx\right)(k+1)\right)}{(k+1)\left(c_3+\int \mathrm{e}^{\int \frac{a\,x^{k+2}\cos(x)^{m}+k}{x}dx}x^{-2k-2}dx\right)}$$

Verified OK.

Problem number: 23.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[[_1st_order, `_with_symmetry_[F(x),G(x)]`], _Riccati]
```

$$\boxed{y' - a\cos(\lambda x+\mu)^k (y - b\,x^n - c)^2 = b\,x^{n-1}n}$$

10.10.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= x^{2n}\cos(\lambda x+\mu)^k\,a\,b^2 + 2x^n\cos(\lambda x+\mu)^k\,abc - 2x^n\cos(\lambda x+\mu)^k\,aby + \cos(\lambda x+\mu)^k\,a\,c^2 - 2\cos(\lambda x \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^{2n}(\cos(\mu)\cos(\lambda x) - \sin(\lambda x)\sin(\mu))^k\,a\,b^2 + 2x^n(\cos(\mu)\cos(\lambda x) - \sin(\lambda x)\sin(\mu))^k\,abc - 2x^n(\cos(\mu$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = x^{2n}\cos(\lambda x+\mu)^k\,a\,b^2 + 2x^n\cos(\lambda x+\mu)^k\,abc + \cos(\lambda x+\mu)^k\,a\,c^2 + b\,x^{n-1}n$, $f_1(x) = -2a\,x^n b\cos(\lambda x+\mu)^k - 2ca\cos(\lambda x+\mu)^k$ and $f_2(x) = a\cos(\lambda x+\mu)^k$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{a\cos(\lambda x+\mu)^k\,u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$f_2' = -\frac{a\cos(\lambda x+\mu)^k\,k\lambda\sin(\lambda x+\mu)}{\cos(\lambda x+\mu)}$$

$$f_1f_2 = \left(-2a\,x^n b\cos(\lambda x+\mu)^k - 2ca\cos(\lambda x+\mu)^k\right)a\cos(\lambda x+\mu)^k$$

$$f_2^2f_0 = a^2\cos(\lambda x+\mu)^{2k}\left(x^{2n}\cos(\lambda x+\mu)^k\,a\,b^2 + 2x^n\cos(\lambda x+\mu)^k\,abc + \cos(\lambda x+\mu)^k\,a\,c^2 + b\,x^{n-1}n\right)$$

Substituting the above terms back in equation (2) gives

$$a\cos(\lambda x+\mu)^k\,u''(x) - \left(-\frac{a\cos(\lambda x+\mu)^k\,k\lambda\sin(\lambda x+\mu)}{\cos(\lambda x+\mu)} + \left(-2a\,x^n b\cos(\lambda x+\mu)^k - 2ca\cos(\lambda x+\mu)^k\right.\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(c_1 - ic_2\lambda\left(\int\cos(\lambda x+\mu)^k\,dx\right)\right)\sqrt{\sin(\lambda x+\mu)}\,(\cos(\mu)\cos(\lambda x) - \sin(\lambda x)\sin(\mu))^{-\frac{k}{2}}\,\mathrm{e}^{-\frac{\left(\int\left(2\sec(\lambda x+\mu)a(b\,x^n+c)\cos(\lambda x+\mu)^{k+1}+\lambda(\tan(\lambda x+\mu)k+\cot(\lambda x+\mu))\right)dx\right)}{2}}$$

The above shows that

$$u'(x) = \Bigg(\left(\cos(\mu)\cos(\lambda x) - \sin(\lambda x)\sin(\mu)\right)\left(ic_2a(b\,x^n+c)\,\lambda\left(\int\cos(\lambda x+\mu)^k\,dx\right) - x^nc_1ab - ic_2\lambda - c_1ca\right)\cos(\lambda x+\mu)^{k+1}$$
$$+\frac{k\left(ic_2\lambda\left(\int\cos(\lambda x+\mu)^k\,dx\right) - c_1\right)\left((-\sin(\lambda x)\cos(\mu) - \cos(\lambda x)\sin(\mu))\cos(\lambda x+\mu) + \sin(\lambda x+\mu)\right.}{2}$$
$$+\mu)\,(\cos(\mu)\cos(\lambda x) - \sin(\lambda x)\sin(\mu))^{-\frac{k}{2}-1}\,\mathrm{e}^{-\frac{\left(\int\left(2\sec(\lambda x+\mu)a(b\,x^n+c)\cos(\lambda x+\mu)^{k+1}+\lambda(\tan(\lambda x+\mu)k+\cot(\lambda x+\mu))\right)dx\right)}{2}}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\left(\cos(\mu)\cos(\lambda x) - \sin(\lambda x)\sin(\mu)\right)\left(ic_2a(b\,x^n+c)\,\lambda\left(\int\cos(\lambda x+\mu)^k\,dx\right) - x^nc_1ab - ic_2\lambda - c_1ca\right)\right.}{}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{a(b\,x^n + c)\,\lambda\left(\int \cos\left(\lambda x + \mu\right)^k dx\right) + i x^n c_3 a b - \lambda + i c_3 c a}{a\left(\lambda\left(\int \cos\left(\lambda x + \mu\right)^k dx\right) + i c_3\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{a(b\,x^n + c)\,\lambda\left(\int \cos\left(\lambda x + \mu\right)^k dx\right) + i x^n c_3 a b - \lambda + i c_3 c a}{a\left(\lambda\left(\int \cos\left(\lambda x + \mu\right)^k dx\right) + i c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{a(b\,x^n + c)\,\lambda\left(\int \cos\left(\lambda x + \mu\right)^k dx\right) + i x^n c_3 a b - \lambda + i c_3 c a}{a\left(\lambda\left(\int \cos\left(\lambda x + \mu\right)^k dx\right) + i c_3\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-2. Equations with cosine.
Problem number: 24.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - a\cos(\lambda x)^m y^2 - ky = a\,b^2x^{2k}\cos(\lambda x)^m}$$

10.11.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}
y' &= F(x,y)\\
&= \frac{a\cos(\lambda x)^m y^2 + ky + a\,b^2x^{2k}\cos(\lambda x)^m}{x}
\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,b^2x^{2k}\cos(\lambda x)^m}{x} + \frac{a\cos(\lambda x)^m y^2}{x} + \frac{ky}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{a\,b^2x^{2k}\cos(\lambda x)^m}{x}$, $f_1(x) = \frac{k}{x}$ and $f_2(x) = \frac{a\cos(\lambda x)^m}{x}$. Let

$$\begin{aligned}
y &= \frac{-u'}{f_2 u}\\
&= \frac{-u'}{\frac{a\cos(\lambda x)^m u}{x}} \qquad (1)
\end{aligned}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{a \cos(\lambda x)^m m\lambda \sin(\lambda x)}{\cos(\lambda x) x} - \frac{a \cos(\lambda x)^m}{x^2} \\ f_1 f_2 &= \frac{ka \cos(\lambda x)^m}{x^2} \\ f_2^2 f_0 &= \frac{a^3 \cos(\lambda x)^{3m} b^2 x^{2k}}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a \cos(\lambda x)^m u''(x)}{x} - \left(-\frac{a \cos(\lambda x)^m m\lambda \sin(\lambda x)}{\cos(\lambda x) x} - \frac{a \cos(\lambda x)^m}{x^2} + \frac{ka \cos(\lambda x)^m}{x^2}\right) u'(x) + \frac{a^3 \cos(\lambda x)^{3m} b^2 x}{x^3}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 e^{iab\left(\int x^{k-1} \cos(\lambda x)^m dx\right)} + c_2 e^{-iab\left(\int x^{k-1} \cos(\lambda x)^m dx\right)}$$

The above shows that

$$u'(x) = iab\, x^{k-1} \cos(\lambda x)^m \left(c_1 e^{iab\left(\int x^{k-1} \cos(\lambda x)^m dx\right)} - c_2 e^{-iab\left(\int x^{k-1} \cos(\lambda x)^m dx\right)}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{ib\, x^{k-1} \left(c_1 e^{iab\left(\int x^{k-1} \cos(\lambda x)^m dx\right)} - c_2 e^{-iab\left(\int x^{k-1} \cos(\lambda x)^m dx\right)}\right) x}{c_1 e^{iab\left(\int x^{k-1} \cos(\lambda x)^m dx\right)} + c_2 e^{-iab\left(\int x^{k-1} \cos(\lambda x)^m dx\right)}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{ib\, x^{k} \left(c_3 e^{iab\left(\int x^{k-1} \cos(\lambda x)^m dx\right)} - e^{-iab\left(\int x^{k-1} \cos(\lambda x)^m dx\right)}\right)}{c_3 e^{iab\left(\int x^{k-1} \cos(\lambda x)^m dx\right)} + e^{-iab\left(\int x^{k-1} \cos(\lambda x)^m dx\right)}}$$

Summary

The solution(s) found are the following

$$y = -\frac{ib\,x^{k}\left(c_{3}\mathrm{e}^{iab\left(\int x^{k-1}\cos(\lambda x)^{m}dx\right)}-\mathrm{e}^{-iab\left(\int x^{k-1}\cos(\lambda x)^{m}dx\right)}\right)}{c_{3}\mathrm{e}^{iab\left(\int x^{k-1}\cos(\lambda x)^{m}dx\right)}+\mathrm{e}^{-iab\left(\int x^{k-1}\cos(\lambda x)^{m}dx\right)}} \tag{1}$$

Verification of solutions

$$y = -\frac{ib\,x^{k}\left(c_{3}\mathrm{e}^{iab\left(\int x^{k-1}\cos(\lambda x)^{m}dx\right)}-\mathrm{e}^{-iab\left(\int x^{k-1}\cos(\lambda x)^{m}dx\right)}\right)}{c_{3}\mathrm{e}^{iab\left(\int x^{k-1}\cos(\lambda x)^{m}dx\right)}+\mathrm{e}^{-iab\left(\int x^{k-1}\cos(\lambda x)^{m}dx\right)}}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$\boxed{(\cos(\lambda x) a + b) y' - y^2 - c\cos(x\mu) y = -d^2 + cd\cos(x\mu)}$$

10.12.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{y^2 + c\cos(x\mu) y - d^2 + cd\cos(x\mu)}{\cos(\lambda x) a + b} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{cd\cos(x\mu)}{\cos(\lambda x) a + b} + \frac{c\cos(x\mu) y}{\cos(\lambda x) a + b} - \frac{d^2}{\cos(\lambda x) a + b} + \frac{y^2}{\cos(\lambda x) a + b}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{-d^2+cd\cos(x\mu)}{\cos(\lambda x)a+b}$, $f_1(x) = \frac{c\cos(x\mu)}{\cos(\lambda x)a+b}$ and $f_2(x) = \frac{1}{\cos(\lambda x)a+b}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{u}{\cos(\lambda x)a+b}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{a\lambda\sin(\lambda x)}{(\cos(\lambda x)\,a+b)^2} \\ f_1f_2 &= \frac{c\cos(x\mu)}{(\cos(\lambda x)\,a+b)^2} \\ f_2^2f_0 &= \frac{-d^2+cd\cos(x\mu)}{(\cos(\lambda x)\,a+b)^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{u''(x)}{\cos(\lambda x)\,a+b} - \left(\frac{a\lambda\sin(\lambda x)}{(\cos(\lambda x)\,a+b)^2} + \frac{c\cos(x\mu)}{(\cos(\lambda x)\,a+b)^2}\right)u'(x) + \frac{(-d^2+cd\cos(x\mu))\,u(x)}{(\cos(\lambda x)\,a+b)^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

Problem number: 26.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{(\cos(\lambda x)\, a+b)\left(y'-y^2\right)=a\,\lambda^2\cos(\lambda x)}$$

10.13.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\,y^2\cos(\lambda x)+a\,\lambda^2\cos(\lambda x)+y^2b}{\cos(\lambda x)\,a+b} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=\frac{a\,\lambda^2\cos(\lambda x)}{\cos(\lambda x)\,a+b}+\frac{a\,y^2\cos(\lambda x)}{\cos(\lambda x)\,a+b}+\frac{y^2b}{\cos(\lambda x)\,a+b}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=\frac{a\,\lambda^2\cos(\lambda x)}{\cos(\lambda x)a+b}$, $f_1(x)=0$ and $f_2(x)=1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2 f_0 &= \frac{a\,\lambda^2 \cos(\lambda x)}{\cos(\lambda x)\, a + b} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \frac{a\,\lambda^2 \cos(\lambda x)\, u(x)}{\cos(\lambda x)\, a + b} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = -2c_1 b\left(\cos\left(\frac{\lambda x}{2}\right)^2 a - \frac{a}{2} + \frac{b}{2}\right) \operatorname{arctanh}\left(\frac{\tan\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right) \\ + \sin\left(\frac{\lambda x}{2}\right) \cos\left(\frac{\lambda x}{2}\right) \sqrt{a^2-b^2}\, c_1 a + 2c_2\left(\cos\left(\frac{\lambda x}{2}\right)^2 a - \frac{a}{2} + \frac{b}{2}\right) \end{aligned}$$

The above shows that

$$u'(x) = \frac{\left(2\sqrt{a^2-b^2}\, \operatorname{arctanh}\left(\frac{\tan\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right) c_1 ab \cos\left(\frac{\lambda x}{2}\right) \sin\left(\frac{\lambda x}{2}\right) - 2\sqrt{a^2-b^2}\, c_2 a \cos\left(\frac{\lambda x}{2}\right) \sin\left(\frac{\lambda x}{2}\right) + c_1(a-b)\right.}{\sqrt{a^2-b^2}}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(2\sqrt{a^2-b^2}\, \operatorname{arctanh}\left(\frac{\tan\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right) c_1 ab \cos\left(\frac{\lambda x}{2}\right) \sin\left(\frac{\lambda x}{2}\right) - 2\sqrt{a^2-b^2}\, c_2 a \cos\left(\frac{\lambda x}{2}\right) \sin\left(\frac{\lambda x}{2}\right) + c_1(a-\right.}{\sqrt{a^2-b^2}\, \left(-2c_1 b\left(\cos\left(\frac{\lambda x}{2}\right)^2 a - \frac{a}{2} + \frac{b}{2}\right) \operatorname{arctanh}\left(\frac{\tan\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right) + \sin\left(\frac{\lambda x}{2}\right) \cos\left(\frac{\lambda x}{2}\right) \sqrt{a^2-b^2}\, c_1 a\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\lambda\Bigg(2\sqrt{a^2-b^2}\,\operatorname{arctanh}\left(\frac{\tan\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right)c_3 ab\cos\left(\frac{\lambda x}{2}\right)\sin\left(\frac{\lambda x}{2}\right)-2\sqrt{a^2-b^2}\,\sin\left(\frac{\lambda x}{2}\right)\cos\left(\frac{\lambda x}{2}\right)a+c_3(a-b)}{\sqrt{a^2-b^2}\,\Bigg(2c_3 b\left(\cos\left(\frac{\lambda x}{2}\right)^2 a-\frac{a}{2}+\frac{b}{2}\right)\operatorname{arctanh}\left(\frac{\tan\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right)-\sin\left(\frac{\lambda x}{2}\right)\cos\left(\frac{\lambda x}{2}\right)\sqrt{a^2-b^2}\,c_3 a -}$$

<u>Summary</u>

The solution(s) found are the following

$$y = \frac{\lambda\Bigg(2\sqrt{a^2-b^2}\,\operatorname{arctanh}\left(\frac{\tan\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right)c_3 ab\cos\left(\frac{\lambda x}{2}\right)\sin\left(\frac{\lambda x}{2}\right)-2\sqrt{a^2-b^2}\,\sin\left(\frac{\lambda x}{2}\right)\cos\left(\frac{\lambda x}{2}\right)a+c_3(a-b)}{\sqrt{a^2-b^2}\,\Bigg(2c_3 b\left(\cos\left(\frac{\lambda x}{2}\right)^2 a-\frac{a}{2}+\frac{b}{2}\right)\operatorname{arctanh}\left(\frac{\tan\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right)-\sin\left(\frac{\lambda x}{2}\right)\cos\left(\frac{\lambda x}{2}\right)\sqrt{a^2-b^2}\,c_3 a -} \tag{1}$$

<u>Verification of solutions</u>

$$y = \frac{\lambda\Bigg(2\sqrt{a^2-b^2}\,\operatorname{arctanh}\left(\frac{\tan\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right)c_3 ab\cos\left(\frac{\lambda x}{2}\right)\sin\left(\frac{\lambda x}{2}\right)-2\sqrt{a^2-b^2}\,\sin\left(\frac{\lambda x}{2}\right)\cos\left(\frac{\lambda x}{2}\right)a+c_3(a-b)}{\sqrt{a^2-b^2}\,\Bigg(2c_3 b\left(\cos\left(\frac{\lambda x}{2}\right)^2 a-\frac{a}{2}+\frac{b}{2}\right)\operatorname{arctanh}\left(\frac{\tan\left(\frac{\lambda x}{2}\right)(a-b)}{\sqrt{a^2-b^2}}\right)-\sin\left(\frac{\lambda x}{2}\right)\cos\left(\frac{\lambda x}{2}\right)\sqrt{a^2-b^2}\,c_3 a -}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = \lambda a + a(\lambda - a)\tan(\lambda x)^2}$$

11.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -a^2\tan(\lambda x)^2 + a\tan(\lambda x)^2\lambda + \lambda a + y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2\tan(\lambda x)^2 + a\tan(\lambda x)^2\lambda + \lambda a + y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2\tan(\lambda x)^2 + a\tan(\lambda x)^2\lambda + \lambda a$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= -a^2 \tan(\lambda x)^2 + a \tan(\lambda x)^2 \lambda + \lambda a \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-a^2 \tan(\lambda x)^2 + a \tan(\lambda x)^2 \lambda + \lambda a\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \sqrt{\cos(\lambda x)}\left(c_1 \operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) + c_2 \operatorname{LegendreQ}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right)\right)$$

The above shows that

$$u'(x) = \frac{\sin(\lambda x) \operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) c_1 a + \sin(\lambda x) \operatorname{LegendreQ}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) c_2 a - \lambda(c_1 \operatorname{Leg}}{\sqrt{\cos(\lambda x)}}$$

Using the above in (1) gives the solution

$$y = -\frac{\sin(\lambda x) \operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) c_1 a + \sin(\lambda x) \operatorname{LegendreQ}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) c_2 a - \lambda(c_1 \operatorname{L}}{\cos(\lambda x)\left(c_1 \operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) + c_2 \operatorname{Legend}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\sec(\lambda x)\left(\sin(\lambda x) \operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) c_3 a + \sin(\lambda x) \operatorname{LegendreQ}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) a \right.}{c_3 \operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) + \operatorname{Legendre}}$$

Summary

The solution(s) found are the following

$$y = -\frac{\sec(\lambda x)\left(\sin(\lambda x)\operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right)c_3 a + \sin(\lambda x)\operatorname{LegendreQ}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right)a -}{c_3\operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) + \operatorname{Legendre}} \tag{1}$$

Verification of solutions

$$y = -\frac{\sec(\lambda x)\left(\sin(\lambda x)\operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right)c_3 a + \sin(\lambda x)\operatorname{LegendreQ}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right)a -}{c_3\operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) + \operatorname{Legendre}}$$

Verified OK.

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = 3\lambda a + \lambda^2 + a(\lambda - a)\tan(\lambda x)^2}$$

11.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -a^2 \tan(\lambda x)^2 + a\tan(\lambda x)^2 \lambda + 3\lambda a + \lambda^2 + y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2 \tan(\lambda x)^2 + a\tan(\lambda x)^2 \lambda + 3\lambda a + \lambda^2 + y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2 \tan(\lambda x)^2 + a\tan(\lambda x)^2 \lambda + 3\lambda a + \lambda^2$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= -a^2 \tan(\lambda x)^2 + a \tan(\lambda x)^2 \lambda + 3\lambda a + \lambda^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-a^2 \tan(\lambda x)^2 + a \tan(\lambda x)^2 \lambda + 3\lambda a + \lambda^2\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \sqrt{\cos(\lambda x)} \left(c_1 \operatorname{LegendreP}\left(\frac{2a+\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) + c_2 \operatorname{LegendreQ}\left(\frac{2a+\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right)\right)$$

The above shows that

$$u'(x) = \frac{-2 \operatorname{LegendreP}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) c_1 \lambda - 2 \operatorname{LegendreQ}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) c_2 \lambda + \sin(\lambda x) (c_1 \operatorname{Legen}}{\sqrt{\cos(\lambda x)}}$$

Using the above in (1) gives the solution

$$y = -\frac{-2 \operatorname{LegendreP}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) c_1 \lambda - 2 \operatorname{LegendreQ}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) c_2 \lambda + \sin(\lambda x) (c_1 \operatorname{Leg}}{\cos(\lambda x) \left(c_1 \operatorname{LegendreP}\left(\frac{2a+\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) + c_2 \operatorname{Lege}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\sec(\lambda x) \left(-2 \operatorname{LegendreP}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) c_3 \lambda - 2 \operatorname{LegendreQ}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) \lambda + \sin(\lambda x)\right.}{c_3 \operatorname{LegendreP}\left(\frac{2a+\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) + \operatorname{Legend}}$$

Summary

The solution(s) found are the following

$$y = -\frac{\sec(\lambda x)\left(-2\,\mathrm{LegendreP}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right)c_3\lambda - 2\,\mathrm{LegendreQ}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right)\lambda + \sin(\lambda x)\right.}{c_3\,\mathrm{LegendreP}\left(\frac{2a+\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) + \mathrm{Legend}} \tag{1}$$

Verification of solutions

$$y = -\frac{\sec(\lambda x)\left(-2\,\mathrm{LegendreP}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right)c_3\lambda - 2\,\mathrm{LegendreQ}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right)\lambda + \sin(\lambda x)\right.}{c_3\,\mathrm{LegendreP}\left(\frac{2a+\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \sin(\lambda x)\right) + \mathrm{Legend}}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a y^2 - b \tan(x) y = c}$$

11.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= a y^2 + b \tan(x) y + c \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a y^2 + b \tan(x) y + c$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = c$, $f_1(x) = b \tan(x)$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$f_2' = 0$$
$$f_1f_2 = b\tan(x)\,a$$
$$f_2^2f_0 = a^2c$$

Substituting the above terms back in equation (2) gives

$$au''(x) - b\tan(x)\,au'(x) + a^2cu(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \cos(x)^{-\frac{b}{2}+\frac{1}{2}}\left(c_1 \operatorname{LegendreP}\left(\frac{\sqrt{4ca+b^2}}{2} - \frac{1}{2}, \frac{b}{2} - \frac{1}{2}, \sin(x)\right) + c_2 \operatorname{LegendreQ}\left(\frac{\sqrt{4ca+b^2}}{2} - \frac{1}{2}, \frac{b}{2} - \frac{1}{2}, \sin(x)\right)\right)$$

The above shows that

$$u'(x) = -\frac{\left(c_1\left(\cos(x)\sin(x)\sqrt{4ca+b^2} + \cos(x)\sin(x) - \tan(x)(\sin(x)-1)(\sin(x)+1)(b-1)\right) \operatorname{LegendreP}}{}$$

Using the above in (1) gives the solution

$$y = \frac{c_1\left(\cos(x)\sin(x)\sqrt{4ca+b^2} + \cos(x)\sin(x) - \tan(x)(\sin(x)-1)(\sin(x)+1)(b-1)\right) \operatorname{LegendreP}\left(\frac{\sqrt{4}}{}\right.}{}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-\left(c_3 \operatorname{LegendreP}\left(\frac{\sqrt{4ca+b^2}}{2} - \frac{1}{2}, \frac{b}{2} - \frac{1}{2}, \sin(x)\right) + \operatorname{LegendreQ}\left(\frac{\sqrt{4ca+b^2}}{2} - \frac{1}{2}, \frac{b}{2} - \frac{1}{2}, \sin(x)\right)\right) \left(\sqrt{4ca+b^2}\right.}{2\left(c_3 \operatorname{LegendreP}\left(\frac{\sqrt{4ca+b^2}}{2} - \frac{1}{2},\right.\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(-\left(c_3 \operatorname{LegendreP}\left(\frac{\sqrt{4ca+b^2}}{2} - \frac{1}{2}, \frac{b}{2} - \frac{1}{2}, \sin(x)\right) + \operatorname{LegendreQ}\left(\frac{\sqrt{4ca+b^2}}{2} - \frac{1}{2}, \frac{b}{2} - \frac{1}{2}, \sin(x)\right)\right) \left(\sqrt{4ca+b^2}\right.}{2\left(c_3 \operatorname{LegendreP}\left(\frac{\sqrt{4ca+b^2}}{2} - \frac{1}{2},\right.\right.} \tag{1}$$

Verification of solutions

$$y = \frac{\left(-\left(c_3 \operatorname{LegendreP}\left(\frac{\sqrt{4ca+b^2}}{2} - \frac{1}{2}, \frac{b}{2} - \frac{1}{2}, \sin(x)\right) + \operatorname{LegendreQ}\left(\frac{\sqrt{4ca+b^2}}{2} - \frac{1}{2}, \frac{b}{2} - \frac{1}{2}, \sin(x)\right)\right) \left(\sqrt{4ca+b^2}\right.}{2\left(c_3 \operatorname{LegendreP}\left(\frac{\sqrt{4ca+b^2}}{2} - \frac{1}{2},\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-3. Equations with tangent.
Problem number: 30.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[[_1st_order, `_with_symmetry_[F(x),G(x)]`], _Riccati]
```

$$\boxed{y' - ay^2 - 2ab\tan(x)\,y = b(ab-1)\tan(x)^2}$$

11.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \tan(x)^2 a\,b^2 + 2ab\tan(x)\,y - b\tan(x)^2 + a\,y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \tan(x)^2 a\,b^2 + 2ab\tan(x)\,y - b\tan(x)^2 + a\,y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \tan(x)^2 a\,b^2 - b\tan(x)^2$, $f_1(x) = 2b\tan(x)\,a$ and $f_2(x) = a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 2b \tan(x) a^2 \\ f_2^2 f_0 &= a^2 \left(\tan(x)^2 a b^2 - b \tan(x)^2\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$a u''(x) - 2b \tan(x) a^2 u'(x) + a^2 \left(\tan(x)^2 a b^2 - b \tan(x)^2\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \cos(x)^{-ab} \left(c_1 \sinh\left(\sqrt{-ab}\, x\right) + c_2 \cosh\left(\sqrt{-ab}\, x\right)\right)$$

The above shows that

$$\begin{aligned} u'(x) = \Big(&\left(a c_2 b \tan(x) + c_1 \sqrt{-ab}\right) \cosh\left(\sqrt{-ab}\, x\right) \\ &+ \sinh\left(\sqrt{-ab}\, x\right) \left(a b c_1 \tan(x) + c_2 \sqrt{-ab}\right)\Big) \cos(x)^{-ab} \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(a c_2 b \tan(x) + c_1 \sqrt{-ab}\right) \cosh\left(\sqrt{-ab}\, x\right) + \sinh\left(\sqrt{-ab}\, x\right) \left(a b c_1 \tan(x) + c_2 \sqrt{-ab}\right)}{a \left(c_1 \sinh\left(\sqrt{-ab}\, x\right) + c_2 \cosh\left(\sqrt{-ab}\, x\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-a b c_3 \tan(x) - \sqrt{-ab}\right) \sinh\left(\sqrt{-ab}\, x\right) - \left(b \tan(x) a + c_3 \sqrt{-ab}\right) \cosh\left(\sqrt{-ab}\, x\right)}{\left(c_3 \sinh\left(\sqrt{-ab}\, x\right) + \cosh\left(\sqrt{-ab}\, x\right)\right) a}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(-a b c_3 \tan(x) - \sqrt{-ab}\right) \sinh\left(\sqrt{-ab}\, x\right) - \left(b \tan(x) a + c_3 \sqrt{-ab}\right) \cosh\left(\sqrt{-ab}\, x\right)}{\left(c_3 \sinh\left(\sqrt{-ab}\, x\right) + \cosh\left(\sqrt{-ab}\, x\right)\right) a} \tag{1}$$

Verification of solutions

$$y = \frac{\left(-abc_3 \tan \left(x\right)-\sqrt{-ab}\right) \sinh \left(\sqrt{-ab}\, x\right)-\left(b \tan \left(x\right) a+c_3 \sqrt{-ab}\right) \cosh \left(\sqrt{-ab}\, x\right)}{\left(c_3 \sinh \left(\sqrt{-ab}\, x\right)+\cosh \left(\sqrt{-ab}\, x\right)\right) a}$$

Verified OK.

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - a\tan(\beta x)\, y = ab\tan(\beta x) - b^2}$$

11.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + a\tan(\beta x)\, y + ab\tan(\beta x) - b^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\tan(\beta x)\, y + ab\tan(\beta x) - b^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = ab\tan(\beta x) - b^2$, $f_1(x) = \tan(\beta x)\, a$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= \tan(\beta x)\,a \\ f_2^2 f_0 &= ab\tan(\beta x) - b^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \tan(\beta x)\,au'(x) + \left(ab\tan(\beta x) - b^2\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = {} & c_1(\tan(\beta x)+i)^{\frac{ib}{2\beta}}(\tan(\beta x)-i)^{-\frac{ib}{2\beta}} \\ & + c_2(\tan(\beta x)+i)^{\frac{-ib+a}{2\beta}}\operatorname{hypergeom}\left(\left[1,\frac{a}{\beta}\right],\left[\frac{-2ib+a+2\beta}{2\beta}\right],\frac{1}{2} \right. \\ & \left. - \frac{i\tan(\beta x)}{2}\right)(\tan(\beta x)-i)^{\frac{ib+a}{2\beta}} \end{aligned}$$

The above shows that

$$\begin{aligned} & u'(x) \\ & = \left(\frac{c_1b(\tan(\beta x)-i)^{-\frac{ib}{2\beta}}(\tan(\beta x)+i)^{\frac{ib}{2\beta}}}{2-2i\tan(\beta x)} - \frac{i(\tan(\beta x)-i)^{-\frac{ib+2\beta}{2\beta}}c_1b(\tan(\beta x)+i)^{\frac{ib}{2\beta}}}{2}\right. \\ & + \frac{(-ib+a)\,c_2(\tan(\beta x)-i)^{\frac{ib+a}{2\beta}}(\tan(\beta x)+i)^{\frac{-ib+a-2\beta}{2\beta}}\operatorname{hypergeom}\left(\left[1,\frac{a}{\beta}\right],\left[\frac{-2ib+a+2\beta}{2\beta}\right],\frac{1}{2}-\frac{i\tan(\beta x)}{2}\right)}{2} \\ & + \frac{c_2(\tan(\beta x)+i)^{\frac{-ib+a}{2\beta}}a\operatorname{hypergeom}\left(\left[2,\frac{a+\beta}{\beta}\right],\left[\frac{-2ib+a+4\beta}{2\beta}\right],\frac{1}{2}-\frac{i\tan(\beta x)}{2}\right)\beta(\tan(\beta x)-i)^{\frac{ib+a}{2\beta}}}{ia+2i\beta+2b} \\ & \left. + \frac{(\tan(\beta x)-i)^{\frac{ib+a-2\beta}{2\beta}}c_2(\tan(\beta x)+i)^{\frac{-ib+a}{2\beta}}\operatorname{hypergeom}\left(\left[1,\frac{a}{\beta}\right],\left[\frac{-2ib+a+2\beta}{2\beta}\right],\frac{1}{2}-\frac{i\tan(\beta x)}{2}\right)(ib+a)}{2}\right)(\\ & + \tan(\beta x)^2) \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{c_1 b(\tan(\beta x)-i)^{-\frac{ib}{2\beta}}(\tan(\beta x)+i)^{\frac{ib}{2\beta}}}{2-2i\tan(\beta x)} - \frac{i(\tan(\beta x)-i)^{-\frac{ib+2\beta}{2\beta}} c_1 b(\tan(\beta x)+i)^{\frac{ib}{2\beta}}}{2} + \frac{(-ib+a)c_2(\tan(\beta x)-i)^{\frac{ib+a}{2\beta}}(\tan(\beta x)+i)^{\frac{-ib+a-2\beta}{2\beta}}}{2}}{c_1 (\tan(\beta x)+i}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{(1+\tan(\beta x)^2)\left(2\beta(\tan(\beta x)-i)^{\frac{ib+a}{2\beta}} a(\tan(\beta x)+i)^{\frac{-ib+a}{2\beta}} \operatorname{hypergeom}\left(\left[2, \frac{a+\beta}{\beta}\right], \left[\frac{-2ib+a+4\beta}{2\beta}\right], \frac{1}{2} - \frac{i\tan(}{2}\right.\right.}{}$$

Summary

The solution(s) found are the following

$$y = \frac{(1+\tan(\beta x)^2)\left(2\beta(\tan(\beta x)-i)^{\frac{ib+a}{2\beta}} a(\tan(\beta x)+i)^{\frac{-ib+a}{2\beta}} \operatorname{hypergeom}\left(\left[2, \frac{a+\beta}{\beta}\right], \left[\frac{-2ib+a+4\beta}{2\beta}\right], \frac{1}{2} - \frac{i\tan(}{2}\right.\right.}{} \tag{1}$$

Verification of solutions

$$y = \frac{(1+\tan(\beta x)^2)\left(2\beta(\tan(\beta x)-i)^{\frac{ib+a}{2\beta}} a(\tan(\beta x)+i)^{\frac{-ib+a}{2\beta}} \operatorname{hypergeom}\left(\left[2, \frac{a+\beta}{\beta}\right], \left[\frac{-2ib+a+4\beta}{2\beta}\right], \frac{1}{2} - \frac{i\tan(}{2}\right.\right.}{}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - ax\tan(bx)^m y = a\tan(bx)^m}$$

11.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + ax\tan(bx)^m y + a\tan(bx)^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + ax\tan(bx)^m y + a\tan(bx)^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\tan(bx)^m$, $f_1(x) = \tan(bx)^m ax$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \qquad (1) \end{aligned}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \tan(bx)^m\, ax \\ f_2^2 f_0 &= a\tan(bx)^m \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \tan(bx)^m\, ax u'(x) + a\tan(bx)^m\, u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = -\frac{x\left(c_2\left(\int \frac{\mathrm{e}^{\int (\tan(bx)^m ax - \cot(bx)b)dx}\sin(bx)}{x^2}dx\right) - c_1 b\right)}{b}$$

The above shows that

$$u'(x) = \frac{-c_2 \mathrm{e}^{\int (\tan(bx)^m ax - \cot(bx)b)dx}\sin(bx) - \left(\int \frac{\mathrm{e}^{\int (\tan(bx)^m ax - \cot(bx)b)dx}\sin(bx)}{x^2}dx\right) c_2 x + c_1 bx}{bx}$$

Using the above in (1) gives the solution

$$y = \frac{-c_2 \mathrm{e}^{\int (\tan(bx)^m ax - \cot(bx)b)dx}\sin(bx) - \left(\int \frac{\mathrm{e}^{\int (\tan(bx)^m ax - \cot(bx)b)dx}\sin(bx)}{x^2}dx\right) c_2 x + c_1 bx}{x^2\left(c_2\left(\int \frac{\mathrm{e}^{\int (\tan(bx)^m ax - \cot(bx)b)dx}\sin(bx)}{x^2}dx\right) - c_1 b\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\mathrm{e}^{\int (\tan(bx)^m ax - \cot(bx)b)dx}\sin(bx) - \left(\int \frac{\mathrm{e}^{\int (\tan(bx)^m ax - \cot(bx)b)dx}\sin(bx)}{x^2}dx\right) x + c_3 bx}{x^2\left(\int \frac{\mathrm{e}^{\int (\tan(bx)^m ax - \cot(bx)b)dx}\sin(bx)}{x^2}dx - bc_3\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{-\mathrm{e}^{\int (\tan(bx)^m ax-\cot(bx)b)dx} \sin(bx) - \left(\int \frac{\mathrm{e}^{\int (\tan(bx)^m ax-\cot(bx)b)dx} \sin(bx)}{x^2}dx\right) x + c_3 bx}{x^2 \left(\int \frac{\mathrm{e}^{\int (\tan(bx)^m ax-\cot(bx)b)dx} \sin(bx)}{x^2}dx - bc_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-\mathrm{e}^{\int (\tan(bx)^m ax-\cot(bx)b)dx} \sin(bx) - \left(\int \frac{\mathrm{e}^{\int (\tan(bx)^m ax-\cot(bx)b)dx} \sin(bx)}{x^2}dx\right) x + c_3 bx}{x^2 \left(\int \frac{\mathrm{e}^{\int (\tan(bx)^m ax-\cot(bx)b)dx} \sin(bx)}{x^2}dx - bc_3\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + (k+1)\, x^k y^2 - a\, x^{k+1} \tan(x)^m\, y = -a \tan(x)^m}$$

11.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\, x^{k+1} \tan(x)^m\, y - x^k y^2 k - x^k y^2 - a \tan(x)^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\, x^k x \tan(x)^m\, y - x^k y^2 k - x^k y^2 - a \tan(x)^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a \tan(x)^m$, $f_1(x) = x^{k+1} \tan(x)^m\, a$ and $f_2(x) = -x^k k - x^k$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{(-x^k k - x^k)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{k^2x^k}{x} - \frac{k\,x^k}{x} \\ f_1f_2 &= x^{k+1}\tan(x)^m\,a\left(-x^kk - x^k\right) \\ f_2^2f_0 &= -\left(-x^kk - x^k\right)^2 a\tan(x)^m \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\left(-x^kk - x^k\right)u''(x) - \left(-\frac{k^2x^k}{x} - \frac{k\,x^k}{x} + x^{k+1}\tan(x)^m\,a\left(-x^kk - x^k\right)\right)u'(x) - \left(-x^kk - x^k\right)^2 a\tan(x)^m u$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{k+1}\left(c_1 + c_2\left(\int x^{-2k-2}\mathrm{e}^{\int\left(x^{k+1}\tan(x)^m a+\frac{k}{x}\right)dx}dx\right)\right)$$

The above shows that

$$\begin{aligned} u'(x) = x^k\Bigg(& c_2x^{-2k-1}\mathrm{e}^{\int\left(x^{k+1}\tan(x)^m a+\frac{k}{x}\right)dx} \\ &+ \left(c_1 + c_2\left(\int x^{-2k-2}\mathrm{e}^{\int\left(x^{k+1}\tan(x)^m a+\frac{k}{x}\right)dx}dx\right)\right)(k+1)\Bigg) \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{x^k\left(c_2x^{-2k-1}\mathrm{e}^{\int\left(x^{k+1}\tan(x)^m a+\frac{k}{x}\right)dx} + \left(c_1 + c_2\left(\int x^{-2k-2}\mathrm{e}^{\int\left(x^{k+1}\tan(x)^m a+\frac{k}{x}\right)dx}dx\right)\right)(k+1)\right)x^{-k-1}}{\left(-x^kk - x^k\right)\left(c_1 + c_2\left(\int x^{-2k-2}\mathrm{e}^{\int\left(x^{k+1}\tan(x)^m a+\frac{k}{x}\right)dx}dx\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{x^{-k-1}\left(x^{-2k-1}\mathrm{e}^{\int\left(x^{k+1}\tan(x)^m a+\frac{k}{x}\right)dx} + \left(c_3 + \int x^{-2k-2}\mathrm{e}^{\int\left(x^{k+1}\tan(x)^m a+\frac{k}{x}\right)dx}dx\right)(k+1)\right)}{(k+1)\left(c_3 + \int \mathrm{e}^{\int\frac{a\,x^{k+2}\tan(x)^m+k}{x}dx}x^{-2k-2}dx\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{x^{-k-1}\left(x^{-2k-1}\mathrm{e}^{\int \left(x^{k+1}\tan(x)^{m} a+\frac{k}{x}\right)dx}+\left(c_3+\int x^{-2k-2}\mathrm{e}^{\int \left(x^{k+1}\tan(x)^{m} a+\frac{k}{x}\right)dx}dx\right)(k+1)\right)}{(k+1)\left(c_3+\int \mathrm{e}^{\int \frac{a\,x^{k+2}\tan(x)^{m}+k}{x}dx}x^{-2k-2}dx\right)} \tag{1}$$

Verification of solutions

$$y = \frac{x^{-k-1}\left(x^{-2k-1}\mathrm{e}^{\int \left(x^{k+1}\tan(x)^{m} a+\frac{k}{x}\right)dx}+\left(c_3+\int x^{-2k-2}\mathrm{e}^{\int \left(x^{k+1}\tan(x)^{m} a+\frac{k}{x}\right)dx}dx\right)(k+1)\right)}{(k+1)\left(c_3+\int \mathrm{e}^{\int \frac{a\,x^{k+2}\tan(x)^{m}+k}{x}dx}x^{-2k-2}dx\right)}$$

Verified OK.

11.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\tan(\lambda x)^n y^2 - a\,b^2\tan(\lambda x)^{2+n} + b\lambda\tan(\lambda x)^2 + b\lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\tan(\lambda x)^n y^2 - a\,b^2\tan(\lambda x)^2\tan(\lambda x)^n + b\lambda\tan(\lambda x)^2 + b\lambda$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a\,b^2\tan(\lambda x)^{2+n} + b\lambda\tan(\lambda x)^2 + b\lambda$, $f_1(x) = 0$ and $f_2(x) = \tan(\lambda x)^n a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\tan(\lambda x)^n au} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{\tan(\lambda x)^n\, n\lambda(1+\tan(\lambda x)^2)\, a}{\tan(\lambda x)} \\
f_1 f_2 &= 0 \\
f_2^2 f_0 &= \tan(\lambda x)^{2n}\, a^2(-a\, b^2 \tan(\lambda x)^{2+n} + b\lambda \tan(\lambda x)^2 + b\lambda)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\tan(\lambda x)^n\, a u''(x) - \frac{\tan(\lambda x)^n\, n\lambda(1+\tan(\lambda x)^2)\, a u'(x)}{\tan(\lambda x)} + \tan(\lambda x)^{2n}\, a^2(-a\, b^2 \tan(\lambda x)^{2+n} + b\lambda \tan(\lambda x)^2 \cdots$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{a\left(\int \frac{\left(-a\left(\int \tan(\lambda x)^{n+1} \mathrm{e}^{\int \cot(\lambda x)\left(2\tan(\lambda x)^{2+n} ab - \lambda \tan(\lambda x)^2 - \lambda\right) dx} dx\right) b + c_1 b + \mathrm{e}^{\int \cot(\lambda x)\left(2\tan(\lambda x)^{2+n} ab - \lambda\tan(\lambda x)^2 - \lambda\right) dx}\right) \tan(\lambda x)^{n+1}}{a\left(\int \tan(\lambda x)^{n+1} \mathrm{e}^{\int \cot(\lambda x)\left(2\tan(\lambda x)^{2+n} ab - \lambda\tan(\lambda x)^2 - \lambda\right) dx} dx\right) - c_1} dx\right)} c_2$$

The above shows that

$$u'(x) = \frac{\tan(\lambda x)^{n+1}\left(-a\left(\int \tan(\lambda x)^{n+1}\, \mathrm{e}^{\int \left(2ab\tan(\lambda x)^{n+1} - \sec(\lambda x)\csc(\lambda x)\lambda\right) dx} dx\right) b + c_1 b + \mathrm{e}^{\int \left(2ab\tan(\lambda x)^{n+1} - \sec(\lambda x)\csc(\cdots\right.} \cdots}{a\left(\int \tan(\lambda x)^{n+1}\, \mathrm{e}^{\int \cot(\lambda x)\left(2\tan \cdots\right.} \cdots\right.}$$

Using the above in (1) gives the solution

$$y = -\frac{\tan(\lambda x)^{n+1}\left(-a\left(\int \tan(\lambda x)^{n+1}\, \mathrm{e}^{\int \left(2ab\tan(\lambda x)^{n+1} - \sec(\lambda x)\csc(\lambda x)\lambda\right) dx} dx\right) b + c_1 b + \mathrm{e}^{\int \left(2ab\tan(\lambda x)^{n+1} - \sec(\lambda x)\, \mathrm{c}\cdots\right.} \cdots}{\cdots}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\tan(\lambda x)\left(a\left(\int \tan(\lambda x)^{n+1} \mathrm{e}^{\int \left(2ab\tan(\lambda x)^{n+1}-\sec(\lambda x)\csc(\lambda x)\lambda\right)dx}dx\right)b - bc_3 - \mathrm{e}^{\int \left(2ab\tan(\lambda x)^{n+1}-\sec(\lambda x)\csc(\lambda x)\lambda\right)d}}{a\left(\int \tan(\lambda x)^{n+1} \mathrm{e}^{\int \cot(\lambda x)\left(2\tan(\lambda x)^{2+n}ab-\lambda\tan(\lambda x)^2-\lambda\right)dx}dx\right) - c_3}$$

Summary

The solution(s) found are the following

$$y = \frac{\tan(\lambda x)\left(a\left(\int \tan(\lambda x)^{n+1} \mathrm{e}^{\int \left(2ab\tan(\lambda x)^{n+1}-\sec(\lambda x)\csc(\lambda x)\lambda\right)dx}dx\right)b - bc_3 - \mathrm{e}^{\int \left(2ab\tan(\lambda x)^{n+1}-\sec(\lambda x)\csc(\lambda x)\lambda\right)d}}{a\left(\int \tan(\lambda x)^{n+1} \mathrm{e}^{\int \cot(\lambda x)\left(2\tan(\lambda x)^{2+n}ab-\lambda\tan(\lambda x)^2-\lambda\right)dx}dx\right) - c_3} \tag{1}$$

Verification of solutions

$$y = \frac{\tan(\lambda x)\left(a\left(\int \tan(\lambda x)^{n+1} \mathrm{e}^{\int \left(2ab\tan(\lambda x)^{n+1}-\sec(\lambda x)\csc(\lambda x)\lambda\right)dx}dx\right)b - bc_3 - \mathrm{e}^{\int \left(2ab\tan(\lambda x)^{n+1}-\sec(\lambda x)\csc(\lambda x)\lambda\right)d}}{a\left(\int \tan(\lambda x)^{n+1} \mathrm{e}^{\int \cot(\lambda x)\left(2\tan(\lambda x)^{2+n}ab-\lambda\tan(\lambda x)^2-\lambda\right)dx}dx\right) - c_3}$$

Verified OK.

Maple gives the following as the ode type

```
[[_1st_order, `_with_symmetry_[F(x),G(x)]`], _Riccati]
```

Unable to solve or complete the solution.

$$\boxed{y' - a\tan(\lambda x+\mu)^k (y - b\,x^n - c)^2 = b\,x^{n-1}n}$$

11.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= x^{2n}\tan(\lambda x+\mu)^k a\,b^2 + 2x^n\tan(\lambda x+\mu)^k abc - 2x^n\tan(\lambda x+\mu)^k aby + \tan(\lambda x+\mu)^k a\,c^2 - 2\tan(\lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^{2n}\left(\frac{\tan(\mu)}{1-\tan(\mu)\tan(\lambda x)} + \frac{\tan(\lambda x)}{1-\tan(\mu)\tan(\lambda x)}\right)^k a\,b^2 + 2x^n\left(\frac{\tan(\mu)}{1-\tan(\mu)\tan(\lambda x)} + \frac{\tan(\lambda x)}{1-\tan(\mu)\tan}\right.$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = x^{2n}\tan(\lambda x+\mu)^k a\,b^2 + 2x^n\tan(\lambda x+\mu)^k abc + \tan(\lambda x+\mu)^k a\,c^2 + b\,x^{n-1}n$, $f_1(x) = -2\tan(\lambda x+\mu)^k a\,x^n b - 2\tan(\lambda x+\mu)^k ac$ and $f_2(x) = \tan(\lambda x+\mu)^k a$.

Let

$$y = \frac{-u'}{f_2 u} = \frac{-u'}{\tan(\lambda x+\mu)^k a u} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$f_2' = \frac{\tan(\lambda x+\mu)^k k\lambda\left(1+\tan(\lambda x+\mu)^2\right) a}{\tan(\lambda x+\mu)}$$

$$f_1 f_2 = \left(-2\tan(\lambda x+\mu)^k a\, x^n b - 2\tan(\lambda x+\mu)^k ac\right)\tan(\lambda x+\mu)^k a$$

$$f_2^2 f_0 = \tan(\lambda x+\mu)^{2k} a^2 \left(x^{2n}\tan(\lambda x+\mu)^k a\, b^2 + 2x^n \tan(\lambda x+\mu)^k abc + \tan(\lambda x+\mu)^k a\, c^2 + b\, x^{n-1} n\right)$$

Substituting the above terms back in equation (2) gives

$$\tan(\lambda x+\mu)^k a u''(x) - \left(\frac{\tan(\lambda x+\mu)^k k\lambda\left(1+\tan(\lambda x+\mu)^2\right) a}{\tan(\lambda x+\mu)} + \left(-2\tan(\lambda x+\mu)^k a\, x^n b - 2\tan(\lambda x+\right.\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - a\tan(\lambda x)^m y^2 - ky = a\,b^2x^{2k}\tan(\lambda x)^m}$$

11.10.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\tan(\lambda x)^m y^2 + ky + a\,b^2x^{2k}\tan(\lambda x)^m}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,b^2x^{2k}\tan(\lambda x)^m}{x} + \frac{a\tan(\lambda x)^m y^2}{x} + \frac{ky}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{a\,b^2x^{2k}\tan(\lambda x)^m}{x}$, $f_1(x) = \frac{k}{x}$ and $f_2(x) = \frac{a\tan(\lambda x)^m}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{a\tan(\lambda x)^m u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{a \tan(\lambda x)^m m\lambda(1+\tan(\lambda x)^2)}{\tan(\lambda x) x} - \frac{a \tan(\lambda x)^m}{x^2} \\ f_1 f_2 &= \frac{ka \tan(\lambda x)^m}{x^2} \\ f_2^2 f_0 &= \frac{a^3 \tan(\lambda x)^{3m} b^2 x^{2k}}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a \tan(\lambda x)^m u''(x)}{x} - \left(\frac{a \tan(\lambda x)^m m\lambda(1+\tan(\lambda x)^2)}{\tan(\lambda x) x} - \frac{a \tan(\lambda x)^m}{x^2} + \frac{ka \tan(\lambda x)^m}{x^2}\right) u'(x) + \frac{a^3 \tan(\lambda x$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 e^{iab\left(\int x^{k-1} \tan(\lambda x)^m dx\right)} + c_2 e^{-iab\left(\int x^{k-1} \tan(\lambda x)^m dx\right)}$$

The above shows that

$$u'(x) = iab\, x^{k-1} \tan(\lambda x)^m \left(c_1 e^{iab\left(\int x^{k-1} \tan(\lambda x)^m dx\right)} - c_2 e^{-iab\left(\int x^{k-1} \tan(\lambda x)^m dx\right)}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{ib\, x^{k-1} \left(c_1 e^{iab\left(\int x^{k-1} \tan(\lambda x)^m dx\right)} - c_2 e^{-iab\left(\int x^{k-1} \tan(\lambda x)^m dx\right)}\right) x}{c_1 e^{iab\left(\int x^{k-1} \tan(\lambda x)^m dx\right)} + c_2 e^{-iab\left(\int x^{k-1} \tan(\lambda x)^m dx\right)}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{ib\, x^{k} \left(c_3 e^{iab\left(\int x^{k-1} \tan(\lambda x)^m dx\right)} - e^{-iab\left(\int x^{k-1} \tan(\lambda x)^m dx\right)}\right)}{c_3 e^{iab\left(\int x^{k-1} \tan(\lambda x)^m dx\right)} + e^{-iab\left(\int x^{k-1} \tan(\lambda x)^m dx\right)}}$$

Summary
The solution(s) found are the following

$$y = -\frac{ib\,x^k\left(c_3 \mathrm{e}^{iab\left(\int x^{k-1}\tan(\lambda x)^m dx\right)} - \mathrm{e}^{-iab\left(\int x^{k-1}\tan(\lambda x)^m dx\right)}\right)}{c_3 \mathrm{e}^{iab\left(\int x^{k-1}\tan(\lambda x)^m dx\right)} + \mathrm{e}^{-iab\left(\int x^{k-1}\tan(\lambda x)^m dx\right)}} \tag{1}$$

Verification of solutions

$$y = -\frac{ib\,x^k\left(c_3 \mathrm{e}^{iab\left(\int x^{k-1}\tan(\lambda x)^m dx\right)} - \mathrm{e}^{-iab\left(\int x^{k-1}\tan(\lambda x)^m dx\right)}\right)}{c_3 \mathrm{e}^{iab\left(\int x^{k-1}\tan(\lambda x)^m dx\right)} + \mathrm{e}^{-iab\left(\int x^{k-1}\tan(\lambda x)^m dx\right)}}$$

Verified OK.

ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$\boxed{(a\tan(\lambda x)+b)\,y'-y^2-k\tan(x\mu)\,y=-d^2+kd\tan(x\mu)}$$

11.11.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y' &= F(x,y)\\ &= \frac{y^2+k\tan(x\mu)\,y-d^2+kd\tan(x\mu)}{a\tan(\lambda x)+b}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=\frac{kd\tan(x\mu)}{a\tan(\lambda x)+b}+\frac{k\tan(x\mu)\,y}{a\tan(\lambda x)+b}-\frac{d^2}{a\tan(\lambda x)+b}+\frac{y^2}{a\tan(\lambda x)+b}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x) = \frac{-d^2+kd\tan(x\mu)}{a\tan(\lambda x)+b}$, $f_1(x) = \frac{k\tan(x\mu)}{a\tan(\lambda x)+b}$ and $f_2(x) = \frac{1}{a\tan(\lambda x)+b}$. Let

$$
\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{\frac{u}{a\tan(\lambda x)+b}}
\end{aligned}
\tag{1}
$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$
f_2 u''(x) - \left(f_2' + f_1 f_2\right) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}
$$

But

$$
\begin{aligned}
f_2' &= -\frac{a\lambda\left(1+\tan\left(\lambda x\right)^2\right)}{\left(a\tan\left(\lambda x\right)+b\right)^2} \\
f_1 f_2 &= \frac{k\tan\left(x\mu\right)}{\left(a\tan\left(\lambda x\right)+b\right)^2} \\
f_2^2 f_0 &= \frac{-d^2+kd\tan\left(x\mu\right)}{\left(a\tan\left(\lambda x\right)+b\right)^3}
\end{aligned}
$$

Substituting the above terms back in equation (2) gives

$$
\frac{u''(x)}{a\tan\left(\lambda x\right)+b} - \left(-\frac{a\lambda\left(1+\tan\left(\lambda x\right)^2\right)}{\left(a\tan\left(\lambda x\right)+b\right)^2} + \frac{k\tan\left(x\mu\right)}{\left(a\tan\left(\lambda x\right)+b\right)^2}\right) u'(x) + \frac{\left(-d^2+kd\tan\left(x\mu\right)\right) u(x)}{\left(a\tan\left(\lambda x\right)+b\right)^3} = 0
$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

Problem number: 38.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = \lambda a + a(\lambda - a)\cot(\lambda x)^2}$$

12.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -a^2\cot(\lambda x)^2 + a\cot(\lambda x)^2\lambda + \lambda a + y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2\cot(\lambda x)^2 + a\cot(\lambda x)^2\lambda + \lambda a + y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2\cot(\lambda x)^2 + a\cot(\lambda x)^2\lambda + \lambda a$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2 f_0 &= -a^2\cot(\lambda x)^2 + a\cot(\lambda x)^2\lambda + \lambda a \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-a^2\cot(\lambda x)^2 + a\cot(\lambda x)^2\lambda + \lambda a\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \sqrt{\sin(\lambda x)}\left(c_1 \operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) + c_2 \operatorname{LegendreQ}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right)\right)$$

The above shows that

$$u'(x) = -\frac{\cos(\lambda x)\operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right)c_1 a + \cos(\lambda x)\operatorname{LegendreQ}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right)c_2 a - \lambda(c_1}{\sqrt{\sin(\lambda x)}}$$

Using the above in (1) gives the solution

$$y = \frac{\cos(\lambda x)\operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right)c_1 a + \cos(\lambda x)\operatorname{LegendreQ}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right)c_2 a - \lambda(c_1 \mathrm{Le}}{\sin(\lambda x)\left(c_1\operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) + c_2\,\mathrm{Legendre}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\cos(\lambda x)\operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right)c_3 a + \cos(\lambda x)\operatorname{LegendreQ}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right)a - \lambda(c_3 \mathrm{Leg}\right.}{c_3\operatorname{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) + \mathrm{LegendreQ}}$$

Summary
The solution(s) found are the following

$$y = \frac{\left(\cos\left(\lambda x\right) \mathrm{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos\left(\lambda x\right)\right) c_3 a + \cos\left(\lambda x\right) \mathrm{LegendreQ}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos\left(\lambda x\right)\right) a - \lambda\left(c_3 \mathrm{Leg}\right.\right.}{c_3 \mathrm{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos\left(\lambda x\right)\right) + \mathrm{LegendreQ}} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\cos\left(\lambda x\right) \mathrm{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos\left(\lambda x\right)\right) c_3 a + \cos\left(\lambda x\right) \mathrm{LegendreQ}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos\left(\lambda x\right)\right) a - \lambda\left(c_3 \mathrm{Leg}\right.\right.}{c_3 \mathrm{LegendreP}\left(\frac{2a-\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos\left(\lambda x\right)\right) + \mathrm{LegendreQ}}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 = 3\lambda a + \lambda^2 + a(\lambda - a)\cot(\lambda x)^2}$$

12.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= -a^2\cot(\lambda x)^2 + a\cot(\lambda x)^2\lambda + 3\lambda a + \lambda^2 + y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2\cot(\lambda x)^2 + a\cot(\lambda x)^2\lambda + 3\lambda a + \lambda^2 + y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2\cot(\lambda x)^2 + a\cot(\lambda x)^2\lambda + 3\lambda a + \lambda^2$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= -a^2 \cot(\lambda x)^2 + a \cot(\lambda x)^2 \lambda + 3\lambda a + \lambda^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-a^2 \cot(\lambda x)^2 + a \cot(\lambda x)^2 \lambda + 3\lambda a + \lambda^2\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \sqrt{\sin(\lambda x)}\left(c_1 \operatorname{LegendreP}\left(\frac{2a+\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) + c_2 \operatorname{LegendreQ}\left(\frac{2a+\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right)\right)$$

The above shows that

$$u'(x) = -\frac{-2 \operatorname{LegendreP}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) c_1 \lambda - 2 \operatorname{LegendreQ}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) c_2 \lambda + \cos(\lambda x) (c_1 \operatorname{Leg}}{\sqrt{\sin(\lambda x)}}$$

Using the above in (1) gives the solution

$$y = \frac{-2 \operatorname{LegendreP}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) c_1 \lambda - 2 \operatorname{LegendreQ}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) c_2 \lambda + \cos(\lambda x) (c_1 \operatorname{Legen}}{\sin(\lambda x) \left(c_1 \operatorname{LegendreP}\left(\frac{2a+\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) + c_2 \operatorname{Legend}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\csc(\lambda x) \left(-2 \operatorname{LegendreP}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) c_3 \lambda - 2 \operatorname{LegendreQ}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) \lambda + \cos(\lambda x) (\right.}{c_3 \operatorname{LegendreP}\left(\frac{2a+\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) + \operatorname{Legendre}}$$

Summary
The solution(s) found are the following

$$y = \frac{\csc(\lambda x)\left(-2\,\mathrm{LegendreP}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right)c_3\lambda - 2\,\mathrm{LegendreQ}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right)\lambda + \cos(\lambda x)\left(\right.\right.}{c_3\,\mathrm{LegendreP}\left(\frac{2a+\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) + \mathrm{Legendre}} \tag{1}$$

Verification of solutions

$$y = \frac{\csc(\lambda x)\left(-2\,\mathrm{LegendreP}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right)c_3\lambda - 2\,\mathrm{LegendreQ}\left(\frac{2a+3\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right)\lambda + \cos(\lambda x)\left(\right.\right.}{c_3\,\mathrm{LegendreP}\left(\frac{2a+\lambda}{2\lambda}, \frac{2a-\lambda}{2\lambda}, \cos(\lambda x)\right) + \mathrm{Legendre}}$$

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 + 2ab\cot(xa)\,y = -a^2 + b^2}$$

12.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 - 2ab\cot(xa)\,y + b^2 - a^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 - 2ab\cot(xa)\,y + b^2 - a^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2 + b^2$, $f_1(x) = -2\cot(xa)\,ab$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= -2\cot(xa)\, ab \\ f_2^2 f_0 &= -a^2 + b^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + 2\cot(xa)\, ab u'(x) + \left(-a^2 + b^2\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = \sin(xa)^{-b+\frac{1}{2}} \Bigg(& c_1 \operatorname{LegendreP}\left(\frac{-a + 2\sqrt{(b^2-1)\, a^2 + b^2}}{2a}, b - \frac{1}{2}, \cos(xa)\right) \\ & + c_2 \operatorname{LegendreQ}\left(\frac{-a + 2\sqrt{(b^2-1)\, a^2 + b^2}}{2a}, b - \frac{1}{2}, \cos(xa)\right)\Bigg) \end{aligned}$$

The above shows that

$$u'(x) = -\frac{2\Big(c_1\Big(-\cos(xa)\sin(xa)\sqrt{(b^2-1)\, a^2 + b^2} + a\Big(-\frac{\cos(xa)\sin(xa)}{2} + (\cos(xa) - 1)\left(b - \frac{1}{2}\right)\cot(xa)\,(\cos(x \cdots}{\cdots}$$

Using the above in (1) gives the solution

$$y = \frac{2c_1\Big(-\cos(xa)\sin(xa)\sqrt{(b^2-1)\, a^2 + b^2} + a\Big(-\frac{\cos(xa)\sin(xa)}{2} + (\cos(xa) - 1)\left(b - \frac{1}{2}\right)\cot(xa)\,(\cos(xa) \cdots}{\cdots}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\cos\left(xa\right) c_3 \left(ab+\sqrt{\left(b^2-1\right) a^2+b^2}\right) \text{LegendreP}\left(\frac{-a+2\sqrt{\left(b^2-1\right)a^2+b^2}}{2a}, b-\frac{1}{2}, \cos\left(xa\right)\right) + \cos\left(xa\right) \left(ab+\sqrt{}\right.\right.}{}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(\cos\left(xa\right) c_3 \left(ab+\sqrt{\left(b^2-1\right) a^2+b^2}\right) \text{LegendreP}\left(\frac{-a+2\sqrt{\left(b^2-1\right)a^2+b^2}}{2a}, b-\frac{1}{2}, \cos\left(xa\right)\right) + \cos\left(xa\right) \left(ab+\sqrt{}\right.\right.}{} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\cos\left(xa\right) c_3 \left(ab+\sqrt{\left(b^2-1\right) a^2+b^2}\right) \text{LegendreP}\left(\frac{-a+2\sqrt{\left(b^2-1\right)a^2+b^2}}{2a}, b-\frac{1}{2}, \cos\left(xa\right)\right) + \cos\left(xa\right) \left(ab+\sqrt{}\right.\right.}{}$$

Verified OK.

Problem number: 41.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - a\cot(\beta x)\, y = ab\cot(\beta x) - b^2}$$

12.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + a\cot(\beta x)\, y + ab\cot(\beta x) - b^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + a\cot(\beta x)\, y + ab\cot(\beta x) - b^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = ab\cot(\beta x) - b^2$, $f_1(x) = \cot(\beta x)\, a$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \cot(\beta x) a \\ f_2^2 f_0 &= ab\cot(\beta x) - b^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \cot(\beta x) a u'(x) + (ab\cot(\beta x) - b^2) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = -\frac{e^{bx}\left(ic_2\beta\left(\int \sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\sin(\beta x)^{\frac{a}{\beta}}\cos(\beta x)\,e^{-2bx}dx\right) - 2c_1\right)}{2}$$

The above shows that

$$u'(x) = -\frac{i\left(\int \sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\sin(\beta x)^{\frac{a}{\beta}}\cos(\beta x)\,e^{-2bx}dx\right)c_2 b\beta\,e^{bx}}{2} - \frac{i\cos(\beta x)\sin(\beta x)^{\frac{a}{\beta}}\csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\beta c_2 e^{-bx}}{2} + c_1 b\,e^{bx}$$

Using the above in (1) gives the solution

$$y = \frac{2\left(-\frac{i\left(\int \sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\sin(\beta x)^{\frac{a}{\beta}}\cos(\beta x)e^{-2bx}dx\right)c_2 b\beta\,e^{bx}}{2} - \frac{i\cos(\beta x)\sin(\beta x)^{\frac{a}{\beta}}\csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\beta c_2 e^{-bx}}{2} + c_1 b\,e^{\cdots}\right.}{ic_2\beta\left(\int \sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\sin(\beta x)^{\frac{a}{\beta}}\cos(\beta x)\,e^{-2bx}dx\right) - 2c_1}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\beta\sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\sin(\beta x)^{\frac{a}{\beta}}\cos(\beta x)\,e^{-2bx} - 2ibc_3 - \beta\left(\int \sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\sin(\beta x)^{\cdots}\right.}{\beta\left(\int \sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right)\sin(\beta x)^{\frac{a}{\beta}}\cos(\beta x)\,e^{-2bx}dx\right) + 2ic_3}$$

Summary

The solution(s) found are the following

$$y = \frac{-\beta \sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right) \csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right) \sin(\beta x)^{\frac{a}{\beta}} \cos(\beta x)\, \mathrm{e}^{-2bx} - 2ibc_3 - \beta\left(\int \sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right) \csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right) \sin(\beta x)^{\frac{a}{\beta}}\right.}{\beta\left(\int \sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right) \csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right) \sin(\beta x)^{\frac{a}{\beta}} \cos(\beta x)\, \mathrm{e}^{-2bx} dx\right) + 2ic_3} \tag{1}$$

Verification of solutions

$$y = \frac{-\beta \sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right) \csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right) \sin(\beta x)^{\frac{a}{\beta}} \cos(\beta x)\, \mathrm{e}^{-2bx} - 2ibc_3 - \beta\left(\int \sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right) \csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right) \sin(\beta x)^{\frac{a}{\beta}}\right.}{\beta\left(\int \sec\left(\frac{\pi}{4}+\frac{\beta x}{2}\right) \csc\left(\frac{\pi}{4}+\frac{\beta x}{2}\right) \sin(\beta x)^{\frac{a}{\beta}} \cos(\beta x)\, \mathrm{e}^{-2bx} dx\right) + 2ic_3}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - ax\cot(bx)^m y = a\cot(bx)^m}$$

12.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + ax\cot(bx)^m y + a\cot(bx)^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + ax\cot(bx)^m y + a\cot(bx)^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\cot(bx)^m$, $f_1(x) = xa\cot(bx)^m$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= xa\cot(bx)^m \\ f_2^2f_0 &= a\cot(bx)^m \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - xa\cot(bx)^m\,u'(x) + a\cot(bx)^m\,u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x\left(c_1\left(\int e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}dx\right) + c_2\right)$$

The above shows that

$$u'(x) = c_1\left(\int e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}dx\right) + c_2 + xc_1e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}$$

Using the above in (1) gives the solution

$$y = -\frac{c_1\left(\int e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}dx\right) + c_2 + xc_1e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}}{x\left(c_1\left(\int e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}dx\right) + c_2\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-c_3\left(\int e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}dx\right) - 1 - xc_3e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}}{x\left(c_3\left(\int e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}dx\right) + 1\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{-c_3 \left(\int e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}dx\right) - 1 - x c_3 e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}}{x \left(c_3 \left(\int e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}dx\right) + 1\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-c_3 \left(\int e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}dx\right) - 1 - x c_3 e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}}{x \left(c_3 \left(\int e^{\int \frac{\cot(bx)^m a\,x^2-2}{x}dx}dx\right) + 1\right)}$$

Verified OK.

Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-4. Equations with cotangent.
Problem number: 43.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + (k+1)\,x^k y^2 - a\,x^{k+1}\cot(x)^m\,y = -a\cot(x)^m}$$

12.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a\,x^{k+1}\cot(x)^m\,y - x^k y^2 k - x^k y^2 - a\cot(x)^m \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a\,x^k x\cot(x)^m\,y - x^k y^2 k - x^k y^2 - a\cot(x)^m$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a\cot(x)^m$, $f_1(x) = a\cot(x)^m\,x^{k+1}$ and $f_2(x) = -x^k k - x^k$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{(-x^k k - x^k)\,u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{k^2 x^k}{x} - \frac{k\,x^k}{x} \\ f_1 f_2 &= a\cot(x)^m x^{k+1}(-x^k k - x^k) \\ f_2^2 f_0 &= -(-x^k k - x^k)^2 a\cot(x)^m \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$(-x^k k - x^k) u''(x) - \left(-\frac{k^2 x^k}{x} - \frac{k\,x^k}{x} + a\cot(x)^m x^{k+1}(-x^k k - x^k)\right) u'(x) - (-x^k k - x^k)^2 a\cot(x)^m u($$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{k+1}\left(c_1 + c_2\left(\int x^{-2k-2} e^{\int \left(a\cot(x)^m x^{k+1} + \frac{k}{x}\right)dx} dx\right)\right)$$

The above shows that

$$\begin{aligned} u'(x) = &\left(c_2 x^{-2k-1} e^{\int \left(a\cot(x)^m x^{k+1} + \frac{k}{x}\right)dx}\right. \\ &\left. + \left(c_1 + c_2\left(\int x^{-2k-2} e^{\int \left(a\cot(x)^m x^{k+1} + \frac{k}{x}\right)dx} dx\right)\right)(k+1)\right) x^k \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(c_2 x^{-2k-1} e^{\int \left(a\cot(x)^m x^{k+1} + \frac{k}{x}\right)dx} + \left(c_1 + c_2\left(\int x^{-2k-2} e^{\int \left(a\cot(x)^m x^{k+1} + \frac{k}{x}\right)dx} dx\right)\right)(k+1)\right) x^k x^{-k-1}}{(-x^k k - x^k)\left(c_1 + c_2\left(\int x^{-2k-2} e^{\int \left(a\cot(x)^m x^{k+1} + \frac{k}{x}\right)dx} dx\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{x^{-k-1}\left(x^{-2k-1} e^{\int \left(a\cot(x)^m x^{k+1} + \frac{k}{x}\right)dx} + \left(c_3 + \int x^{-2k-2} e^{\int \left(a\cot(x)^m x^{k+1} + \frac{k}{x}\right)dx} dx\right)(k+1)\right)}{(k+1)\left(c_3 + \int e^{\int \frac{a\,x^{k+2}\cot(x)^m + k}{x}dx} x^{-2k-2} dx\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{x^{-k-1}\left(x^{-2k-1}\mathrm{e}^{\int \left(a\cot(x)^{m} x^{k+1}+\frac{k}{x}\right)dx}+\left(c_3+\int x^{-2k-2}\mathrm{e}^{\int \left(a\cot(x)^{m} x^{k+1}+\frac{k}{x}\right)dx}dx\right)(k+1)\right)}{(k+1)\left(c_3+\int \mathrm{e}^{\int \frac{a\,x^{k+2}\cot(x)^{m}+k}{x}dx} x^{-2k-2}dx\right)} \tag{1}$$

Verification of solutions

$$y = \frac{x^{-k-1}\left(x^{-2k-1}\mathrm{e}^{\int \left(a\cot(x)^{m} x^{k+1}+\frac{k}{x}\right)dx}+\left(c_3+\int x^{-2k-2}\mathrm{e}^{\int \left(a\cot(x)^{m} x^{k+1}+\frac{k}{x}\right)dx}dx\right)(k+1)\right)}{(k+1)\left(c_3+\int \mathrm{e}^{\int \frac{a\,x^{k+2}\cot(x)^{m}+k}{x}dx} x^{-2k-2}dx\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-4. Equations with cotangent.
Problem number: 44.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[[_1st_order, `_with_symmetry_[F(x),G(x)]`], _Riccati]
```

Unable to solve or complete the solution.

$$y' - a\cot(\lambda x+\mu)^k (y - b\,x^n - c)^2 = b\,x^{n-1}n$$

12.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y)\\ &= x^{2n}\cot(\lambda x+\mu)^k a\,b^2 + 2x^n\cot(\lambda x+\mu)^k abc - 2x^n\cot(\lambda x+\mu)^k aby + \cot(\lambda x+\mu)^k a\,c^2 - 2\cot(\lambda x \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^{2n}\left(-\frac{1}{\cot(\mu)+\cot(\lambda x)} + \frac{\cot(\mu)\cot(\lambda x)}{\cot(\mu)+\cot(\lambda x)}\right)^k a\,b^2 + 2x^n\left(-\frac{1}{\cot(\mu)+\cot(\lambda x)} + \frac{\cot(\mu)\cot(\lambda x)}{\cot(\mu)+\cot(\lambda x}\right.$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = x^{2n}\cot(\lambda x+\mu)^k a\,b^2 + 2x^n\cot(\lambda x+\mu)^k abc + \cot(\lambda x+\mu)^k a\,c^2 + b\,x^{n-1}n$, $f_1(x) = -2a\,x^n b\cot(\lambda x+\mu)^k - 2a\cot(\lambda x+\mu)^k c$ and $f_2(x) = a\cot(\lambda x+\mu)^k$.

Let

$$y = \frac{-u'}{f_2 u}$$
$$= \frac{-u'}{a \cot(\lambda x+\mu)^k u} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$f_2' = \frac{a \cot(\lambda x+\mu)^k k\lambda(-1-\cot(\lambda x+\mu)^2)}{\cot(\lambda x+\mu)}$$

$$f_1 f_2 = \left(-2a\, x^n b \cot(\lambda x+\mu)^k - 2a \cot(\lambda x+\mu)^k c\right) a \cot(\lambda x+\mu)^k$$

$$f_2^2 f_0 = a^2 \cot(\lambda x+\mu)^{2k} \left(x^{2n} \cot(\lambda x+\mu)^k a\, b^2 + 2x^n \cot(\lambda x+\mu)^k abc + \cot(\lambda x+\mu)^k a\, c^2 + b\, x^{n-1} n\right)$$

Substituting the above terms back in equation (2) gives

$$a \cot(\lambda x+\mu)^k u''(x) - \left(\frac{a \cot(\lambda x+\mu)^k k\lambda(-1-\cot(\lambda x+\mu)^2)}{\cot(\lambda x+\mu)} + \left(-2a\, x^n b \cot(\lambda x+\mu)^k - 2a \cot(\lambda x\right.\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-4. Equations with cotangent.
Problem number: 45.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - a\cot(\lambda x)^m y^2 - ky = a\,b^2x^{2k}\cot(\lambda x)^m}$$

12.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}
y' &= F(x,y)\\
&= \frac{a\cot(\lambda x)^m y^2 + ky + a\,b^2x^{2k}\cot(\lambda x)^m}{x}
\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,b^2x^{2k}\cot(\lambda x)^m}{x} + \frac{a\cot(\lambda x)^m y^2}{x} + \frac{ky}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{a\,b^2x^{2k}\cot(\lambda x)^m}{x}$, $f_1(x) = \frac{k}{x}$ and $f_2(x) = \frac{a\cot(\lambda x)^m}{x}$. Let

$$\begin{aligned}
y &= \frac{-u'}{f_2 u}\\
&= \frac{-u'}{\frac{a\cot(\lambda x)^m u}{x}} \qquad (1)
\end{aligned}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{a \cot(\lambda x)^m m\lambda(-1 - \cot(\lambda x)^2)}{\cot(\lambda x) x} - \frac{a \cot(\lambda x)^m}{x^2} \\ f_1 f_2 &= \frac{ka \cot(\lambda x)^m}{x^2} \\ f_2^2 f_0 &= \frac{a^3 \cot(\lambda x)^{3m} b^2 x^{2k}}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{a \cot(\lambda x)^m u''(x)}{x} - \left(\frac{a \cot(\lambda x)^m m\lambda(-1 - \cot(\lambda x)^2)}{\cot(\lambda x) x} - \frac{a \cot(\lambda x)^m}{x^2} + \frac{ka \cot(\lambda x)^m}{x^2}\right) u'(x) + \frac{a^3 \cot(\lambda x$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 e^{iab\left(\int x^{k-1} \cot(\lambda x)^m dx\right)} + c_2 e^{-iab\left(\int x^{k-1} \cot(\lambda x)^m dx\right)}$$

The above shows that

$$u'(x) = iab\, x^{k-1} \cot(\lambda x)^m \left(c_1 e^{iab\left(\int x^{k-1} \cot(\lambda x)^m dx\right)} - c_2 e^{-iab\left(\int x^{k-1} \cot(\lambda x)^m dx\right)}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{ib\, x^{k-1} \left(c_1 e^{iab\left(\int x^{k-1} \cot(\lambda x)^m dx\right)} - c_2 e^{-iab\left(\int x^{k-1} \cot(\lambda x)^m dx\right)}\right) x}{c_1 e^{iab\left(\int x^{k-1} \cot(\lambda x)^m dx\right)} + c_2 e^{-iab\left(\int x^{k-1} \cot(\lambda x)^m dx\right)}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{ib\, x^{k} \left(c_3 e^{iab\left(\int x^{k-1} \cot(\lambda x)^m dx\right)} - e^{-iab\left(\int x^{k-1} \cot(\lambda x)^m dx\right)}\right)}{c_3 e^{iab\left(\int x^{k-1} \cot(\lambda x)^m dx\right)} + e^{-iab\left(\int x^{k-1} \cot(\lambda x)^m dx\right)}}$$

Summary

The solution(s) found are the following

$$y = -\frac{ib\,x^{k}\left(c_3 \mathrm{e}^{iab\left(\int x^{k-1}\cot(\lambda x)^{m}dx\right)} - \mathrm{e}^{-iab\left(\int x^{k-1}\cot(\lambda x)^{m}dx\right)}\right)}{c_3 \mathrm{e}^{iab\left(\int x^{k-1}\cot(\lambda x)^{m}dx\right)} + \mathrm{e}^{-iab\left(\int x^{k-1}\cot(\lambda x)^{m}dx\right)}} \tag{1}$$

Verification of solutions

$$y = -\frac{ib\,x^{k}\left(c_3 \mathrm{e}^{iab\left(\int x^{k-1}\cot(\lambda x)^{m}dx\right)} - \mathrm{e}^{-iab\left(\int x^{k-1}\cot(\lambda x)^{m}dx\right)}\right)}{c_3 \mathrm{e}^{iab\left(\int x^{k-1}\cot(\lambda x)^{m}dx\right)} + \mathrm{e}^{-iab\left(\int x^{k-1}\cot(\lambda x)^{m}dx\right)}}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$\boxed{(a\cot(\lambda x)+b)\,y'-y^2-c\cot(x\mu)\,y=-d^2+cd\cot(x\mu)}$$

12.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{y^2+c\cot(x\mu)\,y-d^2+cd\cot(x\mu)}{a\cot(\lambda x)+b} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=\frac{cd\cot(x\mu)}{a\cot(\lambda x)+b}+\frac{c\cot(x\mu)\,y}{a\cot(\lambda x)+b}-\frac{d^2}{a\cot(\lambda x)+b}+\frac{y^2}{a\cot(\lambda x)+b}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x) = \frac{-d^2+cd\cot(x\mu)}{a\cot(\lambda x)+b}$, $f_1(x) = \frac{c\cot(x\mu)}{a\cot(\lambda x)+b}$ and $f_2(x) = \frac{1}{a\cot(\lambda x)+b}$. Let

$$
\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{\frac{u}{a\cot(\lambda x)+b}}
\end{aligned}
\tag{1}
$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$
f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}
$$

But

$$
\begin{aligned}
f_2' &= -\frac{\lambda\left(-1-\cot(\lambda x)^2\right) a}{(a\cot(\lambda x)+b)^2} \\
f_1 f_2 &= \frac{c\cot(x\mu)}{(a\cot(\lambda x)+b)^2} \\
f_2^2 f_0 &= \frac{-d^2+cd\cot(x\mu)}{(a\cot(\lambda x)+b)^3}
\end{aligned}
$$

Substituting the above terms back in equation (2) gives

$$
\frac{u''(x)}{a\cot(\lambda x)+b} - \left(-\frac{\lambda\left(-1-\cot(\lambda x)^2\right) a}{(a\cot(\lambda x)+b)^2} + \frac{c\cot(x\mu)}{(a\cot(\lambda x)+b)^2}\right) u'(x) + \frac{(-d^2+cd\cot(x\mu))\, u(x)}{(a\cot(\lambda x)+b)^3} = 0
$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-5. Equations containing combinations of trigonometric functions.
Problem number: 47.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = \lambda^2 + c \sin(\lambda x)^n \cos(\lambda x)^{-n-4}}$$

13.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + \lambda^2 + c \sin(\lambda x)^n \cos(\lambda x)^{-n-4} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \lambda^2 + \frac{c \sin(\lambda x)^n \cos(\lambda x)^{-n}}{\cos(\lambda x)^4}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \lambda^2 + c \sin(\lambda x)^n \cos(\lambda x)^{-n-4}$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \lambda^2 + c \sin(\lambda x)^n \cos(\lambda x)^{-n-4} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(\lambda^2 + c \sin(\lambda x)^n \cos(\lambda x)^{-n-4}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\sin(\lambda x)^n \cos(\lambda x)^{-n-4} \_Y(x) c + \_Y(x) \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\sin(\lambda x)^n \cos(\lambda x)^{-n-4} \_Y(x) c + \_Y(x) \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\sin(\lambda x)^n \cos(\lambda x)^{-n-4} \_Y(x) c + \_Y(x) \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\sin(\lambda x)^n \cos(\lambda x)^{-n-4} \_Y(x) c + \_Y(x) \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\sin(\lambda x)^n \cos(\lambda x)^{-n-4} \_Y(x) c + \_Y(x) \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\sin(\lambda x)^n \cos(\lambda x)^{-n-4} \_Y(x) c + \_Y(x) \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\sin(\lambda x)^n \cos(\lambda x)^{-n-4} \_Y(x) c + \_Y(x) \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\sin(\lambda x)^n \cos(\lambda x)^{-n-4} \_Y(x) c + \_Y(x) \lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\sin(\lambda x)^n \cos(\lambda x)^{-n-4} \_Y(x)\, c + \_Y(x)\,\lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}{\operatorname{DESol}\left(\left\{\sin(\lambda x)^n \cos(\lambda x)^{-n-4} \_Y(x)\, c + \_Y(x)\,\lambda^2 + \_Y''(x)\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-5. Equations containing combinations of trigonometric functions.
Problem number: 48.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 \sin(\lambda x)\, a = b \sin(\lambda x) \cos(\lambda x)^n}$$

13.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 \sin(\lambda x)\, a + b \sin(\lambda x) \cos(\lambda x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 \sin(\lambda x)\, a + b \sin(\lambda x) \cos(\lambda x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b \sin(\lambda x) \cos(\lambda x)^n$, $f_1(x) = 0$ and $f_2(x) = a \sin(\lambda x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{a \sin(\lambda x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= a\lambda \cos(\lambda x) \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= a^2 \sin(\lambda x)^3 b \cos(\lambda x)^n \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$a \sin(\lambda x) u''(x) - a\lambda \cos(\lambda x) u'(x) + a^2 \sin(\lambda x)^3 b \cos(\lambda x)^n u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \sqrt{\cos(\lambda x)} \left(c_1 \operatorname{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}} \cos(\lambda x)^{1+\frac{n}{2}}}{2+n} \right) + c_2 \operatorname{BesselY}\left(\frac{1}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}} \cos(\lambda x)^{1+\frac{n}{2}}}{2+n} \right) \right)$$

The above shows that

$$u'(x) = \frac{\sin(\lambda x) \lambda \left(\operatorname{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}} \cos(\lambda x)^{1+\frac{n}{2}}}{2+n} \right) \cos(\lambda x)^{1+\frac{n}{2}} \sqrt{\frac{ab}{\lambda^2}}\, c_1 + \cos(\lambda x)^{1+\frac{n}{2}} \sqrt{\frac{ab}{\lambda^2}} \operatorname{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}}}{} \right.\right.}{\sqrt{\cos(\lambda x)}}$$

Using the above in (1) gives the solution

$$y = -\frac{\lambda \left(\operatorname{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}} \cos(\lambda x)^{1+\frac{n}{2}}}{2+n} \right) \cos(\lambda x)^{1+\frac{n}{2}} \sqrt{\frac{ab}{\lambda^2}}\, c_1 + \cos(\lambda x)^{1+\frac{n}{2}} \sqrt{\frac{ab}{\lambda^2}} \operatorname{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}} \cos(\lambda x)^{1}}{2+n} \right.\right.}{\cos(\lambda x)\, a \left(c_1 \operatorname{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}} \cos(\lambda x)^{1+\frac{n}{2}}}{2+n} \right) + c_2 \mathrm{B} \right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-\operatorname{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}}\, \cos(\lambda x)^{1+\frac{n}{2}}}{2+n}\right) \cos\left(\lambda x\right)^{1+\frac{n}{2}} \sqrt{\frac{ab}{\lambda^2}}\, c_3 - \operatorname{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}}\, \cos(\lambda x)^{1+\frac{n}{2}}}{2+n}\right) \sqrt{\frac{ab}{\lambda^2}}\, \cos\left(\lambda x\right)^{}}{\left(c_3 \operatorname{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}}\, \cos(\lambda x)^{1+\frac{n}{2}}}{2+n}\right) + \operatorname{BesselY}\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(-\operatorname{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}}\, \cos(\lambda x)^{1+\frac{n}{2}}}{2+n}\right) \cos\left(\lambda x\right)^{1+\frac{n}{2}} \sqrt{\frac{ab}{\lambda^2}}\, c_3 - \operatorname{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}}\, \cos(\lambda x)^{1+\frac{n}{2}}}{2+n}\right) \sqrt{\frac{ab}{\lambda^2}}\, \cos\left(\lambda x\right)^{}}{\left(c_3 \operatorname{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}}\, \cos(\lambda x)^{1+\frac{n}{2}}}{2+n}\right) + \operatorname{BesselY}\right.} \quad (1)$$

Verification of solutions

$$y = \frac{\left(-\operatorname{BesselJ}\left(\frac{n+3}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}}\, \cos(\lambda x)^{1+\frac{n}{2}}}{2+n}\right) \cos\left(\lambda x\right)^{1+\frac{n}{2}} \sqrt{\frac{ab}{\lambda^2}}\, c_3 - \operatorname{BesselY}\left(\frac{n+3}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}}\, \cos(\lambda x)^{1+\frac{n}{2}}}{2+n}\right) \sqrt{\frac{ab}{\lambda^2}}\, \cos\left(\lambda x\right)^{}}{\left(c_3 \operatorname{BesselJ}\left(\frac{1}{2+n}, \frac{2\sqrt{\frac{ab}{\lambda^2}}\, \cos(\lambda x)^{1+\frac{n}{2}}}{2+n}\right) + \operatorname{BesselY}\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \sin(\lambda x) y^2 - a \cos(\lambda x)^n y = -a \cos(\lambda x)^{n-1}}$$

13.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \lambda \sin(\lambda x) y^2 + a \cos(\lambda x)^n y - a \cos(\lambda x)^{n-1} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \lambda \sin(\lambda x) y^2 + a \cos(\lambda x)^n y - \frac{a \cos(\lambda x)^n}{\cos(\lambda x)}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a \cos(\lambda x)^{n-1}$, $f_1(x) = a \cos(\lambda x)^n$ and $f_2(x) = \lambda \sin(\lambda x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\lambda \sin(\lambda x) u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \lambda^2 \cos(\lambda x) \\ f_1 f_2 &= a \cos(\lambda x)^n \lambda \sin(\lambda x) \\ f_2^2 f_0 &= -\lambda^2 \sin(\lambda x)^2 a \cos(\lambda x)^{n-1} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\lambda \sin(\lambda x)\, u''(x) - \left(\lambda^2 \cos(\lambda x) + a \cos(\lambda x)^n \lambda \sin(\lambda x)\right) u'(x) - \lambda^2 \sin(\lambda x)^2 a \cos(\lambda x)^{n-1} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = \mathrm{DESol}\left(\left\{-\sin(\lambda x)\cos(\lambda x)^{n-1} a\lambda \_Y(x) - \cos(\lambda x)^n \_Y'(x)\, a \right.\right. \\ \left.\left. - \cot(\lambda x) \_Y'(x)\, \lambda + \_Y''(x)\right\}, \{\_Y(x)\}\right) \end{aligned}$$

The above shows that

$$\begin{aligned} u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{-\sin(\lambda x)\cos(\lambda x)^{n-1} a\lambda \_Y(x) - \cos(\lambda x)^n \_Y'(x)\, a \right.\right. \\ \left.\left. - \cot(\lambda x) \_Y'(x)\, \lambda + \_Y''(x)\right\}, \{\_Y(x)\}\right) \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{-\sin(\lambda x)\cos(\lambda x)^{n-1} a\lambda \_Y(x) - \cos(\lambda x)^n \_Y'(x)\, a - \cot(\lambda x) \_Y'(x)\, \lambda + \_Y''(x)\right.\right.}{\lambda \sin(\lambda x)\, \mathrm{DESol}\left(\left\{-\sin(\lambda x)\cos(\lambda x)^{n-1} a\lambda \_Y(x) - \cos(\lambda x)^n \_Y'(x)\, a - \cot(\lambda x) \_Y'(x)\, \lambda + \_Y\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\csc(\lambda x)\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{-\sin(\lambda x)\cos(\lambda x)^{n-1} a\lambda \_Y(x) - \cos(\lambda x)^n \_Y'(x)\, a - \cot(\lambda x) \_Y'(x)\, \lambda + \_\right.\right.\right.}{\mathrm{DESol}\left(\left\{-\sin(\lambda x)\cos(\lambda x)^{n-1} a\lambda \_Y(x) - \cos(\lambda x)^n \_Y'(x)\, a - \cot(\lambda x) \_Y'(x)\, \lambda + \_Y''(x)\right\}\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\csc(\lambda x)\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{-\sin(\lambda x)\cos(\lambda x)^{n-1} a\lambda\_Y(x) - \cos(\lambda x)^{n}\_Y'(x)\, a - \cot(\lambda x)\_Y'(x)\,\lambda + \_\right.\right.\right.}{\mathrm{DESol}\left(\left\{-\sin(\lambda x)\cos(\lambda x)^{n-1} a\lambda\_Y(x) - \cos(\lambda x)^{n}\_Y'(x)\, a - \cot(\lambda x)\_Y'(x)\,\lambda + \_Y''(x)\right\}\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{\csc(\lambda x)\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{-\sin(\lambda x)\cos(\lambda x)^{n-1} a\lambda\_Y(x) - \cos(\lambda x)^{n}\_Y'(x)\, a - \cot(\lambda x)\_Y'(x)\,\lambda + \_\right.\right.\right.}{\mathrm{DESol}\left(\left\{-\sin(\lambda x)\cos(\lambda x)^{n-1} a\lambda\_Y(x) - \cos(\lambda x)^{n}\_Y'(x)\, a - \cot(\lambda x)\_Y'(x)\,\lambda + \_Y''(x)\right\}\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 \cos(\lambda x)\, a = b \cos(\lambda x) \sin(\lambda x)^n}$$

13.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 \cos(\lambda x)\, a + b \cos(\lambda x) \sin(\lambda x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 \cos(\lambda x)\, a + b \cos(\lambda x) \sin(\lambda x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b \cos(\lambda x) \sin(\lambda x)^n$, $f_1(x) = 0$ and $f_2(x) = \cos(\lambda x)\, a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\cos(\lambda x)\, a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -a\lambda \sin(\lambda x) \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \cos(\lambda x)^3 a^2 b \sin(\lambda x)^n \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\cos(\lambda x)\, a u''(x) + a\lambda \sin(\lambda x)\, u'(x) + \cos(\lambda x)^3 a^2 b \sin(\lambda x)^n u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{-\csc\left(\frac{\pi(n+3)}{2+n}\right) c_1 \operatorname{BesselI}\left(-\frac{1}{2+n}, 2\sqrt{-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) \pi \left(-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{1}{4+2n}} + c_2 \sin(\lambda x) \operatorname{BesselI}\left(\frac{1}{2+n}, 2\sqrt{-\cdots}\right.}{(2+n)\,\Gamma\left(\frac{n+3}{2+n}\right)}$$

The above shows that

$$u'(x) = \frac{\left(\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} c_2 \cos(\lambda x)(2+n) \operatorname{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) + \cos(\lambda x)\, c_2 \operatorname{BesselI}\left(\cdots\right.\right.}{\cdots}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} c_2 \cos(\lambda x)(2+n) \operatorname{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) + \cos(\lambda x)\, c_2 \operatorname{BesselI}\cdots\right.}{\cos(\lambda x)\, a \left(-\csc\left(\frac{\pi(n+3)}{2+n}\right) c_1 \operatorname{BesselI}\left(-\frac{1}{2+n}, 2\sqrt{-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right)\cdots\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$y =$

$$-\frac{\left(\Gamma\left(\frac{n+3}{2+n}\right)^{2}\left(-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^{2}(2+n)^{2}}\right)^{\frac{n+1}{4+2n}}(2+n)\,\mathrm{BesselI}\left(\frac{n+3}{2+n},2\sqrt{-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^{2}(2+n)^{2}}}\right)-\csc(\lambda x)\,\pi c_{3}\csc\left(\frac{\pi(n+3)}{2+n}\right)\left(-\right.\right.}{\left(-\csc\left(\frac{\pi(n+3)}{2+n}\right)c_{3}\,\mathrm{BesselI}\left(-\frac{1}{2+n},2\sqrt{-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^{2}(2+n)^{2}}}\right)\pi\left(-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^{2}(2+n)^{2}}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\Gamma\left(\frac{n+3}{2+n}\right)^{2}\left(-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^{2}(2+n)^{2}}\right)^{\frac{n+1}{4+2n}}(2+n)\,\mathrm{BesselI}\left(\frac{n+3}{2+n},2\sqrt{-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^{2}(2+n)^{2}}}\right)-\csc(\lambda x)\,\pi c_{3}\csc\left(\frac{\pi(n+3)}{2+n}\right)\left(-\right.\right.}{\left(-\csc\left(\frac{\pi(n+3)}{2+n}\right)c_{3}\,\mathrm{BesselI}\left(-\frac{1}{2+n},2\sqrt{-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^{2}(2+n)^{2}}}\right)\pi\left(-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^{2}(2+n)^{2}}\right.\right.} \tag{1}$$

Verification of solutions

$y =$

$$-\frac{\left(\Gamma\left(\frac{n+3}{2+n}\right)^{2}\left(-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^{2}(2+n)^{2}}\right)^{\frac{n+1}{4+2n}}(2+n)\,\mathrm{BesselI}\left(\frac{n+3}{2+n},2\sqrt{-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^{2}(2+n)^{2}}}\right)-\csc(\lambda x)\,\pi c_{3}\csc\left(\frac{\pi(n+3)}{2+n}\right)\left(-\right.\right.}{\left(-\csc\left(\frac{\pi(n+3)}{2+n}\right)c_{3}\,\mathrm{BesselI}\left(-\frac{1}{2+n},2\sqrt{-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^{2}(2+n)^{2}}}\right)\pi\left(-\frac{ab\sin(\lambda x)^{2+n}}{\lambda^{2}(2+n)^{2}}\right.\right.}$$

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \sin(\lambda x)\, y^2 - a\, x^n \cos(\lambda x)\, y = -x^n a}$$

13.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \lambda \sin(\lambda x)\, y^2 + a\, x^n \cos(\lambda x)\, y - x^n a \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \lambda \sin(\lambda x)\, y^2 + a\, x^n \cos(\lambda x)\, y - x^n a$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -x^n a$, $f_1(x) = x^n \cos(\lambda x)\, a$ and $f_2(x) = \lambda \sin(\lambda x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\lambda \sin(\lambda x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \lambda^2 \cos(\lambda x) \\ f_1 f_2 &= x^n \cos(\lambda x)\, a\lambda \sin(\lambda x) \\ f_2^2 f_0 &= -x^n a\, \lambda^2 \sin(\lambda x)^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\lambda \sin(\lambda x)\, u''(x) - \left(x^n \cos(\lambda x)\, a\lambda \sin(\lambda x) + \lambda^2 \cos(\lambda x)\right) u'(x) - x^n a\, \lambda^2 \sin(\lambda x)^2 u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = -\cos(\lambda x) \left(c_2 \lambda \left(\int \mathrm{e}^{\int (x^n \cos(\lambda x) a + 2\tan(\lambda x)\lambda) dx} \sin(\lambda x)\, dx\right) - c_1\right)$$

The above shows that

$$\begin{aligned} u'(x) = -\lambda \sin(\lambda x) \Bigg(&\cos(\lambda x)\, c_2 \mathrm{e}^{\int (x^n \cos(\lambda x) a + 2\tan(\lambda x)\lambda) dx} \\ &- c_2 \lambda \left(\int \mathrm{e}^{\int (x^n \cos(\lambda x) a + 2\tan(\lambda x)\lambda) dx} \sin(\lambda x)\, dx\right) + c_1\Bigg) \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\cos(\lambda x)\, c_2 \mathrm{e}^{\int (x^n \cos(\lambda x) a + 2\tan(\lambda x)\lambda) dx} - c_2 \lambda \left(\int \mathrm{e}^{\int (x^n \cos(\lambda x) a + 2\tan(\lambda x)\lambda) dx} \sin(\lambda x)\, dx\right) + c_1}{\cos(\lambda x) \left(c_2 \lambda \left(\int \mathrm{e}^{\int (x^n \cos(\lambda x) a + 2\tan(\lambda x)\lambda) dx} \sin(\lambda x)\, dx\right) - c_1\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\sec(\lambda x)\, \lambda \left(\int \mathrm{e}^{\int (x^n \cos(\lambda x) a + 2\tan(\lambda x)\lambda) dx} \sin(\lambda x)\, dx\right) - \sec(\lambda x)\, c_3 - \mathrm{e}^{\int (x^n \cos(\lambda x) a + 2\tan(\lambda x)\lambda) dx}}{\lambda \left(\int \mathrm{e}^{\int (x^n \cos(\lambda x) a + 2\tan(\lambda x)\lambda) dx} \sin(\lambda x)\, dx\right) - c_3}$$

Summary

The solution(s) found are the following

$$y = \frac{\sec \left(\lambda x \right) \lambda \left(\int {\mathrm e}^{\int \left(x^{n} \cos \left(\lambda x \right) a +2 \tan \left(\lambda x \right) \lambda \right)d x} \sin \left(\lambda x \right)d x \right)-\sec \left(\lambda x \right) c_{3} -{\mathrm e}^{\int \left(x^{n} \cos \left(\lambda x \right) a +2 \tan \left(\lambda x \right) \lambda \right)d x}}{\lambda \left(\int {\mathrm e}^{\int \left(x^{n} \cos \left(\lambda x \right) a +2 \tan \left(\lambda x \right) \lambda \right)d x} \sin \left(\lambda x \right)d x \right)-c_{3}} \tag{1}$$

Verification of solutions

$$y = \frac{\sec \left(\lambda x \right) \lambda \left(\int {\mathrm e}^{\int \left(x^{n} \cos \left(\lambda x \right) a +2 \tan \left(\lambda x \right) \lambda \right)d x} \sin \left(\lambda x \right)d x \right)-\sec \left(\lambda x \right) c_{3} -{\mathrm e}^{\int \left(x^{n} \cos \left(\lambda x \right) a +2 \tan \left(\lambda x \right) \lambda \right)d x}}{\lambda \left(\int {\mathrm e}^{\int \left(x^{n} \cos \left(\lambda x \right) a +2 \tan \left(\lambda x \right) \lambda \right)d x} \sin \left(\lambda x \right)d x \right)-c_{3}}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-5. Equations containing combinations of trigonometric functions.
Problem number: 52.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{\sin(2x)^{n+1} y' - a y^2 \sin(x)^{2n} = b\cos(x)^{2n}}$$

13.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \left(a\,y^2 \sin(x)^{2n} + b\cos(x)^{2n}\right)\sin(2x)^{-n-1} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a\,y^2 \sin(x)^{2n} \left(\frac{\sin(2x)}{2}\right)^{-n} 2^{-n}}{2\cos(x)\sin(x)} + \frac{b\cos(x)^{2n} \left(\frac{\sin(2x)}{2}\right)^{-n} 2^{-n}}{2\cos(x)\sin(x)}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \sin(2x)^{-n-1}\cos(x)^{2n} b$, $f_1(x) = 0$ and $f_2(x) = \sin(2x)^{-n-1}\sin(x)^{2n} a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\sin(x)^{2n} a \sin(2x)^{-n-1} u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$f_2' = \frac{2\sin(2x)^{-n-1}\sin(x)^{2n}\,n\cos(x)\,a}{\sin(x)} - \frac{2\sin(x)^{2n}\,a\sin(2x)^{-n-1}\,(n+1)\cos(2x)}{\sin(2x)}$$
$$f_1f_2 = 0$$
$$f_2^2f_0 = \sin(x)^{4n}\,a^2\sin(2x)^{-3-3n}\,b\cos(x)^{2n}$$

Substituting the above terms back in equation (2) gives

$$\sin(x)^{2n}\,a\sin(2x)^{-n-1}\,u''(x) - \left(\frac{2\sin(2x)^{-n-1}\sin(x)^{2n}\,n\cos(x)\,a}{\sin(x)} - \frac{2\sin(x)^{2n}\,a\sin(2x)^{-n-1}\,(n+1)\cos$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \cot(x)^{-\frac{n}{2}}\left(c_1\cot(x)^{\frac{\sqrt{-b4^{-n}a+n^2}}{2}} + c_2\cot(x)^{-\frac{\sqrt{-b4^{-n}a+n^2}}{2}}\right)$$

The above shows that

$$u'(x) = \frac{(\cot(x)+\tan(x))\left(c_2\left(n+\sqrt{-b4^{-n}a+n^2}\right)\cot(x)^{-\frac{\sqrt{-b4^{-n}a+n^2}}{2}} - \cot(x)^{\frac{\sqrt{-b4^{-n}a+n^2}}{2}}\,c_1\left(-n+\sqrt{-b4^{-n}a\right.\right.}{2}$$

Using the above in (1) gives the solution

$$y = -\frac{(\cot(x)+\tan(x))\left(c_2\left(n+\sqrt{-b4^{-n}a+n^2}\right)\cot(x)^{-\frac{\sqrt{-b4^{-n}a+n^2}}{2}} - \cot(x)^{\frac{\sqrt{-b4^{-n}a+n^2}}{2}}\,c_1\left(-n+\sqrt{-b4^{-n}\right.\right.}{2a\left(c_1\cot(x)^{\frac{\sqrt{-b4^{-n}a+n^2}}{2}} + c_2\cot(x)^{-\frac{\sqrt{-b4^{-n}a+n^2}}{2}}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\sin(x)^{-2n}\sec(x)\csc(x)\sin(2x)^{n+1}\left(\left(n+\sqrt{-b4^{-n}a+n^2}\right)\cot(x)^{-\frac{\sqrt{-b4^{-n}a+n^2}}{2}} - \cot(x)^{\frac{\sqrt{-b4^{-n}a+n^2}}{2}} c_3 (\right.}{2\left(c_3\cot(x)^{\frac{\sqrt{-b4^{-n}a+n^2}}{2}} + \cot(x)^{-\frac{\sqrt{-b4^{-n}a+n^2}}{2}}\right)a}$$

Summary

The solution(s) found are the following

$$y = -\frac{\sin(x)^{-2n}\sec(x)\csc(x)\sin(2x)^{n+1}\left(\left(n+\sqrt{-b4^{-n}a+n^2}\right)\cot(x)^{-\frac{\sqrt{-b4^{-n}a+n^2}}{2}} - \cot(x)^{\frac{\sqrt{-b4^{-n}a+n^2}}{2}} c_3 (\right.}{2\left(c_3\cot(x)^{\frac{\sqrt{-b4^{-n}a+n^2}}{2}} + \cot(x)^{-\frac{\sqrt{-b4^{-n}a+n^2}}{2}}\right)a} \tag{1}$$

Verification of solutions

$$y = -\frac{\sin(x)^{-2n}\sec(x)\csc(x)\sin(2x)^{n+1}\left(\left(n+\sqrt{-b4^{-n}a+n^2}\right)\cot(x)^{-\frac{\sqrt{-b4^{-n}a+n^2}}{2}} - \cot(x)^{\frac{\sqrt{-b4^{-n}a+n^2}}{2}} c_3 (\right.}{2\left(c_3\cot(x)^{\frac{\sqrt{-b4^{-n}a+n^2}}{2}} + \cot(x)^{-\frac{\sqrt{-b4^{-n}a+n^2}}{2}}\right)a}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.6-5. Equations containing combinations of trigonometric functions.
Problem number: 53.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 + \tan(x)\, y = a(1-a)\cot(x)^2}$$

13.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -a^2\cot(x)^2 + \cot(x)^2 a - \tan(x)\, y + y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2\cot(x)^2 + \cot(x)^2 a - \tan(x)\, y + y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2\cot(x)^2 + \cot(x)^2 a$, $f_1(x) = -\tan(x)$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= -\tan(x) \\ f_2^2f_0 &= -a^2\cot(x)^2 + \cot(x)^2 a \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \tan(x)\,u'(x) + \left(-a^2\cot(x)^2 + \cot(x)^2 a\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1\sin(x)^a + c_2\sin(x)^{1-a}$$

The above shows that

$$u'(x) = \cot(x)\left(-c_2(-1+a)\sin(x)^{1-a} + c_1\sin(x)^a a\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\cot(x)\left(-c_2(-1+a)\sin(x)^{1-a} + c_1\sin(x)^a a\right)}{c_1\sin(x)^a + c_2\sin(x)^{1-a}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\cot(x)\,c_3\sin(x)^{2a}a + \cos(x)(-1+a)}{c_3\sin(x)^{2a} + \sin(x)}$$

Summary

The solution(s) found are the following

$$y = \frac{-\cot(x)\,c_3\sin(x)^{2a}a + \cos(x)(-1+a)}{c_3\sin(x)^{2a} + \sin(x)} \tag{1}$$

Verification of solutions

$$y = \frac{-\cot(x) c_3 \sin(x)^{2a} a + \cos(x)(-1+a)}{c_3 \sin(x)^{2a} + \sin(x)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 + my\tan(x) = b^2\cos(x)^{2m}}$$

13.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 - my\tan(x) + b^2\cos(x)^{2m} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 - my\tan(x) + b^2\cos(x)^{2m}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b^2\cos(x)^{2m}$, $f_1(x) = -m\tan(x)$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= -m\tan(x) \\ f_2^2 f_0 &= b^2\cos(x)^{2m} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + m\tan(x)\,u'(x) + b^2\cos(x)^{2m}\,u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) = {} & c_1\sin\left(b\sqrt{\cos(x)^{2m}}\,\cos(x)^{-m}\sin(x)\,\mathrm{hypergeom}\left(\left[\frac{1}{2},\frac{1}{2}-\frac{m}{2}\right],\left[\frac{3}{2}\right],\sin(x)^2\right)\right) \\ & + c_2\cos\left(b\sqrt{\cos(x)^{2m-2}}\,\cos(x)^{-m+1}\sin(x)\,\mathrm{hypergeom}\left(\left[\frac{1}{2},\frac{1}{2}-\frac{m}{2}\right],\left[\frac{3}{2}\right],\sin(x)^2\right)\right) \end{aligned}$$

The above shows that

$$\begin{aligned} u'(x) = {} & b\cos(x)^{-m+1}\left(-\frac{\sin(x)^2(m-1)\,\mathrm{hypergeom}\left(\left[\frac{3}{2},\frac{3}{2}-\frac{m}{2}\right],\left[\frac{5}{2}\right],\sin(x)^2\right)}{3}\right. \\ & \left.+\mathrm{hypergeom}\left(\left[\frac{1}{2},\frac{1}{2}-\frac{m}{2}\right],\left[\frac{3}{2}\right],\sin(x)^2\right)\right)\left(-\cos(x)\sqrt{\cos(x)^{2m-2}}\,\sin\left(b\sqrt{\cos(x)^{2m-2}}\,\cos(x)^{-m+1}\right.\right. \\ & \left.+\cos\left(b\sqrt{\cos(x)^{2m}}\,\cos(x)^{-m}\sin(x)\,\mathrm{hypergeom}\left(\left[\frac{1}{2},\frac{1}{2}-\frac{m}{2}\right],\left[\frac{3}{2}\right],\sin(x)^2\right)\right)\sqrt{\cos(x)^{2m}}\,c_1\right) \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{b\cos(x)^{-m+1}\left(-\frac{\sin(x)^2(m-1)\,\mathrm{hypergeom}\left(\left[\frac{3}{2},\frac{3}{2}-\frac{m}{2}\right],\left[\frac{5}{2}\right],\sin(x)^2\right)}{3}+\mathrm{hypergeom}\left(\left[\frac{1}{2},\frac{1}{2}-\frac{m}{2}\right],\left[\frac{3}{2}\right],\sin(x)^2\right)\right)\left(-\right.}{c_1\sin\left(b\sqrt{\cos(x)^{2m}}\,\cos(x)^{-m}\,\mathrm{si}\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\cos(x)\sqrt{\cos(x)^{2m-2}}\,\sin\left(b\sqrt{\cos(x)^{2m-2}}\,\cos(x)^{-m+1}\sin(x)\,\text{hypergeom}\left(\left[\frac{1}{2}, \frac{1}{2}-\frac{m}{2}\right], \left[\frac{3}{2}\right], \sin(x)^2\right)\right)}{c_3 \sin\left(b\sqrt{\cos(x)^{2m}}\,\cos(x)^{-m}\sin(x\right.}$$

Summary
The solution(s) found are the following

$$y = \frac{\left(\cos(x)\sqrt{\cos(x)^{2m-2}}\,\sin\left(b\sqrt{\cos(x)^{2m-2}}\,\cos(x)^{-m+1}\sin(x)\,\text{hypergeom}\left(\left[\frac{1}{2}, \frac{1}{2}-\frac{m}{2}\right], \left[\frac{3}{2}\right], \sin(x)^2\right)\right)}{c_3 \sin\left(b\sqrt{\cos(x)^{2m}}\,\cos(x)^{-m}\sin(x\right.} \tag{1}$$

Verification of solutions

$$y = \frac{\left(\cos(x)\sqrt{\cos(x)^{2m-2}}\,\sin\left(b\sqrt{\cos(x)^{2m-2}}\,\cos(x)^{-m+1}\sin(x)\,\text{hypergeom}\left(\left[\frac{1}{2}, \frac{1}{2}-\frac{m}{2}\right], \left[\frac{3}{2}\right], \sin(x)^2\right)\right)}{c_3 \sin\left(b\sqrt{\cos(x)^{2m}}\,\cos(x)^{-m}\sin(x\right.}$$

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - my\cot(x) = b^2 \sin(x)^{2m}}$$

13.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + my\cot(x) + b^2 \sin(x)^{2m} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + my\cot(x) + b^2 \sin(x)^{2m}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b^2 \sin(x)^{2m}$, $f_1(x) = \cot(x)\, m$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= 0\\
f_1f_2 &= \cot(x)\,m\\
f_2^2f_0 &= b^2\sin(x)^{2m}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \cot(x)\,mu'(x) + b^2\sin(x)^{2m}\,u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) &= c_1\sin\left(\sqrt{\left(\csc(x)^2\right)^{-m}\sin(x)^4}\,\csc(x)^2\left(\csc(x)^2\right)^{\frac{m}{2}}\cot(x)\operatorname{hypergeom}\left(\left[\frac{1}{2}, 1+\frac{m}{2}\right], \left[\frac{3}{2}\right], -\cot(x)^2\right)b\right)\\
&\quad + c_2\cos\left(\sqrt{\left(\csc(x)^2\right)^{-m}\sin(x)^4}\,\csc(x)^2\left(\csc(x)^2\right)^{\frac{m}{2}}\cot(x)\operatorname{hypergeom}\left(\left[\frac{1}{2}, 1+\frac{m}{2}\right], \left[\frac{3}{2}\right], -\cot(x)^2\right)b\right)
\end{aligned}$$

The above shows that

$$u'(x) = \frac{b\left(\csc(x)^2\right)^{-\frac{m}{2}}\left(-\frac{\cot(x)^2(2+m)\operatorname{hypergeom}\left(\left[\frac{3}{2}, 2+\frac{m}{2}\right], \left[\frac{5}{2}\right], -\cot(x)^2\right)}{3} + \operatorname{hypergeom}\left(\left[\frac{1}{2}, 1+\frac{m}{2}\right], \left[\frac{3}{2}\right], -\cot(x)^2\right)\right)\left(\right.}{}$$

Using the above in (1) gives the solution

$$y = -\frac{b\left(\csc(x)^2\right)^{-\frac{m}{2}}\left(-\frac{\cot(x)^2(2+m)\operatorname{hypergeom}\left(\left[\frac{3}{2}, 2+\frac{m}{2}\right], \left[\frac{5}{2}\right], -\cot(x)^2\right)}{3} + \operatorname{hypergeom}\left(\left[\frac{1}{2}, 1+\frac{m}{2}\right], \left[\frac{3}{2}\right], -\cot(x)^2\right)\right.}{\sqrt{\left(\csc(x)^2\right)^{-m}\sin(x)^4}\left(c_1\sin\left(\sqrt{\left(\csc(x)^2\right)^{-m}\sin(x)^4}\,\csc(\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-\sin\left(\sqrt{\left(\csc\left(x\right)^{2}\right)^{-m}\sin\left(x\right)^{4}}\,\csc\left(x\right)^{2}\left(\csc\left(x\right)^{2}\right)^{\frac{m}{2}}\cot\left(x\right)\mathrm{hypergeom}\left(\left[\frac{1}{2}, 1+\frac{m}{2}\right], \left[\frac{3}{2}\right], -\cot\left(x\right)^{2}\right)b\right)\right.}{\left(c_3\sin\left(\sqrt{\left(\csc\left(x\right)^{2}\right)^{-m}\sin\left(x\right)^{4}}\,\csc\left(x\right)^{2}\left(\csc\left(x\right)^{2}\right)^{\frac{m}{2}}\cot\left(x\right)\mathrm{hy}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(-\sin\left(\sqrt{\left(\csc\left(x\right)^{2}\right)^{-m}\sin\left(x\right)^{4}}\,\csc\left(x\right)^{2}\left(\csc\left(x\right)^{2}\right)^{\frac{m}{2}}\cot\left(x\right)\mathrm{hypergeom}\left(\left[\frac{1}{2}, 1+\frac{m}{2}\right], \left[\frac{3}{2}\right], -\cot\left(x\right)^{2}\right)b\right)\right.}{\left(c_3\sin\left(\sqrt{\left(\csc\left(x\right)^{2}\right)^{-m}\sin\left(x\right)^{4}}\,\csc\left(x\right)^{2}\left(\csc\left(x\right)^{2}\right)^{\frac{m}{2}}\cot\left(x\right)\mathrm{hy}\right.\right.} \tag{1}$$

Verification of solutions

$$y = \frac{\left(-\sin\left(\sqrt{\left(\csc\left(x\right)^{2}\right)^{-m}\sin\left(x\right)^{4}}\,\csc\left(x\right)^{2}\left(\csc\left(x\right)^{2}\right)^{\frac{m}{2}}\cot\left(x\right)\mathrm{hypergeom}\left(\left[\frac{1}{2}, 1+\frac{m}{2}\right], \left[\frac{3}{2}\right], -\cot\left(x\right)^{2}\right)b\right)\right.}{\left(c_3\sin\left(\sqrt{\left(\csc\left(x\right)^{2}\right)^{-m}\sin\left(x\right)^{4}}\,\csc\left(x\right)^{2}\left(\csc\left(x\right)^{2}\right)^{\frac{m}{2}}\cot\left(x\right)\mathrm{hy}\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$\boxed{y' - y^2 = -2\lambda^2 \tan(x)^2 - 2\lambda^2 \cot(\lambda x)^2}$$

13.10.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 - 2\lambda^2 \tan(x)^2 - 2\lambda^2 \cot(\lambda x)^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 - 2\lambda^2 \tan(x)^2 - 2\lambda^2 \cot(\lambda x)^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -2\lambda^2 \tan(x)^2 - 2\lambda^2 \cot(\lambda x)^2$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= 0 \\ f_2^2f_0 &= -2\lambda^2\tan(x)^2 - 2\lambda^2\cot(\lambda x)^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-2\lambda^2\tan(x)^2 - 2\lambda^2\cot(\lambda x)^2\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

✗ Solution by Maple

Problem number: 57.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = 2ab + \lambda a + b\lambda + a(\lambda - a)\tan(\lambda x)^2 + b(\lambda - b)\cot(\lambda x)^2}$$

13.11.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= -b^2\cot(\lambda x)^2 + b\cot(\lambda x)^2\lambda - a^2\tan(\lambda x)^2 + a\tan(\lambda x)^2\lambda + 2ab + \lambda a + b\lambda + y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -b^2\cot(\lambda x)^2 + b\cot(\lambda x)^2\lambda - a^2\tan(\lambda x)^2 + a\tan(\lambda x)^2\lambda + 2ab + \lambda a + b\lambda + y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -b^2\cot(\lambda x)^2 + b\cot(\lambda x)^2\lambda - a^2\tan(\lambda x)^2 + a\tan(\lambda x)^2\lambda + 2ab + \lambda a + b\lambda$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= -b^2 \cot(\lambda x)^2 + b\cot(\lambda x)^2 \lambda - a^2 \tan(\lambda x)^2 + a\tan(\lambda x)^2 \lambda + 2ab + \lambda a + b\lambda \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-b^2 \cot(\lambda x)^2 + b\cot(\lambda x)^2 \lambda - a^2 \tan(\lambda x)^2 + a\tan(\lambda x)^2 \lambda + 2ab + \lambda a + b\lambda\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned} u(x) &= c_1 \cos(\lambda x)^{\frac{a}{\lambda}} \sin(\lambda x)^{\frac{b}{\lambda}} \\ &\quad + c_2 \cos(\lambda x)^{\frac{\lambda-a}{\lambda}} \sin(\lambda x)^{\frac{\lambda-b}{\lambda}} \operatorname{hypergeom}\left(\left[1, \frac{-b+\lambda-a}{\lambda}\right], \left[-\frac{-3\lambda+2a}{2\lambda}\right], \cos(\lambda x)^2\right) \end{aligned}$$

The above shows that

$$u'(x) = \frac{-4\cos(\lambda x)^{\frac{2\lambda-a}{\lambda}} \sin(\lambda x)^{\frac{2\lambda-b}{\lambda}} c_2 \lambda(a+b-\lambda) \operatorname{hypergeom}\left(\left[2, \frac{2\lambda-a-b}{\lambda}\right], \left[-\frac{-5\lambda+2a}{2\lambda}\right], \cos(\lambda x)^2\right) - 2\left(-\frac{3\lambda}{2} + \cdots\right.}{\cdots}$$

Using the above in (1) gives the solution

$$y = -\frac{-4\cos(\lambda x)^{\frac{2\lambda-a}{\lambda}} \sin(\lambda x)^{\frac{2\lambda-b}{\lambda}} c_2 \lambda(a+b-\lambda) \operatorname{hypergeom}\left(\left[2, \frac{2\lambda-a-b}{\lambda}\right], \left[-\frac{-5\lambda+2a}{2\lambda}\right], \cos(\lambda x)^2\right) - 2\left(-\frac{3\lambda}{2} \cdots\right.}{(-3\lambda+2a)\left(c_1 \cos(\lambda \cdots\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{4\lambda\cos(\lambda x)^2 \sin(\lambda x)^2 (a+b-\lambda) \operatorname{hypergeom}\left(\left[2, \frac{2\lambda-a-b}{\lambda}\right], \left[-\frac{-5\lambda+2a}{2\lambda}\right], \cos(\lambda x)^2\right) + \left((6\lambda^2 + (-7a-3b)\cdots\right.}{(-3\lambda+2a)\left(c_3 \cos(\lambda x)\cdots\right.}$$

Summary
The solution(s) found are the following

$$y = \frac{4\lambda \cos(\lambda x)^2 \sin(\lambda x)^2 (a+b-\lambda) \operatorname{hypergeom}\left(\left[2, \frac{2\lambda-a-b}{\lambda}\right], \left[-\frac{-5\lambda+2a}{2\lambda}\right], \cos(\lambda x)^2\right) + \left((6\lambda^2 + (-7a-3b)\right.}{(-3\lambda+2a)\left(c_3 \cos(\lambda x)\right.} \tag{1}$$

Verification of solutions

$$y = \frac{4\lambda \cos(\lambda x)^2 \sin(\lambda x)^2 (a+b-\lambda) \operatorname{hypergeom}\left(\left[2, \frac{2\lambda-a-b}{\lambda}\right], \left[-\frac{-5\lambda+2a}{2\lambda}\right], \cos(\lambda x)^2\right) + \left((6\lambda^2 + (-7a-3b)\right.}{(-3\lambda+2a)\left(c_3 \cos(\lambda x)\right.}$$

Verified OK.

Problem number: 58.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 = -\frac{\lambda^2}{2} - \frac{3\lambda^2 \tan(\lambda x)^2}{4} + a\cos(\lambda x)^2 \sin(\lambda x)^n}$$

13.12.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 - \frac{\lambda^2}{2} - \frac{3\lambda^2 \tan(\lambda x)^2}{4} + a\cos(\lambda x)^2 \sin(\lambda x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 - \frac{\lambda^2}{2} - \frac{3\lambda^2 \tan(\lambda x)^2}{4} + a\cos(\lambda x)^2 \sin(\lambda x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{\lambda^2}{2} - \frac{3\lambda^2 \tan(\lambda x)^2}{4} + a\cos(\lambda x)^2 \sin(\lambda x)^n$, $f_1(x) = 0$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= -\frac{\lambda^2}{2} - \frac{3\lambda^2 \tan(\lambda x)^2}{4} + a\cos(\lambda x)^2 \sin(\lambda x)^n \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) + \left(-\frac{\lambda^2}{2} - \frac{3\lambda^2 \tan(\lambda x)^2}{4} + a\cos(\lambda x)^2 \sin(\lambda x)^n\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{-\csc\left(\frac{\pi(n+3)}{2+n}\right) c_1 \operatorname{BesselI}\left(-\frac{1}{2+n}, 2\sqrt{-\frac{a\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) \pi \left(-\frac{a\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{1}{4+2n}} + c_2 \sin(\lambda x) \operatorname{BesselI}\left(\frac{1}{2+n}, 2\sqrt{-\right.}{\sqrt{\cos(\lambda x)}\,(2+n)\,\Gamma\left(\frac{n+3}{2+n}\right)}$$

The above shows that

$$u'(x) = \frac{\left(2\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{a\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} c_2 \cos(\lambda x)^2 (2+n)^2 \operatorname{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{a\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) + c_2 \operatorname{BesselI}\left(\frac{1}{2+n}, 2\sqrt{\right.\right.}{}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(2\Gamma\left(\frac{n+3}{2+n}\right)^2 \left(-\frac{a\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} c_2 \cos(\lambda x)^2 (2+n)^2 \operatorname{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{a\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) + c_2 \operatorname{BesselI}\left(\frac{1}{2+n},\right.\right.}{2\cos(\lambda x)\left(-\csc\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(-2\Gamma\left(\frac{n+3}{2+n}\right)^2 \sin\left(\frac{\pi(n+3)}{2+n}\right) \left(-\frac{a\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} \cos(\lambda x)(2+n)^2 \operatorname{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{a\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) + 2\left(-\frac{a \sin}{\lambda^2}\right.\right.}{-2c_3 \operatorname{Bes}}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(-2\Gamma\left(\frac{n+3}{2+n}\right)^2 \sin\left(\frac{\pi(n+3)}{2+n}\right) \left(-\frac{a\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} \cos(\lambda x)(2+n)^2 \operatorname{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{a\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) + 2\left(-\frac{a \sin}{\lambda^2}\right.\right.}{-2c_3 \operatorname{Bes}} \tag{1}$$

Verification of solutions

$$y = \frac{\left(-2\Gamma\left(\frac{n+3}{2+n}\right)^2 \sin\left(\frac{\pi(n+3)}{2+n}\right) \left(-\frac{a\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}\right)^{\frac{n+1}{4+2n}} \cos(\lambda x)(2+n)^2 \operatorname{BesselI}\left(\frac{n+3}{2+n}, 2\sqrt{-\frac{a\sin(\lambda x)^{2+n}}{\lambda^2(2+n)^2}}\right) + 2\left(-\frac{a \sin}{\lambda^2}\right.\right.}{-2c_3 \operatorname{Bes}}$$

Verified OK.

Problem number: 59.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \sin(\lambda x)\, y^2 - a \sin(\lambda x)\, y = -a \tan(\lambda x)}$$

13.13.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \lambda \sin(\lambda x)\, y^2 + a \sin(\lambda x)\, y - a \tan(\lambda x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \lambda \sin(\lambda x)\, y^2 + a \sin(\lambda x)\, y - a \tan(\lambda x)$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a \tan(\lambda x)$, $f_1(x) = a \sin(\lambda x)$ and $f_2(x) = \lambda \sin(\lambda x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\lambda \sin(\lambda x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \lambda^2 \cos(\lambda x) \\ f_1 f_2 &= a \sin(\lambda x)^2 \lambda \\ f_2^2 f_0 &= -a \tan(\lambda x)\, \lambda^2 \sin(\lambda x)^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\lambda \sin(\lambda x)\, u''(x) - \left(a \sin(\lambda x)^2 \lambda + \lambda^2 \cos(\lambda x)\right) u'(x) - a \tan(\lambda x)\, \lambda^2 \sin(\lambda x)^2 u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = -\mathrm{e}^{-\frac{a\cos(\lambda x)}{\lambda}} c_2 \lambda + \cos(\lambda x) \left(a\ \mathrm{expIntegral}_1\left(\frac{a\cos(\lambda x)}{\lambda}\right) c_2 + c_1\right)$$

The above shows that

$$u'(x) = -\lambda \sin(\lambda x) \left(a\ \mathrm{expIntegral}_1\left(\frac{a\cos(\lambda x)}{\lambda}\right) c_2 + c_1\right)$$

Using the above in (1) gives the solution

$$y = \frac{a\ \mathrm{expIntegral}_1\left(\frac{a\cos(\lambda x)}{\lambda}\right) c_2 + c_1}{-\mathrm{e}^{-\frac{a\cos(\lambda x)}{\lambda}} c_2 \lambda + \cos(\lambda x) \left(a\ \mathrm{expIntegral}_1\left(\frac{a\cos(\lambda x)}{\lambda}\right) c_2 + c_1\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\mathrm{expIntegral}_1\left(\frac{a\cos(\lambda x)}{\lambda}\right) a + c_3}{-\mathrm{e}^{-\frac{a\cos(\lambda x)}{\lambda}} \lambda + \cos(\lambda x) \left(\mathrm{expIntegral}_1\left(\frac{a\cos(\lambda x)}{\lambda}\right) a + c_3\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{\operatorname{expIntegral}_1\left(\frac{a \cos(\lambda x)}{\lambda}\right) a + c_3}{-\mathrm{e}^{-\frac{a \cos(\lambda x)}{\lambda}} \lambda + \cos(\lambda x) \left(\operatorname{expIntegral}_1\left(\frac{a \cos(\lambda x)}{\lambda}\right) a + c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{\operatorname{expIntegral}_1\left(\frac{a \cos(\lambda x)}{\lambda}\right) a + c_3}{-\mathrm{e}^{-\frac{a \cos(\lambda x)}{\lambda}} \lambda + \cos(\lambda x) \left(\operatorname{expIntegral}_1\left(\frac{a \cos(\lambda x)}{\lambda}\right) a + c_3\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - y^2 - \lambda \arcsin(x)^n y = -a^2 + a\lambda \arcsin(x)^n}$$

14.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + \lambda \arcsin(x)^n y - a^2 + a\lambda \arcsin(x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \lambda \arcsin(x)^n y - a^2 + a\lambda \arcsin(x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2 + a\lambda \arcsin(x)^n$, $f_1(x) = \arcsin(x)^n \lambda$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \arcsin(x)^n \lambda \\ f_2^2 f_0 &= -a^2 + a\lambda \arcsin(x)^n \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \arcsin(x)^n \lambda u'(x) + \left(-a^2 + a\lambda \arcsin(x)^n\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\int \frac{a\left(\int \mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}dx\right)-c_1 a+\mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}}{-c_1+\int \mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}dx}dx} c_2$$

The above shows that

$$u'(x) = \frac{\left(a\left(\int \mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}dx\right) - c_1 a + \mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}\right) \mathrm{e}^{\int \frac{a\left(\int \mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}dx\right)-c_1 a+\mathrm{e}^{-(\int (-\mathrm{arc}}}{-c_1+\int \mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}dx}}}{-c_1+\int \mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}dx}$$

Using the above in (1) gives the solution

$$y = -\frac{a\left(\int \mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}dx\right) - c_1 a + \mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}}{-c_1+\int \mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}dx}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-a\left(\int \mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}dx\right) + c_3 a - \mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}}{-c_3+\int \mathrm{e}^{-\left(\int \left(-\arcsin(x)^n\lambda+2a\right)dx\right)}dx}$$

Summary
The solution(s) found are the following

$$y = \frac{-a\left(\int e^{-\left(\int \left(-\arcsin(x)^n \lambda+2a\right)dx\right)}dx\right)+c_3 a-e^{-\left(\int \left(-\arcsin(x)^n \lambda+2a\right)dx\right)}}{-c_3+\int e^{-\left(\int \left(-\arcsin(x)^n \lambda+2a\right)dx\right)}dx} \tag{1}$$

Verification of solutions

$$y = \frac{-a\left(\int e^{-\left(\int \left(-\arcsin(x)^n \lambda+2a\right)dx\right)}dx\right)+c_3 a-e^{-\left(\int \left(-\arcsin(x)^n \lambda+2a\right)dx\right)}}{-c_3+\int e^{-\left(\int \left(-\arcsin(x)^n \lambda+2a\right)dx\right)}dx}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-1. Equations containing arcsine.
Problem number: 2.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - \lambda x \arcsin(x)^n y = \arcsin(x)^n \lambda}$$

14.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + \arcsin(x)^n \lambda x y + \arcsin(x)^n \lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \arcsin(x)^n \lambda x y + \arcsin(x)^n \lambda$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \arcsin(x)^n \lambda$, $f_1(x) = \arcsin(x)^n \lambda x$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= \arcsin(x)^n \lambda x \\ f_2^2 f_0 &= \arcsin(x)^n \lambda \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \arcsin(x)^n \lambda x u'(x) + \arcsin(x)^n \lambda u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x\left(c_1\left(\int e^{\int \frac{\arcsin(x)^n \lambda x^2 - 2}{x}dx}dx\right) + c_2\right)$$

The above shows that

$$u'(x) = c_1\left(\int e^{\int \frac{\arcsin(x)^n \lambda x^2 - 2}{x}dx}dx\right) + c_2 + xc_1 e^{\int \frac{\arcsin(x)^n \lambda x^2 - 2}{x}dx}$$

Using the above in (1) gives the solution

$$y = -\frac{c_1\left(\int e^{\int \frac{\arcsin(x)^n \lambda x^2 - 2}{x}dx}dx\right) + c_2 + xc_1 e^{\int \frac{\arcsin(x)^n \lambda x^2 - 2}{x}dx}}{x\left(c_1\left(\int e^{\int \frac{\arcsin(x)^n \lambda x^2 - 2}{x}dx}dx\right) + c_2\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-c_3\left(\int e^{\int \frac{\arcsin(x)^n \lambda x^2 - 2}{x}dx}dx\right) - 1 - xc_3 e^{\int \frac{\arcsin(x)^n \lambda x^2 - 2}{x}dx}}{x\left(c_3\left(\int e^{\int \frac{\arcsin(x)^n \lambda x^2 - 2}{x}dx}dx\right) + 1\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{-c_3\left(\int e^{\int \frac{\arcsin(x)^n \lambda\, x^2-2}{x}dx}dx\right)-1-x c_3 e^{\int \frac{\arcsin(x)^n \lambda\, x^2-2}{x}dx}}{x\left(c_3\left(\int e^{\int \frac{\arcsin(x)^n \lambda\, x^2-2}{x}dx}dx\right)+1\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-c_3\left(\int e^{\int \frac{\arcsin(x)^n \lambda\, x^2-2}{x}dx}dx\right)-1-x c_3 e^{\int \frac{\arcsin(x)^n \lambda\, x^2-2}{x}dx}}{x\left(c_3\left(\int e^{\int \frac{\arcsin(x)^n \lambda\, x^2-2}{x}dx}dx\right)+1\right)}$$

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-1. Equations containing arcsine.
Problem number: 3.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' + (k+1)\, x^k y^2 - \lambda \arcsin(x)^n \left(x^{k+1} y - 1\right) = 0}$$

14.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= x^{k+1} \arcsin(x)^n \lambda y - x^k y^2 k - x^k y^2 - \arcsin(x)^n \lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^k x \arcsin(x)^n \lambda y - x^k y^2 k - x^k y^2 - \arcsin(x)^n \lambda$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\arcsin(x)^n \lambda$, $f_1(x) = x^{k+1} \arcsin(x)^n \lambda$ and $f_2(x) = -x^k k - x^k$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{(-x^k k - x^k)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{k^2 x^k}{x} - \frac{k\, x^k}{x} \\ f_1 f_2 &= x^{k+1} \arcsin(x)^n \lambda\left(-x^k k - x^k\right) \\ f_2^2 f_0 &= -\left(-x^k k - x^k\right)^2 \arcsin(x)^n \lambda \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\left(-x^k k - x^k\right) u''(x) - \left(-\frac{k^2 x^k}{x} - \frac{k\, x^k}{x} + x^{k+1} \arcsin(x)^n \lambda\left(-x^k k - x^k\right)\right) u'(x) - \left(-x^k k - x^k\right)^2 \arcsin(x)$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{k+1}\left(\left(\int x^{-2k-2} \mathrm{e}^{\int \left(x^{k+1} \arcsin(x)^n \lambda + \frac{k}{x}\right) dx} dx\right) c_2 + c_1\right)$$

The above shows that

$$u'(x) = c_2 x^{-k-1} \mathrm{e}^{\int \frac{x^{k+2} \lambda \arcsin(x)^n + k}{x} dx} + (k+1)\left(\left(\int \mathrm{e}^{\int \frac{x^{k+2} \lambda \arcsin(x)^n + k}{x} dx} x^{-2k-2} dx\right) c_2 + c_1\right) x^k$$

Using the above in (1) gives the solution

$$y = -\frac{\left(c_2 x^{-k-1} \mathrm{e}^{\int \frac{x^{k+2} \lambda \arcsin(x)^n + k}{x} dx} + (k+1)\left(\left(\int \mathrm{e}^{\int \frac{x^{k+2} \lambda \arcsin(x)^n + k}{x} dx} x^{-2k-2} dx\right) c_2 + c_1\right) x^k\right) x^{-k-1}}{\left(-x^k k - x^k\right)\left(\left(\int x^{-2k-2} \mathrm{e}^{\int \left(x^{k+1} \arcsin(x)^n \lambda + \frac{k}{x}\right) dx} dx\right) c_2 + c_1\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{(k+1)\left(\int x^{-2k-2} \mathrm{e}^{\int \left(x^{k+1} \arcsin(x)^n \lambda + \frac{k}{x}\right) dx} dx + c_3\right) x^{-k-1} + x^{-3k-2} \mathrm{e}^{\int \left(x^{k+1} \arcsin(x)^n \lambda + \frac{k}{x}\right) dx}}{(k+1)\left(\int \mathrm{e}^{\int \frac{x^{k+2} \lambda \arcsin(x)^n + k}{x} dx} x^{-2k-2} dx + c_3\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{(k+1)\left(\int x^{-2k-2} e^{\int \left(x^{k+1} \arcsin(x)^{n} \lambda+\frac{k}{x}\right)dx} dx + c_3\right) x^{-k-1} + x^{-3k-2} e^{\int \left(x^{k+1} \arcsin(x)^{n} \lambda+\frac{k}{x}\right)dx}}{(k+1)\left(\int e^{\int \frac{x^{k+2} \lambda \arcsin(x)^{n}+k}{x}dx} x^{-2k-2} dx + c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{(k+1)\left(\int x^{-2k-2} e^{\int \left(x^{k+1} \arcsin(x)^{n} \lambda+\frac{k}{x}\right)dx} dx + c_3\right) x^{-k-1} + x^{-3k-2} e^{\int \left(x^{k+1} \arcsin(x)^{n} \lambda+\frac{k}{x}\right)dx}}{(k+1)\left(\int e^{\int \frac{x^{k+2} \lambda \arcsin(x)^{n}+k}{x}dx} x^{-2k-2} dx + c_3\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-1. Equations containing arcsine.
Problem number: 4.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \arcsin(x)^n y^2 - ay = ab - b^2\lambda \arcsin(x)^n}$$

14.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \lambda \arcsin(x)^n y^2 + ya + ab - b^2\lambda \arcsin(x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \lambda \arcsin(x)^n y^2 + ya + ab - b^2\lambda \arcsin(x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = ab - b^2\lambda \arcsin(x)^n$, $f_1(x) = a$ and $f_2(x) = \arcsin(x)^n \lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\arcsin(x)^n \lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{\arcsin(x)^n\, n\lambda}{\sqrt{-x^2+1}\,\arcsin(x)} \\
f_1f_2 &= a\lambda\arcsin(x)^n \\
f_2^2f_0 &= \arcsin(x)^{2n}\,\lambda^2\left(ab - b^2\lambda\arcsin(x)^n\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\arcsin(x)^n\,\lambda u''(x) - \left(\frac{\arcsin(x)^n\, n\lambda}{\sqrt{-x^2+1}\,\arcsin(x)} + a\lambda\arcsin(x)^n\right)u'(x) + \arcsin(x)^{2n}\,\lambda^2\left(ab - b^2\lambda\arcsin(x)^n\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) = \mathrm{DESol}\Bigg(\Bigg\{_Y''(x) - \frac{n_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)} - a_Y'(x) - \arcsin(x)^{2n}\,b^2\lambda^2_Y(x) \\
+ \arcsin(x)^n\,ab\lambda_Y(x)\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

The above shows that

$$\begin{aligned}
u'(x) = \frac{\partial}{\partial x}\,\mathrm{DESol}\Bigg(\Bigg\{_Y''(x) - \frac{n_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)} - a_Y'(x) \\
- \arcsin(x)^{2n}\,b^2\lambda^2_Y(x) + \arcsin(x)^n\,ab\lambda_Y(x)\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)} - a\_Y'(x) - \arcsin(x)^{2n}\,b^2\lambda^2\_Y(x) + \arcsin(x)^n\,ab\lambda\_Y(x)\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)} - a\_Y'(x) - \arcsin(x)^{2n}\,b^2\lambda^2\_Y(x) + \arcsin(x)^n\,ab\lambda\_\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$
y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\left(-\arcsin(x)^{1+2n}\_\_Y(x)b^2\lambda^2+\arcsin(x)^{n+1}\_\_Y(x)ab\lambda-\arcsin(x)\left(a\_\_Y'(x)-\_\_Y''(x)\right)\right)\sqrt{-x^2+1}-n\_\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)}\right\}\cdots\right)\right)}{\lambda\operatorname{DESol}\left(\left\{\frac{\left(-\arcsin(x)^{1+2n}\_\_Y(x)b^2\lambda^2+\arcsin(x)^{n+1}\_\_Y(x)ab\lambda-\arcsin(x)\left(a\_\_Y'(x)-\_\_Y''(x)\right)\right)\sqrt{-x^2+1}-n\_\_Y\cdots}{\sqrt{-x^2+1}\,\arcsin(x)}\right.\right.}
$$

Summary

The solution(s) found are the following

$$
y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\left(-\arcsin(x)^{1+2n}\_\_Y(x)b^2\lambda^2+\arcsin(x)^{n+1}\_\_Y(x)ab\lambda-\arcsin(x)\left(a\_\_Y'(x)-\_\_Y''(x)\right)\right)\sqrt{-x^2+1}-n\_\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)}\right\}\cdots\right)\right)}{\lambda\operatorname{DESol}\left(\left\{\frac{\left(-\arcsin(x)^{1+2n}\_\_Y(x)b^2\lambda^2+\arcsin(x)^{n+1}\_\_Y(x)ab\lambda-\arcsin(x)\left(a\_\_Y'(x)-\_\_Y''(x)\right)\right)\sqrt{-x^2+1}-n\_\_Y\cdots}{\sqrt{-x^2+1}\,\arcsin(x)}\right.\right.} \tag{1}
$$

Verification of solutions

$$
y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\left(-\arcsin(x)^{1+2n}\_\_Y(x)b^2\lambda^2+\arcsin(x)^{n+1}\_\_Y(x)ab\lambda-\arcsin(x)\left(a\_\_Y'(x)-\_\_Y''(x)\right)\right)\sqrt{-x^2+1}-n\_\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)}\right\}\cdots\right)\right)}{\lambda\operatorname{DESol}\left(\left\{\frac{\left(-\arcsin(x)^{1+2n}\_\_Y(x)b^2\lambda^2+\arcsin(x)^{n+1}\_\_Y(x)ab\lambda-\arcsin(x)\left(a\_\_Y'(x)-\_\_Y''(x)\right)\right)\sqrt{-x^2+1}-n\_\_Y\cdots}{\sqrt{-x^2+1}\,\arcsin(x)}\right.\right.}
$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-1. Equations containing arcsine.
Problem number: 5.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \arcsin(x)^n y^2 + b\lambda\, x^m \arcsin(x)^n y = bm\, x^{m-1}}$$

14.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \lambda \arcsin(x)^n y^2 - b\lambda\, x^m \arcsin(x)^n y + bm\, x^{m-1} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \lambda \arcsin(x)^n y^2 - b\lambda\, x^m \arcsin(x)^n y + \frac{b\, x^m m}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = bm\, x^{m-1}$, $f_1(x) = -b\lambda\, x^m \arcsin(x)^n$ and $f_2(x) = \arcsin(x)^n \lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\arcsin(x)^n \lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{\arcsin(x)^n n\lambda}{\sqrt{-x^2+1}\,\arcsin(x)} \\ f_1 f_2 &= -b\,\lambda^2 x^m \arcsin(x)^{2n} \\ f_2^2 f_0 &= \arcsin(x)^{2n} \lambda^2 bm\,x^{m-1} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\arcsin(x)^n \lambda u''(x) - \left(-b\,\lambda^2 x^m \arcsin(x)^{2n} + \frac{\arcsin(x)^n n\lambda}{\sqrt{-x^2+1}\,\arcsin(x)}\right) u'(x) + \arcsin(x)^{2n} \lambda^2 bm\,x^{m-1} u(x)$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) + b\,x^m \lambda \arcsin(x)^n \_Y'(x) - \frac{n\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)} + bm\,x^{m-1}\lambda\_Y(x)\arcsin(x)^n\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + b\,x^m \lambda \arcsin(x)^n \_Y'(x) - \frac{n\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)} + bm\,x^{m-1}\lambda\_Y(x)\arcsin(x)^n\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + b\,x^m \lambda \arcsin(x)^n \_Y'(x) - \frac{n\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)} + bm\,x^{m-1}\lambda\_Y(x)\arcsin(x)^n\right\},\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\_Y''(x) + b\,x^m \lambda \arcsin(x)^n \_Y'(x) - \frac{n\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)} + bm\,x^{m-1}\lambda\_Y(x)\arcsin(\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(b\lambda\left(m\_\_Y(x)x^{m-1}+\_\_Y'(x)x^{m}\right)\arcsin(x)^{n+1}+\arcsin(x)\_\_Y''(x)\right)\sqrt{-x^2+1}-n\_\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)}\right\},\{\_\_Y(x)\}\right)\right)\mathrm{ar}}{\lambda\,\mathrm{DESol}\left(\left\{\frac{\left(b\lambda\left(m\,x^{m}\_\_Y(x)+\_\_Y'(x)x^{m+1}\right)\arcsin(x)^{n+1}+\arcsin(x)\_\_Y''(x)x\right)\sqrt{-x^2+1}-\_\_Y'(x)xn}{\sqrt{-x^2+1}\,x\arcsin(x)}\right\},\{\_\_Y(x)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(b\lambda\left(m\_\_Y(x)x^{m-1}+\_\_Y'(x)x^{m}\right)\arcsin(x)^{n+1}+\arcsin(x)\_\_Y''(x)\right)\sqrt{-x^2+1}-n\_\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)}\right\},\{\_\_Y(x)\}\right)\right)\mathrm{ar}}{\lambda\,\mathrm{DESol}\left(\left\{\frac{\left(b\lambda\left(m\,x^{m}\_\_Y(x)+\_\_Y'(x)x^{m+1}\right)\arcsin(x)^{n+1}+\arcsin(x)\_\_Y''(x)x\right)\sqrt{-x^2+1}-\_\_Y'(x)xn}{\sqrt{-x^2+1}\,x\arcsin(x)}\right\},\{\_\_Y(x)} \quad (1)$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(b\lambda\left(m\_\_Y(x)x^{m-1}+\_\_Y'(x)x^{m}\right)\arcsin(x)^{n+1}+\arcsin(x)\_\_Y''(x)\right)\sqrt{-x^2+1}-n\_\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)}\right\},\{\_\_Y(x)\}\right)\right)\mathrm{ar}}{\lambda\,\mathrm{DESol}\left(\left\{\frac{\left(b\lambda\left(m\,x^{m}\_\_Y(x)+\_\_Y'(x)x^{m+1}\right)\arcsin(x)^{n+1}+\arcsin(x)\_\_Y''(x)x\right)\sqrt{-x^2+1}-\_\_Y'(x)xn}{\sqrt{-x^2+1}\,x\arcsin(x)}\right\},\{\_\_Y(x)}$$

Verified OK.

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \beta m x^{m-1} - \lambda \beta^2 x^{2m} \arcsin(x)^n$, $f_1(x) = 0$ and $f_2(x) = \arcsin(x)^n \lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\arcsin(x)^n \lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{\arcsin(x)^n \, n\lambda}{\sqrt{-x^2+1}\, \arcsin(x)} \\
f_1 f_2 &= 0 \\
f_2^2 f_0 &= \arcsin(x)^{2n} \lambda^2 \left(\beta m \, x^{m-1} - \lambda\, \beta^2 x^{2m} \arcsin(x)^n\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\arcsin(x)^n \, \lambda u''(x) - \frac{\arcsin(x)^n \, n\lambda u'(x)}{\sqrt{-x^2+1}\, \arcsin(x)} + \arcsin(x)^{2n} \lambda^2 \left(\beta m \, x^{m-1} - \lambda\, \beta^2 x^{2m} \arcsin(x)^n\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) = \mathrm{DESol}\Bigg(\Bigg\{_Y''(x) &- \frac{n_Y'(x)}{\sqrt{-x^2+1}\, \arcsin(x)} - x^{2m}\beta^2_Y(x)\, \lambda^2 \arcsin(x)^{2n} \\
&+ m\beta\, x^{m-1}\lambda_Y(x) \arcsin(x)^n\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

The above shows that

$$\begin{aligned}
u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\Bigg(\Bigg\{_Y''(x) &- \frac{n_Y'(x)}{\sqrt{-x^2+1}\, \arcsin(x)} - x^{2m}\beta^2_Y(x)\, \lambda^2 \arcsin(x)^{2n} \\
&+ m\beta\, x^{m-1}\lambda_Y(x) \arcsin(x)^n\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{\sqrt{-x^2+1}\, \arcsin(x)} - x^{2m}\beta^2\_Y(x)\, \lambda^2 \arcsin(x)^{2n} + m\beta\, x^{m-1}\lambda\_Y(x) \arcsin(x)^n\right.\right.\right.}{\lambda\, \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{\sqrt{-x^2+1}\, \arcsin(x)} - x^{2m}\beta^2\_Y(x)\, \lambda^2 \arcsin(x)^{2n} + m\beta\, x^{m-1}\lambda\_Y(x)\, \mathrm{arcsi}\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\left(-x^{2m}\arcsin(x)^{1+2n}\_\_Y(x)\beta^2\lambda^2+x^{m-1}\arcsin(x)^{n+1}\_\_Y(x)\beta\lambda m+\arcsin(x)\_\_Y''(x)\right)\sqrt{-x^2+1}-n\_\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)}\right\},\{\right.\right.}{\lambda\operatorname{DESol}\left(\left\{\frac{\left(-x^{1+2m}\beta^2\lambda^2\arcsin(x)^{1+2n}\_\_Y(x)+m\beta x^m\lambda\arcsin(x)^{n+1}\_\_Y(x)+\arcsin(x)\_\_Y''(x)x\right)\sqrt{-x^2+1}-\_\_Y'(x}{\sqrt{-x^2+1}\,x\arcsin(x)}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\left(-x^{2m}\arcsin(x)^{1+2n}\_\_Y(x)\beta^2\lambda^2+x^{m-1}\arcsin(x)^{n+1}\_\_Y(x)\beta\lambda m+\arcsin(x)\_\_Y''(x)\right)\sqrt{-x^2+1}-n\_\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)}\right\},\{\right.\right.}{\lambda\operatorname{DESol}\left(\left\{\frac{\left(-x^{1+2m}\beta^2\lambda^2\arcsin(x)^{1+2n}\_\_Y(x)+m\beta x^m\lambda\arcsin(x)^{n+1}\_\_Y(x)+\arcsin(x)\_\_Y''(x)x\right)\sqrt{-x^2+1}-\_\_Y'(x}{\sqrt{-x^2+1}\,x\arcsin(x)}\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\left(-x^{2m}\arcsin(x)^{1+2n}\_\_Y(x)\beta^2\lambda^2+x^{m-1}\arcsin(x)^{n+1}\_\_Y(x)\beta\lambda m+\arcsin(x)\_\_Y''(x)\right)\sqrt{-x^2+1}-n\_\_Y'(x)}{\sqrt{-x^2+1}\,\arcsin(x)}\right\},\{\right.\right.}{\lambda\operatorname{DESol}\left(\left\{\frac{\left(-x^{1+2m}\beta^2\lambda^2\arcsin(x)^{1+2n}\_\_Y(x)+m\beta x^m\lambda\arcsin(x)^{n+1}\_\_Y(x)+\arcsin(x)\_\_Y''(x)x\right)\sqrt{-x^2+1}-\_\_Y'(x}{\sqrt{-x^2+1}\,x\arcsin(x)}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-1. Equations containing arcsine.
Problem number: 7.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[[_1st_order, `_with_symmetry_[F(x),G(x)]`], _Riccati]
```

$$\boxed{y' - \lambda \arcsin(x)^n (y - a\,x^m - b)^2 = am\,x^{m-1}}$$

14.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y' &= F(x,y)\\ &= x^{2m}\arcsin(x)^n a^2\lambda + 2x^m \arcsin(x)^n ab\lambda - 2x^m \arcsin(x)^n a\lambda y + b^2\lambda \arcsin(x)^n - 2\arcsin(x)^n b\lambda y\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^{2m}\arcsin(x)^n a^2\lambda+2x^m \arcsin(x)^n ab\lambda-2x^m \arcsin(x)^n a\lambda y+b^2\lambda \arcsin(x)^n-2\arcsin(x)^n b\lambda y+\lambda\,\mathrm{a}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = x^{2m}\arcsin(x)^n a^2\lambda+2x^m \arcsin(x)^n ab\lambda+b^2\lambda \arcsin(x)^n+am\,x^{m-1}$, $f_1(x) = -2a\lambda\,x^m \arcsin(x)^n - 2\arcsin(x)^n \lambda b$ and $f_2(x) = \arcsin(x)^n \lambda$. Let

$$\begin{aligned}y &= \frac{-u'}{f_2 u}\\ &= \frac{-u'}{\arcsin(x)^n \lambda u}\end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$f_2' = \frac{\arcsin(x)^n n\lambda}{\sqrt{-x^2+1}\arcsin(x)}$$
$$f_1f_2 = (-2a\lambda\, x^m \arcsin(x)^n - 2\arcsin(x)^n \lambda b)\arcsin(x)^n \lambda$$
$$f_2^2 f_0 = \arcsin(x)^{2n} \lambda^2 \left(x^{2m} \arcsin(x)^n a^2\lambda + 2x^m \arcsin(x)^n ab\lambda + b^2\lambda \arcsin(x)^n + am\, x^{m-1}\right)$$

Substituting the above terms back in equation (2) gives

$$\arcsin(x)^n \lambda u''(x) - \left(\frac{\arcsin(x)^n n\lambda}{\sqrt{-x^2+1}\arcsin(x)} + (-2a\lambda\, x^m \arcsin(x)^n - 2\arcsin(x)^n \lambda b)\arcsin(x)^n \lambda\right) u'(x$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{-\frac{n\_Y'(x)}{\sqrt{-x^2+1}} + \arcsin(x)\left(\lambda^2\_Y(x)\left(a^2x^{2m} + 2ab\, x^m + b^2\right)\arcsin(x)^{2n} + \_Y''(x) + \arcsin(x)^n\right.}{\arcsin(x)}\right.\right.$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-\frac{n\_Y'(x)}{\sqrt{-x^2+1}} + \lambda^2\_Y(x)\left(a^2x^{2m} + 2ab\, x^m + b^2\right)\arcsin(x)^{1+2n} + \left(a\, x^{m-1}m\_Y(x) + 2\_Y'(x\right.}{\arcsin(x)}\right.\right.$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-\frac{n\_Y'(x)}{\sqrt{-x^2+1}}+\lambda^2\_Y(x)(a^2x^{2m}+2ab\,x^m+b^2)\arcsin(x)^{1+2n}+\left(a\,x^{m-1}m\_Y(x)+2\_Y'(x)(a\,x^m+b)\right)\lambda\arcsin(x)^n}{\arcsin(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{-\frac{n\_Y'(x)}{\sqrt{-x^2+1}}+\arcsin(x)\left(\lambda^2\_Y(x)(a^2x^{2m}+2ab\,x^m+b^2)\arcsin(x)^{2n}+\_Y''(x)+\arcsin(x)^n am\,x^{m-1}\lambda\_Y(x)+\right.}{\arcsin(x)}\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\left(\lambda^2 \_\_Y(x)(a^2x^{2m}+2ab\,x^m+b^2)\arcsin(x)^{1+2n}+\left(a\,x^{m-1}m\_\_Y(x)+2\_\_Y'(x)(a\,x^m+b)\right)\lambda\arcsin(x)^{n+1}+\arcsin(x)\_\right.}{\sqrt{-x^2+1}\,\arcsin(x)}\right.\right.\right.}{\lambda\operatorname{DESol}\left(\left\{\frac{\left(\lambda^2 \_\_Y(x)(a^2x^{2m}+2ab\,x^m+b^2)\arcsin(x)^{1+2n}+\left(a\,x^{m-1}m\_\_Y(x)+2\_\_Y'(x)(a\,x^m+b)\right)\lambda\arcsin(x)^{n+1}+\mathrm{ar}\right.}{\sqrt{-x^2+1}\,\arcsin(x)}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\left(\lambda^2 \_\_Y(x)(a^2x^{2m}+2ab\,x^m+b^2)\arcsin(x)^{1+2n}+\left(a\,x^{m-1}m\_\_Y(x)+2\_\_Y'(x)(a\,x^m+b)\right)\lambda\arcsin(x)^{n+1}+\arcsin(x)\_\right.}{\sqrt{-x^2+1}\,\arcsin(x)}\right.\right.\right.}{\lambda\operatorname{DESol}\left(\left\{\frac{\left(\lambda^2 \_\_Y(x)(a^2x^{2m}+2ab\,x^m+b^2)\arcsin(x)^{1+2n}+\left(a\,x^{m-1}m\_\_Y(x)+2\_\_Y'(x)(a\,x^m+b)\right)\lambda\arcsin(x)^{n+1}+\mathrm{ar}\right.}{\sqrt{-x^2+1}\,\arcsin(x)}\right.\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\left(\lambda^2 \_\_Y(x)(a^2x^{2m}+2ab\,x^m+b^2)\arcsin(x)^{1+2n}+\left(a\,x^{m-1}m\_\_Y(x)+2\_\_Y'(x)(a\,x^m+b)\right)\lambda\arcsin(x)^{n+1}+\arcsin(x)\_\right.}{\sqrt{-x^2+1}\,\arcsin(x)}\right.\right.\right.}{\lambda\operatorname{DESol}\left(\left\{\frac{\left(\lambda^2 \_\_Y(x)(a^2x^{2m}+2ab\,x^m+b^2)\arcsin(x)^{1+2n}+\left(a\,x^{m-1}m\_\_Y(x)+2\_\_Y'(x)(a\,x^m+b)\right)\lambda\arcsin(x)^{n+1}+\mathrm{ar}\right.}{\sqrt{-x^2+1}\,\arcsin(x)}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-1. Equations containing arcsine.
Problem number: 8.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - \lambda \arcsin(x)^n y^2 - ky = \lambda b^2 x^{2k} \arcsin(x)^n}$$

14.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{\lambda \arcsin(x)^n y^2 + ky + \lambda b^2 x^{2k} \arcsin(x)^n}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{\lambda b^2 x^{2k} \arcsin(x)^n}{x} + \frac{\lambda \arcsin(x)^n y^2}{x} + \frac{ky}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{\lambda b^2 x^{2k} \arcsin(x)^n}{x}$, $f_1(x) = \frac{k}{x}$ and $f_2(x) = \frac{\lambda \arcsin(x)^n}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{\lambda \arcsin(x)^n u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{\lambda \arcsin(x)^n}{x^2} + \frac{\lambda \arcsin(x)^n n}{x\sqrt{-x^2+1}\,\arcsin(x)} \\
f_1f_2 &= \frac{k\lambda \arcsin(x)^n}{x^2} \\
f_2^2f_0 &= \frac{\lambda^3 \arcsin(x)^{3n} b^2x^{2k}}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{\lambda \arcsin(x)^n u''(x)}{x} - \left(-\frac{\lambda \arcsin(x)^n}{x^2} + \frac{\lambda \arcsin(x)^n n}{x\sqrt{-x^2+1}\,\arcsin(x)} + \frac{k\lambda \arcsin(x)^n}{x^2}\right)u'(x) + \frac{\lambda^3 \arcsin(x)^{3n}}{x^3}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1\mathrm{e}^{ib\lambda\left(\int x^{k-1}\arcsin(x)^n dx\right)} + c_2\mathrm{e}^{-ib\lambda\left(\int x^{k-1}\arcsin(x)^n dx\right)}$$

The above shows that

$$u'(x) = ib\,x^{k-1}\lambda \arcsin(x)^n\,\mathrm{e}^{-ib\lambda\left(\int x^{k-1}\arcsin(x)^n dx\right)}\left(c_1\mathrm{e}^{2ib\lambda\left(\int x^{k-1}\arcsin(x)^n dx\right)} - c_2\right)$$

Using the above in (1) gives the solution

$$y = -\frac{ib\,x^{k-1}\mathrm{e}^{-ib\lambda\left(\int x^{k-1}\arcsin(x)^n dx\right)}\left(c_1\mathrm{e}^{2ib\lambda\left(\int x^{k-1}\arcsin(x)^n dx\right)} - c_2\right)x}{c_1\mathrm{e}^{ib\lambda\left(\int x^{k-1}\arcsin(x)^n dx\right)} + c_2\mathrm{e}^{-ib\lambda\left(\int x^{k-1}\arcsin(x)^n dx\right)}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{ib\,x^k\left(c_3\mathrm{e}^{2ib\lambda\left(\int x^{k-1}\arcsin(x)^n dx\right)} - 1\right)}{c_3\mathrm{e}^{2ib\lambda\left(\int x^{k-1}\arcsin(x)^n dx\right)} + 1}$$

Summary

The solution(s) found are the following

$$y = -\frac{ib\,x^{k}\left(c_3 e^{2ib\lambda\left(\int x^{k-1}\arcsin(x)^{n}dx\right)}-1\right)}{c_3 e^{2ib\lambda\left(\int x^{k-1}\arcsin(x)^{n}dx\right)}+1} \tag{1}$$

Verification of solutions

$$y = -\frac{ib\,x^{k}\left(c_3 e^{2ib\lambda\left(\int x^{k-1}\arcsin(x)^{n}dx\right)}-1\right)}{c_3 e^{2ib\lambda\left(\int x^{k-1}\arcsin(x)^{n}dx\right)}+1}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x-\left(a\,x^{2m}y^2+yx^nb+c\right)\arcsin\left(x\right)^m+yn=0}$$

14.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y'&=F(x,y)\\&=\frac{\arcsin\left(x\right)^m x^{2m}a\,y^2+\arcsin\left(x\right)^m x^n by+\arcsin\left(x\right)^m c-ny}{x}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=\frac{\arcsin\left(x\right)^m x^{2m}a\,y^2}{x}+\frac{\arcsin\left(x\right)^m x^n by}{x}+\frac{\arcsin\left(x\right)^m c}{x}-\frac{ny}{x}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=\frac{\arcsin(x)^m c}{x}$, $f_1(x)=\frac{\arcsin(x)^m x^n b-n}{x}$ and $f_2(x)=\frac{\arcsin(x)^m x^{2m}a}{x}$. Let

$$\begin{aligned}y&=\frac{-u'}{f_2u}\\&=\frac{-u'}{\frac{\arcsin(x)^m x^{2m}au}{x}}\end{aligned}\tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{\arcsin(x)^m\, m\, x^{2m}a}{\sqrt{-x^2+1}\,\arcsin(x)\, x} + \frac{2\arcsin(x)^m\, x^{2m}ma}{x^2} - \frac{\arcsin(x)^m\, x^{2m}a}{x^2}\\
f_1f_2 &= \frac{(\arcsin(x)^m\, x^n b - n)\arcsin(x)^m\, x^{2m}a}{x^2}\\
f_2^2f_0 &= \frac{\arcsin(x)^{3m}\, x^{4m}a^2c}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{\arcsin(x)^m\, x^{2m}au''(x)}{x} - \left(\frac{\arcsin(x)^m\, m\, x^{2m}a}{\sqrt{-x^2+1}\,\arcsin(x)\, x} + \frac{2\arcsin(x)^m\, x^{2m}ma}{x^2} - \frac{\arcsin(x)^m\, x^{2m}a}{x^2} + \frac{(\arcsin(}{}\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) = \mathrm{DESol}\Bigg(\Bigg\{&_Y''(x) - \frac{2m_Y'(x)}{x} + \frac{n_Y'(x)}{x} - b\,x^{n-1}\arcsin(x)^m\,_Y'(x) + \frac{_Y'(x)}{x}\\
&- \frac{m_Y'(x)}{\arcsin(x)\sqrt{-x^2+1}} + ac\,x^{2m-2}_Y(x)\arcsin(x)^{2m}\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

The above shows that

$$\begin{aligned}
u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\Bigg(\Bigg\{&_Y''(x) - \frac{2m_Y'(x)}{x} + \frac{n_Y'(x)}{x} - b\,x^{n-1}\arcsin(x)^m\,_Y'(x)\\
&+ \frac{_Y'(x)}{x} - \frac{m_Y'(x)}{\arcsin(x)\sqrt{-x^2+1}} + ac\,x^{2m-2}_Y(x)\arcsin(x)^{2m}\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{2m\_Y'(x)}{x} + \frac{n\_Y'(x)}{x} - b\,x^{n-1}\arcsin(x)^m\,\_Y'(x) + \frac{\_Y'(x)}{x} - \frac{m\_Y'(x)}{\arcsin(x)\sqrt{-x^2+1}} -\right.\right.\right.}{a\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{2m\_Y'(x)}{x} + \frac{n\_Y'(x)}{x} - b\,x^{n-1}\arcsin(x)^m\,\_Y'(x) + \frac{\_Y'(x)}{x} - \frac{m}{\arcsin(}\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{x^{-2m+1} \arcsin(x)^{-m} \left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{\left(\arcsin(x)^{1+2m} x^{2m-1} \_\_Y(x) a c - x^{n} \arcsin(x)^{m+1} \_\_Y'(x) b - 2\left(-\frac{\_\_Y''(x) x}{2} + \_\_Y'(\cdots\right.\right.}{\sqrt{-x^2+1}\, \arcsin(x) x}\cdots\right.\right.}{a\, \mathrm{DESol}\left(\left\{\frac{\left(a\, x^{2m} c \arcsin(x)^{1+2m} \_\_Y(x) - b\, x^{n+1} \arcsin(x)^{m+1} \_\_Y'(x) - 2\left(-\frac{\_\_Y''(x) x}{2} + \_\_Y'(x)\left(m - \frac{n}{2} - \frac{1}{2}\right)\right) \cdots\right.}{\sqrt{-x^2+1}\, x^2 \arcsin(x)}\cdots\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{x^{-2m+1} \arcsin(x)^{-m} \left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{\left(\arcsin(x)^{1+2m} x^{2m-1} \_\_Y(x) a c - x^{n} \arcsin(x)^{m+1} \_\_Y'(x) b - 2\left(-\frac{\_\_Y''(x) x}{2} + \_\_Y'(\cdots\right.\right.}{\sqrt{-x^2+1}\, \arcsin(x) x}\cdots\right.\right.}{a\, \mathrm{DESol}\left(\left\{\frac{\left(a\, x^{2m} c \arcsin(x)^{1+2m} \_\_Y(x) - b\, x^{n+1} \arcsin(x)^{m+1} \_\_Y'(x) - 2\left(-\frac{\_\_Y''(x) x}{2} + \_\_Y'(x)\left(m - \frac{n}{2} - \frac{1}{2}\right)\right) \cdots\right.}{\sqrt{-x^2+1}\, x^2 \arcsin(x)}\cdots\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{x^{-2m+1} \arcsin(x)^{-m} \left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{\left(\arcsin(x)^{1+2m} x^{2m-1} \_\_Y(x) a c - x^{n} \arcsin(x)^{m+1} \_\_Y'(x) b - 2\left(-\frac{\_\_Y''(x) x}{2} + \_\_Y'(\cdots\right.\right.}{\sqrt{-x^2+1}\, \arcsin(x) x}\cdots\right.\right.}{a\, \mathrm{DESol}\left(\left\{\frac{\left(a\, x^{2m} c \arcsin(x)^{1+2m} \_\_Y(x) - b\, x^{n+1} \arcsin(x)^{m+1} \_\_Y'(x) - 2\left(-\frac{\_\_Y''(x) x}{2} + \_\_Y'(x)\left(m - \frac{n}{2} - \frac{1}{2}\right)\right) \cdots\right.}{\sqrt{-x^2+1}\, x^2 \arcsin(x)}\cdots\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - \lambda \arccos(x)^n y = -a^2 + a\lambda \arccos(x)^n}$$

15.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + \lambda \arccos(x)^n y - a^2 + a\lambda \arccos(x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \lambda \arccos(x)^n y - a^2 + a\lambda \arccos(x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2 + a\lambda \arccos(x)^n$, $f_1(x) = \arccos(x)^n \lambda$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \arccos(x)^n \lambda \\ f_2^2 f_0 &= -a^2 + a\lambda \arccos(x)^n \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \arccos(x)^n \lambda u'(x) + \left(-a^2 + a\lambda \arccos(x)^n\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - \lambda x \arccos(x)^n y = \arccos(x)^n \lambda}$$

15.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + \arccos(x)^n \lambda x y + \arccos(x)^n \lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \arccos(x)^n \lambda x y + \arccos(x)^n \lambda$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \arccos(x)^n \lambda$, $f_1(x) = \arccos(x)^n \lambda x$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \arccos(x)^n \lambda x \\ f_2^2 f_0 &= \arccos(x)^n \lambda \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \arccos(x)^n \lambda x u'(x) + \arccos(x)^n \lambda u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x\left(\left(\int e^{\int \frac{\arccos(x)^n \lambda x^2 - 2}{x} dx} dx\right) c_1 + c_2\right)$$

The above shows that

$$u'(x) = \left(\int e^{\int \frac{\arccos(x)^n \lambda x^2 - 2}{x} dx} dx\right) c_1 + c_2 + x\, e^{\int \frac{\arccos(x)^n \lambda x^2 - 2}{x} dx} c_1$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\int e^{\int \frac{\arccos(x)^n \lambda x^2 - 2}{x} dx} dx\right) c_1 + c_2 + x\, e^{\int \frac{\arccos(x)^n \lambda x^2 - 2}{x} dx} c_1}{x\left(\left(\int e^{\int \frac{\arccos(x)^n \lambda x^2 - 2}{x} dx} dx\right) c_1 + c_2\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\left(\int e^{\int \frac{\arccos(x)^n \lambda x^2 - 2}{x} dx} dx\right) c_3 - 1 - x\, e^{\int \frac{\arccos(x)^n \lambda x^2 - 2}{x} dx} c_3}{x\left(\left(\int e^{\int \frac{\arccos(x)^n \lambda x^2 - 2}{x} dx} dx\right) c_3 + 1\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{-\left(\int e^{\int \frac{\arccos(x)^n \lambda x^2-2}{x}dx}dx\right) c_3 - 1 - x\, e^{\int \frac{\arccos(x)^n \lambda x^2-2}{x}dx} c_3}{x\left(\left(\int e^{\int \frac{\arccos(x)^n \lambda x^2-2}{x}dx}dx\right) c_3 + 1\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-\left(\int e^{\int \frac{\arccos(x)^n \lambda x^2-2}{x}dx}dx\right) c_3 - 1 - x\, e^{\int \frac{\arccos(x)^n \lambda x^2-2}{x}dx} c_3}{x\left(\left(\int e^{\int \frac{\arccos(x)^n \lambda x^2-2}{x}dx}dx\right) c_3 + 1\right)}$$

Verified OK.

15.3 problem 12

Internal problem ID [10569]
Internal file name [`OUTPUT/9516_Monday_June_06_2022_03_02_55_PM_9309576/index.tex`]

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-2. Equations containing arccosine.
Problem number: 12.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + (k+1)\, x^k y^2 - \lambda \arccos(x)^n \left(x^{k+1} y - 1\right) = 0}$$

15.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= x^{k+1} \arccos(x)^n \lambda y - x^k y^2 k - x^k y^2 - \arccos(x)^n \lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^k x \arccos(x)^n \lambda y - x^k y^2 k - x^k y^2 - \arccos(x)^n \lambda$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = -\arccos(x)^n \lambda$, $f_1(x) = x^{k+1} \arccos(x)^n \lambda$ and $f_2(x) = -x^k k - x^k$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{(-x^k k - x^k)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{k^2 x^k}{x} - \frac{k\, x^k}{x} \\ f_1 f_2 &= x^{k+1} \arccos(x)^n \lambda(-x^k k - x^k) \\ f_2^2 f_0 &= -(-x^k k - x^k)^2 \arccos(x)^n \lambda \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$(-x^k k - x^k)\, u''(x) - \left(-\frac{k^2 x^k}{x} - \frac{k\, x^k}{x} + x^{k+1} \arccos(x)^n \lambda(-x^k k - x^k)\right) u'(x) - (-x^k k - x^k)^2 \arccos(x$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{k+1} \left(\left(\int x^{-2k-2} e^{\int \left(x^{k+1} \arccos(x)^n \lambda + \frac{k}{x}\right) dx} dx\right) c_2 + c_1\right)$$

The above shows that

$$u'(x) = c_2 x^{-k-1} e^{\int \frac{x^{k+2} \lambda \arccos(x)^n + k}{x} dx} + (k+1) \left(\left(\int e^{\int \frac{x^{k+2} \lambda \arccos(x)^n + k}{x} dx} x^{-2k-2} dx\right) c_2 + c_1\right) x^k$$

Using the above in (1) gives the solution

$$y = -\frac{\left(c_2 x^{-k-1} e^{\int \frac{x^{k+2} \lambda \arccos(x)^n + k}{x} dx} + (k+1) \left(\left(\int e^{\int \frac{x^{k+2} \lambda \arccos(x)^n + k}{x} dx} x^{-2k-2} dx\right) c_2 + c_1\right) x^k\right) x^{-k-1}}{(-x^k k - x^k) \left(\left(\int x^{-2k-2} e^{\int \left(x^{k+1} \arccos(x)^n \lambda + \frac{k}{x}\right) dx} dx\right) c_2 + c_1\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{(k+1) \left(\int x^{-2k-2} e^{\int \left(x^{k+1} \arccos(x)^n \lambda + \frac{k}{x}\right) dx} dx + c_3\right) x^{-k-1} + x^{-3k-2} e^{\int \left(x^{k+1} \arccos(x)^n \lambda + \frac{k}{x}\right) dx}}{(k+1) \left(\int e^{\int \frac{x^{k+2} \lambda \arccos(x)^n + k}{x} dx} x^{-2k-2} dx + c_3\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{(k+1)\left(\int x^{-2k-2} e^{\int \left(x^{k+1} \arccos(x)^{n} \lambda+\frac{k}{x}\right)dx} dx + c_3\right) x^{-k-1} + x^{-3k-2} e^{\int \left(x^{k+1} \arccos(x)^{n} \lambda+\frac{k}{x}\right)dx}}{(k+1)\left(\int e^{\int \frac{x^{k+2} \lambda \arccos(x)^{n}+k}{x} dx} x^{-2k-2} dx + c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{(k+1)\left(\int x^{-2k-2} e^{\int \left(x^{k+1} \arccos(x)^{n} \lambda+\frac{k}{x}\right)dx} dx + c_3\right) x^{-k-1} + x^{-3k-2} e^{\int \left(x^{k+1} \arccos(x)^{n} \lambda+\frac{k}{x}\right)dx}}{(k+1)\left(\int e^{\int \frac{x^{k+2} \lambda \arccos(x)^{n}+k}{x} dx} x^{-2k-2} dx + c_3\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-2. Equations containing arccosine.
Problem number: 13.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y' - \lambda \arccos(x)^n y^2 - ay = ab - b^2\lambda \arccos(x)^n}$$

15.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \arccos(x)^n \lambda y^2 + ya + ab - b^2\lambda \arccos(x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \arccos(x)^n \lambda y^2 + ya + ab - b^2\lambda \arccos(x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = ab - b^2\lambda \arccos(x)^n$, $f_1(x) = a$ and $f_2(x) = \arccos(x)^n \lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\arccos(x)^n \lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{\arccos(x)^n n\lambda}{\sqrt{-x^2+1}\,\arccos(x)} \\ f_1 f_2 &= a\lambda \arccos(x)^n \\ f_2^2 f_0 &= \arccos(x)^{2n} \lambda^2 \left(ab - b^2\lambda \arccos(x)^n\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\arccos(x)^n \lambda u''(x) - \left(-\frac{\arccos(x)^n n\lambda}{\sqrt{-x^2+1}\,\arccos(x)} + a\lambda \arccos(x)^n\right) u'(x) + \arccos(x)^{2n} \lambda^2 \left(ab - b^2\lambda \arccos(\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} - a\_Y'(x) - \arccos(x)^{2n} b^2\lambda^2\_Y(x) + \arccos(x)^n ab\lambda\_Y(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} - a\_Y'(x) - \arccos(x)^{2n} b^2\lambda^2\_Y(x) + \arccos(x)^n ab\lambda\_Y(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} - a\_Y'(x) - \arccos(x)^{2n} b^2\lambda^2\_Y(x) + \arccos(x)^n ab\lambda\_Y(x)\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} - a\_Y'(x) - \arccos(x)^{2n} b^2\lambda^2\_Y(x) + \arccos(x)^n ab\lambda\_\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(-\arccos(x)^{1+2n}\_\_Y(x)b^2\lambda^2+\arccos(x)^{n+1}\_\_Y(x)ab\lambda-\arccos(x)\left(a\_\_Y'(x)-\_\_Y''(x)\right)\right)\sqrt{-x^2+1}+n\_\_Y'(x)}{\sqrt{-x^2+1}\,\arccos(x)}\right\}\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{\left(-\arccos(x)^{1+2n}\_\_Y(x)b^2\lambda^2+\arccos(x)^{n+1}\_\_Y(x)ab\lambda-\arccos(x)\left(a\_\_Y'(x)-\_\_Y''(x)\right)\right)\sqrt{-x^2+1}+n\_\_}{\sqrt{-x^2+1}\,\arccos(x)}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(-\arccos(x)^{1+2n}\_\_Y(x)b^2\lambda^2+\arccos(x)^{n+1}\_\_Y(x)ab\lambda-\arccos(x)\left(a\_\_Y'(x)-\_\_Y''(x)\right)\right)\sqrt{-x^2+1}+n\_\_Y'(x)}{\sqrt{-x^2+1}\,\arccos(x)}\right\}\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{\left(-\arccos(x)^{1+2n}\_\_Y(x)b^2\lambda^2+\arccos(x)^{n+1}\_\_Y(x)ab\lambda-\arccos(x)\left(a\_\_Y'(x)-\_\_Y''(x)\right)\right)\sqrt{-x^2+1}+n\_\_}{\sqrt{-x^2+1}\,\arccos(x)}\right.\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(-\arccos(x)^{1+2n}\_\_Y(x)b^2\lambda^2+\arccos(x)^{n+1}\_\_Y(x)ab\lambda-\arccos(x)\left(a\_\_Y'(x)-\_\_Y''(x)\right)\right)\sqrt{-x^2+1}+n\_\_Y'(x)}{\sqrt{-x^2+1}\,\arccos(x)}\right\}\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{\left(-\arccos(x)^{1+2n}\_\_Y(x)b^2\lambda^2+\arccos(x)^{n+1}\_\_Y(x)ab\lambda-\arccos(x)\left(a\_\_Y'(x)-\_\_Y''(x)\right)\right)\sqrt{-x^2+1}+n\_\_}{\sqrt{-x^2+1}\,\arccos(x)}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-2. Equations containing arccosine.
Problem number: 14.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \arccos(x)^n y^2 + b\lambda x^m \arccos(x)^n y = bm x^{m-1}}$$

15.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \arccos(x)^n \lambda y^2 - b\lambda x^m \arccos(x)^n y + bm x^{m-1} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \arccos(x)^n \lambda y^2 - b\lambda x^m \arccos(x)^n y + \frac{b x^m m}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = bm x^{m-1}$, $f_1(x) = -b\lambda x^m \arccos(x)^n$ and $f_2(x) = \arccos(x)^n \lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\arccos(x)^n \lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{\arccos(x)^n n\lambda}{\sqrt{-x^2+1}\arccos(x)} \\ f_1 f_2 &= -b\lambda^2 x^m \arccos(x)^{2n} \\ f_2^2 f_0 &= \arccos(x)^{2n}\lambda^2 bm\, x^{m-1} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\arccos(x)^n \lambda u''(x) - \left(-b\lambda^2 x^m \arccos(x)^{2n} - \frac{\arccos(x)^n n\lambda}{\sqrt{-x^2+1}\arccos(x)}\right) u'(x) + \arccos(x)^{2n}\lambda^2 bm\, x^{m-1} u(x)$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \text{DESol}\left(\left\{\_Y''(x) + b\,x^m\lambda\arccos(x)^n\_Y'(x) + \frac{n\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} + bm\,x^{m-1}\lambda\_Y(x)\arccos(x)^n\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\text{DESol}\left(\left\{\_Y''(x) + b\,x^m\lambda\arccos(x)^n\_Y'(x) + \frac{n\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} + bm\,x^{m-1}\lambda\_Y(x)\arccos(x)^n\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\text{DESol}\left(\left\{\_Y''(x) + b\,x^m\lambda\arccos(x)^n\_Y'(x) + \frac{n\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} + bm\,x^{m-1}\lambda\_Y(x)\arccos(x)^n\right\},\right.\right.}{\lambda\,\text{DESol}\left(\left\{\_Y''(x) + b\,x^m\lambda\arccos(x)^n\_Y'(x) + \frac{n\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} + bm\,x^{m-1}\lambda\_Y(x)\arccos(\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(b\lambda\left(m\_\_Y(x)x^{m-1}+\_\_Y'(x)x^{m}\right)\arccos(x)^{n+1}+\arccos(x)\_\_Y''(x)\right)\sqrt{-x^{2}+1}+n\_\_Y'(x)}{\sqrt{-x^{2}+1}\,\arccos(x)}\right\},\{\_\_Y(x)\}\right)\right)\mathrm{a}}{\lambda\,\mathrm{DESol}\left(\left\{\frac{\left(b\lambda\left(m\,x^{m}\_\_Y(x)+\_\_Y'(x)x^{m+1}\right)\arccos(x)^{n+1}+\arccos(x)\_\_Y''(x)x\right)\sqrt{-x^{2}+1}+\_\_Y'(x)xn}{\sqrt{-x^{2}+1}\,x\arccos(x)}\right\},\{\_\_Y(x}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(b\lambda\left(m\_\_Y(x)x^{m-1}+\_\_Y'(x)x^{m}\right)\arccos(x)^{n+1}+\arccos(x)\_\_Y''(x)\right)\sqrt{-x^{2}+1}+n\_\_Y'(x)}{\sqrt{-x^{2}+1}\,\arccos(x)}\right\},\{\_\_Y(x)\}\right)\right)\mathrm{a}}{\lambda\,\mathrm{DESol}\left(\left\{\frac{\left(b\lambda\left(m\,x^{m}\_\_Y(x)+\_\_Y'(x)x^{m+1}\right)\arccos(x)^{n+1}+\arccos(x)\_\_Y''(x)x\right)\sqrt{-x^{2}+1}+\_\_Y'(x)xn}{\sqrt{-x^{2}+1}\,x\arccos(x)}\right\},\{\_\_Y(x}\quad(1)$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(b\lambda\left(m\_\_Y(x)x^{m-1}+\_\_Y'(x)x^{m}\right)\arccos(x)^{n+1}+\arccos(x)\_\_Y''(x)\right)\sqrt{-x^{2}+1}+n\_\_Y'(x)}{\sqrt{-x^{2}+1}\,\arccos(x)}\right\},\{\_\_Y(x)\}\right)\right)\mathrm{a}}{\lambda\,\mathrm{DESol}\left(\left\{\frac{\left(b\lambda\left(m\,x^{m}\_\_Y(x)+\_\_Y'(x)x^{m+1}\right)\arccos(x)^{n+1}+\arccos(x)\_\_Y''(x)x\right)\sqrt{-x^{2}+1}+\_\_Y'(x)xn}{\sqrt{-x^{2}+1}\,x\arccos(x)}\right\},\{\_\_Y(x}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-2. Equations containing arccosine.
Problem number: 15.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \arccos\left(x\right)^{n} y^{2} = \beta m\, x^{m-1} - \lambda\, \beta^{2} x^{2m} \arccos\left(x\right)^{n}}$$

15.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \arccos\left(x\right)^{n} \lambda\, y^{2} + \beta m\, x^{m-1} - \lambda\, \beta^{2} x^{2m} \arccos\left(x\right)^{n} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\lambda\, \beta^{2} x^{2m} \arccos\left(x\right)^{n} + \arccos\left(x\right)^{n} \lambda\, y^{2} + \frac{\beta m\, x^{m}}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \beta m\, x^{m-1} - \lambda\, \beta^{2} x^{2m} \arccos\left(x\right)^{n}$, $f_1(x) = 0$ and $f_2(x) = \arccos\left(x\right)^{n} \lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\arccos\left(x\right)^{n} \lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{\arccos(x)^n n\lambda}{\sqrt{-x^2+1}\,\arccos(x)} \\
f_1 f_2 &= 0 \\
f_2^2 f_0 &= \arccos(x)^{2n} \lambda^2 \left(\beta m\, x^{m-1} - \lambda\, \beta^2 x^{2m} \arccos(x)^n\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\arccos(x)^n \lambda u''(x) + \frac{\arccos(x)^n n\lambda u'(x)}{\sqrt{-x^2+1}\,\arccos(x)} + \arccos(x)^{2n} \lambda^2 \left(\beta m\, x^{m-1} - \lambda\, \beta^2 x^{2m} \arccos(x)^n\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} - x^{2m}\beta^2\_Y(x)\,\lambda^2 \arccos(x)^{2n} + m\beta\, x^{m-1}\lambda\_Y(x) \arccos(x)^n\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} - x^{2m}\beta^2\_Y(x)\,\lambda^2 \arccos(x)^{2n} + m\beta\, x^{m-1}\lambda\_Y(x) \arccos(x)^n\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} - x^{2m}\beta^2\_Y(x)\,\lambda^2 \arccos(x)^{2n} + m\beta\, x^{m-1}\lambda\_Y(x) \arccos(x)^n \cdots\right.\right.\right.}{\lambda\, \mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} - x^{2m}\beta^2\_Y(x)\,\lambda^2 \arccos(x)^{2n} + m\beta\, x^{m-1}\lambda\_Y(x) \operatorname{arcc}\cdots\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\left(-x^{2m}\arccos(x)^{1+2n}\_\_Y(x)\beta^{2}\lambda^{2}+x^{m-1}\arccos(x)^{n+1}\_\_Y(x)\beta\lambda m+\arccos(x)\_\_Y''(x)\right)\sqrt{-x^{2}+1}+n\_\_Y'(x)}{\sqrt{-x^{2}+1}\arccos(x)}\right\},\right.\right.}{\lambda\operatorname{DESol}\left(\left\{\frac{\left(-\arccos(x)^{1+2n}\lambda^{2}\beta^{2}x^{1+2m}\_\_Y(x)+\arccos(x)^{n+1}\beta\lambda m\,x^{m}\_\_Y(x)+\arccos(x)\_\_Y''(x)x\right)\sqrt{-x^{2}+1}+\_\_Y'(x)}{\sqrt{-x^{2}+1}\,x\arccos(x)}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\left(-x^{2m}\arccos(x)^{1+2n}\_\_Y(x)\beta^{2}\lambda^{2}+x^{m-1}\arccos(x)^{n+1}\_\_Y(x)\beta\lambda m+\arccos(x)\_\_Y''(x)\right)\sqrt{-x^{2}+1}+n\_\_Y'(x)}{\sqrt{-x^{2}+1}\arccos(x)}\right\},\right.\right.}{\lambda\operatorname{DESol}\left(\left\{\frac{\left(-\arccos(x)^{1+2n}\lambda^{2}\beta^{2}x^{1+2m}\_\_Y(x)+\arccos(x)^{n+1}\beta\lambda m\,x^{m}\_\_Y(x)+\arccos(x)\_\_Y''(x)x\right)\sqrt{-x^{2}+1}+\_\_Y'(x)}{\sqrt{-x^{2}+1}\,x\arccos(x)}\right.\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\left(-x^{2m}\arccos(x)^{1+2n}\_\_Y(x)\beta^{2}\lambda^{2}+x^{m-1}\arccos(x)^{n+1}\_\_Y(x)\beta\lambda m+\arccos(x)\_\_Y''(x)\right)\sqrt{-x^{2}+1}+n\_\_Y'(x)}{\sqrt{-x^{2}+1}\arccos(x)}\right\},\right.\right.}{\lambda\operatorname{DESol}\left(\left\{\frac{\left(-\arccos(x)^{1+2n}\lambda^{2}\beta^{2}x^{1+2m}\_\_Y(x)+\arccos(x)^{n+1}\beta\lambda m\,x^{m}\_\_Y(x)+\arccos(x)\_\_Y''(x)x\right)\sqrt{-x^{2}+1}+\_\_Y'(x)}{\sqrt{-x^{2}+1}\,x\arccos(x)}\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[[_1st_order, `_with_symmetry_[F(x),G(x)]`], _Riccati]
```

$$\boxed{y' - \lambda \arccos(x)^n (y - a\,x^m - b)^2 = am\,x^{m-1}}$$

15.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y' &= F(x,y)\\ &= x^{2m}\arccos(x)^n a^2\lambda + 2x^m \arccos(x)^n ab\lambda - 2x^m\arccos(x)^n a\lambda y + b^2\lambda\arccos(x)^n - 2\arccos(x)^n b\lambda\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^{2m}\arccos(x)^n a^2\lambda+2x^m\arccos(x)^n ab\lambda-2x^m\arccos(x)^n a\lambda y+b^2\lambda\arccos(x)^n-2\arccos(x)^n b\lambda y+a$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = x^{2m}\arccos(x)^n a^2\lambda+2x^m\arccos(x)^n ab\lambda+b^2\lambda\arccos(x)^n+am\,x^{m-1}$, $f_1(x) = -2a\lambda\,x^m\arccos(x)^n - 2\arccos(x)^n\lambda b$ and $f_2(x) = \arccos(x)^n\lambda$. Let

$$\begin{aligned}y &= \frac{-u'}{f_2 u}\\ &= \frac{-u'}{\arccos(x)^n\lambda u}\end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{\arccos(x)^n\,n\lambda}{\sqrt{-x^2+1}\,\arccos(x)} \\ f_1f_2 &= (-2a\lambda\,x^m\arccos(x)^n - 2\arccos(x)^n\,\lambda b)\arccos(x)^n\,\lambda \\ f_2^2f_0 &= \arccos(x)^{2n}\,\lambda^2\left(x^{2m}\arccos(x)^n\,a^2\lambda + 2x^m\arccos(x)^n\,ab\lambda + b^2\lambda\arccos(x)^n + am\,x^{m-1}\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\arccos(x)^n\,\lambda u''(x) - \left(-\frac{\arccos(x)^n\,n\lambda}{\sqrt{-x^2+1}\,\arccos(x)} + (-2a\lambda\,x^m\arccos(x)^n - 2\arccos(x)^n\,\lambda b)\arccos(x)^n\,\lambda\right) u$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{\frac{n\_Y'(x)}{\sqrt{-x^2+1}} + \arccos(x)\left(\lambda^2\_Y(x)\,(a^2x^{2m} + 2ab\,x^m + b^2)\arccos(x)^{2n} + \_Y''(x) + x^{m-1}\arccos\right.}{\arccos(x)}\right.\right.$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{\frac{n\_Y'(x)}{\sqrt{-x^2+1}} + \lambda^2\_Y(x)\,(a^2x^{2m} + 2ab\,x^m + b^2)\arccos(x)^{1+2n} + (a\,x^{m-1}m\_Y(x) + 2\_Y'(x)\,(}{\arccos(x)}\right.\right.$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{\frac{n\_Y'(x)}{\sqrt{-x^2+1}} + \lambda^2\_Y(x)(a^2x^{2m}+2ab\,x^m+b^2)\arccos(x)^{1+2n} + \left(a\,x^{m-1}m\_Y(x) + 2\_Y'(x)(a\,x^m+b)\right)\lambda\arccos(x)^{n+}}{\arccos(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{\frac{n\_Y'(x)}{\sqrt{-x^2+1}} + \arccos(x)\left(\lambda^2\_Y(x)(a^2x^{2m}+2ab\,x^m+b^2)\arccos(x)^{2n} + \_Y''(x) + x^{m-1}\arccos(x)^n am\lambda\_Y(x)+\right.}{\arccos(x)}\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{\left(\lambda^2 \_\_Y(x)\left(a^2x^{2m}+2ab\,x^m+b^2\right)\arccos(x)^{1+2n}+\left(a\,x^{m-1}m\_\_Y(x)+2\_\_Y'(x)(a\,x^m+b)\right)\lambda\arccos(x)^{n+1}+\arccos(x\right.}{\sqrt{-x^2+1}\,\arccos(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{\left(\lambda^2 \_\_Y(x)\left(a^2x^{2m}+2ab\,x^m+b^2\right)\arccos(x)^{1+2n}+\left(a\,x^{m-1}m\_\_Y(x)+2\_\_Y'(x)(a\,x^m+b)\right)\lambda\arccos(x)^{n+1}+a\right.}{\sqrt{-x^2+1}\,\arccos(x)}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{\left(\lambda^2 \_\_Y(x)\left(a^2x^{2m}+2ab\,x^m+b^2\right)\arccos(x)^{1+2n}+\left(a\,x^{m-1}m\_\_Y(x)+2\_\_Y'(x)(a\,x^m+b)\right)\lambda\arccos(x)^{n+1}+\arccos(x\right.}{\sqrt{-x^2+1}\,\arccos(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{\left(\lambda^2 \_\_Y(x)\left(a^2x^{2m}+2ab\,x^m+b^2\right)\arccos(x)^{1+2n}+\left(a\,x^{m-1}m\_\_Y(x)+2\_\_Y'(x)(a\,x^m+b)\right)\lambda\arccos(x)^{n+1}+a\right.}{\sqrt{-x^2+1}\,\arccos(x)}\right.\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{\left(\lambda^2 \_\_Y(x)\left(a^2x^{2m}+2ab\,x^m+b^2\right)\arccos(x)^{1+2n}+\left(a\,x^{m-1}m\_\_Y(x)+2\_\_Y'(x)(a\,x^m+b)\right)\lambda\arccos(x)^{n+1}+\arccos(x\right.}{\sqrt{-x^2+1}\,\arccos(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{\left(\lambda^2 \_\_Y(x)\left(a^2x^{2m}+2ab\,x^m+b^2\right)\arccos(x)^{1+2n}+\left(a\,x^{m-1}m\_\_Y(x)+2\_\_Y'(x)(a\,x^m+b)\right)\lambda\arccos(x)^{n+1}+a\right.}{\sqrt{-x^2+1}\,\arccos(x)}\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - \lambda \arccos(x)^n y^2 - ky = \lambda b^2 x^{2k} \arccos(x)^n}$$

15.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{\arccos(x)^n \lambda y^2 + ky + \lambda b^2 x^{2k} \arccos(x)^n}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{\lambda b^2 x^{2k} \arccos(x)^n}{x} + \frac{\arccos(x)^n \lambda y^2}{x} + \frac{ky}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{\lambda b^2 x^{2k} \arccos(x)^n}{x}$, $f_1(x) = \frac{k}{x}$ and $f_2(x) = \frac{\arccos(x)^n \lambda}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{\arccos(x)^n \lambda u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{\arccos(x)^n n\lambda}{\sqrt{-x^2+1}\,\arccos(x)\,x} - \frac{\arccos(x)^n \lambda}{x^2} \\
f_1 f_2 &= \frac{k \arccos(x)^n \lambda}{x^2} \\
f_2^2 f_0 &= \frac{\arccos(x)^{3n} \lambda^3 b^2 x^{2k}}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{\arccos(x)^n \lambda u''(x)}{x} - \left(-\frac{\arccos(x)^n n\lambda}{\sqrt{-x^2+1}\,\arccos(x)\,x} - \frac{\arccos(x)^n \lambda}{x^2} + \frac{k \arccos(x)^n \lambda}{x^2}\right) u'(x) + \frac{\arccos(x)^{3n} \lambda}{x^3}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \mathrm{e}^{ib\lambda\left(\int x^{k-1} \arccos(x)^n dx\right)} + c_2 \mathrm{e}^{-ib\lambda\left(\int x^{k-1} \arccos(x)^n dx\right)}$$

The above shows that

$$u'(x) = ib\, x^{k-1} \lambda \arccos(x)^n \mathrm{e}^{-ib\lambda\left(\int x^{k-1} \arccos(x)^n dx\right)} \left(\mathrm{e}^{2ib\lambda\left(\int x^{k-1} \arccos(x)^n dx\right)} c_1 - c_2\right)$$

Using the above in (1) gives the solution

$$y = -\frac{ib\, x^{k-1} \mathrm{e}^{-ib\lambda\left(\int x^{k-1} \arccos(x)^n dx\right)} \left(\mathrm{e}^{2ib\lambda\left(\int x^{k-1} \arccos(x)^n dx\right)} c_1 - c_2\right) x}{c_1 \mathrm{e}^{ib\lambda\left(\int x^{k-1} \arccos(x)^n dx\right)} + c_2 \mathrm{e}^{-ib\lambda\left(\int x^{k-1} \arccos(x)^n dx\right)}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{ib\, x^k \left(\mathrm{e}^{2ib\lambda\left(\int x^{k-1} \arccos(x)^n dx\right)} c_3 - 1\right)}{\mathrm{e}^{2ib\lambda\left(\int x^{k-1} \arccos(x)^n dx\right)} c_3 + 1}$$

Summary

The solution(s) found are the following

$$y = -\frac{i b\, x^{k} \left({\mathrm e}^{2 i b \lambda \left(\int x^{k -1} \arccos \left(x \right)^{n}d x \right)} c_{3}-1\right)}{{\mathrm e}^{2 i b \lambda \left(\int x^{k -1} \arccos \left(x \right)^{n}d x \right)} c_{3}+1} \tag{1}$$

Verification of solutions

$$y = -\frac{i b\, x^{k} \left({\mathrm e}^{2 i b \lambda \left(\int x^{k -1} \arccos \left(x \right)^{n}d x \right)} c_{3}-1\right)}{{\mathrm e}^{2 i b \lambda \left(\int x^{k -1} \arccos \left(x \right)^{n}d x \right)} c_{3}+1}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-2. Equations containing arccosine.
Problem number: 18.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y'x-\left(a\,x^{2m}y^2+yx^nb+c\right)\arccos\left(x\right)^m+yn=0}$$

15.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned}y' &= F(x,y)\\ &= \frac{\arccos\left(x\right)^m x^{2m}a\,y^2+\arccos\left(x\right)^m x^n by+\arccos\left(x\right)^m c-ny}{x}\end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y'=\frac{\arccos\left(x\right)^m x^{2m}a\,y^2}{x}+\frac{\arccos\left(x\right)^m x^n by}{x}+\frac{\arccos\left(x\right)^m c}{x}-\frac{ny}{x}$$

With Riccati ODE standard form

$$y'=f_0(x)+f_1(x)y+f_2(x)y^2$$

Shows that $f_0(x)=\frac{\arccos(x)^m c}{x}$, $f_1(x)=\frac{\arccos(x)^m x^n b-n}{x}$ and $f_2(x)=\frac{\arccos(x)^m x^{2m}a}{x}$. Let

$$\begin{aligned}y &= \frac{-u'}{f_2u}\\ &= \frac{-u'}{\frac{\arccos(x)^m x^{2m}au}{x}}\end{aligned}\tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{\arccos(x)^m\, m\, x^{2m}a}{\sqrt{-x^2+1}\,\arccos(x)\,x} + \frac{2\arccos(x)^m\, x^{2m}ma}{x^2} - \frac{\arccos(x)^m\, x^{2m}a}{x^2} \\
f_1f_2 &= \frac{(\arccos(x)^m\, x^nb - n)\arccos(x)^m\, x^{2m}a}{x^2} \\
f_2^2f_0 &= \frac{\arccos(x)^{3m}\, x^{4m}a^2c}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{\arccos(x)^m\, x^{2m}au''(x)}{x} - \left(-\frac{\arccos(x)^m\, m\, x^{2m}a}{\sqrt{-x^2+1}\,\arccos(x)\,x} + \frac{2\arccos(x)^m\, x^{2m}ma}{x^2} - \frac{\arccos(x)^m\, x^{2m}a}{x^2} + \frac{(\arccos$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) + \frac{m\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} - b\,x^{n-1}\arccos(x)^m\_Y'(x) + ac\,x^{2m-2}\_Y(x)\arccos(x)^{2m} + \frac{n\_Y'(x)}{x} - \frac{2m\_Y'(x)}{x} + \frac{\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{m\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} - b\,x^{n-1}\arccos(x)^m\_Y'(x) + ac\,x^{2m-2}\_Y(x)\arccos(x)^{2m} + \frac{n\_Y'(x)}{x} - \frac{2m\_Y'(x)}{x} + \frac{\_Y'(x)}{x}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{m\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} - b\,x^{n-1}\arccos(x)^m\_Y'(x) + ac\,x^{2m-2}\_Y(x)\arccos(x)^{2m} + \right.\right.\right.}{a\,\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{m\_Y'(x)}{\arccos(x)\sqrt{-x^2+1}} - b\,x^{n-1}\arccos(x)^m\_Y'(x) + ac\,x^{2m-2}\_Y(x)\arccos\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{x^{-2m+1}\arccos(x)^{-m}\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(ac\,x^{2m-1}\_\_Y(x)\arccos(x)^{1+2m}-b\,x^{n}\arccos(x)^{m+1}\_\_Y'(x)-2\left(-\frac{\_\_Y''(x)x}{2}+\_\_Y\cdots\right)\right)}{\sqrt{-x^{2}+1}\,\arccos(x)x}\right.\right.\right)}{a\,\mathrm{DESol}\left(\left\{\frac{\left(x^{2m}\arccos(x)^{1+2m}\_\_Y(x)ac-\arccos(x)^{m+1}x^{n+1}\_\_Y'(x)b-2\left(-\frac{\_\_Y''(x)x}{2}+\_\_Y'(x)\left(m-\frac{n}{2}-\frac{1}{2}\right)\right)\cdots\right)}{\sqrt{-x^{2}+1}\,\arccos(x)x^{2}}\right.\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{x^{-2m+1}\arccos(x)^{-m}\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(ac\,x^{2m-1}\_\_Y(x)\arccos(x)^{1+2m}-b\,x^{n}\arccos(x)^{m+1}\_\_Y'(x)-2\left(-\frac{\_\_Y''(x)x}{2}+\_\_Y\cdots\right)\right)}{\sqrt{-x^{2}+1}\,\arccos(x)x}\right.\right.\right)}{a\,\mathrm{DESol}\left(\left\{\frac{\left(x^{2m}\arccos(x)^{1+2m}\_\_Y(x)ac-\arccos(x)^{m+1}x^{n+1}\_\_Y'(x)b-2\left(-\frac{\_\_Y''(x)x}{2}+\_\_Y'(x)\left(m-\frac{n}{2}-\frac{1}{2}\right)\right)\cdots\right)}{\sqrt{-x^{2}+1}\,\arccos(x)x^{2}}\right.\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{x^{-2m+1}\arccos(x)^{-m}\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\left(ac\,x^{2m-1}\_\_Y(x)\arccos(x)^{1+2m}-b\,x^{n}\arccos(x)^{m+1}\_\_Y'(x)-2\left(-\frac{\_\_Y''(x)x}{2}+\_\_Y\cdots\right)\right)}{\sqrt{-x^{2}+1}\,\arccos(x)x}\right.\right.\right)}{a\,\mathrm{DESol}\left(\left\{\frac{\left(x^{2m}\arccos(x)^{1+2m}\_\_Y(x)ac-\arccos(x)^{m+1}x^{n+1}\_\_Y'(x)b-2\left(-\frac{\_\_Y''(x)x}{2}+\_\_Y'(x)\left(m-\frac{n}{2}-\frac{1}{2}\right)\right)\cdots\right)}{\sqrt{-x^{2}+1}\,\arccos(x)x^{2}}\right.\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - \lambda \arctan(x)^n y = -a^2 + a\lambda \arctan(x)^n}$$

16.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + \lambda \arctan(x)^n y - a^2 + a\lambda \arctan(x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \lambda \arctan(x)^n y - a^2 + a\lambda \arctan(x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2 + a\lambda \arctan(x)^n$, $f_1(x) = \arctan(x)^n \lambda$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \arctan(x)^n \lambda \\ f_2^2 f_0 &= -a^2 + a\lambda \arctan(x)^n \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \arctan(x)^n \lambda u'(x) + \left(-a^2 + a\lambda \arctan(x)^n\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\int \frac{a\left(\int \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)}dx\right) - c_1 a + \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)}}{-c_1 + \int \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)}dx} dx} c_2$$

The above shows that

$$u'(x) = \frac{\left(a\left(\int \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)}dx\right) - c_1 a + \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)}\right) \mathrm{e}^{\int \frac{a\left(\int \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)}dx\right) - c_1 a + \mathrm{e}^{-(\int(-a \cdots}}{-c_1 + \int \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)} \cdots}}}{-c_1 + \int \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)}dx}$$

Using the above in (1) gives the solution

$$y = -\frac{a\left(\int \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)}dx\right) - c_1 a + \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)}}{-c_1 + \int \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)}dx}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-a\left(\int \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)}dx\right) + c_3 a - \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)}}{-c_3 + \int \mathrm{e}^{-\left(\int(-\arctan(x)^n\lambda+2a)dx\right)}dx}$$

Summary
The solution(s) found are the following

$$y = \frac{-a\left(\int e^{-\left(\int (-\arctan(x)^n \lambda+2a)dx\right)}dx\right) + c_3 a - e^{-\left(\int (-\arctan(x)^n \lambda+2a)dx\right)}}{-c_3 + \int e^{-\left(\int (-\arctan(x)^n \lambda+2a)dx\right)}dx} \tag{1}$$

Verification of solutions

$$y = \frac{-a\left(\int e^{-\left(\int (-\arctan(x)^n \lambda+2a)dx\right)}dx\right) + c_3 a - e^{-\left(\int (-\arctan(x)^n \lambda+2a)dx\right)}}{-c_3 + \int e^{-\left(\int (-\arctan(x)^n \lambda+2a)dx\right)}dx}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - \lambda x \arctan(x)^n y = \arctan(x)^n \lambda}$$

16.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + \arctan(x)^n \lambda x y + \arctan(x)^n \lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \arctan(x)^n \lambda x y + \arctan(x)^n \lambda$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \arctan(x)^n \lambda$, $f_1(x) = \arctan(x)^n \lambda x$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \arctan(x)^n \lambda x \\ f_2^2 f_0 &= \arctan(x)^n \lambda \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \arctan(x)^n \lambda x u'(x) + \arctan(x)^n \lambda u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x \left(c_1 + c_2 \left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n \lambda\right)}{x^2+1} dx}}{x^2\left(x^2+1\right)} dx\right)\right)$$

The above shows that

$$u'(x) = \frac{\left(x^2+1\right) x c_2 \left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n \lambda\right)}{x^2+1} dx}}{x^2\left(x^2+1\right)} dx\right) + c_2 e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n \lambda\right)}{x^2+1} dx} + c_1 x(x^2+1)}{x\left(x^2+1\right)}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(x^2+1\right) x c_2 \left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n \lambda\right)}{x^2+1} dx}}{x^2\left(x^2+1\right)} dx\right) + c_2 e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n \lambda\right)}{x^2+1} dx} + c_1 x(x^2+1)}{x^2\left(x^2+1\right)\left(c_1 + c_2 \left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n \lambda\right)}{x^2+1} dx}}{x^2\left(x^2+1\right)} dx\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{(-x^3 - x)\left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n\lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right) - c_3x^3 - c_3x - e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n\lambda\right)}{x^2+1}dx}}{x^2\left(x^2+1\right)\left(c_3 + \int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n\lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{(-x^3 - x)\left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n\lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right) - c_3x^3 - c_3x - e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n\lambda\right)}{x^2+1}dx}}{x^2\left(x^2+1\right)\left(c_3 + \int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n\lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right)} \tag{1}$$

Verification of solutions

$$y = \frac{(-x^3 - x)\left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n\lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right) - c_3x^3 - c_3x - e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n\lambda\right)}{x^2+1}dx}}{x^2\left(x^2+1\right)\left(c_3 + \int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\arctan(x)^n\lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-3. Equations containing arctangent.
Problem number: 21.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + (k+1)\, x^k y^2 - \lambda \arctan(x)^n \left(x^{k+1} y - 1\right) = 0}$$

16.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= x^{k+1} \arctan(x)^n \lambda y - x^k y^2 k - x^k y^2 - \arctan(x)^n \lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^k x \arctan(x)^n \lambda y - x^k y^2 k - x^k y^2 - \arctan(x)^n \lambda$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\arctan(x)^n \lambda$, $f_1(x) = x^{k+1} \arctan(x)^n \lambda$ and $f_2(x) = -x^k k - x^k$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{(-x^k k - x^k)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{k^2 x^k}{x} - \frac{k\,x^k}{x} \\ f_1 f_2 &= x^{k+1} \arctan(x)^n \lambda(-x^k k - x^k) \\ f_2^2 f_0 &= -(-x^k k - x^k)^2 \arctan(x)^n \lambda \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$(-x^k k - x^k) u''(x) - \left(-\frac{k^2 x^k}{x} - \frac{k\,x^k}{x} + x^{k+1} \arctan(x)^n \lambda(-x^k k - x^k)\right) u'(x) - (-x^k k - x^k)^2 \arctan(x$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{k+1}\left(\left(\int x^{-2k-2} e^{\int \left(x^{k+1} \arctan(x)^n \lambda + \frac{k}{x}\right) dx} dx\right) c_2 + c_1\right)$$

The above shows that

$$\begin{aligned} u'(x) = {} & c_2 x^{-k-1} e^{\int \frac{x^{k+2} \lambda \arctan(x)^n + k}{x} dx} \\ & + (k+1)\left(\left(\int e^{\int \frac{x^{k+2} \lambda \arctan(x)^n + k}{x} dx} x^{-2k-2} dx\right) c_2 + c_1\right) x^k \end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(c_2 x^{-k-1} e^{\int \frac{x^{k+2} \lambda \arctan(x)^n + k}{x} dx} + (k+1)\left(\left(\int e^{\int \frac{x^{k+2} \lambda \arctan(x)^n + k}{x} dx} x^{-2k-2} dx\right) c_2 + c_1\right) x^k\right) x^{-k-1}}{(-x^k k - x^k)\left(\left(\int x^{-2k-2} e^{\int \left(x^{k+1} \arctan(x)^n \lambda + \frac{k}{x}\right) dx} dx\right) c_2 + c_1\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{(k+1)\left(\int x^{-2k-2} e^{\int \left(x^{k+1} \arctan(x)^n \lambda + \frac{k}{x}\right) dx} dx + c_3\right) x^{-k-1} + x^{-3k-2} e^{\int \left(x^{k+1} \arctan(x)^n \lambda + \frac{k}{x}\right) dx}}{(k+1)\left(\int e^{\int \frac{x^{k+2} \lambda \arctan(x)^n + k}{x} dx} x^{-2k-2} dx + c_3\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{(k+1)\left(\int x^{-2k-2} \mathrm{e}^{\int \left(x^{k+1} \arctan(x)^{n} \lambda+\frac{k}{x}\right)dx} dx+c_{3}\right) x^{-k-1}+x^{-3k-2} \mathrm{e}^{\int \left(x^{k+1} \arctan(x)^{n} \lambda+\frac{k}{x}\right)dx}}{(k+1)\left(\int \mathrm{e}^{\int \frac{x^{k+2} \lambda \arctan(x)^{n}+k}{x}dx} x^{-2k-2}dx+c_{3}\right)} \tag{1}$$

Verification of solutions

$$y = \frac{(k+1)\left(\int x^{-2k-2} \mathrm{e}^{\int \left(x^{k+1} \arctan(x)^{n} \lambda+\frac{k}{x}\right)dx} dx+c_{3}\right) x^{-k-1}+x^{-3k-2} \mathrm{e}^{\int \left(x^{k+1} \arctan(x)^{n} \lambda+\frac{k}{x}\right)dx}}{(k+1)\left(\int \mathrm{e}^{\int \frac{x^{k+2} \lambda \arctan(x)^{n}+k}{x}dx} x^{-2k-2}dx+c_{3}\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \arctan(x)^n y^2 - ay = ab - b^2 \lambda \arctan(x)^n}$$

16.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \lambda \arctan(x)^n y^2 + ya + ab - b^2 \lambda \arctan(x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \lambda \arctan(x)^n y^2 + ya + ab - b^2 \lambda \arctan(x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = ab - b^2 \lambda \arctan(x)^n$, $f_1(x) = a$ and $f_2(x) = \arctan(x)^n \lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\arctan(x)^n \lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{\arctan(x)^n n\lambda}{(x^2+1)\arctan(x)} \\ f_1 f_2 &= a\lambda \arctan(x)^n \\ f_2^2 f_0 &= \arctan(x)^{2n} \lambda^2 \left(ab - b^2\lambda \arctan(x)^n\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\arctan(x)^n \lambda u''(x) - \left(\frac{\arctan(x)^n n\lambda}{(x^2+1)\arctan(x)} + a\lambda \arctan(x)^n\right) u'(x) + \arctan(x)^{2n} \lambda^2 \left(ab - b^2\lambda \arctan(x)^n\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} - a\_Y'(x) - \arctan(x)^{2n} b^2\lambda^2\_Y(x) + \arctan(x)^n ab\lambda\_Y(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} - a\_Y'(x) - \arctan(x)^{2n} b^2\lambda^2\_Y(x) + \arctan(x)^n ab\lambda\_Y(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} - a\_Y'(x) - \arctan(x)^{2n} b^2\lambda^2\_Y(x) + \arctan(x)^n ab\lambda\_Y(x)\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} - a\_Y'(x) - \arctan(x)^{2n} b^2\lambda^2\_Y(x) + \arctan(x)^n ab\lambda\_\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-b^2\_\_Y(x)\lambda^2 \arctan(x)^{1+2n}(x^2+1)+ab\lambda\_\_Y(x)\arctan(x)^{n+1}(x^2+1)+\_\_Y''(x)(x^2+1)\arctan(x)-\_\_Y'(x)(a(x^2}{(x^2+1)\arctan(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{-b^2\_\_Y(x)\lambda^2\arctan(x)^{1+2n}(x^2+1)+ab\lambda\_\_Y(x)\arctan(x)^{n+1}(x^2+1)+\_\_Y''(x)(x^2+1)\arctan(x)-\_\_Y'(x}{(x^2+1)\arctan(x)}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-b^2\_\_Y(x)\lambda^2 \arctan(x)^{1+2n}(x^2+1)+ab\lambda\_\_Y(x)\arctan(x)^{n+1}(x^2+1)+\_\_Y''(x)(x^2+1)\arctan(x)-\_\_Y'(x)(a(x^2}{(x^2+1)\arctan(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{-b^2\_\_Y(x)\lambda^2\arctan(x)^{1+2n}(x^2+1)+ab\lambda\_\_Y(x)\arctan(x)^{n+1}(x^2+1)+\_\_Y''(x)(x^2+1)\arctan(x)-\_\_Y'(x}{(x^2+1)\arctan(x)}\right.\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-b^2\_\_Y(x)\lambda^2 \arctan(x)^{1+2n}(x^2+1)+ab\lambda\_\_Y(x)\arctan(x)^{n+1}(x^2+1)+\_\_Y''(x)(x^2+1)\arctan(x)-\_\_Y'(x)(a(x^2}{(x^2+1)\arctan(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{-b^2\_\_Y(x)\lambda^2\arctan(x)^{1+2n}(x^2+1)+ab\lambda\_\_Y(x)\arctan(x)^{n+1}(x^2+1)+\_\_Y''(x)(x^2+1)\arctan(x)-\_\_Y'(x}{(x^2+1)\arctan(x)}\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \arctan(x)^n y^2 + b\lambda x^m \arctan(x)^n y = bm x^{m-1}}$$

16.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \lambda \arctan(x)^n y^2 - b\lambda x^m \arctan(x)^n y + bm x^{m-1} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \lambda \arctan(x)^n y^2 - b\lambda x^m \arctan(x)^n y + \frac{b x^m m}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = bm x^{m-1}$, $f_1(x) = -b\lambda x^m \arctan(x)^n$ and $f_2(x) = \arctan(x)^n \lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\arctan(x)^n \lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{\arctan(x)^n n\lambda}{(x^2+1)\arctan(x)} \\ f_1f_2 &= -b\,\lambda^2 x^m \arctan(x)^{2n} \\ f_2^2 f_0 &= \arctan(x)^{2n} \lambda^2 bm\, x^{m-1} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\arctan(x)^n \lambda u''(x) - \left(\frac{\arctan(x)^n n\lambda}{(x^2+1)\arctan(x)} - b\,\lambda^2 x^m \arctan(x)^{2n}\right) u'(x) + \arctan(x)^{2n} \lambda^2 bm\, x^{m-1} u(x) =$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} + \arctan(x)^n b\lambda\, x^m \_Y'(x) + \arctan(x)^n \lambda bm\, x^{m-1} \_Y(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} + \arctan(x)^n b\lambda\, x^m \_Y'(x) + \arctan(x)^n \lambda bm\, x^{m-1} \_Y(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} + \arctan(x)^n b\lambda\, x^m \_Y'(x) + \arctan(x)^n \lambda bm\, x^{m-1} \_Y(x)\right\}, \{\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} + \arctan(x)^n b\lambda\, x^m \_Y'(x) + \arctan(x)^n \lambda bm\, x^{m-1} \_Y(\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{b\lambda(x^2+1)\left(m\_\_Y(x)x^{m-1}+\_\_Y'(x)x^m\right)\arctan(x)^{n+1}+\_\_Y''(x)(x^2+1)\arctan(x)-n\_\_Y'(x)}{(x^2+1)\arctan(x)}\right\},\{\_\_Y(x)\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{b\lambda\left(m\,x^m\_\_Y(x)+m\_\_Y(x)x^{2+m}+\_\_Y'(x)x^{3+m}+\_\_Y'(x)x^{m+1}\right)\arctan(x)^{n+1}-x\left((-x^2-1)\arctan(x)\_\_Y''(x)+n\_\_\right.}{(x^2+1)\arctan(x)x}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{b\lambda(x^2+1)\left(m\_\_Y(x)x^{m-1}+\_\_Y'(x)x^m\right)\arctan(x)^{n+1}+\_\_Y''(x)(x^2+1)\arctan(x)-n\_\_Y'(x)}{(x^2+1)\arctan(x)}\right\},\{\_\_Y(x)\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{b\lambda\left(m\,x^m\_\_Y(x)+m\_\_Y(x)x^{2+m}+\_\_Y'(x)x^{3+m}+\_\_Y'(x)x^{m+1}\right)\arctan(x)^{n+1}-x\left((-x^2-1)\arctan(x)\_\_Y''(x)+n\_\_\right.}{(x^2+1)\arctan(x)x}\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{b\lambda(x^2+1)\left(m\_\_Y(x)x^{m-1}+\_\_Y'(x)x^m\right)\arctan(x)^{n+1}+\_\_Y''(x)(x^2+1)\arctan(x)-n\_\_Y'(x)}{(x^2+1)\arctan(x)}\right\},\{\_\_Y(x)\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{b\lambda\left(m\,x^m\_\_Y(x)+m\_\_Y(x)x^{2+m}+\_\_Y'(x)x^{3+m}+\_\_Y'(x)x^{m+1}\right)\arctan(x)^{n+1}-x\left((-x^2-1)\arctan(x)\_\_Y''(x)+n\_\_\right.}{(x^2+1)\arctan(x)x}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-3. Equations containing arctangent.
Problem number: 24.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \arctan(x)^n y^2 = \beta m\, x^{m-1} - \lambda\, \beta^2 x^{2m} \arctan(x)^n}$$

16.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \lambda \arctan(x)^n y^2 + \beta m\, x^{m-1} - \lambda\, \beta^2 x^{2m} \arctan(x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\lambda\, \beta^2 x^{2m} \arctan(x)^n + \lambda \arctan(x)^n y^2 + \frac{\beta m\, x^m}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = \beta m\, x^{m-1} - \lambda\, \beta^2 x^{2m} \arctan(x)^n$, $f_1(x) = 0$ and $f_2(x) = \arctan(x)^n \lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\arctan(x)^n \lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{\arctan(x)^n n\lambda}{(x^2+1)\arctan(x)} \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= \arctan(x)^{2n} \lambda^2 \left(\beta m\, x^{m-1} - \lambda\, \beta^2 x^{2m} \arctan(x)^n\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\arctan(x)^n \lambda u''(x) - \frac{\arctan(x)^n n\lambda u'(x)}{(x^2+1)\arctan(x)} + \arctan(x)^{2n} \lambda^2 \left(\beta m\, x^{m-1} - \lambda\, \beta^2 x^{2m} \arctan(x)^n\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} - \arctan(x)^{2n} x^{2m}\beta^2\lambda^2\_Y(x) + \arctan(x)^n \beta m\, x^{m-1}\lambda\_Y(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} - \arctan(x)^{2n} x^{2m}\beta^2\lambda^2\_Y(x) + \arctan(x)^n \beta m\, x^{m-1}\lambda\_Y(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} - \arctan(x)^{2n} x^{2m}\beta^2\lambda^2\_Y(x) + \arctan(x)^n \beta m\, x^{m-1}\lambda\_Y(x)\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} - \arctan(x)^{2n} x^{2m}\beta^2\lambda^2\_Y(x) + \arctan(x)^n \beta m\, x^{m-1}\lambda\_\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{\_\_Y''(x)\,(x^2+1)\arctan(x) - n\_\_Y'(x) - \beta^2\_\_Y(x)x^{2m}\lambda^2\arctan(x)^{1+2n}(x^2+1) + m\beta\lambda\_\_Y(x)\arctan(x)^{n+1}x^{m-1}(x}{(x^2+1)\arctan(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{-\beta^2\lambda^2\_\_Y(x)(x^{3+2m}+x^{1+2m})\arctan(x)^{1+2n} + m\beta\lambda\_\_Y(x)(x^m+x^{2+m})\arctan(x)^{n+1} - x\left((-x^2-1)\arctan(x)\_\_\right.}{x(x^2+1)\arctan(x)}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{\_\_Y''(x)\,(x^2+1)\arctan(x) - n\_\_Y'(x) - \beta^2\_\_Y(x)x^{2m}\lambda^2\arctan(x)^{1+2n}(x^2+1) + m\beta\lambda\_\_Y(x)\arctan(x)^{n+1}x^{m-1}(x}{(x^2+1)\arctan(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{-\beta^2\lambda^2\_\_Y(x)(x^{3+2m}+x^{1+2m})\arctan(x)^{1+2n} + m\beta\lambda\_\_Y(x)(x^m+x^{2+m})\arctan(x)^{n+1} - x\left((-x^2-1)\arctan(x)\_\_\right.}{x(x^2+1)\arctan(x)}\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{\_\_Y''(x)\,(x^2+1)\arctan(x) - n\_\_Y'(x) - \beta^2\_\_Y(x)x^{2m}\lambda^2\arctan(x)^{1+2n}(x^2+1) + m\beta\lambda\_\_Y(x)\arctan(x)^{n+1}x^{m-1}(x}{(x^2+1)\arctan(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{-\beta^2\lambda^2\_\_Y(x)(x^{3+2m}+x^{1+2m})\arctan(x)^{1+2n} + m\beta\lambda\_\_Y(x)(x^m+x^{2+m})\arctan(x)^{n+1} - x\left((-x^2-1)\arctan(x)\_\_\right.}{x(x^2+1)\arctan(x)}\right.\right.}$$

Verified OK.

16.7 problem 25

Internal problem ID [10582]
Internal file name [`OUTPUT/9529_Monday_June_06_2022_03_04_55_PM_64490874/index.tex`]

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-3. Equations containing arctangent.
Problem number: 25.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[[_1st_order, `_with_symmetry_[F(x),G(x)]`], _Riccati]`

$$\boxed{y' - \lambda \arctan(x)^n (y - a\,x^m - b)^2 = am\,x^{m-1}}$$

16.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y)\\ &= x^{2m}\arctan(x)^n a^2\lambda + 2x^m\arctan(x)^n ab\lambda - 2x^m\arctan(x)^n a\lambda y + b^2\lambda\arctan(x)^n - 2\arctan(x)^n b\lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^{2m}\arctan(x)^n a^2\lambda + 2x^m\arctan(x)^n ab\lambda - 2x^m\arctan(x)^n a\lambda y + b^2\lambda\arctan(x)^n - 2\arctan(x)^n b\lambda y + \lambda$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = x^{2m}\arctan(x)^n a^2\lambda + 2x^m\arctan(x)^n ab\lambda + b^2\lambda\arctan(x)^n + am\,x^{m-1}$, $f_1(x) = -2a\lambda\,x^m\arctan(x)^n - 2\arctan(x)^n\lambda b$ and $f_2(x) = \arctan(x)^n\lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u}\\ &= \frac{-u'}{\arctan(x)^n\lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{\arctan(x)^n n\lambda}{(x^2+1)\arctan(x)} \\
f_1f_2 &= (-2a\lambda\,x^m \arctan(x)^n - 2\arctan(x)^n \lambda b)\arctan(x)^n \lambda \\
f_2^2f_0 &= \arctan(x)^{2n} \lambda^2 (x^{2m}\arctan(x)^n a^2\lambda + 2x^m \arctan(x)^n ab\lambda + b^2\lambda\arctan(x)^n + am\,x^{m-1})
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\arctan(x)^n \lambda u''(x) - \left(\frac{\arctan(x)^n n\lambda}{(x^2+1)\arctan(x)} + (-2a\lambda\,x^m\arctan(x)^n - 2\arctan(x)^n\lambda b)\arctan(x)^n\lambda\right)u'(x$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) = \mathrm{DESol}\Bigg(\Bigg\{&_Y''(x) - \frac{n_Y'(x)}{(x^2+1)\arctan(x)} + 2\arctan(x)^n \lambda\,x^m a_Y'(x) \\
&+ 2\arctan(x)^n b\lambda_Y'(x) + \arctan(x)^{2n} x^{2m}a^2\lambda^2_Y(x) \\
&+ 2\arctan(x)^{2n} x^m ab\,\lambda^2_Y(x) + \arctan(x)^{2n} b^2\lambda^2_Y(x) \\
&+ \arctan(x)^n am\,x^{m-1}\lambda_Y(x)\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

The above shows that

$$\begin{aligned}
u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\Bigg(\Bigg\{&_Y''(x) - \frac{n_Y'(x)}{(x^2+1)\arctan(x)} + 2\arctan(x)^n \lambda\,x^m a_Y'(x) \\
&+ 2\arctan(x)^n b\lambda_Y'(x) + \arctan(x)^{2n} x^{2m}a^2\lambda^2_Y(x) \\
&+ 2\arctan(x)^{2n} x^m ab\,\lambda^2_Y(x) + \arctan(x)^{2n} b^2\lambda^2_Y(x) \\
&+ \arctan(x)^n am\,x^{m-1}\lambda_Y(x)\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} + 2\arctan(x)^n\lambda\,x^m a\_Y'(x) + 2\arctan(x)^n b\lambda\_Y'(x) + \mathrm{arcta}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{n\_Y'(x)}{(x^2+1)\arctan(x)} + 2\arctan(x)^n\lambda\,x^m a\_Y'(x) + 2\arctan(x)^n b\lambda\_Y'(x) + \right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \operatorname{DESol}\left(\left\{\frac{\lambda^2 \_Y(x)\left(x^2+1\right)\left(a^2 x^{2m}+2ab\, x^m+b^2\right) \arctan(x)^{1+2n}+\left(a\, x^{m-1} m \_Y(x)+2 \_Y'(x)(\cdots\right.}{\left(x^2+1\right) \arctan(x \cdots}\right.\right.\right.}{\lambda \operatorname{DESol}\left(\left\{\frac{\_Y(x)\left(a^2 x^{1+2m}+a^2 x^{3+2m}+2a\, x^{3+m} b+2a\, x^{m+1} b+b^2 x\left(x^2+1\right)\right)\lambda^2 \arctan(x)^{1+2n}+\left(2a\, x^{3+m} \_Y'(x)+2a\, x^{m+1} \_Y'(\cdots\right.}{x\left(x^2+1\right) \cdots}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x} \operatorname{DESol}\left(\left\{\frac{\lambda^2 \_Y(x)\left(x^2+1\right)\left(a^2 x^{2m}+2ab\, x^m+b^2\right) \arctan(x)^{1+2n}+\left(a\, x^{m-1} m \_Y(x)+2 \_Y'(x)(\cdots\right.}{\left(x^2+1\right) \arctan(x \cdots}\right.\right.\right.}{\lambda \operatorname{DESol}\left(\left\{\frac{\_Y(x)\left(a^2 x^{1+2m}+a^2 x^{3+2m}+2a\, x^{3+m} b+2a\, x^{m+1} b+b^2 x\left(x^2+1\right)\right)\lambda^2 \arctan(x)^{1+2n}+\left(2a\, x^{3+m} \_Y'(x)+2a\, x^{m+1} \_Y'(\cdots\right.}{x\left(x^2+1\right) \cdots}\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x} \operatorname{DESol}\left(\left\{\frac{\lambda^2 \_Y(x)\left(x^2+1\right)\left(a^2 x^{2m}+2ab\, x^m+b^2\right) \arctan(x)^{1+2n}+\left(a\, x^{m-1} m \_Y(x)+2 \_Y'(x)(\cdots\right.}{\left(x^2+1\right) \arctan(x \cdots}\right.\right.\right.}{\lambda \operatorname{DESol}\left(\left\{\frac{\_Y(x)\left(a^2 x^{1+2m}+a^2 x^{3+2m}+2a\, x^{3+m} b+2a\, x^{m+1} b+b^2 x\left(x^2+1\right)\right)\lambda^2 \arctan(x)^{1+2n}+\left(2a\, x^{3+m} \_Y'(x)+2a\, x^{m+1} \_Y'(\cdots\right.}{x\left(x^2+1\right) \cdots}\right.\right.}$$

Verified OK.

Problem number: 26.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - \lambda \arctan(x)^n y^2 - ky = \lambda b^2 x^{2k} \arctan(x)^n}$$

16.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{\lambda \arctan(x)^n y^2 + ky + \lambda b^2 x^{2k} \arctan(x)^n}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{\lambda b^2 x^{2k} \arctan(x)^n}{x} + \frac{\lambda \arctan(x)^n y^2}{x} + \frac{ky}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{\lambda b^2 x^{2k} \arctan(x)^n}{x}$, $f_1(x) = \frac{k}{x}$ and $f_2(x) = \frac{\arctan(x)^n \lambda}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{\arctan(x)^n \lambda u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{\arctan(x)^n n\lambda}{(x^2+1)\arctan(x)\, x} - \frac{\lambda \arctan(x)^n}{x^2} \\
f_1 f_2 &= \frac{k \arctan(x)^n \lambda}{x^2} \\
f_2^2 f_0 &= \frac{\arctan(x)^{3n} \lambda^3 b^2 x^{2k}}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{\arctan(x)^n \lambda u''(x)}{x} - \left(\frac{\arctan(x)^n n\lambda}{(x^2+1)\arctan(x)\, x} - \frac{\lambda \arctan(x)^n}{x^2} + \frac{k \arctan(x)^n \lambda}{x^2}\right) u'(x) + \frac{\arctan(x)^{3n} \lambda^3 b^2}{x^3}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 e^{ib\lambda\left(\int x^{k-1} \arctan(x)^n dx\right)} + c_2 e^{-ib\lambda\left(\int x^{k-1} \arctan(x)^n dx\right)}$$

The above shows that

$$u'(x) = ib\, x^{k-1} \lambda \arctan(x)^n\, e^{-ib\lambda\left(\int x^{k-1} \arctan(x)^n dx\right)} \left(c_1 e^{2ib\lambda\left(\int x^{k-1} \arctan(x)^n dx\right)} - c_2\right)$$

Using the above in (1) gives the solution

$$y = -\frac{ib\, x^{k-1} e^{-ib\lambda\left(\int x^{k-1} \arctan(x)^n dx\right)} \left(c_1 e^{2ib\lambda\left(\int x^{k-1} \arctan(x)^n dx\right)} - c_2\right) x}{c_1 e^{ib\lambda\left(\int x^{k-1} \arctan(x)^n dx\right)} + c_2 e^{-ib\lambda\left(\int x^{k-1} \arctan(x)^n dx\right)}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{ib\, x^k \left(c_3 e^{2ib\lambda\left(\int x^{k-1} \arctan(x)^n dx\right)} - 1\right)}{c_3 e^{2ib\lambda\left(\int x^{k-1} \arctan(x)^n dx\right)} + 1}$$

Summary
The solution(s) found are the following

$$y = -\frac{ib\,x^k\left(c_3 \mathrm{e}^{2ib\lambda\left(\int x^{k-1}\arctan(x)^n dx\right)}-1\right)}{c_3 \mathrm{e}^{2ib\lambda\left(\int x^{k-1}\arctan(x)^n dx\right)}+1} \tag{1}$$

Verification of solutions

$$y = -\frac{ib\,x^k\left(c_3 \mathrm{e}^{2ib\lambda\left(\int x^{k-1}\arctan(x)^n dx\right)}-1\right)}{c_3 \mathrm{e}^{2ib\lambda\left(\int x^{k-1}\arctan(x)^n dx\right)}+1}$$

Verified OK.

Problem number: 27.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - \left(a\,x^{2m}y^2 + yx^nb + c\right)\arctan\left(x\right)^m + yn = 0}$$

16.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{\arctan\left(x\right)^m x^{2m}a\,y^2 + \arctan\left(x\right)^m x^nby + \arctan\left(x\right)^m c - ny}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{\arctan\left(x\right)^m x^{2m}a\,y^2}{x} + \frac{\arctan\left(x\right)^m x^nby}{x} + \frac{\arctan\left(x\right)^m c}{x} - \frac{ny}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{\arctan(x)^m c}{x}$, $f_1(x) = \frac{\arctan(x)^m x^n b - n}{x}$ and $f_2(x) = \frac{\arctan(x)^m x^{2m}a}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2u} \\ &= \frac{-u'}{\frac{\arctan(x)^m x^{2m}au}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{\arctan(x)^m\, m\, x^{2m}a}{(x^2+1)\arctan(x)\,x} + \frac{2\arctan(x)^m\, x^{2m}ma}{x^2} - \frac{\arctan(x)^m\, x^{2m}a}{x^2}\\
f_1f_2 &= \frac{(\arctan(x)^m\, x^n b - n)\arctan(x)^m\, x^{2m}a}{x^2}\\
f_2^2f_0 &= \frac{\arctan(x)^{3m}\, x^{4m}a^2c}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{\arctan(x)^m\, x^{2m}au''(x)}{x} - \left(\frac{\arctan(x)^m\, m\, x^{2m}a}{(x^2+1)\arctan(x)\,x} + \frac{2\arctan(x)^m\, x^{2m}ma}{x^2} - \frac{\arctan(x)^m\, x^{2m}a}{x^2} + \frac{(\arctan(\cdots}{\cdots}\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) = \mathrm{DESol}\Bigg(\Bigg\{&_Y''(x) - \frac{m_Y'(x)}{\arctan(x)(x^2+1)} - \frac{2m_Y'(x)}{x} + \frac{_Y'(x)}{x}\\
&- b\,x^{n-1}\arctan(x)^m\,_Y'(x) + \frac{n_Y'(x)}{x}\\
&+ ac\,x^{2m-2}_Y(x)\arctan(x)^{2m}\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

The above shows that

$$\begin{aligned}
u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\Bigg(\Bigg\{&_Y''(x) - \frac{m_Y'(x)}{\arctan(x)(x^2+1)} - \frac{2m_Y'(x)}{x} + \frac{_Y'(x)}{x}\\
&- b\,x^{n-1}\arctan(x)^m\,_Y'(x) + \frac{n_Y'(x)}{x}\\
&+ ac\,x^{2m-2}_Y(x)\arctan(x)^{2m}\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{m\_Y'(x)}{\arctan(x)(x^2+1)} - \frac{2m\_Y'(x)}{x} + \frac{\_Y'(x)}{x} - b\,x^{n-1}\arctan(x)^m\,\_Y'(x) + \frac{n\_Y'(x)}{x} + \cdots\right.\right.\right.}{a\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{m\_Y'(x)}{\arctan(x)(x^2+1)} - \frac{2m\_Y'(x)}{x} + \frac{\_Y'(x)}{x} - b\,x^{n-1}\arctan(x)^m\,\_Y'(x) + \cdots\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{x^{-2m+1} \arctan(x)^{-m} \left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{a c\, x^{2m-1} \_\_Y(x) \arctan(x)^{1+2m} (x^2+1) - b\, x^n \arctan(x)^{m+1} (x^2+1) \_\_Y'(x) + \_\_Y''(x)}{x(x^2+1)\arctan(x)}\right.\right.\right.}{a\, \mathrm{DESol}\left(\left\{\frac{ac\_\_Y(x)(x^{2m}+x^{2+2m})\arctan(x)^{1+2m} - \_\_Y'(x) b (x^{n+1}+x^{n+3})\arctan(x)^{m+1} - 2\left(-\frac{\_\_Y''(x)\left(x^2+1\right)\operatorname{arcta}}{2}\right.}{(x^2+1)x^2\arctan(x)}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{x^{-2m+1} \arctan(x)^{-m} \left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{a c\, x^{2m-1} \_\_Y(x) \arctan(x)^{1+2m} (x^2+1) - b\, x^n \arctan(x)^{m+1} (x^2+1) \_\_Y'(x) + \_\_Y''(x)}{x(x^2+1)\arctan(x)}\right.\right.\right.}{a\, \mathrm{DESol}\left(\left\{\frac{ac\_\_Y(x)(x^{2m}+x^{2+2m})\arctan(x)^{1+2m} - \_\_Y'(x) b (x^{n+1}+x^{n+3})\arctan(x)^{m+1} - 2\left(-\frac{\_\_Y''(x)\left(x^2+1\right)\operatorname{arcta}}{2}\right.}{(x^2+1)x^2\arctan(x)}\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{x^{-2m+1} \arctan(x)^{-m} \left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{a c\, x^{2m-1} \_\_Y(x) \arctan(x)^{1+2m} (x^2+1) - b\, x^n \arctan(x)^{m+1} (x^2+1) \_\_Y'(x) + \_\_Y''(x)}{x(x^2+1)\arctan(x)}\right.\right.\right.}{a\, \mathrm{DESol}\left(\left\{\frac{ac\_\_Y(x)(x^{2m}+x^{2+2m})\arctan(x)^{1+2m} - \_\_Y'(x) b (x^{n+1}+x^{n+3})\arctan(x)^{m+1} - 2\left(-\frac{\_\_Y''(x)\left(x^2+1\right)\operatorname{arcta}}{2}\right.}{(x^2+1)x^2\arctan(x)}\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - \lambda \operatorname{arccot}(x)^n y = -a^2 + a\lambda \operatorname{arccot}(x)^n}$$

17.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + \lambda \operatorname{arccot}(x)^n y - a^2 + a\lambda \operatorname{arccot}(x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \lambda \operatorname{arccot}(x)^n y - a^2 + a\lambda \operatorname{arccot}(x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2 + a\lambda \operatorname{arccot}(x)^n$, $f_1(x) = \operatorname{arccot}(x)^n \lambda$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \operatorname{arccot}(x)^n \lambda \\ f_2^2 f_0 &= -a^2 + a\lambda \operatorname{arccot}(x)^n \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \operatorname{arccot}(x)^n \lambda u'(x) + \left(-a^2 + a\lambda \operatorname{arccot}(x)^n\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\int \frac{a\left(\int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)} dx\right) - c_1 a + \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)}}{-c_1 + \int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)} dx} dx} c_2$$

The above shows that

$$u'(x) = \frac{\left(a\left(\int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)} dx\right) - c_1 a + \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)}\right) \mathrm{e}^{\int \frac{a\left(\int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)} dx\right) - c_1 a + \mathrm{e}^{-(\int (- \operatorname{ar}}}{-c_1 + \int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)} d}}}{-c_1 + \int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)} dx}$$

Using the above in (1) gives the solution

$$y = -\frac{a\left(\int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)} dx\right) - c_1 a + \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)}}{-c_1 + \int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)} dx}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-a\left(\int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)} dx\right) + c_3 a - \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)}}{-c_3 + \int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^n \lambda + 2a) dx\right)} dx}$$

Summary
The solution(s) found are the following

$$y = \frac{-a\left(\int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^{n} \lambda+2a)dx\right)}dx\right) + c_3 a - \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^{n} \lambda+2a)dx\right)}}{-c_3 + \int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^{n} \lambda+2a)dx\right)}dx} \tag{1}$$

Verification of solutions

$$y = \frac{-a\left(\int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^{n} \lambda+2a)dx\right)}dx\right) + c_3 a - \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^{n} \lambda+2a)dx\right)}}{-c_3 + \int \mathrm{e}^{-\left(\int (-\operatorname{arccot}(x)^{n} \lambda+2a)dx\right)}dx}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - \lambda x \operatorname{arccot}(x)^n y = \operatorname{arccot}(x)^n \lambda}$$

18.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + \operatorname{arccot}(x)^n \lambda x y + \operatorname{arccot}(x)^n \lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + \operatorname{arccot}(x)^n \lambda x y + \operatorname{arccot}(x)^n \lambda$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \operatorname{arccot}(x)^n \lambda$, $f_1(x) = \operatorname{arccot}(x)^n \lambda x$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= \operatorname{arccot}(x)^n \lambda x \\ f_2^2 f_0 &= \operatorname{arccot}(x)^n \lambda \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - \operatorname{arccot}(x)^n \lambda x u'(x) + \operatorname{arccot}(x)^n \lambda u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x\left(c_1 - c_2\left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n\lambda\right)}{x^2+1}dx}}{x^2\left(x^2+1\right)}dx\right)\right)$$

The above shows that

$$u'(x) = \frac{-\left(x^2+1\right)x c_2\left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n\lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right) - c_2 e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n\lambda\right)}{x^2+1}dx} + c_1 x(x^2+1)}{x\left(x^2+1\right)}$$

Using the above in (1) gives the solution

$$y = -\frac{-\left(x^2+1\right)x c_2\left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n\lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right) - c_2 e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n\lambda\right)}{x^2+1}dx} + c_1 x(x^2+1)}{x^2\left(x^2+1\right)\left(c_1 - c_2\left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n\lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right)\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{(x^3+x)\left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n \lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right) - c_3x^3 - c_3x + e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n \lambda\right)}{x^2+1}dx}}{x^2\left(x^2+1\right)\left(c_3 - \left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n \lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right)\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{(x^3+x)\left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n \lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right) - c_3x^3 - c_3x + e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n \lambda\right)}{x^2+1}dx}}{x^2\left(x^2+1\right)\left(c_3 - \left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n \lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right)\right)} \tag{1}$$

Verification of solutions

$$y = \frac{(x^3+x)\left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n \lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right) - c_3x^3 - c_3x + e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n \lambda\right)}{x^2+1}dx}}{x^2\left(x^2+1\right)\left(c_3 - \left(\int \frac{e^{\int \frac{x\left(2+\left(x^2+1\right)\operatorname{arccot}(x)^n \lambda\right)}{x^2+1}dx}}{x^2(x^2+1)}dx\right)\right)}$$

Verified OK.

Problem number: 30.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + (k+1)\, x^k y^2 - \lambda \operatorname{arccot}(x)^n \left(x^{k+1} y - 1\right) = 0}$$

18.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= x^{k+1} \operatorname{arccot}(x)^n \lambda y - x^k y^2 k - x^k y^2 - \operatorname{arccot}(x)^n \lambda \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^k x \operatorname{arccot}(x)^n \lambda y - x^k y^2 k - x^k y^2 - \operatorname{arccot}(x)^n \lambda$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = -\operatorname{arccot}(x)^n \lambda$, $f_1(x) = x^{k+1} \operatorname{arccot}(x)^n \lambda$ and $f_2(x) = -x^k k - x^k$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{(-x^k k - x^k)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{k^2 x^k}{x} - \frac{k\, x^k}{x} \\
f_1 f_2 &= x^{k+1} \operatorname{arccot}(x)^n \lambda(-x^k k - x^k) \\
f_2^2 f_0 &= -(-x^k k - x^k)^2 \operatorname{arccot}(x)^n \lambda
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$(-x^k k - x^k)\, u''(x) - \left(-\frac{k^2 x^k}{x} - \frac{k\, x^k}{x} + x^{k+1} \operatorname{arccot}(x)^n \lambda(-x^k k - x^k)\right) u'(x) - (-x^k k - x^k)^2 \operatorname{arccot}(x$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{k+1}\left(\left(\int x^{-2k-2} e^{\int \left(x^{k+1} \operatorname{arccot}(x)^n \lambda + \frac{k}{x}\right) dx} dx\right) c_2 + c_1\right)$$

The above shows that

$$u'(x) = c_2 x^{-k-1} e^{\int \frac{x^{k+2} \lambda \operatorname{arccot}(x)^n + k}{x} dx} + (k+1)\left(\left(\int e^{\int \frac{x^{k+2} \lambda \operatorname{arccot}(x)^n + k}{x} dx} x^{-2k-2} dx\right) c_2 + c_1\right) x^k$$

Using the above in (1) gives the solution

$$y = -\frac{\left(c_2 x^{-k-1} e^{\int \frac{x^{k+2} \lambda \operatorname{arccot}(x)^n + k}{x} dx} + (k+1)\left(\left(\int e^{\int \frac{x^{k+2} \lambda \operatorname{arccot}(x)^n + k}{x} dx} x^{-2k-2} dx\right) c_2 + c_1\right) x^k\right) x^{-k-1}}{(-x^k k - x^k)\left(\left(\int x^{-2k-2} e^{\int \left(x^{k+1} \operatorname{arccot}(x)^n \lambda + \frac{k}{x}\right) dx} dx\right) c_2 + c_1\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{(k+1)\left(\int x^{-2k-2} e^{\int \left(x^{k+1} \operatorname{arccot}(x)^n \lambda + \frac{k}{x}\right) dx} dx + c_3\right) x^{-k-1} + x^{-3k-2} e^{\int \left(x^{k+1} \operatorname{arccot}(x)^n \lambda + \frac{k}{x}\right) dx}}{(k+1)\left(\int e^{\int \frac{x^{k+2} \lambda \operatorname{arccot}(x)^n + k}{x} dx} x^{-2k-2} dx + c_3\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{(k+1)\left(\int x^{-2k-2} \mathrm{e}^{\int \left(x^{k+1} \operatorname{arccot}(x)^{n} \lambda+\frac{k}{x}\right)dx} dx + c_3\right) x^{-k-1} + x^{-3k-2} \mathrm{e}^{\int \left(x^{k+1} \operatorname{arccot}(x)^{n} \lambda+\frac{k}{x}\right)dx}}{(k+1)\left(\int \mathrm{e}^{\int \frac{x^{k+2} \lambda \operatorname{arccot}(x)^{n}+k}{x} dx} x^{-2k-2} dx + c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{(k+1)\left(\int x^{-2k-2} \mathrm{e}^{\int \left(x^{k+1} \operatorname{arccot}(x)^{n} \lambda+\frac{k}{x}\right)dx} dx + c_3\right) x^{-k-1} + x^{-3k-2} \mathrm{e}^{\int \left(x^{k+1} \operatorname{arccot}(x)^{n} \lambda+\frac{k}{x}\right)dx}}{(k+1)\left(\int \mathrm{e}^{\int \frac{x^{k+2} \lambda \operatorname{arccot}(x)^{n}+k}{x} dx} x^{-2k-2} dx + c_3\right)}$$

Verified OK.

Problem number: 31.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \operatorname{arccot}(x)^n y^2 - ay = ab - b^2\lambda \operatorname{arccot}(x)^n}$$

18.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \lambda \operatorname{arccot}(x)^n y^2 + ya + ab - b^2\lambda \operatorname{arccot}(x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \lambda \operatorname{arccot}(x)^n y^2 + ya + ab - b^2\lambda \operatorname{arccot}(x)^n$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = ab - b^2\lambda \operatorname{arccot}(x)^n$, $f_1(x) = a$ and $f_2(x) = \operatorname{arccot}(x)^n \lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\operatorname{arccot}(x)^n \lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{\operatorname{arccot}(x)^n n\lambda}{(x^2+1)\operatorname{arccot}(x)} \\ f_1 f_2 &= a\lambda \operatorname{arccot}(x)^n \\ f_2^2 f_0 &= \operatorname{arccot}(x)^{2n} \lambda^2 \left(ab - b^2\lambda \operatorname{arccot}(x)^n\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\operatorname{arccot}(x)^n \lambda u''(x) - \left(-\frac{\operatorname{arccot}(x)^n n\lambda}{(x^2+1)\operatorname{arccot}(x)} + a\lambda \operatorname{arccot}(x)^n\right) u'(x) + \operatorname{arccot}(x)^{2n} \lambda^2 \left(ab - b^2\lambda \operatorname{arccot}(x)^n\right)$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \operatorname{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} - a\_Y'(x) - \operatorname{arccot}(x)^{2n} b^2\lambda^2\_Y(x) + \operatorname{arccot}(x)^n ab\lambda\_Y(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} - a\_Y'(x) - \operatorname{arccot}(x)^{2n} b^2\lambda^2\_Y(x) + \operatorname{arccot}(x)^n ab\lambda\_Y(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} - a\_Y'(x) - \operatorname{arccot}(x)^{2n} b^2\lambda^2\_Y(x) + \operatorname{arccot}(x)^n ab\lambda\_Y(x)\right\}\right.\right.}{\lambda \operatorname{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} - a\_Y'(x) - \operatorname{arccot}(x)^{2n} b^2\lambda^2\_Y(x) + \operatorname{arccot}(x)^n ab\lambda\_\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{-b^2\_\_Y(x)\lambda^2\operatorname{arccot}(x)^{1+2n}(x^2+1)+ab\lambda\_\_Y(x)\operatorname{arccot}(x)^{n+1}(x^2+1)+\_\_Y''(x)(x^2+1)\operatorname{arccot}(x)-(a(x^2+1)\operatorname{arcco}}{\operatorname{arccot}(x)(x^2+1)}\right.\right.\right.}{\lambda\operatorname{DESol}\left(\left\{\frac{-b^2\_\_Y(x)\lambda^2\operatorname{arccot}(x)^{1+2n}(x^2+1)+ab\lambda\_\_Y(x)\operatorname{arccot}(x)^{n+1}(x^2+1)+\_\_Y''(x)(x^2+1)\operatorname{arccot}(x)-(a(x^2+1}{\operatorname{arccot}(x)(x^2+1)}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{-b^2\_\_Y(x)\lambda^2\operatorname{arccot}(x)^{1+2n}(x^2+1)+ab\lambda\_\_Y(x)\operatorname{arccot}(x)^{n+1}(x^2+1)+\_\_Y''(x)(x^2+1)\operatorname{arccot}(x)-(a(x^2+1)\operatorname{arcco}}{\operatorname{arccot}(x)(x^2+1)}\right.\right.\right.}{\lambda\operatorname{DESol}\left(\left\{\frac{-b^2\_\_Y(x)\lambda^2\operatorname{arccot}(x)^{1+2n}(x^2+1)+ab\lambda\_\_Y(x)\operatorname{arccot}(x)^{n+1}(x^2+1)+\_\_Y''(x)(x^2+1)\operatorname{arccot}(x)-(a(x^2+1}{\operatorname{arccot}(x)(x^2+1)}\right.\right.} \tag{1}$$

Verification of solutions

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-3. Equations containing arctangent.
Problem number: 32.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \operatorname{arccot}(x)^n y^2 + b\lambda x^m \operatorname{arccot}(x)^n y = bm x^{m-1}}$$

18.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \lambda \operatorname{arccot}(x)^n y^2 - b\lambda x^m \operatorname{arccot}(x)^n y + bm x^{m-1} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \lambda \operatorname{arccot}(x)^n y^2 - b\lambda x^m \operatorname{arccot}(x)^n y + \frac{b x^m m}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = bm x^{m-1}$, $f_1(x) = -b\lambda x^m \operatorname{arccot}(x)^n$ and $f_2(x) = \operatorname{arccot}(x)^n \lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\operatorname{arccot}(x)^n \lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{\operatorname{arccot}(x)^n n\lambda}{(x^2+1)\operatorname{arccot}(x)} \\ f_1f_2 &= -b\,\lambda^2x^m \operatorname{arccot}(x)^{2n} \\ f_2^2f_0 &= \operatorname{arccot}(x)^{2n}\,\lambda^2bm\,x^{m-1} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\operatorname{arccot}(x)^n\,\lambda u''(x) - \left(-\frac{\operatorname{arccot}(x)^n n\lambda}{(x^2+1)\operatorname{arccot}(x)} - b\,\lambda^2x^m \operatorname{arccot}(x)^{2n}\right)u'(x) + \operatorname{arccot}(x)^{2n}\,\lambda^2bm\,x^{m-1}u(x) =$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \operatorname{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} + \operatorname{arccot}(x)^n b\lambda\,x^m\_Y'(x) + \operatorname{arccot}(x)^n\,\lambda bm\,x^{m-1}\_Y(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} + \operatorname{arccot}(x)^n b\lambda\,x^m\_Y'(x) + \operatorname{arccot}(x)^n\,\lambda bm\,x^{m-1}\_Y(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} + \operatorname{arccot}(x)^n b\lambda\,x^m\_Y'(x) + \operatorname{arccot}(x)^n\,\lambda bm\,x^{m-1}\_Y(x)\right\}, \{\_\right.\right.}{\lambda\operatorname{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} + \operatorname{arccot}(x)^n b\lambda\,x^m\_Y'(x) + \operatorname{arccot}(x)^n\,\lambda bm\,x^{m-1}\_Y(x\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{b\lambda(x^2+1)\left(m\_\_Y(x)x^{m-1}+\_\_Y'(x)x^{m}\right)\operatorname{arccot}(x)^{n+1}+\_\_Y''(x)(x^2+1)\operatorname{arccot}(x)+n\_\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)}\right\}, \{\_\_Y(x)\}\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{b\lambda\left(m\,x^{m}\_\_Y(x)+m\_\_Y(x)x^{2+m}+\_\_Y'(x)x^{3+m}+\_\_Y'(x)x^{m+1}\right)\operatorname{arccot}(x)^{n+1}+x\left(\_\_Y''(x)(x^2+1)\operatorname{arccot}(x)+n\_\_Y\right.}{(x^2+1)\operatorname{arccot}(x)x}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{b\lambda(x^2+1)\left(m\_\_Y(x)x^{m-1}+\_\_Y'(x)x^{m}\right)\operatorname{arccot}(x)^{n+1}+\_\_Y''(x)(x^2+1)\operatorname{arccot}(x)+n\_\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)}\right\}, \{\_\_Y(x)\}\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{b\lambda\left(m\,x^{m}\_\_Y(x)+m\_\_Y(x)x^{2+m}+\_\_Y'(x)x^{3+m}+\_\_Y'(x)x^{m+1}\right)\operatorname{arccot}(x)^{n+1}+x\left(\_\_Y''(x)(x^2+1)\operatorname{arccot}(x)+n\_\_Y\right.}{(x^2+1)\operatorname{arccot}(x)x}\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\,\mathrm{DESol}\left(\left\{\frac{b\lambda(x^2+1)\left(m\_\_Y(x)x^{m-1}+\_\_Y'(x)x^{m}\right)\operatorname{arccot}(x)^{n+1}+\_\_Y''(x)(x^2+1)\operatorname{arccot}(x)+n\_\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)}\right\}, \{\_\_Y(x)\}\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{b\lambda\left(m\,x^{m}\_\_Y(x)+m\_\_Y(x)x^{2+m}+\_\_Y'(x)x^{3+m}+\_\_Y'(x)x^{m+1}\right)\operatorname{arccot}(x)^{n+1}+x\left(\_\_Y''(x)(x^2+1)\operatorname{arccot}(x)+n\_\_Y\right.}{(x^2+1)\operatorname{arccot}(x)x}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-3. Equations containing arctangent.
Problem number: 33.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - \lambda \operatorname{arccot}(x)^n y^2 = \beta m\, x^{m-1} - \lambda\, \beta^2 x^{2m} \operatorname{arccot}(x)^n}$$

18.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \lambda \operatorname{arccot}(x)^n y^2 + \beta m\, x^{m-1} - \lambda\, \beta^2 x^{2m} \operatorname{arccot}(x)^n \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\lambda\, \beta^2 x^{2m} \operatorname{arccot}(x)^n + \lambda \operatorname{arccot}(x)^n y^2 + \frac{\beta m\, x^m}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \beta m\, x^{m-1} - \lambda\, \beta^2 x^{2m} \operatorname{arccot}(x)^n$, $f_1(x) = 0$ and $f_2(x) = \operatorname{arccot}(x)^n \lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\operatorname{arccot}(x)^n \lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{\operatorname{arccot}(x)^n n\lambda}{(x^2+1)\operatorname{arccot}(x)} \\
f_1 f_2 &= 0 \\
f_2^2 f_0 &= \operatorname{arccot}(x)^{2n} \lambda^2 \left(\beta m\, x^{m-1} - \lambda\, \beta^2 x^{2m} \operatorname{arccot}(x)^n\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\operatorname{arccot}(x)^n \lambda u''(x) + \frac{\operatorname{arccot}(x)^n n\lambda u'(x)}{(x^2+1)\operatorname{arccot}(x)} + \operatorname{arccot}(x)^{2n} \lambda^2 \left(\beta m\, x^{m-1} - \lambda\, \beta^2 x^{2m} \operatorname{arccot}(x)^n\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} - x^{2m} \operatorname{arccot}(x)^{2n} \beta^2 \lambda^2 \_Y(x) + x^{m-1} \operatorname{arccot}(x)^n \beta m \lambda \_Y(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} - x^{2m} \operatorname{arccot}(x)^{2n} \beta^2 \lambda^2 \_Y(x) + x^{m-1} \operatorname{arccot}(x)^n \beta m \lambda \_Y(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} - x^{2m} \operatorname{arccot}(x)^{2n} \beta^2 \lambda^2 \_Y(x) + x^{m-1} \operatorname{arccot}(x)^n \beta m \lambda \_Y(x)\right\}\right.\right.}{\lambda\, \mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} - x^{2m} \operatorname{arccot}(x)^{2n} \beta^2 \lambda^2 \_Y(x) + x^{m-1} \operatorname{arccot}(x)^n \beta m \lambda\_\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_\_Y''(x)(x^2+1)\operatorname{arccot}(x)+n\_\_Y'(x)-\beta^2\_\_Y(x)x^{2m}\lambda^2\operatorname{arccot}(x)^{1+2n}(x^2+1)+m\beta\lambda\_\_Y(x)\operatorname{arccot}(x)^{n+1}x^{m-1}(x^2}{(x^2+1)\operatorname{arccot}(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{-\beta^2\lambda^2\_\_Y(x)(x^{3+2m}+x^{1+2m})\operatorname{arccot}(x)^{1+2n}+m\beta\lambda\_\_Y(x)(x^m+x^{2+m})\operatorname{arccot}(x)^{n+1}+x\left(\_\_Y''(x)(x^2+1)\operatorname{arcco}\right.}{(x^2+1)\operatorname{arccot}(x)x}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_\_Y''(x)(x^2+1)\operatorname{arccot}(x)+n\_\_Y'(x)-\beta^2\_\_Y(x)x^{2m}\lambda^2\operatorname{arccot}(x)^{1+2n}(x^2+1)+m\beta\lambda\_\_Y(x)\operatorname{arccot}(x)^{n+1}x^{m-1}(x^2}{(x^2+1)\operatorname{arccot}(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{-\beta^2\lambda^2\_\_Y(x)(x^{3+2m}+x^{1+2m})\operatorname{arccot}(x)^{1+2n}+m\beta\lambda\_\_Y(x)(x^m+x^{2+m})\operatorname{arccot}(x)^{n+1}+x\left(\_\_Y''(x)(x^2+1)\operatorname{arcco}\right.}{(x^2+1)\operatorname{arccot}(x)x}\right.\right.} \quad (1)$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{\_\_Y''(x)(x^2+1)\operatorname{arccot}(x)+n\_\_Y'(x)-\beta^2\_\_Y(x)x^{2m}\lambda^2\operatorname{arccot}(x)^{1+2n}(x^2+1)+m\beta\lambda\_\_Y(x)\operatorname{arccot}(x)^{n+1}x^{m-1}(x^2}{(x^2+1)\operatorname{arccot}(x)}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\frac{-\beta^2\lambda^2\_\_Y(x)(x^{3+2m}+x^{1+2m})\operatorname{arccot}(x)^{1+2n}+m\beta\lambda\_\_Y(x)(x^m+x^{2+m})\operatorname{arccot}(x)^{n+1}+x\left(\_\_Y''(x)(x^2+1)\operatorname{arcco}\right.}{(x^2+1)\operatorname{arccot}(x)x}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-3. Equations containing arctangent.
Problem number: 34.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[[_1st_order, `_with_symmetry_[F(x),G(x)]`], _Riccati]
```

$$\boxed{y' - \lambda \operatorname{arccot}(x)^n (y - a\,x^m - b)^2 = am\,x^{m-1}}$$

18.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= x^{2m} \operatorname{arccot}(x)^n a^2\lambda + 2x^m \operatorname{arccot}(x)^n ab\lambda - 2x^m \operatorname{arccot}(x)^n a\lambda y + b^2\lambda \operatorname{arccot}(x)^n - 2\operatorname{arccot}(x)^n b\lambda y \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = x^{2m} \operatorname{arccot}(x)^n a^2\lambda + 2x^m \operatorname{arccot}(x)^n ab\lambda - 2x^m \operatorname{arccot}(x)^n a\lambda y + b^2\lambda \operatorname{arccot}(x)^n - 2\operatorname{arccot}(x)^n b\lambda y + \lambda$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = x^{2m} \operatorname{arccot}(x)^n a^2\lambda + 2x^m \operatorname{arccot}(x)^n ab\lambda + b^2\lambda \operatorname{arccot}(x)^n + am\,x^{m-1}$, $f_1(x) = -2a\lambda\,x^m \operatorname{arccot}(x)^n - 2\operatorname{arccot}(x)^n \lambda b$ and $f_2(x) = \operatorname{arccot}(x)^n \lambda$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\operatorname{arccot}(x)^n \lambda u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{\operatorname{arccot}(x)^n\,n\lambda}{(x^2+1)\operatorname{arccot}(x)}\\
f_1f_2 &= \left(-2a\lambda\,x^m\operatorname{arccot}(x)^n - 2\operatorname{arccot}(x)^n\,\lambda b\right)\operatorname{arccot}(x)^n\,\lambda\\
f_2^2f_0 &= \operatorname{arccot}(x)^{2n}\,\lambda^2\left(x^{2m}\operatorname{arccot}(x)^n\,a^2\lambda + 2x^m\operatorname{arccot}(x)^n\,ab\lambda + b^2\lambda\operatorname{arccot}(x)^n + am\,x^{m-1}\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\operatorname{arccot}(x)^n\,\lambda u''(x) - \left(-\frac{\operatorname{arccot}(x)^n\,n\lambda}{(x^2+1)\operatorname{arccot}(x)} + \left(-2a\lambda\,x^m\operatorname{arccot}(x)^n - 2\operatorname{arccot}(x)^n\,\lambda b\right)\operatorname{arccot}(x)^n\,\lambda\right)u'(x$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) = \mathrm{DESol}\Bigg(\Bigg\{&_Y''(x) + \frac{n_Y'(x)}{\operatorname{arccot}(x)\,(x^2+1)} + 2\operatorname{arccot}(x)^n\,x^ma\lambda_Y'(x)\\
&+ 2\operatorname{arccot}(x)^n\,b\lambda_Y'(x) + x^{2m}\operatorname{arccot}(x)^{2n}\,a^2\lambda^2_Y(x)\\
&+ 2x^m\operatorname{arccot}(x)^{2n}\,ab\,\lambda^2_Y(x) + \operatorname{arccot}(x)^{2n}\,b^2\lambda^2_Y(x)\\
&+ x^{m-1}\operatorname{arccot}(x)^n\,am\lambda_Y(x)\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

The above shows that

$$\begin{aligned}
u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\Bigg(\Bigg\{&_Y''(x) + \frac{n_Y'(x)}{\operatorname{arccot}(x)\,(x^2+1)} + 2\operatorname{arccot}(x)^n\,x^ma\lambda_Y'(x)\\
&+ 2\operatorname{arccot}(x)^n\,b\lambda_Y'(x) + x^{2m}\operatorname{arccot}(x)^{2n}\,a^2\lambda^2_Y(x)\\
&+ 2x^m\operatorname{arccot}(x)^{2n}\,ab\,\lambda^2_Y(x) + \operatorname{arccot}(x)^{2n}\,b^2\lambda^2_Y(x)\\
&+ x^{m-1}\operatorname{arccot}(x)^n\,am\lambda_Y(x)\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} + 2\operatorname{arccot}(x)^n\,x^ma\lambda\_Y'(x) + 2\operatorname{arccot}(x)^n\,b\lambda\_Y'(x) + x^{2m}\operatorname{ar}\right.\right.\right.}{\lambda\,\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{n\_Y'(x)}{\operatorname{arccot}(x)(x^2+1)} + 2\operatorname{arccot}(x)^n\,x^ma\lambda\_Y'(x) + 2\operatorname{arccot}(x)^n\,b\lambda\_Y'(x) + x\right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \operatorname{DESol}\left(\left\{\frac{\lambda^2 \_\_Y(x)\left(x^2+1\right)\left(a^2 x^{2m}+2ab\, x^m+b^2\right) \operatorname{arccot}(x)^{1+2n}+\left(x^2+1\right)\left(a\, x^{m-1} m \_\_Y(x)+2\_\_\right.}{\operatorname{arccot}(x)\left(x^2+1\right)}\right.\right.\right.}{\lambda \operatorname{DESol}\left(\left\{\frac{\left(a^2 x^{1+2m}+a^2 x^{3+2m}+2a\, x^{3+m} b+2a\, x^{m+1} b+b^2 x\left(x^2+1\right)\right)\_\_Y(x)\lambda^2 \operatorname{arccot}(x)^{1+2n}+\left(2a\, x^{3+m}\_\_Y'(x)+2a\, x^{m+1}\_\_Y'(x\right.}{x\left(x^2+1\right) \mathrm{a}}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x} \operatorname{DESol}\left(\left\{\frac{\lambda^2 \_\_Y(x)\left(x^2+1\right)\left(a^2 x^{2m}+2ab\, x^m+b^2\right) \operatorname{arccot}(x)^{1+2n}+\left(x^2+1\right)\left(a\, x^{m-1} m \_\_Y(x)+2\_\_\right.}{\operatorname{arccot}(x)\left(x^2+1\right)}\right.\right.\right.}{\lambda \operatorname{DESol}\left(\left\{\frac{\left(a^2 x^{1+2m}+a^2 x^{3+2m}+2a\, x^{3+m} b+2a\, x^{m+1} b+b^2 x\left(x^2+1\right)\right)\_\_Y(x)\lambda^2 \operatorname{arccot}(x)^{1+2n}+\left(2a\, x^{3+m}\_\_Y'(x)+2a\, x^{m+1}\_\_Y'(x\right.}{x\left(x^2+1\right) \mathrm{a}}\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x} \operatorname{DESol}\left(\left\{\frac{\lambda^2 \_\_Y(x)\left(x^2+1\right)\left(a^2 x^{2m}+2ab\, x^m+b^2\right) \operatorname{arccot}(x)^{1+2n}+\left(x^2+1\right)\left(a\, x^{m-1} m \_\_Y(x)+2\_\_\right.}{\operatorname{arccot}(x)\left(x^2+1\right)}\right.\right.\right.}{\lambda \operatorname{DESol}\left(\left\{\frac{\left(a^2 x^{1+2m}+a^2 x^{3+2m}+2a\, x^{3+m} b+2a\, x^{m+1} b+b^2 x\left(x^2+1\right)\right)\_\_Y(x)\lambda^2 \operatorname{arccot}(x)^{1+2n}+\left(2a\, x^{3+m}\_\_Y'(x)+2a\, x^{m+1}\_\_Y'(x\right.}{x\left(x^2+1\right) \mathrm{a}}\right.\right.}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - \lambda \operatorname{arccot}(x)^{n} y^{2} - ky = \lambda b^{2} x^{2k} \operatorname{arccot}(x)^{n}}$$

18.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \frac{\lambda \operatorname{arccot}(x)^{n} y^{2} + ky + \lambda b^{2} x^{2k} \operatorname{arccot}(x)^{n}}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{\lambda b^{2} x^{2k} \operatorname{arccot}(x)^{n}}{x} + \frac{\lambda \operatorname{arccot}(x)^{n} y^{2}}{x} + \frac{ky}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = \frac{\lambda b^{2} x^{2k} \operatorname{arccot}(x)^{n}}{x}$, $f_1(x) = \frac{k}{x}$ and $f_2(x) = \frac{\operatorname{arccot}(x)^{n} \lambda}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{\operatorname{arccot}(x)^{n} \lambda u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{\operatorname{arccot}(x)^n n\lambda}{(x^2+1)\operatorname{arccot}(x)\, x} - \frac{\operatorname{arccot}(x)^n \lambda}{x^2} \\
f_1 f_2 &= \frac{k \operatorname{arccot}(x)^n \lambda}{x^2} \\
f_2^2 f_0 &= \frac{\operatorname{arccot}(x)^{3n} \lambda^3 b^2 x^{2k}}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{\operatorname{arccot}(x)^n \lambda u''(x)}{x} - \left(-\frac{\operatorname{arccot}(x)^n n\lambda}{(x^2+1)\operatorname{arccot}(x)\, x} - \frac{\operatorname{arccot}(x)^n \lambda}{x^2} + \frac{k \operatorname{arccot}(x)^n \lambda}{x^2}\right) u'(x) + \frac{\operatorname{arccot}(x)^{3n} \lambda^3 b}{x^3}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \mathrm{e}^{ib\lambda\left(\int x^{k-1} \operatorname{arccot}(x)^n dx\right)} + c_2 \mathrm{e}^{-ib\lambda\left(\int x^{k-1} \operatorname{arccot}(x)^n dx\right)}$$

The above shows that

$$u'(x) = ib\, x^{k-1} \lambda \operatorname{arccot}(x)^n \mathrm{e}^{-ib\lambda\left(\int x^{k-1} \operatorname{arccot}(x)^n dx\right)} \left(\mathrm{e}^{2ib\lambda\left(\int x^{k-1} \operatorname{arccot}(x)^n dx\right)} c_1 - c_2\right)$$

Using the above in (1) gives the solution

$$y = -\frac{ib\, x^{k-1} \mathrm{e}^{-ib\lambda\left(\int x^{k-1} \operatorname{arccot}(x)^n dx\right)} \left(\mathrm{e}^{2ib\lambda\left(\int x^{k-1} \operatorname{arccot}(x)^n dx\right)} c_1 - c_2\right) x}{c_1 \mathrm{e}^{ib\lambda\left(\int x^{k-1} \operatorname{arccot}(x)^n dx\right)} + c_2 \mathrm{e}^{-ib\lambda\left(\int x^{k-1} \operatorname{arccot}(x)^n dx\right)}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{ib\, x^k \left(\mathrm{e}^{2ib\lambda\left(\int x^{k-1} \operatorname{arccot}(x)^n dx\right)} c_3 - 1\right)}{\mathrm{e}^{2ib\lambda\left(\int x^{k-1} \operatorname{arccot}(x)^n dx\right)} c_3 + 1}$$

Summary
The solution(s) found are the following

$$y = -\frac{ib\,x^k\left(\mathrm{e}^{2ib\lambda\left(\int x^{k-1}\operatorname{arccot}(x)^n dx\right)}c_3 - 1\right)}{\mathrm{e}^{2ib\lambda\left(\int x^{k-1}\operatorname{arccot}(x)^n dx\right)}c_3 + 1} \tag{1}$$

Verification of solutions

$$y = -\frac{ib\,x^k\left(\mathrm{e}^{2ib\lambda\left(\int x^{k-1}\operatorname{arccot}(x)^n dx\right)}c_3 - 1\right)}{\mathrm{e}^{2ib\lambda\left(\int x^{k-1}\operatorname{arccot}(x)^n dx\right)}c_3 + 1}$$

Verified OK.

18.8 problem 36

Internal problem ID [10593]
Internal file name [OUTPUT/9540_Monday_June_06_2022_03_06_54_PM_87619199/index.tex]

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.7-3. Equations containing arctangent.
Problem number: 36.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[_Riccati]
```

$$\boxed{y'x - \left(a\,x^{2m} y^2 + y x^n b + c\right) \operatorname{arccot}\left(x\right)^m + yn = 0}$$

18.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{\operatorname{arccot}\left(x\right)^m x^{2m} a\, y^2 + \operatorname{arccot}\left(x\right)^m x^n b y + \operatorname{arccot}\left(x\right)^m c - n y}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{\operatorname{arccot}\left(x\right)^m x^{2m} a\, y^2}{x} + \frac{\operatorname{arccot}\left(x\right)^m x^n b y}{x} + \frac{\operatorname{arccot}\left(x\right)^m c}{x} - \frac{n y}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = \frac{\operatorname{arccot}(x)^m c}{x}$, $f_1(x) = \frac{\operatorname{arccot}(x)^m x^n b - n}{x}$ and $f_2(x) = \frac{\operatorname{arccot}(x)^m x^{2m} a}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{\operatorname{arccot}(x)^m x^{2m} a u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= -\frac{\operatorname{arccot}(x)^m\, m\, x^{2m}a}{(x^2+1)\operatorname{arccot}(x)\, x} + \frac{2\operatorname{arccot}(x)^m\, x^{2m} m a}{x^2} - \frac{\operatorname{arccot}(x)^m\, x^{2m} a}{x^2}\\
f_1f_2 &= \frac{(\operatorname{arccot}(x)^m\, x^n b - n)\operatorname{arccot}(x)^m\, x^{2m} a}{x^2}\\
f_2^2f_0 &= \frac{\operatorname{arccot}(x)^{3m}\, x^{4m} a^2 c}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{\operatorname{arccot}(x)^m\, x^{2m} a u''(x)}{x} - \left(-\frac{\operatorname{arccot}(x)^m\, m\, x^{2m}a}{(x^2+1)\operatorname{arccot}(x)\, x} + \frac{2\operatorname{arccot}(x)^m\, x^{2m} m a}{x^2} - \frac{\operatorname{arccot}(x)^m\, x^{2m} a}{x^2} + \frac{(\operatorname{arccot}(\right.$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) = \mathrm{DESol}\Bigg(\Bigg\{&_Y''(x) + \frac{m_Y'(x)}{(x^2+1)\operatorname{arccot}(x)} - \frac{2m_Y'(x)}{x} + \frac{_Y'(x)}{x}\\
&- b\,x^{n-1}\operatorname{arccot}(x)^m\,_Y'(x) + \frac{n_Y'(x)}{x}\\
&+ ac\,x^{2m-2}_Y(x)\operatorname{arccot}(x)^{2m}\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

The above shows that

$$\begin{aligned}
u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\Bigg(\Bigg\{&_Y''(x) + \frac{m_Y'(x)}{(x^2+1)\operatorname{arccot}(x)} - \frac{2m_Y'(x)}{x} + \frac{_Y'(x)}{x}\\
&- b\,x^{n-1}\operatorname{arccot}(x)^m\,_Y'(x) + \frac{n_Y'(x)}{x}\\
&+ ac\,x^{2m-2}_Y(x)\operatorname{arccot}(x)^{2m}\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{m\_Y'(x)}{(x^2+1)\operatorname{arccot}(x)} - \frac{2m\_Y'(x)}{x} + \frac{\_Y'(x)}{x} - b\,x^{n-1}\operatorname{arccot}(x)^m\,\_Y'(x) + \frac{n\_Y'(x)}{x} + \right.\right.\right.}{a\,\mathrm{DESol}\left(\left\{\_Y''(x) + \frac{m\_Y'(x)}{(x^2+1)\operatorname{arccot}(x)} - \frac{2m\_Y'(x)}{x} + \frac{\_Y'(x)}{x} - b\,x^{n-1}\operatorname{arccot}(x)^m\,\_Y'(x) + \right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{x^{-2m+1} \operatorname{arccot}(x)^{-m} \Bigg(\frac{\partial}{\partial x} \mathrm{DESol}\Bigg(\Bigg\{\frac{a c\, x^{2m-1}\_\_Y(x) \operatorname{arccot}(x)^{1+2m}(x^2+1) - b\, x^n \operatorname{arccot}(x)^{m+1}(x^2+1)\_\_Y'(x) + \_\_Y''(x)(\cdots}{x(x^2+1)\operatorname{arccot}(x)}}{a\, \mathrm{DESol}\Bigg(\Bigg\{\frac{ac\_\_Y(x)(x^{2m}+x^{2+2m})\operatorname{arccot}(x)^{1+2m} - \_\_Y'(x) b(x^{n+1}+x^{n+3})\operatorname{arccot}(x)^{m+1} - 2\Big(-\frac{\_\_Y''(x)(x^2+1)\operatorname{arcco}\cdots}{2}}{(x^2+1)x^2\operatorname{arccot}(x)}}$$

Summary

The solution(s) found are the following

$$y = -\frac{x^{-2m+1} \operatorname{arccot}(x)^{-m} \Bigg(\frac{\partial}{\partial x} \mathrm{DESol}\Bigg(\Bigg\{\frac{a c\, x^{2m-1}\_\_Y(x) \operatorname{arccot}(x)^{1+2m}(x^2+1) - b\, x^n \operatorname{arccot}(x)^{m+1}(x^2+1)\_\_Y'(x) + \_\_Y''(x)(\cdots}{x(x^2+1)\operatorname{arccot}(x)}}{a\, \mathrm{DESol}\Bigg(\Bigg\{\frac{ac\_\_Y(x)(x^{2m}+x^{2+2m})\operatorname{arccot}(x)^{1+2m} - \_\_Y'(x) b(x^{n+1}+x^{n+3})\operatorname{arccot}(x)^{m+1} - 2\Big(-\frac{\_\_Y''(x)(x^2+1)\operatorname{arcco}\cdots}{2}}{(x^2+1)x^2\operatorname{arccot}(x)}} \tag{1}$$

Verification of solutions

$$y = -\frac{x^{-2m+1} \operatorname{arccot}(x)^{-m} \Bigg(\frac{\partial}{\partial x} \mathrm{DESol}\Bigg(\Bigg\{\frac{a c\, x^{2m-1}\_\_Y(x) \operatorname{arccot}(x)^{1+2m}(x^2+1) - b\, x^n \operatorname{arccot}(x)^{m+1}(x^2+1)\_\_Y'(x) + \_\_Y''(x)(\cdots}{x(x^2+1)\operatorname{arccot}(x)}}{a\, \mathrm{DESol}\Bigg(\Bigg\{\frac{ac\_\_Y(x)(x^{2m}+x^{2+2m})\operatorname{arccot}(x)^{1+2m} - \_\_Y'(x) b(x^{n+1}+x^{n+3})\operatorname{arccot}(x)^{m+1} - 2\Big(-\frac{\_\_Y''(x)(x^2+1)\operatorname{arcco}\cdots}{2}}{(x^2+1)x^2\operatorname{arccot}(x)}}$$

Verified OK.

Problem number: 1.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - f(x)\, y = -a^2 - f(x)\, a}$$

19.1.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= y^2 + f(x)\, y - a^2 - f(x)\, a \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + f(x)\, y - a^2 - f(x)\, a$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -a^2 - f(x)\, a$, $f_1(x) = f(x)$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1f_2 &= f(x) \\ f_2^2 f_0 &= -a^2 - f(x)\,a \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - f(x)\,u'(x) + \left(-a^2 - f(x)\,a\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(\left(\int \mathrm{e}^{2xa+\int f(x)dx}dx\right) c_1 + c_2\right) \mathrm{e}^{-xa}$$

The above shows that

$$u'(x) = -\mathrm{e}^{-xa}\left(\int \mathrm{e}^{2xa+\int f(x)dx}dx\right) c_1a - \mathrm{e}^{-xa}c_2a + c_1\mathrm{e}^{xa+\int f(x)dx}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-\mathrm{e}^{-xa}\left(\int \mathrm{e}^{2xa+\int f(x)dx}dx\right) c_1a - \mathrm{e}^{-xa}c_2a + c_1\mathrm{e}^{xa+\int f(x)dx}\right) \mathrm{e}^{xa}}{\left(\int \mathrm{e}^{2xa+\int f(x)dx}dx\right) c_1 + c_2}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-c_3\mathrm{e}^{2xa+\int f(x)dx} + a\left(\int \mathrm{e}^{2xa+\int f(x)dx}dx\right) c_3 + a}{\left(\int \mathrm{e}^{2xa+\int f(x)dx}dx\right) c_3 + 1}$$

Summary

The solution(s) found are the following

$$y = \frac{-c_3\mathrm{e}^{2xa+\int f(x)dx} + a\left(\int \mathrm{e}^{2xa+\int f(x)dx}dx\right) c_3 + a}{\left(\int \mathrm{e}^{2xa+\int f(x)dx}dx\right) c_3 + 1} \tag{1}$$

Verification of solutions

$$y = \frac{-c_3 \mathrm{e}^{2xa+\int f(x)dx} + a\left(\int \mathrm{e}^{2xa+\int f(x)dx}dx\right) c_3 + a}{\left(\int \mathrm{e}^{2xa+\int f(x)dx}dx\right) c_3 + 1}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) + ay = -ab - b^2 f(x)}$$

19.2.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= f(x)\, y^2 - ya - ab - b^2 f(x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = f(x)\, y^2 - ya - ab - b^2 f(x)$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -ab - b^2 f(x)$, $f_1(x) = -a$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1 f_2 &= -f(x)\, a \\ f_2^2 f_0 &= f(x)^2 \left(-ab - b^2 f(x)\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x)\, u''(x) - (f'(x) - f(x)\, a)\, u'(x) + f(x)^2 \left(-ab - b^2 f(x)\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\int \frac{f(x)\left(b\left(\int f(x)\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx\right) - c_1 b + \mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}\right)}{-c_1 + \int f(x)\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx} dx} c_2$$

The above shows that

$$u'(x) = \frac{f(x)\left(b\left(\int f(x)\,\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx\right) - c_1 b + \mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}\right)\mathrm{e}^{\int \frac{f(x)\left(b\left(\int f(x)\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx\right) - c_1 b + \mathrm{e}^{-\left(\int (2f(x)b+a}{-c_1 + \int f(x)\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx}}}{-c_1 + \int f(x)\,\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx}$$

Using the above in (1) gives the solution

$$y = -\frac{b\left(\int f(x)\,\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx\right) - c_1 b + \mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}}{-c_1 + \int f(x)\,\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{b\left(\int f(x)\,\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx\right) - bc_3 + \mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}}{c_3 - \left(\int f(x)\,\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{b\left(\int f(x)\,\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx\right) - bc_3 + \mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}}{c_3 - \left(\int f(x)\,\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx\right)} \tag{1}$$

Verification of solutions

$$y = \frac{b\left(\int f(x)\,\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx\right) - bc_3 + \mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}}{c_3 - \left(\int f(x)\,\mathrm{e}^{-\left(\int (2f(x)b+a)dx\right)}dx\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 - xf(x)\,y = f(x)}$$

19.3.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= y^2 + f(x)\,xy + f(x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = y^2 + f(x)\,xy + f(x)$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = f(x)$, $f_1(x) = xf(x)$ and $f_2(x) = 1$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= 0 \\ f_1 f_2 &= x f(x) \\ f_2^2 f_0 &= f(x) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$u''(x) - x f(x)\, u'(x) + f(x)\, u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x\left(\left(\int e^{\int \frac{f(x)x^2-2}{x}dx} dx\right) c_1 + c_2\right)$$

The above shows that

$$u'(x) = \left(\int e^{\int \frac{f(x)x^2-2}{x}dx} dx\right) c_1 + c_2 + x\, e^{\int \frac{f(x)x^2-2}{x}dx} c_1$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\int e^{\int \frac{f(x)x^2-2}{x}dx} dx\right) c_1 + c_2 + x\, e^{\int \frac{f(x)x^2-2}{x}dx} c_1}{x\left(\left(\int e^{\int \frac{f(x)x^2-2}{x}dx} dx\right) c_1 + c_2\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-\left(\int e^{\int \frac{f(x)x^2-2}{x}dx} dx\right) c_3 - 1 - x\, e^{\int \frac{f(x)x^2-2}{x}dx} c_3}{x\left(\left(\int e^{\int \frac{f(x)x^2-2}{x}dx} dx\right) c_3 + 1\right)}$$

Summary
The solution(s) found are the following

$$y = \frac{-\left(\int e^{\int \frac{f(x)x^2-2}{x}dx}dx\right)c_3 - 1 - x\,e^{\int \frac{f(x)x^2-2}{x}dx}c_3}{x\left(\left(\int e^{\int \frac{f(x)x^2-2}{x}dx}dx\right)c_3 + 1\right)} \tag{1}$$

Verification of solutions

$$y = \frac{-\left(\int e^{\int \frac{f(x)x^2-2}{x}dx}dx\right)c_3 - 1 - x\,e^{\int \frac{f(x)x^2-2}{x}dx}c_3}{x\left(\left(\int e^{\int \frac{f(x)x^2-2}{x}dx}dx\right)c_3 + 1\right)}$$

Verified OK.

Problem number: 4.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) + a\,x^n f(x)\,y = an\,x^{n-1}}$$

19.4.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= f(x)\,y^2 - a\,x^n f(x)\,y + an\,x^{n-1} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = f(x)\,y^2 - a\,x^n f(x)\,y + \frac{x^n na}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = an\,x^{n-1}$, $f_1(x) = -f(x)\,a\,x^n$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\,u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1f_2 &= -f(x)^2\,a\,x^n \\ f_2^2f_0 &= f(x)^2\,an\,x^{n-1} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x)\,u''(x) - \left(-f(x)^2\,a\,x^n + f'(x)\right)u'(x) + f(x)^2\,an\,x^{n-1}u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{-a\left(\int f(x)x^n dx\right)}\left(c_1 + \left(\int f(x)\,\mathrm{e}^{a\left(\int f(x)x^n dx\right)}dx\right)c_2\right)$$

The above shows that

$$u'(x) = f(x)\left(-x^n\mathrm{e}^{-a\left(\int f(x)x^n dx\right)}\left(\int f(x)\,\mathrm{e}^{a\left(\int f(x)x^n dx\right)}dx\right)c_2a - x^n\mathrm{e}^{-a\left(\int f(x)x^n dx\right)}c_1a + c_2\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(-x^n\mathrm{e}^{-a\left(\int f(x)x^n dx\right)}\left(\int f(x)\,\mathrm{e}^{a\left(\int f(x)x^n dx\right)}dx\right)c_2a - x^n\mathrm{e}^{-a\left(\int f(x)x^n dx\right)}c_1a + c_2\right)\mathrm{e}^{\int f(x)a\,x^n dx}}{c_1 + \left(\int f(x)\,\mathrm{e}^{a\left(\int f(x)x^n dx\right)}dx\right)c_2}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{ac_3x^n + a\left(\int f(x)\,\mathrm{e}^{a\left(\int f(x)x^n dx\right)}dx\right)x^n - \mathrm{e}^{a\left(\int f(x)x^n dx\right)}}{c_3 + \int f(x)\,\mathrm{e}^{a\left(\int f(x)x^n dx\right)}dx}$$

Summary

The solution(s) found are the following

$$y = \frac{ac_3x^n + a\left(\int f(x)\,\mathrm{e}^{a\left(\int f(x)x^n dx\right)}dx\right)x^n - \mathrm{e}^{a\left(\int f(x)x^n dx\right)}}{c_3 + \int f(x)\,\mathrm{e}^{a\left(\int f(x)x^n dx\right)}dx} \tag{1}$$

Verification of solutions

$$y = \frac{ac_3x^n + a\left(\int f(x)\,\mathrm{e}^{a\left(\int f(x)x^n dx\right)}dx\right)x^n - \mathrm{e}^{a\left(\int f(x)x^n dx\right)}}{c_3 + \int f(x)\,\mathrm{e}^{a\left(\int f(x)x^n dx\right)}dx}$$

Verified OK.

Problem number: 5.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) = an\, x^{n-1} - a^2 x^{2n} f(x)}$$

19.5.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= f(x)\, y^2 + an\, x^{n-1} - a^2 x^{2n} f(x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2 x^{2n} f(x) + f(x)\, y^2 + \frac{x^n n a}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = an\, x^{n-1} - a^2 x^{2n} f(x)$, $f_1(x) = 0$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1f_2 &= 0 \\ f_2^2 f_0 &= f(x)^2 \left(an\, x^{n-1} - a^2x^{2n} f(x)\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x)\, u''(x) - f'(x)\, u'(x) + f(x)^2 \left(an\, x^{n-1} - a^2x^{2n} f(x)\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{f'(x)\_Y'(x)}{f(x)} + f(x)\left(an\, x^{n-1} - a^2x^{2n} f(x)\right)\_Y(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{f'(x)\_Y'(x)}{f(x)} + f(x)\left(an\, x^{n-1} - a^2x^{2n} f(x)\right)\_Y(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{f'(x)\_Y'(x)}{f(x)} + f(x)\left(an\, x^{n-1} - a^2x^{2n} f(x)\right)\_Y(x)\right\}, \{\_Y(x)\}\right)}{f(x)\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{f'(x)\_Y'(x)}{f(x)} + f(x)\left(an\, x^{n-1} - a^2x^{2n} f(x)\right)\_Y(x)\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{f'(x)\_Y'(x)}{f(x)} + f(x)\left(an\, x^{n-1} - a^2x^{2n} f(x)\right)\_Y(x)\right\}, \{\_Y(x)\}\right)}{f(x)\,\mathrm{DESol}\left(\left\{\frac{-f(x)^3x^{1+2n}\_Y(x)a^2 + f(x)^2x^n\_Y(x)an + \_Y''(x)xf(x) - f'(x)\_Y'(x)x}{xf(x)}\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\_Y''(x) - \frac{f'(x)\_Y'(x)}{f(x)} + f(x)\left(an\,x^{n-1} - a^2x^{2n}f(x)\right)\_Y(x)\right\}, \{\_Y(x)\}\right)}{f(x)\operatorname{DESol}\left(\left\{\frac{-f(x)^3x^{1+2n}\_Y(x)a^2 + f(x)^2x^n\_Y(x)an + \_Y''(x)xf(x) - f'(x)\_Y'(x)x}{xf(x)}\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\_Y''(x) - \frac{f'(x)\_Y'(x)}{f(x)} + f(x)\left(an\,x^{n-1} - a^2x^{2n}f(x)\right)\_Y(x)\right\}, \{\_Y(x)\}\right)}{f(x)\operatorname{DESol}\left(\left\{\frac{-f(x)^3x^{1+2n}\_Y(x)a^2 + f(x)^2x^n\_Y(x)an + \_Y''(x)xf(x) - f'(x)\_Y'(x)x}{xf(x)}\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 6.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' + (n+1)\, x^n y^2 - x^{n+1} f(x)\, y = -f(x)}$$

19.6.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -x^n y^2 n + x^{n+1} f(x)\, y - x^n y^2 - f(x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -x^n y^2 n + x^n x f(x)\, y - x^n y^2 - f(x)$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = -f(x)$, $f_1(x) = f(x)\, x^{n+1}$ and $f_2(x) = -n\, x^n - x^n$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{(-n\, x^n - x^n)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= -\frac{n^2 x^n}{x} - \frac{x^n n}{x} \\ f_1 f_2 &= f(x)\, x^{n+1}(-n\, x^n - x^n) \\ f_2^2 f_0 &= -(-n\, x^n - x^n)^2\, f(x) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$(-n\, x^n - x^n)\, u''(x) - \left(-\frac{n^2 x^n}{x} - \frac{x^n n}{x} + f(x)\, x^{n+1}(-n\, x^n - x^n)\right) u'(x) - (-n\, x^n - x^n)^2\, f(x)\, u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = x^{n+1}\left(\left(\int x^{-2n-2} \mathrm{e}^{\int \left(f(x)x^{n+1} + \frac{n}{x}\right)dx} dx\right) c_2 + c_1\right)$$

The above shows that

$$u'(x) = x^n(n+1)\left(\left(\int \mathrm{e}^{\int \frac{f(x)x^{2+n}+n}{x} dx} x^{-2n-2} dx\right) c_2 + c_1\right) + c_2 x^{-n-1} \mathrm{e}^{\int \frac{f(x)x^{2+n}+n}{x} dx}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(x^n(n+1)\left(\left(\int \mathrm{e}^{\int \frac{f(x)x^{2+n}+n}{x} dx} x^{-2n-2} dx\right) c_2 + c_1\right) + c_2 x^{-n-1} \mathrm{e}^{\int \frac{f(x)x^{2+n}+n}{x} dx}\right) x^{-n-1}}{(-n\, x^n - x^n)\left(\left(\int x^{-2n-2} \mathrm{e}^{\int \left(f(x)x^{n+1} + \frac{n}{x}\right)dx} dx\right) c_2 + c_1\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{(n+1)\left(\int x^{-2n-2} \mathrm{e}^{\int \left(f(x)x^{n+1} + \frac{n}{x}\right)dx} dx + c_3\right) x^{-n-1} + x^{-2-3n} \mathrm{e}^{\int \left(f(x)x^{n+1} + \frac{n}{x}\right)dx}}{(n+1)\left(\int \mathrm{e}^{\int \frac{f(x)x^{2+n}+n}{x} dx} x^{-2n-2} dx + c_3\right)}$$

Summary

The solution(s) found are the following

$$y = \frac{(n+1)\left(\int x^{-2n-2} e^{\int \left(f(x)x^{n+1}+\frac{n}{x}\right)dx} dx + c_3\right) x^{-n-1} + x^{-2-3n} e^{\int \left(f(x)x^{n+1}+\frac{n}{x}\right)dx}}{(n+1)\left(\int e^{\int \frac{f(x)x^{2+n}+n}{x} dx} x^{-2n-2} dx + c_3\right)} \tag{1}$$

Verification of solutions

$$y = \frac{(n+1)\left(\int x^{-2n-2} e^{\int \left(f(x)x^{n+1}+\frac{n}{x}\right)dx} dx + c_3\right) x^{-n-1} + x^{-2-3n} e^{\int \left(f(x)x^{n+1}+\frac{n}{x}\right)dx}}{(n+1)\left(\int e^{\int \frac{f(x)x^{2+n}+n}{x} dx} x^{-2n-2} dx + c_3\right)}$$

Verified OK.

Problem number: 7.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - y^2 f(x) - yn = f(x)\, x^{2n} a}$$

19.7.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= \frac{f(x)\, y^2 + ny + f(x)\, x^{2n} a}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{f(x)\, a\, x^{2n}}{x} + \frac{f(x)\, y^2}{x} + \frac{ny}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{f(x) a\, x^{2n}}{x}$, $f_1(x) = \frac{n}{x}$ and $f_2(x) = \frac{f(x)}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{f(x)u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{f'(x)}{x} - \frac{f(x)}{x^2} \\ f_1f_2 &= \frac{nf(x)}{x^2} \\ f_2^2 f_0 &= \frac{f(x)^3\, a\, x^{2n}}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{f(x)\,u''(x)}{x} - \left(\frac{f'(x)}{x} - \frac{f(x)}{x^2} + \frac{nf(x)}{x^2}\right)u'(x) + \frac{f(x)^3\, a\, x^{2n} u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 \mathrm{e}^{i\sqrt{a}\left(\int f(x)x^{n-1}dx\right)} + c_2 \mathrm{e}^{-i\sqrt{a}\left(\int f(x)x^{n-1}dx\right)}$$

The above shows that

$$u'(x) = ix^{n-1} f(x)\,\sqrt{a}\,\mathrm{e}^{-i\sqrt{a}\left(\int f(x)x^{n-1}dx\right)}\left(c_1 \mathrm{e}^{2i\sqrt{a}\left(\int f(x)x^{n-1}dx\right)} - c_2\right)$$

Using the above in (1) gives the solution

$$y = -\frac{ix^{n-1}\sqrt{a}\,\mathrm{e}^{-i\sqrt{a}\left(\int f(x)x^{n-1}dx\right)}\left(c_1 \mathrm{e}^{2i\sqrt{a}\left(\int f(x)x^{n-1}dx\right)} - c_2\right)x}{c_1 \mathrm{e}^{i\sqrt{a}\left(\int f(x)x^{n-1}dx\right)} + c_2 \mathrm{e}^{-i\sqrt{a}\left(\int f(x)x^{n-1}dx\right)}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{ix^n\sqrt{a}\left(c_3 \mathrm{e}^{2i\sqrt{a}\left(\int f(x)x^{n-1}dx\right)} - 1\right)}{c_3 \mathrm{e}^{2i\sqrt{a}\left(\int f(x)x^{n-1}dx\right)} + 1}$$

Summary
The solution(s) found are the following

$$y = -\frac{i x^{n} \sqrt{a}\, \left(c_{3} {\mathrm e}^{2 i \sqrt{a}\, \left(\int f \left(x \right) x^{n -1}d x \right)}-1\right)}{c_{3} {\mathrm e}^{2 i \sqrt{a}\, \left(\int f \left(x \right) x^{n -1}d x \right)}+1} \tag{1}$$

Verification of solutions

$$y = -\frac{i x^{n} \sqrt{a}\, \left(c_{3} {\mathrm e}^{2 i \sqrt{a}\, \left(\int f \left(x \right) x^{n -1}d x \right)}-1\right)}{c_{3} {\mathrm e}^{2 i \sqrt{a}\, \left(\int f \left(x \right) x^{n -1}d x \right)}+1}$$

Verified OK.

Problem number: 8.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - x^{2n} f(x)\, y^2 - (f(x)\, a\, x^n - n)\, y = f(x)\, b}$$

19.8.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \frac{a\, x^n f(x)\, y + x^{2n} f(x)\, y^2 + f(x)\, b - ny}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{x^n f(x)\, ay}{x} + \frac{x^{2n} f(x)\, y^2}{x} + \frac{f(x)\, b}{x} - \frac{ny}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{f(x)b}{x}$, $f_1(x) = \frac{f(x)a\, x^n - n}{x}$ and $f_2(x) = \frac{f(x)x^{2n}}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{f(x)x^{2n}u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{f'(x)\, x^{2n}}{x} + \frac{2 f(x)\, x^{2n} n}{x^2} - \frac{f(x)\, x^{2n}}{x^2} \\
f_1 f_2 &= \frac{(f(x)\, a\, x^n - n)\, f(x)\, x^{2n}}{x^2} \\
f_2^2 f_0 &= \frac{f(x)^3\, x^{4n} b}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{f(x)\, x^{2n} u''(x)}{x} - \left(\frac{f'(x)\, x^{2n}}{x} + \frac{2 f(x)\, x^{2n} n}{x^2} - \frac{f(x)\, x^{2n}}{x^2} + \frac{(f(x)\, a\, x^n - n)\, f(x)\, x^{2n}}{x^2}\right) u'(x) + \frac{f(x)^3\, x^{4n} b u(x}{x^3}$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \left(c_1 \operatorname{BesselJ}\left(\frac{\sqrt{3}\,\sqrt{-b}}{8a}, \frac{\sqrt{3}\,\sqrt{2}\,\sqrt{b\, x^{2n}}\, x^{-n}}{8a}\right) + c_2 \operatorname{BesselY}\left(\frac{\sqrt{3}\,\sqrt{-b}}{8a}, \frac{\sqrt{3}\,\sqrt{2}\,\sqrt{b\, x^{2n}}\, x^{-n}}{8a}\right)\right) \mathrm{e}^{\frac{\left(\int \left(\frac{a\, x^n f(x)}{x} + \frac{f'(x)}{f(x)} + \frac{3n}{x}\right) dx\right)}{2}}$$

The above shows that

$$u'(x) = \frac{\left(c_1 \operatorname{BesselJ}\left(\frac{\sqrt{3}\,\sqrt{-b}}{8a}, \frac{\sqrt{3}\,\sqrt{2}\,\sqrt{b\, x^{2n}}\, x^{-n}}{8a}\right) + c_2 \operatorname{BesselY}\left(\frac{\sqrt{3}\,\sqrt{-b}}{8a}, \frac{\sqrt{3}\,\sqrt{2}\,\sqrt{b\, x^{2n}}\, x^{-n}}{8a}\right)\right) \left(f(x)^2\, a\, x^n + f'(x)\, x + 3n\right.}{2 x f(x)}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(f(x)^2\, a\, x^n + f'(x)\, x + 3n f(x)\right) \mathrm{e}^{\frac{\left(\int \frac{f(x)^2 a\, x^n + f'(x) x + 3n f(x)}{f(x) x} dx\right)}{2}} x^{-2n} \mathrm{e}^{\int \left(-\frac{a\, x^{n-1} f(x)}{2} - \frac{f'(x)}{2 f(x)} - \frac{3n}{2x}\right) dx}}{2 f(x)^2}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(f(x)^2 a\, x^n + f'(x)\, x + 3n f(x)\right) x^{-2n}}{2 f\left(x\right)^2}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(f(x)^2 a\, x^n + f'(x)\, x + 3n f(x)\right) x^{-2n}}{2 f\left(x\right)^2} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(f(x)^2 a\, x^n + f'(x)\, x + 3n f(x)\right) x^{-2n}}{2 f\left(x\right)^2}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) - g(x)\, y = -f(x)\, a^2 - a g(x)}$$

19.9.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= f(x)\, y^2 + g(x)\, y - f(x)\, a^2 - a g(x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = f(x)\, y^2 + g(x)\, y - f(x)\, a^2 - a g(x)$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = -f(x)\, a^2 - a g(x)$, $f_1(x) = g(x)$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1 f_2 &= g(x)\, f(x) \\ f_2^2 f_0 &= f(x)^2 \left(-f(x)\, a^2 - a g(x)\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x)\, u''(x) - (f'(x) + g(x)\, f(x))\, u'(x) + f(x)^2 \left(-f(x)\, a^2 - a g(x)\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = -\left(\int e^{\int (2f(x)a + g(x))dx} f(x)\, dx + c_1\right) e^{-a\left(\int f(x)dx\right)} c_2$$

The above shows that

$$u'(x) = c_2 f(x) \left(-e^{\int (2f(x)a+g(x))dx - a\left(\int f(x)dx\right)} + a\, e^{-a\left(\int f(x)dx\right)} \left(\int e^{\int (2f(x)a+g(x))dx} f(x)\, dx + c_1\right)\right)$$

Using the above in (1) gives the solution

$$y = \frac{\left(-e^{\int (2f(x)a+g(x))dx - a\left(\int f(x)dx\right)} + a\, e^{-a\left(\int f(x)dx\right)} \left(\int e^{\int (2f(x)a+g(x))dx} f(x)\, dx + c_1\right)\right) e^{\int f(x) a dx}}{\int e^{\int (2f(x)a+g(x))dx} f(x)\, dx + c_1}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{-e^{\int (2f(x)a+g(x))dx} + c_3 a + \left(\int e^{\int (2f(x)a+g(x))dx} f(x)\, dx\right) a}{\int e^{\int (2f(x)a+g(x))dx} f(x)\, dx + c_3}$$

Summary

The solution(s) found are the following

$$y = \frac{-e^{\int (2f(x)a+g(x))dx} + c_3 a + \left(\int e^{\int (2f(x)a+g(x))dx} f(x)\, dx\right) a}{\int e^{\int (2f(x)a+g(x))dx} f(x)\, dx + c_3} \tag{1}$$

Verification of solutions

$$y = \frac{-e^{\int (2f(x)a+g(x))dx} + c_3 a + \left(\int e^{\int (2f(x)a+g(x))dx} f(x)\, dx\right) a}{\int e^{\int (2f(x)a+g(x))dx} f(x)\, dx + c_3}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 10.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) - g(x)\, y = an\, x^{n-1} - a\, x^n g(x) - a^2 x^{2n} f(x)}$$

19.10.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= f(x)\, y^2 + g(x)\, y + an\, x^{n-1} - a\, x^n g(x) - a^2 x^{2n} f(x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a^2 x^{2n} f(x) - a\, x^n g(x) + f(x)\, y^2 + \frac{x^n na}{x} + g(x)\, y$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x) y + f_2(x) y^2$$

Shows that $f_0(x) = an\, x^{n-1} - a\, x^n g(x) - a^2 x^{2n} f(x)$, $f_1(x) = g(x)$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= f'(x) \\
f_1 f_2 &= g(x)\, f(x) \\
f_2^2 f_0 &= f(x)^2 \left(an\, x^{n-1} - a\, x^n g(x) - a^2 x^{2n} f(x)\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x)\, u''(x) - (f'(x) + g(x)\, f(x))\, u'(x) + f(x)^2 \left(an\, x^{n-1} - a\, x^n g(x) - a^2 x^{2n} f(x)\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(f'(x) + g(x)\, f(x))\_Y'(x)}{f(x)} + f(x) \left(an\, x^{n-1} - a\, x^n g(x) - a^2 x^{2n} f(x)\right)\_Y(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(f'(x) + g(x)\, f(x))\_Y'(x)}{f(x)} + f(x) \left(an\, x^{n-1} - a\, x^n g(x) - a^2 x^{2n} f(x)\right)\_Y(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(f'(x)+g(x)f(x))\_Y'(x)}{f(x)} + f(x) \left(an\, x^{n-1} - a\, x^n g(x) - a^2 x^{2n} f(x)\right)\_Y(x)\right\}, \{\_ \right.}{f(x)\, \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(f'(x)+g(x)f(x))\_Y'(x)}{f(x)} + f(x) \left(an\, x^{n-1} - a\, x^n g(x) - a^2 x^{2n} f(x)\right)\_Y(x)\right\}, \{ \right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(f'(x)+g(x)f(x))\_Y'(x)}{f(x)} + f(x) \left(an\, x^{n-1} - a\, x^n g(x) - a^2 x^{2n} f(x)\right)\_Y(x)\right\}, \{ \right.}{f(x)\, \mathrm{DESol}\left(\left\{\frac{-f(x)^3 x^{1+2n}\_Y(x) a^2 + \_Y''(x) x f(x) - f(x)^2 g(x) x^{n+1}\_Y(x) a - (f'(x)+g(x)f(x))\_Y'(x) x + f(x)^2 x^n \_Y(x) an}{x f(x)} \right.\right.}$$

Summary
The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\_Y''(x) - \frac{(f'(x)+g(x)f(x))\_Y'(x)}{f(x)} + f(x)\left(an\,x^{n-1} - a\,x^{n}g(x) - a^{2}x^{2n}f(x)\right)\_Y(x)\right\}, \{}{f(x)\operatorname{DESol}\left(\left\{\frac{-f(x)^{3}x^{1+2n}\_Y(x)a^{2}+\_Y''(x)xf(x)-f(x)^{2}g(x)x^{n+1}\_Y(x)a-(f'(x)+g(x)f(x))\_Y'(x)x+f(x)^{2}x^{n}\_Y(x)an}{xf(x)}\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\_Y''(x) - \frac{(f'(x)+g(x)f(x))\_Y'(x)}{f(x)} + f(x)\left(an\,x^{n-1} - a\,x^{n}g(x) - a^{2}x^{2n}f(x)\right)\_Y(x)\right\}, \{}{f(x)\operatorname{DESol}\left(\left\{\frac{-f(x)^{3}x^{1+2n}\_Y(x)a^{2}+\_Y''(x)xf(x)-f(x)^{2}g(x)x^{n+1}\_Y(x)a-(f'(x)+g(x)f(x))\_Y'(x)x+f(x)^{2}x^{n}\_Y(x)an}{xf(x)}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 11.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) + a\,x^n g(x)\,y = an\,x^{n-1} + a^2 x^{2n}(g(x) - f(x))}$$

19.11.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a^2 x^{2n} g(x) - a^2 x^{2n} f(x) - x^n g(x)\,ay + an\,x^{n-1} + f(x)\,y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a^2 x^{2n} g(x) - a^2 x^{2n} f(x) - x^n g(x)\,ay + \frac{x^n na}{x} + f(x)\,y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a^2 x^{2n} g(x) - a^2 x^{2n} f(x) + an\,x^{n-1}$, $f_1(x) = -a\,x^n g(x)$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f\,(x)\,u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1f_2 &= -x^n f(x)\, g(x)\, a \\ f_2^2 f_0 &= f(x)^2 \left(a^2x^{2n}g(x) - a^2x^{2n}f(x) + an\, x^{n-1}\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x)\, u''(x) - (-x^n f(x)\, g(x)\, a + f'(x))\, u'(x) + f(x)^2 \left(a^2x^{2n}g(x) - a^2x^{2n}f(x) + an\, x^{n-1}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(-x^n f(x)\, g(x)\, a + f'(x))\_Y'(x)}{f(x)} + f(x)\left(a^2x^{2n}g(x) - a^2x^{2n}f(x) + an\, x^{n-1}\right)\_Y(x)\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(-x^n f(x)\, g(x)\, a + f'(x))\_Y'(x)}{f(x)} + f(x)\left(a^2x^{2n}g(x) - a^2x^{2n}f(x) + an\, x^{n-1}\right)\_Y(x)\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(-x^n f(x)g(x)a+f'(x))\_Y'(x)}{f(x)} + f(x)\left(a^2x^{2n}g(x) - a^2x^{2n}f(x) + an\, x^{n-1}\right)\_Y(x)\right.}{f(x)\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(-x^n f(x)g(x)a+f'(x))\_Y'(x)}{f(x)} + f(x)\left(a^2x^{2n}g(x) - a^2x^{2n}f(x) + an\, x^{n-1}\right)\_Y(x\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(-x^n f(x)g(x)a+f'(x))\_Y'(x)}{f(x)} + f(x)\left(a^2x^{2n}g(x) - a^2x^{2n}f(x) + an\, x^{n-1}\right)\_Y(x)\right\}\right.}{f(x)\,\mathrm{DESol}\left(\left\{\frac{-f(x)^2\_Y(x)a^2(f(x)-g(x))x^{1+2n}+f(x)^2x^n\_Y(x)an+a\,x^{n+1}f(x)g(x)\_Y'(x)-f'(x)\_Y'(x)x+\_Y''(x)xf(x}{f(x)x}\right.\right.}$$

Summary

The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(-x^n f(x) g(x) a + f'(x))\_Y'(x)}{f(x)} + f(x)\left(a^2 x^{2n} g(x) - a^2 x^{2n} f(x) + a n\, x^{n-1}\right)\_Y(x)\right\}}{f(x)\,\mathrm{DESol}\left(\left\{\frac{-f(x)^2\_Y(x) a^2 (f(x)-g(x)) x^{1+2n} + f(x)^2 x^n\_Y(x) a n + a\, x^{n+1} f(x) g(x)\_Y'(x) - f'(x)\_Y'(x) x + \_Y''(x) x f(x}{f(x) x}\right.\right.} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{(-x^n f(x) g(x) a + f'(x))\_Y'(x)}{f(x)} + f(x)\left(a^2 x^{2n} g(x) - a^2 x^{2n} f(x) + a n\, x^{n-1}\right)\_Y(x)\right\}}{f(x)\,\mathrm{DESol}\left(\left\{\frac{-f(x)^2\_Y(x) a^2 (f(x)-g(x)) x^{1+2n} + f(x)^2 x^n\_Y(x) a n + a\, x^{n+1} f(x) g(x)\_Y'(x) - f'(x)\_Y'(x) x + \_Y''(x) x f(x}{f(x) x}\right.\right.}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 12.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - a\,\mathrm{e}^{\lambda x} y^2 - a\,\mathrm{e}^{\lambda x} f(x)\,y = \lambda f(x)}$$

19.12.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= \mathrm{e}^{\lambda x} a\,y^2 + a\,\mathrm{e}^{\lambda x} f(x)\,y + \lambda f(x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \mathrm{e}^{\lambda x} a\,y^2 + a\,\mathrm{e}^{\lambda x} f(x)\,y + \lambda f(x)$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \lambda f(x)$, $f_1(x) = a\,\mathrm{e}^{\lambda x} f(x)$ and $f_2(x) = \mathrm{e}^{\lambda x} a$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\mathrm{e}^{\lambda x} a u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= a\lambda\,\mathrm{e}^{\lambda x} \\ f_1f_2 &= a^2\mathrm{e}^{2\lambda x}f(x) \\ f_2^2f_0 &= \mathrm{e}^{2\lambda x}f(x)\,a^2\lambda \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\mathrm{e}^{\lambda x}au''(x) - \left(a^2\mathrm{e}^{2\lambda x}f(x) + a\lambda\,\mathrm{e}^{\lambda x}\right)u'(x) + \mathrm{e}^{2\lambda x}f(x)\,a^2\lambda u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \frac{\mathrm{e}^{\lambda x}\left(\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}dx\right)c_2 + c_1\lambda\right)}{\lambda}$$

The above shows that

$$u'(x) = \frac{\mathrm{e}^{\lambda x}\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}dx\right)c_2\lambda + \mathrm{e}^{\lambda x}c_1\lambda^2 + c_2\mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}}{\lambda}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\mathrm{e}^{\lambda x}\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}dx\right)c_2\lambda + \mathrm{e}^{\lambda x}c_1\lambda^2 + c_2\mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}\right)\mathrm{e}^{-2\lambda x}}{a\left(\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}dx\right)c_2 + c_1\lambda\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\mathrm{e}^{\lambda x}\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}dx\right)\lambda + \mathrm{e}^{\lambda x}c_3\lambda^2 + \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}\right)\mathrm{e}^{-2\lambda x}}{a\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}dx + \lambda c_3\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\mathrm{e}^{\lambda x}\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}dx\right)\lambda + \mathrm{e}^{\lambda x}c_3\lambda^2 + \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}\right)\mathrm{e}^{-2\lambda x}}{a\left(\int \mathrm{e}^{-\lambda x + a\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}dx + \lambda c_3\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(e^{\lambda x}\left(\int e^{-\lambda x+a\left(\int e^{\lambda x} f(x)dx\right)}dx\right)\lambda + e^{\lambda x} c_3 \lambda^2 + e^{a\left(\int e^{\lambda x} f(x)dx\right)}\right) e^{-2\lambda x}}{a\left(\int e^{-\lambda x+a\left(\int e^{\lambda x} f(x)dx\right)}dx + \lambda c_3\right)}$$

Verified OK.

Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 13.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) + a\,\mathrm{e}^{\lambda x} f(x)\,y = a\lambda\,\mathrm{e}^{\lambda x}}$$

19.13.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= f(x)\,y^2 - a\,\mathrm{e}^{\lambda x} f(x)\,y + a\lambda\,\mathrm{e}^{\lambda x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = f(x)\,y^2 - a\,\mathrm{e}^{\lambda x} f(x)\,y + a\lambda\,\mathrm{e}^{\lambda x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\lambda\,\mathrm{e}^{\lambda x}$, $f_1(x) = -a\,\mathrm{e}^{\lambda x} f(x)$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\,u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1 f_2 &= -f(x)^2 \mathrm{e}^{\lambda x} a \\ f_2^2 f_0 &= \lambda f(x)^2 a \, \mathrm{e}^{\lambda x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x) u''(x) - \left(-f(x)^2 \mathrm{e}^{\lambda x} a + f'(x)\right) u'(x) + \lambda f(x)^2 a \, \mathrm{e}^{\lambda x} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{-a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)} \left(c_1 + \left(\int f(x) \, \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)} dx\right) c_2\right)$$

The above shows that

$$u'(x) = -\left(a\left(c_1 + \left(\int f(x) \, \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)} dx\right) c_2\right) \mathrm{e}^{\lambda x - a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)} - c_2\right) f(x)$$

Using the above in (1) gives the solution

$$y = \frac{\left(a\left(c_1 + \left(\int f(x) \, \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)} dx\right) c_2\right) \mathrm{e}^{\lambda x - a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)} - c_2\right) \mathrm{e}^{\int a \, \mathrm{e}^{\lambda x} f(x) dx}}{c_1 + \left(\int f(x) \, \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)} dx\right) c_2}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(a\left(c_3 + \int f(x) \, \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)} dx\right) \mathrm{e}^{\lambda x - a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)} - 1\right) \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)}}{c_3 + \int f(x) \, \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)} dx}$$

Summary

The solution(s) found are the following

$$y = \frac{\left(a\left(c_3 + \int f(x) \, \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)} dx\right) \mathrm{e}^{\lambda x - a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)} - 1\right) \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)}}{c_3 + \int f(x) \, \mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x} f(x) dx\right)} dx} \tag{1}$$

Verification of solutions

$$y = \frac{\left(a\left(c_3 + \int f(x)\,\mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x} f(x)dx\right)}dx\right)\mathrm{e}^{\lambda x - a\left(\int \mathrm{e}^{\lambda x} f(x)dx\right)} - 1\right)\mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x} f(x)dx\right)}}{c_3 + \int f\left(x\right)\mathrm{e}^{a\left(\int \mathrm{e}^{\lambda x} f(x)dx\right)}dx}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 14.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) = a\lambda\, e^{\lambda x} - a^2 e^{2\lambda x} f(x)}$$

19.14.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= f(x)\, y^2 + a\lambda\, e^{\lambda x} - a^2 e^{2\lambda x} f(x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = f(x)\, y^2 + a\lambda\, e^{\lambda x} - a^2 e^{2\lambda x} f(x)$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\lambda\, e^{\lambda x} - a^2 e^{2\lambda x} f(x)$, $f_1(x) = 0$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1f_2 &= 0 \\ f_2^2f_0 &= f(x)^2\left(a\lambda\,\mathrm{e}^{\lambda x} - a^2\mathrm{e}^{2\lambda x}f(x)\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x)\,u''(x) - f'(x)\,u'(x) + f(x)^2\left(a\lambda\,\mathrm{e}^{\lambda x} - a^2\mathrm{e}^{2\lambda x}f(x)\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{-f(x)^3\,\mathrm{e}^{2\lambda x}\_Y(x)\,a^2 + f(x)^2\,\mathrm{e}^{\lambda x}\_Y(x)\,a\lambda + \_Y''(x)\,f(x) - f'(x)\_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-f(x)^3\,\mathrm{e}^{2\lambda x}\_Y(x)\,a^2 + f(x)^2\,\mathrm{e}^{\lambda x}\_Y(x)\,a\lambda + \_Y''(x)\,f(x) - f'(x)\_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-f(x)^3\mathrm{e}^{2\lambda x}\_Y(x)a^2+f(x)^2\mathrm{e}^{\lambda x}\_Y(x)a\lambda+\_Y''(x)f(x)-f'(x)\_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}{f(x)\,\mathrm{DESol}\left(\left\{\frac{-f(x)^3\mathrm{e}^{2\lambda x}\_Y(x)a^2+f(x)^2\mathrm{e}^{\lambda x}\_Y(x)a\lambda+\_Y''(x)f(x)-f'(x)\_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-f(x)^3\mathrm{e}^{2\lambda x}\_Y(x)a^2+f(x)^2\mathrm{e}^{\lambda x}\_Y(x)a\lambda+\_Y''(x)f(x)-f'(x)\_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}{f(x)\,\mathrm{DESol}\left(\left\{\frac{-f(x)^3\mathrm{e}^{2\lambda x}\_Y(x)a^2+f(x)^2\mathrm{e}^{\lambda x}\_Y(x)a\lambda+\_Y''(x)f(x)-f'(x)\_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}$$

Summary
The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{-f(x)^{3} e^{2\lambda x} \_\_Y(x) a^{2}+f(x)^{2} e^{\lambda x} \_\_Y(x) a\lambda+\_\_Y''(x) f(x)-f'(x) \_\_Y'(x)}{f(x)}\right\}, \left\{\_\_Y(x)\right\}\right)}{f(x) \operatorname{DESol}\left(\left\{\frac{-f(x)^{3} e^{2\lambda x} \_\_Y(x) a^{2}+f(x)^{2} e^{\lambda x} \_\_Y(x) a\lambda+\_\_Y''(x) f(x)-f'(x) \_\_Y'(x)}{f(x)}\right\}, \left\{\_\_Y(x)\right\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{-f(x)^{3} e^{2\lambda x} \_\_Y(x) a^{2}+f(x)^{2} e^{\lambda x} \_\_Y(x) a\lambda+\_\_Y''(x) f(x)-f'(x) \_\_Y'(x)}{f(x)}\right\}, \left\{\_\_Y(x)\right\}\right)}{f(x) \operatorname{DESol}\left(\left\{\frac{-f(x)^{3} e^{2\lambda x} \_\_Y(x) a^{2}+f(x)^{2} e^{\lambda x} \_\_Y(x) a\lambda+\_\_Y''(x) f(x)-f'(x) \_\_Y'(x)}{f(x)}\right\}, \left\{\_\_Y(x)\right\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 15.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) - \lambda y = a^2 e^{2\lambda x} f(x)}$$

19.15.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= f(x)\, y^2 + \lambda y + a^2 e^{2\lambda x} f(x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = f(x)\, y^2 + \lambda y + a^2 e^{2\lambda x} f(x)$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a^2 e^{2\lambda x} f(x)$, $f_1(x) = \lambda$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1 f_2 &= \lambda f(x) \\ f_2^2 f_0 &= f(x)^3 e^{2\lambda x} a^2 \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x) u''(x) - (f'(x) + \lambda f(x)) u'(x) + f(x)^3 e^{2\lambda x} a^2 u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = c_1 e^{ia\left(\int e^{\lambda x} f(x) dx\right)} + c_2 e^{-ia\left(\int e^{\lambda x} f(x) dx\right)}$$

The above shows that

$$u'(x) = ia\, e^{\lambda x} f(x) \left(c_1 e^{ia\left(\int e^{\lambda x} f(x) dx\right)} - c_2 e^{-ia\left(\int e^{\lambda x} f(x) dx\right)}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{ia\, e^{\lambda x} \left(c_1 e^{ia\left(\int e^{\lambda x} f(x) dx\right)} - c_2 e^{-ia\left(\int e^{\lambda x} f(x) dx\right)}\right)}{c_1 e^{ia\left(\int e^{\lambda x} f(x) dx\right)} + c_2 e^{-ia\left(\int e^{\lambda x} f(x) dx\right)}}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{ia\, e^{\lambda x} \left(c_3 e^{ia\left(\int e^{\lambda x} f(x) dx\right)} - e^{-ia\left(\int e^{\lambda x} f(x) dx\right)}\right)}{c_3 e^{ia\left(\int e^{\lambda x} f(x) dx\right)} + e^{-ia\left(\int e^{\lambda x} f(x) dx\right)}}$$

<u>Summary</u>

The solution(s) found are the following

$$y = -\frac{ia\, e^{\lambda x} \left(c_3 e^{ia\left(\int e^{\lambda x} f(x) dx\right)} - e^{-ia\left(\int e^{\lambda x} f(x) dx\right)}\right)}{c_3 e^{ia\left(\int e^{\lambda x} f(x) dx\right)} + e^{-ia\left(\int e^{\lambda x} f(x) dx\right)}} \tag{1}$$

Verification of solutions

$$y = -\frac{ia\,\mathrm{e}^{\lambda x}\left(c_3\mathrm{e}^{ia\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)} - \mathrm{e}^{-ia\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}\right)}{c_3\mathrm{e}^{ia\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)} + \mathrm{e}^{-ia\left(\int \mathrm{e}^{\lambda x}f(x)dx\right)}}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) + f(x) \left(e^{\lambda x} a + b\right) y = a\lambda\, e^{\lambda x}}$$

19.16.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -a\, e^{\lambda x} f(x)\, y + a\lambda\, e^{\lambda x} - f(x)\, by + f(x)\, y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -a\, e^{\lambda x} f(x)\, y + a\lambda\, e^{\lambda x} - f(x)\, by + f(x)\, y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\lambda\, e^{\lambda x}$, $f_1(x) = -a\, e^{\lambda x} f(x) - f(x)\, b$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1 f_2 &= \left(-a\,\mathrm{e}^{\lambda x} f(x) - f(x)\, b\right) f(x) \\ f_2^2 f_0 &= \lambda f(x)^2\, a\,\mathrm{e}^{\lambda x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x)\, u''(x) - \left(\left(-a\,\mathrm{e}^{\lambda x} f(x) - f(x)\, b\right) f(x) + f'(x)\right) u'(x) + \lambda f(x)^2\, a\,\mathrm{e}^{\lambda x} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{-\left(\int f(x)\left(\mathrm{e}^{\lambda x} a + b\right) dx\right)} \left(c_1 + \left(\int f(x)\, \mathrm{e}^{\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) dx} dx\right) c_2\right)$$

The above shows that

$$\begin{aligned} u'(x) = -\Bigg(a\left(c_1 + \left(\int f(x)\, \mathrm{e}^{\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) dx} dx\right) c_2\right) \mathrm{e}^{\lambda x - \left(\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) dx\right)} \\ + \mathrm{e}^{-\left(\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) dx\right)} \left(\int f(x)\, \mathrm{e}^{\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) dx} dx\right) c_2 b + \mathrm{e}^{-\left(\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) dx\right)} c_1 b \\ - c_2\Bigg) f(x) \end{aligned}$$

Using the above in (1) gives the solution

$$y = \frac{\left(a\left(c_1 + \left(\int f(x)\, \mathrm{e}^{\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) dx} dx\right) c_2\right) \mathrm{e}^{\lambda x - \left(\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) dx\right)} + \mathrm{e}^{-\left(\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) dx\right)} \left(\int f(x)\, \mathrm{e}^{\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) da}\right.\right.}{c_1 + \left(\int f(x)\, \mathrm{e}^{\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) dx} dx\right) c_2}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = \frac{\left(\mathrm{e}^{\lambda x} a + b\right) \left(\int f(x)\, \mathrm{e}^{\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) dx} dx\right) + \mathrm{e}^{\lambda x} c_3 a + b c_3 - \mathrm{e}^{\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) dx}}{c_3 + \int f(x)\, \mathrm{e}^{\int f(x)\left(\mathrm{e}^{\lambda x} a+b\right) dx} dx}$$

Summary
The solution(s) found are the following

$$y = \frac{\left(e^{\lambda x} a + b\right) \left(\int f(x)\, e^{\int f(x)\left(e^{\lambda x} a + b\right) dx} dx\right) + e^{\lambda x} c_3 a + b c_3 - e^{\int f(x)\left(e^{\lambda x} a + b\right) dx}}{c_3 + \int f\left(x\right) e^{\int f(x)\left(e^{\lambda x} a + b\right) dx} dx} \tag{1}$$

Verification of solutions

$$y = \frac{\left(e^{\lambda x} a + b\right) \left(\int f(x)\, e^{\int f(x)\left(e^{\lambda x} a + b\right) dx} dx\right) + e^{\lambda x} c_3 a + b c_3 - e^{\int f(x)\left(e^{\lambda x} a + b\right) dx}}{c_3 + \int f\left(x\right) e^{\int f(x)\left(e^{\lambda x} a + b\right) dx} dx}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - e^{\lambda x} f(x)\, y^2 - (f(x)\, a - \lambda)\, y = b\, e^{-\lambda x} f(x)}$$

19.17.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= e^{\lambda x} f(x)\, y^2 + b\, e^{-\lambda x} f(x) + f(x)\, ay - \lambda y \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = e^{\lambda x} f(x)\, y^2 + b\, e^{-\lambda x} f(x) + f(x)\, ay - \lambda y$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = b\, e^{-\lambda x} f(x)$, $f_1(x) = f(x)\, a - \lambda$ and $f_2(x) = e^{\lambda x} f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{e^{\lambda x} f(x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f(x) \mathrm{e}^{\lambda x} \lambda + \mathrm{e}^{\lambda x} f'(x) \\ f_1 f_2 &= (f(x) a - \lambda) \mathrm{e}^{\lambda x} f(x) \\ f_2^2 f_0 &= \mathrm{e}^{2\lambda x} f(x)^3 b \,\mathrm{e}^{-\lambda x} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\mathrm{e}^{\lambda x} f(x) u''(x) - \left(f(x) \mathrm{e}^{\lambda x} \lambda + \mathrm{e}^{\lambda x} f'(x) + (f(x) a - \lambda) \mathrm{e}^{\lambda x} f(x)\right) u'(x) + \mathrm{e}^{2\lambda x} f(x)^3 b \,\mathrm{e}^{-\lambda x} u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{e}^{\frac{a(\int f(x)dx)}{2}} \cosh\left(\frac{\sqrt{a^2 (a^2 - 4b)}\,(a(\int f(x)\,dx) + c_1)}{2a^2}\right) c_2$$

The above shows that

$$u'(x) = \frac{c_2 \mathrm{e}^{\frac{a(\int f(x)dx)}{2}} f(x) \left(a^2 \cosh\left(\frac{\sqrt{a^2(a^2-4b)}\,(a(\int f(x)dx)+c_1)}{2a^2}\right) + \sqrt{a^2 (a^2 - 4b)} \sinh\left(\frac{\sqrt{a^2(a^2-4b)}\,(a(\int f(x)dx)+c_1)}{2a^2}\right)\right)}{2a}$$

Using the above in (1) gives the solution

$$y = -\frac{\left(a^2 \cosh\left(\frac{\sqrt{a^2(a^2-4b)}\,(a(\int f(x)dx)+c_1)}{2a^2}\right) + \sqrt{a^2 (a^2 - 4b)} \sinh\left(\frac{\sqrt{a^2(a^2-4b)}\,(a(\int f(x)dx)+c_1)}{2a^2}\right)\right) \mathrm{e}^{-\lambda x}}{2a \cosh\left(\frac{\sqrt{a^2(a^2-4b)}\,(a(\int f(x)dx)+c_1)}{2a^2}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(a^2 + \tanh\left(\frac{\sqrt{a^2(a^2-4b)}\,(a(\int f(x)dx)+c_3)}{2a^2}\right) \sqrt{a^2 (a^2 - 4b)}\right) \mathrm{e}^{-\lambda x}}{2a}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(a^{2}+\tanh \left(\frac{\sqrt{a^{2} \left(a^{2}-4 b \right)}\, \left(a \left(\int f \left(x \right)d x \right)+c_{3}\right)}{2 a^{2}}\right) \sqrt{a^{2} \left(a^{2}-4 b \right)}\right) {\mathrm e}^{-\lambda x}}{2 a} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(a^{2}+\tanh \left(\frac{\sqrt{a^{2} \left(a^{2}-4 b \right)}\, \left(a \left(\int f \left(x \right)d x \right)+c_{3}\right)}{2 a^{2}}\right) \sqrt{a^{2} \left(a^{2}-4 b \right)}\right) {\mathrm e}^{-\lambda x}}{2 a}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 18.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) - g(x)\,y = a\lambda\,\mathrm{e}^{\lambda x} - a\,\mathrm{e}^{\lambda x} g(x) - a^2 \mathrm{e}^{2\lambda x} f(x)}$$

19.18.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= f(x)\,y^2 + g(x)\,y + a\lambda\,\mathrm{e}^{\lambda x} - a\,\mathrm{e}^{\lambda x} g(x) - a^2 \mathrm{e}^{2\lambda x} f(x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = f(x)\,y^2 + g(x)\,y + a\lambda\,\mathrm{e}^{\lambda x} - a\,\mathrm{e}^{\lambda x} g(x) - a^2 \mathrm{e}^{2\lambda x} f(x)$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\lambda\,\mathrm{e}^{\lambda x} - a\,\mathrm{e}^{\lambda x} g(x) - a^2 \mathrm{e}^{2\lambda x} f(x)$, $f_1(x) = g(x)$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\,u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2u''(x) - (f_2' + f_1f_2)\,u'(x) + f_2^2f_0u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1f_2 &= g(x)\,f(x) \\ f_2^2f_0 &= f(x)^2\left(a\lambda\,\mathrm{e}^{\lambda x} - a\,\mathrm{e}^{\lambda x}g(x) - a^2\mathrm{e}^{2\lambda x}f(x)\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x)\,u''(x) - (f'(x) + g(x)\,f(x))\,u'(x) + f(x)^2\left(a\lambda\,\mathrm{e}^{\lambda x} - a\,\mathrm{e}^{\lambda x}g(x) - a^2\mathrm{e}^{2\lambda x}f(x)\right)u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{-f(x)^3\,\mathrm{e}^{2\lambda x}\_Y(x)\,a^2 + \_Y''(x)\,f(x) + af(x)^2\_Y(x)\,(\lambda - g(x))\,\mathrm{e}^{\lambda x} - (f'(x) + g(x)\,f(x))\_}{f(x)}\right.\right.$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-f(x)^3\,\mathrm{e}^{2\lambda x}\_Y(x)\,a^2 + \_Y''(x)\,f(x) + af(x)^2\_Y(x)\,(\lambda - g(x))\,\mathrm{e}^{\lambda x} - (f'(x) + g(x)\,f(x)}{f(x)}\right.\right.$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-f(x)^3\mathrm{e}^{2\lambda x}\_Y(x)a^2 + \_Y''(x)f(x) + af(x)^2\_Y(x)(\lambda - g(x))\mathrm{e}^{\lambda x} - (f'(x)+g(x)f(x))\_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}{f(x)\,\mathrm{DESol}\left(\left\{\frac{-f(x)^3\mathrm{e}^{2\lambda x}\_Y(x)a^2 + \_Y''(x)f(x) + af(x)^2\_Y(x)(\lambda - g(x))\mathrm{e}^{\lambda x} - (f'(x)+g(x)f(x))\_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-f(x)^3\mathrm{e}^{2\lambda x}\_Y(x)a^2 + \_Y''(x)f(x) + af(x)^2\_Y(x)(\lambda - g(x))\mathrm{e}^{\lambda x} - (f'(x)+g(x)f(x))\_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}{f(x)\,\mathrm{DESol}\left(\left\{\frac{-f(x)^3\mathrm{e}^{2\lambda x}\_Y(x)a^2 + \_Y''(x)f(x) + af(x)^2\_Y(x)(\lambda - g(x))\mathrm{e}^{\lambda x} - (f'(x)+g(x)f(x))\_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}$$

Summary
The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-f(x)^3 \mathrm{e}^{2\lambda x} \_Y(x) a^2 + \_Y''(x) f(x) + a f(x)^2 \_Y(x) (\lambda - g(x)) \mathrm{e}^{\lambda x} - (f'(x) + g(x) f(x)) \_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}{f(x) \mathrm{DESol}\left(\left\{\frac{-f(x)^3 \mathrm{e}^{2\lambda x} \_Y(x) a^2 + \_Y''(x) f(x) + a f(x)^2 \_Y(x) (\lambda - g(x)) \mathrm{e}^{\lambda x} - (f'(x) + g(x) f(x)) \_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-f(x)^3 \mathrm{e}^{2\lambda x} \_Y(x) a^2 + \_Y''(x) f(x) + a f(x)^2 \_Y(x) (\lambda - g(x)) \mathrm{e}^{\lambda x} - (f'(x) + g(x) f(x)) \_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}{f(x) \mathrm{DESol}\left(\left\{\frac{-f(x)^3 \mathrm{e}^{2\lambda x} \_Y(x) a^2 + \_Y''(x) f(x) + a f(x)^2 \_Y(x) (\lambda - g(x)) \mathrm{e}^{\lambda x} - (f'(x) + g(x) f(x)) \_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 19.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) + a\,\mathrm{e}^{\lambda x} g(x)\,y = a\lambda\,\mathrm{e}^{\lambda x} + a^2 \mathrm{e}^{2\lambda x}(g(x) - f(x))}$$

19.19.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= a^2\mathrm{e}^{2\lambda x} g(x) - a^2\mathrm{e}^{2\lambda x} f(x) - g(x)\,\mathrm{e}^{\lambda x} a y + a\lambda\,\mathrm{e}^{\lambda x} + f(x)\,y^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = a^2\mathrm{e}^{2\lambda x} g(x) - a^2\mathrm{e}^{2\lambda x} f(x) - g(x)\,\mathrm{e}^{\lambda x} a y + a\lambda\,\mathrm{e}^{\lambda x} + f(x)\,y^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a^2\mathrm{e}^{2\lambda x} g(x) - a^2\mathrm{e}^{2\lambda x} f(x) + a\lambda\,\mathrm{e}^{\lambda x}$, $f_1(x) = -a\,\mathrm{e}^{\lambda x} g(x)$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\,u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1 f_2 &= -f(x)\, g(x)\, \mathrm{e}^{\lambda x} a \\ f_2^2 f_0 &= f(x)^2 \left(a^2 \mathrm{e}^{2\lambda x} g(x) - a^2 \mathrm{e}^{2\lambda x} f(x) + a\lambda\, \mathrm{e}^{\lambda x}\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x)\, u''(x) - \left(-f(x)\, g(x)\, \mathrm{e}^{\lambda x} a + f'(x)\right) u'(x) + f(x)^2 \left(a^2 \mathrm{e}^{2\lambda x} g(x) - a^2 \mathrm{e}^{2\lambda x} f(x) + a\lambda\, \mathrm{e}^{\lambda x}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{-a^2 f(x)^2 \_Y(x)\,(f(x) - g(x))\, \mathrm{e}^{2\lambda x} + \_Y''(x)\, f(x) + f(x)\, a(\lambda f(x) \_Y(x) + g(x) \_Y'(x))\, \mathrm{e}^{\lambda x}}{f(x)}\right.\right.$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-a^2 f(x)^2 \_Y(x)\,(f(x) - g(x))\, \mathrm{e}^{2\lambda x} + \_Y''(x)\, f(x) + f(x)\, a(\lambda f(x) \_Y(x) + g(x) \_Y'(x)}{f(x)}\right.\right.$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-a^2 f(x)^2 \_Y(x)(f(x)-g(x))\mathrm{e}^{2\lambda x} + \_Y''(x) f(x) + f(x) a\left(\lambda f(x) \_Y(x) + g(x) \_Y'(x)\right)\mathrm{e}^{\lambda x} - f'(x) \_Y'(x)}{f(x)}\right\}, \{\_\right.}{f(x)\, \mathrm{DESol}\left(\left\{\frac{-a^2 f(x)^2 \_Y(x)(f(x)-g(x))\mathrm{e}^{2\lambda x} + \_Y''(x) f(x) + f(x) a\left(\lambda f(x) \_Y(x) + g(x) \_Y'(x)\right)\mathrm{e}^{\lambda x} - f'(x) \_Y'(x)}{f(x)}\right\}, \{\_\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-a^2 f(x)^2 \_Y(x)(f(x)-g(x))\mathrm{e}^{2\lambda x} + \_Y''(x) f(x) + f(x) a\left(\lambda f(x) \_Y(x) + g(x) \_Y'(x)\right)\mathrm{e}^{\lambda x} - f'(x) \_Y'(x)}{f(x)}\right\}, \{\_\right.}{f(x)\, \mathrm{DESol}\left(\left\{\frac{-a^2 f(x)^2 \_Y(x)(f(x)-g(x))\mathrm{e}^{2\lambda x} + \_Y''(x) f(x) + f(x) a\left(\lambda f(x) \_Y(x) + g(x) \_Y'(x)\right)\mathrm{e}^{\lambda x} - f'(x) \_Y'(x)}{f(x)}\right\}, \{\_\right.}$$

Summary
The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-a^2 f(x)^2 \_\_Y(x)(f(x)-g(x))\mathrm{e}^{2\lambda x}+\_\_Y''(x) f(x)+f(x) a\left(\lambda f(x) \_\_Y(x)+g(x) \_\_Y'(x)\right)\mathrm{e}^{\lambda x}-f'(x) \_\_Y'(x)}{f(x)}\right\}, \{\_}{f(x)\,\mathrm{DESol}\left(\left\{\frac{-a^2 f(x)^2 \_\_Y(x)(f(x)-g(x))\mathrm{e}^{2\lambda x}+\_\_Y''(x) f(x)+f(x) a\left(\lambda f(x) \_\_Y(x)+g(x) \_\_Y'(x)\right)\mathrm{e}^{\lambda x}-f'(x) \_\_Y'(x)}{f(x)}\right\}, \{\_} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-a^2 f(x)^2 \_\_Y(x)(f(x)-g(x))\mathrm{e}^{2\lambda x}+\_\_Y''(x) f(x)+f(x) a\left(\lambda f(x) \_\_Y(x)+g(x) \_\_Y'(x)\right)\mathrm{e}^{\lambda x}-f'(x) \_\_Y'(x)}{f(x)}\right\}, \{\_}{f(x)\,\mathrm{DESol}\left(\left\{\frac{-a^2 f(x)^2 \_\_Y(x)(f(x)-g(x))\mathrm{e}^{2\lambda x}+\_\_Y''(x) f(x)+f(x) a\left(\lambda f(x) \_\_Y(x)+g(x) \_\_Y'(x)\right)\mathrm{e}^{\lambda x}-f'(x) \_\_Y'(x)}{f(x)}\right\}, \{\_}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 20.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) = 2a\lambda x\,\mathrm{e}^{\lambda x^2} - a^2 f(x)\,\mathrm{e}^{2\lambda x^2}}$$

19.20.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= f(x)\,y^2 + 2a\lambda x\,\mathrm{e}^{\lambda x^2} - a^2 f(x)\,\mathrm{e}^{2\lambda x^2} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = f(x)\,y^2 + 2a\lambda x\,\mathrm{e}^{\lambda x^2} - a^2 f(x)\,\mathrm{e}^{2\lambda x^2}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = 2a\lambda x\,\mathrm{e}^{\lambda x^2} - a^2 f(x)\,\mathrm{e}^{2\lambda x^2}$, $f_1(x) = 0$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\,u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= f(x)^2 \left(2a\lambda x\, \mathrm{e}^{\lambda x^2} - a^2 f(x)\, \mathrm{e}^{2\lambda x^2}\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x)\, u''(x) - f'(x)\, u'(x) + f(x)^2 \left(2a\lambda x\, \mathrm{e}^{\lambda x^2} - a^2 f(x)\, \mathrm{e}^{2\lambda x^2}\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{-f(x)^3\, \mathrm{e}^{2\lambda x^2} \_Y(x)\, a^2 + 2f(x)^2\, \mathrm{e}^{\lambda x^2} \_Y(x)\, a\lambda x - f'(x) \_Y'(x) + \_Y''(x)\, f(x)}{f(x)}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-f(x)^3\, \mathrm{e}^{2\lambda x^2} \_Y(x)\, a^2 + 2f(x)^2\, \mathrm{e}^{\lambda x^2} \_Y(x)\, a\lambda x - f'(x) \_Y'(x) + \_Y''(x)\, f(x)}{f(x)}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-f(x)^3 \mathrm{e}^{2\lambda x^2} \_Y(x) a^2 + 2f(x)^2 \mathrm{e}^{\lambda x^2} \_Y(x) a\lambda x - f'(x) \_Y'(x) + \_Y''(x) f(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}{f(x)\, \mathrm{DESol}\left(\left\{\frac{-f(x)^3 \mathrm{e}^{2\lambda x^2} \_Y(x) a^2 + 2f(x)^2 \mathrm{e}^{\lambda x^2} \_Y(x) a\lambda x - f'(x) \_Y'(x) + \_Y''(x) f(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-f(x)^3 \mathrm{e}^{2\lambda x^2} \_Y(x) a^2 + 2f(x)^2 \mathrm{e}^{\lambda x^2} \_Y(x) a\lambda x - f'(x) \_Y'(x) + \_Y''(x) f(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}{f(x)\, \mathrm{DESol}\left(\left\{\frac{-f(x)^3 \mathrm{e}^{2\lambda x^2} \_Y(x) a^2 + 2f(x)^2 \mathrm{e}^{\lambda x^2} \_Y(x) a\lambda x - f'(x) \_Y'(x) + \_Y''(x) f(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-f(x)^3 \mathrm{e}^{2\lambda\,x^2}\_Y(x)a^2+2f(x)^2\mathrm{e}^{\lambda\,x^2}\_Y(x)a\lambda x-f'(x)\_Y'(x)+\_Y''(x)f(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}{f(x)\,\mathrm{DESol}\left(\left\{\frac{-f(x)^3 \mathrm{e}^{2\lambda\,x^2}\_Y(x)a^2+2f(x)^2\mathrm{e}^{\lambda\,x^2}\_Y(x)a\lambda x-f'(x)\_Y'(x)+\_Y''(x)f(x)}{f(x)}\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\mathrm{DESol}\left(\left\{\frac{-f(x)^3 \mathrm{e}^{2\lambda\,x^2}\_Y(x)a^2+2f(x)^2\mathrm{e}^{\lambda\,x^2}\_Y(x)a\lambda x-f'(x)\_Y'(x)+\_Y''(x)f(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}{f(x)\,\mathrm{DESol}\left(\left\{\frac{-f(x)^3 \mathrm{e}^{2\lambda\,x^2}\_Y(x)a^2+2f(x)^2\mathrm{e}^{\lambda\,x^2}\_Y(x)a\lambda x-f'(x)\_Y'(x)+\_Y''(x)f(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 21.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) - y\lambda x = a\,\mathrm{e}^{\lambda x} f(x)}$$

19.21.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= f(x)\,y^2 + \lambda x y + a\,\mathrm{e}^{\lambda x} f(x) \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = f(x)\,y^2 + \lambda x y + a\,\mathrm{e}^{\lambda x} f(x)$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = a\,\mathrm{e}^{\lambda x} f(x)$, $f_1(x) = \lambda x$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\,u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1 f_2 &= f(x) \lambda x \\ f_2^2 f_0 &= f(x)^3 e^{\lambda x} a \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x) u''(x) - (f(x) \lambda x + f'(x)) u'(x) + f(x)^3 e^{\lambda x} a u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\frac{\_Y''(x) f(x) + f(x)^3 e^{\lambda x} a \_Y(x) - (f(x) \lambda x + f'(x)) \_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{\_Y''(x) f(x) + f(x)^3 e^{\lambda x} a \_Y(x) - (f(x) \lambda x + f'(x)) \_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{\_Y''(x) f(x) + f(x)^3 e^{\lambda x} a \_Y(x) - (f(x) \lambda x + f'(x)) \_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}{f(x) \mathrm{DESol}\left(\left\{\frac{\_Y''(x) f(x) + f(x)^3 e^{\lambda x} a \_Y(x) - (f(x) \lambda x + f'(x)) \_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{\_Y''(x) f(x) + f(x)^3 e^{\lambda x} a \_Y(x) - (f(x) \lambda x + f'(x)) \_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}{f(x) \mathrm{DESol}\left(\left\{\frac{\_Y''(x) f(x) + f(x)^3 e^{\lambda x} a \_Y(x) - (f(x) \lambda x + f'(x)) \_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\_Y''(x) f(x)+f(x)^{3} \mathrm{e}^{\lambda x} a \_Y(x)-(f(x) \lambda x+f'(x)) \_Y'(x)}{f(x)}\right\}, \left\{\_Y(x)\right\}\right)}{f(x) \operatorname{DESol}\left(\left\{\frac{\_Y''(x) f(x)+f(x)^{3} \mathrm{e}^{\lambda x} a \_Y(x)-(f(x) \lambda x+f'(x)) \_Y'(x)}{f(x)}\right\}, \left\{\_Y(x)\right\}\right)} \quad (1)$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x}\operatorname{DESol}\left(\left\{\frac{\_Y''(x) f(x)+f(x)^{3} \mathrm{e}^{\lambda x} a \_Y(x)-(f(x) \lambda x+f'(x)) \_Y'(x)}{f(x)}\right\}, \left\{\_Y(x)\right\}\right)}{f(x) \operatorname{DESol}\left(\left\{\frac{\_Y''(x) f(x)+f(x)^{3} \mathrm{e}^{\lambda x} a \_Y(x)-(f(x) \lambda x+f'(x)) \_Y'(x)}{f(x)}\right\}, \left\{\_Y(x)\right\}\right)}$$

Verified OK.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$\boxed{y' - y^2 f(x) = -a \tanh(\lambda x)^2 (f(x) a + \lambda) + \lambda a}$$

19.22.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x, y) \\ &= -\tanh(\lambda x)^2 f(x) a^2 - a \tanh(\lambda x)^2 \lambda + f(x) y^2 + \lambda a \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\tanh(\lambda x)^2 f(x) a^2 - a \tanh(\lambda x)^2 \lambda + f(x) y^2 + \lambda a$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\tanh(\lambda x)^2 f(x)\, a^2 - a \tanh(\lambda x)^2 \lambda + \lambda a$, $f_1(x) = 0$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= f'(x) \\ f_1 f_2 &= 0 \\ f_2^2 f_0 &= f(x)^2 \left(-\tanh(\lambda x)^2 f(x)\, a^2 - a \tanh(\lambda x)^2 \lambda + \lambda a\right) \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x)\, u''(x) - f'(x)\, u'(x) + f(x)^2 \left(-\tanh(\lambda x)^2 f(x)\, a^2 - a \tanh(\lambda x)^2 \lambda + \lambda a\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 23.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

Unable to solve or complete the solution.

$$\boxed{y' - y^2 f(x) = -a\coth(\lambda x)^2 (f(x)\, a + \lambda) + \lambda a}$$

19.23.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\coth(\lambda x)^2 f(x)\, a^2 - a\coth(\lambda x)^2 \lambda + f(x)\, y^2 + \lambda a \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\coth(\lambda x)^2 f(x)\, a^2 - a\coth(\lambda x)^2 \lambda + f(x)\, y^2 + \lambda a$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\coth(\lambda x)^2 f(x) a^2 - a\coth(\lambda x)^2 \lambda + \lambda a$, $f_1(x) = 0$ and $f_2(x) = f(x)$. Let

$$
\begin{aligned}
y &= \frac{-u'}{f_2 u} \\
&= \frac{-u'}{f(x) u}
\end{aligned}
\tag{1}
$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$
f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}
$$

But

$$
\begin{aligned}
f_2' &= f'(x) \\
f_1 f_2 &= 0 \\
f_2^2 f_0 &= f(x)^2 \left(-\coth(\lambda x)^2 f(x) a^2 - a\coth(\lambda x)^2 \lambda + \lambda a\right)
\end{aligned}
$$

Substituting the above terms back in equation (2) gives

$$
f(x) u''(x) - f'(x) u'(x) + f(x)^2 \left(-\coth(\lambda x)^2 f(x) a^2 - a\coth(\lambda x)^2 \lambda + \lambda a\right) u(x) = 0
$$

Solving the above ODE (this ode solved using Maple, not this program), gives Unable to solve. Terminating.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 24.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y' - y^2 f(x) = -f(x)\, a^2 + a\lambda \sinh(\lambda x) - \sinh(\lambda x)^2 f(x)\, a^2}$$

19.24.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= f(x)\, y^2 - f(x)\, a^2 + a\lambda \sinh(\lambda x) - \sinh(\lambda x)^2 f(x)\, a^2 \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = f(x)\, y^2 - f(x)\, a^2 + a\lambda \sinh(\lambda x) - \sinh(\lambda x)^2 f(x)\, a^2$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -f(x)\, a^2 + a\lambda \sinh(\lambda x) - \sinh(\lambda x)^2 f(x)\, a^2$, $f_1(x) = 0$ and $f_2(x) = f(x)$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{f(x)\, u} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2) u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= f'(x) \\
f_1 f_2 &= 0 \\
f_2^2 f_0 &= f(x)^2 \left(-f(x) a^2 + a\lambda \sinh(\lambda x) - \sinh(\lambda x)^2 f(x) a^2\right)
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$f(x) u''(x) - f'(x) u'(x) + f(x)^2 \left(-f(x) a^2 + a\lambda \sinh(\lambda x) - \sinh(\lambda x)^2 f(x) a^2\right) u(x) = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$\begin{aligned}
u(x) = \mathrm{DESol}\Bigg(\Bigg\{&_Y''(x) - \frac{f'(x)_Y'(x)}{f(x)} \\
&+ \left(-f(x) a^2 + a\lambda \sinh(\lambda x) - \sinh(\lambda x)^2 f(x) a^2\right) f(x)_Y(x)\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

The above shows that

$$\begin{aligned}
u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\Bigg(\Bigg\{&_Y''(x) - \frac{f'(x)_Y'(x)}{f(x)} \\
&+ \left(-f(x) a^2 + a\lambda \sinh(\lambda x) - \sinh(\lambda x)^2 f(x) a^2\right) f(x)_Y(x)\Bigg\}, \{_Y(x)\}\Bigg)
\end{aligned}$$

Using the above in (1) gives the solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{f'(x)\_Y'(x)}{f(x)} + \left(-f(x) a^2 + a\lambda \sinh(\lambda x) - \sinh(\lambda x)^2 f(x) a^2\right) f(x)\_Y(x)\right\}, \right.}{f(x)\,\mathrm{DESol}\left(\left\{\_Y''(x) - \frac{f'(x)\_Y'(x)}{f(x)} + \left(-f(x) a^2 + a\lambda \sinh(\lambda x) - \sinh(\lambda x)^2 f(x) a^2\right) f(x)\_Y(x) \right.\right.}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-f(x)^3 \cosh(\lambda x)^2 \_Y(x) a^2 + f(x)^2 \sinh(\lambda x) \_Y(x) a\lambda + \_Y''(x) f(x) - f'(x)\_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\frac{-f(x)^3 \cosh(\lambda x)^2 \_Y(x) a^2 + f(x)^2 \sinh(\lambda x) \_Y(x) a\lambda + \_Y''(x) f(x) - f'(x)\_Y'(x)}{f(x)}\right\}, \{\_Y(x)\}\right) f(x)}$$

Summary
The solution(s) found are the following

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-f(x)^3 \cosh(\lambda x)^2 \_\_Y(x) a^2 + f(x)^2 \sinh(\lambda x) \_\_Y(x) a \lambda + \_\_Y''(x) f(x) - f'(x) \_\_Y'(x)}{f(x)}\right\}, \{\_\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\frac{-f(x)^3 \cosh(\lambda x)^2 \_\_Y(x) a^2 + f(x)^2 \sinh(\lambda x) \_\_Y(x) a \lambda + \_\_Y''(x) f(x) - f'(x) \_\_Y'(x)}{f(x)}\right\}, \{\_\_Y(x)\}\right) f(x)} \tag{1}$$

Verification of solutions

$$y = -\frac{\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{-f(x)^3 \cosh(\lambda x)^2 \_\_Y(x) a^2 + f(x)^2 \sinh(\lambda x) \_\_Y(x) a \lambda + \_\_Y''(x) f(x) - f'(x) \_\_Y'(x)}{f(x)}\right\}, \{\_\_Y(x)\}\right)}{\mathrm{DESol}\left(\left\{\frac{-f(x)^3 \cosh(\lambda x)^2 \_\_Y(x) a^2 + f(x)^2 \sinh(\lambda x) \_\_Y(x) a \lambda + \_\_Y''(x) f(x) - f'(x) \_\_Y'(x)}{f(x)}\right\}, \{\_\_Y(x)\}\right) f(x)}$$

Verified OK.

Book: Handbook of exact solutions for ordinary differential equations. By Polyanin and Zaitsev. Second edition
Section: Chapter 1, section 1.2. Riccati Equation. subsection 1.2.8-1. Equations containing arbitrary functions (but not containing their derivatives).
Problem number: 25.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

`[_Riccati]`

$$\boxed{y'x - y^2 f(x) = a - a^2 f(x) \ln(x)^2}$$

19.25.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y) \\ &= -\frac{a^2 f(x) \ln(x)^2 - f(x)\, y^2 - a}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = -\frac{a^2 f(x) \ln(x)^2}{x} + \frac{f(x)\, y^2}{x} + \frac{a}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = -\frac{-a+a^2 f(x)\ln(x)^2}{x}$, $f_1(x) = 0$ and $f_2(x) = \frac{f(x)}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u} \\ &= \frac{-u'}{\frac{f(x)u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned}
f_2' &= \frac{f'(x)}{x} - \frac{f(x)}{x^2} \\
f_1 f_2 &= 0 \\
f_2^2 f_0 &= -\frac{f(x)^2 \left(-a + a^2 f(x) \ln(x)^2\right)}{x^3}
\end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{f(x)\, u''(x)}{x} - \left(\frac{f'(x)}{x} - \frac{f(x)}{x^2}\right) u'(x) - \frac{f(x)^2 \left(-a + a^2 f(x) \ln(x)^2\right) u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(\frac{f'(x)}{x} - \frac{f(x)}{x^2}\right) x\_Y'(x)}{f(x)} - \frac{f(x)\left(-a + a^2 f(x) \ln(x)^2\right)\_Y(x)}{x^2}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(\frac{f'(x)}{x} - \frac{f(x)}{x^2}\right) x\_Y'(x)}{f(x)} - \frac{f(x)\left(-a + a^2 f(x) \ln(x)^2\right)\_Y(x)}{x^2}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(\frac{f'(x)}{x} - \frac{f(x)}{x^2}\right) x\_Y'(x)}{f(x)} - \frac{f(x)\left(-a+a^2 f(x) \ln(x)^2\right)\_Y(x)}{x^2}\right\}, \{\_Y(x)\}\right)\right) x}{f(x)\, \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(\frac{f'(x)}{x} - \frac{f(x)}{x^2}\right) x\_Y'(x)}{f(x)} - \frac{f(x)\left(-a+a^2 f(x) \ln(x)^2\right)\_Y(x)}{x^2}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{-\frac{f(x)^3 \ln(x)^2 \_Y(x) a^2 - f(x)^2 a \_Y(x) - \_Y''(x) x^2 f(x) + f'(x) \_Y'(x) x^2 - f(x) \_Y'(x) x}{x^2 f(x)}\right\}, \{\_Y(x)\}\right)\right) x}{f(x) \mathrm{DESol}\left(\left\{-\frac{f(x)^3 \ln(x)^2 \_Y(x) a^2 - f(x)^2 a \_Y(x) - \_Y''(x) x^2 f(x) + f'(x) \_Y'(x) x^2 - f(x) \_Y'(x) x}{x^2 f(x)}\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{-\frac{f(x)^3 \ln(x)^2 \_Y(x) a^2 - f(x)^2 a \_Y(x) - \_Y''(x) x^2 f(x) + f'(x) \_Y'(x) x^2 - f(x) \_Y'(x) x}{x^2 f(x)}\right\}, \{\_Y(x)\}\right)\right) x}{f(x) \mathrm{DESol}\left(\left\{-\frac{f(x)^3 \ln(x)^2 \_Y(x) a^2 - f(x)^2 a \_Y(x) - \_Y''(x) x^2 f(x) + f'(x) \_Y'(x) x^2 - f(x) \_Y'(x) x}{x^2 f(x)}\right\}, \{\_Y(x)\}\right)} \tag{1}$$

Verification of solutions

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{-\frac{f(x)^3 \ln(x)^2 \_Y(x) a^2 - f(x)^2 a \_Y(x) - \_Y''(x) x^2 f(x) + f'(x) \_Y'(x) x^2 - f(x) \_Y'(x) x}{x^2 f(x)}\right\}, \{\_Y(x)\}\right)\right) x}{f(x) \mathrm{DESol}\left(\left\{-\frac{f(x)^3 \ln(x)^2 \_Y(x) a^2 - f(x)^2 a \_Y(x) - \_Y''(x) x^2 f(x) + f'(x) \_Y'(x) x^2 - f(x) \_Y'(x) x}{x^2 f(x)}\right\}, \{\_Y(x)\}\right)}$$

Verified OK.

Problem number: 26.
ODE order: 1.
ODE degree: 1.

The type(s) of ODE detected by this program : **"riccati"**

Maple gives the following as the ode type

```
[[_1st_order, `_with_symmetry_[F(x),G(x)]`], _Riccati]
```

$$\boxed{y'x - f(x)\left(y + a\ln\left(x\right)\right)^2 = -a}$$

19.26.1 Solving as riccati ode

In canonical form the ODE is

$$\begin{aligned} y' &= F(x,y)\\ &= \frac{a^2 f(x)\ln\left(x\right)^2 + 2\ln\left(x\right)f(x)\,ay + f(x)\,y^2 - a}{x} \end{aligned}$$

This is a Riccati ODE. Comparing the ODE to solve

$$y' = \frac{a^2 f(x)\ln\left(x\right)^2}{x} + \frac{2\ln\left(x\right)f(x)\,ay}{x} + \frac{f(x)\,y^2}{x} - \frac{a}{x}$$

With Riccati ODE standard form

$$y' = f_0(x) + f_1(x)y + f_2(x)y^2$$

Shows that $f_0(x) = \frac{-a+a^2 f(x)\ln(x)^2}{x}$, $f_1(x) = \frac{2af(x)\ln(x)}{x}$ and $f_2(x) = \frac{f(x)}{x}$. Let

$$\begin{aligned} y &= \frac{-u'}{f_2 u}\\ &= \frac{-u'}{\frac{f(x)u}{x}} \end{aligned} \tag{1}$$

Using the above substitution in the given ODE results (after some simplification)in a second order ODE to solve for $u(x)$ which is

$$f_2 u''(x) - (f_2' + f_1 f_2)\, u'(x) + f_2^2 f_0 u(x) = 0 \tag{2}$$

But

$$\begin{aligned} f_2' &= \frac{f'(x)}{x} - \frac{f(x)}{x^2} \\ f_1 f_2 &= \frac{2a f(x)^2 \ln(x)}{x^2} \\ f_2^2 f_0 &= \frac{f(x)^2 \left(-a + a^2 f(x) \ln(x)^2\right)}{x^3} \end{aligned}$$

Substituting the above terms back in equation (2) gives

$$\frac{f(x)\, u''(x)}{x} - \left(\frac{f'(x)}{x} - \frac{f(x)}{x^2} + \frac{2a f(x)^2 \ln(x)}{x^2}\right) u'(x) + \frac{f(x)^2 \left(-a + a^2 f(x) \ln(x)^2\right) u(x)}{x^3} = 0$$

Solving the above ODE (this ode solved using Maple, not this program), gives

$$u(x) = \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(\frac{f'(x)}{x} - \frac{f(x)}{x^2} + \frac{2a f(x)^2 \ln(x)}{x^2}\right) x\_Y'(x)}{f(x)} + \frac{f(x)\left(-a + a^2 f(x) \ln(x)^2\right)\_Y(x)}{x^2}\right\}, \{\_Y(x)\}\right)$$

The above shows that

$$u'(x) = \frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(\frac{f'(x)}{x} - \frac{f(x)}{x^2} + \frac{2a f(x)^2 \ln(x)}{x^2}\right) x\_Y'(x)}{f(x)} + \frac{f(x)\left(-a + a^2 f(x) \ln(x)^2\right)\_Y(x)}{x^2}\right\}, \{\_Y(x)\}\right)$$

Using the above in (1) gives the solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(\frac{f'(x)}{x} - \frac{f(x)}{x^2} + \frac{2a f(x)^2 \ln(x)}{x^2}\right) x\_Y'(x)}{f(x)} + \frac{f(x)\left(-a + a^2 f(x) \ln(x)^2\right)\_Y(x)}{x^2}\right\}, \{\_Y(x)\}\right)\right) x}{f(x)\, \mathrm{DESol}\left(\left\{\_Y''(x) - \frac{\left(\frac{f'(x)}{x} - \frac{f(x)}{x^2} + \frac{2a f(x)^2 \ln(x)}{x^2}\right) x\_Y'(x)}{f(x)} + \frac{f(x)\left(-a + a^2 f(x) \ln(x)^2\right)\_Y(x)}{x^2}\right\}, \{\_Y(x)\}\right)}$$

Dividing both numerator and denominator by c_1 gives, after renaming the constant $\frac{c_2}{c_1} = c_3$ the following solution

$$y = -\frac{\left(\frac{\partial}{\partial x} \mathrm{DESol}\left(\left\{\frac{\_Y''(x) x^2 f(x) - 2\left(f(x)^2 \ln(x) a + \frac{f'(x) x}{2} - \frac{f(x)}{2}\right) x \_Y'(x) + f(x)^2 a \left(f(x) \ln(x)^2 a - 1\right) \_Y(x)}{x^2 f(x)}\right\}, \{\_Y(x)\}\right)\right) x}{f(x) \mathrm{DESol}\left(\left\{\frac{\_Y''(x) x^2 f(x) - 2\left(f(x)^2 \ln(x) a + \frac{f'(x) x}{2} - \frac{f(x)}{2}\right) x \_Y'(x) + f(x)^2 a \left(f(x) \ln(x)^2 a - 1\right) \_Y(x)}{x^2 f(x)}\right\}, \{\_Y(x)\}\right)}$$

Summary

The solution(s) found are the following
